lun mapping add-reporting-nodes	261
lun mapping create	262
lun mapping delete	264
lun mapping remove-reporting-nodes	264
lun mapping show	265
lun mapping show-initiator	266
lun move commands	268
lun move cancel	268
lun move modify	268
lun move pause	269
lun move resume	270
lun move show	270
lun move start	272
lun persistent-reservation commands	273
lun persistent-reservation clear	273
lun persistent-reservation show	274
lun portset commands	275
lun portset add	275
lun portset create	276
lun portset delete	277
lun portset remove	278
lun portset show	278
lun transition commands	280
lun transition show	280
lun transition start	281
lun transition 7-mode commands	281
metrocluster commands	285
metrocluster configure	285
metrocluster heal	288
metrocluster modify	288

metrocluster show	289
metrocluster switchback	291
metrocluster switchover	292
metrocluster check commands	293
metrocluster check disable-periodic-check	293
metrocluster check enable-periodic-check	294
metrocluster check run	294
metrocluster check show	296
metrocluster check aggregate commands	298
metrocluster check cluster commands	301
metrocluster check config-replication commands	303
metrocluster check connection commands	306
metrocluster check lif commands	309
metrocluster check node commands	312
metrocluster check volume commands	317
metrocluster config-replication commands	319
metrocluster config-replication cluster-storage-configuration commands ..	319
metrocluster config-replication resync-status commands	320
metrocluster configuration-settings commands	321
metrocluster configuration-settings show-status	321
metrocluster configuration-settings calibration commands	323
metrocluster configuration-settings connection commands	325
metrocluster configuration-settings dr-group commands	333
metrocluster configuration-settings interface commands	337
metrocluster configuration-settings mediator commands	343
metrocluster interconnect commands	344
metrocluster interconnect adapter commands	344
metrocluster interconnect mirror commands	349
metrocluster node commands	352
metrocluster node show	352
metrocluster operation commands	356
metrocluster operation show	356
metrocluster operation history commands	356
metrocluster vsriver commands	358
metrocluster vsriver recover-from-partial-switchback	358
metrocluster vsriver recover-from-partial-switchover	358
metrocluster vsriver resync	359
metrocluster vsriver show	359
network commands	362
network ping	362
network ping6	363
network test-path	365
network traceroute	366
network traceroute6	367
network arp commands	369

network arp create	369
network arp delete	370
network arp show	370
network arp active-entry commands	371
network bgp commands	373
network bgp config commands	373
network bgp defaults commands	375
network bgp peer-group commands	376
network bgp vserver-status commands	379
network cloud commands	380
network cloud routing-table commands	380
network connections commands	382
network connections active commands	382
network connections listening commands	389
network device-discovery commands	390
network device-discovery show	391
network fcp commands	392
network fcp adapter commands	393
network fcp topology commands	398
network fcp zone commands	400
network interface commands	402
network interface create	402
network interface delete	406
network interface migrate	407
network interface migrate-all	407
network interface modify	408
network interface rename	411
network interface revert	412
network interface show	413
network interface start-cluster-check	417
network interface capacity commands	418
network interface check commands	419
network interface dns-lb-stats commands	421
network interface failover-groups commands	423
network interface lif-weights commands	427
network interface service-policy commands	428
network interface service commands	438
network ipspace commands	439
network ipspace create	439
network ipspace delete	439
network ipspace rename	440
network ipspace show	440
network ndp commands	441
network ndp default-router commands	441
network ndp neighbor commands	443

network ndp prefix commands	446
network options commands	448
network options cluster-health-notifications commands	448
network options detect-switchless-cluster commands	449
network options ipv6 commands	450
network options load-balancing commands	451
network options multipath-routing commands	452
network options port-health-monitor commands	453
network options send-soa commands	456
network options switchless-cluster commands	457
network port commands	458
network port delete	458
network port modify	458
network port show	459
network port show-address-filter-info	462
network port broadcast-domain commands	463
network port ifgrp commands	469
network port vip commands	473
network port vlan commands	475
network qos-marking commands	477
network qos-marking modify	477
network qos-marking show	478
network route commands	479
network route create	479
network route delete	479
network route show	480
network route show-lifs	481
network route active-entry commands	482
network subnet commands	484
network subnet add-ranges	484
network subnet create	484
network subnet delete	485
network subnet modify	486
network subnet remove-ranges	487
network subnet rename	487
network subnet show	488
network tcpdump commands	489
network tcpdump show	489
network tcpdump start	490
network tcpdump stop	490
network tcpdump trace commands	491
network test-link commands	492
network test-link run-test	492
network test-link show	493
network test-link start-server	495

network test-link stop-server	495
network tuning commands	496
network tuning icmp commands	496
network tuning icmp6 commands	497
network tuning tcp commands	499
pod commands	501
pod status commands	501
pod status show	501
protection-type commands	502
protection-type show	502
qos commands	503
qos adaptive-policy-group commands	503
qos adaptive-policy-group create	503
qos adaptive-policy-group delete	504
qos adaptive-policy-group modify	505
qos adaptive-policy-group rename	506
qos adaptive-policy-group show	507
qos policy-group commands	508
qos policy-group create	508
qos policy-group delete	510
qos policy-group modify	510
qos policy-group rename	511
qos policy-group show	512
qos settings commands	513
qos settings cache commands	513
qos statistics commands	516
qos statistics characteristics commands	516
qos statistics latency commands	517
qos statistics performance commands	519
qos statistics resource commands	521
qos statistics volume commands	524
qos statistics workload commands	533

exit

Quit the CLI session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `exit` command ends the current CLI session.

Examples

The following example ends the current CLI session:

```
cluster1::> exit
Goodbye
```

history

Show the history of commands for this CLI session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `history` command displays the command history of the current CLI session. A numeric ID precedes each command. Use this number with the [redo](#) command to re-execute that history item.

Examples

The following example displays the command history of the current CLI session:

```
cluster1::> history
 1  vserver show
 2  man volume show
 3  volume delete -vserver vs0 -volume temporary2
 4  volume modify { -volume temp* } -state offline
cluster1::> redo 3
```

Related references

[redo](#) on page 34

man

Display the online manual pages

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `man` command displays the manual page of the command you specify. If you do not specify a command, command displays the man page index.

Parameters

[<text>] - Valid CLI command

The command for which you'd like to see the manual page. The syntax of the command is the same as the command itself. The `man` command supports abbreviations and tab completion of the command name.

Examples

The following example displays the manual page for the *storage aggregate create* command.

```
cluster1::> man sto aggr cre
```

That example could also have been fully specified as:

```
cluster1::> man storage aggregate create
```

redo

Execute a previous command

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `redo` command re-executes a command that has been executed previously in the current CLI session. Specify a previously run command using:

- A string that matches part of a previous command. For example, if the only *volume* command you have run is *volume show*, enter `redo vol` to re-execute the command.
- The numeric ID of a previous command, as listed by the [history](#) command. For example, enter `redo 4` to re-execute the fourth command in the history list.
- A negative offset from the end of the history list. For example, enter `redo -2` to re-execute the command that you ran two commands ago.

Parameters

[<text>] - String, Event Number, or Negative Offset

Use this parameter to specify a string, a numeric ID from the command history, or a negative number that identifies the command to be re-executed.

Examples

The following example re-executes command number 10 in the command history:

```
cluster1::> redo 10
```

Related references

[history](#) on page 32

rows

Show/Set the rows for the CLI session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `rows` command displays the number of rows that can be displayed in the current CLI session before the interface pauses output. If you do not set this value, it adjusts automatically based on the actual height of your terminal. If the actual height is undefined, the default number of rows is 24.

Specify a number to set the number of rows that can be displayed. Setting this value manually disables auto-adjustment. Specify zero (0) to disable pausing.

You can also set this value using the `set -rows` command.

Parameters

[<integer>] - Number of Rows the Screen Can Display

Use this parameter to specify the number of rows your terminal can display.

Examples

The following example displays the current number of rows, then resets the number of rows to 48:

```
cluster1::> rows
36

cluster1::> rows 48
```

[set](#) on page 36

set

Display/Set CLI session settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The **set** command changes attributes of the user interface.

Parameters

[-privilege <PrivilegeLevel>] - Privilege Level

Use this parameter to specify the privilege level of the command session. Possible values are

- **admin** - Used for routine system management commands
- **advanced** - Used for infrequent, dangerous, or complicated commands
- **diagnostic** - Used for detailed diagnostic commands that are used only by support personnel

[-confirmations {on/off}] - Confirmation Messages

Use this parameter with the value **on** to specify that the interface prompt for confirmation before executing potentially dangerous commands. Use this parameter with the value **off** to specify that the interface not prompt for confirmation, even before potentially dangerous commands execute. The default setting is **on**.

[-showallfields {true/false}] - Show All Fields

Use this parameter with the value **true** to specify that the interface display all field columns when displaying tabular output. Use this parameter with the value **false** to specify that the interface display only selected columns. The default setting is **false**.

[-showseparator <text>] - Show Separator

Use this parameter to specify the characters to use as the field separator. The field separator is used between field columns when **-showallfields** is set to "true". The separator can be from one to three characters in length. When specifying the separator, enclose it in quotation marks ("). Set the separator to one or more spaces to disable this feature.

[-active-help {true/false}] - Active Help

Use this parameter with the value **true** to specify that pressing the question mark (?) key is sufficient to execute a help request. Use this parameter with the value **false** to specify that you must press the Return key after the question mark key to execute a help request. The default setting is **true**.

[-units {auto/raw/B/KB/MB/GB/TB/PB}] - Data Units

Use this parameter to specify the default units used when reporting data sizes. Possible values are:

- **auto** - Auto-scale data size for human-readable output
- **raw** - Bytes without unit designation
- **B** - Bytes

- **KB** - Kilobytes (1024 bytes, aka kibibytes)
- **MB** - Megabytes (KB x 1024, aka mebibytes)
- **GB** - Gigabytes (MB x 1024, aka gibibytes)
- **TB** - Terabytes (GB x 1024, aka tebibytes)
- **PB** - Petabytes (TB x 1024, aka pebibytes)

The default setting is **auto**.

[-rows <integer>] - Pagination Rows ('0' disables)

Use this parameter to specify the number of rows that can be displayed in the current CLI session before the interface pauses output. If you do not set this value, it adjusts automatically based on the actual height of your terminal. If the actual height is undefined, the default number of rows is 24.

Setting this value manually disables auto-adjustment. Specify zero (0) to disable pausing.

You can also set this value using the **rows** command.

[-vserver <text>] - Default Vserver

Use this parameter to specify the name of the Vserver to use as the default value for the **-vserver** parameter of commands.

WARNING: Vserverized commands that only have a single required parameter, which is the <userinput>-vserver<userinput>, allow the Vserver to be specified positionally, without <userinput>-vserver<userinput> preceding it. Due to this, care must be taken when using CLI commands that do not require the <userinput>-vserver<userinput> parameter. For example, using the "vserver nfs delete *" command will ignore the "set -vserver" value as the parser considers the "*" to be the Vserver.

[-node <text>] - Default Node

Use this parameter to specify the name of the node to use as the default value for the **-node** parameter of commands.

[-stop-on-error {true/false}] - Stop On Error

Use this parameter with the value **true** to specify that continuing commands should stop if they encounter an error. Use this parameter with the value **false** to specify that continuing commands should continue if they encounter an error.

[-prompt-timestamp {above/inline/none}] - Display Prompt Timestamp

Print the current date and time as a part of the prompt. The possible values are

- *above* - print the timestamp using the system timestamp format on the line above the remainder of the prompt.
- *inline* - print the timestamp using the system timestamp format at the beginning of the line with the remainder of the prompt.
- *none* - do not print the timestamp.

The default value is *none*.

Examples

The following example sets the privilege level to advanced.

```
cluster1::> set -privilege advanced

Warning: These advanced commands are potentially dangerous; use them only
when
    directed to do so by NetApp personnel.
Do you wish to continue? (y or n): y

cluster1::*>
```

The following examples cause all columns to be shown in output rows, with a comma used as the field separator.

```
cluster1::> set -showallfields true

cluster1::> set -showseparator ","

cluster1::> network port show
node,port,role,link,mtu,autonegotiate-admin,autonegotiate-oper,duplex-
admin,duplex-oper,speed-admin,speed-oper,flowcontrol-admin,flowcontrol-

[rows](#) on page 35

top

Go to the top-level directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `top` command changes the current working directory of the command prompt to the top-level command directory.

Examples

The following example returns the command prompt from the *storage aggregate* directory to the top-level directory:

```
cluster1::storage aggregate> top  
cluster1::>
```

Related references

[storage aggregate](#) on page 940

up

Go up one directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `up` command, which can also be specified as two dots (`..`), changes the current working directory of the command prompt to the directory that is up one level in the command hierarchy.

Examples

The following example takes the command prompt up one level from the *storage aggregate* directory:

```
cluster1::storage aggregate> up
cluster1::storage>
```

application commands

Display and manage applications

application provisioning commands

Manage application provisioning

application provisioning config commands

Manage configuration for application provisioning

application provisioning config modify

Modify options for application provisioning

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the options for application provisioning operations.

Parameters

`[-is-mixed-storage-services-allowed {true/false}] - Is Mixed Storage Services Allowed`

Specifies whether mixed cost storage services are allowed for provisioning placement. If the value of this parameter is *false*, only the aggregates closest to the performance requirements of the storage service are used. If the value of this parameter is *true*, all aggregates with sufficient performance are considered. The initial value for option is *false*.

Examples

```
cluster1::*> application provisioning config modify -is-mixed-storage-
services-allowed true
```

application provisioning config show

Display options for application provisioning

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays options for application provisioning.

Examples

```
cluster1::*> application provisioning config show
Is Mixed Storage Services Allowed: false
```

autobalance commands

The autobalance directory

autobalance aggregate commands

Auto Balance Aggregate

autobalance aggregate show-aggregate-state

Display the Auto Balance Aggregate state for an aggregate

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `autobalance aggregate show-aggregate-state` command displays information about an aggregate state that is considered by the Auto Balance Aggregate feature.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance]]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>/local}] - Node Name`

If this parameter is specified, the display will be limited to only those aggregates with a node that matches the specified value.

`[-aggregate <aggregate name>] - Name of the Aggregate`

If this parameter is specified, the display will be limited to only that aggregate with a name that matches the specified value.

`[-total-size {<integer>[KB/MB/GB/TB/PB]}] - Total Size of the Aggregate`

If this parameter is specified, the display will be limited to only those aggregates with a total-size that matches the specified value.

`[-used-size {<integer>[KB/MB/GB/TB/PB]}] - Used Size of the Aggregate`

If this parameter is specified, the display will be limited to only those aggregates with a used-size that matches the specified value.

`[-aggregate-unbalanced-threshold {<integer>[KB/MB/GB/TB/PB]}] - Threshold When Aggregate Is Considered Unbalanced`

If this parameter is specified, the display will be limited to only those aggregates with a threshold that matches the specified value.

`[-outgoing-size {<integer>[KB/MB/GB/TB/PB]}] - Size of Outgoing Volumes in the Aggregate`

If this parameter is specified, the display will be limited to only those aggregates with an outgoing-size that matches the specified value. Outgoing size will be equal to the total size of the volumes that move away from each one of those aggregate.

`[-incoming-size {<integer>[KB/MB/GB/TB/PB]}]` - Size of Incoming Volumes in the Aggregate

If this parameter is specified, the display will be limited to only those aggregates with an incoming-size that matches the specified value. Incoming size will be equal to the total size of the volumes that move towards to each one of those aggregates.

`[-raidtype {raid_tec/raid_dp/raid4}]` - RAID Type

If this parameter is specified, the display will be limited to only those aggregates with a raidtype that matches the specified value.

`[-home-cluster <UUID>]` - Home Cluster ID

If this parameter is specified, the display will be limited to only those aggregates with a home-cluster ID that matches the specified value.

`[-is-hybrid {true/false}]` - Aggregate Is a Hybrid

If this parameter is specified as true, the display will be limited to only hybrid aggregates. If the parameter is specified as false, the display will be limited to only non-hybrid aggregates.

`[-is-incoming-volume-thin {true/false}]` - An Incoming Volume Is Thin

When you use thin provisioning for a volume, it can run out of space even if it has not yet consumed its nominal size and you should carefully monitor space utilization to avoid unexpected errors due to the volume running out of space. If this parameter is specified as true, the display will be limited to only those aggregates which are the target of a move of thin volume. If the parameter is specified as false, the display will be limited to only those aggregates which are not the target of a move of thin volume.

`[-is-balanceable {true/false}]` - Is Balanceable

If this parameter is specified as true, the display will be limited to only balanceable aggregates. If the parameter is specified as false, the display will be limited to only non-balanceable aggregates.

`[-is-move-target {true/false}]` - Aggregate Is a Volume Move Target

If this parameter is specified as true, the display will be limited to only those aggregates which are target of a volume move. If the parameter is specified as false, the display will be limited to only those aggregates which are not the target of a volume move.

`[-attributes <text>, ...]` - Aggregate Attributes

If this parameter is specified, the display will be limited to only those aggregates with attributes that matches the specified values.

`[-aggregate-available-threshold {<integer>[KB/MB/GB/TB/PB]}]` - Threshold When Aggregate Is Considered Balanced

If this parameter is specified, the display will be limited to only those aggregates which meet the specified threshold to be considered as balanced.

Examples

The following example displays information about the state for all aggregates in the cluster.

```
cluster1::*> autobalance aggregate show-aggregate-state
Aggregate: aggr0
Total Size: 4.78GB
Used Size: 4.56GB
Outgoing Size: 0B
Incoming Size: 0B
Aggregate Used Space Threshold: 3.34GB

Total Size of the Aggregate: 12.61GB
Used Size of the Aggregate: 111.6MB
Threshold When Aggregate Is Considered Unbalanced: 8.83GB
Size of Outgoing Volumes in the Aggregate: 0B
Size of Incoming Volumes in the Aggregate: 0B
RAID Type: raid4
Home Cluster ID: edf0379b-16da-11e6-aa3c-0050568558c2
Aggregate Is a Hybrid: false
An Incoming Volume Is Thin: false
Is Balanceable: false
Aggregate Is a Volume Move Target: false
Aggregate Attributes: Excluded
Threshold When Aggregate Is Considered Balanced: 5.04GB

```

autobalance aggregate show-unbalanced-volume-state

Display the Auto Balance Aggregate state for a volume

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `autobalance aggregate show-unbalanced-volume-state` command displays information about a volume that is considered by the Auto Balance Aggregate feature.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use 'fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node Name

If this parameter is specified, the display will be limited to only those volumes with a node that matches the specified value.

[-DSID <integer>] - DSID of the Last Volume Queried

If this parameter is specified, the display will be limited to only those volumes with a DSID that matches the specified value.

[-aggregate <aggregate name>] - Aggregate

If this parameter is specified, the display will be limited to only those volumes with an aggregate name that matches the specified value.

[-volume-name <text>] - Name of the Volume

If this parameter is specified, the display will be limited to only that volume with a name that matches the specified value.

[-last-threshold-crossed-time <MM/DD/YYYY HH:MM:SS>] - Last Time Threshold Crossed

If this parameter is specified, the display will be limited to only those volumes with a threshold crossing time that matches the specified value.

[-last-placed-time <MM/DD/YYYY HH:MM:SS>] - Last Time Volume Was Moved

If this parameter is specified, the display will be limited to only those volumes with a last time they have been moved that matches the specified value.

[-is-moving {true/false}] - Is Volume Currently Moving

If this parameter is specified as true, the display will be limited to only the moving volumes. If the parameter is specified as false, the display will be limited to only the non-moving volumes.

[-is-quiesced {true/false}] - Is Volume Quiesced

If this parameter is specified as true, the display will be limited to only the quiesced volumes. If the parameter is specified as false, the display will be limited to only the non-quiesced volumes.

[-total-footprint {<integer>[KB/MB/GB/TB/PB]}] - Total Size of the Volume

If this parameter is specified, the display will be limited to only those volumes with a total footprint that matches the specified value.

[-attributes <text>, ...] - Volume's Attributes

If this parameter is specified, the display will be limited to only those volumes with attributes that matches the specified value.

[-last-checked <MM/DD/YYYY HH:MM:SS>] - Last Time Volume State Was Checked

If this parameter is specified, the display will be limited to only those volumes with a last time their state was checked that matches the specified value.

Examples

The following example display information about all of the unbalanced volumes that the Auto Balance Aggregate feature is aware of.

```
cluster1::*> autobalance aggregate show-unbalanced-volume-state
Last Checked On: 3/13/2014 14:32:01

Volume: rol0
Footprint: 20.20MB
Last Time Over IOPS Threshold: 3/12/2014 16:20:18
Last Placed: 3/11/2014 10:16:04
Attributes: Over IOPS Threshold
Stabilizing

Volume: test
Footprint: 20.20MB
Last Time Over IOPS Threshold: 3/12/2014 16:20:18
Last Placed: 3/11/2014 10:16:42
Attributes: Over IOPS Threshold
In Mirror
Stabilizing
```

The following example displays all of the information that the Auto Balance Aggregate feature has collected for all of the unbalanced volumes it is aware of.

```
cluster1::*> autobalance aggregate show-unbalanced-volume-state -instance
Node Name: cluster-1-01
DSID of the Last Volume Queried: 1025
Aggregate: aggr_1
Name of the Volume: rol0
Last Time Threshold Crossed: 3/12/2014 16:20:18
Last Time Volume Was Moved: 3/11/2014 10:16:04
Is Volume Currently Moving: false
Is Volume Quiesced: false
Total Size of the Volume: 20.20MB
Volume's Attributes: Over IOPS Threshold
Stabilizing
Last Time Volume State Was Checked: 3/13/2014 08:20:18

Node Name: cluster-1-01
DSID of the Last Volume Queried: 1026
Aggregate: aggr_1
Name of the Volume: test
Last Time Threshold Crossed: 3/12/2014 16:20:18
Last Time Volume Was Moved: 3/11/2014 10:16:42
Is Volume Currently Moving: false
Is Volume Quiesced: false
Total Size of the Volume: 20.20MB
Volume's Attributes: Over IOPS Threshold
In Mirror
Stabilizing
Last Time Volume State Was Checked: 3/13/2014 08:20:18
```

autobalance aggregate config commands

Auto Balance Aggregate configuration

autobalance aggregate config modify

Modify the Auto Balance Aggregate feature configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `autobalance aggregate config modify` command allows the user to customize the parameters that determine when volumes should be considered for automatic move or recommendation by the Auto Balance Aggregate feature.

Parameters

`[-is-enabled {true/false}]` - Is the Auto Balance Aggregate Feature Enabled

This specifies whether the Auto Balance Aggregate feature is enabled and running.

`[-aggregate-unbalanced-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Unbalanced (%)

This specifies the space used threshold percentage that will cause the Auto Balance Aggregate feature to consider an aggregate as unbalanced.

`[-aggregate-available-threshold-percent <integer>]` - Threshold When Aggregate Is Considered Balanced (%)

This specifies the threshold percentage which will determine if an aggregate is a target destination for a move. The Auto Balance Aggregate feature will attempt to move volumes from an unbalanced aggregate until it is under this percentage.

Examples

The following example displays a modification for the default configuration of the Auto Balance Aggregate feature

```
cluster1::*> autobalance aggregate config show
    Is the Auto Balance Aggregate Feature Enabled: false
    Threshold When Aggregate Is Considered Unbalanced (%): 70
    Threshold When Aggregate Is Considered Balanced (%): 40

    cluster1::*> autobalance aggregate config modify -is-enabled
true

    cluster1::*> autobalance aggregate config show
    Is the Auto Balance Aggregate Feature Enabled: true
    Threshold When Aggregate Is Considered Unbalanced (%): 70
    Threshold When Aggregate Is Considered Balanced (%): 40
```

At the diagnostic level, there are additional modifiable parameters.

```
cluster1::*> autobalance aggregate config show
    Is the Auto Balance Aggregate Feature Enabled: false
    Mode of the Auto Balance Aggregate Feature:
recommend
    Polling Interval: 3600
    Threshold When Aggregate Is Considered Unbalanced (%): 70
    Threshold When Aggregate Is Considered Balanced (%): 40
    Volume Operations Threshold (IOPS): 100
    Volume Operations Threshold Not Exceeded for Duration: 24
    Volume Not Moved Again for Duration: 48

    cluster1::*> autobalance aggregate config modify -mode auto -
polling-interval 4000

    cluster1::*> autobalance aggregate config show
    Is the Auto Balance Aggregate Feature Enabled: false
    Mode of the Auto Balance Aggregate Feature: auto
    Polling Interval: 4000
    Threshold When Aggregate Is Considered Unbalanced (%): 70
    Threshold When Aggregate Is Considered Balanced (%): 40
    Volume Operations Threshold (IOPS): 100
    Volume Operations Threshold Not Exceeded for Duration: 24
    Volume Not Moved Again for Duration: 48
```

autobalance aggregate config show

Display the Auto Balance Aggregate feature configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `autobalance aggregate config show` command displays information about parameters that determine when volumes should be considered for automatic move or recommendation by the Auto Balance Aggregate feature.

Examples

The following example displays the default configuration for the Auto Balance Aggregate feature

```
cluster1::*> autobalance aggregate config show
      Is the Auto Balance Aggregate Feature Enabled: false
      Threshold When Aggregate Is Considered Unbalanced (%): 70
      Threshold When Aggregate Is Considered Balanced (%): 40
```

At the diagnostic level, the output displays the information below.

```

                                Is the Auto Balance Aggregate Feature Enabled: false
                                Mode of the Auto Balance Aggregate Feature:
recommend
                                Polling Interval: 3600
      Threshold When Aggregate Is Considered Unbalanced (%): 70
      Threshold When Aggregate Is Considered Balanced (%): 40
                                Volume Operations Threshold (IOPS): 100
      Volume Operations Threshold Not Exceeded for Duration: 24
                                Volume Not Moved Again for Duration: 48
```

Cluster Commands

Manage clusters

The `cluster` commands enable you to create and manage Data ONTAP 8 clusters.

cluster add-node

Expand the cluster by discovering and adding new nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster add-node` command discovers and adds new nodes to the cluster. When the `-node-count` parameter is specified, the command attempts to add that many nodes to the cluster. The `-node-ip` parameter can be specified to directly add a node. The `-cluster-ips` parameter can be specified to directly add one or more nodes in parallel. Only one of the `-node-count`, `-node-ip` and `-cluster-ips` parameters can be provided. The `system node show-discovered` command displays all the nodes discovered on the local network.

Note: The `node-count` parameter is deprecated and may be removed in a future release of Data ONTAP. Use the `-cluster-ips` parameter instead.

Note: The `node-ip` parameter is deprecated and may be removed in a future release of Data ONTAP. Use the `-cluster-ips` parameter instead.

Parameters

{ -cluster-ips <IP Address>, ... - List of Cluster Interface IP Addresses of the Nodes Being Added

This parameter contains a comma separated list of cluster interface IP addresses of the nodes in the cluster you are creating. All the nodes specified in the list will be added to the cluster.

| -retry [true] - Retry a failed cluster add-node operation

Use this parameter to retry the most recently failed `cluster add-node` command with the originally specified parameters. Retry is not supported if the `cluster add-node` command was originally run with either the `-node-count` or `-node-ip` parameters.

| -node-count <integer> - (DEPRECATED)-Number of Nodes Being Added

Number of nodes to be added to the cluster. If fewer nodes are discovered, all the discovered nodes are added to the cluster and the command will fail since there are fewer nodes than specified. If more nodes are found than the number specified, the command will fail because there is no way to determine which nodes you intend to add to the cluster.

Note: The `-node-count` parameter is supported on non-shared architecture platforms only.

| -node-ip <IP Address> - (DEPRECATED)-Cluster IP Address of Node

Cluster IP address of the node to add. When this parameter is provided, the command directly adds the node.

`[-node-names <text>, ...]` - List of Node Names

This parameter contains a comma separated list of node names of all the nodes in the cluster you are creating. The node names must have an one to one correspondence with `-cluster-ips` parameter. The names provided will be used to rename the nodes once they are added to the cluster.

`[-foreground {true/false}]` - Foreground Process

When set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes.

`[-allow-mixed-version-join [true]]` - Allow a Node At a Different Version to Join Cluster

This parameter allows nodes with different, but compatible versions of Data ONTAP to be added to the cluster. A Data ONTAP best practice is to add nodes to the cluster that are of the same Data ONTAP version as the nodes in the cluster, but that may not always be possible.

Examples

The following example adds a node using `-cluster-ips`:

```
cluster1:> cluster add-node -cluster-ips 1.1.1.1, 2.2.2.2
Use the 'cluster add-node-status' command to see the progress of the
add-node operation.
```

The following example adds 3 nodes using `-node-count`.

```
cluster1:> cluster add-node -node-count 3
[Job 22] Job succeeded.
```

Related references

[system node show-discovered](#) on page 1440

[cluster create](#) on page 51

cluster add-node-status

Show cluster expansion progress

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster add-node-status` command displays the progress of the node joining a cluster initiated by using the `cluster create` command or the `cluster add-node` command

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-node-uuid* <UUID>] - Node UUID

Select the node that match the specified node UUID.

[*-node-name* <text>] - Node Name

Select the nodes that match the specified node name.

[*-cluster-ip* <IP Address>] - IP Address of a Cluster Interface of Node

Select the nodes that match the specified cluster IP.

[*-status* <Cluster Operation Status>] - The Status of Current Task Being Performed

Select the nodes that match the specified status. This status shows whether the operation is ongoing or complete with success or failure. The various phases that a node goes through are node-initialization, joining-cluster, service-startup, post-cluster-setup and success or failure.

[*-failure-msg* <text>] - Error Reason

Select the nodes that match the specified error string.

[*-last-updated* <MM/DD/YYYY HH:MM:SS>] - Last Updated

The date/time stamp of the last update to the status.

Examples

The following example shows the progress of a node add operation:

```
clus1::> cluster add-node-status
```

Node Name	Node IP	Status	Error Reason
node1	1.1.1.1	success	-

[cluster create](#) on page 51

[cluster add-node](#) on page 49

cluster create

Create a cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster create` command creates a cluster with one or more nodes. When the **-node-count** parameter is specified, the command attempts to add that many nodes to the cluster. The **-cluster-ips** parameter can be specified to add one or more nodes in parallel. Only one of the **-node-count** and **-cluster-ips** parameters can be provided.

Note that single-node clusters do not require configuring the cluster network. A cluster network interface must be configured before other nodes can join the cluster.

Note: The `node-count` parameter is deprecated and may be removed in a future release of Data ONTAP. Use the `-cluster-ips` parameter instead.

Parameters

`[-license <License Code v2>]` - (DEPRECATED)-Base License

Note: This parameter is deprecated and may be removed in a future release of Data ONTAP.

Use this optional parameter to specify the base license for the cluster. Obtain this value from your sales or support representative.

`-clustername <text>` - Cluster Name

Use this parameter to specify the name of the cluster you are creating.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 44 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

`[-cluster-ips <IP Address>, ...]` - List of Cluster Interface IP Addresses of the Nodes Being Added

This parameter contains a comma separated list of cluster interface IP addresses of the nodes in the cluster you are creating. All the nodes specified in the list will be added to the cluster.

`[-node-count <integer>]` - (DEPRECATED)-Node Count

Use this parameter to specify the number of nodes in the cluster you are creating.

- `-node-count` parameter is supported on non-shared architecture platforms only.

`[-node-names <text>, ...]` - List of Node Names

This parameter contains a comma separated list of node names of all the nodes in the cluster you are creating. The node names must have an one to one correspondence with `-cluster-ips` parameter. The names provided will be used to rename the nodes once they are added to the cluster.

`[-retry [true]]` - Retry a failed cluster create operation

Use this parameter to retry the most recently failed `cluster create` command with the originally specified parameters. Retry is not supported if the `cluster create` command was originally run with either the `-node-count` or `-node-ip` parameters.

Examples

The following example creates a cluster named `cluster1`

```
cluster1::> cluster create -clustername cluster1
```

The following example creates a cluster named `cluster1` with `node-count 4` on a non-shared architecture platform.

```
cluster1::> cluster create -clustername cluster1 -node-count 4
```

cluster join

(DEPRECATED)-Join an existing cluster using the specified member's IP address or by cluster name

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release of Data ONTAP. Use [cluster add-node](#) from a node in the cluster instead.

The `cluster join` command adds a node to an existing cluster. Use the [cluster create](#) command to create a cluster if one does not already exist.

Note that a cluster network interface must be configured for the cluster before other nodes can join the cluster.

Parameters

{ -clusteripaddr <IP Address> - IP Address of a Cluster Interface from a Node in the Cluster

Use this parameter to specify the IP address of a cluster interface. This must be the IP address of a cluster interface of a node that is already in the cluster. This parameter is mutually exclusive with the `-cluster-name` parameter.

| -cluster-name <text> } - (DEPRECATED)-Cluster Name of the Cluster to Join

Deprecated. Use this parameter to specify the name of an existing cluster to join.

[-allow-mixed-version-join [true]] - Allow a Node at a Different Version to Join Cluster

This parameter allows nodes with different, but compatible versions of Data ONTAP to join the cluster. A Data ONTAP best practice is to join nodes to the cluster that are of the same Data ONTAP version as the nodes in the cluster, but that may not always be possible.

[-node-name <text>] - Name to Use for the Node in the Cluster

This parameter specifies the name that the node will have when we join it to the cluster.

Examples

The following example joins the local node to a cluster. The IP address 192.0.2.66 is the address of a cluster interface of a node that already belongs to the cluster.

```
node::> cluster join -clusteripaddr 192.0.2.66
```

cluster modify

Modify cluster node membership attributes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster modify` command modifies the cluster attributes of a node, including its eligibility to participate in the cluster.

At the advanced privilege level, you can use the command to specify whether a node holds epsilon. Epsilon is an extra fractional vote that enables quorum to form using slightly weaker requirements. For example, two out of four eligible nodes are sufficient to form quorum if one of those two nodes holds epsilon.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the name of the node to modify. If you do not specify a node, the command runs on the local node.

[-epsilon {true/false}] - Epsilon

Use this parameter with the value **true** to specify that the node holds Epsilon in the cluster. Use this parameter with the value **false** to specify that the node does not hold Epsilon in the cluster. In a cluster, only one node can be designated as Epsilon at any given time. You can designate a node as Epsilon to add weight to its voting in a cluster with an even number of nodes.

[-eligibility {true/false}] - Eligibility

Use this parameter with the value **true** to specify that the node is eligible to participate in the cluster. Use this parameter with the value **false** to specify that the node is not eligible to participate in the cluster.

If you modify a node as ineligible to participate in the cluster, the command prompts you for confirmation before it runs.

[-skip-quorum-check-before-eligible [true]] - Skip Quorum Check Before Setting Node Eligible

If this parameter is specified, quorum checks will be skipped prior to setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.

[-skip-quorum-check-before-ineligible [true]] - Skip Quorum Check Before Setting Node Ineligible

If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

Examples

This example modifies a node to make it eligible to participate in the cluster.

```
cluster1::*> cluster modify -node node3 -eligibility true
```

The following example removes epsilon from the node named node0 and adds it to the node named node1:

```
cluster1::*> cluster modify -node node0 -epsilon false
cluster1::*> cluster modify -node node1 -epsilon true
```

cluster ping-cluster

Ping remote cluster interfaces and perform RPC server check

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster ping-cluster` command probes network connectivity to remote cluster interfaces, and performs an RPC server check.

Parameters

-node <nodename> - Node

Use this parameter to send the ping from the node you specify.

[-use-sitelist {true/false}] - Use Sitelist for Cluster Interfaces

Use this parameter with the value `true` to specify that the command use the sitelist to determine any incomplete cluster IP information. Use this parameter with the value `false` to specify that the command not use the sitelist.

[-skip-rpccheck {true/false}] - Skip RPC Server Check

Use this parameter with the value `true` to specify that the command not perform the `rpcinfo` check of remote hosts. Use this parameter with the value `false` to specify that the command perform the `rpcinfo` check. The `rpcinfo` check checks the status of the RPC servers on the remote hosts. By default, the `rpcinfo` check runs on the program number of the portmapper. Use the `-rpc-prognum` parameter to override this default.

[-rpc-prognum <integer>] - RPC Server to Check

Use this parameter to override default behavior and run the `rpcinfo` check on the program number you specify. By default, the `rpcinfo` check runs on the program number of the portmapper.

Examples

The following example shows typical output for this command.

```
cluster1::*> cluster ping-cluster -node node1
Host is node1
Getting addresses from network interface table...
Local = 10.254.231.102  10.254.91.42
Remote = 10.254.42.25   10.254.16.228
Ping status:
....
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
.....
Detected 1500 byte MTU on 4 path(s):
  Local 10.254.231.102 to Remote 10.254.16.228
  Local 10.254.231.102 to Remote 10.254.42.25
  Local 10.254.91.42 to Remote 10.254.16.228
  Local 10.254.91.42 to Remote 10.254.42.25
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

cluster remove-node

Remove a node from the cluster

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster remove-node` command removes a node from a cluster.

Before you can remove a node from a cluster, you must shut down all of the node's shared resources, such as virtual interfaces to clients. If any of a node's shared resources are still active, the command fails. The failure message will display which active resources must be shut down before the node can be removed from the cluster.

Parameters

{ -node <nodename> - Node to Unjoin

Use this parameter to specify the name of the node to remove from the cluster.

| -cluster-ip <IP Address>} - IP Address of a Cluster Interface of Node to Unjoin

Use this parameter to specify the cluster IP of the node to remove from the cluster.

[-skip-quorum-check-before-unjoin [*true*]] - Skip Quorum Check before Unjoin

If this parameter is specified, quorum checks will be skipped prior to the remove-node command. The operation will continue even if there is a possible data outage due to a quorum issue.

[-skip-last-low-version-node-check [*true*]] - Skip the Check That Prevents Unjoining the Last Low Versioned Node

This parameter allows the node with lowest version of Data ONTAP to be removed from the cluster.

Examples

The following example shows how to remove the node named **node4** from the cluster.

```
cluster1::*> cluster remove-node -node node4
```

The following example forcibly removes the node from the cluster:

```
cluster1::*> cluster remove-node -node node4 -force
```

cluster setup

Setup wizard

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: Use of this command to join a node to an existing cluster is deprecated and might be removed in a future release of Data ONTAP. From a node in the cluster use the `system node show-discovered` command and then use the `cluster add-node` command.

The `cluster setup` command runs the cluster setup wizard, which can be used to either create a cluster or join a node to an existing cluster. When you run the cluster setup wizard, enter the

appropriate information at the prompts. You will be asked to provide the following information to create a cluster:

- Node management interface port, IP address, netmask, default gateway
- Cluster name
- Cluster base license key

Note: This parameter has been deprecated. It may be removed from a future release of Data ONTAP.

- Feature license keys
- Cluster administrator's password
- Cluster management interface port, IP address, netmask, default gateway
- DNS domain names
- Name server IP addresses
- Location

You will be asked to provide the following information to join a cluster:

- Node management interface port, IP address, netmask, default gateway
- Cluster IP address

The cluster management interface is used for managing the cluster. It provides one IP address to manage the cluster and will fail over to another node, if necessary. This is the preferred IP address for managing the cluster, but you can also manage the cluster by logging in to the node management IP address of a node in the cluster. Since the cluster management interface must be able to fail over, the port role for the interface must be "data" and typically the best choice for an IP address is one on the data network. The node management interface will not fail over, so an IP address on the management network and a port with the role "node management" is the best choice. Alternatively, you can assign an IP address on the data network to the cluster management interface - if that is better in your network topology - but the port must be a data port. The two examples below illustrate the cluster create and cluster join operations, respectively.

Examples

The following example shows the create option of `cluster setup`.

```
node::> cluster setup

Welcome to the cluster setup wizard.

You can enter the following commands at any time:
  "help" or "?" - if you want to have a question clarified,
  "back" - if you want to change previously answered questions, and
  "exit" or "quit" - if you want to quit the cluster setup wizard.
  Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup".
To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp Technical
Support. To disable this feature, enter
autosupport modify -support disable
within 24 hours.

Enabling AutoSupport can significantly speed problem determination and
resolution should a problem occur on your system.
For further information on AutoSupport, see:
http://support.netapp.com/autosupport/
```

```

Type yes to confirm and continue {yes}: yes

Enter the node management interface port [e0c]:
Enter the node management interface IP address: 192.0.2.66
Enter the node management interface netmask: 255.255.255.192
Enter the node management interface default gateway: 192.0.2.1
The node management interface has been modified to use port e0c with IP
address 192.0.2.66.
Use your web browser to complete cluster setup by accessing
https://192.0.2.66

Otherwise, press Enter to complete cluster setup using the command line
interface:

Do you want to create a new cluster or join an existing cluster? {create,
join}:
create

Do you intend for this node to be used as a single node cluster? {yes, no}
[no]:

Existing cluster interface configuration found:

Port      MTU      IP          Netmask
e0a       9000     169.254.21.189 255.255.0.0
e0b       9000     169.254.29.73  255.255.0.0

Do you want to use this configuration? {yes, no} [yes]:

Enter the cluster administrator's (username "admin") password:

Retype the password:

Step 1 of 5: Create a Cluster
You can type "back", "exit", or "help" at any question.

Enter the cluster name: cluster1

Creating cluster cluster1

Starting cluster support services .

Cluster cluster1 has been created.

Step 2 of 5: Add Feature License Keys
You can type "back", "exit", or "help" at any question.

Enter an additional license key []:

Step 3 of 5: Set Up a Vserver for Cluster Administration
You can type "back", "exit", or "help" at any question.

Enter the cluster management interface port [e0d]:
Enter the cluster management interface IP address: 192.0.2.60
Enter the cluster management interface netmask: 255.255.255.192
Enter the cluster management interface default gateway [192.0.2.1]:

A cluster management interface on port e0d with IP address 192.0.2.60 has
been created. You can use this address to connect to and manage the cluster.

Enter the DNS domain names: data.example.com
Enter the name server IP addresses: 192.0.2.147
DNS lookup for the admin Vserver will use the data.example.com domain.

Step 4 of 5: Configure Storage Failover (SFO)
You can type "back", "exit", or "help" at any question.

SFO is licensed.
SFO will be enabled when the partner joins the cluster.

Step 5 of 5: Set Up the Node

```

```

You can type "back", "exit", or "help" at any question.

Where is the controller located []: Sunnyvale

Cluster "cluster1" has been created.

To complete cluster setup, you must join each additional node to the cluster
by running "system node show-discovered" and "cluster add-node" from a node
in the cluster.

To complete system configuration, you can use either OnCommand System Manager
or the Data ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster
management IP address (https://192.0.2.60).

To access the command-line interface, connect to the cluster management
IP address (for example, ssh admin@192.0.2.60).

cluster1::>

```

An example of using `cluster setup` to join a cluster is shown below.

```

node::> cluster setup

Welcome to the cluster setup wizard.

You can enter the following commands at any time:
  "help" or "?" - if you want to have a question clarified,
  "back" - if you want to change previously answered questions, and
  "exit" or "quit" - if you want to quit the cluster setup wizard.
  Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup".
To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp Technical
Support. To disable this feature, enter
autosupport modify -support disable
within 24 hours.

Enabling AutoSupport can significantly speed problem determination and
resolution should a problem occur on your system.
For further information on AutoSupport, see:
http://support.netapp.com/autosupport/

Type yes to confirm and continue {yes}: yes

Enter the node management interface port [e0c]:
Enter the node management interface IP address: 192.0.2.67
Enter the node management interface netmask: 255.255.255.192
Enter the node management interface default gateway: 192.0.2.1
A node management interface on port e0c with IP address 192.0.2.67 has been
created.

Use your web browser to complete cluster setup by accessing
https://192.0.2.67

Otherwise, press Enter to complete cluster setup using the command line
interface:

Do you want to create a new cluster or join an existing cluster? {create,
join}:
join

Existing cluster interface configuration found:

Port      MTU      IP      Netmask

```

```

e0a      9000      169.254.31.170  255.255.0.0
e0b      9000      169.254.115.61   255.255.0.0

Do you want to use this configuration? {yes, no} [yes]:

Step 1 of 3: Join an Existing Cluster
You can type "back", "exit", or "help" at any question.

Enter the IP address of an interface on the private cluster network from the
cluster you want to join: 169.254.115.8

Joining cluster at address 169.254.115.8

This node has joined the cluster cluster1.

Step 2 of 3: Configure Storage Failover (SFO)
You can type "back", "exit", or "help" at any question.

SFO is licensed.
SFO will be enabled when the partner joins the cluster.

Step 3 of 3: Set Up the Node
You can type "back", "exit", or "help" at any question.

This node has been joined to cluster "cluster1".

To complete cluster setup, you must join each additional node to the cluster
by running "system node show-discovered" and "cluster add-node" from a node
in the cluster.

To complete system configuration, you can use either OnCommand System Manager
or the Data ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster
management IP address (https://192.0.2.60).

To access the command-line interface, connect to the cluster management
IP address (for example, ssh admin@192.0.2.60).

cluster1::>

cluster show

Display cluster node members

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster show` command displays information about the nodes in a cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the nodes that match this parameter value.

[-node-uuid <UUID>] - UUID (privilege: advanced)

Selects the nodes that match this parameter value.

[-epsilon {true/false}] - Epsilon (privilege: advanced)

Selects the nodes that match this parameter value. In a cluster, only one node can be designated as Epsilon at any given time. You can designate a node as Epsilon to add weight to its voting in a cluster with an even number of nodes.

[-eligibility {true/false}] - Eligibility

Selects the nodes that match this parameter value (true means eligible to participate in the cluster).

[-health {true/false}] - Health

Selects the nodes that match this parameter value (true means online).

Examples

The following example displays information about all nodes in the cluster:

```
cluster1::> cluster show
Node           Health Eligibility
-----
node0          true   true
node1          true   true
node2          true   true
node3          true   true
```

The following example displays information about the node named node1:

```
cluster1::> cluster show -node node1
Node: node1
Eligibility: true
Health: true
```

cluster contact-info commands

Manage contact information for the cluster.

cluster contact-info modify

Modify contact information for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster contact-info modify` command modifies contact information for the cluster administrators. If any values contain spaces, you must enclose those values in quotes.

Use the `cluster contact-info show` command to display contact information for the cluster administrators.

Parameters

`[-primary-name <text>]` - Name of Primary Contact

Use this parameter to specify the name of the primary contact.

`[-primary-phone <text>]` - Phone Number of Primary Contact

Use this parameter to specify the phone number of the primary contact.

`[-primary-alt-phone <text>]` - Alternate Phone Number of Primary Contact

Use this parameter to specify the alternate phone number of the primary contact.

`[-primary-email <text>]` - Email Address or User ID of Primary Contact

Use this parameter to specify the email address of the primary contact.

`[-secondary-name <text>]` - Name of Secondary Contact

Use this parameter to specify the name of the secondary contact.

`[-secondary-phone <text>]` - Phone Number of Secondary Contact

Use this parameter to specify the phone number of the secondary contact.

`[-secondary-alt-phone <text>]` - Alternate Phone Number of Secondary Contact

Use this parameter to specify the alternate phone number of the secondary contact.

`[-secondary-email <text>]` - Email Address or User ID of Secondary Contact

Use this parameter to specify the email address of the secondary contact.

`[-business-name <text>]` - Business Name

Use this parameter to specify the name of the business responsible for this cluster.

`[-address <text>]` - Business Address

Use this parameter to specify the street address of the business responsible for this cluster.

`[-city <text>]` - City Where Business Resides

Use this parameter to specify the name of the city in which the business is located.

`[-state <text>]` - State Where Business Resides

Use this parameter to specify the name of the state or province in which the business is located.

`[-country <Country Code>]` - 2-Character Country Code

Use this parameter to specify the 2-character country code of the country in which the business is located.

`[-zip-code <text>]` - Postal Code Where Business Resides

Use this parameter to specify the postal or ZIP code area in which the business is located.

Examples

The following example changes the name and phone numbers of the secondary contact person for the cluster.

```
cluster1::> cluster contact-info modify -secondary-name "John Doe" -
secondary-phone 123.555.0156 -secondary-alt-phone 123.555.0178
```

The following example changes the mailing address of the business responsible for the cluster.

```
cluster1::> cluster contact-info modify -address "123 Example Avenue" -city
Exampleville -state "New Example" -zip-code 99999 -country US
```

                Postal Code Where Business Resides : 99999
```

cluster date commands

Manage cluster's date and time setting

cluster date modify

Modify the current date and time for the nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster date modify` command sets the time zone, date, and time on every node in the cluster.

Parameters

[`-timezone <Area/Location Timezone>`] - Time Zone

This parameter sets the timezone, specified in the Olson format.

{ [-date {MM/DD/YYYY HH:MM:SS [{+/-}hh:mm]}] - Date and Time

This parameter sets the date and time, in the format MM/DD/YYYY HH:MM:SS.

| [-dateandtime <[[[[cc]yy]mm]dd]hhmm[.ss]]>] - Date and Time

This parameter sets the date and time information, in the format [[[[cc]yy]mm]dd]hhmm[.ss]]. The argument for setting the date and time is interpreted as follows:

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 10 for 2010).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

If the first two digits of the year are omitted, and the last two digits are greater than 68, a date in the 1900s is used. Otherwise, a date in the 2000s is used. If all four digits of the year are omitted, the default is the current year. If the month or day is omitted, the default is the current month or day, respectively. If the seconds are omitted, the default is set to 00. The system automatically handles the time changes for Daylight Saving and Standard time, and for leap seconds and years.

| [-utcdateandtime | -u <[[[[cc]yy]mm]dd]hhmm[.ss]]>] - UTC Date and Time

This parameter sets the date and time information in Coordinated Universal Time (UTC), in the format [[[[cc]yy]mm]dd]hhmm[.ss]]. -u is an alias for -utcdateandtime. The argument for setting the date and time is interpreted as follows:

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 10 for 2010).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

If the first two digits of the year are omitted, and the last two digits are greater than 68, a date in the 1900s is used. Otherwise, a date in the 2000s is used. If all four digits of the year are omitted, the default is the current year. If the month or day is omitted, the default is the current month or day, respectively. If the seconds are omitted, the default is set to 00. Time changes for Daylight Saving and Standard time, and for leap seconds and years, are handled automatically.

Examples

The following example sets the date and time to January 1 2011, at 1:00 a.m.:

```
cluster1::> cluster date modify -date "01/01/2011 01:00:00"
```

The following example sets the date and time in the UTC format to May 22, 2011, at 09:25:00 a.m.:

```
cluster1::> cluster date modify -u 201105220925.00.
```

cluster date show

Display the current date and time for the nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster date show` command displays the time zone, date, and time settings for one or more nodes in the cluster. By default, the command displays date and time settings for all nodes in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-utc]

Displays date and time information in Coordinated Universal Time (UTC).

[-utcdate]

Displays date and time information in UTC.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the nodes that match this parameter value.

[-timezone <Area/Location Timezone>] - Time Zone

Selects the nodes that match this parameter value (specified in the Olson format).

[-date {MM/DD/YYYY HH:MM:SS [{+/-}hh:mm]}] - Date and Time

Selects the nodes that match this parameter value.

[-utc-date <MM/DD/YYYY HH:MM:SS>] - UTC Date and Time

Selects the nodes that match this parameter value.

[-dateandtime <[[[[cc]yy]mm]dd]hhmm[.ss]]>] - Date and Time

Selects the nodes that match this parameter value (interpreted as follows):

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 11 for 2011).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.

- ss Second, a number from 00 to 59.

`[-utcdateandtime | -u <[[[[[cc]yy]mm]dd]hhmm[.ss]]>]` - UTC Date and Time

-u is used as an alias for -utcdateandtime. Selects the nodes that match this parameter value (interpreted as follows):

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 11 for 2011).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

Examples

The following example displays the date and time settings for all nodes in the cluster:

```
cluster1::> cluster date show
Node      Date              Timezone
-----
node0     10/06/2011 09:35:15 America/New_York
node1     10/06/2011 09:35:15 America/New_York
node2     10/06/2011 09:35:15 America/New_York
node3     10/06/2011 09:35:15 America/New_York
4 entries were displayed.
```

Manage the timezone zoneinfo files.

The zoneinfo directory

Manage the timezone zoneinfo files.

cluster date zoneinfo load-from-uri

Load timezone zoneinfo data

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster date zoneinfo load-from-uri` command loads a new set of timezone zoneinfo data to replace the version installed in the cluster. Releases of Data ONTAP software contain the timezone data that is current at the time of release. If a change is made to the timezone between Data ONTAP releases, then an update can be made to the release data. For instance, if a change is made to when daylight saving time is observed for a country then an update to cluster zoneinfo data may be required.

Only zoneinfo files provided by NetApp for use in Data ONTAP should be used with this command.

To update the zoneinfo database do the following:

- Download the required zoneinfo file from the NetApp support website.
- Place the file on a local web server accessible without password from the cluster.
- Execute the `cluster date zoneinfo load-from-uri` command, passing the Universal Resource Identifier (URI) of the file as parameter.

Note: The command need only be executed once for the cluster. The data will be distributed to each node of the cluster.

Parameters

-uri {(ftp/http)://(hostname/IPv4 Address/'[IPv6 Address]')...} - URI

of Timezone Zoneinfo Data

URI of the new zoneinfo file.

Examples

The following example loads a new version of the timezone zoneinfo database to the cluster:

```
cluster1::> cluster date zoneinfo load-from-uri http://www.example.com/
ontap_zoneinfo.zip
```

[cluster date zoneinfo show](#) on page 67

cluster date zoneinfo show

Display cluster timezone zoneinfo information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display information about the current timezone zoneinfo data.

Examples

The following example shows the zoneinfo information for a cluster:

```
cluster1::> cluster date zoneinfo show
Cluster Zoneinfo Version: 2016f
```

cluster ha commands

Manage high-availability configuration

cluster ha modify

Modify high-availability configuration of cluster management services

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster ha modify` command enables or disables cluster high availability in a two-node cluster. Enable high availability when performing some procedures, such as replacing hardware.

Note: This command is required to enable high availability if the cluster only has two nodes. Do not run this command in a cluster that has three or more nodes.

Note: Cluster high availability for two-node clusters differs from the storage failover technology used between two nodes for storage high availability.

Parameters**`[-configured {true/false}] - HA Configured`**

Use this parameter with the value **true** to enable high availability mode in the cluster. Use this parameter with the value **false** to disable high availability mode in the cluster.

Examples

The following example enables cluster high availability in a cluster.

```
cluster1::> cluster ha modify -configured true
```

cluster ha show

Show high-availability configuration status for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster ha show` command displays the high-availability status of the cluster. Cluster high-availability mode applies only to two-node clusters.

Examples

The following example displays the high-availability status for a two-node cluster:

```
cluster1::> cluster ha show
High Availability Configured: true
```

cluster identity commands

Manage the cluster's attributes, including name and serial number

cluster identity modify

Modify the cluster's attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster identity modify` command changes a cluster's identity information.

Parameters**`[-name <Cluster name>] - Cluster Name`**

Use this parameter to specify a new name for the cluster.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 44 characters.

- The system reserves the following names: "all", "cluster", "local" and "localhost".

`[-location <text>]` - Cluster Location

Use this parameter to specify the physical location of the cluster. For example, "Lab 5".

`[-contact <text>]` - Cluster Contact

Use this parameter to specify contact information for the cluster, such as a name or e-mail address.

Examples

The following example renames the current cluster to *cluster2*:

```
cluster1::> cluster identity modify -name cluster2
```

cluster identity show

Display the cluster's attributes including Name, Serial Number, Cluster UUID, Location and Contact

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster identity show` command displays the identity information of the cluster.

Examples

The following example displays the cluster's UUID, name, serial number, location and contact information:

```
cluster1::> cluster identity show

Cluster UUID: 1cd8a442-86d1-11e0-ae1c-123478563412
Cluster Name: cluster1
Cluster Serial Number: 1-80-123456
Cluster Location: Lab2
Cluster Contact: jsmith@example.com

cluster1::>
```

The following example displays the cluster's UUID, name, serial number, location, contact information, and RDB UUID:

```
cluster1::> set -privilege diagnostic

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

cluster1::~*> cluster identity show

Cluster UUID: 1cd8a442-86d1-11e0-ae1c-123478563412
Cluster Name: cluster1
Cluster Serial Number: 1-80-123456
Cluster Location: Lab2
Cluster Contact: jsmith@example.com
RDB UUID: 1cd8f3bf-86d1-11e0-ae1c-123478563412

cluster1::~*>
```

cluster image commands

Manage cluster images for automated nondisruptive update

cluster image cancel-update

Cancel an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image cancel-update` command is used to cancel an update that is in either paused-by-user or paused-by-error state. The update cannot be canceled if it is not in a paused state.

Examples

The following example displays a cancel-update operation:

```
cluster1::> cluster image cancel-update

Warning: The cancel operation can result in a mixed version
         cluster and/or mixed version HA pair. The cancel
         operation can take several minutes to complete.
Do you want to proceed with the cancel operation? {y|n}: y

Info: Canceling update. It may take a few minutes to finish canceling the
update
```

cluster image pause-update

Pause an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image pause-update` command is used to pause a currently running update. The update pauses at the next predefined pause point (for example, after validation, download to the boot device, takeover completion, or giveback completion) which might take some time to reach. When the update reaches the pause point, it transitions into the pause-by-user state.

Examples

The following example displays pause-update operation:

```
cluster1::> cluster image pause-update

Info: Pausing update. It may take a few minutes to finish pausing the update
```

cluster image resume-update

Resume an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image resume-update` command is used to resume an update that is currently paused in paused-by-user or paused-by-error state. If the update is not paused then an error is returned.

Parameters

`[-ignore-post-update-checks-failures {true/false}] - Ignore Post-update-checks Phase Failures (privilege: advanced)`

Specifies whether the post update checks phase warnings and/or errors should be ignored. The default value is false.

Examples

The following example shows an resume-update operation:

```
cluster1::> cluster image resume-update
Info: Resuming update...
```

cluster image show

Display currently running image information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image show` command displays information about the version of Data ONTAP that is running on each node and the date/time when it was installed. By default, the command displays the following information:

- Node name
- Current version
- Installation date and time

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>/local}] - Node`

Displays information about the specified node.

`[-version <text>] - Current Version`

Displays information about the nodes running the specified version.

`[-date <MM/DD/YYYY HH:MM:SS>] - Date Installed`

Displays information about the nodes with the specified installation date.

Examples

The following example displays information about currently running images on all nodes of the cluster:

```
cluster1::> cluster image show
```

Node	Current Version	Installation Date
-----	-----	-----
node1	8.3	-
node2	8.3	-

2 entries were displayed.

cluster image show-update-history

Display the update history

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image show-update-history` command displays the update history for each node. By default, the command displays the following information:

- Status
- Package version
- Start time
- Completion time
- Component ID
- Previous version
- Updated version

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-component-id <text>] - Component ID

Displays updates for the specified component.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

Displays updates with the specified start time.

[-package-version <text>] - Package Version

Displays updates for the specified package version.

[-status {successful/canceled/back-out}] - Status

Displays updates that completed with the specified status.

[-completion-time <MM/DD/YYYY HH:MM:SS>] - Completion Time

Displays updates with the specified completion time.

[-previous-version <text>] - Previous Version

Displays updates with the specified previous version.

[-updated-version <text>] - Updated Version

Displays updates with the specified updated version.

Examples

The following example displays history of automated nondisruptive updates:

```
cluster1::> cluster image show-update-history
```

Package Status	Start Version	Completion Time	Time	Component ID	Previous Version	Updated Version
canceled	8.3	2/11/2014 12:05:51	2/11/2014 12:05:51	ssan-3240-55a	8.3	8.3

successful	8.3	2/13/2014 16:48:42	2/18/2014 09:45:30	ssan-3240-55a	8.3	8.3
successful	8.3	2/18/2014 10:33:10	2/18/2014 11:02:45	ssan-3240-55a	8.3	8.3
canceled	8.3	2/11/2014 12:05:51	2/11/2014 12:05:51	ssan-3240-55b	8.3	8.3
successful	8.3	2/11/2014 14:23:58	2/11/2014 15:54:43	ssan-3240-55b	8.3	8.3
successful	8.3	2/13/2014 16:48:42	2/18/2014 10:05:02	ssan-3240-55b	8.3	8.3
successful	8.3	2/18/2014 10:33:10	2/18/2014 11:22:02	ssan-3240-55b	8.3	8.3

8 entries were displayed.

cluster image show-update-log

Display the update transaction log

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster image show-update-log` command displays detailed information about the currently running, or previously run nondisruptive updates. By default, the command displays the following information:

- Phase
- Transaction
- Transaction ID
- Component ID
- Time stamp
- Status

Parameters**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-trans-id <integer>] - Transaction ID

Displays information for the step associated with the specified transaction ID.

[-component-id {<nodename>/local}] - Component ID

Displays information for steps associated with the specified component.

[-phase {validation/prereq-updates/ontap-updates/package-management/default-phase/post-update-checks}] - Transaction Phase

Displays information for steps associated with the specified update phase.

[-trans-name {initialize/mount-image/restart-hm/get-health/run-scripts/unmount-image/clear-alert/post-restart-hm/cleanup-rd/synch-image/do-download-job/do-failover-job/do-giveback-job/check-progress/complete-validation/invalid-task/default-task/do-postupdate-checks-task}] -**Transaction Name**

Displays information for steps associated with the specified transaction.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp

Displays information for steps associated with the specified timestamp.

[-status {waiting/started/completed/paused-on-error/paused-by-user/pause-pending/cancel-pending/canceled/failed}] - Status

Displays information for steps matching the specified status.

Examples

The following example displays information about automated nondisruptive update events:

```
cluster1::*> cluster image show-update-log

13 entries were displayed.

cluster image show-update-log-detail

Display detailed information about nondisruptive update events

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster image show-update-log-detail` command displays detailed information about the currently running and previously run nondisruptive update events. By default, the command displays the following information:

- Node
- Transaction ID
- Time stamp
- Destination node
- Task phase
- Task name
- Task status
- Message

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Displays information only for the specified node.

[-task-id <integer>] - Task Id

Displays information only for the specified task ID.

[-posted-time <MM/DD/YYYY HH:MM:SS>] - Posted Time

Displays information that occurred at the specified time.

[-msg-seq-no <integer>] - Message Sequence

Displays information only for the specified message sequence number.

[-current-pid <integer>] - Process ID

Displays information only for the specified process ID.

[-destination <text>] - Task Target node

Displays information only for the specified destination node.

[-ndu-phase {validation/prereq-updates/ontap-updates/package-management/default-phase/post-update-checks}] - Update phase

Displays information only for the specified phase.

[-task-name {initialize/mount-image/restart-hm/get-health/run-scripts/unmount-image/clear-alert/post-restart-hm/cleanup-rd/synch-image/do-download-job/do-failover-job/do-giveback-job/check-progress/complete-validation/invalid-task/default-task/do-postupdate-checks-task}] - Task Name

Displays information only for the specified task name.

[-status {created/ready-to-run/running/completed/failed/pause_req/paused/paused-error/cancel_req/canceled/resume_req/default_status}] - Status Of Task

Displays information only for items with the specified status.

[-message <text>] - Update Log Message

Displays information only for items with the specified message.

[-msg-type <text>] - Type of Message

Displays information only for items with the specified message type.

[-src-info <text>] - Source Information

Displays information only for items for the specified source.

Examples

The following example displays detailed information automated nondisruptive updates:

```
cluster1::*> cluster image show-update-log-detail
```

Node	TID	Time Stamp	Dest Node	Task Phase	Task Name	Task Status	Message
node1	15	3/19/2014 13:52:38	MUM	ontap-update	initialize	ready-to-run	Created Task
node1	15	3/19/2014 13:52:38	MUM	ontap-update	initialize	running	Updated Task Status
node1	16	3/19/2014 13:52:38	node1	ontap-update	download	ready-to-run	Created Task

node2	17	3/19/2014 13:52:38	node2	ontap-update	download	running	Updated Task Status

6 entries were displayed.

cluster image show-update-progress

Display the update progress

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image show-update-progress` command displays information about the current state of an update. By default, the command displays the following information:

- Update phase
- Status
- Estimated Duration
- Elapsed Duration

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-ndu-phase {validation/prereq-updates/ontap-updates/package-management/default-phase/post-update-checks}] - Update Phase

Displays information about the specified update phase.

[-phase-status {in-progress/waiting/paused-by-user/paused-on-error/completed/canceled/failed/pause-pending/cancel-pending}] - Phase Status

Displays information about progress matching the specified phase status.

[-phase-duration <text>] - Phase Duration

Displays information about progress matching the specified phase duration.

[-phase-comments <text>] - Phase Comments

Displays information about progress matching the specified phase comments.

[-elapsed-duration {<seconds>/[<d> days] <hh>:<mm>[:<ss>]}] - Elapsed duration of the phase

Displays information about progress matching the specified elapsed duration.

[-estimated-duration {<seconds>/[<d> days] <hh>:<mm>[:<ss>]}] - Estimated duration of the phase

Displays information about progress matching the specified estimated duration.

[-phase-description <text>] - Phase Description

Displays information about progress matching the specified phase description.

[-subsystem-name <text>] - Subsystem Name

Displays information about progress matching the specified subsystem name.

[-subsystem-status <text>] - Subsystem Status

Displays information about progress matching the specified subsystem status.

[-subsystem-details <text>] - Subsystem Details

Displays information about progress matching the specified subsystem details.

[-subsystem-action <text>] - Subsystem Action

Displays information about progress matching the specified subsystem action.

Examples

The following example shows the automated nondisruptive update of two nodes, nodeA and nodeB. In this case, nodeA's update is waiting, nodeB's update is in progress. nodeB's giveback operation is in progress.

```
cluster1::> cluster image show-update-progress
```

Update Phase	Status	Estimated Duration	Elapsed Duration
Pre-update checks	completed	00:10:00	00:00:02
Data ONTAP updates	in-progress	01:23:00	00:32:07

Details:

Node name	Status	Status Description
nodeA	waiting	
nodeB	in-progress	Performing giveback operation.

3 entries were displayed.

```
cluster1::>
```

The following example shows the automated nondisruptive update of two nodes, nodeA and nodeB. In this case, automated nondisruptive update is paused-on-error in "Data ONTAP updates" phase. nodeA's update is waiting, nodeB's update is failed. "Status Description" show nodeB's error and action.

```
cluster1:> cluster image show-update-progress
```

Update Phase	Status	Estimated Duration	Elapsed Duration
Pre-update checks	completed	00:10:00	00:00:02
Data ONTAP updates	paused-on-error	00:49:00	00:05:21

Details:

Node name	Status	Status Description
nodeA	waiting	
nodeB	failed	Error: Takeover of node "nodeB" is not possible. Action: Use the "storage failover show" command to view the cause of the failure.

2 entries were displayed.

Status: Paused - An error occurred in "Data ONTAP updates" phase. The non-disruptive update cannot continue until the error has been resolved. Resolve all issues, then use the "cluster image resume-update" command to resume the update.

```
cluster1:>
```

The following example shows that the automated nondisruptive update is paused-on-error in "Post-update checks" update phase and "Status Description" shows the error and action.

```
cluster1::> cluster image show-update-progress
```

	Estimated	Elapsed
--	-----------	---------

```

Update Phase      Status      Duration      Duration
-----
Data ONTAP updates completed      02:19:00      00:00:03
Post-update checks paused-on-error 00:10:00      00:00:02

Details:

Post-update Check Status      Error-Action
-----
Cluster Quorum      Error      Error: Cluster is not in quorum.
Status

Action: Use the (privilege: advanced)
"cluster ring show" command to verify
all replication unit details.

5 entries were displayed.

Status: Paused - An error occurred in "Post-update checks" phase. The
non-disruptive update cannot continue until the error has been resolved.
Resolve all issues, then use the "cluster image resume-update" command
to resume the update.

cluster1::>

```

The following example shows that the automated nondisruptive update is completed on nodeA and nodeB.

```

cluster1::> cluster image show-update-progress

Update Phase      Status      Estimated      Elapsed
-----
Pre-update checks completed      00:10:00      00:00:13
Data ONTAP updates completed      01:23:00      01:15:11
Post-update checks completed      00:10:00      00:00:02
3 entries were displayed.

Updated nodes: nodeA, nodeB.
cluster1:>

```

The following example shows the automated update of two-node MetroCluster configuration having clusters cluster_A and cluster_B. In this case, cluster_A's update is waiting and cluster_B's update is in progress. cluster_B's switchback operation is in progress.

```

cluster_A::> cluster image show-update-progress

Cluster      Estimated      Elapsed      Status
-----
cluster_A      00:00:00      00:00:00      waiting
cluster_B      00:00:00      00:06:42      in-progress

Details: Switchback in progress.

Waiting for partner cluster "sti60-vsims134f_siteB" to be up.

cluster_A::>

```

The following example shows that the automated update is completed on both cluster_A and cluster_B in two-node MetroCluster configuration.

```

cluster_A::> cluster image show-update-progress

Cluster      Estimated      Elapsed      Status
-----
cluster_A      00:00:00      00:20:44      completed
cluster_B      00:00:00      00:10:43      completed

```

```
Details: MetroCluster updated successfully.
```

```
cluster_A::>
```

cluster image update

Manage an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image update` command is used to initiate a Data ONTAP update. The update is preceded by a validation of the cluster to ensure that any issues that might affect the update are identified. There are two types of updates of a cluster. A rolling update updates Data ONTAP one HA pair at a time. This type of update is performed for clusters with fewer than eight nodes or when the **-force-rolling** option is specified for clusters with eight or more nodes. A batch update is used for clusters of eight or more nodes, and performs updates of multiple HA pairs at the same time.

There are predefined points in the update when the update can be paused (either by the user or by an error). These pause points occur after validation, after download to the boot device, after takeover has completed, and after giveback has completed.

Parameters

-version <text> - Update Version

Specifies the Data ONTAP version to use to update the cluster.

[-nodes {<nodename>/local}, ...] - Node

Specifies the nodes that are to be updated. This parameter is not supported for updates of MetroCluster configurations and for two-stage upgrades.

[-estimate-only [true]] - Estimate Only

Creates a report of the steps that occur during the update without actually doing them.

[-pause-after {none/all}] - Update Pause

Specifies that the update should pause at each predefined pause points (for example, after validation, after download to the boot device, after takeover, and after giveback) during the update.

[-ignore-validation-warning {true/false}] - Ignore Validation

Specifies that the update should proceed even if the validation reports warnings.

[-skip-confirmation {true/false}] - Skip Confirmation

Specifies that a validation that does not detect any error issues should not ask the user to confirm the update but simply proceed with the update.

[-force-rolling [true]] - Force Rolling Update

This option is used for clusters with eight or more nodes to specify that a rolling update (one HA pair at a time) should be done. This parameter is not supported for single-node cluster and two-node MetroCluster.

[-stabilize-minutes <integer>] - Minutes to stabilize

Specifies the number of minutes that the update should wait after a takeover or giveback is completed. This allows time for the clients to recover from the pause in I/O that occurs during takeover and giveback. This parameter is not supported for single-node cluster.

Examples

The following example shows the update operation:

```
cluster1::> cluster image update -version 8.3

It can take several minutes to complete validation...
Pre-update Check      Status      Error-Action
-----
CIFS status           OK
Cluster health status OK
Cluster quorum status OK
Disk status           OK
High Availability     OK
status
LIF status            OK
LIFs on home node     OK
status
MetroCluster          OK
configuration status
SnapMirror status     OK
Overall Status        OK
10 entries were displayed.

Do you want to continue? {y|n}: y
Starting update...
```

cluster image validate

Validates the cluster's update eligibility

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image validate` command checks for issues within the cluster that might lead to problems during the update.

Parameters

[-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-version <text>] - Update Version

Specifies the Data ONTAP version to use to validate the cluster.

[-rolling [true]] - Rolling Update

Specify this optional parameter on a cluster with eight or more nodes to perform a rolling-update check. The default is to perform a batch-update check.

Note: This parameter is only supported on a cluster with eight or more nodes, and is not supported for two-node MetroCluster.

[-nodes {<nodename>/local}, ...] - Nodes

Specifies the nodes that are to be validated. This parameter is not supported for MetroCluster configurations and for two-stage upgrades.

Examples

The following example shows the validate operation:

```
cluster1::> cluster image validate -version 8.3

It can take several minutes to complete validation...
Pre-update Check      Status      Error-Action
-----
CIFS status           OK
Cluster health status OK
Cluster quorum status OK
Disk status           OK
High Availability      OK
status
LIF status            OK
LIFs on home node     OK
MetroCluster          OK
configuration status
SnapMirror status      OK
Overall Status        OK
10 entries were displayed.
```

cluster image package commands

Manage the cluster image package repository

cluster image package delete

Remove a package from the cluster image package repository

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image package delete` command deletes the specified version of the package from the package repository. The associated information about the package is also deleted from the update database.

Parameters

-version <text> - Version To Be Deleted

Specifies the package version that is to be deleted.

Examples

The following example deletes the package with version 8.3:

```
cluster1::> cluster image package delete -version 8.3

Package Delete Operation Completed Successfully
```

cluster image package get

Fetch a package file from a URL into the cluster image package repository

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image package get` command fetches a Data ONTAP package file specified by the URL into the cluster. The package is stored in the cluster package repository and the information from the package is stored in the update database.

Parameters**-url <text> - Package URL**

Specifies the URL from which to get the package.

Examples

The following example displays how to get a package from a URL:

```
cluster1::> cluster image package get -url http://example.com/image.tgz
```

cluster image package show-repository

Display information about packages available in the cluster image package repository

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image package show-repository` command displays the package versions that are in the cluster package repository. By default, the command displays the following information:

- Package version

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-detail]

This parameter specifies that detailed information should be displayed.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-download-ver <text>] - Downloaded Version

Displays packages with the specified download version.

[-component-name <text>, ...] - Component Name

Displays packages for the specified component.

[-component-version <text>, ...] - Component Version

Displays packages with the specified component version.

[-package-build-time <MM/DD/YYYY HH:MM:SS>] - Package Build Time

Displays packages with the specified build time.

Examples

The following example displays the packages in the cluster package repository:

```
cluster1::> cluster image package show-repository
Package Version Package Build Time
-----
8.3           9/12/2014 10:27:33
```

cluster kernel-service commands

Display and manage the cluster kernel services

Commands and methods used to manage the distributed kernel services of the cluster.

cluster kernel-service show

Display cluster service state in the kernel

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster kernel-service show` command displays the following information from the master node for each node in the cluster:

- Node name
- The quorum status of that node
- The availability status of that node
- The operational status of that node

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-master-node {<nodename>/local}] - Node

The node in the cluster where the information be being reported from. If this parameter is not specified, the command displays information about all nodes in the cluster.

[-cluster-node <text>] - Cluster Node

The node in the cluster that the information listed is regarding. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[-status-quorum {out-of-quorum/in-quorum}] - Quorum Status

The quorum status of the node specified by **-cluster-node**. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[-status-avail {false/true/unknown}] - Availability Status

The availability status of the node specified by **-cluster-node**. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[-status-oper {unknown/operational/not-operational}] - Operational Status

The operational status of the node specified by **-cluster-node**. If this parameter is specified, the command displays information only about the nodes with the specified state value.

Examples

The following example displays information about all nodes in the cluster:

```
cluster1::*> cluster kernel-service show
Master      Cluster      Quorum      Availability  Operational
Node        Node          Status       Status        Status
-----
cluster1-01 cluster1-01    in-quorum    true          operational
              cluster1-02    in-quorum    true          operational
2 entries were displayed.

cluster1::*> cluster kernel-service show -instance

      Master Node: cluster1-01
      Cluster Node: cluster1-01
      Quorum Status: in-quorum
      Availability Status: true
      Operational Status: operational

      Master Node: cluster1-01
      Cluster Node: cluster1-02
      Quorum Status: in-quorum
      Availability Status: true
      Operational Status: operational
2 entries were displayed.
```

cluster log-forwarding commands

Manage the cluster's log forwarding configuration

cluster log-forwarding create

Create a log forwarding destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding create` command creates log forwarding destinations for remote logging.

Parameters

-destination <Remote InetAddress> - Destination Host

Host name or IPv4 or IPv6 address of the server to forward the logs to.

[-port <integer>] - Destination Port

The port that the destination server listen on.

[-protocol {udp-unencrypted/tcp-unencrypted/tcp-encrypted}] - Log Forwarding Protocol

The protocols are used for sending messages to the destination. The protocols can be one of the following values:

- *udp-unencrypted* - User Datagram Protocol with no security
- *tcp-unencrypted* - Transmission Control Protocol with no security
- *tcp-encrypted* - Transmission Control Protocol with Transport Layer Security (TLS)

[-verify-server {true/false}] - Verify Destination Server Identity

When this parameter is set to **true**, the identity of the log forwarding destination is verified by validating its certificate. The value can be set to **true** only when the *tcp-encrypted* value is selected in the protocol field. When this value is **true** the remote server might be validated by OCSP. The OCSP validation for cluster logs is controlled with the `security config ocsf enable -app audit_log` and `security config ocsf disable -app audit_log`.

[-facility <Syslog Facility>] - Syslog Facility

The syslog facility to use for the forwarded logs.

[-force [true]] - Skip the Connectivity Test

Normally, the `cluster log-forwarding create` command checks that the destination is reachable via an ICMP ping, and fails if it is not reachable. Setting this value to **true** bypasses the ping check so that the destination can be configured when it is unreachable.

Examples

This example causes audit logs to be forwarded to a server at address 192.168.0.1, port 514 with USER facility.

```
cluster1::> cluster log-forwarding create -destination 192.168.0.1 -port 514
-facility user
```

cluster log-forwarding delete

Delete a log forwarding destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding delete` command deletes log forwarding destinations for remote logging.

Parameters**-destination <Remote InetAddress> - Destination Host**

Host name or IPv4 or IPv6 address of the server to delete the forwarding entry for.

-port <integer> - Destination Port

The port that the destination server listen on.

Examples

This example deletes the forwarding of all logs to the server at address 1.1.1.1, port 514.

```
cluster1::> cluster log-forwarding delete -destination 1.1.1.1 -port 514
```

cluster log-forwarding modify

Modify log forwarding destination settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding modify` command modifies log forwarding destinations for remote logging.

Parameters

-destination <Remote InetAddress> - Destination Host

The host name or IPv4 or IPv6 address of the server to be modified.

-port <integer> - Destination Port

The port that the destinations servers listen on.

[-verify-server {true/false}] - Verify Destination Server Identity

When this parameter is set to **true**, the identity of the log forwarding destination is verified by validating its certificate. The value can be set to **true** only when the *tcp-encrypted* value is selected in the protocol field. When this value is **true** the remote server might be validated by OCSP. The OCSP validation for cluster logs is controlled with the `security config ocsd enable -app audit_log` and `security config ocsd disable -app audit_log`.

[-facility <Syslog Facility>] - Syslog Facility

The syslog facility to use for the forwarded logs.

Examples

This example modifies the facility of audit logs that are forwarded to the destination server at address 192.168.0.1, port 514.

```
cluster1::> cluster log-forwarding modify -destination 192.168.0.1 -port 514
-facility local1
```

cluster log-forwarding show

Display log forwarding destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding show` command displays log forwarding information:

- Destination (IPv4/IPv6/hostname)
- Port number
- List of log classes
- Facility

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

`[-destination <Remote InetAddress>] - Destination Host`

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified host name, IPv4 or IPv6 address.

`[-port <integer>] - Destination Port`

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified ports.

`[-protocol {udp-unencrypted/tcp-unencrypted/tcp-encrypted}] - Log Forwarding Protocol`

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified protocols.

`[-verify-server {true/false}] - Verify Destination Server Identity`

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified verify-server values.

`[-facility <Syslog Facility>] - Syslog Facility`

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified facility.

Examples

```
cluster-1::> cluster log-forwarding show
```

Destination Host	Port	Protocol	Verify Server	Syslog Facility
192.168.0.1	514	udp-unencrypted	false	user

cluster peer commands

Manage cluster peer relationships

cluster peer create

Create a new cluster peer relationship

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer create` command establishes a peer relationship between two clusters. Cluster peering enables independent clusters to coordinate and exchange data.

Before creating a new cluster peer relationship, make sure that both clusters are individually healthy and that there are no other peer relationships between the two clusters that might interfere with the new relationship.

You can create a cluster peer relationship using the IPv4 or IPv6 protocol. You may not use both protocols within a single relationship.

Use the `cluster show` and `cluster peer show` commands on each cluster to display health, peering eligibility, and peering information about the two clusters.

Parameters

`[-peer-addr <Remote InetAddress>, ...]` - Remote Intercluster Addresses

Use this parameter to specify the names or IP addresses of the logical interfaces used for intercluster communication. Separate the addresses with commas.

The addresses you provide here are associated with the remote cluster until you modify or delete the relationship, regardless of whether the addresses are valid. Make sure to provide addresses which you know will remain available on the remote cluster. You can use the hostnames of the remote cluster's intercluster addresses, the IP addresses of the remote cluster's intercluster LIFs or both.

`[-username <text>]` - Remote User Name

Use this optional parameter to specify a username that runs a reciprocal `cluster peer create` command on the peered cluster. If you choose not to use the reciprocal creation option, by not supplying a username for reciprocal creation, you must run `cluster peer create` again on the remote cluster to complete the peering relationship.

If you specify the username for the remote cluster, you will be prompted to enter the associated remote password. These credentials are not stored, they are used only during creation to authenticate with the remote cluster and to enable the remote cluster to authorize the peering request. The provided username's profile must have access to the console application in the remote cluster.

Use the `security login role show` and `security login show` commands on each cluster to find user names and their privilege levels.

`[-no-authentication [true]]` - Do Not Use Authentication

Use this optional parameter when omitting the `-username` parameter to indicate that you will create an unauthenticated peering relationship.

`[-timeout <integer>]` - Operation Timeout (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for peer communications. Specify the value in seconds. The default timeout value is 60 seconds.

`[-address-family {ipv4/ipv6}]` - Address Family of Relationship

Use this optional parameter to specify the address family of the cluster peer relationship. The default is based on existing relationships, existing local intercluster LIFs belonging to a particular address-family, and the addresses supplied to the `cluster peer create` command.

`[-offer-expiration {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}]` - Passphrase Match Deadline

Specifying `cluster peer create` normally creates an offer to establish authentication with a cluster that is a potential cluster peer to this cluster. Such offers expire unless they are accepted within some definite time. Use this optional parameter to specify the date and time at which this offer should expire, the time after which the offer will no longer be accepted.

`[-rpc-connect-timeout <integer>]` - Timeout for RPC Connect (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for the RPC connect during peer communications. Specify the value in seconds. The default timeout value is 10 seconds.

`[-update-ping-timeout <integer>]` - Timeout for Update Pings (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for pings while updating remote cluster information. Specify the value in seconds. The default timeout value

is 5 seconds. This parameter applies only to cluster peer relationships using the IPv4 protocol.

`[-ipspace <IPspace>] - IPspace for the Relationship`

Use this optional parameter to specify the IPspace within which the cluster peering relationship is to operate. The default is to use the 'Default' IPspace.

`[-local-name <Cluster name>] - Peer Cluster Local Name`

Use this optional parameter to specify a unique local name to identify the remote cluster that is being peered. The local name must conform to the same rules as a cluster name. The default value is the remote cluster name.

`[-generate-passphrase [true]] - Use System-Generated passphrase`

Use this optional parameter alone to create cluster peer offer for the unidentified clusters or use it along with `-peer-addr`s option to automatically generate the passphrase for the cluster peer operation with the peer cluster.

`[-initial-allowed-vserver-peers <Vserver Name>, ...] - Vservers allowed for auto peering`

Use this optional parameter to specify the list of Vservers for which reciprocal Vserver peering with peer cluster should be enabled. Upon the time of successful peering, Vserver peer permission entries will be created for the peer cluster for the specified list of Vservers.

`[-encryption-protocol-proposed {none/tls-psk}] - Encryption Protocol To Be Used In Inter-Cluster Communication`

Use this optional parameter to specify how this cluster should use encryption in data connections to the other cluster. Specify 'tls-psk' to specify that TLS should be used with a Pre-Shared Key. Specify 'none' to use no encryption. Where authentication is used, the default is 'tls-psk'. Where authentication is not used, the default is 'none'.

`[-applications {snapmirror/flexcache}, ...] - Peering Applications`

List of peering applications for initially allowed vservers.

Examples

This example creates a peer relationship between cluster1 and cluster2. This reciprocal create executes the create command on both the local cluster and the remote cluster. The cluster peer create command can use the hostnames of cluster2's intercluster addresses, the IP addresses of cluster2's intercluster LIFs, or both. Note that the admin user's password was typed at the prompt, but was not displayed.

```
cluster1::> cluster peer create -peer-addr cluster2-d2,10.98.234.246 -
username admin

Remote Password:

cluster1::> cluster peer show -instance

                Peer Cluster Name: cluster2
      Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Available
                Remote Cluster Name: cluster2
                Active IP Addresses: 10.98.234.246, 10.98.234.243
                Cluster Serial Number: 1-80-123456
      Address Family of Relationship: ipv4
Authentication Status Administrative: no-authentication
      Authentication Status Operational: absent
                Last Update Time: 02/05 21:05:41
                IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none
```

This example shows coordinated peer creation. The `cluster peer create` command was issued locally on each cluster. This does not require you to provide the username and password for the remote cluster. There is a password prompt, but if you are logged in as the admin user, you may simply press enter.

```
cluster1::> cluster peer create -peer-addr cluster2-d2, 10.98.234.246 -no-
authentication

Remote Password:
NOTICE: Addition of the local cluster information to the remote cluster has
failed with the following error: not authorized for that command. You may
need to repeat this command on the remote cluster.
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster2	1-80-123456	Available	absent

```
cluster2::> cluster peer create -peer-addr cluster1-d2 -no-authentication

Remote Password:
NOTICE: Addition of the local cluster information to the remote cluster has
failed with the following error: not authorized for that command. You may
need to repeat this command on the remote cluster.
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster1	1-80-654321	Available	absent

This example shows a reciprocal cluster peer create over IPv6 addresses, that establishes a cluster peer relationship with an IPv6 address family.

```
cluster1::> cluster peer create -peer-addr
FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523 -username admin

Remote Password:

cluster1::> cluster peer show -instance

Address Family of Relationship: ipv6
Peer Cluster Name: cluster2
Remote Intercluster Addresses:
FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses:
FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523
Cluster Serial Number: 1-80-123456
Address Family of Relationship: ipv6
Authentication Status Administrative: no-authentication
Authentication Status Operational: absent
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none
```

This example shows creation of an authenticated peering relationship. It is an example of using the coordinated method to create a cluster peer relationship. The `cluster peer create` command is issued locally on each cluster. Before executing this pair of commands, a passphrase to be used with the commands is chosen and given at the prompts. The passphrase can be any text; it is prompted for twice on each cluster, and all four copies of the passphrase must agree. The passphrase does not echo on the screen. The passphrase must be longer than the minimum length as specified by the `cluster peer policy` on both clusters.

```
cluster1::> cluster peer create -peer-addr cluster2-d2, 10.98.234.246

Enter the passphrase:
Enter the passphrase again:

Notice: Now use the same passphrase in the "cluster peer create" command in
```

```

the
    other cluster.

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability Authentication
-----
cluster2               -                Unavailable    pending

cluster2::> cluster peer create -peer-addr cluster1-d2

Enter the passphrase:
Enter the passphrase again:

cluster2::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability Authentication
-----
cluster1               1-80-654321        Available    ok

```

This example creates a peer relationship between cluster1 and cluster2. This reciprocal create executes the create command on both the local cluster and the remote cluster. The cluster peer create command can use the hostnames of cluster2's intercluster addresses, the IP addresses of cluster2's intercluster LIFs or both. Note that the admin user's password was typed at the prompt, but was not displayed. The **-local-name** parameter is specified to create a local name used to identify the peer cluster in cases where the name of the peer cluster is not unique or not descriptive.

```

cluster1::> create -peer-addr 10.98.191.193 -username admin -local-name
locallyUniqueName

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability Authentication
-----
locallyUniqueName      1-80-000011        Available    absent

cluster1::> cluster peer show -instance

                Peer Cluster Name: locallyUniqueName
Remote Intercluster Addresses: 10.98.191.193
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.191.193
Cluster Serial Number: 1-80-000011
Address Family of Relationship: ipv4
Authentication Status Administrative: no-authentication
Authentication Status Operational: absent
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none

```

The following example create a peer relationship between cluster1 and cluster2 using system-generated passphrases:

```

cluster1::> cluster peer create -peer-addr 10.98.191.193 -generate-
passphrase

Passphrase: UC+a6lRVICXeL/gq1WrK7ShR
Peer Cluster Name: cluster2
Initial Allowed Vserver Peers: -
Expiration Time: 6/7/2017 09:16:10 +5:30
Intercluster LIF IP: 10.140.106.185

Warning: make a note of the passphrase - it cannot be displayed
again.

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability Authentication
-----
cluster2               -                Unavailable    pending

cluster2::> cluster peer create -peer-addr 10.140.106.185

Enter the passphrase:

```

Clusters cluster1 and cluster2 are peered.

```
cluster2::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster1	1-80-654321	Available	ok

The following example creates a cluster peer offer from cluster1 for an anonymous cluster using system-generated passphrase with offer expiration period of two days and the cluster2 uses the offer from cluster2 with the system-generated passphrase:

```
cluster1::> cluster peer create -generate-passphrase -offer-expiration 2days
```

```

Passphrase: UCa+6lRVICXeL/gqlWrK7ShR
Peer Cluster Name: Clus_7ShR (temporary generated)
Initial Allowed Vserver Peers: -
Expiration Time: 6/9/2017 08:16:10 +5:30
Intercluster LIF IP: 10.140.106.185

Warning: make a note of the passphrase - it cannot be displayed
again.
```

```
cluster1::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
Clus_7ShR	-	Unidentified	pending

```
cluster2::> cluster peer create -peer-addr 10.140.106.185
```

Enter the passphrase:

Clusters cluster1 and cluster2 are peered.

```
cluster2::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster1	1-80-654321	Available	ok

Cluster "cluster1" creates an offer with **initial-allowed-vserver-peers** option set to Vservers "vs1" and "vs2". And the peer cluster "cluster2" uses the offer and creates peer relationship with cluster1, upon the successful peer relationship establishment, Vserver peer permission entries are created for the Vservers "vs1" and "vs2" in cluster "cluster1" for the peer cluster "cluster2". The following example describes the usage of **initial-allowed-vserver-peers** option in the cluster peer creation workflow:

```
cluster1::> cluster peer create -generate-passphrase -initial-allowed-
vserver-peers vs1,vs2
```

```

Passphrase: UCa+6lRVICXeL/gqlWrK7ShR
Peer Cluster Name: Clus_7ShR (temporary generated)
Initial Allowed Vserver Peers: vs1,vs2
Expiration Time: 6/7/2017 09:16:10 +5:30
Intercluster LIF IP: 10.140.106.185

Warning: make a note of the passphrase - it cannot be displayed
again.
```

```
cluster1::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
Clus_7ShR	-	Unidentified	pending

```
cluster2::> cluster peer create -peer-addr 10.140.106.185
```

Enter the passphrase:

Clusters cluster1 and cluster2 are peered.

```
cluster2::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
-------------------	-----------------------	--------------	----------------

```

-----

cluster peer delete

Delete a cluster peer relationship

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer delete` command removes a peering relationship. It removes the relationship records, state data, and all associated jobs.

Before removing the relationship, the command verifies that no resources depend on the relationship. For example, if any SnapMirror relationships exist, the command denies the request to delete the peering relationship. You must remove all dependencies for the deletion to succeed. The `cluster peer delete` command removes only the local instance of the peer relationship. An administrator in the peer cluster must use the `cluster peer delete` command there as well to completely remove the relationship.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify the peering relationship to delete by specifying the name of the peered cluster.

Examples

This example shows a failed deletion due to a SnapMirror dependency.

```

cluster2::> cluster peer delete -cluster cluster1

Error: command failed: Unable to delete peer relationship. Reason: A
SnapMirror source exists in this cluster

```

cluster peer modify

Modify cluster peer relationships

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer modify` command modifies the attributes of a peering relationship. When you modify a peer relationship and specify `-peer-addr`s, all of the remote addresses must respond, must be intercluster addresses, and must belong to the remote cluster that is being modified; or the modification request is denied.

Parameters

`-cluster <text>` - Peer Cluster Name

Use this parameter to specify the peering relationship to modify by specifying the name of the peered cluster.

`[-peer-addr <Remote InetAddress>, ...]` - Remote Intercluster Addresses

Use this parameter to specify the names or IP addresses of the logical interfaces used for intercluster communication. Separate the addresses with commas. The list of addresses you provide replaces the existing list of addresses.

`[-address-family {ipv4/ipv6}]` - Address Family of Relationship

Use this parameter to specify the address family of the names specified with the `peer-addr`s parameter.

`[-timeout <integer>]` - Operation Timeout (seconds) (privilege: advanced)

Use this parameter to specify a timeout value for peer communications. Specify the value in seconds.

`[-auth-status-admin {no-authentication/revoked/use-authentication}]` - Authentication Status Administrative

Use this parameter to adjust the authentication in use for the peer relationship. The defined values for this field are as follows.

- `no-authentication` - The cluster peer relationship uses no authentication.
- `use-authentication` - The cluster peer relationship is to be authenticated. After you use this value, you will be prompted for a passphrase to be used in determining a new authentication key, just as in the authenticated `cluster peer create` command or you can use the option `generate-passphrase` to automatically generate the passphrase.
- `revoked` - The cluster peer relationship is no longer to be trusted. Peering communication with this cluster peer is suspended until the two clusters set their `auth-status-admin` attributes either both to `no-authentication` or both to `use-authentication`.

Changes should be reflected on both clusters involved in a peering relationship.

`[-rpc-connect-timeout <integer>]` - Timeout for RPC Connect (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for the RPC connect during peer communications. Specify the value in seconds.

`[-update-ping-timeout <integer>]` - Timeout for Update Pings (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for pings while updating remote cluster information. Specify the value in seconds. This parameter applies only to cluster peer relationships using the IPv4 protocol.

`[-ipspace <IPspace>]` - IPspace for the Relationship

Use this optional parameter to specify that cluster peering communication for this remote cluster is to be done using local intercluster LIFs that are on ports in the named IPspace.

[-generate-passphrase [true]] - Use System-Generated passphrase

Use this optional parameter along with **-auth-status-admin** option's **use-authentication** to automatically generate the passphrase which can be used for cluster peer operation.

[-encryption-protocol-proposed {none/tls-psk}] - Encryption For Inter-Cluster Communication

Use this parameter to adjust the encryption of connections in use for the peer relationship. The defined values for this field are as follows.

- **tls-psk** - Use TLS with a Pre-Shared Key.
- **none** - Use no encryption.

Examples

This example modifies the peering relationship to use a new IP address in the remote cluster for intercluster communications and revoke authentication.

View existing cluster peer configuration using following command :

```
cluster1::> cluster peer show -instance

Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246, 10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01, cluster2-02
Remote Cluster Health: true
Unreachable Local Nodes: -
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
Authentication Status Operational: ok
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: tls-psk
```

Modify the cluster peer configuration using following command :

```
cluster1::> cluster peer modify -cluster cluster2 -peer-addr cluster2-
d2,10.98.234.264 -auth-status-admin revoked
```

Warning: This will discard the authentication key.

Warning: You are removing authentication from the peering relationship with cluster "cluster2". Use the "cluster peer modify" command on cluster "cluster2" with the "-auth-status-admin no-authentication" parameter to complete authentication removal from the peering relationship.

Do you want to continue?{y|n}:y

The following example modifies the peering relationship to use authentication with **-generate-passphrase** option.

```

cluster1::> cluster peer modify -cluster cluster2
-auth-status-admin use-authentication -generate-passphrase

Notice: Use the below system-generated passphrase in the "cluster peer
modify"
command in the other cluster.

      Passphrase: UCa+6lRVICXeL/gq1WrK7ShR
      Expiration Time: 6/7/2017 09:16:10 +5:30
      Peer Cluster Name: cluster2

Warning: make a note of the passphrase - it cannot be displayed again.

Until then, the operational authentication state of the relationship remains
as "pending".

cluster1::> cluster peer offer show

      Allowed
Peer Cluster Name      Authentication Creation      Expiration
Vserver Peers
-----
cluster2                ok-and-offer      6/7/2017 08:16:10      6/7/2017 09:16:10
-

Modify cluster peer relationship in cluster2 with use-authentication option
and use the auto-generated passphrase.

cluster2::> cluster peer modify -cluster cluster2 -auth-status-admin use-
authentication

Notice: Use a auto-generated passphrase or choose a passphrase of 8 or more
characters.
      To ensure the authenticity of the peering relationship, use a phrase
or sequence
      of characters that would be hard to guess.

Enter the passphrase:
Confirm the passphrase:

```

cluster peer modify-local-name

Modify the local name for a cluster peer

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer modify-local-name` command modifies the local name for a remote cluster. The new local name must be unique among all the local names for the remote clusters with which this cluster is peered.

Parameters

-name <text> - Cluster Peer Name

Use this parameter to specify the existing local name for a peer cluster.

-new-name <Cluster name> - Cluster Peer Local Name

Use this parameter to specify the new local name of the peer cluster. The new local name must conform to the same rules as a cluster name.

Examples

```
cluster2::> cluster peer modify-local-name -name cluster1 -new-name cluster1A
```

[cluster identity modify](#) on page 68

cluster peer ping

Initiate intercluster connectivity test

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer ping` command displays the status of the network mesh used by the peering relationship. The command checks the network connection to each remote IP address known by the cluster. This includes all intercluster addresses. It is possible for a known address to be not present during the ping. These addresses are not checked, but the absence is temporary.

The most useful parameters for diagnosing problems are `-count` and `-packet-size`. Use the `-count` and `-packet-size` parameters to diagnose problems similarly to how you use them with the standard ping utility.

To display network connection status within a cluster, use the [network ping](#) command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-originating-node {<nodename>/local}] - Node that Initiates Ping

Use this parameter to send the ping from the node you specify.

[-destination-cluster <Cluster name>] - Cluster to Ping

Use this parameter to specify the peer cluster you wish to ping.

[-destination-node <Peer Node Name>] - Node to Ping in Destination Cluster

Use this parameter to specify a specific node in the destination cluster to ping.

[-ip-address <IP Address>] - Active IP Address

Use this parameter to specify the active IP address you wish to ping.

[-count <integer>] - Ping Count

Use this parameter to specify the number of requests to be sent to the destination.

[-status {unknown_node/internal_error/unreachable/session_reachable/interface_reachable}] - Status of Ping Operation

Use this parameter to display only ping results that have the status you specify.

[-timeout <integer>] - Ping Timeout in Seconds

Use this parameter to specify a timeout value in seconds for the ping operation.

[-packet-size <integer>] - Size of Packet

Use this parameter to specify the number of data bytes to be sent in the ping packet.

[-ttl <integer>] - Time to Live/ Number of Hops

Use this parameter to specify the maximum number of network hops a packet may make before it is considered a failure.

[-response-time <double>] - Response Time (ms)

Use this parameter to display only nodes that have the response time (in milliseconds) that you specify. This parameter is most useful when specified with a range of values, such as >500

Examples

This example shows a ping of cluster1 and cluster2 from cluster2. All nodes are reachable.

```
cluster2::> cluster peer ping
Node: node1      Destination Cluster: cluster2
Destination Node IP Address      Count  TTL  RTT(ms) Status
-----
node1            10.98.228.230             1    255    0.209 interface_reachable
node2            10.98.228.234             1    255    0.42  interface_reachable
Node: node2      Destination Cluster: cluster2
Destination Node IP Address      Count  TTL  RTT(ms) Status
-----
node1            10.98.228.230             1    255    0.358 interface_reachable
node2            10.98.228.234             1    255    0.17  interface_reachable
Node: node1      Destination Cluster: cluster1
Destination Node IP Address      Count  TTL  RTT(ms) Status
-----
node3            10.98.229.22              1    255    0.336 interface_reachable
node4            10.98.229.29              1    255    0.354 interface_reachable
Node: node2      Destination Cluster: cluster1
Destination Node IP Address      Count  TTL  RTT(ms) Status
-----
node3            10.98.229.22              1    255    0.354 interface_reachable
node4            10.98.229.29              1    255    0.336 interface_reachable
6 entries were displayed.

cluster peer show

Display peer cluster information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer show` command displays information about the peering relationships between the current cluster and other clusters. Cluster peering enables independent clusters to coordinate and exchange data.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[`-instance`]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-cluster <text>`] - Peer Cluster Name

Selects the peered clusters that match this parameter value.

[`-cluster-uuid <UUID>`] - Cluster UUID (privilege: advanced)

Selects the peered clusters that match this parameter value.

[`-peer-addr <Remote InetAddress>, ...`] - Remote Intercluster Addresses

Selects the peered clusters that match this parameter value (remote-host name or IP address).

[`-availability <availability>`] - Availability of the Remote Cluster

Selects the peered clusters that match this parameter value. This parameter can have four different values:

- Available - The peer cluster availability status will be *Available* only if all the nodes in the local cluster are able to contact all the nodes in the remote cluster.
- Partial - The peer cluster availability status will be *Partial* only if some nodes in the local cluster are not able to contact some or all nodes in the peer cluster.
- Unavailable - The peer cluster availability status will be *Unavailable* only if all the nodes in the local cluster are not able to contact any node in the peer cluster.
- Pending - The peer cluster availability status will be *Pending* while the system is creating in-memory health data.
- Unidentified - The peer cluster availability status will be *Unidentified* if the cluster peer offer is created for an anonymous cluster and is unused. When the offer is used, then the availability will get changed to any of the above mentioned status.

Note: If one or more nodes in the local cluster are offline or unreachable, then those nodes are not used to determine the availability status for the remote nodes.

[`-rcluster <text>`] - Remote Cluster Name

Selects the peered clusters that match this parameter value.

[`-ip-addr <Remote InetAddress>, ...`] - Active IP Addresses

Selects the peered clusters that match this parameter value.

[`-serialnumber <Cluster Serial Number>`] - Cluster Serial Number

Selects the peered clusters that match this parameter value.

[`-remote-cluster-nodes <text>, ...`] - Remote Cluster Nodes

Selects the peered clusters that match this parameter value.

[`-remote-cluster-health {true/false}`] - Remote Cluster Health

Selects the peered clusters that match this parameter value.

- true - This means that there is cluster quorum in the peer cluster.
- false - This means that there is no cluster quorum in the peer cluster.

[`-unreachable-local-nodes <text>, ...`] - Unreachable Local Nodes

Selects the peered clusters that match this parameter value.

`[-timeout <integer>]` - Operation Timeout (seconds) (privilege: advanced)

Selects the peered clusters that match this parameter value.

`[-address-family {ipv4/ipv6}]` - Address Family of Relationship

Selects the peered clusters that have a relationship established using this protocol.

`[-auth-status-admin {no-authentication/revoked/use-authentication}]` - Authentication Status Administrative

Selects the peered clusters that match this parameter value, which must be chosen from the following values.

- no-authentication - The cluster peer relationship uses no authentication.
- use-authentication - The cluster peer relationship is authenticated.
- revoked - The cluster peer relationship is revoked until agreement can be reached.

`[-auth-status-operational {ok/absent/pending/expired/revoked/declined/refused/ok-and-offer/absent-but-offer/revoked-but-offer/key-mismatch/intent-mismatch/incapable}]` - Authentication Status Operational

Selects the peered clusters that match this parameter value, which must be one of the following values.

- ok - The clusters both use authentication and they have agreed on an authentication key.
- absent - The clusters agree not to use authentication.
- pending - This cluster has made an outstanding offer to authenticate with the other cluster, but agreement has not yet been reached.
- expired - This cluster's offer to authenticate with the other cluster expired before agreement was reached.
- revoked - This cluster has revoked any prior authentication agreement.
- declined - The other cluster has revoked the authentication agreement and is declining to communicate with this cluster.
- refused - The other cluster actively refuses the communication attempts, perhaps because its part of the peering relationship has been deleted.
- ok-and-offer - The clusters agree on an authentication key and are using it. In addition, this cluster has made an outstanding offer to re-authenticate with the other cluster.
- absent-but-offer - The clusters currently agree that neither side requires authentication of the other, but this cluster has made an outstanding offer to authenticate.
- revoked-but-offer - This cluster has revoked any authentication agreement, but it has made an outstanding offer to authenticate.
- intent-mismatch - The two clusters disagree on whether authentication is required.
- key-mismatch - The two clusters both believe that they are authenticated, but one of the shared secrets has become corrupted.
- incapable - The other cluster is no longer running a version of Data ONTAP that supports authenticated cluster peering.

[-rpc-connect-timeout <integer>] - Timeout for RPC Connect (privilege: advanced)

Selects the peered clusters that match this parameter value.

[-update-ping-timeout <integer>] - Timeout for Update Pings (privilege: advanced)

Selects the peered clusters that match this parameter value.

[-last-updated <MM/DD/YYYY HH:MM:SS>] - Last Update Time

Selects the peered clusters that match this parameter value.

[-ipspace <IPspace>] - IPspace for the Relationship

Selects the peered clusters whose relationships are to cross the named local IPspace. The default value is the IPspace name "Default". In relationships created before ONTAP 8.3.1, the initial value is "-" and is not updated to "Default" until an action is taken on a cluster peer relationship, such as creating, modifying, or deleting a relationship.

[-encryption-protocol-proposed {none/tls-psk}] - Proposed Setting for Encryption of Inter-Cluster Communication

Selects the peered clusters that match the value of this parameter, that is, whether they are proposing to encrypt their cross-cluster communication or not.

[-encryption-protocol {none/tls-psk}] - Encryption Protocol For Inter-Cluster Communication

Selects the peered clusters that match the value of this parameter, that is, whether they are encrypting their cross-cluster communication or not.

[-psk-algorithm {akep2/jpake}] - Algorithm By Which the PSK Was Derived

Selects the peered clusters that match the value of this parameter, that is, which of the following algorithms was used to derive the Pre-Shared Key between the clusters.

- akep2 - The key was obtained through the AKEP2-and-PBKDF2 algorithm.
- jpake - The key was obtained through the J-PAKE algorithm.

Examples

This example shows the output of the cluster peer show command when all nodes in the local cluster are able to contact all nodes in the remote peer cluster. Additionally, the peer relationship is authenticated and operating correctly.

```
cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability Authentication
-----
cluster2               1-80-123456         Available      ok
```

Detailed information for this scenario is shown below.

```
cluster1::> cluster peer show -instance

Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246, 10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01, cluster2-02
Remote Cluster Health: true
Unreachable Local Nodes: -
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
```

```

Authentication Status Operational: ok
                        Last Update Time: 02/05 21:05:41
                        IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none

```

This example shows the output of the cluster peer show command when some nodes in the local cluster are not able to contact some or all of the nodes in the remote peer cluster.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability Authentication
-----
cluster2               1-80-123456         Available      ok

```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Partial
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246, 10.98.234.243

10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01,
cluster2-02
Remote Cluster Health: false
Unreachable Local Nodes: -
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
Authentication Status Operational: ok
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none

```

This example shows the output of the cluster peer show command when some nodes in the local cluster cannot be contacted from the node where the command is executed, but all the other nodes including node on which command is executed are able to contact all nodes in the remote peer cluster.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Available      ok

```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
Remote Intercluster Addresses: cluster2-d2,
10.98.234.246
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses: 10.98.234.246,
10.98.234.243
Cluster Serial Number: 1-80-123456
Remote Cluster Nodes: cluster2-01,
cluster2-02
Remote Cluster Health: true
Unreachable Local Nodes: cluster1-01
Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
Authentication Status Operational: ok
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none

```

This example shows the output of the cluster peer show command when some nodes in the local cluster cannot be contacted from the node where the command is executed, and the node on which command is executed is also not able to contact the remote peer cluster.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Unavailable    ok

```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance

                        Peer Cluster Name: cluster2
                        Remote Intercluster Addresses: cluster2-d2,

```

Cluster Peer Connection Commands

The connection directory

The `cluster peer connection` commands provide you with the ability to observe, and to some extent manage, the connections created on behalf of cluster peering, both for control and data access.

cluster peer connection show

Show current peering connections for a cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer connection show` command displays information about the current TCP connections and how they are supporting the set of peering relationships.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-cluster-name <text>] - Remote Cluster

Selects the connections associated with the named peered cluster.

[-node {<nodename>/local}] - Node

Selects the connections hosted by the given node.

[-connection-type {mgmt-client/mgmt-server/data}] - Cluster Peering Connection Type

Selects the connections of the named type. This parameter can have one of three different values:

- **Mgmt-client** - Management-plane client connections, created so that this node may make management-plane requests of other nodes.
- **Mgmt-server** - Management-plane server connections, over which this node services requests made by other nodes' mgmt-client connections.
- **Data** - Connections made between data-planes of different nodes.

[-index <integer>] - Index of Connection

Selects the connections with the given index value.

[-cluster-uuid <UUID>] - Cluster UUID (privilege: advanced)

Selects the connections to the cluster with the given cluster UUID.

[-auth-status-admin {no-authentication/revoked/use-authentication}] - Authentication Status Administrative

Selects connections to the peered clusters whose intended authentication matches this parameter value.

[-auth-status-operational {ok/absent/pending/expired/revoked/declined/refused/ok-and-offer/absent-but-offer/revoked-but-offer/key-mismatch/intent-mismatch/incapable}] - Authentication Status Operational

Selects connections to the peered clusters whose authentication state matches this parameter value.

[-authenticated {true/false}] - Authenticated

Selects connections that have been authenticated, or not, according to this parameter value.

[-port <integer>] - Network Port

Selects the connections whose port matches this parameter value.

[-idle <[<integer>h][<integer>m][<integer>s]>] - Idle Time

Selects the connections whose idle times match this parameter value.

[-address <IP Address>] - Remote Network Address

Selects the connections that have this parameter value as the remote network address.

[-psk-algorithm {akep2/jpake}] - PSK Algorithm

Selects the connections for clusters whose PSKs were generated by the named algorithm. This parameter can have one of two different values:

- akep2 - The original algorithm, PBKDF2 followed by AKEP2.
- jpake - Newer algorithm: J-PAKE.

Examples

This example shows the output of the cluster peer connection show command.

```
cluster1::> cluster peer connection show
Cluster Node      Connection Type  Auth  Encrypt Idle  Remote
Address
-----
cluster2
  node1
                                Authentication: ok
                                data  true  true   6s   10.10.10.100
                                data  true  true   7s   10.10.10.100
                                data  true  true  20s   10.10.10.100
                                data  true  true  11s   10.10.10.100
                                data  true  true   7s   10.10.10.100
                                data  true  true   7s   10.10.10.100
                                data  true  true  11s   10.10.10.200
                                data  true  true  11s   10.10.10.200
                                data  true  true  48s   10.10.10.200
                                data  true  true  48s   10.10.10.200
                                data  true  true  37s   10.10.10.200
                                data  true  true  37s   10.10.10.200
12 entries were displayed.
```

cluster peer health commands

The health directory

cluster peer health show

Check peer cluster health

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer health show` command displays information about the health of the nodes in peer clusters from the perspective of the nodes in the local cluster. The command obtains health information by performing connectivity and status probes of each peer cluster's nodes from each node in the local cluster.

To enable quick access to remote cluster health information, remote cluster health status is periodically checked and cached. These cached results enable users and system features to quickly assess the availability of remote resources. By default, this command accesses cached results. Use the `-bypass-cache true` option to force a current, non-cached check of remote cluster health.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-originating-node {<nodename>/local}] - Local Node

Selects the node that matches this parameter value.

[-destination-cluster <Cluster name>] - Peer Cluster

Selects the cluster that matches this parameter value.

[-destination-node <Peer Node Name>] - Peer Node

Selects the node that matches this parameter value.

[-destination-cluster-uuid <UUID>] - Peer UUID

Selects the cluster that matches this parameter value.

[-data-ping {unknown_node/internal_error/unreachable/session_reachable/interface_reachable}] - Status of Data Ping Operation

Selects the nodes that match this parameter value.

[-icmp-ping {unknown_node/internal_error/unreachable/session_reachable/interface_reachable}] - Status of ICMP Ping Operation

Selects the nodes that match this parameter value.

[-node-health {true/false}] - RDB Health of the Node

Selects the nodes that match this parameter value (**true** means healthy).

[-cluster-health {true/false}] - Cluster Health

Selects the nodes that match this parameter value (**true** means healthy).

[-availability {true/false}] - Communication Indicator

Selects the nodes that match this parameter value (**true** means communicating).

[-bypass-cache {true/false}] - Bypass Cache and Determine Health

Bypasses cached results to determine current cluster health (**true** means bypass the cache). Cached results may not be current, but they are displayed more quickly.

[-last-updated <MM/DD/YYYY HH:MM:SS>] - Last Update Time

Selects the nodes that match this parameter value.

Examples

The following example shows typical output for this command in a cluster of two nodes that has a peer cluster of two nodes.

```
cluster1::> cluster peer health show
Node      Cluster-Name      Node-Name
          Ping-Status      RDB-Health Cluster-Health Availability
-----
node1
          cluster2      node3
          Data: interface_reachable
          ICMP: interface_reachable true      true
          node4
          Data: interface_reachable
          ICMP: interface_reachable true      true
node2
          cluster2      node3
```

```

Data: interface_reachable
ICMP: interface_reachable true      true      true
                                node4
Data: interface_reachable
ICMP: interface_reachable true      true      true
4 entries were displayed.

```

The following example shows detailed health information for node3 in cluster2 from the perspective of node1 in cluster1.

```

cluster1::> cluster peer health show -originating-node node1 -destination-
cluster cluster2 -destination-node node3 -instance

Local Node: node1
Peer Cluster: cluster2
Peer Node: node3
Peer UUID: 5e4befb2-1f36-11d0-98c9-123476563412
Status of Data Ping Operation: interface_reachable
Status of ICMP Ping Operation: interface_reachable
RDB health of the node: true
Cluster Health: true
Communication Indicator: true
Last Update Time: 02/06 18:58:38

```

Cluster Peer Offer Commands

Manage offers to authenticate cluster peer relationships

The `cluster peer offer` commands provide you with the ability to manage the authentication offers that can be created by the [cluster peer create](#) and [cluster peer modify](#) commands.

Related references

[cluster peer create](#) on page 88

[cluster peer modify](#) on page 94

cluster peer offer cancel

Cancel the outstanding offer to authenticate with a peer cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer offer cancel` command cancels an outstanding offer to authenticate with a potentially peered cluster. After the command completes, the given cluster can no longer establish authentication using the given authentication offer.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify which offer should be cancelled, by specifying the name of the cluster to which the offer is extended.

Examples

The following example cancels the authentication offer to cluster2.

```
cluster1::> cluster peer offer cancel -cluster cluster2
```

cluster peer offer modify

Modify an outstanding offer to authenticate with a peer cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer offer modify` command modifies the outstanding offer to authenticate with a potentially peered cluster. Every authentication offer has an expiration time, after which the offer will no longer be honored. This command is used to change that expiration time. To cancel the offer outright, use the `cluster peer offer cancel` command instead.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify the offer to be modified by indicating the name of the cluster to which it has been extended.

[-offer-expiration {MM/DD/YYYY HH:MM:SS / {1..7}days / {1..168}hours / PnDTnHnMnS / PnW}] - Authentication Offer Expiration Time

Use this parameter to specify the new expiration time for the offer.

[-initial-allowed-vserver-peers <Vserver Name>, ...] - Vservers Initially Allowed for Peering

Use this optional parameter to specify the list of Vservers for which reciprocal Vserver peering with peer cluster should be enabled.

Examples

This example modifies the expiration time for the authentication offer to push it out by an hour.

```
cluster1::> cluster peer offer show
Peer Cluster Name      Authentication Creation      Expiration
-----
cluster2               absent_but_offer
                        7/23/2013 14:45:47  7/23/2013 15:45:47

cluster1::> cluster peer offer modify -cluster cluster2 -offer-expiration
"7/23/2013 16:45:47"

cluster1::> cluster peer offer show
Peer Cluster Name      Authentication Creation      Expiration
-----
cluster2               absent_but_offer
                        7/23/2013 14:45:47  7/23/2013 16:45:47
```

Related references

[cluster peer offer cancel](#) on page 112

cluster peer offer show

Display outstanding offers to authenticate with a peer cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer offer show` command displays information about authentication offers still pending with potential peer clusters. By default, the command displays information about all unexpired offers made by the local cluster.

To display detailed information about a specific offer, run the command with the `-cluster` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <text>] - Peer Cluster Name

Selects the offer that matches this parameter value.

[-auth-status-operational {ok/absent/pending/expired/revoked/declined/refused/ok-and-offer/absent-but-offer/revoked-but-offer/key-mismatch/intent-mismatch/incapable}] - Authentication Status Operational

Selects the offers that match this parameter value.

[-offer-creation <MM/DD/YYYY HH:MM:SS>] - Authentication Offer Creation Time

Selects the offers that match this parameter value.

[-offer-expiration {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Authentication Offer Expiration Time

Selects the offers that match this parameter value.

[-initial-allowed-vserver-peers <Vserver Name>, ...] - Vservers Initially Allowed for Peering

Selects the offers that match this parameter value.

[-offer-creator <text>] - Authentication Offer Creator

Selects the offers that match this parameter value.

[-encryption-protocol-proposed {none/tls-psk}] - Encryption Protocol to Be Used For the Relationship

Selects the offers that match this parameter value.

Examples

The following example displays information about the outstanding authentication offers:

```
cluster1::> cluster peer offer show

  Allowed
Peer Cluster Name      Authentication Creation
Expiration             Vserver Peers
-----
cluster2              absent_but_offer 7/11/2013 22:22:52 7/11/2013
23:22:52 vs1,vs2
```

cluster peer policy commands

Manage the policy configuration of the cross-cluster relationship facility

cluster peer policy modify

Modify the policy configuration for the cluster peering service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer policy modify` command modifies the prevailing policy settings. One setting governs whether unauthenticated cluster peer relationships can exist. The other setting specifies a minimum length for passphrases.

Parameters

`[-is-unauthenticated-access-permitted {true/false}] - Is Unauthenticated Cluster Peer Access Permitted`

Use this parameter to specify whether unauthenticated peering relationships are allowed to exist. Setting the parameter value to *true* allows such relationships to exist. Setting the value to *false* prevents both the creation of unauthenticated peering relationships as well as the modification of existing peering relationships to be unauthenticated. Setting the value to *false* is not possible if the cluster currently is in any unauthenticated relationships.

`[-passphrase-minlength <integer>] - Passphrase Length Minimum`

Use this parameter to specify a minimum length for passphrases as given to the `cluster peer create` or `cluster peer modify` commands in the future. The default value for this parameter is 8.

`[-is-unencrypted-access-permitted {true/false}] - Is Unencrypted Cluster Peer Access Permitted`

Use this parameter to specify whether peering relationships that do not use encryption are allowed to exist. Setting the parameter value to *true* allows such relationships to exist. Setting the value to *false* prevents the creation of unauthenticated peering relationships and the modification of existing peering relationships to be unauthenticated, as well as preventing unencrypted peering relationships from being created and the modification of existing peering relationships to be unencrypted. Setting the value to *false* is not possible if the cluster currently is in any unauthenticated or unencrypted relationships.

Examples

This example modifies the peering policy to disallow unauthenticated intercluster communications.

```
cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted:  true
Minimum Length for a Passphrase:  8

cluster1::> cluster peer policy modify -is-unauthenticated-access-permitted
false

cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted:  false
Minimum Length for a Passphrase:  8
```

Related references

[cluster peer create](#) on page 88

[cluster peer modify](#) on page 94

cluster peer policy show

Display the policy configuration for the cluster peering service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer policy show` command displays the prevailing cluster peer authentication policy. There are two policies at present: one to control whether any cluster peer relationships can be unauthenticated, and one to control the minimum length for a passphrase. If the policy is set to preclude unauthenticated peering relationships, then unauthenticated relationships cannot be created inadvertently. Passphrases of less than the minimum length may not be used. By default, this minimum length is set to 8, so passphrases must be 8 characters long or longer.

Examples

This example shows the cluster peer policy when unauthenticated relationships may not be created inadvertently.

```
cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted: false
                  Minimum Length for a Passphrase: 9
Is Unencrypted Cluster Peer Communication Permitted: true
```

cluster quorum-service commands

Manage the quorum options of the cluster

cluster quorum-service options commands

The options directory

cluster quorum-service options modify

Modify the settings for cluster quorum-service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster quorum-service options modify` command modifies the values of cluster quorum services options.

Parameters

`[-ignore-quorum-warning-confirmations {true/false}]` - Whether or Not Warnings Are Enabled

Specifies whether cluster quorum warnings and confirmations should be ignored when cluster operations could negatively impact cluster quorum:

- Halting a node ([system node halt](#))
- Rebooting a node ([system node reboot](#))

- Issuing a planned takeover (*storage failover takeover*)

The default setting is false.

Examples

The following example shows the usage of this command:

```
cluster1::> set advanced

Warning: These advanced commands are potentially dangerous; use them only
when
    directed to do so by NetApp personnel.
    Do you want to continue? {y|n}: y

cluster1::*> cluster quorum-service options modify -ignore-quorum-warning-
confirmations true
```

Related references

system node halt on page 1429

system node reboot on page 1433

storage failover takeover on page 1166

cluster quorum-service options show

Display the settings for cluster quorum-service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster quorum-service options show` command displays the values of cluster quorum services options.

Examples

The following example demonstrates showing the state of `ignore-quorum-warning-confirmations` when it is false and true.

```
cluster1::*> set advanced

Warning: These advanced commands are potentially dangerous; use them only
when
    directed to do so by NetApp personnel.
    Do you want to continue? {y|n}: y

cluster1::*> cluster quorum-service options show
Ignore Quorum Warning Confirmations
-----
false
```

cluster ring commands

Display information about cluster replication rings

cluster ring show

Display cluster node member's replication rings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster ring show` command displays a cluster's ring-replication status. Support personnel might ask you to run this command to assist with troubleshooting.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the rings that match this parameter value.

[-unitname {mgmt/vldb/vifmgr/bcomd/crs/availd}] - Unit Name

Selects the rings that match this parameter value. Possible values are:

- **mgmt** - The management application
- **vldb** - The volume location database
- **vifmgr** - The virtual-interface manager
- **bcomd** - The SAN management daemon
- **crs** - The configuration replication service

[-online {master/secondary/offline}] - Status

Selects the rings that match this parameter value.

[-epoch <integer>] - Epoch

Selects the rings that match this parameter value.

[-master <nodename>] - Master Node

Selects the rings that match this parameter value.

[-local <nodename>] - Local Node

Selects the rings that match this parameter value.

[-db-epoch <integer>] - DB Epoch

Selects the rings that match this parameter value.

[-db-trnxs <integer>] - DB Transaction

Selects the rings that match this parameter value.

[-num-online <integer>] - Number Online

Selects the rings that match this parameter value.

[-rdb-uuid <UUID>] - RDB UUID

Selects the rings that match this parameter value.

Examples

The following example displays information about all replication rings in a two-node cluster:

```
cluster1::*> cluster ring show
Node      UnitName Epoch      DB Epoch DB Trnxs Master      Online
-----
node0     mgmt      1          1          1068    node0     master
node0     vldb      1          1          98      node0     master
node0     vifmgr    1          1          350     node0     master
node0     bcomd     1          1          56      node0     master
node0     crs       1          1          88      node0     master
node1     mgmt      1          1          1068    node0     secondary
node1     vldb      1          1          98      node0     secondary
node1     vifmgr    1          1          350     node0     secondary
node1     bcomd     1          1          56      node0     secondary
node1     crs       1          1          88      node0     secondary
10 entries were displayed.
```

Cluster Statistics Commands

The statistics directory

The `cluster statistics` command displays statistics of Data ONTAP 8 systems.

cluster statistics show

Display cluster-wide statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster statistics show` command displays the following information. Each item lists the current value and; if applicable, the change (delta) from the previous reported value.

- CPU busy percentage
- Average of CPU busy percentage (advanced privilege level only)
- Total number of NFS and CIFS operations
- Number of NFS operations
- Number of CIFS operations
- Number of cache operations (advanced privilege level only)
- Total amount of network data received (advanced privilege level only)
- Total amount of network data sent (advanced privilege level only)
- Number of packets received (advanced privilege level only)
- Number of packets sent (advanced privilege level only)
- Busy percentage for the data network
- Amount of data received on the data network
- Amount of data sent on the data network
- Busy percentage for the cluster network

- Amount of data received on the cluster network
- Amount of data sent on the cluster network
- Amount of data read from disk
- Amount of data written to disk

At the diagnostic privilege level, the command displays the following information:

- Average of CPU busy percentage
- CPU busy percentage
- Total number of operations
- Number of NFS operations
- Number of CIFS operations
- Number of 7M Fcache operations
- Number of SpinFS operations
- Total amount of network traffic received
- Total amount of network traffic sent
- Percentage of data-network utilization
- Amount of data-network traffic received
- Amount of data-network traffic sent
- Percentage of cluster-network utilization
- Amount of cluster-network traffic received
- Amount of cluster-network traffic sent
- Amount of data read from disk
- Amount of data written to disk
- Number of packets received
- Number of packets sent

Examples

The following example displays cluster statistics:

```
cluster1::> cluster statistics show
Counter      Value      Delta
-----
CPU Busy:    84%      +27
Operations:
  Total:     951471448  7210/s:11s
  NFS:      12957951479  13759/s:11s
  CIFS:      342195460   230/s:11s
Data Network:
  Busy:      0%      -
  Received:  1.98TB   3.18MB/s:11s
  Sent:      6.20TB   903KB/s:11s
Cluster Network:
  Busy:      0%      -
  Received:  6.33TB   1.34MB/s:11s
```

Sent:	6.24TB	3.54MB/s:11s
Storage Disk:		
Read:	207TB	82.7MB/s:11s
Write:	53.3TB	53.5MB/s:11s

cluster time-service commands

Manage cluster time services

cluster time-service ntp commands

Manage cluster Network Time Protocol (NTP) service

cluster time-service ntp key commands

The key directory

cluster time-service ntp key create

Create an NTP symmetric authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp key create` command creates a cryptographic key that can be used to verify that Network Time Protocol (NTP) packets are coming from a configured NTP server.

To use the created key it must be assigned to the required NTP server configuration using the `cluster time-service ntp server create` or `cluster time-service ntp server modify` commands.

Note: The id, key-type and value must all be configured identically on both the ONTAP cluster and the external NTP time server for the cluster to be able to synchronize time to that server.

Parameters

-id <integer> - NTP Symmetric Authentication Key ID

Uniquely identifies this key in the cluster. Must be an integer between 1 and 65535.

-type <sha1> - NTP Symmetric Authentication Key Type

The cryptographic algorithm that this key is used with. Only SHA1 is currently supported.

-value <text> - NTP Symmetric Authentication Key Value

A 40 character hexadecimal digit string that represents a cryptographic key that is shared with the NTP server.

Examples

The following example creates a new SHA-1 NTP symmetric authentication key.

```
cluster1::> cluster time-service ntp key create 1 sha1
2e874852e7d41cda65b23915aa5544838b366c51
```

Related references

[cluster time-service ntp server create](#) on page 124

[cluster time-service ntp server modify](#) on page 126

cluster time-service ntp key delete

Delete an NTP symmetric authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete an NTP symmetric authentication key.

Note: It is not possible to delete a key that is referenced in an existing NTP server configuration. Remove all references to this key using the [cluster time-service ntp server modify](#) or [cluster time-service ntp server delete](#) commands before attempting to delete the key using this command.

Parameters

-id <integer> - NTP Symmetric Authentication Key ID

Unique identifier of this key in the cluster.

Examples

The following example deletes the NTP key with ID 1.

```
cluster1::> cluster time-service ntp key delete 1
```

Related references

[cluster time-service ntp server modify](#) on page 126

[cluster time-service ntp server delete](#) on page 126

cluster time-service ntp key modify

Modify an NTP symmetric authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp key modify` command modifies a Network Time Protocol (NTP) symmetric authentication key.

Parameters

-id <integer> - NTP Symmetric Authentication Key ID

Unique identifier of this key in the cluster.

[-type <sha1>] - NTP Symmetric Authentication Key Type

The cryptographic algorithm that this key is used with. Only SHA1 is currently supported.

[-value <text>] - NTP Symmetric Authentication Key Value

A 40 character hexadecimal digit string that represents a cryptographic key that is shared with the NTP server.

Examples

The following example modifies the NTP key with ID 1 to have a new value.

```
cluster1::> cluster time-service ntp key modify 1 -value
2e874852e7d41cda65b23915aa5544838b366c51
```

cluster time-service ntp key show

Display NTP symmetric authentication keys

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp key show` command displays the configured Network Time Protocol (NTP) symmetric authentication keys.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance {}]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-id <integer>] - NTP Symmetric Authentication Key ID

If this parameter is specified, the command displays the keys that match the specified key ID.

[-type <sha1>] - NTP Symmetric Authentication Key Type

If this parameter is specified, the command displays the keys that match the specified key type.

[-value <text>] - NTP Symmetric Authentication Key Value

If this parameter is specified, the command displays the keys that match the specified value.

Examples

The following example displays information about the NTP authentication keys in the cluster:

```
cluster1::> cluster time-service ntp key show
ID      Type      Value
-----
2       sha1       5a01120580b5a6ade6ebcd5bad7673fdd6db0113
10      sha1       1f48d2e6f02f17e3f8fa8798cc77af101df29642
2 entries were displayed.
```

cluster time-service ntp security commands

The security directory

cluster time-service ntp security modify

Modify NTP security settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp security modify` command allows setting of security parameters related to the Network Time Protocol (NTP) subsystem.

Parameters

`[-is-query-enabled {true/false}]` - Is Querying of NTP Server Enabled?

Setting this parameter to *true* allows querying of the NTP subsystem from systems external to the cluster. For example, querying a node using the standard "ntpq" command can be enabled by this command. The default setting is *false* to protect against possible security vulnerabilities. If querying of the NTP subsystem is disabled, the `cluster time-service ntp status show` command can be used to obtain similar information. Although querying of the NTP subsystem from external hosts can be disabled with this command, executing a local query to the localhost address is always enabled.

Examples

The following example enables the querying of the NTP subsystem from clients external to the cluster:

```
cluster-1::> cluster time-service ntp security modify -is-query-enabled true
```

Related references

[cluster time-service ntp status show](#) on page 129

cluster time-service ntp security show

Display NTP security settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp security show` command displays the configuration of security features related to the Network Time Protocol (NTP) subsystem.

Examples

The following example displays the NTP security configuration of the cluster:

```
cluster1::> cluster time-service ntp security show
External queries enabled?: true
```

cluster time-service ntp server commands

The server directory

cluster time-service ntp server create

Add a NTP Server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server create` command associates the cluster with an external network time server for time correction and adjustment by using the Network Time Protocol (NTP).

The command resolves the time server host name to an IP address and performs several validation checks. If an error is detected during validation, it is reported.

The validation checks performed by this command include the following:

- The NTP replies to an NTP query with the specified protocol version.
- The NTP reply indicates that the external time server is synchronized to another time server.
- The distance and dispersion of the NTP reply from the "root" or source clock are within the required limits.

Parameters

-server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This parameter specifies the host name or IP address of the external NTP server that is to be associated with the cluster for time correction and adjustment.

[-version {3/4/auto}] - NTP Version for Server (default: auto)

Use this parameter to optionally specify the NTP protocol version that should be used for communicating with the external NTP server. If the external NTP server does not support the specified protocol version, time exchange cannot take place.

The supported values for this parameter include the following:

- **3** - Use NTP protocol version 3, which is based on Internet Standard request for comments (RFC) #1305.
- **4** - Use NTP protocol version 4, which is based on Internet Standard RFC #5905.
- **auto** - Have Data ONTAP select the NTP protocol version.

The default setting is **auto**.

[-is-preferred {true/false}] - Is Preferred NTP Server (default: false) (privilege: advanced)

Use this parameter to optionally specify whether the external NTP server is the primary time source for correcting and adjusting the cluster time. The responses from this source are used unless its time is outside the accepted selection range.

The default setting is **false**.

You use this parameter when a high quality radio (or GPS) based time server is being used with a set of non-radio based backup time servers.

[-key-id <integer>] - NTP Symmetric Authentication Key ID

Use this parameter to optionally enable NTP symmetric authentication key for communication with the specified time server. The ID must refer to a key created by the `cluster time-service ntp key create` command and must be a key with the same ID and value as one configured on the specified time server.

Examples

The following example associates the cluster with an NTP server named `ntp1.example.com`.

```
cluster1::> cluster time-service ntp server create -server ntp1.example.com
```

Related references

[cluster time-service ntp key create](#) on page 121

cluster time-service ntp server delete

Delete a NTP Server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server delete` command removes the association between the cluster and an external network time server that uses the Network Time Protocol (NTP).

Parameters

-server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This specifies the host name or IP address of an existing external NTP server that the cluster will disassociate from.

Examples

The following example disassociates an NTP server named `ntp2.example.com` from the cluster:

```
cluster1::> cluster time-service ntp server delete -server ntp2.example.com
```

cluster time-service ntp server modify

Modify NTP Server Options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server modify` command modifies the configuration of an existing external network time server that uses the Network Time Protocol (NTP) for time correction and adjustment.

Parameters

-server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This parameter specifies the host name or IP address of an existing external NTP server that is to be modified.

[-version { 3/4/auto}] - NTP Version for Server (default: auto)

Use this parameter to optionally specify the NTP protocol version that should be used for communicating with the external NTP server. If the external NTP server does not support the specified protocol version, time exchange cannot take place.

The supported values for this parameter include the following:

- **3** - Use NTP protocol version 3, which is based on Internet Standard request for comments (RFC) #1305.
- **4** - Use NTP protocol version 4, which is based on Internet Standard RFC #5905.

- **auto** - Have Data ONTAP select the NTP protocol version.

The default setting is **auto**.

`[-is-preferred {true/false}] - Is Preferred NTP Server (default: false) (privilege: advanced)`

Use this parameter to optionally specify whether the external NTP server is the primary time source for correcting and adjusting the cluster time. The responses from this source are used unless its time is outside the accepted selection range

The default setting is **false**.

You use this parameter when a high quality radio (or GPS) based time server is being used with a set of non-radio based backup time servers.

This parameter is available only at the advanced privilege level and higher.

`[-is-authentication-enabled {true/false}] - Is NTP Symmetric Key Authentication Enabled`

Use this parameter to optionally disable NTP symmetric key authentication for communication with the specified time server. Using this parameter and selecting *false* disables the NTP symmetric key authentication and clears the **key-id** parameter for the specified server. This parameter is not required to enable NTP symmetric key authentication, but if specified as *true* the NTP symmetric authentication key must also be specified using the **key-id** parameter.

`[-key-id <integer>] - NTP Symmetric Authentication Key ID`

Use this parameter to optionally enable NTP symmetric authentication key for communication with the specified time server. The ID must refer to a key created by the *cluster time-service ntp key create* command and must be a key with the same ID and value as one configured on the specified time server.

Examples

The following example modifies the NTP version of an NTP server named `ntp1.example.com`. The NTP version is changed to 4.

```
cluster1::> cluster time-service ntp server modify -server ntp1.example.com -
version 4
```

Related references

cluster time-service ntp key create on page 121

cluster time-service ntp server reset

Reset NTP server list to a default selection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp server reset` command replaces the current configuration with one of the selected configurations.

If none or more than one time service configuration is selected, the command will fail.

Parameters

`[-use-public {true/false}]` - Reset Server List to Public Identified Defaults (default: false)

When set to true, this specifies that the public NTP server list used by Data ONTAP should replace the current configuration.

The default setting is **false**.

Examples

The following example replaces the current time service configuration with the default public NTP server list that is used by Data ONTAP.

```
cluster1::> cluster time-service ntp server reset -use-public true
```

cluster time-service ntp server show

Display a list of NTP Servers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server show` command displays the association between the cluster and external network time servers that use the Network Time Protocol (NTP).

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the **`-fields <fieldname>, ...`** parameter, the command only displays the fields that you specify. For example: **`-fields server, version`**.

`[-instance]`

If this parameter is specified, the command displays all the available field information.

`[-server <text>]` - NTP Server Host Name, IPv4 or IPv6 Address

If this parameter is specified, the command displays the external NTP servers that match the specified server name or IP address.

`[-version {3/4/auto}]` - NTP Version for Server (default: auto)

If this parameter is specified, the command displays the external NTP servers that use the specified NTP version.

`[-is-preferred {true/false}]` - Is Preferred NTP Server (default: false) (privilege: advanced)

If this parameter is specified, the command displays the external NTP server or servers that match the specified preferred server status.

`[-is-public {true/false}]` - Is Public NTP Server Default (privilege: advanced)

If this parameter is specified, the command displays the information for the external NTP servers that are either on the NTP server list defined by Data ONTAP (**`true`**) or not on the list (**`false`**).

`[-is-authentication-enabled {true/false}]` - Is NTP Symmetric Key Authentication Enabled

If this parameter is specified, the command displays the external NTP server or servers that require NTP symmetric key authentication for communication.

[-key-id <integer>] - NTP Symmetric Authentication Key ID

If this parameter is specified, the command displays the external NTP server or servers that match the specified symmetric authentication key ID.

Examples

The following example displays information about all external NTP time servers that are associated with the cluster:

```
cluster1::> cluster time-service ntp server show
```

Server	Version	Is Authentication Enabled	Key ID
ntp1.example.com	auto	false	-
ntp2.example.com	auto	true	10

cluster time-service ntp status commands

The status directory

cluster time-service ntp status show

Display status of the node's NTP client

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp status show` command displays the status of the associations between the cluster and external network time servers that use the Network Time Protocol (NTP).

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-node {<nodename>/local}] - Node

If this parameter is specified, the command displays information related to associations on the specified node.

[-server <text>] - NTP Server Host Name, IPv4 or IPv6 Address

If this parameter is specified, the command displays information about the associations related to the specified NTP server. The server should be specified as it is configured in the `cluster time-service ntp server show` command.

[-server-address <IP Address>] - Server IP Address

If this parameter is specified, the command displays information about the associations related to the NTP server with the specified IP address.

[-is-peer-reachable {true/false}] - Is Peer Reachable and Responding to Polls?

If this parameter is specified as *true*, the command displays information about associations with the NTP servers that have been successfully polled.

`[-is-peer-selected {true/false}] - Is Peer Selected as Clock Source?`

If this parameter is specified as *true*, the command displays information about associations with the NTP servers that have been selected as the current clock source.

`[-selection-state <State of NTP Peer Selection>] - State of Server Selection`

If this parameter is specified, the command displays information about associations with the specified selection state.

`[-selection-state-text <text>] - Description of Server Selection State`

If this parameter is specified, the command displays information about associations with the specified selection state description.

`[-poll-interval <integer>] - Poll Interval (secs)`

If this parameter is specified, the command displays information about associations that have the specified polling interval.

`[-time-last-poll <integer>] - Time from Last Poll (secs)`

If this parameter is specified, the command displays information about associations that are polled at the specified time.

`[-offset <double>] - Offset from Server Time (ms)`

If this parameter is specified, the command displays information about associations with the specified offset from the NTP server.

`[-delay <double>] - Delay Time to Server (ms)`

If this parameter is specified, the command displays information about associations with the specified travelling time to the NTP server.

`[-jitter <double>] - Maximum Offset Error (ms)`

If this parameter is specified, the command displays information about associations with the specified offset error from the NTP server.

`[-reachability <Hex String>] - Reachability of Server`

If this parameter is specified, the command displays information about associations with the specified reachability to the NTP server. Reachability is specified as a hexbyte that has a bit to represent the success of each of the last eight polls of the specified server. A set bit represents a successful poll. The least significant bit represents the most recent poll, the next most significant bit the poll before that, and so on.

`[-server-stratum <integer>] - Stratum of Server Clock`

If this parameter is specified, the command displays information about associations with NTP servers with the specified clock stratum.

`[-server-reference <text>] - Reference Clock at Server`

If this parameter is specified, the command displays information about associations with NTP servers using the specified clock as reference.

`[-reported-errors <NTP Peer and Packet Errors>, ...] - Reported Packet and Peer Errors`

If this parameter is specified, the command displays information about associations with the specified errors.

Examples

The following example displays the status of the NTP associations of the cluster:

```
cluster-1::*>cluster time-service ntp status show
Node: node-1
Server          Reachable  Selection State          Offset (ms)
-----
ntp1.eng.netapp.com      true   Currently Selected Server
39.122
ntp2.eng.netapp.com      true   Candidate Server
37.786
2 entries were displayed.
```

The following example displays the status of the association with the specified external NTP server:

```
cluster-1::*>cluster time-service ntp status show -instance -server
ntp1.example.com

Node: node-1
NTP Server Host Name, IPv4 or IPv6 Address: ntp1.example.com
Server IP Address: 10.56.32.33
Is Peer Reachable and Responding to Polls?: true
Is Peer Selected as Clock Source?: true
State of Server Selection: sys_peer
Description of Server Selection State: Currently Selected Server
Poll Interval (secs): 64
Time from Last Poll (secs): 1
Offset from Server Time (ms): 26.736
Delay Time to Server (ms): 61.772
Maximum Offset Error (ms): 3.064
Reachability of Server: 01
Stratum of Server Clock: 2
Reference Clock at Server: 10.56.68.21
Reported Packet and Peer Errors: -
```

[cluster time-service ntp server show](#) on page 128

Event Commands

Manage system events

The event commands enable you to work with system events and set up notifications.

event catalog commands

View the event catalog.

event catalog show

Display event definitions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event catalog show` command displays information about events in the catalog. By default, this command displays the following information:

- Message name of the event
- Severity of the event
- SNMP trap type of the event

To display detailed information about a specific event, run the command with the **-message-name** parameter, and specify the name of the event. The detailed view adds the following information:

- Full description of the event
- Action to be taken to address the event
- Event's deprecation status

You can specify additional parameters to limit output to the information that matches those parameters. For example, to display information only about events with an event name that begins with *raid*, enter the command with the **-message-name** *raid** parameter. The parameter value can either be a specific text string or a wildcard pattern.

Alternatively, an event filter can also be specified to limit the output events.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-message-name <Message Name>] - Message Name

Selects the events that match this parameter value.

[-filter-name <text>] - Filter Name

Selects the events that match this parameter value. The parameter value indicates an existing filter name that, when applied permits the inclusion of the listed events.

[-severity {*EMERGENCY*/*ALERT*/*ERROR*/*NOTICE*/*INFORMATIONAL*/*DEBUG*}] - Severity

Selects the events that match this parameter value.

[-description <text>] - Description

Selects the events that match this parameter value.

[-action <text>] - Corrective Action

Selects the events that match this parameter value.

[-snmp-trap-type {*Standard*/*Built-in*/*Severity-based*}] - SNMP Trap Type

Selects the events that match this parameter value. The parameter value describes the type of SNMP trap associated with the event. The value can be one of the following: *Standard* trap type events are those defined in the RFCs. *Built-in* trap types are those that are NetApp Enterprise traps specific to events. The remaining events are considered to have *Severity-based* SNMP trap types.

[-deprecated {*true*/*false*}] - Is Deprecated

Selects the events that match this parameter value. The parameter value indicates whether the event is deprecated or not.

Note: Deprecated events may be removed in a future release of Data ONTAP.

Examples

The following example displays the event catalog:

```
cluster1::> event filter show -filter-name filter1
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
-----
filter1
          1      include  zapi.*            *
          2      exclude  *                  *
2 entries were displayed.
```

```
cluster1::> event catalog show -filter-name filter1
Message      Severity      SNMP Trap Type
-----
zapi.killed  NOTICE      Severity-based

event config commands

Configure the mail server settings used for notifications

event config force-sync

Synchronize a node's EMS configuration with the cluster wide EMS configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event config force-sync` command forces a node's EMS configuration to be synchronized with the cluster wide EMS configuration. The configuration is automatically synchronized among all nodes in the cluster, but in rare cases a node may not be updated. This command simplifies the recovery from this issue.

The following example shows where this command is useful: An email destination is configured for all CRITICAL level event occurrences. When the event is generated, all nodes generate an email except one. This command forces that node to refresh a stale configuration.

Parameters

`[-node {<nodename>/local}] - Node`

The node parameter specifies which controller will be synchronized.

event config modify

Modify log configuration parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `event config modify` command to configure event notification and logging for the cluster.

Parameters

`[-mail-from <mail address>] - Mail From`

Use this parameter to configure the email address from which email notifications will be sent. You can configure the cluster to send email notifications when specific events occur. Use the `event route add-destinations` and `event destination create` commands to configure email destinations for events.

`[-mail-server <text>] - Mail Server (SMTP)`

Use this parameter to configure the name or IP address of the SMTP server used by the cluster when sending email notification of events.

`[-suppression {on/off}] - Event Throttling/Suppression (privilege: advanced)`

Use this parameter to configure whether event suppression algorithms are enabled ("on") or disabled ("off"). The event processing system implements several algorithms to throttle events. The documentation for `event show-suppression` command describes the suppression algorithms in detail.

Note: The suppression parameter can disable both autosuppression and duplicate suppression, but timer suppression cannot be disabled.

`[-console {on/off}] - Console Logging (privilege: advanced)`

Use this parameter to configure whether events are displayed on the console port ("on") or not displayed("off").

`[-proxy-url <text>] - HTTP/HTTPS Proxy URL`

If your organization uses a proxy, use this parameter to specify an HTTP or HTTPS proxy for rest-api type EMS notification destinations. The URL must start with an `http://` prefix. HTTPS connections to a proxy are not supported. To specify a URL that contains a question mark, press ESC followed by the "?".

`[-proxy-user <text>] - User Name for HTTP/HTTPS Proxy`

If authentication is required, use this parameter to specify the user name for the HTTP or HTTPS proxy server specified by the `-proxy-url` parameter. Use the `event config set-proxy-password` command to set the password used for this user name.

Examples

The following command sets the "Mail From" address for event notifications to "admin@example.com" and the "Mail Server" to "mail.example.com":

```
cluster1::> event config modify -mailfrom admin@example.com -mailserver
mail.example.com
```

The following command configures a proxy that requires authentication:

```
cluster1::> event config modify -proxy-url http://proxy.example.com:8080 -
proxy-user-name admin
cluster1::> event config set-proxy-password

Enter the password:
Confirm the password:
```

The following example turns on event suppression and console logging:

```
cluster1::> event config modify -suppression on -console on
```

[event destination create](#) on page 137

[event log show](#) on page 158

[event config set-proxy-password](#) on page 136

event config set-proxy-password

Modify password for proxy server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `event config set-proxy-password` command to set the password for authenticated access to an HTTP or HTTPS proxy being used for EMS notifications. This password is used with the user name you specify using the `event config modify -proxy-user` command to send EMS messages to REST API destinations via the proxy you specify using the `event config modify -proxy-url` command. IF you enter the command without parameters, the command prompts you for a password and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed.

Examples

The following example shows successful execution of this command:

```
cluster1::> event config set-proxy-password

Enter the password:
Confirm the password:
```

event config show

Display log configuration parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event config show` command displays information about the configuration of event notification and event logging for the cluster.

"Mail From" is the email address that the event notification system uses as the "From" address for email notifications.

"Mail Server" is the name or IP address of the SMTP server that the event notification system uses to send email notification of events.

"Proxy URL" is the HTTP or HTTPS proxy server URL used by rest-api type EMS notification destinations if your organization uses a proxy.

"Proxy User Name" is the user name for the HTTP or HTTPS proxy server if authentication is required.

"Suppression" indicates whether event suppression algorithms are enabled ("on") or disabled ("off"). The event processing system implements several algorithms to throttle events.

Note: The suppression parameter can disable both autosuppression and duplicate suppression, but not timer suppression.

"Console" indicates whether events are displayed on the console port ("on") or not displayed ("off").

Examples

The following example displays the configuration of event notification for the cluster:

```
cluster1::> event config show
      Mail From:  admin@example.com
      Mail Server: mail.example.com
      Proxy URL:  -
      Proxy User Name: -
```

The following example displays the configuration of event notification with HTTP or HTTPS proxy:

```
cluster1::> event config show
      Mail From:  admin@example.com
      Mail Server: mail.example.com
      Proxy URL:  http://proxy.example.com:3128
      Proxy User Name: admin
```

At the diagnostic level, the output displays the following information:

```
cluster1::*> event config show
      Mail From:  admin@example.com
      Mail Server: mail.example.com
      Suppression: on
      Console:    on
      Max Target Log Size: 5242880
      Max Filter Count: 50
      Max Filter Rule Count: 128
      Max Destination Count: 20
      Max Notification Count: 20
      Filter Exempt from Suppression: no_info_debug_events
      Duplicate Suppression Duration (secs): 120
      Log Rotation Size (bytes): 40MB
```

event destination commands

(DEPRECATED)-Manage route destinations, for example e-mail or snmp

event destination create

(DEPRECATED)-Create an event destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The `event destination create` command creates a new event destination. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP trap hosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

When you create a destination, you can add e-mail addresses, SNMP trap hosts, and syslog hosts to the definition of the destination. Once the destination is fully defined, use the `event route add-destinations` command to associate the destination with event routes so that notifications of those events are sent to the recipients in the destination.

To see the current list of all destinations and their recipients, use the `event destination show` command.

There are several default destinations provided for your use.

- `allevents` - A useful destination for all system events, though no events are routed to this destination by default.
- `asup` - Events routed to this destination trigger AutoSupport(tm). Only use this destination to send notifications to technical support. See `system node autosupport` for more information.
- `criticals` - A useful destination for critical events though no events are routed to this destination by default.
- `pager` - A useful destination for all events that are urgent enough to page a system administrator, though no events are routed to this destination by default.
- `traphost` - The default destination for all SNMP traps. You can also use the `system snmp traphost add` command to add SNMP recipients to the traphost default destination.

To add recipients to the default destinations, use the `event destination modify` command.

You should not create a destination that sends events to more than one type of recipient. Use separate destinations for e-mail, SNMP, and syslog activity. Also, use the traphost default destination for all SNMP activity. You must not create any other destination that sends traps to SNMP trap hosts. The traphost default destination is not required to be added to any event route.

Parameters

-name <text> - Name

This mandatory parameter specifies name of the event destination to create.

[-mail <mail address>, ...] - Mail Destination

Use this parameter to specify one or more e-mail addresses to which event notifications will be sent. For events to properly generate e-mail notifications, the event system must also be configured with an address and mail server from which to send mail. See `event config modify` for more information.

[-snmp <Remote IP>, ...] - SNMP Destination

To send traps to SNMP trap hosts, use this parameter with the host names or IP addresses of those trap hosts.

[-syslog <Remote IP>, ...] - Syslog Destination

Use this parameter with the host names or IP addresses of any remote syslog daemons to which syslog entries will be sent.

[-syslog-facility <Syslog Facility>] - Syslog Facility

This parameter optionally specifies a syslog facility with which the syslog is sent. Possible values for this parameter are default, local0, local1, local2, local3, local4, local5, local6, and local7. If you specify the default syslog facility, syslogs are tagged LOG_KERN or LOG_USER.

[-snmp-community <text>] - SNMP Trap Community

To specify an SNMP trap community, use this parameter with that string.

[-hide-parameters {true/false}] - Hide Parameter Values?

Use this parameter with the value "true" to hide event parameters by removing them from event notifications. This is useful to prevent sensitive information from being sent over non-secure channels.

Examples

The following example creates an event destination named support.email that e-mails events to the addresses supportmgr@example.com, techsupport@example.com, and oncall@example.com.

```
cluster1::> event destination create -name support.email -mail
supportmgr@example.com,techsupport@example.com,oncall@example.com
```

This example creates an event destination named support.bucket01 that sends the notifications to a syslog host.

```
cluster1::> event destination create -name support.bucket01 -syslog
loghost.example.com
```

event destination delete

(DEPRECATED)-Delete an event destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The `event destination delete` command removes a specified destination from the list of valid destinations. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP trap hosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

Once you delete a destination, you will not be able to add that destination to any event route.

You will not be able to delete a destination if it is in use by any event routes. To remove a destination from all event routes, so that you can delete it, use the [event route remove-destinations - messagename * -destination name](#) command.

There are several default destinations that cannot be deleted:

- `allevents` - A useful destination for all system events, though no events are routed to this destination by default.
- `asup` - Events routed to this destination trigger AutoSupport(tm). Only use this destination to send notifications to technical support. See [system node autosupport](#) for more information.
- `criticals` - A useful destination for critical events though no events are routed to this destination by default.
- `pager` - A useful destination for all events that are urgent enough to page a system administrator, though no events are routed to this destination by default.
- `traphost` - The default destination for all SNMP traps. You can also use the [system snmp traphost delete](#) command to delete SNMP recipients from the traphost default destination.

To see the current list of all destinations, use the [event destination show](#) command. To add a new destination to the list, use the [event destination create](#) command.

Parameters

-name <text> - Name

This mandatory parameter specifies the event destination to delete.

Examples

The following example deletes an event destination named manager.pager:

```
cluster1::> event destination delete -name manager.pager
```

Related references

[event route remove-destinations](#) on page 176

[event destination show](#) on page 142

[event destination create](#) on page 137

event destination modify

(DEPRECATED)-Modify an event destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The `event destination modify` command changes the definition of an existing event destination. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP traphosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

Modifying a parameter writes over the existing value of the parameter. To extend a parameter, make sure to include the current value of that parameter. For instance, to add an e-mail address to a destination, include all of the current e-mail addresses assigned to that destination along with the new address. To see the current definition of a destination, use the `event destination show -name name` command.

You must not create a destination that sends events to more than one type of recipient. Use separate destinations for e-mail, SNMP, and syslog activity. Also, use the traphost default destination for all SNMP activity. You should not create any other destination that sends to SNMP traphosts. The traphost default destination is not required to be added to any event route.

Parameters

-name <text> - Name

This mandatory parameter specifies name of the event destination to modify.

[-mail <mail address>, ...] - Mail Destination

Use this parameter to specify one or more e-mail addresses to which event notifications will be sent. For events to properly generate e-mail notifications, the event system must also be configured with an address and mail server from which to send mail. See `event config modify` for more information.

[-snmp <Remote IP>, ...] - SNMP Destination

To send traps to SNMP trap hosts, use this parameter with the host names or IP addresses of those trap hosts.

[-syslog <Remote IP>, ...] - Syslog Destination

Use this parameter with the host names or IP addresses of any remote syslog daemons to which syslog entries will be sent.

[-syslog-facility <Syslog Facility>] - Syslog Facility

This parameter optionally specifies a syslog facility with which the syslog is sent. Possible values for this parameter are default, local0, local1, local2, local3, local4, local5, local6, and local7. If you specify the default syslog facility, syslogs are tagged LOG_KERN or LOG_USER.

[-snmp-community <text>] - SNMP Trap Community

To specify an SNMP trap community, use this parameter with that string.

[-hide-parameters { true/false }] - Hide Parameter Values?

Enter this parameter with the value "true" to hide event parameters by removing them from event notifications. This is useful to prevent sensitive information from being sent over non-secure channels. Enter it with the value "false" to turn off parameter hiding.

Examples

The following example modifies an event destination named snmp.hosts to send events to SNMP trap hosts named traphost1 and traphost2:

```
cluster1::> event destination modify -name snmp.hosts -snmp
traphost1.example.com, traphost2.example.com
```

This example adds the e-mail address of a remote support facility to an existing list of e-mail recipients.

```
cluster1::> event destination show -name support

Name: support
Mail Destination: support.hq@company.com
SNMP Destination: -
Syslog Destination: -
```

```

        Syslog Facility: -
        SNMP Trap Community: -
        Hide Parameter Values?: -

cluster1::> event destination modify -name support -mail
support.hq@company.com,support.remote@company.com

cluster1::> event destination show -name support

        Name: support
        Mail Destination: support.hq@company.com, support.remote@company.com
        SNMP Destination: -
        Syslog Destination: -
        Syslog Facility: -
        SNMP Trap Community: -
        Hide Parameter Values?: -

```

[event config modify](#) on page 135

[event destination show](#) on page 142

event destination show

(DEPRECATED)-Display event destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification destination" command set.

The `event destination show` command displays information about configured event destinations. An event destination is a list of addresses that receive event notifications. These addresses can be e-mail addresses, SNMP trap hosts, and syslog servers. Event destinations are used by event routes. Event routes describe which events generate notifications, and event destinations describe where to send those notifications.

Default destinations:

- `allevents` - A useful destination for all system events, though no events are routed to this destination by default.
- `asup` - Events routed to this destination trigger AutoSupport(tm). Only use this destination to send notifications to technical support. See [system node autosupport](#) for more information.
- `criticals` - A useful destination for critical events although no events are routed to this destination by default.
- `pager` - A useful destination for all events that are urgent enough to page a system administrator, though no events are routed to this destination by default.
- `traphost` - The default destination for all SNMP traps. You can also use the [system snmp traphost show](#) command to view SNMP recipients for the traphost default destination.

To add recipients to the default destination, use the [event destination modify](#) command.

Note: While you can use both host names and IP addresses with parameters, only IP addresses are stored. Unless all DNS and reverse-DNS operations complete successfully, IP addresses might appear in command output.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-facility]

Displays only the syslog destinations and syslog facilities.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-name <text>] - Name

Selects the destinations that match this parameter value.

[-mail <mail address>, ...] - Mail Destination

Selects the destinations that match this parameter value.

[-snmp <Remote IP>, ...] - SNMP Destination

Selects the destinations that match this parameter value (SNMP trap hosts).

[-syslog <Remote IP>, ...] - Syslog Destination

Selects the destinations that match this parameter value (syslog event notification daemons).

[-syslog-facility <Syslog Facility>] - Syslog Facility

Selects the destinations that match this parameter value. Valid values are: **default**, **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

[-snmp-community <text>] - SNMP Trap Community

Selects the destinations that match this parameter value.

[-hide-parameters { true/false}] - Hide Parameter Values?

Selects the destinations that match this parameter value (**true** selects destinations that do not receive full event parameters, **false** selects destinations that receive full event parameters). Event parameters may be hidden to prevent sensitive information from being sent over non-secure channels.

Examples

The following example displays information about all event destinations:

```
cluster1::> event destination show
```

Name Params	Mail Dest.	SNMP Dest.	Syslog Dest.	Hide
-----	-----	-----	-----	
allevents	-	-	logger.example.com	-
asup	-	-	-	-
criticals	oncall	-	-	-
	@example.com			
pager	pager@example.com	-	-	-
support.email	supportmgr	-	-	-
	@example.com,			
	techsupport			
	@example.com,			
	oncall			
	@example.com	-	-	-

```
traphost      -          th0.example.com,  -          -
                th1.example.com

6 entries were displayed.
```

event filter commands

Create, delete and view event filters.

event filter copy

Copy an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter copy` command copies an existing filter to a new filter. The new filter will be created with rules from the source filter. For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to copy.

-new-filter-name <text> - New Event Filter Name

Use this mandatory parameter to specify the name of the new event filter to create and copy the rules.

Examples

The following example copies an existing event filter named `emer-wafl-events` to a new filter named `filter1`:

```
cluster1::> event filter show
```

Filter Name	Rule	Rule	Message Name	SNMP Trap Type
Severity	Position	Type		
default-trap-events	1	include	*	*
EMERGENCY, ALERT	2	include	*	Standard, Built-in
	3	exclude	*	*
emer-wafl-events	1	include	wafl.*	*
EMERGENCY	2	exclude	*	*
important-events	1	include	*	*
EMERGENCY, ALERT	2	include	callhome.*	ERROR
	3	exclude	*	*
no-info-debug-events				

```

1      include *
EMERGENCY, ALERT, ERROR, NOTICE
2      exclude *
10 entries were displayed.

cluster1::> event filter copy -filter-name emer-wafl-events -new-filter-name
filter1

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
1      include *
EMERGENCY, ALERT
2      include *
Standard, Built-in
3      exclude *
emer-wafl-events
1      include wafl.*
EMERGENCY
2      exclude *
filter1
1      include wafl.*
EMERGENCY
2      exclude *
important-events
1      include *

2      include callhome.*
3      exclude *
no-info-debug-events
1      include *
EMERGENCY, ALERT, ERROR, NOTICE
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
no-info-debug-events
2      exclude *
12 entries were displayed.

```

Related references

[event filter create](#) on page 145

event filter create

Create a new event filter.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter create` command creates a new event filter. An event filter is used to select the events of interest and is made up of one or more rules, each of which contains the following three fields:

- ◦ name - event (message) name.
- severity - event severity.
- snmp-trap-type - event SNMP trap type.

These fields are evaluated for a match using a logical "AND" operation: name AND severity AND SNMP trap type. Within a field, the specified values are evaluated with an implicit logical

"OR" operation. So, if **-snmp-trap-type** *Standard*, *Built-in* is specified, then the event must match *Standard* OR *Built-in*. The wildcard matches all values for the field.

- **Type** - include or exclude. When an event matches an include rule, it will be included into the filter, whereas it will be excluded from the filter if it matches an exclude rule.

Rules are checked in the order they are listed for a filter, until a match is found. There is an implicit rule at the end that matches every event to be excluded. For more information, see the [event filter rule](#) command.

There are three system-defined event filters provided for your use:

- **default-trap-events** - This filter matches all ALERT and EMERGENCY events. It also matches all Standard, Built-in SNMP trap type events.
- **important-events** - This filter matches all ALERT and EMERGENCY events.
- **no-info-debug-events** - This filter matches all non-INFO and non-DEBUG messages (EMERGENCY, ALERT, ERROR and NOTICE).

The system-defined event filters cannot be modified or deleted.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to create. An event filter name is 2 to 64 characters long. Valid characters are the following ASCII characters: A-Z, a-z, 0-9, "_", and "-". The name must start and end with: A-Z, a-z, "_", or 0-9.

Examples

The following example creates an event filter named filter1:

```
cluster1::> event filter create -filter-name filter1

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
1             include   *              *
EMERGENCY, ALERT
2             include   *              Standard, Built-in
3             exclude  *              *
filter1
1             exclude  *              *
important-events
1             include  *              *
EMERGENCY, ALERT
2             include  callhome.*     *              ERROR
3             exclude  *              *

event filter delete

Delete existing event filters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter delete` command deletes an existing event filter, along with all its rules.

The system-defined event filters cannot be deleted.

For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to delete.

Examples

The following example deletes an event filter named `filter1`:

```
cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
Position Type
-----
default-trap-events
1          include *          *
EMERGENCY, ALERT
2          include *          Standard, Built-in
3          exclude *          *
filter1
1          include waf1.*      *
EMERGENCY
2          exclude *          *
important-events
1          include *          *
EMERGENCY, ALERT
2          include callhome.*    *
3          exclude *          ERROR
no-info-debug-events
1          include *          *
EMERGENCY, ALERT, ERROR, NOTICE
2          exclude *          *
10 entries were displayed.

cluster1::> event filter delete -filter-name filter1

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
Position Type
-----
default-trap-events
1          include *          *
EMERGENCY, ALERT
2          include *          Standard, Built-in
3          exclude *          *
important-events
1          include *          *
EMERGENCY, ALERT
2          include callhome.*    *
3          exclude *          ERROR
no-info-debug-events
```

```

1      include *
EMERGENCY, ALERT, ERROR, NOTICE
2      exclude *
8 entries were displayed.

```

event filter rename

Rename an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rename` command is used to rename an existing event filter.

There are system-defined event filters provided for your use. The system-defined event filters cannot be modified or deleted.

For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to rename.

-new-filter-name <text> - New Event Filter Name

Use this mandatory parameter to specify the new name the event filter should be renamed to.

Examples

The following example renames an existing filter named `filter1` as `emer-wafl-events`:

```

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
-----
default-trap-events
1      include *
EMERGENCY, ALERT
2      include *
3      exclude *
filter1
1      include wafl.*
EMERGENCY
2      exclude *
important-events
1      include *
EMERGENCY, ALERT
2      include callhome.*
3      exclude *
no-info-debug-events
1      include *
EMERGENCY, ALERT, ERROR, NOTICE
2      exclude *
10 entries were displayed.
cluster1::> event filter rename -filter-name filter1 -new-filter-name emer-
wafl-events

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
-----

```

Position Type				

default-trap-events				
1	include	*	*	
EMERGENCY, ALERT				
2	include	*	Standard, Built-in	
			*	*
3	exclude	*	*	*
emer-wafl-events				
1	include	wafl.*	*	
EMERGENCY			*	
2	exclude	*	*	*
important-events				
1	include	*	*	
EMERGENCY, ALERT				
2	include	callhome.*	*	ERROR
3	exclude	*	*	*
no-info-debug-events				
1	include	*	*	
EMERGENCY, ALERT, ERROR, NOTICE				
2	exclude	*	*	*
10 entries were displayed.

[event filter create](#) on page 145

event filter show

Display the list of existing event filters.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter show` command displays all the event filters which are configured. An event filter is used to select the events of interest and is made up of one or more rules, each of which contains the following three fields:

- ◦ name - event (message) name.
- severity - event severity.
- snmp-trap-type - event SNMP trap type.

These fields are evaluated for a match using a logical "AND" operation: name AND severity AND SNMP trap type. Within a field, the specified values are evaluated with an implicit logical "OR" operation. So, if `-snmp-trap-type Standard, Built-in` is specified, then the event must match *Standard* OR *Built-in*. The wildcard matches all values for the field.

- Type - include or exclude. When an event matches an include rule, it will be included into the filter, whereas it will be excluded from the filter if it matches an exclude rule.

Rules are checked in the order they are listed for a filter, until a match is found. There is an implicit rule at the end that matches every event to be excluded. For more information, see [event filter rule](#) command.

There are three system-defined event filters provided for your use:

- default-trap-events - This filter matches all ALERT and EMERGENCY events. It also matches all Standard, Built-in SNMP trap type events.
- important-events - This filter matches all ALERT and EMERGENCY events.
- no-info-debug-events - This filter matches all non-INFO and non-DEBUG messages (EMERGENCY, ALERT, ERROR and NOTICE).

The system-defined event filters cannot be modified or deleted.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-filter-name <text>] - Filter Name

Selects the event filters that match this parameter value.

[-position <integer>] - Rule Position

Selects the event filters that match this parameter value.

[-type {include/exclude}] - Rule Type

Selects the event filters that match this parameter value. The rule types are as follows:

- include - Events matching this rule are included in the specified filter.
- exclude - Events matching this rule are excluded in the specified filter.

[-message-name <text>] - Message Name

Selects the event filters that match this parameter value.

[-severity <text>, ...] - Severity

Selects the events that match this parameter value. Severity levels:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.
- * - Includes all severities.

[-snmp-trap-type <text>, ...] - SNMP Trap Type

Selects the event filters that match this parameter value. The SNMP trap types are as follows:

- Standard - Traps defined in RFCs.
- Built-in - Enterprise traps specific to events.
- Severity-based - Traps specific to events that do not belong to the above two types.
- * - Includes all SNMP trap types.

Examples

The following example displays the event filters:

```

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
      1      include *
EMERGENCY, ALERT
      2      include *
Standard, Built-in
      3      exclude *
*
important-events
      1      include *
EMERGENCY, ALERT
      2      exclude *
*
no-info-debug-events
      1      include *
EMERGENCY, ALERT, ERROR, NOTICE
      2      exclude *
*
7 entries were displayed.

```

The following example displays the event filters queried on the SNMP trap type value "Standard":

```

cluster1::> event filter show -snmp-trap-type Standard
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
      2      include *
Standard, Built-in
*

```

The following example displays the event filters with one or more rules that have no condition on the SNMP trap type. Note that the wildcard character has to be specified in double-quotes. Without double-quotes, output would be the same as not querying on the field.

```

cluster1::> event filter show -snmp-trap-type "*"
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
      1      include *
*
EMERGENCY, ALERT
      3      exclude *
*
important-events
      1      include *
EMERGENCY, ALERT
      2      exclude *
*
no-info-debug-events
      1      include *
EMERGENCY, ALERT, ERROR, NOTICE
      2      exclude *
*
6 entries were displayed.

```

event filter test

Test an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter test` command is used to test an event filter. When specified with a message name, the command displays whether the message name is included or excluded from the filter. When specified without a message name, the command displays the number of events from the catalog that match the filter. For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to test.

[-message-name <Message Name>] - Message Name

Use this optional parameter to specify the message name of the event to test against the filter.

Examples

The following example tests an event filter named `err-wafl-no-scan-but-clone`:

```
cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
1            include   *                *
EMERGENCY, ALERT
2            include   *                Standard, Built-in
3            exclude  *                *
err-wafl-no-scan-but-clone
1            include  wafl.scan.clone.* *                *
2            exclude  wafl.scan.*      *                *
3            include  wafl.*           *
EMERGENCY, ALERT, ERROR
4            exclude  *                *
important-events
1            include  *                *
EMERGENCY, ALERT
2            include  callhome.*       *                ERROR
3            exclude  *                *
no-info-debug-events
1            include  *                *
EMERGENCY, ALERT, ERROR, NOTICE

Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
no-info-debug-events
2            exclude  *                *
12 entries were displayed.

cluster1::> event filter test -filter-name err-wafl-no-scan-but-clone
271 events will be included in the given filter.

cluster1::> event filter test -filter-name err-wafl-no-scan-but-clone -
message-name wafl.scan.clone.split.cantLock
The message-name "wafl.scan.clone.split.cantLock" is included in the given
filter.
```

```
cluster1::> event filter test -filter-name err-wafl-no-scan-but-clone -
message-name wafl.scan.layout.cantWrite
The message-name "wafl.scan.layout.cantWrite" is excluded from the given
filter.
```

event filter rule commands

Create and delete rules for a filter.

event filter rule add

Add a rule for an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rule add` command adds a new rule to an existing event filter. See [event filter create](#) for more information on event filters and how to create a new event filter.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to add the rule. Rules cannot be added to system-defined event filters.

[-position <integer>] - Rule Position

Use this optional parameter to specify the position of the rule in the event filter. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule. Rules are checked in the order they are listed for a filter, until a match is found.

-type {include/exclude} - Rule Type

Use this mandatory parameter to specify the type of the rule which determines whether to include or exclude the events that match this rule.

[-message-name <text>] - Message Name

Use this parameter to specify the message name of the event to include or exclude from the filter.

[-severity <text>, ...] - Severity

Use this parameter to specify the list of severity values to match against the events. Enter multiple severities separated by a comma. To enter all severities, the wild card (*) can be used. The wild card cannot be specified with other severities. The default value is *.

[-snmp-trap-type <text>, ...] - SNMP Trap Type

Use this parameter to specify the list of the SNMP trap type values to match against the events. Enter multiple SNMP trap types separated by comma. To enter all SNMP trap types, the wild card (*) can be used. The wild card cannot be specified with other SNMP trap types. The default value is *.

Examples

The following example adds a rule to an existing event filter "emer-and-wafl": All events with severity EMERGENCY and message name starting with "wafl.*" are included in the filter. Not specifying the SNMP trap type implies a default value of "*".

```
cluster1::> event filter rule add -filter-name emer-and-wafl -type include -
message-name wafl.* -severity EMERGENCY
cluster1::> event filter show
```

Filter Name	Rule	Rule	Message Name	SNMP Trap Type
Severity	Position	Type		

default-trap-events				
	1	include	*	*
EMERGENCY, ALERT	2	include	*	Standard, Built-in
	3	exclude	*	*
emer-and-wafl	1	include	wafl.*	*
EMERGENCY	2	exclude	*	*
important-events	1	include	*	*
EMERGENCY, ALERT	2	include	callhome.*	ERROR
	3	exclude	*	*
no-info-debug-events	1	include	*	*
EMERGENCY, ALERT, ERROR, NOTICE	2	exclude	*	*
10 entries were displayed.				

The following example adds a rule to the event filter "emer-and-wafl" at position 1: All events with severity ALERT and message name starting with "wafl.scan.*" are included in the filter.

```
cluster1::> event filter rule add -filter-name emer-and-wafl -type include -
message-name wafl.scan.* -position 1 -severity ALERT
cluster1::> event filter show
```

Filter Name	Rule	Rule	Message Name	SNMP Trap Type
Severity	Position	Type		

default-trap-events				
	1	include	*	*
EMERGENCY, ALERT	2	include	*	Standard, Built-in
	3	exclude	*	*
emer-and-wafl	1	include	wafl.scan.*	ALERT
	2	include	wafl.*	*
EMERGENCY	3	exclude	*	*
important-events	1	include	*	*
EMERGENCY, ALERT	2	include	callhome.*	ERROR
	3	exclude	*	*
no-info-debug-events	1	include	*	*
EMERGENCY, ALERT, ERROR, NOTICE	2	exclude	*	*
11 entries were displayed.				

The following example adds a rule to the event filter "emer-and-wafl" to include all "Standard" SNMP trap type events:

```

cluster1::> event filter rule add -filter-name emer-and-wafl -type include -
snmp-trap-type Standard

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
      1      include *
EMERGENCY, ALERT
      2      include *
Standard, Built-in
      3      exclude *
*
emer-and-wafl
      1      include wafl.scan.*
*
ALERT
      2      include wafl.*
*
EMERGENCY
      3      include *
Standard
*
      4      exclude *
*
important-events
      1      include *
*
EMERGENCY, ALERT
      2      include callhome.*
*
ERROR
      3      exclude *
*
no-info-debug-events
      1      include *
*
EMERGENCY, ALERT, ERROR, NOTICE
      2      exclude *
*
12 entries were displayed.

```

[event filter create](#) on page 145

event filter rule delete

Delete a rule for an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rule delete` command deletes a rule from an event filter. The position of all the rules following the deleted rule is updated to maintain a contiguous sequence. Use [event filter show](#) command to view the filters and the rules associated with them.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter from which you want to delete the rule. Rules cannot be deleted from system-defined filters.

-position <integer> - Rule Position

Use this mandatory parameter to specify the position of the rule to delete from the filter. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

Examples

The following example deletes a rule at position 2 from an existing event filter "emer-and-wafl":

```

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
      1      include *
EMERGENCY, ALERT
      2      include *
Standard, Built-in
      3      exclude *
*
emer-and-wafl
      1      include wafl.scan.*
*
      2      include wafl.*
*
EMERGENCY
      3      include *
Standard
      4      exclude *
*
important-events
      1      include *
*
EMERGENCY, ALERT
      2      include callhome.*
*
      3      exclude *
*
no-info-debug-events
      1      include *
*
EMERGENCY, ALERT, ERROR, NOTICE
      2      exclude *
*
12 entries were displayed.
cluster1::> event filter rule delete -filter-name emer-and-wafl -position 2

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity      Position Type
-----
default-trap-events
      1      include *
*
EMERGENCY, ALERT
      2      include *
Standard, Built-in
      3      exclude *
*
emer-and-wafl
      1      include wafl.scan.*
*
      2      include *
Standard
      3      exclude *
*
important-events
      1      include *
*
EMERGENCY, ALERT
      2      include callhome.*
*
      3      exclude *
*
no-info-debug-events
      1      include *
*
EMERGENCY, ALERT, ERROR, NOTICE
      2      exclude *
*
11 entries were displayed.

```

[event filter show](#) on page 149

event filter rule reorder

Modify the index of a rule for an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The event filter rule reorder command moves a rule to a new position in an existing event filter. Use `event filter show` command to display all the event filters and the rules associated with them.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter from which you want to change the position of the rule. Rules from system-defined event filters cannot be modified.

-position <integer> - Rule Position

Use this mandatory parameter to specify the position of the rule you want to change. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

-to-position <integer> - New Rule Position

Use this mandatory parameter to specify the new position to move the rule. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

Examples

The following example changes the position of a rule from 1 to 2 from an existing event filter "emer-and-wafl":

```
cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
Position Type
-----
default-trap-events
1      include *
EMERGENCY, ALERT
2      include *
Standard, Built-in
3      exclude *
*
emer-and-wafl
1      include wafl.scan.*
*
2      include *
Standard
3      exclude *
*
important-events
1      include *
*
EMERGENCY, ALERT
2      include callhome.*
*
3      exclude *
*
no-info-debug-events
1      include *
*
EMERGENCY, ALERT, ERROR, NOTICE
2      exclude *
*
11 entries were displayed.

cluster1::> event filter rule reorder -filter-name emer-and-wafl -position 1
-to-position 2

cluster1::> event filter show
Filter Name Rule      Rule      Message Name      SNMP Trap Type
Severity
Position Type
-----
default-trap-events
1      include *
*
EMERGENCY, ALERT
2      include *
Standard, Built-in
3      exclude *
*
emer-and-wafl
```

	1	include	*	Standard	*
	2	include	wafl.scan.*	*	ALERT
	3	exclude	*	*	*
important-events					
	1	include	*	*	
EMERGENCY, ALERT					
	2	include	callhome.*	*	ERROR
	3	exclude	*	*	*
no-info-debug-events					
	1	include	*	*	
EMERGENCY, ALERT, ERROR, NOTICE					
	2	exclude	*	*	*
11 entries were displayed.

[event filter show](#) on page 149

event log commands

Display the list of event occurrences

event log show

Display latest log events

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event log show` command displays the contents of the event log, which lists significant occurrences within the cluster. Use the [event catalog show](#) command to display information about events that can occur.

By default, the command displays EMERGENCY, ALERT and ERROR severity level events with the following information, with the most recent events listed first:

- The time at which the event occurred
- The node on which the event occurred
- The severity of the event
- The event's message

To display detailed information about events, use one or more of the optional parameters that affect how the command output is displayed and the amount of detail that is included. For example, to display all detailed event information, use the `-detail` parameter.

To display NOTICE, INFORMATIONAL or DEBUG severity level events, use the `-severity` parameter.

Parameters

{ `[-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-detail]`

Displays additional event information such the sequence number of the event.

[`-detailtime`]

Displays detailed event information in reverse chronological order.

[`-instance`]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>/local`}] - Node

Displays a list of events for the node you specify. Use this parameter with the `-seqnum` parameter to display detailed information.

[`-seqnum <Sequence Number>`] - Sequence#

Selects the events that match this parameter value. Use with the `-node` parameter to display detailed information.

[`-time <MM/DD/YYYY HH:MM:SS>`] - Time

Selects the events that match this parameter value. Use the format: MM/DD/YYYY HH:MM:SS [+ HH:MM]. You can specify a time range by using the `".."` operator between two time statements.

```
show -time "08/13/2010 05:55:00".. "08/13/2010 06:10:00"
```

Comparative time values are relative to "now". For example, to display only events that occurred within the last minute:

```
show -time >1m
```

Note: The month and date fields of this parameter are not zero-padded. These fields can be single digits: for example, "7/1/2019 05:55:00".

[`-severity {EMERGENCY/ALERT/ERROR/NOTICE/INFORMATIONAL/DEBUG}`] - Severity

Selects the events that match this parameter value. Severity levels are as follows:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.

To display all events, including ones with severity levels of NOTICE, INFORMATIONAL and DEBUG, specify severity as follows:

```
show -severity <=DEBUG
```

[`-ems-severity {NODE_FAULT/SVC_FAULT/NODE_ERROR/SVC_ERROR/WARNING/NOTICE/INFO/DEBUG/VAR}`] - EMS Severity (privilege: advanced)

Selects the events that match this parameter value. Severity levels:

- NODE_FAULT - Data corruption has been detected or the node is unable to provide client service
- SVC_FAULT - A temporary loss of service, typically a transient software fault, has been detected

- **NODE_ERROR** - A hardware error that is not immediately fatal has been detected
- **SVC_ERROR** - A software error that is not immediately fatal has been detected
- **WARNING** - A high-priority message that does not indicate a fault
- **NOTICE** - A normal-priority message that does not indicate a fault
- **INFO** - A low-priority message that does not indicate a fault
- **DEBUG** - A debugging message
- **VAR** - A message with variable severity, selected at runtime.

`[-source <text>] - Source`

Selects the events that match this parameter value (typically a software module).

`[-message-name <Message Name>] - Message Name`

Selects the events that match this parameter value (string). Message names are descriptive, so filtering output by message name displays messages of a specific type.

`[-event <text>] - Event`

Selects the events that match this parameter value. The "event" field contains the full text of the event, including any parameters. For example, a `wafl.vol.offline` event will contain the name of the volume taken offline.

`[-kernel-generation-num <integer>] - Kernel Generation Number (privilege: advanced)`

Selects the events that match this parameter value. Only events that emanate from the kernel have kernel generation numbers.

`[-kernel-sequence-num <integer>] - Kernel Sequence Number (privilege: advanced)`

Selects the events that match this parameter value. Only events that emanate from the kernel have kernel sequence numbers.

`[-action <text>] - Corrective Action`

Selects the events that match this parameter value. The "action" field describes what steps, if any, you must take to remedy the situation.

`[-description <text>] - Description`

Selects the events that match this parameter value. The "description" field describes why the event was encountered and what it means.

`[-filter-name <text>] - Filter Name`

Selects the events that match this parameter value. Only events that were included by existing filters that match this value are displayed.

Examples

Selects the events that match this parameter value. Use the format: `MM/DD/YYYY HH:MM:SS` [`+- HH:MM`]. You can specify a time range by using the `".."` operator between two time statements.

```
show -time "08/13/2010 05:55:00".."08/13/2010 06:10:00"
```

Comparative time values are relative to "now". For example, to display only events that occurred within the last minute:

```
show -time >1m
```

Selects the events that match this parameter value. Severity levels are as follows:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.

To display all events, including ones with severity levels of NOTICE, INFORMATIONAL and DEBUG, specify severity as follows:

```
show -severity <=DEBUG
```

The following example displays the event log:

```
cluster1::> event log show
Time                Node                Severity      Event
-----
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link up
event was received on node node1, port e0a.
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link up
event was received on node node1, port e0d.
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link up
event was received on node node1, port e0c.
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link up
event was received on node node1, port e0b.
...
```

This example demonstrates how to use a range with the **-time** parameter to display all events that occurred during an extended time period. It displays all events that occurred between 1:45pm and 1:50pm on November 9, 2010.

```
cluster1::> event log show -time "11/9/2015 13:45:00".. "11/9/2015 13:50:0"
```

The **-time** parameter also accepts values that are relative to "now". The following example displays events that occurred more than one hour ago:

```
cluster1::event log> show -time <1h
Time                Node                Severity      Event
-----
11/9/2015 13:02:03  node1                INFORMATIONAL monitor.globalStatus.ok:
The system's global status is normal.
11/9/2015 13:02:03  node2                INFORMATIONAL monitor.globalStatus.ok:
The system's global status is normal.
...
```

Severity levels sort in the order opposite to what you might expect. The following example displays all events that have a severity level of ERROR or more severe:

```
cluster1::> event log show -severity <ERROR
```

event mailhistory commands

(DEPRECATED)-Display the list of e-mailed events

event mailhistory delete

(DEPRECATED)-Delete an e-mail history record

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future major release of Data ONTAP. Instead, use the "event notification history" command set.

The `event mailhistory delete` command deletes a record from the e-mail history.

To delete a record, you must know which node contains the record, and the record's sequence number. Use the `event mailhistory show` command to view this information.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the name of the node that contains the e-mail history record to delete.

-seqnum <Sequence Number> - Sequence Number

Use this parameter to specify the sequence number of the e-mail history record to delete.

Examples

The following example deletes all mail-history records on node1:

```
cluster1::> event mailhistory delete -node node1 -seqnum *
```

Related references

[event mailhistory show](#) on page 162

event mailhistory show

(DEPRECATED)-Display a list of e-mail history records

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification history" command set.

The `event mailhistory show` command displays a list of the event notifications that have been e-mailed. The command output depends on the parameters you specify with the command. By default, the command displays basic information about all notification e-mails that were sent.

To display detailed information about a specific mail-history record, run the command with the **-seqnum** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the mail-history records that match this parameter value.

[-seqnum <Sequence Number>] - Sequence Number

Selects the mail-history records that match this parameter value.

[-message-name <Message Name>] - Message Name

Selects the mail-history records that match this parameter value.

[-address <mail address>, ...] - Mail Address

Selects the mail-history records that match this parameter value.

[-time <MM/DD/YYYY HH:MM:SS>] - Transmission Time

Selects the mail-history records that match this parameter value.

[-message <text>] - Alert Message

Selects the mail-history records that match this parameter value (text pattern).

[-previous-time <MM/DD/YYYY HH:MM:SS>] - Previous Transmission Time

Selects the mail-history records that match this parameter value.

[-num-drops-since-previous <integer>] - Number of Drops Since Previous

Transmission

Selects the mail-history records that match this parameter value (number of event drops since last transmission).

Examples

The following example displays detailed information about the mail-history record with the sequence number 20520:

```
cluster1::> event mailhistory show -seqnum 20520
Sequence Number: 20520
Message Name:    waf1.vol.full
Address:         admin@example.com
Time:           10/1/2008 14:06:24
Node:           node3
Previous Time:   5/31/2007 00:33:22
# Drops Since Prev: 0
Mail Message:    waf1.vol.full: file system on volume
                  vol0@vserver:28558fe3-2462-11da-85ab
                  -000423bacd20 is full
```

event notification commands

Create, modify, delete and view event notifications.

event notification create

Create an event notification

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification create` command is used to create a new notification of a set of events defined by an event filter to one or more notification destinations.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter. Events that are included in the event filter are forwarded to the destinations specified in the destinations parameter.

The filter name passed to this command must be an existing filter. For more information, see the [event filter create](#) command.

-destinations <text>, ... - List of Event Notification Destinations

Use this mandatory parameter to specify the list of destinations to which the notification should be forwarded. Enter multiple destinations separated by a comma.

The destination passed to this command must be an existing destination. For more information, see the [event destination create](#) command.

Examples

The following example creates an event notification for filter name "filter1" to destinations "email_dest, snmp-traphost and syslog_dest":

```
cluster1::> event notification destination show
```

Name	Type	Hide Params	Destination
email_dest	email	false	test@example.com
snmp-traphost	snmp	true	10.27.12.1 (from "system snmp traphost")
syslog_dest	syslog	false	10.23.12.1

3 entries were displayed.

```
cluster1::> event filter show -filter-name filter1
```

Filter Name	Rule	Rule	Message Name	SNMP Trap	Type
filter1	1	exclude	callhome.bad.ram	*	*
	2	include	callhome.*	*	ALERT,
	3	exclude	*	*	*

3 entries were displayed.

```
cluster1::> event notification create -filter-name filter1 -destinations
email_dest,syslog_dest,snmp-traphost
```

```
cluster1::> event notification show
```

ID	Filter Name	Destinations
1	filter1	email_dest, syslog_dest, snmp-traphost

[event destination create](#) on page 137

event notification delete

Delete event notifications

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification delete` command deletes an existing event notification.

Parameters

-ID <integer> - Event Notification ID

Use this parameter to specify the ID of the notification to be deleted.

Examples

The following example shows the deletion of event notification with ID 1:

```
cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1              email_dest, syslog_dest, snmp-traphost

cluster1::> event notification delete -ID 1

cluster1::> event notification show
This table is currently empty.
```

event notification modify

Modify event notifications

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification modify` command is used to modify an existing notification.

Parameters

-ID <integer> - Event Notification ID

Use this mandatory parameter to specify the ID of the notification to be modified.

[-filter-name <text>] - Event Filter Name

Use this parameter to specify the filter name to be modified.

[-destinations <text>, ...] - List of Event Notification Destinations

Use this parameter to specify the destinations to be modified. Enter multiple destinations separated by a comma.

Provide the complete set of destinations to be modified. Individual destination cannot be added or removed.

Examples

The following example shows the modification of event notification with ID 1:

```

cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1          email_dest, syslog_dest, snmp-traphost

cluster1::> event notification modify -ID 1 -destinations email_dest,
syslog_dest

cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1          email_dest, syslog_dest

```

event notification show

Display event notifications

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification show` command is used to display the list of existing event notifications.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-ID <integer>] - Event Notification ID

Use this parameter to display the detailed information about the notification ID you specify.

[-filter-name <text>] - Event Filter Name

Use this parameter to display event notifications that use the filter-name you specify.

[-destinations <text>, ...] - List of Event Notification Destinations

Use this parameter to display event notifications that use the destinations you specify.

Examples

The following example displays the event notification:

```

cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1          email_dest, syslog_dest, snmp-traphost

```

event notification destination commands

Create, modify, delete and view event notification destinations.

event notification destination create

Create an event notification destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination create` command creates a new event notification destination of either email or syslog type.

The following system-defined notification destination is configured for your use:

- `snmp-traphost` - This destination reflects the configuration in "system snmp traphost".

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of the notification destination that is to be created. An event notification destination name must be 2 to 64 characters long. Valid characters are the following ASCII characters: A-Z, a-z, 0-9, "_", and "-". The name must start and end with: A-Z, a-z, or 0-9.

{ -email <mail address> - Email Destination

Use this parameter to specify the email address to which event notifications will be sent. For events to properly generate email notifications, the event system must also be configured with an address and mail server from which the mail will be sent. See `event config modify` command for more information.

| -syslog <text> - Syslog Destination

Use this parameter to specify syslog server host name or IP address to which syslog entries will be sent.

| -rest-api-url <text> - REST API Server URL

Use this parameter to specify REST API server URL to which event notifications will be sent. Enter the full URL, which must start either with an `http://` or `https://` prefix. To specify a URL that contains a question mark, press ESC followed by the "?".

If an `https://` URL is specified, then Data ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for EMS, then Data ONTAP uses that protocol to determine the certificate's revocation status. Use the `security config oscp show - application ems` command to determine if the OCSP-based certificate revocation status check is enabled for EMS.

[-certificate-authority <text>] - Client Certificate Issuing CA

Use this parameter to specify the name of the certificate authority (CA) that signed the client certificate that will be sent in case mutual authentication with the REST API server is required.

There can be multiple client certificates installed for the admin vserver in the cluster, and this parameter, along with the `certificate-serial` parameter, uniquely identifies which one.

Use the `security certificate show` command to see the list of certificates installed in the cluster.

[-certificate-serial <text>] - Client Certificate Serial Number

Use this parameter to specify the serial number of the client certificate that will be sent in case mutual authentication with the REST API server is required.

Examples

The following example shows the creation of a new event notification destination of type email called "StorageAdminEmail":

```
cluster1::> event notification destination create -name StorageAdminEmail -
email StorageAdmin@example.com

cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminEmail	email	StorageAdmin@example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

2 entries were displayed.

The following example shows the creation of a new event notification destination of type rest-api called "RestApi":

```
cluster1::> event notification destination create -name RestApi -rest-api-
url https://rest.example.com/rest
-certificate-authority cluster1-root-ca -certificate-serial 052213E60B7088

cluster1::> event notification destination show -name RestApi -instance
```

```

      Destination Name: RestApi
      Type of Destination: rest-api
      Destination Values: https://rest.example.com/rest
      Client Certificate Issuing CA: cluster1-root-ca
      Client Certificate Serial Number: 052213E60B7088

```

[event config modify](#) on page 135

[security certificate show](#) on page 562

event notification destination delete

Delete existing event destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination delete` command deletes an event notification destination.

The following system-defined notification destination is configured for your use:

- `snmp-traphost` - This destination reflects the configuration in "system snmp traphost". To remove snmp-traphost addresses, use the [system snmp traphost](#) command.

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of an event destination to be removed.

Examples

The following shows the examples of deleting event notification destinations:

```
cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminEmail	email	StorageAdmin@example.com
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

3 entries were displayed.

```
cluster1::> event notification destination delete -name StorageAdminEmail
```

```
cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

2 entries were displayed.

```
cluster1::> event notification destination delete -name Storage*
```

```
cluster1::> event notification destination show
```

Name	Type	Destination
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

1 entries were displayed.

Related references

[system snmp traphost](#) on page 1615

event notification destination modify

Modify an event notification destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination modify` command modifies event notification destination.

The following system-defined notification destination is configured for your use:

- `snmp-traphost` - This destination reflects the configuration in "system snmp traphost". To modify traphost addresses, use the [system snmp traphost](#) command.

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of an event notification destination to be modified. The name of the destination must already exist.

{ [-email <mail address>] - Email Destination

Use this parameter to specify a new value of email address to replace the current address in the event notification destination. The parameter is specified only when the event notification destination type is already "email". It is not allowed to specify the parameter for a destination that already has another type of destination address.

[[-syslog <text>] - Syslog Destination

Use this parameter to specify a new syslog server host name or IP address to replace the current address of the event notification destination. The parameter is

specified only when the event notification destination type is already "syslog". It is not allowed to specify the parameter for a destination that already has another type of destination address.

[`-rest-api-url <text>`] - REST API Server URL

Use this parameter to specify a new REST API server URL to replace the current address of the event notification destination. Enter the full URL, which must start either with an `http://` or `https://` prefix.

To specify a URL that contains a question mark, press ESC followed by the "?". If an `https://` URL is specified, then Data ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for EMS, then Data ONTAP uses that protocol to determine the certificate's revocation status. Use the `security config oscp show - application ems` command to determine if the OCSP-based certificate revocation status check is enabled for EMS. The parameter is specified only when the event notification destination type is already "rest-api". It is not allowed to specify the parameter for a destination that already has another type of destination address.

[`-certificate-authority <text>`] - Client Certificate Issuing CA

Use this parameter to specify a new value of the certificate authority (CA) to replace the current value in the event notification destination. There can be multiple client certificates installed for the admin vserver in the cluster, and this parameter, along with the `certificate-serial` parameter, uniquely identifies which one. Use the `security certificate show` command to see the list of certificates installed in the cluster.

[`-certificate-serial <text>`]} - Client Certificate Serial Number

Use this parameter to specify a new serial number of the client certificate to replace the current value in the event notification destination.

Examples

The following example shows the modification of event notification destinations:

```
cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminEmail	email	Storage@example.com
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

3 entries were displayed.

```
cluster1::> event notification destination modify -name StorageAdminEmail -
email StorageAdmin@example.com
```

```
cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminEmail	email	StorageAdmin@example.com
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

3 entries were displayed.

The following example shows how to clear the client certificate configuration when mutual authentication with the REST API server is no longer required:

```

cluster1::> event notification destination show -name RestApi -instance

    Destination Name: RestApi
    Type of Destination: rest-api
    Destination Values: https://rest.example.com/rest
    Client Certificate Issuing CA: cluster1-root-ca
    Client Certificate Serial Number: 052213E60B7088

cluster-1::> event notification destination modify -name RestApi -
certificate-authority - -certificate-serial -

cluster-1::> event notification destination show -name RestApi -instance

    Destination Name: RestApi
    Type of Destination: rest-api
    Destination Values: https://rest.example.com/rest
    Client Certificate Issuing CA: -
    Client Certificate Serial Number: -

```

[system snmp traphost](#) on page 1615

event notification destination show

Display event notification destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination show` command displays event notification destinations. Note: In the case of a `rest-api` destination type, OCSP information is not included. It's available in `security config ocsp show -app ems` command.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-name <text>`] - Destination Name

Use this optional parameter to display information of an event notification destination that has the specified name.

[`-type {snmp/email/syslog/rest-api}`] - Type of Destination

Use this optional parameter to display information of event notification destinations that have the specified destination type.

[`-destination <text>,...`] - Destination

Use this optional parameter to display information of event notification destinations that have the specified destination address. Enter multiple addresses separated by a comma.

[`-server-ca-present {true/false}`] - Server CA Certificates Present?

Use this optional parameter to display information of event notification destinations that have the specified `server-ca-present` value. This field indicates whether there

are certificates of the server-ca type exist in the system. If not, event messages will not be sent to a rest-api type destination having an HTTPS URL.

`[-certificate-authority <text>]` - Client Certificate Issuing CA

Use this optional parameter to display information of event notification destinations that have the specified certificate authority name.

`[-certificate-serial <text>]` - Client Certificate Serial Number

Use this optional parameter to display information of event notification destinations that have the specified certificate serial number.

`[-certificate-valid {true/false}]` - Client Certificate Valid?

Use this optional parameter to display information of event notification destinations that have the specified certificate-valid value. This field indicates whether the client certificate specified by the certificate-authority and certificate-serial fields is valid. If not, and if the REST API server requires client authentication, event messages will not be sent to the server.

Examples

The following shows examples of "event notification destination show":

```
cluster1::> event notification destination show
```

Name	Type	Destination
-----	-----	-----
StorageAdminEmail	email	StorageAdmin@example.com
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")
RestApi	rest-api	https://rest.example.com/rest
4 entries were displayed.		

```
cluster1::> event notification destination show -type snmp -instance
```

```

    Destination Name: snmp-traphost
    Type of Destination: snmp
    Destination values: 10.30.40.10 (from "system snmp traphost")

```

event notification history commands

The history directory

event notification history show

Display latest events sent to destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification history show` command displays a list of event messages that have been sent to a notification destination. Information displayed by the command for each event is identical to that of the `event log show` command. This command displays events sent to a notification destination while the `event log show` command displays all events that have been logged.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

-destination <text> - Destination

Specifies the destination to which event messages have been sent to be displayed.

[*-node* {<nodename>/local}] - Node

Displays a list of events for the node you specify. Use this parameter with the **-seqnum** parameter to display detailed information.

[*-seqnum* <Sequence Number>] - Sequence#

Selects the events that match this parameter value. Use with the **-node** parameter to display detailed information.

[*-time* <MM/DD/YYYY HH:MM:SS>] - Time

Selects the events that match this parameter value. Use the format: MM/DD/YYYY HH:MM:SS [+ HH:MM]. You can specify a time range by using the **".."** operator between two time statements.

[*-severity* {*EMERGENCY*/*ALERT*/*ERROR*/*NOTICE*/*INFORMATIONAL*/*DEBUG*}] - Severity

Selects the events that match this parameter value. Severity levels are as follows:

- **EMERGENCY** - Disruption.
- **ALERT** - Single point of failure.
- **ERROR** - Degradation.
- **NOTICE** - Information.
- **INFORMATIONAL** - Information.
- **DEBUG** - Debug information.

[*-message-name* <Message Name>] - Message Name

Selects the events that match this parameter value (string). Message names are descriptive, so filtering output by message name displays messages of a specific type.

[*-event* <text>] - Event

Selects the events that match this parameter value. This parameter is useful when entered with wildcards. The **"event"** field contains the full text of the event, including any parameters. For example, the **waf.vol.offline** event displays the name of the volume that is taken offline.

Examples

The following example displays all the events which match **"important-events"** filter and forwarded to the **"snmp-traphost"** destination:

```
cluster1::> event filter show

event route commands

(DEPRECATED)-Manage the mapping between events and destinations

event route add-destinations

(DEPRECATED)-Add destination(s) to an event definition

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification" command set.

The `event route add-destinations` command adds destinations to an event route. Any existing destinations assigned to the route are not removed.

The destinations you add must already exist. See the documentation for the [event destination create](#) command for information about creating destinations. To show all existing destinations and their attributes, use the [event destination show](#) command. To remove destinations from an event route, use the [event route remove-destinations](#) command.

You can use extended queries with such parameters as **-severity** and **-snmp-support** to specify multiple events that meet certain criteria. See examples below that show how to use extended queries.

Parameters

-message-name <Message Name> - Message Name

Specify the message name of the event you are modifying. You can use wildcards to specify a family of events or type of event.

`[-severity {EMERGENCY/ALERT/ERROR/NOTICE/INFORMATIONAL/DEBUG}] - Severity`

Use this optional parameter to specify a set of events that match this parameter value. You must use the **`-message-name`** parameter with wildcards to specify the family of events or type of events.

`-destinations <Event Destination>, ... - Destinations`

Specify a comma-separated list of destinations to which notifications for the named event are sent. These destinations will be added to any existing destinations assigned to this event route.

Examples

The following example specifies that all RAID events go to the destinations named support.email, mgr.email, and sreng.pager:

```
cluster1::> event route add-destinations -message-name raid* -destinations
support.email,mgr.email,sreng.pager
```

The following example specifies that all alert, and emergency events go to the destination named test_dest:

```
cluster1::> event route add-destinations -message-name * -severity <=ALERT -
destinations test_dest
```

The following example specifies that all alert events that support a SNMP trap go to the destination named traphost. In this example, because the **`-snmp-support`** parameter is specified as part of extended queries, the **`-severity`** parameter must also be specified in the extended queries:

```
cluster1::> event route add-destinations {-snmp-support true -severity
ALERT} -destinations traphost
```

[event route remove-destinations](#) on page 176

event route modify

(DEPRECATED)-Modify an event's destination, reporting threshold, or both

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification" command set.

Use the `event route modify` command to modify an event's destination, frequency threshold, and time threshold. The event's destination must already exist; see the documentation for the [event destination create](#) command for information about creating destinations. The frequency threshold and time threshold prevent multiple event notifications in a brief period of time.

You can use extended queries with such parameters as **`-severity`** and **`-snmp-support`** to specify multiple events that meet certain criteria. See examples provided in the [event route add-destinations](#) command manpage that show how to use extended queries.

The frequency threshold specifies the number of times an event occurs before a repeat notification of the event is sent; for instance, a frequency threshold of 5 indicates that a notification is sent every fifth time an event occurs. The time threshold specifies the number of seconds between notifications for an event; for instance, a time threshold of 120 indicates that a notification is sent only if it has been two minutes or more since the last notification for that event was sent.

If both the frequency threshold and time threshold are set, a notification is sent if either threshold is met. For instance, if the frequency threshold is set to 5 and the time threshold is set to 120, and the event occurs more than five times within two minutes, a notification is sent. If both thresholds are set to 0 (zero) or empty ("- " or ""), there is no suppression of multiple event notifications.

Parameters

-message-name <Message Name> - Message Name

Specify the message name of the event you are modifying. You can use wildcards to specify a family of events or type of event.

[-severity {*EMERGENCY*/*ALERT*/*ERROR*/*NOTICE*/*INFORMATIONAL*/*DEBUG*}] - Severity

Use this optional parameter to specify a set of events that match this parameter value. You must use the **-messagename** parameter with wildcards to specify the family of events or type of events.

[-destinations <Event Destination>, ...] - Destinations

Use this optional parameter to specify a comma-separated list of destinations to which notifications for the named event are sent. Using this parameter replaces the current list of destinations with the list of destinations you specify. To add or remove individual destinations from the current list, use [event route add-destinations](#) or [event route remove-destinations](#).

[-frequencythreshold <integer>] - Number of Drops Between Transmissions

Specifies the number of event notifications that must occur within the **timethreshold** period before a repeat notification is sent.

[-timethreshold <integer>] - Dropping Interval (Seconds) Between Transmissions

If multiple notifications of an event occur within this many seconds, only the first notification is sent. Multiple notifications will be sent during this time period only if the **frequencythreshold** quantity is exceeded.

Examples

The following example modifies all RAID events to send messages to a destination named "support.email", and specify that multiple messages should only be sent if an event occurs more than five times within 60 seconds.

```
cluster1::> event route modify -messagename raid* -destinations
support.email -frequencythreshold 5 -timethreshold 60
```

[event destination create](#) on page 137

event route remove-destinations

(DEPRECATED)-Remove destination(s) from an event definition

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification" command set.

The `event route remove-destinations` command can be used to remove existing destinations from an event route. This command removes only the specified destinations from the route, leaving any other destinations assigned to that route.

The named destinations are not deleted, just removed from the specified event route. To delete a destination entirely, use the `event destination delete` command. To show all existing destinations and their attributes, use the `event destination show` command.

You can use extended queries with such parameters as `-severity` and `-snmp-support` to specify multiple events that meet certain criteria. See examples provided in the `event route add-destinations` command manpage that show how to use extended queries.

Parameters

-message-name <Message Name> - Message Name

Specify the message name of the event you are modifying. You can use wildcards to specify a family of events or type of event.

[-severity {*EMERGENCY*/*ALERT*/*ERROR*/*NOTICE*/*INFORMATIONAL*/*DEBUG*}] - Severity

Use this optional parameter to specify a set of events that match this parameter value. You must use the `-message-name` parameter with wildcards to specify the family of events or type of events.

-destinations <Event Destination>, ... - Destinations

Specify a comma-separated list of destinations to remove from the event's list of destinations.

Examples

The following example specifies that the destination named "mgr.email" should no longer receive notifications of RAID events.

```
cluster1::> event route remove-destinations -message-name raid* -
destinations mgr.email
```

[event destination show](#) on page 142

[event route add-destinations](#) on page 174

event route show

(DEPRECATED)-Display event routes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event catalog" command set.

This command displays information about event routes. Event routes describe which events generate notifications. A route specifies what to watch for, whom to notify, and what to do should a particular event occur. By default, the command displays the following information:

- Message name of the event
- Severity of the event
- Destinations for event notifications
- Frequency threshold for event notifications
- Time threshold for event notifications

To display detailed information about a specific event route, run the command with the **-message-name** parameter, and specify the name of the message. The detailed view adds the following information:

- Full description of the event
- Action to be taken to address the event

You can specify additional parameters to limit output to the information that matches those parameters. For example, to display information only about events with a message name that begins with "raid", run the command with the **-message-name** **raid*** parameter. You can enter either a specific text string or a wildcard pattern.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-message-name <Message Name>] - Message Name

Selects the event routes that match this parameter value.

[-severity {*EMERGENCY*/*ALERT*/*ERROR*/*NOTICE*/*INFORMATIONAL*/*DEBUG*}] - Severity

Selects the event routes that match this parameter value. Valid values:

- EMERGENCY - Disruption
- ALERT - Single point of failure
- ERROR - Degradation
- NOTICE - Information
- INFORMATIONAL - Information
- DEBUG - Debug information

[-action <text>] - Corrective Action

Selects the events that match this parameter value. This parameter is most useful when entered with wildcards. The "action" field describes what steps, if any, you must take to remedy the situation.

[-description <text>] - Description

Selects the events that match this parameter value. This parameter is most useful when entered with wildcards. The "description" field describes why the event was encountered and what it means.

[-snmp-support {true/false}] - Supports SNMP trap

Selects the event routes that match this parameter value.

[-destinations <Event Destination>, ...] - Destinations

Selects the event routes that match this parameter value. A destination is a list of email addresses, SNMP clients, and syslogs.

[-frequencythreshold <integer>] - Number of Drops Between Transmissions

Selects the event routes that match this parameter value (number of events since previous notification).

[-timethreshold <integer>] - Dropping Interval (Seconds) Between Transmissions

Selects the event routes that match this parameter value.

Examples

The following example displays information about all event routes:

```
cluster1::> event route show
```

event snmphistory commands

(DEPRECATED)-Display the list of SNMP-trap events

event snmphistory delete

(DEPRECATED)-Delete an SNMP trap history record

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification history" command set.

The `event snmphistory delete` command deletes an SNMP trap-history record. To delete a record, you will need to know which node generated the event, and you will need to know the sequence number of that event in the trap-history.

Use the `event snmphistory show` command to display a list of trap-history records and their sequence numbers.

Parameters**-node {<nodename>/local} - Node**

Use this parameter to specify the name of the node that contains the snmp history record to delete.

-seqnum <Sequence Number> - Sequence Number

Use this parameter to specify the sequence number of the SNMP trap-history record to delete.

Examples

The following example deletes all SNMP trap-history records on node1:

```
cluster1::> event snmphistory delete -node node1 -seqnum *
```

Related references

[event snmphistory show](#) on page 180

event snmphistory show

(DEPRECATED)-Display a list of SNMP trap history records

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command has been deprecated. It may be removed from a future release of Data ONTAP. Instead, use the "event notification history" command set.

The `event snmphistory show` command displays a list of event notifications that have been sent to SNMP traps. The command output depends on the parameters specified with the command. By default, the command displays general information about all trap-history records.

To display detailed information about a specific trap-history record, run the command with the **-seqnum** parameter.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the trap-history records that match this parameter value (text pattern).

[-seqnum <Sequence Number>] - Sequence Number

Selects the trap-history records that match this parameter value (sequence number).

[-message-name <Message Name>] - Message Name

Selects the trap-history records that match this parameter value.

[-address <text>, ...] - SNMP Client Address

Selects the trap-history records that match this parameter value (IP address).

[-time <MM/DD/YYYY HH:MM:SS>] - Transmission Time

Selects the trap-history records that match this parameter value.

[-message <text>] - Alert Message

Selects the trap-history records that match this parameter value (text pattern).

[-previous-time <MM/DD/YYYY HH:MM:SS>] - Previous Transmission Time

Selects the trap-history records that match this parameter value.

[-num-drops-since-previous <integer>] - Number of Drops Since Previous Transmission

Selects the trap-history records that match this parameter value (number of event drops since last transmission).

Examples

The following example displays information about all SNMP trap-history records:

```
cluster1::> event snmphistory show
Seq # Message Name          Address   Node   Time
-----
12481 raid.mirror.restrict  10.0.2.20 node0   4/14/2008 15:11:04
12482 aggrcopy.dst.noMemory 10.0.2.20 node0   4/14/2008 14:52:54
12483 raid.mirror.restrict  10.0.2.21 node1   4/14/2008 14:41:04
```

event status commands

Display the status of events, including occurrences and drops

event status show

Display event status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event status show` command summarizes information about occurrences of events. For detailed information about specific occurrences of events, use the `event log show` command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance {}]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the event records that match this parameter value. Events are tracked on a node-by-node basis, rather than being rolled up cluster-wide.

[-message-name <Message Name>] - Message Name

Selects the event records that match this parameter value. The message name is a short descriptive string. Filtering output by message name displays messages of a specific type.

[-indications <integer>] - Number of Indications

Selects the event records that match this parameter value. This parameter is most useful when used with a range, such as using the range ">20" to display only events that have been posted more than 20 times.

[-drops <integer>] - Number of Drops

Selects the event records that match this parameter value.

[-last-time-occurred <MM/DD/YYYY HH:MM:SS>] - Last Indication Time

Selects the event records that match this parameter value.

[-last-time-dropped <MM/DD/YYYY HH:MM:SS>] - Last Suppressed Indication Time

Selects the event records that match this parameter value.

[-last-time-processed <MM/DD/YYYY HH:MM:SS>] - Last Processed Indication Time

Selects the event records that match this parameter value.

[-stat-starting-time <MM/DD/YYYY HH:MM:SS>] - Stat Starting Time

Selects the event records that match this parameter value.

[-last-hour-histogram <integer>, ...] - 60-minute Histogram (privilege: advanced)

Use this parameter with the **-fields** parameter to display the "last hour" histogram for each event type. The last hour histogram records the number of times each event occurred in the last hour. The histogram is divided into sixty buckets, and each bucket collects one minute's events. The buckets display with the most recent event first.

[-last-day-histogram <integer>, ...] - 24-hour Histogram (privilege: advanced)

Use this parameter with the **-fields** parameter to display the "last day" histogram for each event type. The last day histogram records the number of times each event occurred in the last day. The histogram is divided into 24 buckets, and each bucket collects one hour's events. The buckets display with the most recent event first.

[-last-week-histogram <integer>, ...] - 7-day Histogram (privilege: advanced)

Use this parameter with the **-fields** parameter to display the "last week" histogram for each event type. The last week histogram records the number of times each event occurred in the last week. The histogram is divided into 7 buckets, and each bucket collects one day's events. The buckets display with the most recent event first.

[-severity {*NODE_FAULT*/*SVC_FAULT*/*NODE_ERROR*/*SVC_ERROR*/*WARNING*/*NOTICE*/*INFO*/*DEBUG*/*VAR*}] - Severity

Selects events that have the event severity you specify. Severity levels sort with the most severe levels first. Severity levels:

- **NODE_FAULT** - The node has detected data corruption, or is unable to provide client service.
- **SVC_FAULT** - The node has detected a temporary loss of service. Typically, this is caused by a transient software fault.
- **NODE_ERROR** - The node has detected a hardware error that is not immediately fatal.
- **SVC_ERROR** - The node has detected a software error that is not immediately fatal.
- **WARNING** - A high-priority message that does not indicate a fault.
- **NOTICE** - A normal-priority message that does not indicate a fault.

- INFO - A low-priority message that does not indicate a fault.
- DEBUG - A debugging message. These messages are typically suppressed.
- VAR - These messages have variable severity. Severity level for these messages is selected at runtime.

The examples below illustrate how to query on severity.

Examples

The following example displays recent event-occurrence status for node1:

```
cluster1::> event status show -node node1
Node      Message                                     Occurs Drops Last Time
-----
node1      raid.spares.media_scrub.start              6      0    3/11/2010
15:59:00
node1      raid.uninitialized.parity.vol              3      0    3/11/2010
15:58:28
node1      raid.vol.state.online                     3      0    3/11/2010
15:58:29

Job Commands

Manage jobs and job schedules

The `job` commands enable you to manage jobs and schedules. A job is defined as any asynchronous operation.

job delete

Delete a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job delete` command deletes a job. Use the `job show` command to view a list of running jobs that can be deleted.

Parameters

-id <integer> - Job ID

The numeric ID of the job you want to delete. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example deletes the job that has ID 99:

```
cluster1::> job delete -id 99
```

Related references

[job show](#) on page 186

job pause

Pause a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job pause` command pauses a job. Use the `job resume` command to resume a paused job. Use the `job show` command to view a list of running jobs that can be paused.

Parameters

-id <integer> - Job ID

The numeric ID of the job you want to pause. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example pauses the job that has ID 183:

```
cluster1::> job pause -id 183
```

Related references

[job resume](#) on page 186

[job show](#) on page 186

job resume

Resume a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job resume` command resumes a job that was previously paused by using the [job pause](#) command. Use the [job show](#) command to view a list of paused jobs that can be resumed.

Parameters

-id <integer> - Job ID

The numeric ID of the paused job to be resumed. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example resumes the paused job that has ID 183:

```
cluster1::> job resume -id 183
```

[job pause](#) on page 185

[job show](#) on page 186

job show

Display a list of jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show` command displays information about jobs. By default, the command displays information about all current jobs.

To display detailed information about a specific job, run the command with the `-id` parameter.

You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the **-node** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-inprogress]

Displays the job ID, the job name, the owning Vserver, and the progress of the job.

| [-jobstate]

Displays information about each job's state, including the queue state, whether the job was restarted, and when the job has completely timed out.

| [-sched]

Displays the job ID, the job name, the owning Vserver, and the schedule on which the job runs.

| [-times]

Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended.

| [-type]

Displays the job ID, the job name, the job type, and the job category.

| [-jobuuid] (privilege: advanced)

Displays the job ID, the job name, the owning Vserver, and the job UUID.

| [-instance]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-id <integer>] - Job ID

Selects the jobs that match the ID or range of IDs that you specify.

[-vserver <vserver name>] - Owning Vserver

Selects jobs that are owned by the specified Vserver.

[-name <text>] - Name

Selects the jobs that match this parameter value.

[-description <text>] - Description

Selects the jobs that match this parameter value.

[-priority {Low/Medium/High/Exclusive}] - Priority

Selects the jobs that match this parameter value.

[-node <nodename>] - Node

Selects the jobs that match this parameter value.

[-affinity {Cluster/Node}] - Affinity

Selects the jobs that match this parameter value.

[-schedule <job_schedule>] - Schedule

Selects the jobs that match this parameter value.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

Selects the jobs that match this parameter value.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Selects the jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time

Selects the jobs that match this parameter value.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time

Selects the jobs that match this parameter value.

[-restarted {true/false}] - Restarted?

Selects the jobs that match this parameter value.

[-state {Initial/Queued/Running/Waiting/Pausing/Paused/Quitting/Success/Failure/Reschedule/Error/Quit/Dead/Unknown/Restart/Dormant}] - State

Selects the jobs that match this parameter value.

[-code <integer>] - Status Code

Selects the jobs that match this parameter value.

[-completion <text>] - Completion String

Selects the jobs that match this parameter value.

[-jobtype <text>] - Job Type

Selects the jobs that match this parameter value.

[-category <text>] - Job Category

Selects the jobs that match this parameter value.

[-uuid <UUID>] - UUID (privilege: advanced)

Selects the jobs that match this parameter value.

[-progress <text>] - Execution Progress

Selects the jobs that match this parameter value.

[-username <text>] - User Name

Selects the jobs that match this parameter value.

[-restart-is-delayed-by-module <text>] - Restart Is Delayed by Module

Selects jobs which are or were delayed by the specified module during the restart.
For example: MCC_SWITCHBACK

Examples

The following example displays information about all jobs on the node named node1:

```
cluster1::> job show -node node1
      Owing
Job ID Name      Vserver  Node      State
-----
308114 mirror-daily-3587206
      node-vserver
      node1      Running
      Descr:Auto-replicate to 1 mirror(s)
308115 mirror-daily-3618985
      node-vserver
      node1      Running
      Descr:Auto-replicate to 1 mirror(s)
308116 mirror-daily-3619010
      node-vserver
      node1      Queued
      Descr:Auto-replicate to 1 mirror(s)
```

```

308117 mirror-daily-3749547
           node-vserver
           node1           Queued
           Descr:Auto-replicate to 1 mirror(s)
4 entries were displayed.

```

job show-bynode

Display a list of jobs by node

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show-bynode` command displays information about jobs on a per-node basis. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays information about all jobs in the cluster that are currently owned by a node.

To display detailed information about a specific job, run the command with the `-id` parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the job name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

`[-affinity {Cluster/Node}] - Affinity`

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

`[-username <text>] - User Name`

Use this parameter with a username to display only jobs that are associated with that user.

Examples

The following example displays information about all jobs on a per-node basis:

```
node::> job show-bynode
```

Node	Job ID	Name	Owning Vserver	Affinity
node0	1501	log-rotation	node-vserver	Cluster
node1	1498	log-rotation	node-vserver	Cluster
node2	1499	log-rotation	node-vserver	Cluster
node3	1500	log-rotation	node-vserver	Cluster

job show-cluster

Display a list of cluster jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show-cluster` command displays information about cluster-affiliated jobs. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays information about all cluster-affiliated jobs.

To display detailed information about a specific job, run the command with the `-id` parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the job name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[-priority {Low/Medium/High/Exclusive}] - Priority

Use this parameter to display information only about the jobs that match the priority you specify.

[-node <nodename>] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-affinity {Cluster/Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[-schedule <job_schedule>] - Schedule

Use this parameter to display information only about the jobs that run on the schedule you specify.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

Use this parameter to display information only about the jobs that match the queue time you specify.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Use this parameter to display information only about the jobs that match the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time

Use this parameter to display information only about the jobs that match the end time you specify.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time

Use this parameter to display information only about the jobs that match the final timeout time you specify.

[-restarted {true/false}] - Restarted?

Use this parameter to display information only about the jobs that match the restart value you specify.

[-state {Initial/Queued/Running/Waiting/Pausing/Paused/Quitting/Success/Failure/Reschedule/Error/Quit/Dead/Unknown/Restart/Dormant}] - State

Use this parameter to display information only about the jobs that match the job state you specify.

[-code <integer>] - Status Code

Use this parameter to display information only about the jobs that match the status code you specify.

[-completion <text>] - Completion String

Use this parameter to display information only about the jobs that match the completion text you specify.

[-jobtype <text>] - Job Type

Use this parameter to display information only about the jobs that match the job type you specify.

[-category <text>] - Job Category

Use this parameter to display information only about the jobs that match the job category you specify.

[-uuid <UUID>] - UUID

Use this parameter to display information only about the jobs that match the UUID you specify.

[-username <text>] - User Name

Use this parameter with a username to display only jobs that are associated with the user you specify.

Examples

The following example displays information about all cluster-affiliated jobs:

```
cluster1::> job show-cluster
```

Job ID	Name	Owning Vserver	Node	State
305	Auto_Mirror	node-vserver	-	Running
6202	mirror-03_10	node-vserver	-	Queued
6203	Descr:Auto mirror mirror-04_10	node-vserver	-	Queued
6204	Descr:Auto mirror mirror-01_10	node-vserver	-	Queued
6205	Descr:Auto mirror mirror-02_10	node-vserver	-	Queued
6206	Descr:Auto mirror mirror-05_10	node-vserver	-	Queued
	Descr:Auto mirror			

job show-completed

Display a list of completed jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show-completed` command displays information about completed jobs. The command output depends on the parameters you specify with the command. If you do not use any parameters, the command displays information about all completed jobs.

To display detailed information about a specific job, run the command with the **-id** parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about jobs running on a specific node, run the command with the **-node** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[-priority {Low/Medium/High/Exclusive}] - Priority

Use this parameter to display information only about the jobs that match the priority you specify.

[-node <nodename>] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-affinity {Cluster/Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[-schedule <job_schedule>] - Schedule

If you use this parameter, the command displays information only about the jobs that have the schedule you specify.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

If you use this parameter, the command displays information only about the jobs that have the queue time you specify.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Use this parameter to display information only about the jobs that have the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time

Use this parameter to display information only about the jobs that have the end time you specify.

[-dropdeadttime <MM/DD HH:MM:SS>] - Drop-dead Time

Use this parameter to display information only about the jobs that time out at the time you specify.

[-restarted {true/false}] - Restarted?

Use this parameter to display information only about the jobs that match the restart value you specify.

[-state {Initial/Queued/Running/Waiting/Pausing/Paused/Quitting/Success/Failure/Reschedule/Error/Quit/Dead/Unknown/Restart/Dormant}] - State

Use this parameter to display information only about the jobs that match the job state you specify.

[-code <integer>] - Status Code

Use this parameter to display information only about the jobs that match the status code you specify.

[-completion <text>] - Completion String

Use this parameter to display information only about the jobs that match the completion text you specify.

[-jobtype <text>] - Job Type

Use this parameter to display information only about the jobs that match the job type you specify.

[-category <text>] - Job Category

Use this parameter to display information only about the jobs that match the job category you specify.

[-uuid <UUID>] - UUID

Use this parameter to display information only about the jobs that match the UUID you specify.

[-username <text>] - User Name

Use this parameter with a username to display only jobs that are associated with that user.

Examples

The following example displays information about all completed jobs:

```
node::> job show-completed
      Owing
Job ID Name      Vserver  End Time      Code      Completion String
-----
305    Auto_Mirror  node-vserver  10/10 08:07:05 0      Succeeded
6202   mirror-03_10  node-vserver  10/10 11:10:07 0
6203   mirror-04_10  node-vserver  10/10 12:10:09 0
6204   mirror-01_10  node-vserver  10/10 09:10:03 0
6205   mirror-02_10  node-vserver  10/10 10:10:08 0
6206   mirror-05_10  node-vserver  10/10 05:10:04 0
```

job stop

Stop a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job stop` command stops a running job. A stopped job cannot be resumed. Use the [job pause](#) command to pause a job so that you can later resume it. Use the [job show](#) command to view a list of running jobs.

Parameters

-id <integer> - Job ID

The numeric ID of the job to stop. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example stops the job that has ID 101:

```
cluster1::> job stop -id 101
```

Related references

[job pause](#) on page 185

[job show](#) on page 186

job unclaim

Unclaim a cluster job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job unclaim` command causes a cluster-affiliated job that is owned by an unavailable node to be unclaimed by that node. Another node in the cluster can then take ownership of the job. Use the [job show-cluster](#) command to obtain a list of cluster-affiliated jobs.

Parameters

-id <integer> - Job ID

Use this parameter to specify the ID number of the job to unclaim.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example shows how to unclaim the cluster-affiliated job with the ID 27 that is owned by the Vserver **vs1**:

```
cluster1::*> job unclaim -vserver vs1 -id 27
```

Related references

[job show-cluster](#) on page 190

job watch-progress

Watch the progress of a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job watch-progress` command displays the progress of a job, and periodically updates that display. You can specify the frequency of the updates.

Parameters

-id <integer> - Job ID

Use this parameter to specify the numeric ID of the job to monitor.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

[-interval <integer>] - Refresh Interval (seconds)

Use this parameter to specify the number of seconds between updates.

Examples

The following example show how to monitor the progress of the job that has ID 222 on Vserver `vs0`. The progress display updates every 3 seconds.

```
cluster1::> job watch-progress -vserver vs0 -id 222 -interval 3
```

job history commands

The history directory

job history show

Display a history of jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job history show` command displays a history of completed jobs with newer entries displayed first. You can specify optional parameters to select information about job history items that match only those parameters. For example, to display information about jobs that were completed on February 27 at noon, run the command with `-endtime "02/27 12:00:00"`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the completed jobs that match this parameter value.

[-record <Sequence Number>] - Record ID

Selects the completed jobs that match the record ID or range of record IDs you specify. Note that record IDs are unique for each node, not for the cluster as a whole. As a result, there can be two records with the same record ID within the cluster.

[-vserver <vserver name>] - Owning Vserver

Selects the completed jobs that are owned by the Vserver you specify.

[-id <integer>] - Job ID

Selects the completed jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time

Selects jobs that completed at the time you specify. This parameter is most useful when used with a range of times.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Selects completed jobs that were started at the time you specify. This parameter is most useful when used with a range of times.

[-name <text>] - Name

Selects the completed jobs that match this parameter value.

[-description <text>] - Description

Selects the completed jobs that match this parameter value.

[-code <integer>] - Status Code

Selects the completed jobs that match this parameter value. Each job defines its own status codes. The completion text is more informative, but support technicians may request this numeric code.

[-progress <text>] - Progress String

Selects the completed jobs that match this parameter value.

[-completion <text>] - Completion String

Selects the completed jobs that match this parameter value.

[-jobuuid <UUID>] - Job UUID (privilege: advanced)

Selects the completed jobs that match this parameter value.

[-event-type {Idle/Running/Succeeded/Failed/Paused/Stopped/Deleted/Error}] - Event Type

Selects the completed jobs that match this parameter value.

[-event-time <MM/DD HH:MM:SS>] - Event Time

Selects the completed jobs that match this parameter value. This parameter is most useful when used with a range of times.

[-error-code <integer>] - Job Manager Error Code

Selects the completed jobs that match this parameter value.

[-error-text <text>] - Job Manager Error Text

Selects the completed jobs that match this parameter value.

[-username <text>] - User Name

Selects the completed jobs that match this parameter value.

Examples

The following example displays information about all completed jobs:

```
cluster1::> job history show
```

Time ID	Node	Owning Vserver	Name	Event	Job
08/23 08:58:24 76	node1	node1-vs	Vol Create	Succeeded	
Description: Create testvol Completion: Successful					
08/23 08:58:22 76	node1	node1-vs	Vol Create	Running	
Description: Create testvol					
08/22 08:16:36 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Succeeded	
Description: Cluster Backup Job					
08/22 08:15:49 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Running	
Description: Cluster Backup Job					
08/22 08:15:08 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Idle	
Description: Cluster Backup Job					
08/22 08:15:03 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Running	
Description: Cluster Backup Job					

6 entries were displayed.

The following example shows how to use a range with the "endtime" parameter to select only the events that ended between 8:15 and 8:16 on August 22nd.

```
cluster1::> job history show -endtime "08/22 08:15:00".. "08/22 08:16:00"
```

Time ID	Node	Owning Vserver	Name	Event	Job
08/22 08:15:49 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Running	
Description: Cluster Backup Job					
08/22 08:15:08 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Idle	
Description: Cluster Backup Job					
08/22 08:15:03 4	node1	node1-vs	CLUSTER BACKUP AUTO	weekly Running	
Description: Cluster Backup Job					

3 entries were displayed.

job initstate commands

Display the initialization state of job managers

job initstate show

Display init state for job managers

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `job initstate show` command displays information about the initialization states of job-manager processes.

Parameters

[`-fields` <fieldname>, ...]

If you specify the `-fields` <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node` {<nodename>/local}] - Node

Selects the nodes that match this parameter value.

[`-process` <process_name>] - Process Name

Selects the nodes that match this parameter value.

[`-initialized` {true/false}] - Initialized?

Selects the nodes that match this parameter value (**true** means initialized; **false** means not initialized).

[`-cache-root` <text>] - Cache Root

Selects the nodes that match this parameter value.

[`-siteid` <UUID>] - Site ID

Selects the nodes that match this parameter value.

[`-hp-threads` <integer>] - High Priority Threads

Selects the nodes that have the number of high-priority threads you specify.

[`-mp-threads` <integer>] - Medium Priority Threads

Selects the nodes that have the number of medium-priority threads you specify.

[`-lp-threads` <integer>] - Low Priority Threads

Selects the nodes that have the number of low-priority threads you specify.

[`-tx-interval` <integer>] - Transaction Interval

Selects the nodes that have the number of seconds you specify as their transaction interval.

[`-initmsg` <text>] - Initialization Message

Selects the nodes that match this parameter value.

[-thread-initmsg <text>] - Thread Initialization Message

Selects the nodes that match this parameter value. The thread initialization message contains information about thread status. If there is no information to communicate, this message is empty.

[-recovery-enabled {true/false}] - Job Failover Enabled?

Selects the nodes that match this parameter value (**true** means enabled, **false** means not enabled).

[-ex-threads <integer>] - Exclusive Priority Threads

Selects the nodes that match this parameter value.

Examples

The following example shows how to display general job-manager initialization-state information for a cluster.

```
cluster1::*> job initstate show
```

Node	Process	Init?	HP Thr	MP Thr	LP Thr	EX Thr	TX Int	Failover?
node1	mgwd	true	2	3	5	8	300	true
node2	mgwd	true	2	3	5	8	300	true

2 entries were displayed.

The following example shows how to display detailed job-manager initialization-state information for a node named **node0**.

```
cluster1::*> job initstate show -instance -node node0
Node: node0
Process Name: mgwd
Initialized?: true
Cache Root: /mroot/jm_cache
Site ID: 824e8f7d-f49-1d9-84af-00423b7352
High Priority Threads: 2
Medium Priority Threads: 3
Low Priority Threads: 5
Transaction Interval: 300
Initialization Message: Initialized
Are Threads Running?: -
Job Failover Enabled?: true
Exclusive Priority Threads: 8
```

job private commands

Manage private jobs

job private delete

Delete a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private delete` command deletes a private job. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

If you use this command on a job that does not support the delete operation, the command returns an error message.

Use the `job private show` command to view a list of private jobs that can be deleted.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the node with which the private job is associated.

-id <integer> - Job ID

Use this parameter to specify the numeric ID of the private job to be deleted. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example shows how to delete the job that has ID **273** from the node named **node2**:

```
cluster1::*> job private delete -node node2 -id 273
```

job private pause

Pause a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private pause` command pauses a private job. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

If you use this command to pause a job that does not support it, the command returns an error message.

Use the `job private resume` command to resume a paused private job.

Use the `job private show` command to view a list of private jobs.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the node with which the private job is associated.

-id <integer> - Job ID

Use this parameter to specify the numeric ID of the paused private job to be paused. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example pauses the private job that has ID **99** on the node **node1**:

```
cluster1::*> jobs private pause -node node1 -id 99
```

[job private resume](#) on page 202

[job private show](#) on page 202

job private resume

Resume a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private resume` command resumes a private job that was paused by using the [job private pause](#) command. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Use the [job private show](#) command to view a list of paused private jobs that can be resumed.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the node with which the paused private job is associated.

-id <integer> - Job ID

Use this parameter to specify the numeric ID of the paused private job to be resumed. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example resumes the paused private job that has ID **99** on a node named **node2**:

```
cluster1::*> job private resume -node node2 -id 99
```

job private show

Display a list of jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private show` command displays information about private jobs. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-inprogress]

Displays the job ID, name, owning Vserver, and progress of each private job.

| [-jobstate]

Displays information about each private job's state, including the queue state, whether the job was restarted, and when the job has timed out.

| [-jobuuid]

Displays the ID, name, owning Vserver, and UUID of each private job.

| [-sched]

Displays the job ID, name, owning Vserver, and run schedule of each private job.

| [-times]

Displays the queue time, start time, and end time of each private job.

| [-type]

Displays the type and category of each private job.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the private jobs that match this parameter value. .

[-id <integer>] - Job ID

Selects the private jobs that match the ID or range of IDs that you specify.

[-vserver <vserver name>] - Owning Vserver

Selects the private jobs that match this parameter value.

[-name <text>] - Name

Selects the private jobs that match this parameter value.

[-description <text>] - Description

Selects the private jobs that match this parameter value.

[-priority {Low/Medium/High/Exclusive}] - Priority

Selects the private jobs that match this parameter value.

[-schedule <job_schedule>] - Schedule

Selects the private jobs that match this parameter value.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

Selects the private jobs that match this parameter value.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Selects the private jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time

Selects the private jobs that match this parameter value.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time

Selects the private jobs that match this parameter value.

`[-restarted {true/false}] - Restarted?`

Selects the private jobs that match this parameter value.

`[-state {Initial/Queued/Running/Waiting/Pausing/Paused/Quitting/Success/Failure/Reschedule/Error/Quit/Dead/Unknown/Restart/Dormant}] - State`

Selects the private jobs that match this parameter value.

`[-code <integer>] - Status Code`

Selects the private jobs that match this parameter value.

`[-completion <text>] - Completion String`

Selects the private jobs that match this parameter value.

`[-jobtype <text>] - Job Type`

Selects the private jobs that match this parameter value.

`[-category <text>] - Job Category`

Selects the private jobs that match this parameter value.

`[-uuid <UUID>] - UUID`

Selects the private jobs that match this parameter value.

`[-progress <text>] - Execution Progress`

Selects the private jobs that match this parameter value.

`[-username <text>] - User Name`

Selects the private jobs that match this parameter value.

Examples

The following example displays information about all private jobs on the local node:

```
cluster1::*> job private show -node local
Node: node1
```

Job ID	Name	Owning Vserver	State
3	snap-hourly Description: Auto-Snapshot	cluster1	Queued
4	snap-daily Description: Auto-Snapshot	cluster1	Queued
5	snap-weekly Description: Auto-Snapshot	cluster1	Queued
6	sync task Description: sync task	cluster1	Queued
7	ldap-certs Description: ldap resync	cluster1	Queued

5 entries were displayed.

job private show-completed

Display a list of completed jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private show-completed` command displays information about completed private jobs. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about completed jobs that are associated with the node you specify.

[-id <integer>] - Job ID

Use this parameter to display information only about completed jobs that have the ID you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to display only completed jobs that are owned by the Vserver you specify.

[-name <text>] - Name

Use this parameter to display information only about completed jobs that have the name you specify.

[-description <text>] - Description

Use this parameter to display information only about completed jobs that have the description you specify.

[-priority {Low/Medium/High/Exclusive}] - Priority

Use this parameter to display information only about completed jobs that have the priority you specify.

[-schedule <job_schedule>] - Schedule

Use this parameter to display information only about completed jobs that have the schedule you specify.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

Use this parameter to display information only about completed jobs that have the queue time you specify.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Use this parameter to display information only about completed jobs that have the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time

Use this parameter to display information only about completed jobs that have the end time you specify.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time

Use this parameter to display information only about completed jobs that have the final timeout time you specify.

[-restarted {true/false}] - Restarted?

Use this parameter to display information only about completed jobs that have the restart value you specify.

`[-state {Initial/Queued/Running/Waiting/Pausing/Paused/Quitting/Success/Failure/Reschedule/Error/Quit/Dead/Unknown/Restart/Dormant}] - State`

Use this parameter to display information only about completed jobs that have the job state you specify.

`[-code <integer>] - Status Code`

Use this parameter to display information only about completed jobs that have the status code you specify.

`[-completion <text>] - Completion String`

Use this parameter to display information only about completed jobs that have the completion text you specify.

`[-jobtype <text>] - Job Type`

Use this parameter to display information only about completed jobs that have the job type you specify.

`[-category <text>] - Job Category`

Use this parameter to display information only about completed jobs that have the job category you specify.

`[-uuid <UUID>] - UUID`

Use this parameter to display information only about completed jobs that have the UUID you specify.

`[-username <text>] - User Name`

Use this parameter to display information only about completed jobs that are associated with the user you specify.

Examples

The following example shows how to display information about all completed private jobs on the node named **node1**:

```
cluster1::*> job private show-completed -node node1
Node: node1
```

Job ID	Name	Owning Vserver	End Time	Code	Completion String
1	sync task	node1	02/17 15:03:23	0	
2	load_balancing	node1	02/17 16:29:28	0	DONE_VIF_STATS
3	snap-hourly	node1	02/17 16:05:00	0	
4	snap-daily	node1	02/17 00:10:00	0	
5	snap-weekly	node1	02/13 00:15:00	0	
8	Cross-Cluster Manager	node1	02/17 16:27:27	0	complete
9	reconcile service policy	node1	02/17 15:03:12	0	

7 entries were displayed.

job private stop

Stop a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private stop` command stops a running private job. A private job is a job that is associated with a specific node and does not use cluster facilities. A stopped job cannot be restarted.

Parameters**-node {<nodename>/local} - Node**

This specifies the node on which the job is running.

-id <integer> - Job ID

This specifies the numeric ID of the job that is to be stopped.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example stops a private job with the ID 416 on a node named node0:

```
cluster1::*> job private stop -node node0 -id 416
```

job private watch-progress

Watch the progress of a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.**Description**

The `job private watch-progress` command displays and periodically updates the progress of a private job. A private job is a job that is associated with a specific node and does not use cluster facilities. You can specify the frequency of the progress updates.

Parameters**-node {<nodename>/local} - Node**

This specifies the node on which the job is running.

-id <integer> - Job ID

This specifies the numeric ID of the job whose progress is to be monitored.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the Vserver with which the paused private job is associated. Use this parameter to specify the name of the Vserver that owns the job.

[-interval <integer>] - Refresh Interval (seconds)

This optionally specifies, in seconds, the frequency of the updates.

Examples

The following example monitors the progress of the private job that has ID 127 on a node named node1. The progress is updated every 2 seconds.

```
cluster1::*> job private watch-progress -node node1 -id 127 -interval 2
Queued
```

job schedule commands

Manage job schedules

job schedule delete

Delete a schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule delete` command deletes a schedule. Use the `job schedule show` command to display all current schedules.

You cannot delete any schedules that are in use by jobs. Use the `job schedule show-jobs` command to display jobs by schedule.

You cannot delete any schedules that are referenced by:

- Volume Snapshot copy policy entries
- SnapMirror entries
- SIS policy entries
- configuration backup settings

You must remove all references to a schedule before you can delete it. If you attempt to delete a schedule that is referenced, an error message will list which entries reference the schedule you want to delete. Use the **show** command for each of the items listed by the error message to display which entries reference the schedule. You may need to use the **-instance** parameter to display more detail.

Parameters

[-cluster <Cluster name>] - Cluster

This parameter specifies the name of the cluster on which you want to delete a schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Schedule Name

Use this parameter with the name of an existing schedule to specify the schedule you want to delete.

Examples

The following example deletes a schedule named overnightbackup:

```
cluster1::> job schedule delete -name overnightbackup
```

job schedule show

Display a list of available schedules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule show` command displays information about schedules.

Parameters

- { [-fields <fieldname>, ...]**
If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.
- [-instance]}**
If you specify the **-instance** parameter, the command displays detailed information about all fields.
- [-cluster <Cluster name>] - Cluster**
Selects the schedules that match this parameter value.
- [-name <text>] - Schedule Name**
Selects the schedules that match this parameter value.
- [-type {cron/interval/builtin}] - Schedule Type**
Selects the schedules that match this parameter value.
- [-description <text>] - Description**
Selects the schedules that match this parameter value.

Examples

The following example displays information about all schedules:

```
cluster1::> job schedule show
Cluster      Name      Type      Description
-----
cluster1
      5min      cron      @:
00,:05,:10,:15,:20,:25,:30,:35,:40,:45,:50,:55
      daily      cron      @0:10
      hourly      cron      @:05
      monthly      cron      1@0:20
      weekly      cron      Sun@0:15
```

job schedule show-jobs

Display the list of jobs by schedule

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `job schedule show-jobs` command displays information about jobs that are associated with schedules.

Parameters

- { [-fields <fieldname>, ...]**
If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-name* <text>] - Schedule Name

Use this parameter to display information only about the jobs that are associated with the schedule you specify.

[*-affinity* {*Cluster/Node*}] - Cluster / Node

Use this parameter to display information only about the jobs that match the affinity value you specify.

[*-owner* <text>] - Owner

Use this parameter to display information only about the jobs that are owned by the nodes you specify.

[*-jobid* <integer>] - ID

Use this parameter to display information only about the jobs that match the ID or range of IDs that you specify.

[*-jobname* <text>] - Job Name

Use this parameter to display information only about the jobs that match the name you specify.

Examples

The following example shows information about schedules that are associated with jobs:

```
cluster1::> job schedule show-jobs
Name          Type      Owner          Job ID      Job Name
-----
hourly        Cluster  -              98644      mirror-hourly
weeklylog     Node     node0          1501       log-rotation
weeklylog     Node     node1          1498       log-rotation
weeklylog     Node     node2          1499       log-rotation
weeklylog     Node     node3          1500       log-rotation
5 entries were displayed.
```

job schedule cron commands

Manage cron-type job schedules

job schedule cron create

Create a cron schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron create` command creates a cron schedule. A cron schedule, like a UNIX cron job, runs at a specified time. You can also specify months, days of the month, or days of the week on which the schedule will run.

If you specify values for both days of the month and days of the week, they are considered independently. For example, a cron schedule with the day specification Friday, 13 runs every Friday and on the 13th day of each month, not just on every Friday the 13th.

Parameters

`[-cluster <cluster_name>] - Cluster`

This parameter specifies the name of the cluster on which you want to create a cron schedule. By default, the schedule is created on the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`-name <text> - Name`

Use this parameter to specify the name of the cron schedule that you want to create.

`[-month <cron_month>, ...] - Month`

Use this parameter to specify months in which the schedule runs. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to run the schedule every month.

`[-dayofweek <cron_dayofweek>, ...] - Day of Week`

Use this parameter to specify days of the week on which the schedule runs. Valid values are Sunday, Monday, Tuesday, Thursday, Friday, and Saturday, and all. Specify "all" to run the schedule every day.

`[-day <cron_dayofmonth>, ...] - Day`

Use this parameter to specify days of the month on which the schedule runs. Valid values range from 1 to 31.

`[-hour <cron_hour>, ...] - Hour`

Use this parameter to specify the hours value of the time of day at which the schedule runs. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to run the schedule every hour.

`-minute <cron_minute>, ... - Minute`

Use this parameter to specify the minutes portion of the time of day at which the schedule runs. Valid values range from 0 to 59.

Examples

The following example creates a cron schedule named weekendcron that runs on weekend days (Saturday and Sunday) at 3:00 a.m.

```
cluster1::> job schedule cron create -name weekendcron -dayofweek "Saturday,
Sunday" -hour 3 -minute 0
```

job schedule cron delete

Delete a cron schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron delete` command deletes a cron schedule. Use the `job schedule cron show` command to display all current cron schedules.

You cannot delete any cron schedules that are associated with jobs. Use the `job schedule show-jobs` command to display jobs by schedule.

Parameters**[-cluster <Cluster name>] - Cluster**

This parameter specifies the name of the cluster on which you want to delete a cron schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Name

Use this parameter with the name of an existing cron schedule to specify the cron schedule that you want to delete.

Examples

The following example deletes a cron schedule named midnightcron:

```
cluster1::> job schedule cron delete -name midnightcron
```

Related references

[job schedule cron show](#) on page 213

[job schedule show-jobs](#) on page 209

job schedule cron modify

Modify a cron schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron modify` command modifies a cron schedule. A cron schedule, like a UNIX cron job, runs at a specified time. You can also specify months, days of the month, or days of the week on which the schedule runs. Use the [job schedule cron show](#) command to display all current cron schedules. See the documentation for [job schedule cron show](#) for more information about how cron schedules work.

Modifying one parameter of a cron schedule does not affect the other parameters. For example, if cron schedule is set to run at 3:15 AM, and you modify the "hour" parameter to 4, the schedule's new time will be 4:15am. To clear a parameter of the schedule's interval, you must explicitly set that portion to "0" or "-" Some parameters can also be set to "all".

Parameters**[-cluster <Cluster name>] - Cluster**

Use this parameter to specify the cluster of an existing cron schedule you want to modify. The local cluster is provided as the default value. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Name

Use this parameter with the name of an existing cron schedule to specify the cron schedule you want to modify.

[-month <cron_month>, ...] - Month

Use this parameter to specify a new "month" value for the cron schedule. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, or all. Specify "all" to run the schedule every month.

[-dayofweek <cron_dayofweek>, ...] - Day of Week

Use this parameter to specify a new "day of week" value for the cron schedule. Valid values include Sunday, Monday, Tuesday, Thursday, Friday, Saturday, or all. Specify "all" to run the schedule every day.

[-day <cron_dayofmonth>, ...] - Day

Use this parameter to specify a new "day of month" value for the cron schedule. Valid values range from 1 to 31.

[-hour <cron_hour>, ...] - Hour

Use this parameter to specify a new "hour of the day" value for the cron schedule. Valid values range from 0 (midnight) to 23 (11:00 p.m.), Specify "all" to run the schedule every hour.

[-minute <cron_minute>, ...] - Minute

Use this parameter to specify a new "minute of the hour" value for the cron schedule. Valid values range from 0 to 59.

Examples

The following example modifies a cron schedule named weekendcron so that it runs at 3:15 a.m.:

```
cluster1::> job schedule cron modify -name weekendcron -hour 3 -minute 15
```

Related references

[job schedule cron show](#) on page 213

job schedule cron show

Show cron schedules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron show` command displays information about cron schedules. A cron schedule runs a job at a specified time on specified days.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Cluster

Selects the cron schedules that match this parameter value.

[-name <text>] - Name

Selects the cron schedules that match this parameter value.

[-month <cron_month>, ...] - Month

Selects the cron schedules that match this parameter value. Valid values are **January, February, March, April, May, June, July, August, September, October, November, December**, or **all**.

[-dayofweek <cron_dayofweek>, ...] - Day of Week

Selects the cron schedules that match this parameter value. Valid values include **Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday**, or **all**.

[-day <cron_dayofmonth>, ...] - Day

Selects the cron schedules that match this parameter value. Valid values range from **1** to **31**.

[-hour <cron_hour>, ...] - Hour

Selects the cron schedules that match this parameter value.

[-minute <cron_minute>, ...] - Minute

Selects the cron schedules that match the minute or range of minutes that you specify.

[-description <text>] - Description

Selects the cron schedules that match this parameter value.

Examples

The following example displays information about all current cron schedules:

```
cluster1::> job schedule cron show
Cluster      Name      Description
-----
cluster1
      5min      @:00,:05,:10,:15,:20,:25,:30,:35,:40,:45,:50,:55
      8hour      @2:15,10:15,18:15
      weekly      Sun@0:15
```

The following example displays information about the cron schedule named weekly:

```
cluster1::> job schedule cron show -name weekly -instance

Cluster: cluster1
Name: weekly
Month: -
Day of Week: Sunday
Day: -
Hour: 0
Minute: 15
Description: Sun@0:15
```

job schedule interval commands

Manage interval-based job schedules

job schedule interval create

Create a schedule that runs on an interval

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval create` creates an interval schedule. An interval schedule runs jobs at specified intervals after the previous job finishes. For instance, if a job uses an interval schedule of 12 hours and takes 30 minutes to complete, the job runs at the following times:

- Day one at 8:00 a.m. (the job's initial run)
- Day one at 8:30 p.m.
- Day two at 9:00 a.m.
- Day two at 9:30 p.m.

Each of the numerical parameters of the interval must be a whole number. These parameters can be used individually, or combined to define complex time values. For example, use a value of 1 day, 12 hours to create an interval of 1.5 days.

Large parameter values are converted into larger units. For example, if you create a schedule with an interval of 36 hours, the `job schedule interval show` command will display it with an interval of 1 day 12 hours.

Parameters

`[-cluster <Cluster name>] - Cluster`

This parameter specifies the name of the cluster on which you want to create an interval schedule. By default, the schedule is created on the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`-name <text> - Name`

Use this parameter to specify the name of the interval schedule you want to create.

`[-days <integer>] - Days`

Use this parameter to specify the "days" portion of the schedule's interval. A day is one calendar day.

`[-hours <integer>] - Hours`

Use this parameter to specify the "hours" portion of the schedule's interval.

`[-minutes <integer>] - Minutes`

Use this parameter to specify the "minutes" portion of the schedule's interval.

`[-seconds <integer>] - Seconds`

Use this parameter to specify the "seconds" portion of the schedule's interval.

Examples

The following example creates an interval schedule named `rollingdaily` that runs six hours after the completion of the previous occurrence of the job:

```
cluster1::> job schedule interval create -name rollingdaily -hours 6
```

Related references

[job schedule interval show](#) on page 217

job schedule interval delete

Delete an interval schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval delete` command deletes an interval schedule. Use the `job schedule interval show` command to display all current interval schedules.

You cannot delete interval schedules that are currently being run. Use the `job schedule show-jobs` command to display jobs by schedule.

Parameters

[-cluster <Cluster name>] - Cluster

This parameter specifies the name of the cluster on which you want to delete an interval schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Name

Use this parameter with the name of an existing interval schedule to specify the interval schedule you want to delete.

Examples

The following example deletes an interval schedule named `rollingdaily`:

```
cluster1::> job schedule interval delete -name rollingdaily
```

Related references

[job schedule show-jobs](#) on page 209

job schedule interval modify

Modify an interval schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval modify` command modifies an interval schedule. An interval schedule runs jobs at a specified interval after the previous job finishes. Use the `job schedule interval show` command to display all current interval schedules. See the documentation of `job schedule interval show` for more information on how interval schedules work.

Modifying one parameter of a schedule's interval does not affect the other parameters. For example, if a schedule's interval is 1 day 12 hours, and you modify the "hours" parameter to 16, the schedule's new interval is 1 day 16 hours. To clear a parameter of the schedule's interval, you must explicitly set that parameter to "0" or "-".

Parameters**[-cluster <Cluster name>] - Cluster**

Use this parameter to specify the cluster of an existing interval schedule you want to modify. The local cluster is provided as the default value. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

-name <text> - Name

Use this parameter with the name of an existing interval schedule to specify the interval schedule you want to modify.

[-days <integer>] - Days

Use this parameter to specify a different "days" value for the schedule's interval.

[-hours <integer>] - Hours

Use this parameter to specify a different "hours" value for the schedule's interval.

[-minutes <integer>] - Minutes

Use this parameter to specify a different "minutes" value for the schedule's interval.

[-seconds <integer>] - Seconds

Use this parameter to specify a different "seconds" value for the schedule's interval.

Examples

The following example sets the schedule named `rollingdaily` to run every eight hours:

```
cluster1::> job schedule interval modify -name rollingdaily -hours 8
```

Related references

[*job schedule interval show*](#) on page 217

job schedule interval show

Show interval schedules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval show` command displays information about interval schedules.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Cluster

Selects the interval schedules that match this parameter value.

[-name <text>] - Name

Selects the interval schedules that match this parameter value.

[-days <integer>] - Days

Selects the interval schedules that match the day value or range of values you specify.

[-hours <integer>] - Hours

Selects the interval schedules that match the hour value or range of values you specify.

[-minutes <integer>] - Minutes

Selects the interval schedules that match the minute value or range of values you specify.

[-seconds <integer>] - Seconds

Selects the interval schedules that match the second value or range of values you specify.

[-description <text>] - Description

Selects the interval schedules that match the description you specify.

Examples

The following example displays information about all interval schedules:

```
cluster1::> job schedule interval show
Cluster      Name      Description
-----
cluster1
              rollingdaily
                  Every 8h
```

lun commands

Manage LUNs

lun create

Create a new LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new LUN of a specific size. You cannot create a LUN at a path that already exists. You must create LUNs at the root of a volume or qtree. You can not create LUNs in the Vserver root volume.

You might find it useful to provide a meaningful path name for the LUN and containing volume. For example, you might choose a name that describes how the LUN is used, such as the name of the application, the type of data that it stores, or the user accessing the data. Examples are `/vol/database/lun0`, `/vol/finance/lun1`, and `/vol/bill/lun2`.

It is recommended that you distribute LUNs across the cluster.

When you can create a LUN, the size of the LUN could be larger than what you specified. The system generates a message if the size of the LUN is different from what you specified.

By default, when you create a LUN, it is online and it is space-reserved. Use the `lun offline` command to take a LUN offline. When you set space reserved to false, the LUN is non-space reserved.

Note: For non-space reserved LUNs, write operations to that LUN might fail due to insufficient disk space. As a result, the host application or operating system might crash.

Note: When you create a LUN from a file, that file cannot be deleted without deleting the LUN itself.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the new LUN. The LUN path cannot contain any files.

Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

| -volume <volume name> - Volume Name

Specifies the volume that contains the new LUN.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the new LUN.

-lun <text> - LUN Name

Specifies the new LUN name. A LUN name is a case-sensitive name and has the following requirements:

- Must contain one to 255 characters. Spaces are not allowed.

- Can contain the letters A-Z, a-z, numbers 0-9, "-", "_", "{", "}", and ".".

{ -size | -s <size> - LUN Size

Specifies the size of the LUN in bytes. You can specify a one-character multiplier suffix:

- c (1 byte)
- w (2 bytes)
- B (512 bytes)
- k (1024 bytes)
- M (k*k bytes)
- G (k*m bytes)
- T (m*m bytes)

[-use-exact-size [true]] - Use Exact Size (privilege: advanced)

Create the LUN using the exact value specified by the **-size** parameter instead of rounding the size to best fit the LUN geometry. Size of the LUN must be a multiple of 512 bytes.

[-file-path | -f <text> - File Path

Creates a LUN using the file path as the source.

[-foreign-disk <text>]] - Foreign Disk Serial number (privilege: advanced)

LUN is created with the same attributes (size, alignment, bytes per sector and so on) as the specified foreign disk.

[-prefix-size | -P <size>] - Prefix Size (privilege: advanced)

Specifies the size of the prefix stream for the new LUN.

-ostype | -t <LUN Operating System Format> - OS Type

Specifies the OS type for the new LUN.

On an All SAN Array, the following OS types are supported:

- aix - the LUN will be used with AIX.
- hyper_v - the LUN will be used with Microsoft Hyper-V.
- linux - the LUN will be used with Linux.
- vmware - the LUN will be used with VMware VMFS.
- windows - the LUN will be used with Microsoft Windows.

On all other clusters, the following OS types are supported:

- aix - the LUN will be used with AIX.
- hpux - the LUN will be used with HP-UX.
- hyper_v - the LUN will be used with Microsoft Hyper-V.
- linux - the LUN will be used with Linux.
- netware - the LUN will be used with NetWare.
- openvms - the LUN will be used with Open-VMS.
- solaris - the LUN will be used with Solaris slice partitioning.

- `solaris_efi` - the LUN will be used with Solaris EFI partitioning.
- `vmware` - the LUN will be used with VMware VMFS.
- `windows` - the LUN will be used with a Master Boot Record (MBR) partition table on Microsoft Windows 2003 or earlier.
- `windows_2008` - the LUN will be used with Microsoft Windows 2008 or later.
- `windows_gpt` - the LUN will be used with a GUID Partition Type (GPT) partition table on Microsoft Windows.
- `xen` - the LUN will be used with Xen

`[-space-reserve {enabled/disabled}] - Space Reservation`

Specifies whether the space reservation setting is *enabled* or *disabled* for the new LUN. If you set the parameter to *enabled*, the LUN is space-reserved. If you set the parameter to *disabled*, the LUN is non-space reserved. The default is *enabled*.

`[-comment <text>] - Comment`

A description for the LUN you want to create. If the comment string contains white space, you must enclose the comment string in double quotes. The limit is 254 characters.

`[-space-allocation {enabled/disabled}] - Space Allocation`

Specifies the value for the space allocation attribute of the LUN. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.

Specifying *enabled* for this parameter enables support for the SCSI Thin Provisioning features.

Specifying *disabled* for this parameter disables support for the SCSI Thin Provisioning features.

Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

The default is *disabled*.

`[-class {regular/protocol-endpoint/vvol}] - Class`

Specifies the class of the new LUN. The class types are:

- `regular` - the LUN is for normal blocks protocol access. This is the default value.
- `protocol-endpoint` - the LUN is a vvol protocol endpoint.
- `vvol` - the LUN is a vvol data LUN.

`{ [-qos-policy-group <text>] - QoS Policy Group`

This optionally specifies which QoS policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a LUN, the system will not monitor and control the traffic to it.

Note: If you specify this parameter for a LUN that you want to create from a file and that file belongs to a QoS policy group, Data ONTAP adds the LUN to the specified policy group and removes the file from its policy group. Both the file and the LUN that you created from the file cannot belong to QoS policy groups.

[`-qos-adaptive-policy-group <text>`]} - QoS Adaptive Policy Group

This optionally specifies which QoS adaptive policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) and service level agreements (SLAs) that adjust based on the LUN's allocated space or used space.

[`-caching-policy <text>`] - Caching Policy Name

This optionally specifies the caching policy to apply to the LUN. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- `none` - Does not cache any user data or metadata blocks.
- `auto` - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- `meta` - Read caches only metadata blocks.
- `random_read` - Read caches all metadata and randomly read user data blocks.
- `random_read_write` - Read caches all metadata, randomly read and randomly written user data blocks.
- `all_read` - Read caches all metadata, randomly read and sequentially read user data blocks.
- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is `auto`.

Examples

```
cluster1::> lun create -vserver vs1 -path /vol/vol1/lun1 -size 100M -ostype
linux
```

lun delete

Delete the LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes a LUN from a specified Vserver and volume. If the LUN is mapped and online, the `force` option is required to delete it.

If a LUN is mapped to an initiator group, you can unmap it by using the `lun unmap` command. If a LUN is online, you take it offline by using the `lun offline` command.

Note: If you create a LUN from a file, you cannot remove the file while the LUN is linked to it. If you want to remove the file, you must first delete the LUN.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

{ -path <path> - LUN PathSpecifies the path of the LUN you want to delete. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.**| -volume <volume name> - Volume Name**

Specifies the volume that contains the LUN you want to delete.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN you want to delete.

-lun <text>} - LUN Name

Specifies the LUN that you want to delete.

[-force | -f [*true*]] - Force Deletion of an Online and Mapped LUN

Force deletion of an online LUN that is mapped to an initiator group.

[-force-fenced [*true*]] - Force Deletion of a Fenced LUN

Force deletion of a LUN that is currently fenced.

Examples

```
cluster1::> lun delete -vserver vs1 -path /vol/vol1/lun1
```

Related references[lun mapping delete](#) on page 264

lun maxsize

Display the maximum possible size of a LUN on a given volume or qtree.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.**Description**

This command returns the maximum size of LUNs for different OS types in a volume or qtree. The command also includes possible maximum size for LUNs with Snapshots or without Snapshots. You can specify the path of the volume or qtree to determine the maximum size of a LUN that you want to create within that volume or qtree.

If you do not specify a path, the command returns the maximum LUN size for each OS type for all volumes and qtrees in a cluster.

The available space in a volume can change over time which means that the size reported by `lun maxsize` can change as well. In addition, the maximum LUN size allowed in a [lun resize](#) command may be less than the size reported by `lun maxsize`.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-vserver <Vserver Name>*] - Vserver Name

Specifies the Vserver.

{ [*-path <qtree path>*] - Volume or Qtree Path

Specifies the path of the root volume or qtree. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

[*-volume <volume name>*] - Volume Name

Specifies the volume that contains the LUN you want to get the maximum size for.

[*-qtree <qtree name>*]} - Qtree Name

Specifies the qtree that contains the LUN you want to get the maximum size for.

[*-ostype | -t <text>*] - OS Type

Specifies the OS type for the new LUN.

On an All SAN Array, the following OS types are supported:

- *aix* - the LUN will be used with AIX.
- *hyper_v* - the LUN will be used with Microsoft Hyper-V.
- *linux* - the LUN will be used with Linux.
- *vmware* - the LUN will be used with VMware VMFS.
- *windows* - the LUN will be used with Microsoft Windows.

On all other clusters, the following OS types are supported:

- *aix* - the LUN will be used with AIX.
- *hpux* - the LUN will be used with HP-UX.
- *hyper_v* - the LUN will be used with Microsoft Hyper-V.
- *linux* - the LUN will be used with Linux.
- *netware* - the LUN will be used with NetWare.
- *openvms* - the LUN will be used with Open-VMS.
- *solaris* - the LUN will be used with Solaris slice partitioning.
- *solaris_efi* - the LUN will be used with Solaris EFI partitioning.
- *vmware* - the LUN will be used with VMware VMFS.
- *windows* - the LUN will be used with a Master Boot Record (MBR) partition table on Microsoft Windows 2003 or earlier.
- *windows_2008* - the LUN will be used with Microsoft Windows 2008 or later.
- *windows_gpt* - the LUN will be used with a GUID Partition Type (GPT) partition table on Microsoft Windows.
- *xen* - the LUN will be used with Xen

[*-complete-ss-reserve <size>*] - With Complete Snapshot Reserve

Shows the maximum size possible of a LUN if you have the complete Snapshot reserve enabled.

[-ss-reserve <size>] - With Snapshot Reserve

Shows the maximum size possible of a LUN if you have the Snapshot reserve enabled.

[-without-ss-reserve <size>] - Without Snapshot Reserve

Shows the maximum size possible of a LUN if you have no Snapshot reserve enabled.

Examples

```
cluster1::> lun maxsize -vserver vs1 -volume voll -ostype linux
Virtual
Server      Volume      Qtree      OS Type      Without SS Reserve  With SS Reserve  Complete SS Reserve
-----
vs1         voll         " "         linux         45MB             45MB             45MB
```

Displays the maximum size of a LUN for the OS type linux.

```
cluster1::> lun maxsize -vserver vs1 -volume voll
Vserver      Volume      Qtree      OS Type      Without SS Reserve  With SS Reserve  Complete SS Reserve
-----
vs1         voll         " "         aix          178MB             178MB             178MB
              hpux          178MB             178MB             178MB
              hyper_v       172.6MB           172.6MB           172.6MB
              linux        178MB             178MB             178MB
              netware       178MB             178MB             178MB
              openvms      178MB             178MB             178MB
              solaris       178MB             178MB             178MB
              solaris_efi   178MB             178MB             178MB
              windows    172.6MB           172.6MB           172.6MB
              windows_2008 172.6MB           172.6MB           172.6MB
              windows_gpt 172.6MB           172.6MB           172.6MB
              xen        178MB             178MB             178MB
12 entries were displayed.
```

[lun resize](#) on page 229

lun modify

Modify a LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies LUN attributes. Because LUN modifications can result in data corruption or other problems, we recommend that you call technical support if you are unsure of the possible consequences of modifying a LUN.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path for the LUN you want to modify. Examples of correct LUN paths are */vol/voll/lun1* and */vol/voll/qtrees1/lun1*.

| -volume <volume name> - Volume Name

Specifies the volume for the LUN you want to modify.

-qtree <qtree name> - Qtree Name

Specifies the qtree for the LUN you want to modify.

-lun <text> - LUN Name

Specifies the name for the LUN you want to modify. A LUN name is a case-sensitive name and has the following requirements:

- Must contain one to 255 characters. Spaces are not allowed.
- Can contain the letters A through Z, a through z, numbers 0 through 9, hyphen (-), underscore (_), right bracket (}), left bracket ({) and period (.).
- Must start with a letter or number.

[-space-reserve {*enabled/disabled*}] - Space Reservation

Specifies whether the space reservation setting is enabled or disabled for a LUN. If you set the parameter to *enabled*, the LUN is space-reserved. If you set the parameter to *disabled*, the LUN is non-space reserved. The default is *enabled*.

{ [-serial <text>] - Serial Number

Specifies the serial number for the LUN you want to modify.

The LUN serial number is a twelve-character alphanumeric string containing one or more of the following:

- upper- and lower-case letters
- numbers
- the characters: &, <, >, /, -, #, \$, %, *, +, =, ?, @, [, !,], ^, ~

Some of the characters that are valid in a LUN serial number also have special meaning to the cluster shell command line:

- The question mark (?) activates the command line active help. In order to type a question mark as part of a LUN's serial number, it is necessary to disable active help with the command `set -active-help false`. Active help can later be re-enabled with the command `set -active-help true`.
- The number sign (#) indicates the beginning of a comment to the command line and will cause the remainder of the line to be ignored. To avoid this, enclose the serial number in double quotes (").

Alternatively, the `-serial-hex` parameter can be used to set the LUN serial number specifying the serial number encoded in hexadecimal form.

[-serial-hex <Hex String>] - Serial Number (Hex)

Specifies the serial number, encoded in hexadecimal form, for the LUN you want to modify. See the description of the `-serial` parameter for additional details.

[-comment <text>] - Comment

Specifies the comment for the LUN you want to modify.

[-space-allocation {*enabled/disabled*}] - Space Allocation

Specifies the new value for the space allocation attribute of the LUN. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.

Specifying *enabled* for this parameter enables support for the SCSI Thin Provisioning features.

Specifying *disabled* for this parameter disables support for the SCSI Thin Provisioning features.

Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

`[-state {online/offline/nvfail/space-error/foreign-lun-error}] - State`

Specifies the administrative state of a LUN. The options are:

- online
- offline

`{ [-device-legacy-id <integer>] - Device Legacy ID`

Specifies the device legacy ID for the LUN you want to modify.

`| [-device-binary-id <text>] - Device Binary ID`

Specifies the device binary ID for the LUN you want to modify.

`| [-clear-binary-id [true]] - Clear Device Binary ID`

Clears the binary format of the optional device ID.

`{ [-device-text-id <text>] - Device Text ID`

Specifies the device text ID for the LUN you want to modify.

`| [-clear-text-id [true]] - Clear Device Text ID`

Clears the text format of the optional device ID.

`{ [-qos-policy-group <text>] - QoS Policy Group`

This optionally specifies which QoS policy group to apply to the lun. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a lun, the system will not monitor and control the traffic to it. To remove this lun from a policy group, enter the reserved keyword "none".

`| [-qos-adaptive-policy-group <text>]] - QoS Adaptive Policy Group`

This optional parameter specifies which QoS adaptive policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the LUN's allocated space or used space. To remove this LUN from an adaptive policy group, enter the reserved keyword "none".

`[-caching-policy <text>] - Caching Policy Name`

This optionally specifies the caching policy to apply to the LUN. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.

- `random_read_write` - Read caches all metadata, randomly read and randomly written user data blocks.
- `all_read` - Read caches all metadata, randomly read and sequentially read user data blocks.
- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

Examples

```
cluster1::> lun modify -path /vol/vol1/lun1 -space-reserve disable
```

Disables the space reserve attribute for LUN /vol/vol1/lun1.

```
cluster1::> lun modify -path /vol/vol1/lun1 -state offline
```

Takes the LUN /vol/vol1/lun1 offline.

```
cluster1::> lun modify -path /vol/vol1/lun1 -comment "new comment"
```

lun move-in-volume

Move a LUN within a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command moves a LUN to a new path in the same volume or renames a LUN. If you are organizing LUNs in a qtree, the command moves a LUN from one qtree to another. You can perform a LUN move while the LUN is online and serving data. The process is non-disruptive. Use the [lun move start](#) command to move a LUN to a different volume within the same Vserver.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the LUN you want to move. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

| -volume <volume name> - Volume Name

Specifies the volume of the LUN you want to move.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree of the LUN you want to move.

-lun <text>} - LUN Name

Specifies the name of the LUN that you want to move.

{ -new-path <path> - New LUN Path

Specifies the new path of the LUN. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`.

| [-new-qtrees <qtrees name>] - New Qtrees Name

Specifies the new qtrees name that you want to move the LUN to.

-new-lun <text> - New LUN Name

Specifies the new name of the LUN.

Examples

```
cluster1::> lun move-in-volume -vserver vs1 -volume vol1 -lun lun1 -new-lun
newlun1
```

Renames `lun1` to `newlun1` on Vserver `vs1` and volume `vol1`.

```
cluster1::> lun show -vserver vs1 -volume vol1
Vserver  Path                               State  Mapped  Type      Size
-----
vs1      /vol/vol1/A/lun1                  online mapped  linux     10MB

cluster1::> lun move-in-volume -vserver vs1 -path /vol/vol1/A/lun1 -new-
path /vol/vol1/B/lun1

cluster1::> lun show -vserver vs1 -volume vol1
Vserver  Path                               State  Mapped  Type      Size
-----
vs1      /vol/vol1/B/lun1                  online mapped  linux     10MB
```

Related references

[lun move start](#) on page 272

lun resize

Changes the size of the LUN to the input value size.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command resizes a LUN. You can resize a LUN that is mapped and online. However, to prevent any potential problems, take the LUN offline before resizing it.

When you reduce the size of the LUN, the data in the LUN could be truncated. You will receive an error message if you reduce the size of the LUN. To avoid this error message, use the *force* parameter.

When you increase the size of a LUN, the maximum resize size is based on the initial geometry of the LUN and the currently available space in the volume. You will receive an error message if you exceed this limit. The `lun show -instance` command reports the "Maximum Resize Size" for a LUN based on the initial geometry. The `lun maxsize` command reports the maximum LUN size based on the available space. The maximum size of the LUN is the smaller of the two limits issued by the `lun show -instance` command or the `lun maxsize` command.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

{ -path <path> - LUN PathSpecifies the path of the LUN that you want to resize. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.**| -volume <volume name> - Volume Name**

Specifies the volume that contains the LUN that you want to resize.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN that you want to resize.

-lun <text>} - LUN Name

Specifies the LUN name that you want to resize.

[-force | -f [*true*]] - Force Reduce LUN Size

Overrides any warnings if you are reducing the size of the LUN. If you use this parameter without a value, it is set to true, and the command does not prompt you when reducing the size of a LUN would produce warnings. If you do not use this parameter, the command displays an error if reducing the size of a LUN would create a problem.

[-size <size>] - New Size

Specifies the new size of the LUN.

- c (1 byte)
- w (2 bytes)
- B (512 bytes)
- k (1024 bytes)
- M (k*k bytes)
- G (k*m bytes)
- T (m*m bytes)

Examples

```
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size 500M -force
```

Resizes LUN `/vol/vol1/lun1` on Vserver `vs1` to 500M, overriding all warnings.

```
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size +5m
```

```
cluster1::> lun show -vserver vs1 -volume vol1
Vserver  Path                               State  Mapped  Type      Size
-----  -
vs1      /vol/vol1/lun1                     online mapped  linux     15MB
```

Adds 5M of space to LUN `/vol/vol1/lun1` for a total of 15MB.

```
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size -10m
```

```
Error: command failed: Reducing LUN size without coordination with the host
system
      may cause permanent data loss or corruption. Use the force flag to
allow
      LUN size reduction.
```

```
cluster1::> lun resize -path /vol/vol1/lun1 -size -5m -f

cluster1::> lun show -vserver vs1 -volume vol1
Vserver  Path                               State  Mapped  Type      Size
-----
vs1      /vol/vol1/lun1                     online mapped  linux    10MB
```

lun show

Display a list of LUNs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The command displays information for LUNs. Use the **instance** parameter to display additional LUN details, such as serial number and space-reservation settings.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the LUNs that match this parameter value.

{ [-path <path>] - LUN Path

Selects the LUNs that match this parameter value. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtrees1/lun1*

[-volume <volume name>] - Volume Name

Selects the LUNs that match this parameter value.

[-qtree <qtree name>] - Qtree Name

Selects the LUNs that match this parameter value.

[-lun <text>]} - LUN Name

Selects the LUNs that match this parameter value.

[-size | -s <size>] - LUN Size

Selects the LUNs that match this parameter value.

[-prefix-size | -P <size>] - Prefix Size (privilege: advanced)

Selects the LUNs that match the prefix stream size that you specify.

[-ostype | -t <LUN Operating System Format>] - OS Type

Selects the LUNs that match this parameter value. The operating system types are:

- *aix* - the LUN stores AIX data.
- *hpux* - the LUN stores HP-UX data.
- *hyper_v* - the LUN stores Windows Server 2008 or Windows Server 2012 Hyper-V data
- *linux* - the LUN stores a Linux raw disk without a partition table.
- *netware* - the LUN stores NetWare data.
- *openvms* - the LUN stores Open-VMS data
- *solaris* - the LUN stores Solaris raw disk in a single-slice partition.
- *solaris_efi* - the LUN stores Solaris_EFI data.
- *vmware* - the LUN stores VMware data
- *windows* - the LUN stores a raw disk type in a single-partition Windows disk using the Master Boot Record (MBR) partitioning style.
- *windows_gpt* - the LUN stores Windows data using the GUID Partition Type (GPT) partitioning style.
- *windows_2008* - the LUN stores Windows data for Windows 2008 or later systems.
- *xen* - the LUN stores Xen data

[-space-reserve {*enabled/disabled*}] - Space Reservation

Selects the LUNs that match this parameter value. A value of *enabled* selects LUN that are space-reserved. A value of *disabled* select LUNs that are non-space reserved.

[-serial <text>] - Serial Number

Selects the LUNs that match this parameter value.

The LUN serial number is a twelve-character alphanumeric string containing one or more of the following:

- upper- and lower-case letters
- numbers
- the characters: &, <, >, /, -, #, \$, %, *, +, =, ?, @, [, !,], ^, ~

Some of the characters that are valid in a LUN serial number also have special meaning to the cluster shell command:

- The question mark (?) activates the command line active help. In order to type a question mark as part of a LUN's serial number, it is necessary to disable active help with the command `set -active-help false`. Active help can later be re-enabled with the command `set -active-help true`.
- The number sign (#) indicates the beginning of a comment to the command line and will cause the remainder of the line to be ignored. To avoid this, enclose the serial number in double quotes (").

- The less than (<), greater than (>), asterisk (*), and exclamation point (!) influence the query behavior of the command. To use these as characters in a LUN's serial query, you must first press escape (ESC). To use these characters to influence the query, enclose the serial number, or partial serial number, in double quotes (") and apply <, >, *, or !, outside of the double quotes.

Alternatively, the `-serial-hex` parameter can be used to select LUNs using the serial number encoded in hexadecimal form.

`[-serial-hex <Hex String>] - Serial Number (Hex)`

Selects the LUNs that match this parameter value. This parameter applies to the LUN serial number encoded in hexadecimal form. See the description of the `-serial` parameter for additional details.

`[-comment <text>] - Comment`

Selects the LUNs that match this parameter value.

`[-space-reserve-honored {true/false}] - Space Reservations Honored`

Selects the LUNs that match this parameter value. A value of *true* select LUNs that have their space reservation honored by the container volume. A value of *false* displays the LUNs that are non-space reserved.

`[-space-allocation {enabled/disabled}] - Space Allocation`

Selects the LUNs that match this parameter value. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.

Specifying *enabled* for this parameter selects LUNs with support enabled for the SCSI Thin Provisioning features.

Specifying *disabled* for this parameter selects LUNs with support disabled for the SCSI Thin Provisioning features.

Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

`[-container-state {online/aggregate-offline/volume-offline/error}] - LUN Container State (privilege: advanced)`

Selects the LUNs that match this parameter value. The container states are:

- *online*- The LUN's aggregate and volume are online.
- *aggregate-offline*- The LUN's aggregate is offline.
- *volume-offline*- The LUN's volume is offline.
- *error*- An error occurred accessing the LUN's volume.

`[-state {online/offline/nvfail/space-error/foreign-lun-error}] - State`

Selects the LUNs that match this parameter value. The states are:

- *online*- The LUN is online.
- *offline*- The LUN is administratively offline, or a more detailed offline reason is not available.
- *foreign-lun-error*- The LUN has been automatically taken offline due to a media error on the associated foreign LUN.
- *nvfail*- The LUN has been automatically taken offline due to an NVRAM failure.

- *space-error*- The LUN has been automatically taken offline due to insufficient space.

[-uuid <UUID>] - LUN UUID

Selects the LUNs that match this parameter value.

[-mapped {mapped/unmapped}] - Mapped

Selects the LUNs that match this parameter value. A value of **mapped** selects the LUNs that are mapped to an initiator group.

[-block-size {512/4KB}] - Physical Size of Logical Block

Selects the LUNs that match this parameter value.

[-device-legacy-id <integer>] - Device Legacy ID

Selects the LUNs that match this parameter value.

[-device-binary-id <text>] - Device Binary ID

Selects the LUNs that match this parameter value.

[-device-text-id <text>] - Device Text ID

Selects the LUNs that match this parameter value.

[-read-only {true/false}] - Read Only

Selects the LUNs that match this parameter value.

[-restore-inaccessible {true/false}] - Fenced Due to Restore

Selects the LUNs that match the state you specify. A value of *true* means that a LUN is fenced for I/O and management due to a restore operation.

[-size-used <size>] - Used Size

Selects the LUNs that match this parameter value.

[-max-resize-size <size>] - Maximum Resize Size

Selects the LUNs that match this parameter value.

[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Creation Time

Selects the LUNs that match this parameter value.

[-class {regular/protocol-endpoint/vvol}] - Class

Selects the LUNs that match this parameter value.

[-node <nodename>] - Node Hosting the LUN

Selects the LUNs that match this parameter value.

[-qos-policy-group <text>] - QoS Policy Group

Selects the LUNs that match this parameter value.

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a LUN, the system will not monitor and control the traffic to it.

[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group

Selects the LUNs that match this parameter value.

An adaptive policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the adaptive policy group is associated.

[-caching-policy <text>] - Caching Policy Name

Display the LUNs that match the specified cache.

A caching policy defines the caching behavior of this LUN at the Flash Cache level. If a caching policy is not assigned to this LUN, the system uses the caching policy

that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

`[-is-clone {true/false}] - Clone`

Selects the LUNs that match this parameter value.

`[-is-clone-autodelete-enabled {true/false}] - Clone Autodelete Enabled`

Selects the LUNs that match this parameter value.

`[-inconsistent-import {true/false}] - Inconsistent Import`

Selects the LUNs that match this parameter value. A value of *true* means that the import of this LUN is incomplete.

`[-serial-7-mode <text>] - 7-mode Serial Number (privilege: advanced)`

Selects the LUNs that match this parameter value.

LUNs transitioned from Data ONTAP 7-Mode are assigned new serial numbers for use with Clustered Data ONTAP. The original 7-Mode serial number is displayed in this field for reference.

`[-application <text>] - Application`

Selects the LUNs that are part of an application that matches the parameter value.

`[-include-offline-containers [true]] - Include LUNs on Offline Volumes and Aggregates (privilege: advanced)`

If true, include available information for LUNs in offline aggregates and offline volumes in the output. By default, LUNs in offline aggregates and offline volumes are excluded from the output.

Examples

The following example displays details of the LUN at path /vol/vol1/lun1 in Vserver vs1.

```
cluster1::> lun show -vserver vs1 -path /vol/vol1/lun1 -instance
Vserver Name: vs1
LUN Path: /vol/vol1/lun1
Volume Name: vol1
Qtree Name: ""
LUN Name: lun1
LUN Size: 10MB
```

```

        OS Type: linux
        Space Reservation: disabled
        Serial Number: wCVt1jIlvQWv
        Serial Number (Hex): 77435674315d496c76515776
        Comment: new comment
    Space Reservations Honored: false
        Space Allocation: disabled
        State: offline
        LUN UUID: 76d2eba4-dd3f-494c-ad63-1995c1574753
        Mapped: mapped
        Block Size: 512
        Device Legacy ID: -
        Device Binary ID: -
        Device Text ID: -
        Read Only: false
    Fenced Due to Restore: false
        Used Size: 5MB
        Maximum Resize Size: 64.00GB
        Creation Time: 9/14/2016 13:55:09
        Class: regular
    Node Hosting the LUN: node1
        QoS Policy Group: -
        Caching Policy Name: -
        Clone: false
    Clone Autodelete Enabled: false
    Inconsistent Import: false
    Application: -

```

The following example displays information for the LUN with serial number 1r/wc+9Cpbls:

```

cluster1::> lun show -serial 1r/wc+9Cpbls
Vserver  Path                               State  Mapped  Type      Size
-----  -
vs1      /vol/vol2/lun1                     online mapped  linux     10MB

```

The following example displays all the LUNs on Vserver vs1 and volume vol1:

```

cluster1::> lun show -vserver vs1 -volume vol1
Vserver  Path                               State  Mapped  Type      Size
-----  -
vs1      /vol/vol1/lun1                     offline mapped  linux     10MB
vs1      /vol/vol1/lun2                     online  mapped  windows  47.07MB
2 entries were displayed.

```

lun bind commands

The bind directory

lun bind create

Bind a VVol LUN to a protocol endpoint

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command creates a new binding between a protocol endpoint and a vvol LUN. If a binding between the specified endpoint and vvol already exists, the reference count for the binding is incremented by one.

Note: For optimal results, the protocol endpoint and vvol must be hosted by the same node in the cluster.

Parameters**-vserver <Vserver Name> - Vserver name**

Specifies the name of the Vserver.

-protocol-endpoint-path <path> - Protocol EndpointSpecifies the path to the protocol endpoint. The specified LUN must already exist and be of class "protocol-endpoint". Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`.**-vvol-path <path> - VVol Path**Specifies the path to the vvol. The specified LUN must already exist and be of the class "vvol". Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`.**Examples**

```
cluster1::*> lun bind create -vserver vs1 -protocol-endpoint-path /vol/VV1/PE1 -vvol-path /vol/VV3/234ace
```

lun bind destroy

Unbind a VVol LUN from a protocol endpoint

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.**Description**

Decrement the reference count of the binding between a protocol endpoint and vvol LUN. If the resulting reference count is zero, the binding is removed.

Parameters**-vserver <Vserver Name> - Vserver name**

Specifies the Vserver.

-protocol-endpoint-path <path> - Protocol EndpointSpecifies the path of the protocol endpoint LUN. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`.**-vvol-path <path> - VVol Path**Specifies the path of the vvol LUN. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`.**[-force [true]] - If true, unbind the Vvol completely even if the current reference count is greater than 1. The default is false.**

Completely remove the specified binding, regardless of the current reference count.

Examples

```
cluster1::*> lun bind destroy -protocol-endpoint-path /vol/VV2/PE2 -vvol-path /vol/VV2/30dfab -vserver vs1
```

lun bind show

Show list of VVol bindings

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Shows the configured VVol to protocol endpoint bindings.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the bindings that match this parameter value.

[-protocol-endpoint-msid <integer>] - PE MSID

Selects the bindings that match this parameter value.

[-protocol-endpoint-vdisk-id <text>] - PE Vdisk ID

Selects the bindings that match this parameter value.

[-vvol-msid <integer>] - VVol MSID

Selects the bindings that match this parameter value.

[-vvol-vdisk-id <text>] - VVol Vdisk ID

Selects the bindings that match this parameter value.

[-vserver-uuid <UUID>] - Vserver UUID

Selects the bindings that match this parameter value.

[-protocol-endpoint-path <path>] - Protocol Endpoint

Selects the bindings that match this parameter value. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*.

[-protocol-endpoint-node <nodename>] - PE Node

Selects the bindings that match this parameter value.

[-vvol-path <path>] - VVol

Selects the bindings that match this parameter value. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*.

[-vvol-node <nodename>] - VVol Node

Selects the bindings that match this parameter value.

[-secondary-lun <Hex 64bit Integer>] - Secondary LUN

Selects the bindings that match this parameter value.

[-is-optimal {true/false}] - Optimal binding

Selects the bindings that match this parameter value.

[-reference-count <integer>] - Reference Count

Selects the bindings that match this parameter value.

Examples

```
cluster1::*> lun bind show -vserver vs1
Vserver      Protocol Endpoint      Node
              Vvol LUN
Optimal?
-----
vs1           /vol/VV1/PE1      cluster-node1
              /vol/VV2/30dfab   d20000010000 false
              /vol/VV3/234ace d20000020000 true
              /vol/VV3/234acf d20000030000 true
              /vol/VV2/PE2      cluster-node2
              /vol/VV2/30dfab   d20000010000 true
4 entries were displayed.
```

Manage Lun Copy Operations

Manage LUN copy operations

lun copy cancel

Cancel a LUN copy operation before the new LUN has been created

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `lun copy cancel` command cancels an ongoing LUN copy operation prior to creation of the new LUN. The command fails if the LUN already exists at the destination path; in that case, use the [lun delete](#) command to delete the LUN at the destination path.

All data transfers will be halted.

Note: This is an advanced command because the preferred way to cancel a LUN copy operation is to wait until the new LUN becomes visible, and then use the [lun delete](#) command to delete the LUN.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::*> lun copy cancel -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

[lun delete](#) on page 222

lun copy modify

Modify an ongoing LUN copy operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy modify` command modifies the maximum throughput of an ongoing copy operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

-max-throughput {<integer>[KB/MB/GB/TB/PB]} - Maximum Transfer Rate (per sec)

Specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

Note: The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun copy modify -vserver vs1 -destination-path /vol/vol2/lun2 -
max-throughput 25MB
```

lun copy pause

Pause an ongoing LUN copy operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy pause` command pauses an ongoing copy operation. Use the `lun copy resume` command to resume the copy operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::> lun copy pause -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

[lun copy resume](#) on page 241

lun copy resume

Resume a paused LUN copy operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy resume` command resumes a paused copy operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::> lun copy resume -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

[lun copy pause](#) on page 240

lun copy show

Display a list of LUNs currently being copied

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy show` command shows information about LUNs currently being copied in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Destination Vserver Name

Selects LUN copy operations that match this parameter value.

[-destination-path <path>] - Destination Path

Selects LUN copy operations that match this parameter value.

[-source-vserver <vserver name>] - Source Vserver Name

Selects LUN copy operations that match this parameter value.

[-source-path <path>] - Source Path

Selects LUN copy operations that match this parameter value.

[-source-snapshot <snapshot name>] - Source Snapshot Name

Selects LUN copy operations that match this parameter value.

[-is-promoted-early {true/false}] - Is Destination Promoted Early

Selects LUN copy operations that match this parameter value.

[-max-throughput {<integer>[KB/MB/GB/TB/PB]}] - Maximum Transfer Rate (per sec)

Selects LUN copy operations that match this parameter value.

[-job-status {Preparing/Allocation-Map/Data/Destroying/Paused-Admin/Paused-Error/Complete/Destroyed}] - LUN Copy Status

Selects LUN copy operations that match this parameter value. The possible values are:

- **Preparing** - the LUN copy job is in Preparing status.
- **Allocation-Map** - the LUN copy job is in Allocating status.
- **Data** - the LUN copy job is in Moving Data status.
- **Destroying** - the LUN copy job is in Destroying status.
- **Paused-Admin** - the LUN copy job is in Paused By Admin status.
- **Paused-Error** - the LUN copy job is in Paused By Error status.
- **Complete** - the LUN copy job is in Complete status.
- **Destroyed** - the LUN copy job is in Destroyed status.

[-progress-percent <percent>] - LUN Copy Progress (%)

Selects LUN copy operations that match this parameter value.

[-elapsed-time <time_interval>] - Elapsed Time

Selects LUN copy operations that match this parameter value.

[-cutover-time <time_interval>] - Cutover Time

Selects LUN copy operations that match this parameter value.

[-is-snapshot-fenced {true/false}] - Is Snapshot Fenced

Selects LUN copy operations that match this parameter value.

[-is-destination-ready {true/false}] - Is Destination Ready

Selects LUN copy operations that match this parameter value.

[-last-failure-reason <text>] - Last Failure Reason

Selects LUN copy operations that match this parameter value.

Examples

```
cluster1::> lun copy show
Vserver      Destination Path      Status      Progress
-----
vs1          /vol/vol2/lun1       Data        35%
vs1          /vol/vol2/lun2       Complete    100%
2 entries were displayed.
```

The example above displays information about all the LUN copy operations in the cluster.

```
cluster1::> lun copy show -vserver vs1 -destination-path /vol/vol2/lun1 -
instance

      Destination Vserver Name: vs1
      Destination Path: /vol/vol2/lun1
      Source Vserver Name: vs1
      Source Path: /vol/vol1/lun1
      Source Snapshot Name: -
      Is Destination Promoted Early: false
      Maximum Transfer Rate (per sec): 0B
      LUN Copy Status: Data
      LUN Copy Progress (%): 35%
      Elapsed Time: 145s
      Cutover Time (secs): 0s
      Is Snapshot Fenced: true
      Is Destination Ready: true
      Last Failure Reason: -
```

lun copy start

Start copying a LUN from one volume to another within a cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy start` command initiates copying of a LUN from one volume to another. The destination volume can be located in the same Vserver as the source volume (intra-Vserver copy) or in a different Vserver (inter-Vserver).

Note: A cluster administrator must first create a Vserver peering relationship using `vserver peer create` before initiating an inter-Vserver LUN copy operation.

Parameters

-vserver <Vserver Name> - Destination Vserver Name

Specifies the name of the Vserver that will host the new LUN.

| -destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

-source-path <path>} - Source Path

Specifies the full path to the source LUN, in the format `/vol/<volume>[/snapshot/<snapshot>[/<qtree>]]/<lun>`.

[-source-vserver <vserver name>] - Source Vserver Name

Optionally specifies the name of the Vserver hosting the LUN to be copied.

If this parameter is not specified, it is assumed that an intra-Vserver copy operation is being initiated. The source volume is expected to be in the same Vserver as the destination volume.

`[-promote-early [true]] - Promote Early`

Optionally specifies that the destination LUN needs to be promoted early.

If the destination is promoted early, the new LUN will be visible immediately. However, Snapshot copies of the volume containing the new LUN cannot be taken until the LUN copy operation reaches 'Moving Data' status.

If the destination is promoted late, the new LUN will be visible only after it has been fully framed. However, the LUN copy job will not block the creation of Snapshot copies of the volume containing the new LUN.

If this parameter is not specified, the destination LUN will be promoted late.

`[-max-throughput {<integer>[KB/MB/GB/TB/PB]}] - Maximum Transfer Rate (per sec)`

Optionally specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

If this parameter is not specified, throttling is not applied to the data transfer.

Note: The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun copy start -vserver vs2 -destination-path /vol/vol2/lun2 -
source-vserver vs1 -source-path /vol/vol1/lun1
```

Starts an inter-Vserver copy of LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs2*.

```
cluster1::> lun copy start -vserver vs1 -destination-path /vol/vol2/lun2 -
source-path /vol/vol1/lun1
```

Starts an intra-Vserver copy of LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs1*.

```
cluster1::> lun copy start -vserver vs1 -destination-path /vol/vol2/lun2 -
source-path /vol/vol1/.snapshot/snap1/lun1
```

lun igroup commands

Manage initiator groups

lun igroup add

Add initiators to an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds initiators to an existing initiator group (igroup). You can add an initiator to an initiator group only if there are no LUN mapping conflicts. Mapping conflicts occur when an initiator is already paired with a LUN. If you attempt to run this command and there are LUN mapping conflicts, the command returns an error.

An initiator cannot be a member of two igroups of different OS types. For example, if you have an initiator that belongs to a Solaris igroup, the command does not allow you to add this initiator to an AIX igroup.

When you add FCP initiators, you can specify an alias instead of the initiator's World Wide Port Name (WWPN) or the iSCSI Qualified name (IQN).

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group to which you want to add a new initiator.

-initiator <text>, ... - Initiators

Specifies the initiator that you want to add. You can specify the WWPN, IQN, or alias of the initiator.

Examples

```
cluster1::> lun igroup add -vserver vs1 -igroup ig1 -initiator ign.
1992-08.com.mv.mvinitiator
```

lun igroup bind

Bind an existing initiator group to a given portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command binds an initiator group to a port set so the host knows which LIFs or TPGs to access. When you bind a port set to an igroup, the host knows which iSCSI or FCP LIF to access. If you do not bind an igroup to a port set, and you map a LUN to the igroup, then the initiators in the igroup can access the LUN on any port on the Vserver.

The initiator group cannot be bound to another port set when you use this command. If you attempt to bind a port set to an initiator group that is already bound to an existing port set, the command returns an error. You can only bind an initiator group to one port set at a time.

If the initiator group is bound, use the [lun igroup unbind](#) command to unbind the initiator group from the port set. After the initiator group is unbound, you can bind it to another port set.

You can only bind an initiator group to a non-empty port set.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group that you want to bind a port set to.

-portset <text> - Portset Binding Igroup

Specifies the port set name that you want to bind an initiator group to.

Examples

```
cluster1::> lun igroup bind -vserver vs1 -igroup ig1 -portset-name ps1
```

Related references

[lun igroup unbind](#) on page 252

lun igroup create

Create a new initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new initiator group (igroup). Use igroups to control which hosts have access to specific LUNs. When you bind an igroup to a port set, a host in the igroup can access the LUNs only by connecting to the target ports in the port set.

When you create an igroup, you can add multiple existing initiators by specifying them in a list, separating them with commas. Later, you can add or remove initiators from the initiator group. Use the [lun igroup add](#) command to add initiators. Use the [lun igroup remove](#) command to remove an initiator. Unless the **-initiator** option is supplied, no initiators are added to a new igroup.

You can also bind a port set to an initiator when you create an initiator group. You can modify the port set binding of an initiator group by using the [lun igroup bind](#) command or the [lun igroup unbind](#) command.

The name you assign to an igroup is independent of the name of the host that is used by the host operating system, host files, or Domain Name Service (DNS). If you name an igroup *aix1*, for example, it is not mapped to the actual IP host name (DNS name) of the host.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the name of the new initiator group. An initiator group name is a case-sensitive name that must contain one to 96 characters. Spaces are not allowed.

Note: It might be useful to provide meaningful names for igroups, ones that describe the hosts that can access the LUNs mapped to them.

{ [-protocol <protocol_enum>] - Protocol

Specifies if the initiator group protocol is *fc*, *iscsi*, or *mixed*.

| [-fcp | -f [true]] - FCP

Specifies FCP as the protocol type of the new igroup.

| [-iscsi | -i [true]] - iSCSI

Specifies iSCSI as the protocol type of the new igroup.

-ostype | -t <Initiator Group OS Type> - OS Type

Specifies the operating system type for the new initiator group. The operating system type indicates the type of host operating system used by all of the initiators in the igroup. All initiators in an igroup must be of the same operating system type. The operating system types of initiators are

- solaris
- windows
- hpux
- aix
- linux
- netware
- vmware
- openvms
- xen
- hyper_v

[-portset | -a <text>] - Portset Binding Igroup

Specifies that a port set is bound to the initiator.

-initiator <text>, ... - Initiators

Specifies the initiators that are attached to the new initiator group. By default, no initiators are added to the new igroup.

Examples

```
cluster1::> lun igroup create -vserver vs1 -igroup ig1 -protocol mixed -
ostype linux -initiator iqn.2001-04.com.example:abc123
```

lun igroup delete

Delete an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an existing initiator group. By default, you cannot delete an initiator group if LUN maps for that initiator group exist. You need to unmap all the LUNs that are associated with that initiator group before you can delete the initiator group. Use the [lun unmap](#) command to remove LUNS from an initiator group.

You can specify the **force** option to delete an initiator group and remove existing LUN maps defined for that initiator group.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group that you want to delete.

[-force | -f [*true*]] - Force

Deletes an initiator group and all associated LUN maps.

Examples

```
cluster1::> lun igroup delete -vserver vs1 -igroup ig1
```

Related references

[lun mapping delete](#) on page 264

lun igroup disable-aix-support

Disables SAN AIX support on the cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the SAN AIX support across the cluster (all Vservers and all AIX initiator groups). However, before you can disable SAN AIX support, you must remove all SAN AIX related objects from the cluster. You need to unmap all the LUNs that are associated with the AIX initiator groups. Then you need to delete all of the AIX initiator groups. Use the [lun unmap](#) command to remove LUNS from an initiator group. Use the `igroup delete` command to delete an initiator group.

Note: This command is not intended to be used in normal operation. Use only when you are downgrading to a release that does not support SAN AIX operation.

Examples

```
cluster1::> lun igroup disable-aix-support
```

Related references

[lun mapping delete](#) on page 264

lun igroup modify

Modify an existing initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies an attribute for an initiator group. Currently, the only settable attribute is the operating system.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group whose attribute you want to modify.

[-ostype | -t <Initiator Group OS Type>] - OS Type

Specifies the operating system that you want to modify. The operating system types of initiators are

- solaris
- windows
- hpux
- aix
- linux
- netware
- vmware
- openvms
- xen
- hyper_v

[-delete-on-unmap { true/false }] - Delete on Last Unmap

Specifies if this initiator group will be deleted automatically when no longer used in a LUN mapping relationship.

Examples

```
cluster1::> lun igroup modify -vserver vs1 -igroup ig1 -ostype windows
```

lun igroup remove

Remove initiators from an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes an initiator from an initiator group. You can only remove an initiator if no existing LUN maps are defined for that initiator group. You must unmap the LUNs from the initiator group with the [lun unmap](#) command before you can remove initiators from the initiator group.

You can use the **force** option to remove an initiator and associated LUN maps.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group from which you want to remove an initiator.

-initiator <text>, ... - Initiators

Specifies the initiator name you want to remove. Use the WWPN, IQN or the alias of the initiator.

[-force | -f [true]] - Force

Forcibly removes an initiator and any associated LUN maps.

Examples

```
cluster1::> lun igroup remove -vserver vs1 -igroup ig1 -initiator iqn.
1992-08.com.mv.mvinitiator
```

Related references

[lun mapping delete](#) on page 264

lun igroup rename

Rename an existing initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command renames an existing initiator group. When you rename an initiator group, this action does not affect access to the LUNs mapped to the initiator group you want to rename.

An initiator group name is a case-sensitive name and must meet the following requirements:

- Must contain one to 96 characters. Spaces are not allowed.
- Can contain the letters A through Z, a through z, numbers 0 through 9, hyphen (-), underscore (_), colon (:), and period (.).
- Must start with a letter or number.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group you want to rename.

-new-name <text> - New Igroup Name

Specifies the new name of the initiator group.

Examples

```
cluster1::> lun igroup rename -vserver vs1 -igroup ig1 -new-name ignew1
```

lun igroup show

Display a list of initiator groups

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays status information for initiator groups (igroup). By default, the command displays status for all initiator groups.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Specifies the Vserver.

[-igroup <text>] - Igroup Name

Selects the initiator groups that match this parameter value.

[-protocol <protocol_enum>] - Protocol

Selects the initiator groups that match this parameter value (**FCP**, **iSCSI**, or **mixed**).

[-ostype | -t <Initiator Group OS Type>] - OS Type

Selects the initiator groups that match this parameter value. The operating system types are

- **solaris**
- **windows**
- **hpux**
- **aix**
- **linux**
- **netware**
- **vmware**
- **openvms**
- **xen**

- **hyper_v**

[-portset | -a <text>] - Portset Binding Igroup

Selects the initiator groups that match this parameter value.

[-initiator <text>, ...] - Initiators

Selects the initiator groups that match this parameter value.

[-uuid <UUID>] - Igroup UUID

Selects the initiator groups that match this parameter value.

[-delete-on-unmap { true/false }] - Delete on Last Unmap

Selects the initiator groups that match this parameter value. A value of **true** displays all the initiator groups that will be deleted automatically when they are no longer used in a LUN mapping relationship.

Examples

```
cluster1::> igroup show -instance
      Vserver Name: vs0
      Igroup Name: ig1
      Protocol: mixed
      OS Type: linux
Portset Binding Igroup: -
      Igroup UUID: 358338ba-cfd6-11df-a9ab-123478563412
      Initiators: ign.1992-08.com.mv:abc (not logged in)

      Vserver Name: vs0
      Igroup Name: ig2
      Protocol: mixed
      OS Type: linux
Portset Binding Igroup: -
      Igroup UUID: 3fb136c7-cfd6-11df-a9ab-123478563412
      Initiators: -

      Vserver Name: vs1
      Igroup Name: ig1
      Protocol: mixed
      OS Type: windows
Portset Binding Igroup: p1
      Igroup UUID: 03accf6b-d08c-11df-a9ab-123478563412
      Initiators: -
3 entries were displayed.
```

lun igroup unbind

Unbind an existing initiator group from a portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command unbinds an initiator group from a port set. When you unbind an initiator group from a port set, all of the initiators in the initiator group have access to all target LUNs on all network interfaces.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group that you want to unbind from the port set.

Examples

```
cluster1::> lun igroup unbind -vserver vs1 -igroup ig1
```

lun import commands

Manage Foreign LUN Import

lun import create

Create an import relationship

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command creates an import relationship between a specified LUN and a specified foreign disk so you can import the foreign disk data into a LUN.

The foreign disk must be marked as foreign using [storage disk set-foreign-lun](#) command before you can begin the import progress.

The LUN must be of the same size as the foreign disk.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN where you import data to from the foreign disk data.

-foreign-disk <text> - Foreign Disk Serial Number

Specifies the serial number of the Foreign Disk.

-path <path> - LUN Path

Specifies the path of the LUN where you want to import the data of the foreign disk to. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`.

Examples

```
cluster1::> lun import create -vserver vs1 -path /vol/dvol1/lun1 -foreign-disk 6000B5D0006A0000006A020E00040000
```

Related references

[storage disk set-foreign-lun](#) on page 1087

lun import delete

Deletes the import relationship of the specified LUN or the specified foreign disk

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command deletes the import relationship of a specified LUN or a specified foreign disk.

You cannot use this command if an import is in-progress between the foreign disk and the LUN unless you use the force option. The import has to either successfully completed or be stopped before deleting the import relationship.

You can use the `lun import stop` command to stop the data import, and then you delete the import relationship.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN that you want to delete the import relationship.

-path <path> - LUN Path

Specifies the path of the LUN where you want to delete the import relationship. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`.

| -foreign-disk <text>} - Foreign Disk Serial Number

Specifies the serial number of the foreign disk.

[-force {true/false}] - Force Delete

When set to true, stops the in progress data import.

Examples

```
cluster1::> lun import delete -vserver vs1 -path /vol/vol2/lun2
```

Deletes the import relationship of lun2 at the path `/vol/vol2/lun2`.

```
cluster1::> lun import delete -vserver vs0 -foreign-disk
6000B5D0006A0000006A020E00040000
```

Related references

[lun import stop](#) on page 259

lun import pause

Pause the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command pauses the data import to a specified LUN.

This command does not reset all import checkpoints. To resume a paused import, use the `lun import resume` command to retart from the last checkpoint taken before you paused the data import.

If you want to resume the data import from the beginning, use the `lun import stop` command. Then use the `lun import start` command.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to pause the data import to.

-path <path> - LUN Path

Specifies the path of the LUN you want to pause the data import to. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`.

Examples

```
cluster1::> lun import pause -vserver vs1 -path /vol/vol2/lun2
```

lun import prepare-to-downgrade

Prepares LUN import to be downgraded

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command prepares the cluster for a downgrade to a version of Data ONTAP earlier than 8.3.1 by disabling the online LUN import feature. Before using this command verify that all LUNs in an import relationships are offline by running [lun show](#).

Examples

```
cluster1::> lun import prepare-to-downgrade
```

Related references

[lun show](#) on page 231

lun import resume

Resume the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Resumes the data import to a specified LUN.

The import starts from the last checkpoint taken before you paused the data import.

If you want to resume the data import from the beginning, use the `lun import stop` command. Then use the `lun import start` command.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to resume the data import to.

-path <path> - LUN Path

Specifies the path of the LUN that you want to resume the data import to. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`.

Examples

```
cluster1::> lun import resume -vserver vs1 -path /vol/vol2/lun2
```

lun import show

Display a list of import relationships

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays information about the import relationships.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Displays import relationships for a specified Vserver.

[-foreign-disk <text>] - Foreign Disk Serial Number

Enables you to see the import relationship for a particular foreign disk with the specified serial number.

[-path <path>] - LUN Path

Enables you to see the import relationship for a particular LUN path. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

[-import-home-node {<nodename>/local}] - Import Home Node

Enables you to see the node that initially started the data import and where the I/O for the foreign disk is directed. If failover occurs, any in-progress data import restarts on the partner node.

[-import-current-node {<nodename>/local}] - Import Current Node

Displays the node that is currently importing data and where the I/O for the foreign disk is directed. During giveback and if the import home node is different from the current home node, import restarts on the initial node (import-home-node).

[-operation-in-progress {import/verify}] - Operation in Progress

Enables you to see the imports in progress or import verification in progress.

[-admin-state {stopped/started/paused}] - Admin State

Enables you to see the import relationships for a specified administrative state. For example, you can list all the imports that have started in a cluster.

[-operational-state {in_progress/failed/completed/stopped/paused}] - Operational State

Enables you to see the import relationships for a specified operational state. For example, you can list all the imports that have completed in a cluster.

[-percent-complete <integer>] - Percent Complete

Enables you to see the percentage of completion for both import and verification. If you want to see all the complete imports and verifications, you would specify 100.

[-imported-blocks <integer>] - Blocks Imported

Enables you to see the number of blocks that have been imported to the LUN.

[-compared-blocks <integer>] - Blocks Compared

Enables you to see the number of LUN and foreign disk blocks that have been compared.

[-total-blocks <integer>] - Total Blocks

Enables you to see the total number of blocks that must be imported to complete the data import to a LUN or the number of blocks that must be compared to complete the import verification.

[-estimated-remaining-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Estimated Remaining Duration

If this parameter is specified, the command displays import or verify operations that match the specified time.

[-failure-reason <text>] - Failure Reason

Selects LUN import operations that match this parameter value.

[-max-throughput-limit {<integer>[KB/MB/GB/TB/PB]}] - Maximum Throughput Limit (per sec)

Selects the LUN import operations that match this parameter value. This value is the throughput limit at which an import or verify will be throttled. By default, there is no throttling.

[-current-throughput {<integer>[KB/MB/GB/TB/PB]}] - Current Throughput (per sec)

Selects the LUN import operations that match this parameter value. This value is the current throughput for an in-progress import or verify operation.

[-qos-policy-group <text>] - QoS Policy Group

Selects the LUN import operations that match this parameter value. This value is the QoS policy group associated with an import relationship.

Examples

```
cluster1::> lun import show
vserver      foreign-disk      path
operation-in-progress  admin-state  operational-state  percent-complete
-----

stop      -                        0%

```

Display information about the LUNs in an import relationships in a specific vsriver.

```

cluster1::> lun import show -admin-state start
vserver  path                foreign-disk                admin-
state operational-state percent-complete
-----
vs2      /vol/dvoll/lun2         vgv3040f46a:vgbr300s70:9.126L2
start      in-progress             5%

```

lun import start

Start the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command initiates the data import to a specified LUN.

You must use the `lun import create` command to create an import relationship between a LUN and a foreign disk before you can initiate the data import.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver that contains the LUN you want to import data to.

-path <path> - LUN PathSpecifies the path of the LUN that you want to import data to. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.**Examples**

```
cluster1::> lun import start -vserver vs1 -path /vol/vol2/lun2
```

lun import stop

Stop the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.**Description**

This command stops the data import into a specified LUN.

After you stop the data import and if you start the import again using `lun import start` command, then the import restarts from the beginning.**Parameters****-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver that contains the LUN you want to stop importing data to.

-path <path> - LUN Path

Specifies the path of the LUN that you want to stop the data import to.

Examples

```
cluster1::> lun import stop -vserver vs1 -path /vol/vol2/lun2
```

Related references[lun import start](#) on page 258**lun import throttle**

Modify the max throughput limit for the specified import relationship

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.**Description**

This command throttles the speed of the import for a given LUN by specifying a maximum throughput limit on the import.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver that contains the LUN to which data from the foreign disk is imported.

-path <path> - LUN Path

Specifies the path of the LUN to which data from the foreign disk is imported.

Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

-max-throughput-limit {<integer>[KB/MB/GB/TB/PB]} - Maximum Throughput Limit (per sec)

Specifies the maximum amount of throughput to be allocated for processing import requests on the bound LUN. At the time of creation, the default is zero. A value of zero implies that import traffic is processed by the system at best effort rate along with on-going user I/O. A non-zero value indicates that import will be throttled at a rate which is at most the maximum throughput limit set.

Examples

```
cluster1::*> lun import throttle -vserver vs1 -path /vol/vol1/lun1 -max-throughput-limit 3M
```

lun import verify commands

Manage Foreign LUN import verify

lun import verify start

Start the verification of the foreign disk and LUN data

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command compares the LUN and the foreign disk block by block. You are not required to run this command; it is optional. Before you can do this verification process, the operation state must be stopped or completed. Use the `lun import show` command to determine the operation state.

If a block mismatch occurs, the verification process stops.

Verification must be done offline. Ensure the foreign disk and LUN cannot be accessed by a host. To prevent access of the LUN, the LUN should be taken offline administratively using the `lun offline` command.

Note: The specified LUN must be in an import relationship with a foreign disk before you can verify the data import.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver that contains the LUN you want to compare block by block with the foreign disk.

-path <path> - LUN Path

Specifies the path of the LUN that you want to compare the foreign disk to.

Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

Examples

```
cluster1::> lun import verify start -vserver vs1 -path /vol/vol2/lun2
```

lun import verify stop

Stop the verify for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command stops the block by block verification of the foreign disk and LUN data.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to stop block by block comparison with the foreign disk.

-path <path> - LUN Path

Specifies the path of the LUN that you want to stop the block by block comparison. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

Examples

```
cluster1::> lun import verify stop -vserver vs1 -path /vol/vol2/lun2
```

lun mapping commands

Manage LUN Maps

lun mapping add-reporting-nodes

Add Reporting Nodes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is used before or after a data mobility event that modifies the owning node of the LUN to add the new optimized nodes to the specified LUN mapping's reporting nodes.

For more information on managing reporting nodes in response to data mobility events, please see the Data ONTAP SAN Administration Guide.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver containing the LUN.

{ -path <path> - LUN Path

Specifies the path of the LUN. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`.

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN.

-lun <text> - LUN Name

Specifies the LUN name.

-igroup | -g <text> - Igroup Name

Specifies the igroup the LUN is mapped to.

{ -local-nodes [true] - Add Nodes for Current LUN Location

Add the current LUN owner node and HA partner to the LUN mapping's reporting nodes.

This option should be used after a LUN mobility event to restore optimized access to the LUN.

| -destination-aggregate <aggregate name> - Add Nodes for Aggregate

Add the specified aggregate's owner node and HA partner to the LUN mapping's reporting nodes.

This option may be used prior to a LUN mobility event that changes the LUN's containing aggregate.

| -destination-volume <volume name> - Add Nodes for Volume

Add the specified volume's owner node and HA partner to the LUN mapping's reporting nodes.

This option may be used prior to a LUN mobility event that changes the LUN's containing volume.

| -all [true]} - Add All Nodes (privilege: advanced)

Set the LUN mapping to report on all nodes in preparation for a revert to a previous version of Data ONTAP.

Examples

```
cluster1::> lun mapping add-reporting-nodes -vserver vs1 -path /vol/vol1/
lun1 -igroup ig1
```

Add the current owner node and HA partner for the LUN mapping of `/vol/vol1/lun1` to igroup `ig1`

```
cluster1::> lun mapping add-reporting-nodes -vserver vs1 -volume vol1 -lun *
-igroup ig1 -destination-aggregate aggr2
```

lun mapping create

Map a LUN to an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command maps a LUN to all of the initiators in an initiator group (igroup). After you map the LUN, the LUN is visible to all initiators in the igroup.

Data ONTAP ensures that there are no LUN map conflicts whether the LUN is offline or online. A LUN map conflict is a mapping that would violate either of the following rules:

- Each LUN can be mapped to an initiator only once. A LUN can be mapped to multiple igroups as long as each igroup has a distinct set of initiators.
- LUN IDs must be unique such that every initiator has a unique ID for each LUN to which it is mapped. If you map a LUN to an igroup, the LUN ID for that mapping cannot be reused by any of the initiators in that igroup.

In order to determine if a LUN ID is valid for a mapping, Data ONTAP checks each initiator in the igroup to make sure that the LUN ID is not used for another mapping that includes that initiator.

Note: Prior to mapping a LUN, you must have at least one iSCSI or FCP LIF provisioned on the LUN's owner node and high-availability partner node.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to map.

{ -path <path> - LUN Path

Specifies the path of the LUN that you want to map. Examples of correct LUN paths are `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`.

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN you want to map.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN you want to map.

-lun <text> - LUN Name

Specifies the LUN name that you want to map.

-igroup | -g <text> - Igroup Name

Specifies the igroup that you want to map.

[-lun-id <integer>] - LUN ID

Specifies the LUN ID for the mapping. The LUN ID is specific to the mapping, not to the LUN itself. This is used by the initiators in the igroup as the Logical Unit Number for the initiator when accessing the storage.

[-additional-reporting-node <nodename>] - Additional Reporting Node (privilege: advanced)

Specifies an additional node to populate the **-reporting-nodes** list when creating the LUN mapping. The specified node's high availability partner will be automatically populated as well. Use this parameter when preferred data mobility destinations are known ahead of time and the appropriate paths can be pre-configured.

Examples

```
cluster1::> lun mapping create -vserver vs1 -path /vol/vol1/lun1 -igroup ig1
-lun-id 8
```

lun mapping delete

Unmap a LUN from an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command unmaps a LUN from an initiator group. After you use this command, the LUN is not visible to any of the initiators in the initiator group.

Parameters

-vserver <Vserver Name> - Vserver Name

Selects the LUN maps for the Vserver that matches the parameter value.

{ -path <path> - LUN Path

Specifies the path of the LUN you want to unmap. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtreen1/lun1*.

| -volume <volume name> - Volume Name

Specifies the volume of the LUN you want to unmap.

-qtree <qtree name> - Qtree Name

Specifies the qtree of the LUN you want to unmap.

-lun <text>} - LUN Name

Specifies the name of the LUN you want to unmap.

-igroup | -g <text> - Igroup Name

Specifies the initiator group that you want to unmap the LUN from.

Examples

```
cluster1::> lun mapping delete -vserver vs1 -path /vol/vol1/lun1 -igroup ig1
```

lun mapping remove-reporting-nodes

Remove Reporting Nodes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is used after a data mobility event to remove reporting nodes that are no longer required for optimized access from the specified LUN mapping.

For more information on managing reporting nodes in response to data mobility events, please see the Data ONTAP SAN Administration Guide.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver containing the LUN.

{ -path <path> - LUN Path

Specifies the path of the LUN. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtreen1/lun1*.

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN.

-lun <text> - LUN Name

Specifies the LUN name.

-igroup | -g <text> - Igroup Name

Specifies the igroup the LUN is mapped to.

-remote-nodes [true] - Remove Remote Nodes for LUN Location

If specified, remove all nodes other than the LUN's owner and HA partner from the LUN mapping's reporting nodes.

Examples

```
cluster1::> lun mapping remove-reporting-nodes -vserver vs1 -path /vol/vol1/
lun1 -igroup ig1
```

lun mapping show

Lists the mappings between LUNs and initiator groups.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command lists the mappings between LUNs and initiator groups.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the LUN maps for the Vserver that matches the parameter value.

{ [-path <path>] - LUN Path

Selects the LUN maps for the LUN with the path that matches the parameter value. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

| [-volume <volume name>] - Volume Name

Selects the LUN maps for the volumes that match the parameter value.

[-qtree <qtree name>] - Qtree Name

Selects the LUN maps for the queue trees that match the parameter value.

[-lun <text>] - LUN Name

Selects the LUN maps for the LUNs with a name that matches the parameter value.

[-igroup | -g <text>] - Igroup Name

Selects the LUN maps for the igroup that matches the parameter value.

[-ostype <Initiator Group OS Type>] - Igroup OS Type

Selects the LUN maps for the initiator groups with the OS type that matches the parameter value.

[-protocol <protocol_enum>] - Igroup Protocol Type

Selects the LUN maps for initiator groups with a protocol that matches the parameter value. Possible values include FCP, iSCSI, or mixed.

[-lun-id <integer>] - LUN ID

Selects the LUN maps with a LUN ID that matches the parameter value.

[-portset <text>] - Portset Binding Igroup

Selects the LUN maps for initiator groups bound to the portset that matches the parameter value.

[-alua {true/false}] - ALUA

Selects the LUN maps with ALUA settings that match the parameter value.

[-initiators | -n <text>, ...] - Initiators

Selects the LUN maps for initiator groups containing the initiators that match the parameter value.

[-node <nodename>] - LUN Node

Selects the LUN maps for nodes that match the parameter value.

[-reporting-nodes <nodename>, ...] - Reporting Nodes

Selects the LUN maps that match the parameter value.

Examples

```
cluster1::> lun mapping show
Vserver    Path                                Igroup    LUN ID
Protocol
-----
vs1        /vol/vol1/lun1                        igroup1    10  mixed
vs1        /vol/vol1/lun1                        igroup2     4  mixed
vs1        /vol/vol5/lun1                        igroup3     6  mixed
vs1        /vol/vol5/lun2                        igroup3     1  mixed
4 entries were displayed.
```

lun mapping show-initiator

Show the LUN mappings to a specific initiator

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `lun mapping show-initiator` command lists the LUNs which are mapped to an initiator group which contains a specific initiator.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the LUN mappings for the vservers that you specify.

-initiator <text> - Initiator Name

Selects the LUN mappings for the initiator that you specify.

[-lun-id <integer>] - Logical Unit Number

Selects the LUN mappings with a LUN ID that you specify.

[-igroup <text>] - Igroup Name

Selects the LUN mappings for the initiator group that you specify.

[-path <path>] - LUN Path

Selects the LUN mappings for the LUN path that you specify.

[-node <nodename>] - LUN Node

Selects the LUN mappings for the LUNs which are being hosted on the node that you specify.

[-reporting-nodes <nodename>, ...] - Reporting Nodes

Selects the LUN mappings for the LUNs which have reporting nodes that you specify.

[-vserver-uuid <UUID>] - Vserver UUID

Selects the LUN mappings for the Vserver UUID that you specify.

[-igroup-uuid <UUID>] - Igroup UUID

Selects the LUN mappings for the initiator group UUID that you specify.

[-lun-uuid <UUID>] - LUN UUID

Selects the LUN mappings for the LUN UUID that you specify.

Examples

The following example displays the LUN mappings for initiator **20:10:0a:50:00:01:01:01** in Vserver **vs1**.

```
cluster1::> lun mapping show-initiator -vserver vs1 -initiator 20:10:0a:
50:00:01:01:01
Vserver Initiator LUN ID Path IGroup
-----
vs1      20:10:0a:50:00:01:01:01
          0 /vol/igroup_1_1_vol/lun1    igroup_1
          2 /vol/igroup_1_1_vol/lun3    igroup_1
          3 /vol/igroup_1_2_vol/lun1    igroup_1
          5 /vol/igroup_1_2_vol/lun3    igroup_1
          6 /vol/igroup_1_3_vol/lun1    igroup_1
          8 /vol/igroup_1_3_vol/lun3    igroup_1
          9 /vol/igroup_1_4_vol/lun1    igroup_1
         11 /vol/igroup_1_4_vol/lun3    igroup_1
         12 /vol/igroup_2_1_vol/lun1    igroup_2
         14 /vol/igroup_2_1_vol/lun3    igroup_2
         15 /vol/igroup_2_2_vol/lun1    igroup_2
         17 /vol/igroup_2_2_vol/lun3    igroup_2
```

```

18 /vol/igroup_2_3_vol/lun1      igroup_2
20 /vol/igroup_2_3_vol/lun3      igroup_2
21 /vol/igroup_2_4_vol/lun1      igroup_2
23 /vol/igroup_2_4_vol/lun3      igroup_2
16 entries were displayed.

```

Manage Lun Move Operations

Manage LUN move operations

lun move cancel

Cancel a LUN move operation before the new LUN has been created

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `lun move cancel` command cancels an ongoing LUN move operation prior to creation of the new LUN. The command fails if the LUN already exists at the destination path; in that case, allow the current move operation to complete and then move it back using the `lun move start` command.

All data transfers will be halted. If the source LUN was quiesced, it will be restored to normal operation.

Note: This is an advanced command because the preferred way to cancel a LUN move operation is to wait until the new LUN becomes visible, and then move it back.

Parameters

{ `-vserver <Vserver Name>` - **Vserver Name**

Specifies the name of the Vserver that will host the destination LUN.

`-destination-path <path>` - **Destination Path**

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::*> lun move cancel -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

[lun move start](#) on page 272

lun move modify

Modify an ongoing LUN move operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move modify` command modifies the maximum throughput of an ongoing move operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

-max-throughput {<integer>[KB/MB/GB/TB/PB]} - Maximum Transfer Rate (per sec)

Specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

Note: The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun move modify -vserver vs1 -destination-path /vol/vol2/lun2 -
max-throughput 25MB
```

lun move pause

Pause an ongoing LUN move operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move pause` command pauses an ongoing move operation. Use the [lun move resume](#) command to resume the move operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::> lun move pause -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

[lun move resume](#) on page 270

lun move resume

Resume a paused LUN move operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move resume` command resumes a paused move operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::> lun move resume -vserver vs1 -destination-path /vol/vol2/lun2
```

Related references

[lun move pause](#) on page 269

lun move show

Display a list LUNs currently being moved

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move show` command shows information about LUNs currently being moved in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects LUN move operations that match this parameter value.

[-destination-path <text>] - Destination Path

Selects LUN move operations that match this parameter value.

[-source-path <path>] - Source Path

Selects LUN move operations that match this parameter value.

[-is-promoted-late {true/false}] - Is Destination Promoted Late

Selects LUN move operations that match this parameter value.

[-max-throughput {<integer>[KB/MB/GB/TB/PB]}] - Maximum Transfer Rate (per sec)

Selects LUN move operations that match this parameter value.

[-job-status {Preparing/Allocation-Map/Data/Destroying/Paused-Admin/Paused-Error/Complete/Destroyed}] - LUN Move Status

Selects LUN move operations that match this parameter value. The possible values are:

- **Preparing** - the LUN move job is in Preparing status.
- **Allocation-Map** - the LUN move job is in Allocating status.
- **Data** - the LUN move job is in Moving Data status.
- **Destroying** - the LUN move job is in Destroying status.
- **Paused-Admin** - the LUN move job is in Paused By Admin status.
- **Paused-Error** - the LUN move job is in Paused By Error status.
- **Complete** - the LUN move job is in Complete status.
- **Destroyed** - the LUN move job is in Destroyed status.

[-progress-percent <percent>] - LUN Move Progress (%)

Selects LUN move operations that match this parameter value.

[-elapsed-time <time_interval>] - Elapsed Time

Selects LUN move operations that match this parameter value.

[-cutover-time <time_interval>] - Cutover Time

Selects LUN move operations that match this parameter value.

[-is-snapshot-fenced {true/false}] - Is Snapshot Fenced

Selects LUN move operations that match this parameter value.

[-is-destination-ready {true/false}] - Is Destination Ready

Selects LUN move operations that match this parameter value.

[-last-failure-reason <text>] - Last Failure Reason

Selects LUN move operations that match this parameter value.

Examples

```
cluster1::> lun move show
Vserver    Destination Path    Status    Progress
-----
vs1        /vol/vol2/lun1     Data      35%
vs1        /vol/vol2/lun2     Complete  100%
2 entries were displayed.
```

The example above displays information about all the LUN move operations in the cluster.

```
cluster1::> lun move show -vserver vs1 -destination-path /vol/vol2/lun1 -
instance

Destination Vserver Name: vs1
Destination Path: /vol/vol2/lun1
Source Path: /vol/vol1/lun1
```

```

    Is Destination Promoted Early: false
    Maximum Transfer Rate (per sec): 0B
        LUN Move Status: Data
    LUN Move Progress (%): 35%
        Elapsed Time: 145s
    Cutover Time (secs): 0s
    Is Snapshot Fenced: true
    Is Destination Ready: true
    Last Failure Reason: -

```

lun move start

Start moving a LUN from one volume to another within a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move start` command initiates moving of a LUN from one volume to another. The destination volume can be located on the same node as the original volume or on a different node.

Note: Use `lun move-in-volume` command if you want to rename the LUN or move it within the same volume.

Note: This command does not support movement of LUNs that are created from files.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the new LUN.

| -destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

-source-path <path> - Source Path

Specifies the full path to the source LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

[-promote-late [true]] - Promote Late

Optionally specifies that the destination LUN needs to be promoted late.

If the destination is promoted early, the new LUN will be visible immediately. However, Snapshot copies of the volume containing the new LUN cannot be taken until the LUN move operation reaches 'Moving Data' status.

If the destination is promoted late, the new LUN will be visible only after it has been fully framed. However, the LUN move job will not block the creation of Snapshot copies of the volume containing the new LUN.

If this parameter is not specified, the destination LUN will be promoted early.

[-max-throughput {<integer>[KB/MB/GB/TB/PB]}] - Maximum Transfer Rate (per sec)

Optionally specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

If this parameter is not specified, throttling is not applied to the data transfer.

Note: The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun move start -vserver vs1 -destination-path /vol/vol2/lun2 -
source-path /vol/vol1/lun1
```

lun persistent-reservation commands

Manage SCSI-2 and SCSI-3 persistent reservations

Commands used for managing persistent reservations on LUNs.

lun persistent-reservation clear

Clear the SCSI-3 persistent reservation information for a given LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Clears the persistent reservation for the specified LUN.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the LUN. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtreen1/lun1*.

| -volume <volume name> - Volume Name

Specifies the volume.

-lun <text> - LUN Name

Specifies the name of the LUN.

[-qtreen <qtreen name>]] - Qtreen Name

Specifies the qtreen.

Examples

```
cluster1::*> lun persistent-reservation clear -vserver vs_1 -path /vol/vol_1/
lun_1
```

lun persistent-reservation show

Display the current reservation information for a given LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Displays reservation information for a specified LUN in a Vserver. Unlike other show commands, the user must specify the LUN.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the LUN. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

| -volume <volume name> - Volume Name

Specifies the volume.

-lun <text> - LUN Name

Specifies the name of the LUN.

[-qtree <qtree name>]] - Qtree Name

Specifies the qtree.

[-scsi-revision {scsi2/scsi3}] - SCSI Revision

Selects the reservations that match this parameter value.

[-entry-type {reservation/registration}] - Reservation or Registration

Selects the reservations that match this parameter value.

[-protocol {fcp/iscsi}] - Protocol

Selects the reservations that match this parameter value.

[-reservation-key <text>] - Reservation Key

Selects the reservations that match this parameter value.

[-reservation-type-code <text>] - Reservation Type

Selects the reservations that match this parameter value. The possible values for SCSI-3 reservations are:

- write exclusive
- exclusive access
- write exclusive registrants only
- exclusive access registrants only

- write exclusive all registrants
- exclusive access all registrants

and for SCSI-2 are:

- regular
- third party

[-initiator-name <text>] - Initiator Name

Selects the reservations that match this parameter value.

[-aptpl {true/false}] - Persist Through Power Loss

Selects the reservations that match this parameter value. If **true**, the reservation will be preserved over a power loss. If **false**, it will not. This value is for SCSI-3 reservations only.

[-target-wwpn <text>] - FCP Target WWPN

Selects the reservations that match the specified World Wide Port Name (WWPN).

[-isid <text>] - Initiator Session ID

Selects the reservations that match this parameter value.

[-tpgroup-tag <integer>] - TPGGroup Tag

Selects the reservations that match the specified target portal group tag. The tag identifies the tpgroup the reservation was made over.

[-third-party-initiator-name <text>] - Third Party Initiator Name

Selects the reservations that match this parameter value (the initiator name that the reservation was made for). This is specific to third party reservation types, which is indicated by reservation-type-code.

Examples

```
cluster1:*> lun persistent-reservation show -vserver vs_1 /vol/vol_1/lun_1
Key                      Protocol Type          Initiator Name
-----
APTPL: true
a0:00:00:00:00:00:00:01 iscsi    write exclusive    iqn.
1993-08.org.debian:01:fa752b8a5a3a
a0:00:00:00:00:00:00:01 iscsi    -                  iqn.
1993-08.org.debian:01:fa752b8a5a3a
2 entries were displayed.
```

lun portset commands

Manage portsets

lun portset add

Add iSCSI/FCP LIFs to a portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds existing iSCSI and FCP LIFs to a port set. To create a new port set, use the [lun portset create](#) command.

Use the [network interface create](#) command to create new LIFs.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the port set you want to add the LIFs to.

-port-name <port_name>, ... - LIF or TPG Name

Specifies the LIF name you want to add to the port set.

Examples

```
cluster1::> portset add -vserver vs1 -portset psl -port-name lif1
```

[network interface create](#) on page 402

lun portset create

Creates a new portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new port set for FCP and iSCSI. The port set name can include a maximum of 96 characters. You can add LIFs to the new port set. If you do not add a LIF to the port set, you create an empty port set. To add LIFs to an existing port set, use the [lun portset add](#) command.

After you create a port set, you must bind the port set to an igroup so the host knows which FC or iSCSI LIFs to access. If you do not bind an igroup to a port set, and you map a LUN to an igroup, then the initiators in the igroup can access the LUN on any LIF on the Vserver.

Note: You cannot bind an igroup to an empty port set because the initiators in the igroup would have no LIFs to access the LUN.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the name of the new port set. A port set name is a case-sensitive name that must contain one to 96 characters. Spaces are not allowed.

[-port-name <port_name>, ...] - LIF Or TPG Name

Specifies the name of the logical interface that you want to add to the portset you want to create.

{ [-protocol {mixed/fcp/iscsi}] - Protocol

Specifies if the portset protocol type is *fcp*, *iscsi*, or *mixed*. The default is *mixed*.

| [-fcp | -f [true]] - FCP

Specifies FCP as the protocol type of the new port set.

| [-iscsi | -i [true]] - iSCSI

Specifies iSCSI as the protocol type of the new port set.

Examples

```
cluster1::> portset create -vserver vs1 -portset ps1 -protocol mixed
```

Creates a port set *ps1* on Vserver *vs1* with the protocol type of *mixed*.

```
cluster1::> portset create -vserver vs1 -portset iscsips -protocol iscsi
```

Creates a port set *iscsips* on Vserver *vs1* with the protocol type of *iscsi*.

```
cluster1::> portset create -vserver vs1 -portset fcpps -protocol fcp
```

Creates a port set *fcpps* on Vserver *vs1* with the protocol type of *fcp*.

```
cluster1::> portset create -vserver vs1 -portset ps2 -protocol mixed -port-  
name 111
```

[lun portset add](#) on page 275

lun portset delete

Delete the portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an existing port set. By default, you cannot delete a port set if it is bound to an initiator group. If a port set is bound to an initiator group, you can do one of the following:

- specify the **force** option to unbind the port set from the initiator group and delete the port set.
- use the [lun igroup unbind](#) command to unbind the port set from the initiator group. Then you can delete the port set.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the port set you want to delete.

[-force | -f [true]] - Force

Forcibly unbinds the port set from the initiator group.

Examples

```
cluster1::> portset delete -vserver vs1 -portset ps1
```

Related references

[lun igroup unbind](#) on page 252

lun portset remove

Remove iSCSI/FCP LIFs from a portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes a LIF from a port set.

You cannot remove the last LIF in a port set if the port set is bound to an initiator group (igroup). To remove the last LIF in a port set, use the [lun igroup unbind](#) command to unbind the port set from the igroup. Then you can remove the last LIF in the port set.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the port set you want to remove a LIF from.

-port-name <port_name>, ... - LIF or TPG Name

Specifies the LIF name you want to remove from the port set.

Examples

```
cluster1::> port set remove -vserver vs1 -portset ps1 -port-name lif1
```

Related references

[lun igroup unbind](#) on page 252

lun portset show

Displays a list of portsets

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the LIFs in a port set. By default, the command displays all LIFs in all port sets.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance {}]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the port sets that match this parameter value.

[-portset <text>] - Portset Name

Selects the port sets that match this parameter value.

[-port-name <port_name>, ...] - LIF Or TPG Name

Selects the port sets that match this parameter value.

[-protocol {mixed/fcp/iscsi}] - Protocol

Selects the port sets that match this parameter value.

[-port-count <integer>] - Number Of Ports

Selects the port sets that match this parameter value.

[-igroups <igroup>, ...] - Bound To Igroups

Selects the port sets that match this parameter value.

Examples

```
cluster1::> lun portset show
Vserver  Portset      Protocol Port Names      Igroups
-----
vs1      ps0           mixed   lif1, lif2       igroup1
         ps1           iscsi   lif3             igroup2
         ps2           fcp     lif4             -
3 entries were displayed.
```

The example above displays all port sets.

```
cluster1::> lun portset show -port-count 0
Vserver  Portset      Protocol Port Names      Igroups
-----
vs1      p1           iscsi   -               -
```

The example above displays the port sets that contain zero LIFs.

```
cluster1::> lun portset show -protocol iscsi
Vserver  Portset      Protocol Port Names      Igroups
-----
vs1      p1           iscsi   -               -
vs1      iscsips      iscsi   lif1            igroup1
2 entries were displayed.
```

The example above displays the port sets that have the iSCSI protocol.

```
cluster1::> lun portset show -port-name lif1
Vserver  Portset      Protocol Port Names      Igroups
-----
vs1      iscsips      iscsi   lif1            igroup1
```

lun transition commands

Manage LUN Transition from Data ONTAP 7-Mode

lun transition show

Display the status of LUN transition processing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition show` command displays information about the LUN transition processing status of volumes. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Transition status

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the volumes in the specified Vserver.

[-volume <volume name>] - Volume Name

Selects the volumes with the specified name.

[-status {none/complete/failed/active}] - Transition Status

Selects the volumes that match the specified transition status. The possible status values are:

- *active* - The volume is in an active SnapMirror transition relationship and not yet transitioned.
- *complete* - LUN transition has completed for the volume.
- *failed* - LUN transition has failed for the volume.
- *none* - The volume did not contain LUNs to transition from Data ONTAP 7-Mode.

[-vserver-uuid <UUID>] - Vserver UUID

Selects the volumes in the Vserver that matches the specified UUID.

[-node <nodename>] - Filer ID

Selects the volumes that match the specified node.

Examples

The following example displays LUN transition information for all volumes in a Vserver named `vs1`:

```
cluster1::*> lun transition show -vserver vs1
Vserver      Volume      Transition Status
-----
vs1          vol0        none
             vol1        complete
             vol2        failed
             vol3        active
4 entries were displayed.
```

lun transition start

Start LUN Transition Processing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition start` command starts LUN transition for the specified volume. Normally, transition is started automatically when *snapmirror break* is issued for the volume, this command allows restarting in the event automatic transitioning was interrupted or failed.

Parameters

-vserver <Vserver Name> - Vserver Name

The name of the Vserver containing the volume. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

The name of the volume to restart LUN transition.

Examples

The following example starts LUN transition on a volume named `volume1` in a Vserver named `vs1`:

```
cluster1::*> lun transition start -vserver vs1 -volume volume1
```

snapmirror break on page 738

lun transition 7-mode commands

The 7-mode directory

lun transition 7-mode delete

Delete an Untransitioned 7-Mode LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition 7-mode delete` command deletes an untransitioned LUN copied from a Data ONTAP 7-Mode system. This allows the admin to recover space from the volume for LUNs that may not be transitioned to clustered Data ONTAP without disrupting LUNs that have transitioned, for example, if the LUN is an unsupported OS type.

Parameters

-vserver <Vserver Name> - Vserver Name

This specifies the name of the Vserver from which the LUN is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.

-path <path> - LUN Path

This specifies the path to the LUN to delete.

Examples

The following example deletes the LUN `/vol/vol1/lun1` in a Vserver named `vs1`:

```
cluster1::*> lun transition 7-mode delete -vserver vs1 -path /vol/vol1/lun1
```

lun transition 7-mode show

Display the 7-Mode LUN Inventory

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition 7-mode show` command displays information about LUNs copied from a Data ONTAP 7-Mode system. If no parameters are specified, the command displays the following information about all 7-Mode LUNs:

- Vserver name
- LUN path
- Operating system type
- Size
- Whether or not the LUN has been transitioned to clustered Data ONTAP

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the 7-Mode LUNs in the specified Vserver.

[-path <path>] - LUN Path

Selects the 7-Mode LUNs with the specified path.

[-volume <volume name>] - Volume Name

Selects the 7-Mode LUNs that match the specified volume.

[-ostype <LUN Operating System Format>] - OS Type

Selects the 7-Mode LUNs that match the specified operating system type.

[-size <size>] - LUN Size

Selects the 7-Mode LUNs that match the specified size.

[-prefix-size <size>] - Prefix Stream Size

Selects the 7-Mode LUNs that match the specified prefix stream size.

[-suffix-size <size>] - Suffix Stream Size

Selects the 7-Mode LUNs that match the specified suffix stream size.

[-serial <text>] - Serial Number

Selects the 7-Mode LUNs that match the specified serial number for clustered Data ONTAP. LUNs where **is-transitioned** is *false* do not have a serial number assigned for clustered Data ONTAP.

[-uuid <UUID>] - UUID

Selects the 7-Mode LUNs that match the specified UUID for clustered Data ONTAP. LUNs where **is-transitioned** is *false* do not have a UUID assigned for clustered Data ONTAP.

[-serial-7-mode <text>] - 7-mode Serial Number

Selects the 7-Mode LUNs that match the specified serial number from 7-Mode.

[-is-transitioned {true/false}] - Transition Complete

Selects the 7-Mode LUNs that match the specified transition state. LUNs where this value is *true* have been transitioned and are available to be mapped for client access. LUNs where this value is *false* have not yet been transitioned and may not be mapped.

[-vserver-uuid <UUID>] - Vserver UUID

Selects the 7-Mode LUNs that match the specified Vserver UUID.

[-node <nodename>] - Node

Selects the 7-Mode LUNs that match the specified node name.

Examples

The following example displays a summary of all 7-Mode LUNs for the volume *vol1* in a Vserver named *vs1*:

```
cluster1::*> lun transition 7-mode show -vserver vs1 -volume vol1
Vserver  Path                               Type    Size    Transitioned
-----  -
vs1      /vol/vol1/lun1                     linux   10MB    false
         /vol/vol1/lun2                     linux   500MB   true
         /vol/vol1/lun3                     linux   500MB   true
8 entries were displayed.
```

The following example displays detailed information for the 7-Mode LUN */vol/vol1/lun2* in a Vserver named *vs1*:

```
cluster1::*> lun transition 7-mode show -vserver vs1 -path /vol/vol1/lun2

Vserver Name: vs1
LUN Path: /vol/vol1/lun2
```

```
Volume Name: voll
OS Type: linux
LUN Size: 500MB
Prefix Stream Size: 0
Suffix Stream Size: 0
Serial Number: BCVvv$DLZu8g
UUID: f53d603b-9663-4567-9680-95c1a9cc6d9e
7-mode Serial Number: C4eqKotPI8Ui
Transition Complete: true
Vserver UUID: be4cc135-163f-11e3-931f-123478563412
Node: cluster-01
```

metrocluster commands

Manage MetroCluster

The `metrocluster` commands enable you to manage MetroCluster.

metrocluster configure

Configure MetroCluster and start DR mirroring for the node and its DR group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configure` command creates a MetroCluster configuration on either all the nodes in both MetroCluster clusters or solely on nodes in a DR group. The command configures a HA partner, DR partner, and a DR auxiliary partner for the nodes and also starts NVRAM mirroring between the configured DR partner nodes.

In MetroCluster, a DR group is a group of four nodes, two in each of the MetroCluster clusters:

- In the local cluster, a node and its HA partner,
- In the peer cluster, a node and its HA partner. These nodes are DR partners to the nodes in the local cluster.

In a two node MetroCluster configuration, a DR group is a group of two nodes, one in each of the MetroCluster clusters.

There can be several DR groups in the MetroCluster configuration. MetroCluster provides synchronous DR protection to all data sets belonging to nodes within a properly configured DR group.

Without the `-node` parameter, the `metrocluster configure` command configures all the DR groups in both the MetroCluster clusters.

With the `-node mynode` parameter, the command configures both the *mynode* node and its HA partner node from the local cluster, and its DR partner and DR auxiliary partner from the peer cluster. Before running the `metrocluster configure` command, the aggregates and Vservers on each node must be prepared for the MetroCluster configuration. Each node should have:

- At least one non-root, mirrored aggregate of size greater than 10GB. This non-root aggregate should not have any volumes in it.
- No other non-root aggregates. Any other non-root, unmirrored aggregates and volumes should be deleted.
- No Vservers other than Vservers of type "node" or "admin." Any Vservers that are not of type "node" or "admin" should be deleted.
- A mirrored and healthy root aggregate.

After the command is successful all nodes in the local and remote clusters will have HA, DR, and DR auxiliary partners and NVRAM mirroring between the DR partners will be turned on. The same conditions apply before running the `metrocluster configure -node mynode` command, except that only one DR group is configured.

For a MetroCluster over IP configuration, the [metrocluster configuration-settings](#) commands must be completed before using the `metrocluster configure` command. The commands required to be completed are:

- *metrocluster configuration-settings dr-group create*
- *metrocluster configuration-settings interface create*
- *metrocluster configuration-settings connection connect*

Parameters

`[-node-name {<nodename>/local}]` - Node to Configure

This optional parameter specifies the name of a single node in the local cluster. The command creates MetroCluster configuration on the local node specified by this parameter and the three other nodes belonging to the same DR group.

`[-refresh {true/false}]` - Refresh Configuration (privilege: advanced)

This optional parameter specifies if the node partner configuration steps should be done again. Not specifying this parameter will cause the MetroCluster configuration to continue using the current node partner information.

`[-allow-with-one-aggregate {true/false}]` - Override the Two Data Aggregates Requirement (privilege: advanced)

This optional parameter specifies if MetroCluster configuration should be allowed with only one data aggregate in each cluster. This option has no effect if two or more aggregates are present.

Examples

The following example shows the creation of the MetroCluster configuration for a single DR group:

```
clusA::> metrocluster show
Cluster                               Configuration State      Mode
-----
Local: clusA                          not-configured           -
Remote: clusB                         not-configured           -

clusA::> metrocluster node show
DR Group Cluster Node                Configuration State      DR Mirroring Mode
-----
-      clusA  clusA-01                ready to configure      -
                        clusA-02                ready to configure      -
                        clusA-03                ready to configure      -
                        clusA-04                ready to configure      -
4 entries were displayed.

clusA::> metrocluster configure -node clusA-01
[Job 45] Job succeeded: Configure is successful

clusA::> metrocluster show
Cluster                               Configuration State      Mode
-----
Local: clusA                          partially-configured      normal
Remote: clusB                         partially-configured      normal

clusA::> metrocluster node show
DR Group Cluster Node                Configuration State      DR Mirroring Mode
-----
-      clusA  clusA-03                ready to configure      -
                        clusA-04                ready to configure      -
```

```

1      clusA    clusA-01      configured    enabled    normal
          clusA    clusA-02      configured    enabled    normal
      clusB    clusB-01      configured    enabled    normal
          clusB    clusB-02      configured    enabled    normal
6 entries were displayed.

```

The following example shows the creation of the MetroCluster configuration for all DR groups:

```

clusA::> metrocluster show
Cluster                               Configuration State      Mode
-----
Local: clusA                          not-configured          -
Remote: clusB                         not-configured          -

clusA::> metrocluster node show
DR
Group Cluster Node                    Configuration State      DR
                               State      Mirroring Mode
-----
-      clusA    clusA-01              ready to configure      -
                               -
                               clusA-02              ready to configure      -
                               -
                               clusA-03              ready to configure      -
                               -
                               clusA-04              ready to configure      -
                               -
4 entries were displayed.

clusA::> metrocluster configure
[Job 45] Job succeeded: Configure is successful

clusA::> metrocluster show

metrocluster heal

Heal DR data aggregates and DR root aggregates

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster heal` command heals DR data aggregates and DR root aggregates in preparation for a DR switchback. You must issue this command twice to complete the two phases of the healing process: first to heal the aggregates by resynchronizing the mirrored plexes and then to heal the root aggregates by switching them back to the disaster site. The DR partner nodes must be powered off and remote disk shelves must be powered on before running this command.

Parameters

-phase {*aggregates*/*root-aggregates*} - MetroCluster Healing Phase

This parameter specifies the healing phase. The first phase, *aggregates*, heals aggregates by resynchronizing mirrored plexes. The second phase, *root-aggregates*, heals the root aggregates of partner nodes. Healing root aggregates switches them back to the disaster site, allowing the site to boot up.

[-override-vetoes [*true*]] - Override All Soft Vetoes

This optional parameter overrides almost all heal operation soft vetoes. If this optional parameter is set to true, the system overrides subsystem soft vetoes that might prevent the heal operation. Hard vetoes cannot be overridden and can still prevent the switchback operation.

Examples

The following example performs the healing of both the aggregates and root aggregates:

```
cluster1::> metrocluster heal -phase aggregates
[Job 136] Job succeeded: Heal Aggregates is successful

cluster1::> metrocluster heal -phase root-aggregates
[Job 137] Job succeeded: Heal Root Aggregates is successful
```

metrocluster modify

Modify MetroCluster configuration options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster modify` command modifies MetroCluster parameters for nodes in the MetroCluster configuration.

Parameters

{ -auto-switchover-failure-domain <MetroCluster AUSO Failure Domain> - Cluster Level AUSO Option

This parameter specifies the configuration of automatic switchover. Modifying *auto-switchover-failure-domain* is not supported on a MetroCluster over IP configuration.

The parameter values are:

- `auso-on-cluster-disaster` - triggers an unplanned switchover if all nodes in a DR cluster are down.
- `auso-on-dr-group-disaster` - triggers an unplanned switchover if both nodes of a DR group are down.
- `auso-disabled` - automatic switchover is disabled.

On a MetroCluster over IP configuration, `auto-switchover-failure-domain` is set to `auso-disabled`; otherwise, it is set to `auso-on-cluster-disaster`.

A change to the parameter affects only the local cluster where the `metrocluster modify` command is used.

| `-node-name {<nodename>/local}` - Node to Change the Option On

This parameter is used to specify the node in the cluster for which the parameter needs to be modified.

`[-automatic-switchover-onfailure [true]]` - Node Level AUSO Option (privilege: advanced)

This parameter is used to enable automatic switchover on node failures. The `automatic-switchover-onfailure` parameter is not supported on a MetroCluster over IP configuration.

All nodes in a MetroCluster configuration must have this option enabled to enable automatic switchover on failure.

Examples

The following example shows the output of Metrocluster modification done on a node:

```
clusA:*> metrocluster modify -node-name clusA-01 -node-object-limit on
[Job 168] Job succeeded: Modify is successful

clusA:*> metrocluster modify -node-name clusA-01 -automatic-switchover-
onfailure false
[Job 308] Job succeeded: Modify is successful

clusA:> metrocluster modify -auto-switchover-failure-domain auso-on-
cluster-disaster
[Job 308] Job succeeded: Modify is successful
```

metrocluster show

Display MetroCluster configuration information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster show` command displays configuration information for the pair of clusters configured in MetroCluster.

This command displays the following details about the local cluster and the DR partner cluster:

- Configuration State: This field specifies the configuration state of the cluster.
- Mode: This field specifies the operational mode of the cluster.
- AUSO Failure Domain: This field specifies the AUSO failure domain of the cluster.

Parameters

[`-periodic-check-status`]

If this option is used the MetroCluster periodic check status is displayed.

Examples

The following example shows the output of the command before MetroCluster configuration is done:

```
clusA::> metrocluster show
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  not-configured
      Mode                 -
      AUSO Failure Domain  -
Remote: clusB
      Configuration State  not-configured
      Mode                 -
      AUSO Failure Domain  -
```

The following example shows the output of the command after MetroCluster configuration is done only for some DR groups:

```
clusA::> metrocluster show
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  partially-configured
      Mode                 -
      AUSO Failure Domain  -
Remote: clusB
      Configuration State  partially-configured
      Mode                 -
      AUSO Failure Domain  -
```

The following example shows the output of the command after MetroCluster configuration is done:

```
clusA::> metrocluster show
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  configured
      Mode                 normal
      AUSO Failure Domain  auso-on-cluster-disaster
Remote: clusB
      Configuration State  configured
      Mode                 normal
      AUSO Failure Domain  auso-on-cluster-disaster
```

The following example shows the output of the command in switchover mode:

```

clusA::> metrocluster show
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State    configured
      Mode                   switchover
      AUSO Failure Domain    auso-on-cluster-disaster
Remote: clusB
      Configuration State    not-reachable
      Mode                   -
      AUSO Failure Domain    not-reachable

```

The following example shows the output of the command when `-periodic-check-status` option is used:

```

clusA::> metrocluster show -periodic-check-status
Cluster                               Periodic Check Enabled
-----
Local: clusA                          true
Remote: clusB                         true

```

metrocluster switchback

Switch back storage and client access

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster switchback` command initiates the switchback of storage and client access from nodes in the DR site to their home nodes. The home nodes and storage shelves must be powered on and reachable by nodes in the DR site. The `metrocluster heal -phase aggregates` and `metrocluster heal -phase root-aggregates` commands must have successfully completed before running the `metrocluster switchback` command.

Parameters

`[-override-vetoes | -f [true]] - Override All Soft Vetoes`

This optional parameter overrides all switchback operation soft vetoes. If this optional parameter is used, the system overrides subsystem soft vetoes that might prevent the switchback operation. Hard vetoes cannot be overridden and can still prevent the switchover operation.

`[-simulate [true]] - Simulate Switchback (privilege: advanced)`

If this optional parameter is used, the system runs a simulation of the switchback operation to make sure all the prerequisites for the operation are met. This parameter cannot be used with switchback operations performed for switching back left-behind aggregates or for retrying a partially successful switchback.

Examples

The following is an example of how to start the switchback operation.

```
clusA:> metrocluster switchback
```

[metrocluster heal](#) on page 288

metrocluster switchover

Switch over storage and client access

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster switchover` command initiates the switchover of storage and client access from the source cluster to the disaster recovery (DR) site. This command is to be used after a disaster that renders all the nodes in the source cluster unreachable and powered off. It can also be used for negotiated switchover when the outage of the source cluster is anticipated as in cases such as disaster recovery testing or a site going offline for maintenance. If a switchover operation previously failed on certain nodes on the DR site then issuing the command retries the operation on all of those nodes.

Parameters

{ [-simulate [true]] - Simulate Negotiated Switchover (privilege: advanced)

If this optional parameter is used, the system runs a simulation of the negotiated switchover operation to make sure all the prerequisites for the operation are met. This parameter cannot be used with switchover with the **-forced-on-disaster** parameter.

[-forced-on-disaster [true]] - Force Switchover on Disaster

This optional parameter forces a switchover on disaster. This parameter should be used if all the nodes on the disaster stricken site are powered off and unreachable. In the absence of this parameter, the command attempts to perform a negotiated switchover operation.

[-force-nvfail-all [true]] - Sets in-nvfailed-state on All Volumes (privilege: advanced)

If this parameter is used, the switchover command will set the `in-nvfailed-state` parameter to true for all volumes being switched over and will set the **-dr-force-nvfail** parameter to true for any volumes that do not already have it enabled. This parameter has no effect when performing a negotiated switchover.

[-retry-failed-nodes <Node name>, ...] - Nodes to Switchover

This optional parameter takes the list of nodes that previously failed the switchover operation and it retries the switchover operation on each of the nodes. This parameter is applicable only for a switchover with the **-forced-on-disaster** parameter.

[-override-vetoes [true]] - Override All Soft Vetoes

This optional parameter overrides all switchover operation soft vetoes. If this parameter is used, the system overrides all subsystem soft vetoes that might prevent the switchover operation. Hard vetoes cannot be overridden and can still prevent the switchover operation.

Examples

When a disaster strikes one site, the `metrocluster switchover` command is issued on the disaster recovery site as follows:

```
cluster1::> metrocluster switchover -forced-on-disaster true

Warning: MetroCluster switchover is a Disaster Recovery operation that could
        cause some data loss. The cluster on the other site must either be
        prevented from serving data or be simply powered off (nodes and disk
        shelves)
        The following nodes ( cluster1-01 cluster1-02 ) will participate in
        the switchover operation
Do you want to continue? {y|n}: y
Queued job. Use 'metrocluster operation show' to check status of the DR
operation.

cluster1::> metrocluster operation show
Operation: switchover
State: successful
Start time: 10/3/2013 22:11:47
End time: 10/3/2013 22:11:53
Errors: -
```

metrocluster check commands

Check MetroCluster configuration and display results

metrocluster check disable-periodic-check

Disable Periodic Check

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check disable-periodic-check` command disables the periodic checking of the MetroCluster configuration.

After this command is run, the MetroCluster Check job will be prevented from periodically checking the configuration for errors.

Examples

```
clusA::> metrocluster check disable-periodic-check
```

[metrocluster check enable-periodic-check](#) on page 294

metrocluster check enable-periodic-check

Enable Periodic Check

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check enable-periodic-check` command enables the periodic checking of the MetroCluster configuration.

After this command is run, the MetroCluster Check job will be able to run in the background and periodically check the configuration for errors.

Examples

```
clusA::> metrocluster check enable-periodic-check
```

[metrocluster check disable-periodic-check](#) on page 293

metrocluster check run

Check the MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check run` command performs checks on the MetroCluster configuration and reports configuration errors if any.

To run this command, at least one DR group needs to be configured. The command checks the following parts of the configuration:

Node Configuration:

- `node-reachable`: This check verifies that the node is reachable.
- `metrocluster-ready`: This check verifies that the node is ready for MetroCluster configuration.
- `local-ha-partner`: This check verifies that the HA partner node is in the same cluster.
- `ha-mirroring-on`: This check verifies that HA mirroring for the node is configured.
- `symmetric-ha-relationship`: This check verifies that the relationship between the node and its HA partner is symmetric.
- `remote-dr-partner`: This check verifies that the DR partner node is in the remote cluster.
- `dr-mirroring-on`: This check verifies that DR mirroring for the node is configured.
- `symmetric-dr-relationship`: This check verifies that the relationship between the node and its DR partner is symmetric.
- `remote-dr-auxiliary-partner`: This check verifies that the DR auxiliary partner node is in the remote cluster.
- `symmetric-dr-auxiliary-relationship`: This check verifies that the relationship between the node and its DR auxiliary partner is symmetric.

- `storage-failover-enabled`: This check verifies that storage failover is enabled.
- `has-intercluster-lif`: This check verifies that the node has an intercluster LIF.
- `node-object-limit`: This check verifies that the node object limit option for the node is turned on.

Aggregate Configuration:

- `mirroring-status`: This check verifies that the aggregate is mirrored.
- `disk-pool-allocation`: This check verifies that the disks belonging to this aggregate have been correctly allocated to the right pools.

At the end of the check the command displays a summary of the results. This summary output can be viewed again by running `metrocluster check show`. If any of the rows in this output show any warnings more details can be viewed by running the `metrocluster check show` command for that component.

Parameters

`[-skip-dr-simulation {true/false}]` - Skip the DR Readiness Checks (privilege: advanced)

If this optional parameter is set to true, the switchover and switchback simulations are not run.

Examples

The following example shows the execution of the command when there are no warnings:

```
clusA::> metrocluster check run

Last Checked On: 4/9/2014 20:11:46

Component          Result
-----
nodes               ok
clusters            ok
lifs                ok
config-replication ok
aggregates          ok
5 entries were displayed.

Command completed. Use the "metrocluster check show -instance"
command or sub-commands in "metrocluster check" directory for detailed
results.
```

The following example shows the execution of the command when there are some warnings:

```
clusA::> metrocluster check run

Last Checked On: 4/9/2014 20:11:46

Component          Result
-----
nodes               warning
clusters            ok
lifs                ok
config-replication ok
aggregates          ok
5 entries were displayed.

Command completed. Use the "metrocluster check show -instance"
```

```
command or sub-commands in "metrocluster check" directory for detailed results.

metrocluster check show

Show the results of the last instance of MetroCluster check

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check show` command displays the results of the [metrocluster check run](#) command.

This command displays the high-level verification results for each of the components. If there are any errors for a component, running the show command for that component (for example [metrocluster check node show](#) or [metrocluster check aggregate show](#)) will display more information about the warning.

Note: Please note that this command does not run the checks but only displays the results of checks. To look at the latest results, run the [metrocluster check run](#) command and then run this command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Check

This is the time at which the [metrocluster check run](#) command was last run in this cluster and these results were produced. If this parameter is specified, only rows with this timestamp will be displayed.

[-component <MetroCluster Check Components>] - Name of the Component

This is the name of the component. If this parameter is specified, only rows with this component will be displayed.

[-result {ok/warning/not-run/not-applicable}] - Result of the Check

This is the result of the check for the component. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is the additional info for the verification for this component. This field will have detailed information about the warning and recovery steps. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command when there are no warnings:

```
clusA::> metrocluster check show

Last Checked On: 4/9/2014 20:11:46

Component          Result
-----
nodes               ok
clusters            ok
lifs                ok
config-replication ok
aggregates          ok
connections         ok
6 entries were displayed.
```

The following example shows the execution of the command when there are some warnings:

```
clusA::> metrocluster check show

Last Checked On: 4/9/2014 20:11:46

Component          Result
-----
nodes               warning
clusters            ok
lifs                ok
config-replication ok
aggregates          ok
connections         ok
6 entries were displayed.
```

The following example shows the execution of the command with -instance option:

```
clusA::> metrocluster check show -instance

metrocluster check aggregate commands

The aggregate directory

metrocluster check aggregate show

Show results of MetroCluster check for aggregates

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check aggregate show` command displays the results of aggregate checks performed by the `metrocluster check run` command.

The command verifies the following aspects of the configuration of all aggregates in MetroCluster:

- **mirroring-status:** This check verifies that the aggregate is mirrored.
- **disk-pool-allocation:** This check verifies that the disks belonging to this aggregate have been correctly allocated to the right pools.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <Node name>] - Node Name

This is the name of the node for which the check was run. If this parameter is specified, only rows with this node will be displayed.

[-aggregate <aggregate name>] - Name of the Aggregate

This is the name of the aggregate for which the check was run. If this parameter is specified, only rows with this aggregate will be displayed.

[-check <MetroCluster Aggregate Check>] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Name of Cluster

This is the name of the cluster the node belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-result {ok/warning/not-run/not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>, ...] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with two nodes per cluster:

```
clusA:> metrocluster check aggregate show
Last Checked On: 4/9/2014 20:11:46
```

Node	Aggregate	Check	Result
clusA-01	a1_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok
	aggr0_a1	mirroring-status	ok
		disk-pool-allocation	ok
clusA-02	a2_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok
	aggr0_a2	mirroring-status	ok
		disk-pool-allocation	ok
clusB-01	b1_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok
	aggr0_b1	mirroring-status	ok
		disk-pool-allocation	ok
clusB-02	aggr0_b2	mirroring-status	ok
		disk-pool-allocation	ok
	b2_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok

16 entries were displayed.

The following example shows the execution of the command with -instance option:

```
clusA:> metrocluster check aggregate show -instance
```

```

Node Name: clusA-01
Name of the Aggregate: a1_required_data_aggr_1
Type of Check: mirroring-status

metrocluster check cluster commands

The cluster directory

metrocluster check cluster show

Show results of MetroCluster check for the cluster components

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check cluster show` command displays the results of cluster checks performed by the `metrocluster check run` command.

The command displays the results of the following cluster configuration checks:

- **negotiated-switchover-ready:** This check verifies that the cluster is ready for a negotiated switchover operation.
- **switchback-ready:** This check verifies that the cluster is ready for a switchback operation.
- **job-schedules:** This check verifies that the job schedules between the local and remote clusters are consistent.
- **licenses:** This check verifies that the licenses between the local and remote clusters are consistent.
- **periodic-check-enabled:** This check verifies that the periodic MetroCluster Check Job is enabled.
- **onboard-key-management:** This check verifies that the Onboard Key Management hierarchies are consistent.
- **external-key-management:** This check verifies that the External Key Management configurations are consistent.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the **-instance** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-check {negotiated-switchover-ready/switchback-ready/job-schedules/licenses/periodic-check-enabled/onboard-key-management/external-key-management}] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Cluster Name

This is the name of the cluster the check results apply to. If this parameter is specified, only rows matching the specified cluster will be displayed.

[-result {ok/warning/not-run/not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration:

```
clusA::> metrocluster check cluster show

Last Checked On: 11/29/2018 17:15:00
```

Cluster	Check	Result
clusA	negotiated-switchover-ready	not-applicable
	switchback-ready	not-applicable
	job-schedules	ok
	licenses	ok
	periodic-check-enabled	ok
	onboard-key-management	ok
	external-key-management	ok
clusB	negotiated-switchover-ready	not-applicable
	switchback-ready	not-applicable
	job-schedules	ok
	licenses	ok
	periodic-check-enabled	ok
	onboard-key-management	ok
	external-key-management	ok

14 entries were displayed.

The following example shows the execution of the command with the **-instance** parameter:

```
clusA::> metrocluster check cluster show -instance

Type of Check: negotiated-switchover-ready
Cluster Name: clusA
Result of the Check: not-applicable
Additional Information/Recovery Steps: Disaster recovery readiness checks
are not performed as part of periodic metrocluster check. To run these
checks, use the "metrocluster check run" command.

Type of Check: switchback-ready
Cluster Name: clusA
Result of the Check: not-applicable
Additional Information/Recovery Steps: Disaster recovery readiness checks
are not performed as part of periodic metrocluster check. To run these
checks, use the "metrocluster check run" command.

Type of Check: job-schedules
Cluster Name: clusA
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: licenses
Cluster Name: clusA
Result of the Check: ok
Additional Information/Recovery Steps:
```

```

Type of Check: periodic-check-enabled
Cluster Name: clusA
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: onboard-key-management
Cluster Name: clusA
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: external-key-management
Cluster Name: clusA
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: negotiated-switchover-ready
Cluster Name: clusB
Result of the Check: not-applicable
Additional Information/Recovery Steps: Disaster recovery readiness checks
are not performed as part of periodic metrocluster check. To run these
checks, use the "metrocluster check run" command.

Type of Check: switchback-ready
Cluster Name: clusB
Result of the Check: not-applicable
Additional Information/Recovery Steps: Disaster recovery readiness checks
are not performed as part of periodic metrocluster check. To run these
checks, use the "metrocluster check run" command.

Type of Check: job-schedules
Cluster Name: clusB
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: licenses
Cluster Name: clusB
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: periodic-check-enabled
Cluster Name: clusB
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: onboard-key-management
Cluster Name: clusB
Result of the Check: ok
Additional Information/Recovery Steps:

Type of Check: external-key-management
Cluster Name: clusB
Result of the Check: ok
Additional Information/Recovery Steps:
14 entries were displayed.

metrocluster check config-replication commands

Display MetroCluster check configuration replication status

metrocluster check config-replication show

Display MetroCluster config-replication status information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check config-replication show` command displays the results of MetroCluster configuration replication.

The command verifies the following aspects of MetroCluster configuration replication :

- Enabled: Verifies that MetroCluster configuration replication is enabled on the cluster.
- Running: Verifies that MetroCluster configuration replication is running on the cluster.
- Remote Heartbeat: Verifies that the MetroCluster configuration replication heartbeat with the remote cluster is healthy.
- Last Heartbeat Sent: Prints the timestamp of the last MetroCluster configuration replication heartbeat sent to the remote cluster.
- Last Heartbeat Received: Prints the timestamp of the last MetroCluster configuration replication heartbeat received from the remote cluster.
- Storage Status: Verifies that MetroCluster configuration replication storage is healthy.
- Storage In Use: Prints the location of MetroCluster configuration replication storage.
- Storage Remarks: Prints the underlying root cause for non healthy MetroCluster configuration storage.
- Vserver Streams: Verifies that MetroCluster configuration replication Vserver streams are healthy.
- Cluster Streams: Verifies that MetroCluster configuration replication Cluster streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

`[-instance]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example shows the output of `metrocluster check config-replication show`:

```
clusA::metrocluster check config-replication> show
      Enabled: true
      Running: true
      Remote Heartbeat: ok
      Last Heartbeat Sent: 12/12/2013 14:24:59
      Last Heartbeat Received: 12/12/2013 14:25:00
      Storage Status: ok
      Storage In Use: Cluster-wide Volume:
MDV_CRS_1bc7134a5ddf11e3b63f123478563412_A
      Storage Remarks: -
      Vserver Streams: ok
      Cluster Streams: ok
```

[metrocluster check config-replication show-aggregate-eligibility](#) on page 305

metrocluster check config-replication show-aggregate-eligibility

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check config-replication show-aggregate-eligibility` command displays the MetroCluster configuration replication aggregate eligibility.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate

This is the aggregate name. If this parameter is specified, only rows with this aggregate will be displayed.

[-hosted-configuration-replication-volumes <volume name>, ...] - Currently Hosted Configuration Replication Volumes

This is the list of the configuration replication volumes hosted on this aggregate. If this parameter is specified, only rows with these configuration replication volumes will be displayed.

[-is-eligible-to-host-additional-volumes { true/false}] - Eligibility to Host Another Configuration Replication Volume

This is the eligibility of the aggregate to host additional configuration replication volumes. If this parameter is specified, only rows with this eligibility will be displayed.

[-comment <text>] - Comment for Eligibility Status

This is a comment regarding the eligibility of the aggregate to host configuration replication volumes. If this parameter is specified, only rows with this comment will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with thirteen aggregates in the cluster:

```
clusA::metrocluster check config-replication> show-aggregate-eligibility
```

Aggregate Comments	Hosted Config Replication Vols	Eligible to Host Addl Vols	
a0 Aggregate	-	false	Root
a1	MDV_CRS_1bc7134a5ddf11e3b63f123478563412_A	true	-

metrocluster check config-replication show-capture-status

Display MetroCluster capture status information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster check config-replication show-capture-status` command indicates whether or not a configuration change that would prevent a negotiated switchover is currently being captured for replication.

Examples

The following example shows the execution of the command in a MetroCluster configuration when capture is not in progress:

```

cluster1::*> metrocluster check config-replication show-capture-status
Is Capture in Progress: false

```

metrocluster check connection commands

Display the check results of connections for nodes in a MetroCluster over IP configuration

metrocluster check connection show

Display the check results of connections for nodes in a MetroCluster over IP configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check connection show` command displays the check results of connections for nodes in a MetroCluster over IP configuration.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command displays only the fields that you specify.

[-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster specified by uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the matching cluster.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching node specified by uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-home-port {<netport>/<ifgrp>}] - Home Port

If this parameter is specified, the command displays information for the matching home-port.

[-relationship-type <Roles of MetroCluster Nodes>] - Relationship Role Type

If this parameter is specified, the command displays information for the matching relationship-type.

[-source-address <IP Address>] - Source Network Address

If this parameter is specified, the command displays information for the matching source address.

[-destination-address <IP Address>] - Destination Network Address

If this parameter is specified, the command displays information for the matching destination address.

[-partner-cluster-uuid <UUID>] - Partner Cluster UUID

If this parameter is specified, the command displays information for the matching partner-cluster-uuid.

[-partner-node-uuid <UUID>] - Partner Node UUID

If this parameter is specified, the command displays information for the matching partner-node-uuid.

[-partner-node <text>] - Partner Node Name

If this parameter is specified, the command displays information for the matching partner-node.

[-partner-type <text>] - Partner Relationship Type

If this parameter is specified, the command displays information for the matching partner-type.

[-config-state <text>] - Configuration State

If this parameter is specified, the command displays information for the matching config-state.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, the command displays information for the matching config-error-info.

[-check-result {ok/warning/not-run/not-applicable}] - Check Connection Result

If this parameter is specified, the command displays information for the matching check-result.

[-check-ping-error-info <text>] - Check Connection Ping Error Info

If this parameter is specified, the command displays information for the matching check-ping-error-info.

[-check-mtu-size-error-info <text>] - Check Connection MTU Size Error Info

If this parameter is specified, the command displays information for the matching check-mtu-size-error-info.

[-check-storage-error-info <text>] - Check Connection Storage Error Info

If this parameter is specified, the command displays information for the matching check-storage-error-info.

Examples

The following example shows the output of the metrocluster check connection show command:

```

metrocluster check lif commands

Display LIF placement check results in MetroCluster configuration

metrocluster check lif repair-placement

Repair LIF placement for the sync-source Vserver LIFs in the destination cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check lif repair-placement` command reruns LIF placement for those LIFs displayed by the `metrocluster check lif show` command. This command is expected to be run after the admin manually rectifies the LIF placement failures displayed in the `metrocluster check lif show` command output. The command is successful if the LIF placement rerun does not encounter any LIF placement failure. This is to be confirmed by subsequent running of the `metrocluster check lif show`.

Parameters**-vserver <Vserver Name> - sync-source Vserver Name**

This is the name of the sync source Vserver that has LIF placement failures as reported by the `metrocluster check lif show` command. This input ensures that the command is run on the specified Vserver.

[-lif <lif-name>] - Logical Interface Name

This is the Logical Interface name that belongs to the sync source Vserver that has a LIF placement failure in the destination cluster as reported by the `metrocluster check lif show` command. This input ensures that the command is run on the specified LIF only.

Examples

The following example shows the execution of the command with a sync source Vserver and a LIF specified:

```
clusA:> metrocluster check lif repair-placement -vserver vs1.example.com -
lif fcplif1
Command completed. Run the "metrocluster check lif show" command for results.

clusA:> metrocluster check lif repair-placement -vserver vs1.example.com -
lif iscsilif1
Command completed. Run the "metrocluster check lif show" command for results.
```

The following example shows the execution of the command with only a sync-source Vserver specified:

```
clusA:> metrocluster check lif repair-placement -vserver vs1.example.com
Command completed. Run the "metrocluster check lif show" command for results.
clusA:>
```

metrocluster check lif show

Show results of MetroCluster check results for the data LIFs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check lif show` command displays the LIF placement failures in the MetroCluster configuration.

The command verifies the following aspects of the LIF placements of all the data LIFs in Metrocluster:

- `lif-placed-on-dr-node`: This check verifies that the LIF is placed on DR partner node.
- `port-selection`: This check verifies that the LIF is placed on correct port.

The LIF placement failures are mostly fabric/network connectivity issues that require manual intervention. Once the connectivity issues are resolved manually, the admin is expected to run

`metrocluster check lif repair-placement` command to resolve the LIF placement issues for the sync source Vserver.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

[`-fields <fieldname>, ...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[`-instance`]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-cluster <Cluster name>`] - Name of the Cluster

This is the name of the cluster the LIF belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[`-vserver <text>`] - Name of the Vserver

This is the name of the Vserver in the MetroCluster configuration

[`-lif <lif-name>`] - Name of the Lif

This is the name of the LIF.

[`-check <MetroCluster LIF placement Check>`] - Description

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[`-result {ok/warning/not-run/not-applicable}`] - Result of the Check

This is the result of the check performed. If this parameter is specified, only rows with this result will be displayed.

[`-additional-info <text>`] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with two nodes per cluster:

```
clusA::>metrocluster check lif show

metrocluster check node commands

The node directory

metrocluster check node show

Show results of MetroCluster check for nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check node show` command displays the results of node checks performed by the [metrocluster check run](#) command.

The command displays the results of the following node configuration checks:

- `node-reachable`: This check verifies that the node is reachable.
- `metrocluster-ready`: This check verifies that the node is ready for MetroCluster configuration.
- `local-ha-partner`: This check verifies that the HA partner node is in the same cluster.
- `ha-mirroring-on`: This check verifies that HA mirroring for the node is configured.
- `ha-mirroring-op-state`: This check verifies that the HA mirroring operation is online.
- `symmetric-ha-relationship`: This check verifies that the relationship between the node and its HA partner is symmetric.
- `remote-dr-partner`: This check verifies that the DR partner node is in the remote cluster.
- `dr-mirroring-on`: This check verifies that DR mirroring for the node is configured.
- `dr-mirroring-op-state`: This check verifies that the DR mirroring operation is online.
- `symmetric-dr-relationship`: This check verifies that the relationship between the node and its DR partner is symmetric.
- `remote-dr-auxiliary-partner`: This check verifies that the DR auxiliary partner node is in the remote cluster.
- `symmetric-dr-auxiliary-relationship`: This check verifies that the relationship between the node and its DR auxiliary partner is symmetric.
- `storage-failover-enabled`: This check verifies that storage failover is enabled.
- `has-intercluster-lif`: This check verifies that the node has an intercluster LIF.
- `node-object-limit`: This check verifies that the node object limit option for the node is turned on.
- `automatic-uso`: This check verifies that the automatic USO option for the node is enabled.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the **-instance** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node <Node name>] - Node Name

This is the name of the node for which the check was run. If this parameter is specified, only rows with this node will be displayed.

[-check <MetroCluster Node Check>] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Cluster Name

This is the name of the cluster the node belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-result {ok/warning/not-run/not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with two nodes per cluster:

```
clusA:> metrocluster check node show

Last Checked On: 9/12/2016 13:47:00
```

Node	Check	Result
clusA-01	node-reachable	ok
	metrocluster-ready	ok
	local-ha-partner	ok
	ha-mirroring-on	warning
	ha-mirroring-op-state	ok
	symmetric-ha-relationship	warning
	remote-dr-partner	ok
	dr-mirroring-on	ok
	dr-mirroring-op-state	ok
	symmetric-dr-relationship	ok
	remote-dr-auxiliary-partner	ok
	symmetric-dr-auxiliary-relationship	warning
	storage-failover-enabled	ok
	has-intercluster-lif	ok
	node-object-limit	ok
	automatic-uso	ok
clusA-02	node-reachable	ok
	metrocluster-ready	ok

Additional Information/Recovery Steps: Node's HA mirroring is not active.
Enable it on using "storage failover" commands.

```

Node Name: clusA-01

metrocluster check volume commands

Display check results for Volumes

metrocluster check volume show

Show results of the MetroCluster check for volumes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check volume show` command displays the results of volume checks performed by the [metrocluster check run](#) command.

The command displays the results of the following volume configuration checks:

- **unmirrored-flexgroups:** This check looks for flexgroups residing on unmirrored aggregates.
- **mixed-flexgroups:** This check looks for flexgroups residing on a mix of mirrored and unmirrored aggregates.

Additional information about the warnings, if any, and recovery steps can be viewed by running the command with the **-instance** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This is the name of the vservers that contains the volume that the check results apply to. If this parameter is specified, only rows matching the specified cluster will be displayed.

[-volume <volume name>] - Volume Name

This is the name of the volume that the check results apply to. If this parameter is specified, only rows matching the specified volume will be displayed.

[-check <MetroCluster Volume Check>] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-result {ok/warning/not-run/not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>, ...] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration:

```
clusA::*> metrocluster check volume show

Last Checked On: 7/25/2018 10:04:07
```

Vserver	Volume	Check	Result
vs1	unMirr	unmirrored-volumes	warning
vs2	vs2UnMirrA	unmirrored-volumes	warning

```
2 entries were displayed.

clusA::*> metrocluster check volume show -instance

Vserver Name: vs1
Volume Name: unMirr
Type of Check: unmirrored-volumes
Result of the Check: warning
Additional Information/Recovery Steps: FlexGroup "unMirr" resides on
unmirrored aggregates. Parts of the FlexGroup may not be available after an
un-planned switchover.

Vserver Name: vs2
Volume Name: vs2UnMirrA
Type of Check: unmirrored-volumes
Result of the Check: warning
Additional Information/Recovery Steps: FlexGroup "vs2UnMirrA" resides on
unmirrored aggregates. Parts of the FlexGroup may not be available after an
un-planned switchover.
2 entries were displayed.
clusA::*>

metrocluster config-replication commands

Display configuration replication information

metrocluster config-replication cluster-storage-configuration commands

Display configuration replication storage configuration

metrocluster config-replication cluster-storage-configuration modify

Modify MetroCluster storage configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster config-replication cluster-storage-configuration modify` command modifies the configuration of storage used for configuration replication.

Parameters

`[-disallowed-aggregates <aggregate name>, ...]` - Disallowed Aggregates

Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

Examples

The following example disallows two aggregates named *aggr1* and *aggr2*:

```
cluster1::*> metrocluster config-replication cluster-storage-configuration
modify -disallowed-aggregates aggr1,aggr2
```

[metrocluster config-replication cluster-storage-configuration show](#) on page 319

metrocluster config-replication cluster-storage-configuration show

Display MetroCluster storage configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- **Disallowed Aggregates** - The list of storage aggregates that are configured as not allowed to host storage areas.
- **Auto-Repair** - Displays *true* if the automatic repair of storage areas used by configuration replication is enabled.
- **Auto-Recreate** - Displays *true* if the automatic recreation of storage volumes used by configuration replication is enabled.

- Use Mirrored Aggregate - Displays *true* if storage areas for configuration replication are to be hosted on a mirrored aggregate.

Examples

The following is an example of the `metrocluster config-replication cluster-storage-configuration show` command:

```
cluster1::*> metrocluster config-replication cluster-storage-configuration
show

  Disallowed Aggregates: -
        Auto-Repair: true
        Auto-Recreate: true
  Use Mirrored Aggregate: true
```

metrocluster config-replication resync-status commands

Display MetroCluster configuration synchronization status

metrocluster config-replication resync-status show

Display MetroCluster Configuration Resynchronization Status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster config-replication resync-status show` command displays the state of the configuration synchronization operation between the two clusters in the MetroCluster configuration.

This command displays the following details about the local cluster and the peer cluster:

- Source: This is the source side whose configuration is being replicated to the destination side.
- Destination: This is the destination side where the configuration is being replicated to from the source side.
- State: This is the state of the synchronization operation.
- % Complete: This is completion percentage of the operation.

Examples

The following example shows the output of the command when synchronization is in progress:

```
clusterA::> metrocluster config-replication resync-status show
Source           Destination           State      % Complete
-----
clusterA         clusterB              complete   -
clusterB         clusterA              complete   -
```

The following example shows the output of the command when synchronization from clusB to clusA is in progress:

```

clusA::> metrocluster config-replication resync-status show
Source          Destination          State          % Complete
-----
clusterA        clusterB              complete       -
clusterB        clusterA              messaging      95

```

metrocluster configuration-settings commands

Configuration settings to set up MetroCluster

metrocluster configuration-settings show-status

Display the configuration settings status for a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings show-status` command displays the configuration settings status for nodes in a MetroCluster setup. If a DR group has not been created, then status for nodes in the local cluster only are displayed.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>,...** parameter, the command displays only the fields that you specify.

[-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays detailed information about all nodes in the cluster matching the specified cluster-uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays detailed information about all the nodes in the specified cluster.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-configuration-status <text>] - Configuration Settings Status

If this parameter is specified, the command displays detailed information about all nodes with the specified configuration status.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, the command displays detailed information about all nodes with the specified configuration error information.

Examples

The following example shows the display of MetroCluster setup status:

Nodes do not have a valid platform-specific personality value (equivalent to HAOSC parameter on non-Apollo platforms) for a MetroCluster setup.

```
clusA::> metrocluster configuration-settings show-status
Cluster          Node          Configuration Settings Status
-----
clusA            A1            not a MetroCluster setup
                  A2            not a MetroCluster setup
2 entries were displayed.
```

MetroCluster setup uses FC links rather than IP link:

```
clusA::> metrocluster configuration-settings show-status
Cluster          Node          Configuration Settings Status
-----
clusA            A1            not applicable for FC and SAS
                  A2            not applicable for FC and SAS
2 entries were displayed.
```

Output of the command when MetroCluster setup uses IP links and before "metrocluster configuration-settings dr-group create" command is run:

```
clusA::> metrocluster configuration-settings show-status
Cluster          Node          Configuration Settings Status
-----
clusA            A1            ready for DR group create
                  A2            ready for DR group create
2 entries were displayed.
```

Output of the command after "metrocluster configuration-settings dr-group create" command is run:

```
clusA::> metrocluster configuration-settings show-status
Cluster          Node          Configuration Settings Status
-----
clusA            A1            ready for interface create
                  A2            ready for interface create
clusB            B1            ready for interface create
                  B2            ready for interface create
4 entries were displayed.
```

Output of the command after "metrocluster configuration-settings interface create" command is run for every node:

```
clusA::> metrocluster configuration-settings show-status
Cluster          Node          Configuration Settings Status
-----
clusA            A1            ready for next interface create
                  A2            ready for connection connect
clusB
```

```

B1      ready for connection connect
B2      ready for connection connect
4 entries were displayed.

```

Output of the command after "metrocluster configuration-settings connection connect" command is run:

```

clusA::> metrocluster configuration-settings show-status
Cluster      Node      Configuration Settings Status
-----
clusA
            A1      completed
            A2      completed
clusB
            B1      completed
            B2      completed
4 entries were displayed.

```

Output of the command after "metrocluster configuration-settings connection connect" command is run and there are connection errors:

```

clusA::> metrocluster configuration-settings show-status
Cluster      Node      Configuration Settings Status
-----
clusA
            A1      connection error
            A2      completed
clusB
            B1      connection error
            B2      completed
4 entries were displayed.

```

metrocluster configuration-settings calibration commands

Calibrate network parameters for nodes in MetroCluster over IP configuration

metrocluster configuration-settings calibration measure

Measure latency and bandwidth values

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster configuration-settings calibration measure` command measures the bandwidth and latency between local and remote nodes in a MetroCluster over IP configuration.

This command should not be run when the MetroCluster configuration is under a heavy load. Bandwidth measurements will attempt to fully saturate network connections to the remote cluster and may disrupt the quality of service.

Examples

The following example shows the output for the calibration measure command in MetroCluster over IP configurations:

```

clusA::> metrocluster configuration-settings calibration measure

Warning: This operation will attempt to fully saturate the network
connection to
the remote cluster for measuring bandwidth. This may disrupt

```

```

heavy          performance and should not be run when MetroCluster is under
load. Do you want to continue? {y|n}: y
Measuring latency and bandwidth between node "A1" (10.140.113.214) and
node "B1" (10.140.113.26) over port "e0f".
Measuring latency and bandwidth between node "A1" (10.140.113.215) and
node "B1" (10.140.113.27) over port "e0g".
Measuring latency and bandwidth between node "A2" (10.140.113.216) and
node "B2" (10.140.113.25) over port "e0f".
Measuring latency and bandwidth between node "A2" (10.140.113.217) and
node "B2" (10.140.113.28) over port "e0g".
Measurements complete. Use the "metrocluster configuration-settings
calibration show" command to display the results.

```

metrocluster configuration-settings calibration show

Display the calibration measurements for local nodes in MetroCluster over IP configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings calibration show` command shows the bandwidth and latency between local and remote nodes in a MetroCluster over IP configuration.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-calibration-id <integer>] - Calibration ID

This field specifies Calibration ID.

[-subnet <IP Address>] - IP Subnet

This field specifies subnet.

[-node-uuid <UUID>] - Node UUID

This field specifies UUID of the node.

[-home-port {<netport>/<ifgrp>}] - Home Port

This field specifies name of the port used to measure latency and bandwidth.

[-node {<nodename>/local}] - Node Name

This field specifies name of the node.

[-collection-time <MM/DD/YYYY HH:MM:SS>] - Collection Time of Sample

This field specifies collection time of sample.

[-source-address <IP Address>] - Source Network Address

This field specifies IP address of the port on the node.

[-destination-address <IP Address>] - Destination Network Address

This field specifies IP address of the port on the partner node.

[-latency <double>] - Latency in ms

This field specifies latency in ms.

[-bandwidth <double>] - Bandwidth in Mb/s

This field specifies bandwidth in Mb/s.

Examples

The following example shows the output for the calibration show command in MetroCluster over IP configurations:

```
clusA::*> metrocluster configuration-settings calibration show
Home Latency Bandwidth
ID Subnet      Node      Port (ms)  (Mb/s)  Collection Time
-----
1  172.21.96.0  A1
                                e0f  0.341  764      8/6/2019 16:20:07

metrocluster configuration-settings connection check

Check the network connections between partner nodes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster configuration-settings connection check` command checks the settings of a MetroCluster over IP configuration.

This command is used for MetroCluster configurations that are connected through IP links.

Examples

The following example shows the output for the check command in MetroCluster over IP configurations:

```
clusA::*> metrocluster configuration-settings connection check
[Job 68] Job succeeded: Connect is successful.

Begin connection check.
Start checking the partner cluster.
  Check partner cluster: PASS.
Start checking the configuration settings.
  Check configuration settings: PASS.
Start ping the network endpoints from cluster "clusA".
  Ping network endpoints: PASS.
Start ping the network endpoints from cluster "clusB".
  Ping network endpoints: PASS.
Start checking the network MTU sizes from cluster "clusA".
  Check network MTU sizes: PASS.
Start checking the network MTU sizes from cluster "clusB".
  Check network MTU sizes: PASS.
Start checking the network subnets from cluster "clusA".
  Check network subnets: PASS.
Start checking the network subnets from cluster "clusB".
  Check network subnets: PASS.
Start checking the storage daemons on cluster "clusA".
  Check storage daemons: PASS.
```

```
Start checking the storage daemons on cluster "clusB".
  Check storage daemons: PASS.
End of connection check.
```

metrocluster configuration-settings connection connect

Configure the network connections between partner nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings connection connect` command configures the connections that mirror NV logs and access remote storage between partner nodes in a MetroCluster setup.

This command is used for MetroCluster setups that are connected though IP links. MetroCluster setups that are connected through FC links will configure the FC connections automatically.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create,`
- `metrocluster configuration-settings interface create,`
- `metrocluster configuration-settings connection connect.`

Before this command is run

- The DR groups must have been configured. Run the `metrocluster configuration-settings dr-group show` command to verify that every node is partnered in a DR group.
- The network logical interfaces must have been configured on every node. Use the `metrocluster configuration-settings interface show` command to verify that every node has network logical interfaces configured to mirror NV logs and access remote storage.

After this command completes successfully, every node will:

- Have NV log mirroring configured and mirroring disabled. NV log mirroring will be enabled by the `metrocluster configure` command.
- Have access to remote storage. Use the `storage disk show -pool Pool1` command to view the remote disks that are hosted on DR partner nodes.

The DR groups and network logical interfaces that were configured by the `metrocluster configuration-settings` commands cannot be deleted after the connections have been configured. The `metrocluster configuration-settings connection disconnect` command must be run to remove the connections before the DR groups and network logical interfaces can be deleted.

Examples

The following example shows configuration of connections in a MetroCluster over IP setup:

```
clusA:> metrocluster configuration-settings connection connect
[Job 269] Job succeeded: Connect is successful.
```

```
clusA:> metrocluster configuration-settings connection show
```

metrocluster configuration-settings connection disconnect

Tear down the network connections between partner nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings connection disconnect` command removes the connections between nodes in a DR group that are used to mirror NV logs and access remote storage.

This command cannot be run if a node in the DR group has remote disks assigned to the node. The assigned ownership of remote disks can be removed by running the [storage disk removeowner](#) command.

The [metrocluster configuration-settings](#) commands are run in the following order to remove MetroCluster over IP configuration:

- `metrocluster configuration-settings connection disconnect`,
- [metrocluster configuration-settings interface delete](#),
- [metrocluster configuration-settings dr-group delete](#).

Parameters

-dr-group-id <integer> - DR Group ID

This parameter identifies the DR group to be disconnected.

Examples

The following example illustrates removal of connections in a four-node MetroCluster setup:

```
clusA::> metrocluster configuration-settings connection disconnect -dr-group-id 1
[Job 270] Job succeeded: Disconnect is successful.

metrocluster configuration-settings connection show

Display the connections between partner nodes in a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings connection show` command displays the connection configuration information between the nodes in a MetroCluster setup.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster specified by uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the matching cluster.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching node specified by uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-home-port {<netport>/<ifgrp>}] - Home Port

If this parameter is specified, the command displays information for the matching home-port.

[-relationship-type <Roles of MetroCluster Nodes>] - Relationship Role Type

If this parameter is specified, the command displays information for the matching relationship-type.

[-source-address <IP Address>] - Source Network Address

If this parameter is specified, the command displays information for the matching source address.

[-destination-address <IP Address>] - Destination Network Address

If this parameter is specified, the command displays information for the matching destination address.

[-partner-cluster-uuid <UUID>] - Partner Cluster UUID

If this parameter is specified, the command displays information for the matching partner-cluster-uuid.

[-partner-node-uuid <UUID>] - Partner Node UUID

If this parameter is specified, the command displays information for the matching partner-node-uuid.

[-partner-node <text>] - Partner Node Name

If this parameter is specified, the command displays information for the matching partner-node.

[-partner-type <text>] - Partner Relationship Type

If this parameter is specified, the command displays information for the matching partner-type.

[-config-state <text>] - Configuration State

If this parameter is specified, the command displays information for the matching config-state.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, the command displays information for the matching config-error-info.

Examples

The following example shows the output of `metrocluster configuration-settings connection connect` command:

```

Output of the command before the connections are established using the

metrocluster configuration-settings dr-group commands

Configure DR groups

metrocluster configuration-settings dr-group create

Create a DR group in a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings dr-group create` command partners the nodes that will comprise a DR group in a MetroCluster setup.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links will configure DR groups automatically and do not require the [metrocluster configuration-settings](#) commands.

The [metrocluster configuration-settings](#) commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create`,
- [*metrocluster configuration-settings interface create*](#),
- [*metrocluster configuration-settings connection connect*](#).

Before running this command, cluster peering must be configured between the local and partner clusters. Run the [*cluster peer show*](#) command to verify that peering is available between the local and partner clusters.

This command configures a local node and a remote node as DR partner nodes. The command also configures the HA partner of the local node and the HA partner of the remote node as the other DR partner nodes in the DR group.

Parameters

-partner-cluster <Cluster name> - Partner Cluster Name

Use this parameter to specify the name of the partner cluster.

-local-node {<nodename>/local} - Local Node Name

Use this parameter to specify the name of a node in the local cluster.

-remote-node <text> - Remote Node Name

Use this parameter to specify the name of a node in the partner cluster that is to be the DR partner of the specified local node.

Examples

The following example shows the creation of the MetroCluster DR group:

```
clusA:> metrocluster configuration-settings dr-group create -partner-
cluster clusB -local-node A1 -remote-node B1
[Job 268] Job succeeded: DR Group Create is successful.
```

```
clusA:> metrocluster configuration-settings dr-group show
```

DR Group ID	Cluster	Node	DR Partner Node
1	clusA	A1	B1
		A2	B2
	clusB	B2	A2
		B1	A1

4 entries were displayed.

```
clusA:> metrocluster configuration-settings show-status
```

Cluster	Node	Configuration Settings	Status
clusA	A1	ready for interface create	
	A2	ready for interface create	
clusB	B1	ready for interface create	
	B2	ready for interface create	

4 entries were displayed.

metrocluster configuration-settings dr-group delete

Delete a DR group in a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings dr-group delete` command deletes a DR group and its node partnerships that were configured using the [metrocluster configuration-settings dr-group create](#) command.

This command cannot be run if the [metrocluster configuration-settings interface create](#) command has configured a network logical interface on a network port provisioned for MetroCluster. The [metrocluster configuration-settings interface delete](#) command must then be run to delete the network logical interfaces on every node in the DR group.

The [metrocluster configuration-settings](#) commands are run in the following order to remove the MetroCluster over IP configuration:

- [metrocluster configuration-settings connection disconnect](#),
- [metrocluster configuration-settings interface delete](#),
- `metrocluster configuration-settings dr-group delete`.

Parameters

-dr-group-id <integer> - Dr group Id

This parameter identifies the DR group to be deleted.

Examples

The following example shows the deletion of the MetroCluster DR group:

```
clusA:> metrocluster configuration-settings dr-group delete -dr-group-id 1

Warning: This command deletes the existing DR group relationship. Are you
sure
      you want to proceed ? {y|n}: y
[Job 279] Job succeeded: DR Group Delete is successful.

clusA:> metrocluster configuration-settings dr-group show
No DR groups exist.

clusA:> metrocluster configuration-settings show-status
Cluster                Node                Configuration Settings Status
-----
clusA
                        A1                ready for DR group create
                        A2                ready for DR group create
clusB
                        B1                ready for DR group create
                        B2                ready for DR group create
4 entries were displayed.
```

metrocluster configuration-settings dr-group show

Display the DR groups in a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings dr-group show` command displays the DR groups and their nodes.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

[-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the specified cluster.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching nodes uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-dr-partner-node-uuid <UUID>] - DR Partner Node UUID

If this parameter is specified, the command displays information for the matching DR partner node uuid.

[-dr-partner-node <text>] - DR Partner Node Name

If this parameter is specified, the command displays information for the matching DR partner nodes.

Examples

The following example illustrates the display of DR group configuration in a four-node MetroCluster setup:

```
clusA:> metrocluster configuration-settings dr-group show
DR Group ID Cluster Node DR Partner Node
-----
```

```

1          clusA
          A1          B1
          A2          B2
          clusB
          B2          A2
          B1          A1
4 entries were displayed.

```

metrocluster configuration-settings interface commands

Configure network logical interfaces

metrocluster configuration-settings interface create

Create a MetroCluster interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings interface create` command configures the network logical interfaces that will be used on a node in a MetroCluster setup to mirror NV logs and access remote storage.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links do not require the user to provision network logical interfaces to mirror NV logs and access remote storage.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create`,
- `metrocluster configuration-settings interface create`,
- `metrocluster configuration-settings connection connect`.

Before running this command, the node's DR group must be configured using the `metrocluster configuration-settings dr-group create` command. Run the `metrocluster configuration-settings dr-group show` command to verify that the node's DR group has been configured.

Parameters

-cluster-name <Cluster name> - Cluster Name

Use this parameter to specify the name of the local or partner cluster.

-home-node <text> - Home Node

Use this parameter to specify the home node in the cluster which hosts the interface.

-home-port {<netport>/<ifgrp>} - Home Port

Use this parameter to specify the home port provisioned for MetroCluster.

-address <IP Address> - Network Address

Use this parameter to specify the network address to be assigned to the home port.

-netmask <Continuous IP Mask> - Netmask

Use this parameter to specify the network mask to be assigned to the interface.

Examples

This example shows configuring logical interface on MetroCluster IP capable port:

```
clusA:> metrocluster configuration-settings interface create -cluster-name
clusA -home-node A1 -home-port e0f -address 10.140.113.214 -netmask
255.255.192.0
[Job 281] Job succeeded: Interface Create is successful.
```

```
clusA:> metrocluster configuration-settings interface show
DR
Group Cluster Node      Network Address Netmask      Gateway      Config
-----
1      clusA A1
      Home Port: e0f
      10.140.113.214 255.255.192.0
-      completed
```

Output after configuring all the interfaces:

```
clusA:> metrocluster configuration-settings interface show
DR
Group Cluster Node      Network Address Netmask      Gateway      Config
-----
1      clusA A1

metrocluster configuration-settings interface delete

Delete a MetroCluster interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings interface delete` command deletes the network logical interface that was configured on a network port provisioned for MetroCluster.

This command cannot be run if the [metrocluster configuration-settings connection connect](#) command has set up the connections between the nodes in a DR group. The [metrocluster configuration-settings connection disconnect](#) command must then be run to remove the connections.

The [metrocluster configuration-settings](#) commands are run in the following order to remove the MetroCluster over IP configuration:

- [metrocluster configuration-settings connection disconnect](#),
- `metrocluster configuration-settings interface delete`,
- [metrocluster configuration-settings dr-group delete](#).

Parameters

-cluster-name <Cluster name> - Cluster Name

Use this parameter to specify the name of the local or partner cluster.

-home-node <text> - Home Node

Use this parameter to specify the home node in the cluster which hosts the interface.

-home-port {<netport>/<ifgrp>} - Home Port

Use this parameter to specify the home port provisioned for MetroCluster.

Examples

The following example shows the deletion of interface in a MetroCluster setup:

```
clusA:> metrocluster configuration-settings interface delete -cluster-name
clusA -home-node A1 -home-port e0f
[Job 271] Job succeeded: Interface Delete is successful.

metrocluster configuration-settings interface show

Display the network logical interfaces provisioned for MetroCluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings interface show` command displays the network logical interfaces that were provisioned for MetroCluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command displays only the fields that you specify.

[-instance]}

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster specified by uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the matching cluster..

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching nodes uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-home-port {<netport>/<ifgrp>}] - Home Port

If this parameter is specified, all interfaces with home-port set to this value are displayed.

[-address <IP Address>] - Network Address

If this parameter is specified, the command displays information for the matching network address.

[-netmask <Contiguous IP Mask>] - Netmask

If this parameter is specified, all interfaces with netmask set to this value are displayed.

[-gateway <IP Address>] - Gateway

If this parameter is specified, all interfaces with gateway set to this value are displayed.

[-config-state <text>] - Configuration State

If this parameter is specified, all interfaces with this field set to the specified value are displayed.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, all interfaces with this field set to the specified value are displayed.

Examples

The following example illustrates display of logical interfaces configured in a four-node MetroCluster setup:

```

clusA::> metrocluster configuration-settings interface show
DR
Group Cluster Node Network Address Netmask Gateway Config
-----

```

metrocluster configuration-settings mediator commands

Configure connections between the Mediator and nodes in a MetroCluster Configuration

metrocluster configuration-settings mediator add

Configure the network connections between the Mediator and MetroCluster nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings mediator add` command configures the connection between the mediator and all the nodes in a MetroCluster configuration.

Before this command is run MetroCluster should be configured on all the clusters.

Mediator username and password are required to successfully add the mediator.

After this command completes successfully, every node will:

- Have a connection with the mediator.
- The mediator disks will be assigned to the nodes in the MetroCluster configuration.
- AUSO will be enabled.

Parameters

-mediator-address <IP Address> - Mediator IP Address

Specifies the IP address of the mediator to which the nodes in the MetroCluster configuration will be connected.

Examples

The following example connects the nodes to the mediator in a MetroCluster configuration over IP setup:

```
clusA::> metrocluster configuration-settings mediator add -mediator-
address 10.234.133.115
Adding mediator and enabling Automatic Unplanned Switchover. It
might take a few minutes to complete.
Please enter the username for the mediator: mediatoradmin
Please enter the password for the mediator:
Confirm the mediator password:
Creating mediator mailboxes...
Setting up connections to mediator from all nodes in the clusters...
Setting mediator mailbox from all nodes in the cluster...
Enabling Automatic Unplanned Switchover for all nodes in the
cluster...
Successfully added mediator.
```

metrocluster configuration-settings mediator remove

Tear down connections between the Mediator and MetroCluster nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings mediator remove` command removes the connection between the mediator and all the nodes in a MetroCluster configuration.

Mediator username and password are required to successfully remove the mediator.

Examples

The following example removes the connections between the nodes and the mediator in a MetroCluster configuration over IP setup:

```
clusA::> metrocluster configuration-settings mediator remove
Removing the mediator and disabling Automatic Unplanned Switchover. It
may take a few minutes to complete.
Please enter the username for the mediator: mediatoradmin
Please enter the password for the mediator:
Confirm the mediator password:
Disabling Automatic Unplanned Switchover for all nodes in the
cluster...
Removing mediator mailboxes...
Performing final cleanup...
Successfully removed the mediator.
```

metrocluster interconnect commands

MetroCluster interconnect commands

metrocluster interconnect adapter commands

Manage MetroCluster interconnect adapters

metrocluster interconnect adapter modify

Modify MetroCluster interconnect adapter settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster interconnect adapter modify` command enables you to modify settings of the MetroCluster interconnect adapter.

Parameters

-node {<nodename>/local} - Node Name

This parameter specifies the node name.

-is-ood-enabled {true/false} - Is Out-of-Order Delivery Enabled?

This parameter specifies the out-of-order delivery setting on the adapter.

Examples

The following example enables out-of-order delivery for the port 'fcvi_device_0' on the node 'clusA-01':

```
clusA::*> metrocluster interconnect adapter modify -node clusA-01 -
adapter-port-name fcvi_device_0 -is-ood-enabled true
```

metrocluster interconnect adapter show

Display MetroCluster interconnect adapter information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster interconnect adapter show` command displays interconnect adapter information for the nodes in a MetroCluster configuration.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Adapter Name:** This field specifies the name of the interconnect adapter.
- **Adapter Type:** This field specifies the type of the interconnect adapter.
- **Link Status:** This field specifies the physical link status of the interconnect adapter.
- **Is OOD Enabled:** This field specifies the out-of-order delivery status of the interconnect adapter.
- **IP Address:** This field specifies the IP address assigned to the interconnect adapter.
- **Port Number:** This field specifies the port number of the interconnect adapter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-connectivity`]

Displays the connectivity information from all the interconnect adapters to the connected nodes.

[`-switch`]

Displays details of switches connected to all the interconnect adapters.

[`-connectivity-hidden`] (privilege: advanced)

Displays additional connectivity information (IP address, Area ID, Port ID) from all the interconnect adapters to the connected nodes.

[`-instance`]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>/local`}] - Node Name

Displays information only about the interconnect adapters that are hosted by the specified node.

[`-adapter <text>`] - Adapter

Displays information only about the interconnect adapters that match the specified name.

[`-port-name <text>`] - Port Name

Displays information only about the interconnect adapters that host the specified port name.

[`-type <text>`] - Adapter Type

Displays information only about the interconnect adapters that match the specified adapter type.

[`-physical-status <text>`] - Physical Status

Displays information only about the interconnect adapters that match the specified physical status.

[`-wwn <text>`] - Adapter Port World Wide Name

Displays information only about the interconnect adapters that match the specified world wide name.

[`-address <text>`] - IP Address

Displays information only about the interconnect adapters that match the specified IP address.

[`-firmware-version <text>`] - Firmware Version

Displays information only about the interconnect adapters that match the specified firmware version.

[`-link-speed <text>`] - Link Speed

Displays information only about the interconnect adapters that match the specified link speed.

[`-link-speed-neg-type <text>`] - Link Speed Negotiation Type

Displays information only about the interconnect adapters that match the specified negotiated link speed type.

[`-switch-name <text>`] - Switch Name

Displays information only about the interconnect adapters that are connected to the specified switch.

[-switch-model <text>] - Switch Model

Displays information only about the interconnect adapters that are connected to the switch with the specified model.

[-switch-wnn <text>] - Switch WWName

Displays information only about the interconnect adapters that are connected to the switch with the specified world wide name.

[-switch-vendor <text>] - Switch Vendor

Displays information only about the interconnect adapters that are connected to the switch with the specified vendor.

[-switch-status <text>] - Switch Status

Displays information only about the interconnect adapters that are connected to the switch with the specified operational status.

[-switch-port-number <text>] - Switch Port Number

Displays information only about the interconnect adapters that are connected to the switch with the specified port number.

[-switch-port-wwpn <text>] - Switch Port WWPName

Displays information only about the interconnect adapters that are connected to the switch with the specified word wide port name.

[-remote-adapter-name-list <text>, ...] - Remote Adapter Name List

Displays information only about the interconnect adapters that are connected to the specified remote adapters.

[-remote-adapter-wnn-list <text>, ...] - Remote Adapter WWName List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified world wide names.

[-remote-adapter-address-list <text>, ...] - Remote Adapter IP Address List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified IP addresses.

[-remote-adapter-port-id-list <Hex Integer>, ...] - Remote Adapter Port ID List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified port IDs.

[-remote-adapter-domain-id-list <integer>, ...] - Remote Adapter Domain ID List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified domain IDs.

[-remote-adapter-area-id-list <integer>, ...] - Remote Adapter Area ID List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified Area IDs.

[-remote-partner-system-id-list <integer>, ...] - Remote Partner System ID List

Displays information only about the interconnect adapters that are connected to the remote nodes with the specified System IDs.

[-remote-partner-name-list {<nodename>/local}, ...] - Remote Partner Name List

Displays information only about the interconnect adapters that are connected to the specified remote nodes.

[-is-ood-enabled {true/false}] - Is Out-of-Order Delivery Enabled?

Displays information only about the interconnect adapters that match the specified out-of-order delivery setting.

Examples

The following example shows the output of the command during normal operation (neither cluster is in switchover state):

```
clusA::> metrocluster interconnect adapter show
Link Is OOD
Number Node Adapter Type Status Enabled? IP Address Port
-----
clusA-01 cxgb3_0 iWARP Up false 10.0.1.1 c0a
clusA-01 cxgb3_0 iWARP Down false 10.0.2.1 c0b
clusA-01 fcvi_device_0 FC-VI Up false 1.0.0.1 1a
clusA-01 fcvi_device_1 FC-VI Up false 2.0.0.3 1b
clusA-02 cxgb3_0 iWARP Up false 10.0.1.2 c0a
clusA-02 cxgb3_0 iWARP Down false 10.0.2.2 c0b
clusA-02 fcvi_device_0 FC-VI Up false 1.0.1.1 1a
clusA-02 fcvi_device_1 FC-VI Up false 2.0.1.3 1b
```

The following example shows the output of the command after MetroCluster switchover is performed:

```
clusA::> metrocluster interconnect adapter show
Link Is OOD
Number Node Adapter Type Status Enabled? IP Address Port
-----
clusA-01 cxgb3_0 iWARP Up false 10.0.1.1 c0a
clusA-01 cxgb3_0 iWARP Down false 10.0.2.1 c0b
clusA-01 fcvi_device_0 FC-VI Down false 1.0.0.1 1a
clusA-01 fcvi_device_1 FC-VI Down false 2.0.0.3 1b
clusA-02 cxgb3_0 iWARP Up false 10.0.1.2 c0a
clusA-02 cxgb3_0 iWARP Down false 10.0.2.2 c0b
clusA-02 fcvi_device_0 FC-VI Down false 1.0.1.1 1a
clusA-02 fcvi_device_1 FC-VI Down false 2.0.1.3 1b
```

The following example shows the output of the command with connectivity field during normal operation (neither cluster is in switchover state):

```
clusA::> metrocluster interconnect adapter show -connectivity -node
local -type FC-VI

Adapter Name: fcvi_device_0
WWName: 21:00:00:24:ff:32:01:68
PortNo: 1a

Remote Adapters:

Adapter Name Partner Node Name World Wide Name PortId
-----

```

metrocluster interconnect mirror commands

Manage MetroCluster interconnect mirrors

metrocluster interconnect mirror show

Display MetroCluster interconnect mirror information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster interconnect mirror show` command displays NVRAM mirror information for the nodes configured in a MetroCluster.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Partner Name:** This field specifies the name of the partner node.
- **Partner Type:** This field specifies the type of the partner.
- **Mirror Admin Status:** This field specifies the administrative status of the NVRAM mirror between partner nodes.
- **Mirror Oper Status:** This field specifies the operational status of the NVRAM mirror between partner nodes.
- **Adapter:** This field specifies the name of the interconnect adapter used for NVRAM mirroring.

- **Type:** This field specifies the type of the interconnect adapter used for NVRAM mirroring.
- **Status:** This field specifies the physical status of the interconnect adapter used for NVRAM mirroring.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node Name

If this parameter is specified, mirror details of the specified node are displayed.

[-partner-type {HA/DR/AUX}] - Partner Type

If this parameter is specified, mirror details of the specified partner type are displayed.

[-adapter <text>] - Adapter

If this parameter is specified, mirror details of the specified adapter are displayed.

[-type <text>] - Adapter Type

If this parameter is specified, mirror details of the specified adapter type are displayed.

[-status <text>] - Status

If this parameter is specified, mirror details of the adapter with the specified status are displayed.

[-mirror-oper-status {unknown/online/offline}] - Mirror Operational Status

If this parameter is specified, only mirror details with the specified operational status are displayed.

[-partner-name <text>] - Partner Name

If this parameter is specified, mirror details of the specified partner are displayed.

[-mirror-admin-status {enabled/disabled}] - Mirror Administrative Status

If this parameter is specified, only mirror details with the specified administrative status are displayed.

Examples

The following example shows the output of the command during normal operation (neither cluster is in switchover state):

```
clusA::> metrocluster interconnect mirror show
           Mirror      Mirror
           Admin      Oper

```

metrocluster interconnect mirror multipath commands

Manage MetroCluster interconnect mirror multipath policy

metrocluster interconnect mirror multipath show

Display multipath information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster interconnect mirror multipath show` command displays the NVRAM mirror multipath policy for the nodes configured in a MetroCluster.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Multipath Policy:** This field specifies the multipath policy used for NVRAM mirroring.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node Name

If this parameter is specified, mirror details of the specified node are displayed.

[-multipath-policy {no-mp/static-map/dynamic-map/round-robin}] - Multipath Policy

If this parameter is specified, nodes with the specified multipath policy are displayed.

Examples

The following example shows the output of the command:

```
clusA::> metrocluster interconnect mirror multipath show
Node           Multipath Policy
-----
clusA-1        static-map
clusA-2        static-map
```

metrocluster node commands

Display MetroCluster nodes

metrocluster node show

Display MetroCluster node configuration information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster node show` command displays configuration information for the nodes in the MetroCluster configuration.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-partners]

If this option is used the MetroCluster node partnership view will be displayed.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, all nodes belonging to the specified DR group are displayed.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, all nodes belonging to the specified cluster are displayed.

[-node <Node name>] - Node Name

If this parameter is specified, the specified node is displayed.

[-ha-partner <Node name>] - HA Partner Name

If this parameter is specified, the node with the specified HA partner is displayed.

[-dr-cluster <Cluster name>] - DR Cluster Name

If this parameter is specified, all nodes belonging to the specified cluster are displayed.

[-dr-partner <Node name>] - DR Partner Name

If this parameter is specified, the node with the specified DR partner is displayed.

[-dr-auxiliary <Node name>] - DR Auxiliary Name

If this parameter is specified, the node with the specified DR auxiliary partner is displayed.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the node with the specified Uuid is displayed.

[-ha-partner-uuid <UUID>] - HA Partner UUID

If this parameter is specified, the nodes with the specified HA partner is displayed.

[-dr-partner-uuid <UUID>] - DR Partner UUID

If this parameter is specified, the node with the specified DR partner is displayed.

[-dr-auxiliary-uuid <UUID>] - DR Auxiliary UUID

If this parameter is specified, the node with the specified DR auxiliary partner is displayed.

[-node-cluster-uuid <UUID>] - Node Cluster UUID

If this parameter is specified, all nodes belonging to the specified cluster are displayed.

[-ha-partner-cluster-uuid <UUID>] - HA Partner Cluster UUID

If this parameter is specified, all nodes whose HA partner belong to the specified cluster are displayed.

[-dr-partner-cluster-uuid <UUID>] - DR Partner Cluster UUID

If this parameter is specified, all nodes whose DR partner belong to the specified cluster are displayed.

[-dr-auxiliary-cluster-uuid <UUID>] - DR Auxiliary Cluster UUID

If this parameter is specified, all nodes whose DR auxiliary partner belong to the specified cluster are displayed.

[-node-systemid <integer>] - Node System ID

If this parameter is specified, all nodes with the specified system ID are displayed.

[-ha-partner-systemid <integer>] - HA Partner System ID

If this parameter is specified, all nodes with an HA partner with the specified system ID are displayed.

[-dr-partner-systemid <integer>] - DR Partner System ID

If this parameter is specified, all nodes with a DR partner with the specified system ID are displayed.

[-dr-auxiliary-systemid <integer>] - DR Auxiliary System ID

If this parameter is specified, all nodes with a DR auxiliary partner with the specified system ID are displayed.

[-dr-mirroring-state <text>] - State of DR Mirroring Config

If this parameter is specified, all nodes with this field set to the specified value are displayed. This field specifies if the NVRAM mirroring to the DR partner is enabled through the [metrocluster configure](#) command. This field needs to be set to "enabled" for the DR mirroring to be active.

[-configuration-state <text>] - Configuration State of Node

If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-additional-configuration-info <text>] - Additional Configuration Info

If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-dr-operation-state <text>] - DR Operation State

If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-dr-operation-time <integer>] - Time to Complete Operation (secs)

If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-node-object-limit {on/off}] - Specifies if the Node Object Limits are Enforced

If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-node-ha-partner <text>] - Node and its HA Partner

If this parameter is specified, all nodes with this field set to the specified value are displayed.

[-automatic-uso {true/false}] - Automatic USO (privilege: advanced)

If this parameter is specified, all nodes with this field set to the specified value are displayed.

Examples

The following example shows the output of the command before the MetroCluster configuration is done:

```
clusA::> metrocluster node show
DR
Group Cluster Node Configuration State DR
-----
-      clusA  clusA-01 ready to configure -
              clusA-02 ready to configure -
              clusA-03 ready to configure -
              clusA-04 ready to configure -
4 entries were displayed.

clusA::> metrocluster node show -partners
```

```

Node (HA Partner) DR Partner (DR Auxiliary)
-----
Cluster:                                clusA -
                                         clusA-01 (-) - (-)
                                         clusA-02 (-) - (-)
                                         clusA-03 (-) - (-)
                                         clusA-04 (-) - (-)

4 entries were displayed.

```

The following example shows the output of the command when some DR groups in the MetroCluster configuration are not yet configured:

```

clusA::> metrocluster node show
DR
Group Cluster Node Configuration State DR Mirroring Mode
-----
-      clusA  clusA-03  ready to configure - -
              clusA-04  ready to configure - -
1      clusA  clusA-01  configured         enabled  normal
              clusA-02  configured         enabled  normal
      clusB  clusB-01  configured         enabled  normal
              clusB-02  configured         enabled  normal
6 entries were displayed.

clusA::> metrocluster node show -partners
Node (HA Partner) DR Partner (DR Auxiliary)
-----
Cluster:                                clusA -
                                         clusA-03 (-) - (-)
                                         clusA-04 (-) - (-)

metrocluster operation commands

Display MetroCluster operation status

metrocluster operation show

Display details of the last MetroCluster operation

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster operation show` command displays information about the most recent MetroCluster operation run on the local cluster.

This command will display information about all MetroCluster commands except for the commands in the [metrocluster check](#) directory. This command will not display any information after MetroCluster has been completely unconfigured using the `metrocluster unconfigure` command.

Examples

The following example shows the output of `metrocluster operation show` after running a [metrocluster configure](#) command was successful:

```

clusA::> metrocluster operation show
Operation: configure
State: successful
Start time: 2/15/2013 18:22:46
End time: 2/15/2013 18:25:18
Errors: -

```

metrocluster operation history commands

The history directory

metrocluster operation history show

Display details of all MetroCluster operations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster operation history show` command displays information about all the MetroCluster operations run on the local cluster.

This command will display information about all MetroCluster commands except for the commands in the `metrocluster check` directory. This command will not display any information after MetroCluster has been completely unconfigured using the `metrocluster unconfigure` command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-operation-uuid <UUID>] - Identifier for the Operation

This is the UUID of the operation. If this parameter is specified, only the operation with this UUID is displayed.

[-cluster <Cluster name>] - Cluster Where the Command Was Run

This is the name of the cluster where the command was run. If this parameter is specified, only the operations that were run in this cluster are displayed.

[-node-name <Node name>] - Node Where the Command Was run

This is the name of the node where the command was run. If this parameter is specified, only the operations that were run on this node are displayed.

[-operation <MetroCluster Operation Name>] - Name of the Operation

This is the name of the operation. If this parameter is specified, only the operations with this name are displayed.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

This is the time the operation started execution. If this parameter is specified, only the operations that were started at this time are displayed.

[-state <MetroCluster Operation state>] - State of the Operation

This is the state of the operation. If this parameter is specified, only the operations that are in this state are displayed.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time

This is the time the operation completed. If this parameter is specified, only the operations that completed at this time are displayed.

[-error-list <text>, ...] - Error List For the Operation

This is the list of errors that were encountered during an operation's execution. If this parameter is specified, only the operations that have the matching errors are displayed.

[-job-id <integer>] - Identifier for the Job

This is the job id for the operation. If this parameter is specified, only the operation that has the matching job id displayed.

[-additional-info <text>] - Additional Info for Auto Heal

This is the completion status of the auto heal aggregates and auto heal root aggregates phases when processing switchover with auto heal.

Examples

The following example shows the output of `metrocluster operation history show` after some MetroCluster operations have been performed:

```
clusA::> metrocluster operation history show
Operation      State      Start time      End time
-----
configure      successful  2/15/2013 18:22:46
                2/15/2013 18:25:18
configure      failed     2/15/2013 18:13:45
                2/15/2013 18:13:45
2 entries were displayed.
```

metrocluster vsver commands

Manage MetroCluster Vservers

metrocluster vsver recover-from-partial-switchback

Recover vservers from partial switchback

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster vsver recover-from-partial-switchback` command executes the necessary steps needed for a Vserver to be in healthy state after partial completion of the Switchback.

Examples

```
cluster::> metrocluster vsver recover-from-partial-switchback
```

Related references

[metrocluster vsver recover-from-partial-switchover](#) on page 358

metrocluster vsver recover-from-partial-switchover

Recover vservers from partial switchover

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster vserver recover-from-partial-switchover` command executes the necessary steps needed for a Vserver to be in healthy state after partial completion of the Switchover.

Examples

```
cluster::> metrocluster vserver recover-from-partial-switchover
```

[metrocluster vserver recover-from-partial-switchback](#) on page 358

metrocluster vserver resync

Resynchronize Vserver with its partner Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster vserver resync` command resynchronizes the Vserver with its partner Vserver

Parameters

-cluster <Cluster name> - Cluster Name

Name of the cluster where the Vserver belongs

-vserver <vserver> - Vserver

Name of the Vserver to be resynchronized

Examples

```
vs1      cluster::> metrocluster vserver resync -cluster clus1 -vserver
```

Related references

[metrocluster vserver show](#) on page 359

metrocluster vserver show

Display MetroCluster Vserver relationships

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster vserver show` command displays configuration information for all pairs of Vservers in MetroCluster.

Parameters

{ [-fields <fieldname>, ...]

The command output includes the specified field or fields

[*-creation-time*] (privilege: advanced)

Shows the last configuration modification time on the Vserver

[*-instance*]}

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-cluster* <cluster name>] - Cluster Name

Name of the cluster where the Vserver belongs

[*-vserver* <vserver>] - Vserver

Name of the Vserver

[*-partner-vserver* <vserver>] - Partner Vserver

Name of the partner Vserver

[*-configuration-state* {*healthy/unhealthy/degraded/pending-setup/syncing/replication-paused/pending-switchback*}] - Configuration State

Configuration states include:

- *healthy*
- *unhealthy*
- *degraded* indicates that Vservers are not in sync
- *syncing* indicates that the Vserver configuration is being synchronized
- *replication-paused* indicates that the configuration replication was manually paused
- *pending-setup* indicates that partner Vserver creation is pending

[*-corrective-action* <text>] - Corrective Action

Corrective action which can be followed to successfully create the partner Vserver

[*-creation-time-of-last-applied-change* <MM/DD/YYYY HH:MM:SS>] - Creation Time on the source

Last configuration modification time on the Vserver

[*-out-of-sync* [*true*]] - Is out of sync

Indicates that the Vserver configuration replication is not in sync

[*-config-resume-time* <MM/DD/YYYY HH:MM:SS>] - configuration Resume Time

Displays the resume time of the Vserver configuration replication

Examples

The following example shows the output of the command when partner Vservers are created

```
clusA::> metrocluster vserver show

Cluster: clusA

Configuration
Vserver
-----
clusA
vs1

Cluster: clusB

Partner
Vserver
-----
clusB
vs1-mc

State
healthy
healthy
```

Vserver	Vserver	State
-----	-----	
clusB	clusA	healthy
3 entries were displayed.		

The following example shows the output of the command when the partner Vserver creation is pending

```
clusA::> metrocluster vserver show

Cluster: clusA

Configuration
Vserver
-----
clusA
vs1
pending-setup
Corrective Action: Create Ipspace ips1 on the partner cluster.
2 entries were displayed.
```

Partner	Vserver	State
-----	-----	
clusB	-	healthy

Network Commands

Manage physical and virtual network connections

The `network` commands enable you to manage the network interfaces in a cluster.

network ping

Ping

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network ping` command displays whether a remote address is reachable and responsive, the (if specified) number of transmitted and received packets, and their round-trip time. The command requires a source node or logical interface from where the ping will be run, and a destination IP address. You can specify the source node by name, or a logical interface and its Vserver.

Parameters

{ -node <nodename> - Node

Use this parameter to send the ping from the node you specify.

| -lif <lif-name>} - Logical Interface

Use this parameter to send the ping from the logical interface you specify.

-vserver <vserver> - Vserver

Use this parameter to send the ping from the Vserver where the intended logical interface resides. The default value is the system Vserver for cluster administrators.

[-use-source-port { true/false}] - (DEPRECATED)-Use Source Port of Logical Interface (privilege: advanced)

This parameter is only applicable when the `-lif` parameter is specified. When set to `true`, the ping packet will be sent out via the port which is currently hosting the IP address of the logical interface. Otherwise, the ping packet will be sent out via a port based on the routing table.

Note: The `use-source-port` parameter is deprecated and may be removed in a future release of Data ONTAP.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the remote internet address destination of the ping.

[-show-detail | -s [true]] - Show Detail Output

Use this parameter to display detailed output about the ping.

[-record-route | -R [true]] - Record Route

Use this parameter to display the route followed by the ping. You should set this option to `false` for ping to succeed.

[-verbose | -v [true]] - Show All ICMP Packets

Use this parameter to display all ICMP packets.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the number of data bytes to be sent in the ping packet. The default is 56 bytes, which is 64 ICMP data bytes total after 8 bytes of ICMP header data is added.

[-count <integer>] - Count

Use this parameter to specify the maximum number of ECHO_REQUESTS to be sent to the destination. The default is 20 requests. In the absence of the 'show-detail' option, ping reports that the destination is alive after receiving the first ECHO_REPLY response, independent of this value.

[-wait <integer>] - Packet Send Wait Time (secs)

Use this parameter to specify the number of seconds to wait between sending packets. The default is one second.

[-flood [*true*]] - Flood Ping (privilege: advanced)

Use this parameter to execute the command in flood mode. In flood mode, the command issues pings as fast as they are received, unless you specify a wait time.

[-disallow-fragmentation | -D [*true*]] - Disallow Packet Fragmentation

Use this parameter to prevent transport mechanisms from fragmenting ping packets in transit. Preventing fragmentation assures consistent packet size, making it easier to see transport bottlenecks.

[-wait-response <integer>] - Packet Response Wait Time (ms)

Use this parameter to specify the number of milliseconds to wait for each response packet. The default is 10000 milliseconds (10 seconds).

Examples

This example shows a ping from node xena to the destination server 10.98.16.164 with the server responding that it is up and running.

```
cluster1::> network ping -node xena -destination 10.98.16.164
(network ping)
10.98.16.164 is alive
```

network ping6

Ping an IPv6 address

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network ping6` command uses the ICMPv6 protocol's mandatory ICMP6_ECHO_REQUEST datagram to elicit an ICMP6_ECHO_REPLY from a host or gateway. ICMP6_ECHO_REQUEST datagrams ("pings") have an IPv6 header, and ICMPv6 header formatted as documented in RFC2463.

Parameters**{ -node <nodename> } - Node Name**

Use this parameter to originate ping6 from the specified node.

| -lif <lif-name> } - Logical Interface

Use this parameter to originate ping6 from the specified logical interface.

-vserver <vserver name> - Vserver Name

Use this parameter to originate ping6 from the specified Vserver. The default value is the system Vserver for cluster administrators.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the IPv6 address of the destination node.

[-buffer-size | -b <integer>] - Socket Buffer Size

Use this parameter to set the socket buffer size.

[-count | -c <integer>] - Max Requests to Send/Recieve

Use this parameter to specify the maximum number of requests and replies. The default value is 20.

[-reverse-lookup | -H [true]] - Reverse-lookup of IPv6 addresses

Use this parameter to specify reverse-lookup of IPv6 addresses. Unless this parameter is specified, ping6 command does not attempt reverse lookup.

[-interval | -i <integer>] - Wait between Packets (secs)

Use this parameter to specify the delay time between packets in seconds. The default value is 1 second. This parameter is incompatible with the flood parameter.

[-preload | -l <integer>] - Send Packets as Fast as Possible (privilege: advanced)

Use this parameter if preload is required. If specified, ping6 sends that many packets as fast as possible before falling into its normal mode of behaviour.

[-use-source-port {true/false}] - Use Source Port of Logical Interface (privilege: advanced)

This parameter is only applicable when the **-lif** parameter is specified. When set to true, the ping packet will be sent out via the port which is currently hosting the IP address of the logical interface. Otherwise, the ping packet will be sent out via a port based on the routing table.

[-pattern | -p <text>] - Up to 16 'pad' Specified for Out Packet

Use this parameter to fill the -16 'pad' bytes in the sent packet. This is useful for diagnosing data dependent problems in a network. For example, **-pattern ff** causes the sent packet to be filled with all ones.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the number of data bytes to be sent. The default is 56, which translates to 64 ICMP data bytes when combined with the 8 bytes of ICMP header data.

[-verbose | -v [true]] - Show All ICMP Packets

Use this parameter to get verbose output. Verbose output displays both source address and destination addresses. Received ICMP packets other than ECHO_RESPONSE are listed. This parameter can be used only in conjunction with the show-detail parameter.

[-show-detail | -s [true]] - Show Detail Output

Use this parameter to display detailed output about the ping.

[-flood | -f [true]] - Flood Ping (privilege: advanced)

Use this parameter to output packets as fast as they come back or one hundred times per second, whichever is more. For every ECHO_REQUEST sent a period "." is printed, while for every ECHO_REPLY received a backspace is printed. This provides a rapid display of how many packets are being dropped. This can be very hard on a network and should be used with caution.

[-disable-fragmentation | -D [true]] - Disable Fragmentation.

Use this parameter to disallow fragmentation of the outgoing packets, if they do not fit in the Maximum Transmission Unit.

Examples

This example shows a ping6 from node 'node1' to the destination server ipv6.google.com with the server responding that it is up and running.

```
cluster1::> network ping6 -node node1 -destination ipv6.google.com
ipv6.google.com is alive.
```

network test-path

Test path performance between two nodes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-path` command runs a performance test between two nodes. The command requires a source node, destination node, destination cluster, and application, or session type. All tests are run using intracluster or intercluster LIFs, depending on whether the test is between two nodes in the same cluster, or between nodes in peered clusters.

The test itself is different from most bandwidth test tools. It creates a "session" consisting of TCP connections between all possible paths between the nodes being tested. This is how internal Data ONTAP applications communicate between nodes. This means the test is using multiple paths, and thus the bandwidth reported might exceed the capacity of a single 10 Gb path.

Parameters**-source-node {<nodename>/local} - Node Initiating Session**

Use this parameter to specify the node that initiates the test. Source-node parameter must be a member of the cluster in which the command is run.

-destination-cluster <Cluster name> - Cluster Containing Passive Node

Use this parameter to specify the destination cluster; the local cluster, or a peered cluster.

-destination-node <text> - Remote Node in Destination Cluster

Use this parameter to specify the destination node in the destination cluster

-session-type {AsyncMirrorLocal/AsyncMirrorRemote/RemoteDataTransfer} -**Type of Session to Test**

The session type parameter is used to mimic the application settings used. A session consists of multiple TCP connections.

- AsyncMirrorLocal: settings used by SnapMirror between nodes in the same cluster

- **AsyncMirrorRemote**: settings used by SnapMirror between nodes in different clusters
- **RemoteDataTransfer**: settings used by Data ONTAP for remote data access between nodes in the same cluster

The default session-type is AsyncMirrorRemote.

Examples

The following example runs a test between two nodes in the same cluster:

```
cluster1::*> network test-path -source-node node1 -destination-cluster
cluster1 -destination-node node2

Test Duration: 10.65 secs
Send Throughput: 1092.65 MB/sec
Receive Throughput: 1092.65 MB/sec
  MB Sent: 11633.69
  MB Received: 11633.69
  Avg Latency: 64.40 ms
  Min Latency: 2.41 ms
  Max Latency: 2099.17 ms
```

network traceroute

Traceroute

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network traceroute` command performs a network probe from a node to a specified IP address. The command requires a source node or logical interface and a destination IP address. You can specify the source node by name, or specify a logical interface and its Vserver. The traceroute is performed between the source and destination.

Parameters

{ -node <nodename> } - Node

Use this parameter to originate the traceroute from the node you specify.

| -lif <lif-name> } - Logical Interface

Use this parameter to originate the traceroute from the specified network interface.

-vserver <vserver> - LIF Owner

Use this parameter to originate the traceroute from the Vserver where the intended logical interface resides. The default value is the system Vserver for cluster administrators.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the remote internet address destination of the traceroute.

[-maxttl | -m <integer>] - Maximum Number of Hops

Use this parameter to specify the maximum number of hops (time-to-live) setting used by outgoing probe packets. The default is 30 hops.

[-numeric | -n [true]] - Print Hop Numerically

Use this parameter to print the hop addresses only numerically rather than symbolically and numerically.

[-port <integer>] - Base UDP Port Number

Use this parameter to specify the base UDP port number used in probes. The default is port 33434.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the size of probe packets, in bytes.

[-nqueries | -q <integer>] - Number of Queries

Use this parameter to specify the number of probes per hop. The default is 3 probes.

[-verbose | -v [true]] - Verbose Output

Use this parameter to display all received ICMP packets, rather than just TIME_EXCEEDED and UNREACHABLE packets.

[-waittime | -w <integer>] - Wait Between Packets (secs)

Use this parameter to specify the time (in seconds) to wait for the response to a probe. The default is 5 seconds.

Examples

This example shows a traceroute from node node1 to a destination address of 10.98.16.164, showing a maximum of five hops.

```
cluster1::> traceroute -node node1 -destination 10.98.16.164 -maxttl 5
1  10.68.208.1 <10.68.208.1> 0.307 ms 293 ms 305 ms
2  152.164.13.205 <152.164.13.205> 3.754 ms 3.722 ms 3.981 ms
3  68.137.122.222 <68.137.122.222> 25.603 ms 24.947 ms 24,565 ms
4  * * *
5  * * *

traceroute to 10.98.16.164, 5 hops max, 52 byte packets
```

network traceroute6

traceroute6

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network traceroute6` command performs a network probe from a node to a specified IPv6 address. The command requires a source node or logical interface, Vserver from where `traceroute6` will originate and a destination IPv6 address. `traceroute6` is performed between the source and destination.

Parameters**{ -node <nodename> - Node**

Use this parameter to originate `traceroute6` from the node you specify. This parameter is available only to cluster administrators.

| -lif <lif-name> } - Logical Interface

Use this parameter to originate traceroute6 from the logical interface you specify.

-vserver <vserver name> - LIF Owner

Use this parameter to originate traceroute6 from the Vserver you specify. The default value is the system Vserver for cluster administrators.

[-debug-mode | -d [true]] - Debug Mode

Use this parameter to enable socket level debugging. The default value is false.

{ [-icmp6 | -I [true]] - ICMP6 ECHO instead of UDP

Use this parameter to specify the use of ICMP6 ECHO instead of UDP datagrams for the probes. The default value is false.

| [-udp | -U [true]] } - UDP

Use this parameter to specify the use of UDP datagrams for the probes. The default value is true.

[-numeric | -n [true]] - Print Hops Numerically

Use this parameter to print the hop addresses only numerically rather than symbolically and numerically. The default value is false.

[-verbose | -v [true]] - Verbose Output

Use this parameter to display all received ICMP packets, rather than just TIME_EXCEEDED and UNREACHABLE packets. The default value is false.

[-first-hop | -f <integer>] - Number of Hops to Skip in Trace

Use this parameter to specify the number of hops to skip in trace. The default value is 1.

[-gateway | -g <Remote InetAddress>] - Intermediate Gateway

Use this parameter to specify the intermediate gateway.

[-hop-limit | -m <integer>] - Maximum Number of Hops

Use this parameter to specify the maximum hoplimit, upto 255. The default value is 64 hops.

[-port | -p <integer>] - Base UDP Port Number

Use this parameter to specify the base UDP port number used in probes. The default value is port 33434.

[-nqueries | -q <integer>] - Number of Queries

Use this parameter to specify the number of probes per hop. The default value is 3 probes.

[-wait-time | -w <integer>] - Wait Between Packets (secs)

Use this parameter to specify the delay time between probes in seconds. The default value is 5 seconds.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the remote IPv6 address destination of traceroute6.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the size of probe packets, in bytes. The default value is 16 bytes for ICMP6 ECHO and 12 bytes for UDP datagrams.

Examples

The following example shows traceroute6 from node node1 to the destination fd20:8b1e:b255:4071:d255:1fcd:a8cd:b9e8.

```
cluster1::> network traceroute6 -node node1 -vserver vs1
               -destination 3ffe:b00:c18:1::10
traceroute6 to 3ffe:b00:c18:1::10 (3ffe:b00:c18:1::10)
               from 2001:0db8:0000:f101::2,
               64 hops max, 12 byte packets
 1  2001:0db8:0000:f101::1 4.249 ms  2.021 ms  0.864 ms
 2  3ffe:2000:0:400::1 0.831 ms  0.579 ms
 3  3ffe:2000:0:1::132 227.693 ms 227.596 ms 227.439 ms
 4  3ffe:c00:8023:2b::2 229.028 ms 228.267 ms 231.891 ms
 5  3ffe:2e00:e:c::3 227.929 ms 228.696 ms 228.558 ms
 6  3ffe:b00:c18:1::10 227.702 ms 227.806 ms 227.439 ms
```

network arp commands

The arp directory

network arp create

Create static ARP entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network arp create` command creates a static ARP entry for a given Vserver. Statically created ARP entries will be stored permanently in the Vserver context and will be used by the network stack.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the Vserver on which the ARP entry is created.

-remotehost <IP Address> - Remote IP Address

Use this parameter to specify the IP address to be added as an ARP entry.

-mac <MAC Address> - MAC Address

Use this parameter to specify the MAC address (Ethernet address) for the host specified with `-remotehost`. Specify the MAC address as six hex bytes separated by colons.

Examples

The following example creates a static ARP entry on Vserver vs1 for the remote host with the IP address 10.63.0.2 having MAC address 40:55:39:25:27:c1

```
cluster1::> network arp create -vserver vs1 -remotehost 10.63.0.2 -mac
40:55:39:25:27:c1
```

network arp delete

Delete static ARP entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network arp delete` command deletes static ARP entries from the Vserver and from the network stack.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the Vserver from which the ARP entry is deleted.

-remotehost <IP Address> - Remote IP Address

Use this parameter to specify the IP address of the ARP entry being deleted.

Examples

The following example deletes the ARP entry for IP address 10.63.0.2 from the Vserver vs1.

```
cluster1::> network arp delete -vserver vs1 -remotehost 10.63.0.2
```

network arp show

Display static ARP entries

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network arp show` command displays static ARP entries present in a given Vserver. This command will not display dynamically learnt ARP entries in the network stack. Use the [network arp active-entry show](#) command to display dynamically learned ARP entries in the network stack.

Parameters

{ [-fields <fieldname>, ...]

Use this parameter to display only certain fields of the ARP table.

| [-instance]}

Use this parameter to display all the fields of the ARP table.

[-vserver <vserver name>] - Vserver Name

Use this parameter to display ARP entries that are specific to a given Vserver.

[-remotehost <IP Address>] - Remote IP Address

Use this parameter to display ARP entries for the specified IP address

[-mac <MAC Address>] - MAC Address

Use this parameter to display ARP entry for the specified MAC address

[-ipSPACE <IPspace>] - IPspace

Use this parameter to specify the IPspace associated with the Vserver

Examples

The following example displays static ARP entries from the Vserver vs1.

```
cluster1::> network arp show -vserver vs1
Vserver      Remote Host      MAC Address
-----
vs1          10.238.0.2       40:55:39:25:27:c1
```

Related references

[network arp active-entry show](#) on page 372

network arp active-entry commands

Manage active ARP entries

network arp active-entry delete

Delete active ARP entry from a System or Admin Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network arp active-entry delete` command deletes dynamically learned ARP entries from the network stack of a node. To delete statically configured ARP entries use the [network arp delete](#) command.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the name of the node in which the ARP entry is deleted.

-vserver <vserver> - System or Admin Vserver Name

Use this parameter to specify the name of the Vserver in which the ARP entry is deleted. Only Vservers with a type of Admin or System have dynamically learned ARP entries.

-subnet-group <IP Address/Mask> - Subnet Group Name

Use this parameter to specify the name of the routing group in which the ARP entry is deleted.

-remotehost <text> - Remote IP Address

Use this parameter to specify the IP address to be deleted from the active ARP entries.

-port <text> - Port

Use this parameter to specify the name of the Port to be deleted from the active ARP entries.

Examples

The following example deletes the active ARP entry with an IP address of 10.224.64.1, subnet group of 0.0.0.0/0, port e0c on node node2 in the Admin Vserver cluster1:

```
cluster1::network arp active-entry*> delete -node cluster1-01 -vserver
cluster1 -subnet-group 0.0.0.0/0 -remotehost 10.224.64.1 -port e0c
```

Related references

[network arp delete](#) on page 370

network arp active-entry show

Display active ARP entries organized by Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network arp active-entry show` command displays ARP entries present in the network stack of the node. The entries includes both dynamically learned ARP entries and user configured static ARP entries.

Parameters

{ [-fields <fieldname>, ...]

Use this parameter to display only certain fields of the active ARP table.

[-instance]}

Use this parameter to display all the fields of the active ARP table.

[-node {<nodename>/local}] - Node

Use this parameter to display active ARP entries that are specific to a given node.

[-vserver <vserver>] - System or Admin Vserver Name

Use this parameter to display active ARP entries that are specific to a given System or Admin Vserver. Data and Node Vservers will not have any active-arp entries.

[-subnet-group <IP Address/Mask>] - Subnet Group Name

Use this parameter to display active ARP entries that are specific to a given subnet group.

[-remotehost <text>] - Remote IP Address

Use this parameter to display active ARP entries for the specified IP address.

[-port <text>] - Port

Use this parameter to display active ARP entries for the specified Port name.

[-mac <text>] - MAC Address

Use this parameter to display the active ARP entry for the specified MAC address.

[-ipSPACE <IPspace>] - IPspace

Use this parameter to specify the IPspace associated with the System or Admin Vserver.

Examples

The following example displays active ARP entries for the Admin Vserver cluster1:

```
cluster1::*> network arp active-entry show -vserver cluster1

Node: node-01
Vserver: cluster1
Subnet Group: 169.254.0.0/16
```

Remote IP Address	MAC Address	Port
169.254.106.95	0:55:39:27:d1:c1	10

network bgp commands

The bgp directory

network bgp config commands

Manage BGP configuration

network bgp config create

Create BGP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp config create` command is used to create the border gateway protocol (BGP) configuration for a node. It can be used to override the BGP parameters defined in the global BGP defaults.

Parameters

-node {<nodename>/local} - Node

This parameter specifies the node on which configuration details will be created.

-asn <integer> - Autonomous System Number

This parameter specifies the autonomous system number (ASN). The ASN attribute is a non-negative 16-bit integer. It should typically be chosen from RFC6996 "Autonomous System (AS) Reservation for Private Use" or the AS number assigned to the operator's organization.

-hold-time <integer> - Hold Time

This parameter specifies the hold time in seconds. The default value is 180.

-router-id <IP Address> - Router ID

This parameter specifies the local router ID. The router-id value takes the form of an IPv4 address. The default router-id will be initialized using a local IPv4 address in admin vserver.

Examples

```
cluster1::> network bgp config create -node node1 -asn 10 -hold-time 180 -
router-id 10.0.1.112
```

network bgp config delete

Delete BGP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp config delete` command deletes a node's border gateway protocol (BGP) configuration. A BGP configuration cannot be deleted if there are BGP peer groups configured on the associated node.

Parameters

-node {<nodename>/local} - Node

This parameter specifies the node for which the BGP configuration will be deleted.

Examples

```
cluster1::> network bgp config delete -node node1
```

network bgp config modify

Modify BGP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp config modify` command is used to modify a node's border gateway protocol (BGP) configuration.

Parameters

-node {<nodename>/local} - Node

This parameter specifies the node on which BGP configuration will be modified.

[-asn <integer>] - Autonomous System Number

This parameter specifies the autonomous system number (ASN). The ASN attribute is a non-negative 16-bit integer. It should typically be chosen from RFC6996 "Autonomous System (AS) Reservation for Private Use" or the AS number assigned to the operator's organization.

[-hold-time <integer>] - Hold Time

This parameter specifies the hold time in seconds.

[-router-id <IP Address>] - Router ID

This parameter specifies the local router ID. The router-id value takes the form of an IPv4 address.

Examples

```
cluster1::> network bgp config modify -node node1 -router-id 1.1.1.1 -asn 20
```

network bgp config show

Display BGP configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp config show` command displays the border gateway protocol (BGP) configuration for each node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

This parameter selects the BGP configurations that match the specified node.

[-asn <integer>] - Autonomous System Number

This parameter selects the BGP configurations that match the specified autonomous system number.

[-hold-time <integer>] - Hold Time

This parameter selects BGP configurations that match the specified hold time.

[-router-id <IP Address>] - Router ID

This parameter selects the BGP configurations that match the specified router ID.

Examples

```
cluster1::> network bgp config show
```

Node	Autonomous System Number	Hold Time (seconds)	Router ID
node1	10	180	10.0.1.112

network bgp defaults commands

Manage default BGP configuration

network bgp defaults modify

Modify BGP defaults

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp defaults modify` command modifies the global defaults for border gateway protocol (BGP) configurations.

Parameters

[-asn <integer>] - Autonomous System Number

This parameter specifies the autonomous system number (ASN). The ASN attribute is a non-negative 16-bit integer. It should typically be chosen from RFC6996 "Autonomous System (AS) Reservation for Private Use", or the AS number assigned to the operator's organization. The default ASN is 65501.

`[-hold-time <integer>] - Hold Time`

This parameter specifies the hold time in seconds. The default value is 180.

Examples

```
cluster1::> network bgp defaults modify -asn 20
```

network bgp defaults show

Display BGP defaults

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp defaults show` command displays the global defaults for border gateway protocol (BGP) configurations.

Examples

```
cluster1::> network bgp defaults show
Autonomous
System Number      Hold Time
      (Seconds)
-----
10                180
```

network bgp peer-group commands

Manage BGP peer-group

network bgp peer-group create

Create a new BGP peer group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group create` command is used to create a border gateway protocol (BGP) peer group. A BGP peer group will advertise VIP routes for the list of vservers in the peer group's **vserver-list** using the BGP LIF of the peer group. A BGP peer group will advertise VIP routes to a peer router using the border gateway protocol. The address of the peer router is identified by the **peer-address** value.

Parameters

-ip-space <IPspace> - IPspace Name

This parameter specifies the IPspace of the peer group being created.

-peer-group <text> - Peer Group Name

This parameter specifies the name of the peer group being created.

-bgp-lif <lif-name> - BGP LIF

This parameter specifies the BGP interface (BGP LIF) of the peer group being created.

-peer-address <IP Address> - Peer Router Address

This parameter specifies the IP address of the peer router for the peer group being created.

[-peer-asn <integer>] - Peer Router Autonomous number

This parameter specifies the peer router autonomous system number (ASN) in the peer group being created. The default value is the value of the local node's ASN.

-route-preference <integer> - Route Preference

This parameter specifies the preference field in BGP update messages for VIP routes. If a router receives multiple VIP route announcements for the same VIP LIF from different BGP LIFs, it will install the one that has the highest preference value. The default route preference value is 100.

Examples

```
cluster1::> network bgp peer-group create -peer-group group1 -ip-space
Default -bgp-lif bgp_lif -peer-address 10.0.1.112
```

network bgp peer-group delete

Delete a BGP peer group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group delete` command is used to delete border gateway protocol (BGP) peer group configuration.

Parameters**-ip-space <IPspace> - IPspace Name**

This parameter specifies the IPspace of the BGP peer group being deleted.

-peer-group <text> - Peer Group Name

This parameter specifies the name of the BGP peer group being deleted.

Examples

```
cluster1::> network bgp peer-group delete -ip-space Default -peer-group group1
```

network bgp peer-group modify

Modify a BGP peer group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group modify` command is used to modify a border gateway protocol (BGP) peer group configuration.

Parameters**-ipspace <IPspace> - IPspace Name**

This parameter specifies the IPspace of the peer group being modified.

-peer-group <text> - Peer Group Name

This parameter specifies the name of the peer group being modified.

[-peer-address <IP Address>] - Peer Router Address

This parameter specifies an updated value for the IP address of the peer router.

Examples

```
cluster1::> network bgp peer-group modify -ipspace Default -peer-group peer1
-peer-address 10.10.10.10
```

network bgp peer-group rename

Rename a BGP peer group

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.**Description**The `network bgp peer-group rename` command is used to assign a new name to a BGP peer group.**Parameters****-ipspace <IPspace> - IPspace Name**

This parameter specifies the IPspace of the peer group being renamed.

-peer-group <text> - Peer Group Name

The name of the peer group to be updated.

-new-name <text> - New Name

The new name for the peer group.

Examples

```
cluster1::> network bgp peer-group rename -peer-group old_name -new-name
new_name
```

network bgp peer-group show

Display BGP peer groups information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.**Description**The `network bgp peer-group show` command displays the BGP peer groups configuration.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - IPspace Name

This parameter selects peer groups that match the specified IPspace.

[-peer-group <text>] - Peer Group Name

This parameter selects peer groups that match the specified name.

[-bgp-lif <lif-name>] - BGP LIF

This parameter selects peer groups that match the specified BGP Interface.

[-peer-address <IP Address>] - Peer Router Address

This parameter selects peer groups that match the specified peer router address.

[-peer-asn <integer>] - Peer Router Autonomous number

This parameter selects peer groups that match the specified autonomous system number.

[-state <BGP Session State>] - Peer Group State

This parameter selects peer groups that match the specified BGP session state.

[-bgp-node <nodename>] - BGP LIF Node

This parameter selects peer groups that match the specified **bgp-node** value. This value is calculated based on the current node of the corresponding BGP LIF.

[-bgp-port <netport>] - BGP LIF Port

This parameter selects peer groups that match the specified **bgp-port** value. This value is calculated based on the current port of the associated BGP LIF.

[-route-preference <integer>] - Route Preference

This parameter selects peer groups that match the specified route preference value.

Examples

```
cluster1::> network bgp peer-group show
IPspace: Default
Peer      Local BGP Peer router
Group     Interface Address/subnet  state      Autonomous
Node      Port
-----
node1     gp1          bgp_lif1  10.0.5.37      up          10
node1     el1a
node1     gp2          bgp_lif2  10.0.6.38      up          12
node1     e2a
```

network bgp vserver-status commands

Display vserver BGP status

network bgp vserver-status show

Display Vserver BGP status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp vserver-status show` command displays the per-node border gateway protocol (BGP) status for each vserver. The BGP status for a particular vserver is "up" when at least one BGP peer group supporting that vserver is able to communicate with its peer router.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

This parameter selects the BGP status that match the specified node.

[-vserver <vserver name>] - Vserver

This parameter selects the BGP status for specified vserver.

[-ipv4-status {unknown/unconfigured/up/down}] - IPv4 status

This parameter selects the BGP status that matches the specified status for IPv4 address family.

[-ipv6-status {unknown/unconfigured/up/down}] - IPv6 status

This parameter selects the BGP status that matches the specified status for IPv6 address family.

Examples

```
cluster1::> network bgp vserver-status show
Node          vserver  IPv4 status IPv6 status
-----
node1         vs1      up          up
```

network cloud commands

Manage cloud-based features

network cloud routing-table commands

Manage external routing tables

network cloud routing-table create

Create a new external routing table

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network cloud routing-table create` command creates a new external routing table.

Parameters

-route-table-id <text> - Route Table ID

This parameter is used to provide the name of the external routing table to be created.

Examples

The following example creates an external routing table "eni-123456":

```
cluster1::> network cloud routing-table create -route-table-id eni-123456
```

network cloud routing-table delete

Delete an existing external routing table

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network cloud routing-table delete` deletes an existing external routing table.

Parameters

-route-table-id <text> - Route Table ID

This parameter is used to provide the name of an existing external routing table to be deleted.

Examples

The following example deletes the external routing table "eni-123456":

```
cluster1::> network cloud routing-table delete -route-table-id eni-123456
```

network cloud routing-table show

Show existing external routing tables

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network cloud routing-table show` command retrieves the configured routing tables on mediator and displays them.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-route-table-id <text>] - Route Table ID

This parameter is the name of the external routing table to be shown.

Examples

The following example shows external routing tables, for this cluster, that are configured on the mediator

```
cluster1::> network cloud routing-table show
Route Table ID
-----
rtb-16924571
rtb-9c9245fb
rtb-a36calc4
3 entries were displayed.
```

network connections commands

The connections directory

network connections active commands

The active directory

network connections active show

Show the active connections in this cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show` command displays information about active network connections.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[*-print-ip-addresses*] -

Print IP addresses for remote hosts -- do not attempt to resolve the addresses to a hostname.

[*-instance*] -

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node {<nodename>/local*}] - Node

Selects the connections that match this parameter value.

[*-cid <cid>*] - Connection ID

Selects the connections that match this parameter value.

[*-vserver <vserver>*] - Vserver

Selects the connections that match this parameter value.

[*-lif-name <lif-name>*] - Logical Interface Name

Selects the connections that match this parameter value.

[*-local-address <IP Address>*] - Local IP address

Selects the connections that match this parameter value.

[*-local-port <integer>*] - Local Port

Selects the connections that match this parameter value.

[*-remote-ip <InetAddress>*] - Remote IP Address

Selects the connections that match this parameter value.

[*-remote-host <Remote IP>*] - Remote Host

Selects the connections that match this parameter value.

[*-remote-port <integer>*] - Remote Port

Selects the connections that match this parameter value.

[*-proto {UDP/TCP}*] - Protocol

Selects the connections that match this parameter value. Possible values are tcp (TCP), udp (UDP), and NA (not applicable).

[*-lifid <integer>*] - Logical Interface ID

Selects the connections that match this parameter value.

[*-service <protocol service>*] - Protocol Service

Selects the connections that match this parameter value. Possible values include: nfs, iscsi, and loopback.

[*-lru {yes/no}*] - Least Recently Used

Selects the connections that match this parameter value.

[*-blocks-lb {true/false}*] - Connection Blocks Load Balance Migrate

Selects the logical interfaces that are blocked (true) or not blocked (false) from migrating due to an active client connection.

Examples

The following example displays information about active network connections for the node named node0:

```
cluster1::> network connections active show node -node0

Vserver  Interface      Remote
Name     Name:Local Port  IP Address:Port  Protocol/Service
```

```

-----
node0 cluslif1:7070 192.0.2.253:48621 UDP/rclopcp
node0 cluslif1:7070 192.0.2.253:48622 UDP/rclopcp
node0 cluslif2:7070 192.0.2.252:48644 UDP/rclopcp
node0 cluslif2:7070 192.0.2.250:48646 UDP/rclopcp
node0 cluslif1:7070 192.0.2.245:48621 UDP/rclopcp
node0 cluslif1:7070 192.0.2.245:48622 UDP/rclopcp
node0 cluslif2:7070 192.0.2.251:48644 UDP/rclopcp
node0 cluslif2:7070 192.0.2.251:48646 UDP/rclopcp
node0 cluslif1:7070 192.0.2.248:48621 UDP/rclopcp
node0 cluslif1:7070 192.0.2.246:48622 UDP/rclopcp
node0 cluslif2:7070 192.0.2.252:48644 UDP/rclopcp
node0 cluslif2:7070 192.0.2.250:48646 UDP/rclopcp
node0 cluslif1:7070 192.0.2.254:48621 UDP/rclopcp
node0 cluslif1:7070 192.0.2.253:48622 UDP/rclopcp
[...]
```

At privilege levels above "admin", the command displays an extra column.

```

cluster1::*> network connections active show node -node0

Vserver Interface Remote Blocks
Name Name:Local Port IP Address:Port Protocol/Service LB Migrate
-----
node0 cluslif1:7070 192.0.2.253:48621 UDP/rclopcp false

[...]
```

network connections active show-clients

Show a count of the active connections by client

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-clients` command displays information about client connections, including the client's IP address and the number of client connections.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver

This parameter is used by the system to break down the output per vservers.

[-remote-address <Remote IP>] - Remote IP Address

Use this parameter to display information only about the connections that use the remote IP address you specify.

[-count <integer>] - Client Count

Use this parameter to only clients with the number of active client connections you specify.

Examples

The following example displays information about active client connections:

```
cluster1::> network connections active show-clients
Node      Vserver Name      Client IP Address      Count
-----
node0     vs1                192.0.2.253            1
          vs2                192.0.2.252            2
          vs3                192.0.2.251            5
node1     vs1                192.0.2.250            1
          vs2                192.0.2.252            3
          vs2                customer.example.com    4
```

network connections active show-lifs

Show a count of the active connections by logical interface

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-lifs` command displays the number of active connections on each logical interface, organized by node and Vserver.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver

Use this parameter to display information only about the connections that are using the node or Vserver you specify.

[-lif-name <lif-name>] - Logical Interface Name

Use this parameter to display information only about the connections that are using the logical interface you specify.

[-count <integer>] - Client Count

Use this parameter to display only logical interfaces with the number of active client connections you specify.

[-blocked-count <integer>] - (DEPRECATED)-Load Balancing Blocking Count

Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to display information only about data logical interfaces blocked from migrating and the connection that is blocking it.

Examples

The following example displays information about the servers and logical interfaces being used by all active connections:

```
cluster1::> network connections active show-lifs
Node      Vserver Name      Interface Name      Count
-----
node0
    vs0      datalif1           3
    vs0      cluslif1           6
    vs0      cluslif2           5
node1
    vs0      datalif2           3
    vs0      cluslif1           3
    vs0      cluslif2           5
node2
    vs1      datalif2           1
    vs1      cluslif1           5
    vs1      cluslif2           3
node3
    vs1      datalif1           1
    vs1      cluslif1           2
    vs1      cluslif2           1
```

At privilege levels above "admin", the command displays an extra column.

```
cluster1::*> network connections active show-lifs
Node      Vserver Name      Interface Name      Count      LB Migrate
-----

    vs1      cluslif2           3           2
node3
    vs1      datalif1           1           0
    vs1      cluslif1           2           0
    vs1      cluslif2           1           0
```

network connections active show-protocols

Show a count of the active connections by protocol

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-protocols` command displays the number of active connections per protocol, organized by node.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver

This parameter is used by the system to break down the output per vservers.

[-proto {UDP/TCP}] - Protocol

Use this parameter to display information only about the connections that use the network protocol you specify. Possible values include `tcp` (TCP), `udp` (UDP), and `NA` (not applicable).

[-count <integer>] - Client Count

Use this parameter to display only protocols with the number of active client connections you specify.

Examples

The following example displays information about all network protocols being used by active connections:

```
cluster1::> network connections active show-protocols
Node      Vserver Name      Protocol      Count
-----
node0
    vs1             UDP           19
    vs1             TCP           11
    vs2             UDP           17
node1
    vs1             UDP           14
    vs2             TCP           10
```

network connections active show-services

Show a count of the active connections by service

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-services` command displays the number of active connections by protocol service, organized by node.

Note: The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver

This parameter is used by the system to break down the output per vservers

[-service <protocol service>] - Protocol Service

Use this parameter to display information only about the connections that use the protocol service you specify. Possible values include: `nfs`, `iscsi`, and `loopback`.

[-count <integer>] - Client Count

Use this parameter to display information only about protocol services with the number of active client connections you specify.

Examples

The following example displays information about all protocol services being used by active connections:

```
cluster1::> network connections active show-services
Node      Vserver Name      Service      Count
-----
node0
    vs1            mount         3
    vs1            nfs           14
    vs1            nlm_v4        4
    vs1            cifs_srv      3
    vs1            port_map      18
    vs2            rclopcp       27
node1
    vs1            nfs           5
    vs2            rclopcp       12
    vs2            nfs           4
    vs2            port_map      8
```

network connections listening commands

The listening directory

network connections listening show

Show the listening connections in this cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections listening show` command displays information about network connections that are in an open and listening state.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the listening connections that match this parameter value.

[-mgmt-cid <integer>] - Management Connection ID

Selects the listening connections that match this parameter value.

[-vserver <vserver>] - Vserver

Selects the listening connections that match this parameter value.

[-cid <integer>] - System Connection ID

Selects the listening connections that match this parameter value.

[-lif-name <lif-name>] - Logical Interface Name

Selects the listening connections that match this parameter value.

[-local-address <IP Address>] - Local IP Address

Selects the listening connections that match this parameter value.

[-local-port <integer>] - Local Port

Selects the listening connections that match this parameter value.

[-remote-ip <InetAddress>] - Remote IP Address

Selects the listening connections that match this parameter value.

[-remote-host <Remote IP>] - Remote Host

Selects the listening connections that match this parameter value.

[-remote-port <integer>] - Remote Port

Selects the listening connections that match this parameter value.

[-proto {UDP/TCP}] - Protocol

Selects the listening connections that match this parameter value. Possible values include `tcp` (TCP), `udp` (UDP), and `NA` (not applicable).

[-lifid <integer>] - Logical Interface ID

Selects the listening connections that match this parameter value.

[-service <protocol service>] - Protocol Service

Selects the listening connections that match this parameter value. Possible values include: nfs, iscsi, and loopback.

[-lru {yes/no}] - Least Recently Used

Selects the listening connections that match this parameter value.

Examples

The following example displays information about all listening network connections:

```
cluster1::> network connections listening show
Vserver Name Interface Name:Local Port Protocol/Service
-----
node0        cluslif1:7700          UDP/rclopcp
node0        cluslif2:7700          UDP/rclopcp
node1        cluslif1:7700          UDP/rclopcp
node1        cluslif2:7700          UDP/rclopcp
node2        cluslif1:7700          UDP/rclopcp
node2        cluslif2:7700          UDP/rclopcp
node3        cluslif1:7700          UDP/rclopcp
node3        cluslif2:7700          UDP/rclopcp
8 entries were displayed.
```

The following example displays detailed information about listening network connections for the node named node0:

```
cluster1::> network connections listening show -node node0
Node: node0
Management Connection Id: 0
System Connection Id: 0
Vserver: vs0
Logical Interface Name: datalif1
Local IP address: 192.0.2.130
Local Port: 111
Remote IP address:
Remote Port: 0
Protocol: UDP
Logical Interface Id: 1029
Protocol Service: port_map
least recently used: yes
Node: node0
Management Connection Id: 1
System Connection Id: 0
Server: vs0
Logical Interface Name: datalif2
Local IP address: 192.0.2.131
Local Port: 111
Remote IP address:
Remote Port: 0
Protocol: UDP
Logical Interface Id: 1030
Protocol Service: port_map
least recently used: yes
```

network device-discovery commands

The device-discovery directory

network device-discovery show

Display device discovery information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The network device-discovery show command displays information about discovered devices. This information may be useful in determining the network topology or investigating connectivity issues. By default, the command displays the following information:

- Local interface
- Discovered device
- Discovered interface
- Discovered platform

Parameters

[-fields <fieldname>, ...]

Include the specified field or fields in the command output. Use '-fields ?' to display the valid fields.

[-instance]

Use this parameter to display detailed information about all fields.

[-node <nodename>] - Node

Displays the discovery ports that match the node name.

[-protocol { cdp / lldp }] - Protocol

Displays the devices that are discovered by the given protocol.

[-port <text>] - Port

Displays the discovery ports that match the physical network port. For example, e0a will display devices discovered on port e0a.

[-discovered-device <text>] - Discovered Device

Displays the discovered devices that match the discovered device name.

[-interface <text>] - Discovered Device Interface

Displays the discovered devices that match this interface port name. The format is dependent on the reporting device. For example: FastEthernet0/12

[-device-ip <IP Address>, ...] - Discovered Device IP Addresses

Displays the discovered devices that match the IP address(es). At present, only IPv4 addresses are included. It is recommended to use wildcards around the desired value.

[-platform <text>] - Discovered Device Platform

Displays the discovery ports that contain the platform of discovered devices. For example: N5K-C5010P-BF

[-version <text>] - Discovered Device Version

Displays the discovery ports that contain the version of discovered devices.

[-chassis-id <text>] - Discovered Device Chassis ID

Displays the discovered devices that match the chassis ID.

`[-system-name <text>] - Discovered Device System Name`

Displays the discovered devices that match the system name.

`[-hold-time-remaining <integer>] - Discovered Device's Remaining Hold Time`

Displays the discovered devices that match the remaining packet hold time in seconds. If an advertisement from the device isn't received before this time reaches zero, the entry will expire and be removed from the list. For example, "<120" will display discovered devices which will expire within the next 120 seconds.

`[-capabilities {router/trans-bridge/source-route-bridge/switch/host/igmp/repeater/phone}, ...] - Discovered Device Capabilities`

Displays the discovered devices that match the capability or capabilities. Possible values:

- "router" - Router
- "trans-bridge" - Trans Bridge
- "source-route-bridge" - Source Route Bridge
- "switch" - Switch
- "host" - Host
- "igmp" - IGMP
- "repeater" - Repeater
- "phone" - Phone

Examples

```
cluster1::> network device-discovery show
```

network fcp commands

The fcp directory

Commands used for manaing FCP target adapters.

network fcp adapter commands

The adapter directory

Commands used for managing FCP adapters.

network fcp adapter modify

Modify the fcp adapter settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Modifies the FCP target adapter information.

The adapter argument is in the form Xy or Xy_z where X and z are integers and y is a letter. An example is 4a or 4a_1.

You cannot bring an adapter offline until all logical interfaces connected to that adapter are offline. Use the [network interface modify](#) command to take your logical interfaces offline.

The speed option sets the Fibre Channel link speed of an adapter. You can set adapters that support:

- 10Gb/s to 10 or auto
- 8Gb/s to 2, 4, 8 or auto
- 4Gb/s to 2, 4 or auto
- 2Gb/s to 2 or auto

By default, the link speed option is set to auto for auto negotiation. Setting the link speed to a specific value disables auto negotiation. Under certain conditions, a speed mismatch can prevent the adapter from coming online.

Note: The system reports the actual link speed with the "Data Link Rate (Gbit)" field in the output of [network fcp adapter show -instance](#).

Parameters

-node {<nodename>/local} - Node

Specifies the node of the target adapter.

-adapter <text> - Adapter

Specifies the target adapter.

[-status-admin {down/up}] - Administrative Status

Specifies the desired (administrative) status of the adapter. To view the actual operational status, run [network fcp adapter show -fields status-oper](#).

[-speed {1/2/4/8/10/16/32/auto}] - Configured Speed

Specifies the adapter configuration speed in Gigabytes.

Examples

```
cluster1::> network fcp adapter modify -node node1 -adapter 0d -speed 2
```

network fcp adapter show

Display FCP adapters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays FCP target adapter information. You can also use this information to determine if adapters are active and online.

The adapter argument is in the form Xy or Xy_z where X and z are integers and y is a letter. An example is 4a or 4a_1.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If this parameter is specified, the command displays information only about the FCP target adapters that are present on the specified node.

[-adapter <text>] - Adapter

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified name.

[-description <text>] - Description

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified description.

[-physical-protocol {fibre-channel/ethernet}] - Physical Protocol

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified physical protocol. Possible values are *fibre-channel* and *ethernet*.

[-max-speed {1/2/4/8/10/16/32/auto}] - Maximum Speed

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified maximum speed.

[-status-admin {down/up}] - Administrative Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the administrative state. Possible values are *up* and *down*.

[-status-oper <text>] - Operational Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified operational status.

[-status-extended <text>] - Extended Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified extended status.

[-portaddr <Hex Integer>] - Host Port Address

If this parameter is specified, the command displays information only about the FCP target adapters connected with the specified fabric port address.

[-firmware-rev <text>] - Firmware Revision

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified firmware revision.

[-data-link-rate <integer>] - Data Link Rate (Gbit)

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified data link rate.

[-fabric-established {true/false}] - Fabric Established

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified fabric login establishment state.

[-fabric-name <text>] - Fabric Name

If this parameter is specified, the command displays information only about the FCP target adapters that are logged in to the fabric with the specified WWN.

[-conn-established {loop/ptp}] - Connection Established

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified connection type. Possible values are *loop* and *ptp*.

[-is-conn-established {true/false}] - Is Connection Established

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified connection established state.

[-media-type {loop/ptp/auto}] - Mediatype

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified configured media type. Possible values are *loop*, *ptp*, and *auto*.

[-speed {1/2/4/8/10/16/32/auto}] - Configured Speed

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified configured speed. If the adapter is set to auto-negotiate, then the value will be *auto*.

[-data-protocols-supported {fcp/fc-nvme}, ...] - Data Protocols Supported

If this parameter is specified, the command displays information only about the FCP target adapters that may host LIFs with the specified data protocol. Possible values are *fcp* and *fc-nvme*.

[-fc-wwnn <text>] - Adapter WWNN

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified world wide node name.

[-fc-wwpn <text>] - Adapter WWPNN

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified world wide port name.

[-switch-port <text>] - Switch Port

If this parameter is specified, the command displays information only about the FCP target adapters that are connected to the specified switch port.

[-sfp-formfactor <text>] - Form Factor Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP form factor.

[-sfp-vendor-name <text>] - Vendor Name Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP vendor name.

[-sfp-part-number <text>] - Part Number Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP part number.

[-sfp-rev <text>] - Revision Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP revision number.

[-sfp-serial-number <text>] - Serial Number Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP serial number.

[-sfp-fc-speed-capabilities <text>] - FC Capabilities Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP speed capabilities.

[-sfp-vendor-oui <text>] - Vendor OUI Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP vendor OUI.

[-sfp-wavelength <integer>] - Wavelength In Nanometers

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP wavelength.

[-sfp-date-code <text>] - Date Code Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP date code.

[-is-sfp-optical-transceiver-valid {true/false}] - Validity Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the SFP is installed and valid.

[-sfp-connector <text>] - Connector Used

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP connector type.

[-sfp-encoding <text>] - Encoding Used

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP physical encoding.

[-is-sfp-diagnostics-internally-calibrated {true/false}] - Is Internally Calibrated

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the SFP diagnostics are internally calibrated or not.

[-sfp-diagnostic-monitoring-type <Hex Integer>] - Diagnostic Monitoring Type

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP diagnostic monitoring type.

[-sfp-ddm-capabilities <text>] - Status Monitoring Available

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the specified SFP digital diagnostics monitoring are supported or not.

[-sfp-sff8472-compliance <Hex Integer>] - SFF-8472 Compliance

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP SFF8472 compliance.

[-sfp-rx-power <text>] - Received Optical Power

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified observed SFP receive power.

[-is-sfp-rx-power-in-range {true/false}] - Is Received Power In Range

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP receive power is within the valid range for the SFP.

[-sfp-tx-power <text>] - SFP Transmitted Optical Power

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP transmit power.

[-is-sfp-tx-power-in-range {true/false}] - Is Xmit Power In Range

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmit power is within the valid range for the SFP.

[-sfp-ddm-status-control <Hex Integer>] - DDM Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP DDM status and control.

[-is-sfp-tx-in-disable {true/false}] - Is Xmit Disabled

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmitter is in disabled state.

[-is-sfp-tx-in-fault {true/false}] - Is Xmit In Fault

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmitter is in faulted state.

[-is-sfp-rx-in-los {true/false}] - Is Receiver In LOS

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP receiver is in loss of signal state.

Examples

```
cluster1::> fcp adapter show
                        Connection Host
Node      Adapter  Established Port Address
-----
sti6280-021  0a      ptp          30012c
```

The example above displays information regarding FCP adapters within cluster1.

```
cluster1::> fcp adapter show -instance -node sti6280-021 -adapter 0a
                        Node: sti6280-021
                        Adapter: 0a
                        Description: Fibre Channel Target Adapter 0a (QLogic 2532
(2562), rev. 2, 8G)
                        Physical Protocol: fibre-channel
                        Maximum Speed: 8
                        Administrative Status: up
                        Operational Status: online
                        Extended Status: ADAPTER UP
```

```

Host Port Address: 30012c
Firmware Revision: 5.8.0
Data Link Rate (Gbit): 4
Fabric Established: true
Fabric Name: 20:14:54:7f:ee:54:b9:01
Connection Established: ptp
Is Connection Established: true

network fcp topology commands

The topology directory

network fcp topology show

FCP topology interconnect elements per adapter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display FCP topology interconnect elements per adapter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to select the interconnect elements for adapters that are located on the node that you specify.

[-adapter <text>] - Adapter

Use this parameter to select the interconnect elements for the specified adapter.

[-domain-id <integer>] - Domain Id

Use this parameter to select the interconnect elements with the specified domain identifier.

[-port-wwpn <text>] - Port WWPN

Use this parameter to select the interconnect elements with the specified port world wide name.

[-switch-name <text>] - Switch Name

Use this parameter to select the interconnect elements with the specified switch.

[-switch-vendor <text>] - Switch Vendor

Use this parameter to select the interconnect elements with the specified vendor.

[-switch-release <text>] - Switch Release

Use this parameter to select the interconnect elements with the specified release.

[-switch-wnn <text>] - Switch WWN

Use this parameter to select the interconnect elements with the specified world wide name.

[-port-count <integer>] - Port Count

Use this parameter to select the interconnect elements with the specified port count.

[-port-slot <text>] - Port Slot

Use this parameter to select the interconnect elements with the specified port slot.

[-port-state {Unknown/Online/Offline/Testing/Fault}] - Port State

Use this parameter to select the interconnect elements with the specified port state.

[-port-type {None/N-Port/NL-Port/FNL-Port/NX-Port/F-Port/FL-Port/E-Port/B-Port/TNP-Port/TF-Port/NV-Port/FV-Port/SD-Port/TE-Port/TL-Port}] - Port Type

Use this parameter to select the interconnect elements with the specified port type.

[-port-attached-wwpn <text>] - Attached Port WWPN

Use this parameter to select the interconnect elements with the specified attached wwpn.

[-port-attached-id <text>] - Attached Port Id

Use this parameter to select the interconnect elements with the specified attached id.

[-port-attached-visible <text>] - Visible

Use this parameter to select the interconnect elements with the specified visibility flag on attached port structure.

Examples

```
cluster1::> network fcp topology show
Switch connected to the adapter 0c
  Switch Name: ssan-fc0e-d58
  Switch Vendor: Cisco Systems, Inc.
  Switch Release: 5.2(1)N1(9)
  Switch Domain: 4

network fcp zone commands

The zone directory

network fcp zone show

Display the active zone set information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays the active zone set information.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to select the active zone set information for adapters that located on the node name that you specify.

[-adapter <text>] - Adapter

Use this parameter to select the active zone set information for the specified adapter.

[-zoneset-name <text>] - Zoneset Name

Use this parameter to select the active zone set information for the specified zone set name.

[-zone-name <text>] - Zone Name

Use this parameter to select the active zone set information for the specified zone name.

[-unique <integer>] - Unique

A unique index for each zoneset record.

[-type-name <text>] - Type Name

Use this parameter to select the active zone set information with the specified symbolic type.

[-type <integer>] - Type

Use this parameter to select the active zone set information with the specified port type.

[-port-id <Hex Integer>] - Member Port Id

Use this parameter to select the active zone set information with the specified member port id.

[-domain-id <integer>] - Member Domain Id

Use this parameter to select the active zone set information with the specified member domain id.

[-port <integer>] - Member Port

Use this parameter to select the active zone set information with the specified member port.

[-wwn <text>] - Member WWN

Use this parameter to select the active zone set information with the specified member WWN.

[-zone-count <integer>] - Zone Count

Use this parameter to select the active zone set information with the specified number of zones.

[-zone-member-count <integer>] - Zone Member Count

Use this parameter to select the active zone set information with the specified number of zone members in a zone.

Examples

```
cluster1::> network fcp adapter zone show
```

	Zone Name	Member Type	WWN

Active Zone Set on adapter 0c			
Zone Set Name:	zoneset_name		
	zone_name_1	Port ID	-
	zone_name_1	Port ID	-
	zone_name_1	Port ID	-
	zone_name_2	Domain ID/Port	-
	zone_name_2	Domain ID/Port	-
	zone_name_2	Domain ID/Port	-
	zone_name_3	Fabric Port Name	
00:00:00:00:00:00:00:00	zone_name_3	Fabric Port Name	
01:00:00:00:00:00:00:00	zone_name_3	Fabric Port Name	
02:00:00:00:00:00:00:00			

9 entries were displayed.

network interface commands

Manage logical interfaces

network interface create

Create a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface create` command creates a logical interface (LIF).

Note: A logical interface is an IP address associated with a physical network port. For logical interfaces using NAS data protocols, the interface can fail over or be migrated to a different physical port in the event of component failures, thereby continuing to provide network access despite the component failure. Logical interfaces using SAN data protocols do not support migration or failover.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the LIF is created.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the LIF that is created. For iSCSI and FC LIFs, the name cannot be more than 254 characters.

[-service-policy <text>] - Service Policy

Use this parameter to specify a service policy for the LIF. If no policy is specified, a default policy will be assigned automatically. Use the [network interface service-policy show](#) command to review available service policies.

-role {cluster/data/node-mgmt/intercluster/cluster-mgmt} - (DEPRECATED)-Role

Note: This parameter has been deprecated and may be removed in a future version of ONTAP. Use the **-service-policy** parameter instead.

Use this parameter to specify the role of the LIF. LIFs can have one of five roles:

- Cluster LIFs, which provide communication among the nodes in a cluster
- Intercluster LIFs, which provide communication among peered clusters
- Data LIFs, which provide data access to NAS and SAN clients
- Node-management LIFs, which provide access to cluster management functionality
- Cluster-management LIFs, which provide access to cluster management functionality

LIFs with the cluster-management role behave as LIFs with the node-management role except that cluster-management LIFs can failover between nodes.

[-data-protocol {*nfs/cifs/iscsi/fcp/fcache/none/fc-nvme/s3*}, ...] - Data Protocol

Use this parameter to specify the list of data protocols that can be served by the LIF. The supported protocols are NFS, CIFS, iSCSI, FCP, and FC-NVMe. NFS and CIFS are available by default when you create a LIF. If you specify "none", the LIF does not support any data protocols. Also, none, iscsi, fcp or fc-nvme cannot be combined with any other protocols.

Note: The data-protocol field must be specified when the LIF is created and cannot be modified later.

Note: The NFS protocol relies on firewall services included in the built-in "data" and "mgmt-nfs" firewall policies. Assigning a different firewall policy might disrupt some NFS client implementations.

-address <IP Address> - Network Address

Use this parameter to specify the LIF's IP address.

Note: A cluster LIF cannot be on the same subnet as a management or data LIF.

{ -netmask <IP Address> - Netmask

Use this parameter to specify the LIF's netmask.

| -netmask-length <integer> - Bits in the Netmask

Use this parameter to specify the length (in bits) of the LIF's netmask.

| -is-vip [true] - Is VIP LIF

Use this parameter to display only logical interfaces matching a specify "is-vip" flag. Specifying "true" matches only LIFs to implement a Virtual IP; "false" matches only LIFs that do not.

{ [-auto [true]] - Allocate Link Local IPv4 Address

Use this parameter to specify whether IPv4 link local addressing is enabled for this LIF.

| [-subnet-name <subnet name>]] - Subnet Name

Use this parameter to allocate the interface address from a subnet. If needed, a default route will be created for this subnet.

[-home-node <nodename>] - Home Node

Use this parameter to specify the LIF's home node. The home node is the node to which the LIF returns when the *network interface revert* command is run on the LIF.

[-home-port {<netport>/<ifgrp>}] - Home Port

Use this parameter to specify the LIF's home port or interface group. The home port is the port or interface group to which the LIF returns when the *network interface revert* command is run on the LIF.

[-status-admin {up/down}] - Administrative Status

Use this parameter to specify whether the initial administrative status of the LIF is up or down. The default setting is **up**. The administrative status can differ from the operational status. For example, if you specify the status as up but a network problem prevents the interface from functioning, the operational status remains as down.

[-failover-policy {system-defined/local-only/sfo-partner-only/disabled/broadcast-domain-wide}] - Failover Policy

Use this parameter to specify the failover policy for the LIF.

- **system-defined** - The system determines appropriate failover targets for the LIF. The default behavior is that failover targets are chosen from the LIF's current hosting node and also from one other non-partner node when possible.
- **local-only** - The LIF fails over to a port on the local or home node of the LIF.
- **sfo-partner-only** - The LIF fails over to a port on the home node or SFO partner only.
- **broadcast-domain-wide** - The LIF fails over to a port in the same broadcast domain as the home port.
- **disabled** - Failover is disabled for the LIF.

The failover policy for cluster logical interfaces is **local-only** and cannot be changed. The default failover policy for data logical interfaces is **system-defined**. This value can be changed.

Note: Logical interfaces for SAN protocols do not support failover. Thus, such interfaces will always show this parameter as **disabled**.

`[-firewall-policy <policy>]` - Firewall Policy

Use this parameter to specify the firewall policy for the LIF. A LIF can use a default firewall policy that corresponds to its role (management, cluster, intercluster, or data) or a custom firewall policy created by an administrator. View and modify existing firewall policies using the `system services firewall policy show` and `system services firewall policy modify` commands, respectively.

Note: The NFS data protocol relies on firewall services included in the built-in "data" and "mgmt-nfs" firewall policies. Assigning a different firewall policy might disrupt some NFS client implementations.

`[-auto-revert {true/false}]` - Auto Revert

Use this parameter to specify whether a data LIF is automatically reverted to its home node under certain circumstances. These circumstances include startup, when the status of the management database changes to either master or secondary, or when the network connection is made. The default setting is **false**. If you set the value of this parameter to **true**, load balancing migration capability of the data LIF is disabled (the `-allow-lb-migrate` parameter is set to **false**).

Note: Logical interfaces for SAN traffic do not support auto-revert. Thus, this parameter is always **false** on such interfaces.

`[-dns-zone {<zone-name>/none}]` - Fully Qualified DNS Zone Name

Use this parameter to specify a unique, fully qualified domain name of a DNS zone to which this data LIF is added. You can associate a data LIF with a single DNS zone. All data LIFs included in a zone must be on the same Vserver. If a LIF is not added to a DNS zone the data LIF is created with the value **none**.

`[-listen-for-dns-query {true/false}]` - DNS Query Listen Enable

Use this parameter to specify if the LIF has to listen for DNS queries. The default value for this parameter is **true**.

`[-allow-lb-migrate {true/false}]` - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to specify whether load balancing migration is activated for this data LIF. The default value of this parameter is **false**. If you set the value of this

parameter to **true**, automatic revert capability for this data LIF is disabled (the **-auto-revert** parameter is set to **false**). Also, data LIFs that migrate as a result of load balancing adhere to network interface failover rules.

Note: During times when a LIF is hosting active NFSv4, CIFS, or NRV connections, load balancing based LIF migrations between nodes will be temporarily disabled.

[-lb-weight {load/0..100}] - Load Balanced Weight (privilege: advanced)

Use this parameter to specify a load balancing weight for a data LIF. A valid numeric load balancing weight is any integer between 0 and 100. When you specify the same load balancing weight for all data LIFs in a DNS zone, client requests are uniformly distributed, similar to round-robin DNS. A data LIF with a low load balancing weight is made available for client requests less frequently than one that has a high load balancing weight. "load" is the default value of this parameter. If set to "load", node utilization statistics are used to dynamically assign the load balancing weight.

[-failover-group <failover-group>] - Failover Group Name

Use this parameter to specify the name of the failover group to associate with the LIF. Manage failover groups by using the *network interface failover-groups* command. Each broadcast domain has a default failover group which is created by the system automatically and has the same name as the broadcast domain. The failover group associated with the broadcast domain includes all ports in the broadcast domain. A logical interface's failover group is set to the failover group of the home port's broadcast domain by default, but this value can be modified.

Note: Logical interfaces for SAN protocols do not support failover. Thus, this parameter cannot be specified for such interfaces.

[-comment <text>] - Comment

Use this parameter to specify the comment to associate with the LIF.

[-force-subnet-association [true]] - Force the LIF's Subnet Association

This command will fail if the IP address falls within the address range of a named subnet. Set this to true to acquire the address from the named subnet and assign the subnet to the LIF.

[-is-dns-update-enabled {true/false}] - Is Dynamic DNS Update Enabled?

If this parameter is set to *true*, then dynamic DNS update is sent to the DNS server for the particular LIF entry if dynamic DNS updates are enabled for the corresponding Vserver. This field is set to *true* by default for both IPv4 and IPv6 LIFs. DNS Update is not supported on LIFs not configured with either the NFS or CIFS protocol.

[-probe-port <integer>] - Probe-port for Azure ILB

Use this parameter to specify a probe-port for the LIF in the Azure environment. It is a required field in the Azure environment. If no probe-port is specified, an error would be returned.

[-broadcast-domain <text>] - Broadcast Domain

Use this parameter to display the broadcast domain that contains the home port of the logical interface.

Examples

The following example creates an IPv4 LIF named datalif1 and an IPv6 LIF named datalif2 on a Vserver named vs0. Their home node is node0 and home port is e0c. The failover policy

broadcast-domain-wide is assigned to both LIFs. The firewall policy is *data* and the LIFs are automatically reverted to their home node at startup and under other circumstances. The *datalif1* has the IP address 192.0.2.130 and netmask 255.255.255.128, and *datalif2* has the IP address 3ffe:1::aaaa and netmask length of 64.

```
cluster1::> network interface create -vserver vs0 -lif datalif1 -role data -
home-node node0 -home-port e0c -address 192.0.2.130 -netmask 255.255.255.128
-failover-policy broadcast-domain-wide -firewall-policy data -auto-revert
true
cluster1::> network interface create -vserver vs0 -lif datalif2 -role data -
home-node node0 -home-port e0c -address 3ffe:1::aaaa -netmask-length 64 -
failover-policy broadcast-domain-wide -firewall-policy data -auto-revert true
```

network interface delete

Delete a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface delete` command deletes a logical interface (LIF) from a Vserver. Only administratively down LIFs can be deleted. To make a LIF administratively down, use the [network interface modify](#) command to set the "status-admin" parameter to "down".

Note: If the LIF is configured for a SAN protocol and is part of a port set, the LIF must be removed from the port set before it can be deleted. To determine if a LIF is in a port set, use the [lun portset show](#) command. To remove the LIF from the port set, use the [lun portset remove](#) command.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the logical interface to be deleted is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the logical interface to delete.

Examples

The following example deletes a logical interface named *cluslif3* that is located on a Vserver named *vs0*.

```
cluster1::> network interface delete -vserver vs0 -lif cluslif3
```

Related references

[network interface modify](#) on page 408

[lun portset remove](#) on page 278

network interface migrate

Migrate a logical interface to a different port

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface migrate` command migrates a logical interface to a port or interface group on the node you specify.

Note: Manual migration of a logical interface can take up to 15 seconds to complete. Also, when you migrate a cluster logical interface, you must do so from the local node. Logical interface migration is a best-effort command, and can only be completed if the destination node and port are operational

Note: Logical interfaces for SAN protocols do not support migration. Attempts to do so will result in an error.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver that owns the logical interface that is to be migrated.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the logical interface that is to be migrated.

-destination-node <nodename> - Destination Node

Use this parameter to specify the node to which the logical interface is to be migrated.

[-destination-port {<netport>/<ifgrp>}] - Destination Port

Use this parameter to specify the port or interface group to which the logical interface is to be migrated.

[-force [true]] - Force Migrate Data LIF Flag (privilege: advanced)

Use this parameter to force the migration operation.

Examples

The following example migrates a logical interface named `datalif1` on a Vserver named `vs0` to port `e0c` on a node named `node2`:

```
cluster1::> network interface migrate -vserver vs0 -lif datalif1 -dest-node
node2 -dest-port e0c
```

network interface migrate-all

Migrate all data logical interfaces away from the specified node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface migrate-all` command migrates all data logical interfaces from the node you specify.

Note: Manual migration of a logical interface can take up to 15 seconds to complete. Logical interface migration is a best-effort command and can only be completed if the destination node and port are operational. Logical interface migration requires that the logical interface be pre-configured with valid failover rules to facilitate failover to a remote node.

Note: Logical interfaces for SAN protocols do not support migration. Attempts to do so will result in an error.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters**-node <nodename> - Node**

Use this parameter to specify the node from which all logical interfaces are migrated. Each data logical interface is migrated to another node in the cluster, assuming that the logical interface is configured with failover rules that specify an operational node and port.

[-port {<netport>/<ifgrp>}] - Port

Use this parameter to specify the port from which all logical interfaces are migrated. This option cannot be used with asynchronous migrations. If this parameter is not specified, then logical interfaces will be migrated away from all ports on the specified node.

Examples

The following example migrates all data logical interfaces from the current (local) node.

```
cluster1::> network interface migrate-all -node local
```

network interface modify

Modify a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface modify` command modifies attributes of a logical interface (LIF).

Note: You cannot modify some properties of an iSCSI or FCP LIF, such as **-home-node** or **-home-port**, if the LIF is in a port set. To modify these properties, first remove the LIF from the port set. To determine if a LIF is in a port set, use the `lun portset show` command. To remove the LIF from the port set, use the `lun portset remove` command.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver on which the LIF to be modified is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the LIF that is to be modified

`[-service-policy <text>] - Service Policy`

Use this parameter to modify the service policy associated with the LIF.

`[-address <IP Address>] - Network Address`

Use this parameter to modify the LIF's IP address.

Note: A cluster LIF cannot be on the same subnet as a data or management LIF.

`{ [-netmask <IP Address>] - Netmask`

Use this parameter to modify the LIF's netmask.

`| [-netmask-length <integer>] - Bits in the Netmask`

Use this parameter to modify the length (in bits) of the LIF's netmask.

`| [-subnet-name <subnet name>]] - Subnet Name`

Use this parameter to allocate the interface address from a subnet. Modifying this parameter will cause a new IP address to be allocated and assigned to the interface.

`[-home-node <nodename>] - Home Node`

Use this parameter to modify the LIF's home node. The home node is the node to which the LIF returns when the `network interface revert` command is run on that LIF.

`[-home-port {<netport>/<ifgrp>}] - Home Port`

Use this parameter to modify the LIF's home port. The home port is the port or interface group to which the LIF returns when the `network interface revert` command is run on that LIF.

Note: If you change this parameter for a cluster or management LIF, you must reboot the storage system to force the change to take effect.

`[-status-admin {up/down}] - Administrative Status`

Use this parameter to modify the administrative status of the LIF. The administrative status can differ from the operational status. For example, if you specify the status as `up` but a network problem prevents the interface from functioning, the operational status remains as `down`.

`[-failover-policy {system-defined/local-only/sfo-partner-only/disabled/broadcast-domain-wide}] - Failover Policy`

Use this parameter to modify the failover policy for the LIF.

- `system-defined` - The system determines appropriate failover targets for the LIF. The default behavior is that failover targets are chosen from the LIF's current hosting node and also from one other non-partner node when possible.
- `local-only` - The LIF fails over to a port on the local or home node of the LIF.
- `sfo-partner-only` - The LIF fails over to a port on the home node or SFO partner only.
- `broadcast-domain-wide` - The LIF fails over to a port in the same broadcast domain as the home port.
- `disabled` - Failover is disabled for the LIF.

Note: The failover policy for cluster logical interfaces is `local-only` and cannot be changed. The default failover policy for data logical interfaces is `system-defined`. This value can be changed.

Note: Logical interfaces for SAN protocols do not support failover. Thus, such interfaces always show this parameter as `disabled`.

[-firewall-policy <policy>] - Firewall Policy

Use this parameter to set the firewall policy for the LIF. A LIF can use a default firewall policy that corresponds to its role (management, cluster, or data) or a custom firewall policy created by an administrator. When using a custom policy, the interface will fallback on its role's default policy for unspecified services. View existing firewall policies with the "*system services firewall policy show*" command. Modify existing firewall policies with the "*system services firewall policy modify*" command.

Note: The NFS data protocol relies on firewall services included in the built-in "data" and "mgmt-nfs" firewall policies. Assigning a different firewall policy might disrupt some NFS client implementations.

[-auto-revert {true/false}] - Auto Revert

Use this parameter to modify whether a data LIF is reverted automatically to its home node under certain circumstances. These circumstances would include startup, when the status of the management database changes to either master or secondary, and when the network connection is made. The default setting is **false**. If you set the value of this parameter to **true**, the load balancing migration capability of the data LIF is disabled (the **-allow-lb-migrate** parameter is set to **false**).

Note: Logical interfaces for SAN traffic do not support auto-revert. Thus, this parameter is always **false** on such interfaces.

[-dns-zone {<zone-name>/none}] - Fully Qualified DNS Zone Name

Use this parameter to modify the unique, fully qualified domain name of the DNS zone to which this data LIF belongs. You can associate a data LIF with a single DNS zone. All data LIFs included in a zone must be on the same Vserver. If you do not specify a value for this parameter, the data LIF is created with the value **none**.

[-listen-for-dns-query {true/false}] - DNS Query Listen Enable

Use this parameter to specify if the LIF has to listen for DNS queries. The default value for this parameter is **true**.

[-allow-lb-migrate {true/false}] - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to modify whether or not load balancing migration is enabled for this data LIF. The default value of this parameter is **false**. If you set the value of this parameter to **true**, the automatic revert capability of the data LIF is disabled (the **-auto-revert** parameter is set to **false**). Also, data LIFs that migrate as a result of load balancing adhere to network interface failover rules.

Note: During times when a LIF is hosting active NFSv4, CIFS, or NRV connections, load balancing based LIF migrations between nodes will be temporarily disabled.

[-lb-weight {load/0..100}] - Load Balanced Weight (privilege: advanced)

Use this parameter to modify the load balancing weight of the data LIF. A valid load balancing weight is any integer between 1 and 100. If you specify the same load balancing weight for all data LIFs in a DNS zone, client requests are uniformly distributed, similar to round-robin DNS. A data LIF with a low load balancing weight is made available for client requests less frequently than one that has a high load balancing weight.

`[-failover-group <failover-group>]` - Failover Group Name

Use this parameter to modify the name of the failover group to associate with the network interface. Manage failover groups using the [network interface failover-groups](#) command. Each broadcast domain has a default failover group which is created by the system automatically and has the same name as the broadcast domain. The failover group associated with the broadcast domain includes all ports in the broadcast domain. A logical interface's failover group is set to the failover group of the home port's broadcast domain by default, but this value can be modified.

Note: Logical interfaces for SAN protocols do not support failover. Thus, this parameter cannot be specified for such interfaces.

`[-comment <text>]` - Comment

Use this parameter to modify the comment associated with the LIF.

`[-force-subnet-association [true]]` - Force the LIF's Subnet Association

This command will fail if the IP address falls within the address range of a named subnet. Set this to true to acquire the address from the named subnet and assign the subnet to the LIF.

`[-is-dns-update-enabled {true/false}]` - Is Dynamic DNS Update Enabled?

If this parameter is set to *true*, then dynamic DNS update is sent to the DNS server for the particular LIF entry if dynamic DNS updates are enabled for the corresponding Vserver. This field is set to *true* by default for both IPv4 and IPv6 LIFs. DNS Update is not supported on LIFs not configured with either the NFS or CIFS protocol.

Examples

The following example modifies a LIF named `datalif1` on a logical server named `vs0`. The LIF's netmask is modified to `255.255.255.128`.

```
cluster1::> network interface modify -vserver vs0 -lif datalif1 -netmask
255.255.255.128
```

network interface rename

Rename a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `network interface rename` command to change the name of an existing logical interface.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver on which the logical interface to rename is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the logical interface to rename.

-newname <text> - The new name for the interface

Use this parameter to specify the new name of the logical interface. For iSCSI and FC LIFs, the name cannot be more than 254 characters.

Examples

The following example renames a cluster logical interface named cluslif1 to cluslif4 on a Vserver named vs0.

```
cluster1::> network interface rename -vserver vs0 -lif cluslif1 -newname
cluslif4
```

network interface revert

Revert a logical interface to its home port

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface revert` command reverts a logical interface that is not currently on its home port to its home port, assuming that the home node and port are both operational. A logical interface's home port is specified when the logical interface is created. Determine a logical interface's home port by using the `network interface show` command.

Note: When you revert a cluster logical interface, you must do so from the local node.

Note: On some cloud platforms, this operation might perform changes to the external route tables.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the Vserver on which the logical interface to be reverted is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the logical interface that is to be reverted.

Note: Logical interfaces for SAN protocols are always home. Thus, this command has no effect on such interfaces. The same applies to logical interfaces for NAS protocols that are already home.

Examples

The following example returns any logical interfaces that are not currently on their home ports to their home ports.

```
cluster1::> network interface revert -vserver * -lif *
```

network interface show

Display logical interfaces

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network interface show` command displays information about logical interfaces.

Running the command with the **-failover** parameter displays information relevant to logical interface failover rules.

Running the command with the **-status** parameter displays information relevant to logical interface operational status.

Running the command with the **-by-ip-space** parameter displays information relevant to logical interfaces on a specific IPspace.

See the examples for more information.

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about logical interfaces whose operational status is down, run the command with the **-status-oper down** parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>,...** parameter, the command displays only the fields that you specify.

| [-by-ip-space]

Use this parameter to display logical-interfaces sorted by IPspace and Vserver.

| [-dns-zones]

Use this parameter to display logical-interfaces and whether the interface is associated with a Domain Name System (DNS) load balancing zone.

| [-failover]

Use this parameter to display logical-interface failover information.

| [-status]

Use this parameter to display detailed logical-interface status information.

| [-instance]}

Use this parameter to display all the fields for the specified logical-interfaces.

[-vserver <vserver>] - Vserver Name

Use this parameter to display information only about logical interfaces on the Vserver you specify.

Use this parameter plus the **-lif** parameter to display detailed information only about the logical interface you specify.

[-lif <lif-name>] - Logical Interface Name

Use this parameter to display information only about logical interfaces that match the name you specify.

Use this parameter with the **-vserver** parameter to display detailed information only about the logical interface you specify.

[-service-policy <text>] - Service Policy

Use this parameter to display information only about logical interfaces that have the service policy you specify.

[-services <LIF Service Name>, ...] - Service List

Use this parameter to display information only about logical interfaces that support all services in a comma-separated list of service names.

[-role {cluster/data/node-mgmt/intercluster/cluster-mgmt}] - (DEPRECATED)-Role

Note: This parameter has been deprecated and may be removed in a future version of ONTAP. Use either the **-service-policy** or **-services** parameter instead.

Use this parameter to display information only about logical interfaces that are associated with network ports that have the role you specify.

[-data-protocol {nfs/cifs/iscsi/fcp/fcache/none/fc-nvme/s3}, ...] - Data Protocol

Use this parameter to display information only about logical interfaces that have the enabled data protocols you specify.

[-address <IP Address>] - Network Address

Use this parameter to display information only about logical interfaces that match the IP address or address range you specify.

[-netmask <IP Address>] - Netmask

Use this parameter to display information only about logical interfaces that have the netmask you specify.

[-netmask-length <integer>] - Bits in the Netmask

Use this parameter to display information only about logical interfaces with a netmask that has the number of bits you specify.

[-is-vip [true]] - Is VIP LIF

Use this parameter to display information only about logical interfaces that are VIP LIFs or not as you specify.

[-subnet-name <subnet name>] - Subnet Name

Use this parameter to display the logical interfaces that matches the subnet name.

[-home-node <nodename>] - Home Node

Use this parameter to display information only about logical interfaces that have the home node you specify.

[-home-port {<netport>/<ifgrp>}] - Home Port

Use this parameter to display information only about logical interfaces that have the home port or interface group you specify.

[-curr-node <nodename>] - Current Node

Use this parameter to display information only about logical interfaces that are currently located on the node you specify.

[-curr-port {<netport>/<ifgrp>}] - Current Port

Use this parameter to display information only about logical interfaces that are currently located on the port or interface group you specify.

[-status-oper {up/down}] - Operational Status

Use this parameter to display information only about logical interfaces that have the operational status you specify.

[-status-extended <text>] - Extended Status

Use this parameter to display information only about logical interfaces that match the extended status that you specify.

[-numeric-id <integer>] - Numeric ID (privilege: advanced)

Use this parameter to display information only about logical interfaces with the numeric ID (or range of IDs) you specify. The numeric ID is an integer that identifies the logical interface in the cluster.

[-is-home {true/false}] - Is Home

Use this parameter to display information only about logical interfaces that are (true) or are not (false) currently located on their home node and port.

[-status-admin {up/down}] - Administrative Status

Use this parameter to display information only about logical interfaces that have the administrative status you specify.

[-failover-policy {system-defined/local-only/sfo-partner-only/disabled/broadcast-domain-wide}] - Failover Policy

Use this parameter to display information only about logical interfaces that use the failover policy you specify.

[-firewall-policy <policy>] - Firewall Policy

Use this parameter to display information only about logical interfaces that use the firewall policies you specify.

[-auto-revert {true/false}] - Auto Revert

Use this parameter to display information only about logical interfaces that have auto-revert setting you specify.

[-sticky {true/false}] - Sticky Flag (privilege: advanced)

Use this parameter to display information only about logical interfaces that are "sticky". A sticky logical interface is one that has been manually migrated to another node and is not subject to auto-revert settings. A sticky logical interface remains at the migrated location until it is manually reverted or until it fails over to another node.

[-dns-zone {<zone-name>/none}] - Fully Qualified DNS Zone Name

Use this parameter to display information only about logical interfaces in the specified DNS zone.

[-listen-for-dns-query {true/false}] - DNS Query Listen Enable

Use this parameter to display information only about logical interfaces that have the DNS query listen value you specify.

[-allow-lb-migrate {true/false}] - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

Note: This parameter has been deprecated and may be removed in a future version of Data ONTAP.

Use this parameter to display information only about logical interfaces for which load balancing migration is activated (true) or not activated (false).

[-lb-weight {load/0..100}] - Load Balanced Weight (privilege: advanced)

Use this parameter to display information only about logical interfaces that have the load balancing weight you specify.

[-failover-group <failover-group>] - Failover Group Name

Use this parameter to display information only about logical interfaces that are in the failover group you specify. Logical interfaces in the same failover group are capable of failing over to the same set of ports.

[-wwpn <text>] - FCP WWPN

Use this parameter to display information only about logical interfaces that have the Fibre Channel Protocol port identifier (World Wide Port Name) you specify.

[-address-family { ipv4 / ipv6 / ipv6z }] - Address family

Use this parameter to view the address family that is in use on the interface. Only IPv4 and IPv6 non-zoned addresses can be configured. Configuration of IPv6z addresses is not allowed.

[-comment <text>] - Comment

Use this parameter to display information only about logical interfaces that have the comment you specify.

[-ipospace <IPspace>] - IPspace of LIF

Use this parameter to display information only about logical interfaces on the IPspace you specify.

[-is-dns-update-enabled { true / false }] - Is Dynamic DNS Update Enabled?

Use this parameter to display information only about logical interfaces that have (true) or do not have (false) dynamic DNS updates enabled for them.

[-probe-port <integer>] - Probe-port for Azure ILB

Use this parameter display the probe-port for the logical interface in the Azure environment.

[-broadcast-domain <text>] - Broadcast Domain

Use this parameter to display the broadcast domain that contains the home port of the logical interface.

Examples

The following example displays general information about all logical interfaces.

```
cluster1::> network interface show
```

Vserver	Logical Interface	Status Admin/Oper	Network Address/Mask	Current Node	Current Is Port
Home					
-----	-----	-----	-----	-----	-----
cluster1	cluster_mgmt	up/up	192.0.2.1/192	node0	e0M
true	node0_mgmt1	up/up	192.0.2.2/192	node0	e0M
true	node1_mgmt1	up/up	192.0.2.3/192	node1	e0M
true	node0_clus1	up/up	192.0.2.66/192	node0	e0a
true	node0_clus2	up/up	192.0.2.67/192	node0	e0b
true	node1_clus1	up/up	192.0.2.68/192	node1	e0a
true	node1_clus2	up/up	192.0.2.69/192	node1	e0b

The following example displays failover information about all logical interfaces.

```
cluster1::> network interface show -failover
```

Vserver	Logical Interface	Home Node:Port	Failover Policy	Failover Group
cluster1	cluster_mgmt	node0:e0M	broadcast-domain-wide	Default
		Failover Targets:	node0:e0M, node0:e0d, node0:e0e, node0:e0f, node1:e0M, node1:e0d, node1:e0e, node1:e0f	
	node0_mgmt1	node0:e0M	local-only	Default
		Failover Targets:	node0:e0M, node0:e0d, node0:e0e, node0:e0f	
	node1_mgmt1	node1:e0M	local-only	Default
		Failover Targets:	node1:e0M, node1:e0d, node1:e0e, node1:e0f	
Cluster	node0_clus1	node0:e0a	local-only	Cluster
		Failover Targets:	node0:e0a, node0:e0b	
	node0_clus2	node0:e0a	local-only	Cluster
		Failover Targets:	node0:e0b, node0:e0a	
	node1_clus1	node1:e0a	local-only	Cluster
		Failover Targets:	node1:e0a, node1:e0b	
	node1_clus2	node1:e0a	local-only	Cluster
		Failover Targets:	node1:e0b, node1:e0a	

network interface start-cluster-check

Start the cluster check function

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface start-cluster-check` command initiates an accessibility check from every logical interface to every aggregate. Automatic checks run periodically, but this command manually initiates a check immediately.

This command produces no direct output. Any errors encountered during the check are reported in the event log. See the [event log show](#) command for more information.

Examples

This example shows an execution of this command, with all parameters and output.

```
cluster1::> network interface start-cluster-check
```

network interface capacity commands

The capacity directory

network interface capacity show

Display the number of IP data LIFs capable of being configured on the cluster.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface capacity show` command displays the number of IP LIFs of role *data* supported on the cluster, as well as the number of IP LIFs of role *data* currently configured on the cluster.

Note: The number of IP LIFs of role *data* that are supported on a node depends on the hardware platform and the Cluster's Data ONTAP version. If one or more nodes in the cluster cannot support additional LIFs, then none of the nodes in the cluster can support additional LIFs.

Examples

The following displays the IP data LIF capacity.

```
cluster1::> network interface capacity show
      IP Data LIF      IP Data LIF
      Supported Limit      Count
      -----
              1024              256
```

network interface capacity details commands

The details directory

network interface capacity details show

Display details about the IP data LIFs capable of being configured on each node.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface capacity details show` command displays the number of IP LIFs of role *data* that can be configured on each node, the number of IP data LIFs of role *data* that are supported on each node, and the number of IP data LIFs of role *data* that are configured to be homed on each node.

Note: The number of IP LIFs of role *data* that are supported on a node depends on the hardware platform and the Cluster's Data ONTAP version. If one or more nodes in the cluster cannot support additional LIFs, then none of the nodes in the cluster can support additional LIFs.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-node* {<nodename>/local}] - Node Name

Use this parameter to specify the node for which to obtain data LIF capacity.

[*-capacity-for-node* <integer>] - Number of IP data LIFs that can be configured on the node

This parameter specifies the number of IP LIFs of role *data* that can be configured on the node at the currently running Data ONTAP version. To view the version of a node, use the [cluster image show](#) command.

[*-limit-for-node* <integer>] - Number of IP data LIFs that are supported on the node

This parameter specifies the number of IP LIFs of role *data* that are supported on the node at the current effective cluster version (ECV). To view the version of a node, use the [cluster image show](#) command.

[*-count-for-node* <integer>] - Number of IP data LIFs that are assigned to the node

This parameter specifies the number of IP LIFs of role *data* currently configured to be homed on the node. To view LIFs homed on this node, use the [network interface show -home-node](#) command.

Examples

The following displays the IP data LIF capacity.

```
cluster1::> network interface capacity details show
              IP Data LIF      IP Data LIF      IP Data LIF
              Capacity      Supported Limit      Count
-----
              node1              512              512              128
              node2              512              512              128
```

network interface check commands

The check directory

network interface check failover commands

The failover directory

network interface check failover show

Discover if any LIFs might become inaccessible during a node outage, due to over-provisioning

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command identifies logical interfaces (LIFs) at risk of becoming inaccessible if their hosting nodes were to experience an outage. The *source-nodes* parameter is the only required input.

The tuple <destination-nodes, vserver-name, lif-name> is sufficient to uniquely identify a record in the returned listing. All fields other than source-nodes can be filtered on in the usual fashion. There are some examples of this filtering below.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-destination-nodes <nodename>, ...] - Set Of Nodes Over Capacity

Use this parameter to display the nodes an at-risk LIF or LIFs could fail over to.

[-vserver-name <vserver>] - Vserver Name

Use this parameter to display only LIFs on the Vserver you specify.

[-lif-name <lif-name>] - LIF Name

Use this parameter to display at-risk information only about the LIF or LIFs whose name you specify.

-source-nodes <nodename>, ... - Nodes Going Down

List of nodes to test. At-risk LIFs currently hosted on these nodes will be identified. The list should contain no more than half the nodes in the cluster.

[-over-amount <integer>] - Amount Capacity Exceeded

Use this parameter to select only at-risk LIFs associated with a set of destination nodes whose amount over capacity matches the number you specify.

Note that the number of LIFs considered to be at risk may be higher than the actual amount over capacity a given set of nodes is. Once a given set of nodes is determined to be potentially over capacity, all LIFs whose set of failover target nodes is an exact match are marked as at risk. The amount over capacity is an upper bound on the number LIFs which could become unhosted if LIFs were to fail over in a random order, each to a target randomly selected from that LIF's configured failover targets.

[-failover-group <failover-group>] - Failover Group Name

Use this parameter to display information only about at-risk LIFs whose failover-group you specify.

[-failover-policy {system-defined/local-only/sfo-partner-only/disabled/broadcast-domain-wide}] - Failover Policy

Use this parameter to display information only about at-risk LIFs whose failover-policy you specify.

Examples

The following example shows all the at-risk LIFs for a specific two-node outage in a six-node cluster.

```
cluster1::> network interface check failover show -source-nodes node1,node5

Destination Nodes: node2, node3, node4, node6
Amount Over Capacity: 2
Vserver            Logical Interface    Failover Group    Failover Policy
-----
```

```

-----
vs0          data1          Default          broadcast-domain-
wide
              data2          Default          broadcast-domain-
wide
              data3          Default          broadcast-domain-
wide
vs1          data1          Custom_Name       broadcast-domain-
wide

Destination Nodes: node2
Amount Over Capacity: 1
Vserver      Logical Interface  Failover Group  Failover Policy
-----
vs0          data6          Default          sfo-partner-only
vs1          data7          Default          sfo-partner-only

```

The following example shows the same two-node outage scenario, but now with some filtering applied to the results.

```

cluster1::> network interface check failover show -source-nodes node1,node5 -
destination-nodes node2,node3,node4,node6 -failover-group Def*

Destination Nodes: node2, node3, node4, node6
Amount Over Capacity: 2
Vserver      Logical Interface  Failover Group  Failover Policy
-----
vs0          data1          Default          broadcast-domain-
wide
              data2          Default          broadcast-domain-
wide
              data3          Default          broadcast-domain-
wide

```

network interface dns-lb-stats commands

The dns-lb-stats directory

network interface dns-lb-stats show

Show the DNS load-balancer stats for this node

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network interface dns-lb-stats show` command displays the statistics for DNS load-balancing lookups for the zones belonging to the specified Vserver. These statistics represent the data for the Vserver on the local node. The following counts can be seen in the statistics output:

- `success-count` : Number of successful lookups.
- `authoritative-count` : Number of authoritative answers sent.
- `nonauthoritative-count` : Number of non authoritative answers sent.
- `rr-set-missing-count` : Number of times the RR set was missing.
- `domain-missing-count` : Number of times the domain was not be found.
- `failure-count` : Number of failed lookups.

- **dropped-count** : Number of lookups dropped.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

Use this parameter to display DNS load-balancer statistics only for the specified Vservers.

[-zone <text>] - DNS Zone

Use this parameter to display DNS load-balancer statistics only for the specified DNS zones.

[-success-count <integer>] - Successful Lookup Count

Use this parameter to display DNS load-balancer statistics only for the specified number of successful lookups.

[-authoritative-count <integer>] - Authoritative Answer Count

Use this parameter to display DNS load-balancer statistics only for the specified number of authoritative answers sent.

[-nonauthoritative-count <integer>] - Non Authoritative Answer Count

Use this parameter to display DNS load-balancer statistics only for the specified number of non-authoritative answers sent.

[-rr-set-missing-count <integer>] - RR Set Missing Count

Use this parameter to display DNS load-balancer statistics only for the specified number of times the RR set was missing.

[-domain-missing-count <integer>] - Name Missing Count

Use this parameter to display DNS load-balancer statistics only for the specified number of times the domain was not found.

[-failure-count <integer>] - Failed Lookup Count

Use this parameter to display DNS load-balancer statistics only for the specified number of failed lookups.

[-dropped-count <integer>] - Dropped Count

Use this parameter to display DNS load-balancer statistics only for the specified number of dropped lookups.

Examples

The following example displays stats for the zone "x.com".

```
cluster1::> network interface dns-lb-stats show -zone x.com
Vserver      DNS Zone      SUCCESS  AUTH  NOAUTH  NORR  NODOM  FAILED
DROP
-----
vs2
      x.com      5      5      0      0      0      0      0
```

network interface failover-groups commands

Manage logical interface failover group configuration

network interface failover-groups add-targets

Add failover targets to a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups add-targets` command enables you to add a list of failover targets such as network ports, interface groups, or VLANs to an existing logical interface failover group.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to extend.

-targets <<node>:<port>>, ... - Failover Targets

Use this parameter to specify the failover targets such as network ports, interface groups, or VLANs you wish to add to the failover group.

Examples

This example shows the failover group "clyde" being extended to include additional failover targets.

```
cluster1::> network interface failover-group add-targets -vserver vs1 -
failover-group clyde -targets xenal:e0c, xenal:e0d-100, xena2:a0a
```

network interface failover-groups create

Create a new failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups create` command creates a grouping of failover targets for logical interfaces on one or more nodes. Use this command to add a new network port or interface group to an existing failover group.

Note: Interfaces for SAN protocols do not support failover. Such interfaces are not valid failover targets.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the name of the logical interface failover group that you want to create.

-targets <<node>:<port>>, ... - Failover Targets

Use this parameter to specify the list of failover targets (network ports, interface groups, or VLANs on a node) belonging to this failover group.

Examples

The following example shows how to create a failover group named failover-group_2 containing ports e1e and e2e on node Xena.

```
cluster1::> network interface failover-groups create -vserver vs0 -failover-group failover-group_2 -targets xena:e1e,xena:e2e
```

network interface failover-groups delete

Delete a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups delete` command deletes a logical interface failover group.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the name of the logical interface failover group to be deleted.

Examples

The following example shows how to delete a failover group named failover-group_2.

```
cluster1::> network interface failover-groups delete -vserver vs1 -failover-group failover-group_2
```

network interface failover-groups modify

Modify a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups modify` command enables you modify the list of network ports, interface groups, or VLANs belonging to an existing logical interface failover group. The specified list will overwrite the existing list of network ports, interface groups, and VLANs currently belonging to the logical interface failover group.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vserver(s) from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to modify.

[-targets <<node>:<port>>, ...] - Failover Targets

Use this parameter to specify the network ports, interface groups, or VLANs you wish to now belong to the failover group.

Examples

This example shows the failover group "clyde" being modified to now contain the specified network ports.

```
cluster1::> network interface failover-group modify -vserver vs1 -failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups remove-targets

Remove failover targets from a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups remove-targets` command enables you to specify a list of failover targets such as network ports, interface groups, or VLANs to be removed from an existing logical interface failover group.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vserver(s) from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to remove failover targets from.

-targets <<node>:<port>>, ... - Failover Targets

Use this parameter to specify the failover targets such as network ports, interface groups, or VLANs you wish to remove from the failover group.

Examples

This example shows the failover targets `xena1:e0c` and `xena1:e0d-100` being removed from the failover group "clyde".

```
cluster1::> network interface failover-group remote-targets -vserver vs1 -failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups rename

Rename a logical interface failover Group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups rename` command enables you to rename an existing logical interface failover group.

Parameters**-vserver <vserver> - Vserver Name**

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to rename.

-new-failover-group-name <text> - New name

Use this parameter to specify the new name of the failover group.

Examples

This example shows the failover group "clusterwide" being renamed "clyde".

```
cluster1::> network interface failover-group rename -failover -vserver vsl -
failover-group clusterwide -new-failover-group-name clyde
```

network interface failover-groups show

Display logical interface failover groups

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network interface failover-groups show` command displays information about logical interface failover groups.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name

Use this parameter to display information only about the logical interface failover groups that have the target Vserver you specify.

[-failover-group <text>] - Failover Group Name

Use this parameter to display information only about the logical interface failover groups you specify.

[-targets <<node>:<port>>, ...] - Failover Targets

Use this parameter to display information only about the logical interface failover groups that have the failover target (physical port, interface group, or VLAN) you specify.

[-broadcast-domain <Broadcast Domain>] - Broadcast Domain

Use this parameter to display information only about the logical interface failover groups that have the broadcast domain you specify.

Examples

The following example displays information about all logical interface failover groups on a two node cluster.

```
cluster1::> network interface failover-groups show
Vserver          Group          Failover
-----          -
Cluster
cluster1         Cluster
                  node1:e1a, node1:e2a,
                  node2:e1a, node2:e2a,
cluster1         Default
                  node1:e0M, node1:e0a,
                  node1:e0b, node1:e0c,
                  node1:e0d, node2:e0M,
                  node2:e0a, node2:e0b,
                  node2:e0c, node2:e0d
```

network interface lif-weights commands

The lif-weights directory

network interface lif-weights show

Show the load-balancer LIF weights

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network interface lif-weights show` command displays the weights assigned to each LIF in a DNS load-balancing zone in a Vserver.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

Use this parameter to display information only for the specified Vservers.

[-zone <text>] - DNS Zone

Use this parameter to display information only for the specified DNS zones.

[-address <IP Address>] - Network Address

Use this parameter to display information only for the specified IP addresses.

[-weight <double>] - Load Balancer Weight

Use this parameter to display information only for the specified load balancer weights

Examples

The following example displays LIF weights for vsrver "vs1".

```
cluster1::> network interface lif-weights show -vsrver vs1
```

Vsrrver	DNS Zone	Network Address	Weight
vs1	a.com	4.4.4.4	12.4206
	x.com	1.1.1.1	12.4206
	x.com	10.72.46.236	12.4206

3 entries were displayed.

network interface service-policy commands

The service-policy directory

network interface service-policy add-service

Add an additional service entry to an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy add-service` command adds an additional service to an existing service-policy. When an allowed address list is specified, the list applies to only the service being added. Existing services included in this policy are not impacted.

Parameters

-vsrver <vsrver name> - Vsrrver

Use this parameter to specify the name of the Vsrrver of the service policy to be updated.

-policy <text> - Policy Name

Use this parameter to specify the name of service policy to be updated.

-service <LIF Service Name> - Service entry to be added

Use this parameter to specify the name of service to be added to the existing service policy.

[-allowed-addresses <IP Address/Mask>, ...] - Allowed address ranges for the service

Use this parameter to specify a list of subnet masks for addresses that are allowed to access this service. Use the value `0.0.0.0/0` to represent the wildcard IPv4 address and `::/0` to represent the wildcard IPv6 address.

Examples

The following example shows the addition of a service to an existing service policy.

```
cluster1::> network interface service-policy show -vsrver cluster1
```

Vsrrver	Policy	Service: Allowed Addresses
cluster1	default-intercluster	intercluster-core: 0.0.0.0/0 management-https: 0.0.0.0/0

```

      default-management      management-core: 0.0.0.0/0
                             management-autosupport: 0.0.0.0/0
                             management-ssh: 0.0.0.0/0
                             management-https: 0.0.0.0/0

      default-route-announce  management-bgp: 0.0.0.0/0

3 entries were displayed.

cluster1::> network interface service-policy add-service -vserver cluster1 -
policy default-intercluster -service management-ssh

cluster1::> network interface service-policy show -vserver cluster1
Vserver  Policy                               Service: Allowed Addresses
-----
cluster1
      default-intercluster      intercluster-core: 0.0.0.0/0

3 entries were displayed.

```

network interface service-policy clone

Clone an existing network service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy clone` command creates a new service policy that includes the same services and allowed addresses as an existing policy. Once the new service policy has been created, it can be modified as necessary without impacting the original policy.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the name of the Vserver of the service policy to be cloned.

-policy <text> - Policy Name

Use this parameter to specify the name of the service policy to be cloned.

-target-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the vservers on which the new service policy should be created.

-target-policy <text> - New Service Policy Name

Use this parameter to specify the name of the new service policy.

Examples

The following example shows the cloning of a service policy.

```

cluster1::> network interface service-policy show -vserver cluster1,ipspace1
Vserver  Policy                               Service: Allowed Addresses
-----
cluster1

```

network interface service-policy create

Create a new service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy create` command creates a new service policy with a list of included services. LIFs can reference this policy to control the list of services that they are

able to transport on their network. Services can represent applications accessed by a LIF as well as applications served by this cluster.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the name of the Vserver on which the service policy will be created.

-policy <text> - Policy Name

Use this parameter to specify the name of service policy to be created.

[-services <LIF Service Name>, ...] - Included Services

Use this parameter to specify a list of services that should be included in this policy.

[-allowed-addresses <IP Address/Mask>, ...] - Allowed Addresses

Use this parameter to specify a list of subnet masks for addresses that are allowed to access the services in this policy. Use the value `0.0.0.0/0` to represent the wildcard IPv4 address and `::/0` to represent the wildcard IPv6 address.

Examples

The following example shows the creation of a service policy with no initial services.

```
cluster1::> network interface service-policy create -vserver cluster1 -
policy empty

cluster1::> network interface service-policy show -vserver cluster1
Vserver  Policy                Service: Allowed Addresses
-----
cluster1
  default-intercluster  intercluster-core: 0.0.0.0/0
                        management-https: 0.0.0.0/0
  default-management    management-core: 0.0.0.0/0
                        management-autosupport: 0.0.0.0/0

network interface service-policy delete

Delete an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy delete` command deletes an existing service policy.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the name of the Vserver of the service policy to be deleted.

-policy <text> - Policy Name

Use this parameter to specify the name of the service policy to be deleted.

Examples

The following example shows the deletion of a service policy.

```
cluster1::> network interface service-policy show -vserver cluster1
Vserver  Policy                               Service: Allowed Addresses
-----
cluster1
  custom                                intercluster-core: 0.0.0.0/0
                                      management-ssh: 0.0.0.0/0

```

network interface service-policy remove-service

Remove a service entry from an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy remove-service` command removes an individual service from an existing service policy. Other services in the the policy are not impacted by the change.

Parameters

-vserver *<vserver name>* - Vserver

Use this parameter to specify the name of the Vserver of the service policy to be updated.

-policy <text> - Policy Name

Use this parameter to specify the name of service policy to be updated.

-service <LIF Service Name> - Service entry to be removed

Use this parameter to specify the name of service to be removed from the existing service policy.

Examples

The following example shows the removal of a service from an existing service policy.

```
cluster1::> network interface service-policy show -vserver cluster1
Vserver      Policy                               Service: Allowed Addresses
-----
```

cluster1		
	default-intercluster	intercluster-core: 0.0.0.0/0 management-https: 0.0.0.0/0
	default-management	management-core: 0.0.0.0/0 management-autosupport: 0.0.0.0/0 management-ssh: 0.0.0.0/0 management-https: 0.0.0.0/0
	default-route-announce	management-bgp: 0.0.0.0/0

3 entries were displayed.

```
cluster1::> network interface service-policy remove-service -vserver
cluster1 -policy default-management -service management-autosupport
```

```
cluster1::> network interface service-policy show -vserver cluster1
Vserver      Policy                               Service: Allowed Addresses
-----
```

cluster1		
	default-intercluster	intercluster-core: 0.0.0.0/0 management-https: 0.0.0.0/0
	default-management	management-core: 0.0.0.0/0 management-ssh: 0.0.0.0/0 management-https: 0.0.0.0/0

```

      default-route-announce      management-bgp: 0.0.0.0/0
3 entries were displayed.

```

network interface service-policy rename

Rename an existing network service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy` rename command assigns a new name to an existing service policy without disrupting the LIFs using the policy.

Parameters

-vserver *<vserver name>* - Vserver

Use this parameter to specify the name of the Vserver of the service policy to be renamed.

-policy <text> - Policy Name

Use this parameter to specify the name of the service policy to be renamed.

-new-name <text> - New Service Policy Name

Use this parameter to specify the new name for the service policy.

Examples

The following example shows the renaming of a service policy.

```

cluster1::> network interface service-policy show -vserver cluster1
Vserver      Policy                               Service: Allowed Addresses
-----
cluster1
    custom                                intercluster-core: 0.0.0.0/0
                                         management-autosupport: 0.0.0.0/0
                                         management-ssh: 0.0.0.0/0

```

network interface service-policy restore-defaults

Restore default settings to a service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy restore-defaults` command restores a built-in service-policy to its original state. The default list of services replaces any customizations that have been applied by an administrator. All included services will be updated to use the default allowed address list.

Parameters

-vserver *<vserver name>* - Vserver

Use this parameter to specify the name of the Vserver of the service policy to be restored.

-policy <text> - Policy Name

Use this parameter to specify the name of the service policy to be restored.

Examples

The following example shows the restoration of a service policy's default settings.

```
cluster1:>> network interface service-policy show -vserver cluster1
Vserver      Policy                               Service: Allowed Addresses
-----
```

cluster1		
	default-intercluster	intercluster-core: 10.1.0.0/16 management-ssh: 10.1.0.0/16 management-https: 10.1.0.0/16
	default-management	management-core: 0.0.0.0/0 management-autosupport: 0.0.0.0/0 management-ssh: 0.0.0.0/0 management-https: 0.0.0.0/0
	default-route-announce	management-bgp: 0.0.0.0/0

```
3 entries were displayed.
```

```
cluster1:>> network interface service-policy restore-defaults -vserver
cluster1 -policy default-intercluster
```

```
cluster1:>> network interface service-policy show -vserver cluster1
Vserver      Policy                               Service: Allowed Addresses
-----
```

cluster1		
	default-intercluster	intercluster-core: 0.0.0.0/0 management-https: 0.0.0.0/0

```

network interface service-policy show

Display existing service policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network interface service-policy show` command displays existing service policies.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects service policies that match the specified vservers name.

[-policy <text>] - Policy Name

Selects service policies that match the specified service policy name.

[-services <LIF Service Name>, ...] - Included Services

Selects service policies that contain all services in the specified list of service names.

[-service-allowed-addresses <text>, ...] - Service: Allowed Addresses

Selects service policies that contain all "`<service>:<allowed-addresses>`" in the specified list of addresses.

Examples

The following example displays the built-in service policies.

```

cluster1::> network interface service-policy show -vserver cluster1
Vserver  Policy                               Service: Allowed Addresses
-----
cluster1
  default-intercluster                intercluster-core: 0.0.0.0/0
                                      management-https: 0.0.0.0/0
  default-management                  management-core: 0.0.0.0/0
                                      management-autosupport: 0.0.0.0/0
                                      management-ssh: 0.0.0.0/0
                                      management-https: 0.0.0.0/0
  default-route-announce              management-bgp: 0.0.0.0/0
3 entries were displayed.

```

network interface service commands

The service directory

network interface service show

Display available interface services

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface service show` command displays available services for IP LIFs and the TCP or UDP ports that each service listens on. The ports listed in this table correspond to well-known ports that each service can be expected to open a listening socket. Services that do not listen for ingress connections are presented with an empty port list.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-restrictions] (privilege: advanced)

The `network interface service show-restrictions` command displays available services for IP LIFs and usage restrictions for each service. The restrictions determine which LIFs are permitted to use each service and what restrictions the service implies for the LIFs that do use it.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-service <LIF Service Name>] - Service Name

Selects services that match the specified service name.

[-ports <integer>, ...] - TCP/UDP Port Numbers

Selects services that contain all IP ports in the specified list.

[-protocol-ports <text>, ...] - Protocol: Port Numbers

Selects services that match the `<protocol>:<port>` combination.

[-vserver-policy <svc_vserver_policy>] - Vserver Restrictions

Selects services that match a specific vservers restriction.

[-failover-policy <svc_failover_policy>] - Failover Restrictions

Selects services that match a specific interface failover restriction.

Examples

The following example displays the built-in services.

```
cluster1::> network interface service show
Service                Protocol:Port
-----
intercluster-core      tcp:11104
                       tcp:11105
```

```
management-bgp      tcp:179
2 entries were displayed.
```

network ipspace commands

Manage IP Spaces

Network IPspace commands.

network ipspace create

Create a new IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

IPspaces are distinct IP address spaces in which Storage Virtual Machines (SVMs) reside. The "Cluster" IPspace and "Default" IPspace are created by default. You can create more custom IPspaces when you need your SVMs to have overlapping IP addresses, or you need more control over networking configurations for cluster peering. Please reference the "Network Management Guide" for the limit of how many custom IPspaces are supported on your system..

Parameters

-ipspace <IPspace> - IPspace name

The name of the IPspace to be created.

- The name must contain only the following characters: A-Z, a-z, 0-9, ".", "-", or "_".
- The first character of each label, delimited by ".", must be one of the following characters: A-Z or a-z.
- The last character of each label, delimited by ".", must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "local" and "localhost".
- The system provides the following IPspaces: "Cluster" and "Default".

Examples

The following example creates IPspace "ips1".

```
cluster1::> network ipspace create -name ips1
```

network ipspace delete

Delete an IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete an IPspace that contains no ports or Vservers.

Parameters**-ipSPACE <IPSPACE> - IPspace name**

The name of the IPspace to be deleted. If the IPspace is associated with one or more logical-interfaces, you must delete them before you can delete the IPspace.

Examples

The following example deletes the IPspace "ips1".

```
cluster1::> network ipspace delete -ipSPACE ips1
```

network ipSPACE rename

Rename an IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Rename an IPspace.

Parameters**-ipSPACE <IPSPACE> - IPspace name**

The name of the IPspace to be renamed.

-new-name <IPSPACE> - New Name

The new name for the IPspace.

- The name must contain only the following characters: A-Z, a-z, 0-9, ".", "-", or "_".
- The first character of each label, delimited by ".", must be one of the following characters: A-Z or a-z.
- The last character of each label, delimited by ".", must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

Examples

The following example renames IPspace "ips1" to "ips2".

```
cluster1::> network ipSPACE rename -ipSPACE ips1 -new-name ips2
```

network ipSPACE show

Display IPspace information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display network IPspaces.

Parameters

{ [-fields <fieldname>, ...]

Specify the fields to be displayed for each IPspace.

| [-instance]}

Display all parameters of the IPspace objects.

[-ipSPACE <IPspace>] - IPspace name

Display the names of the IPspaces.

[-ports <<node>:<port>>, ...] - Ports

The list of network ports assigned to each IPspace.

[-broadcast-domains <Broadcast Domain>, ...] - Broadcast Domains

The list of broadcast domains that belong to the IPspace.

[-vservers <vserver name>, ...] - Vservers

The list of Vservers assigned to each IPspace.

Examples

The following example displays general information about IPspaces.

```
cluster1::> network ipspace show
IPspace          Vserver List          Broadcast Domains
-----
Cluster
Default          Cluster          -
                  cluster1, vs1, vs2    br1, br2, br3
2 entries were displayed.
```

network ndp commands

Manage Neighbor Discovery Protocol

Network Discovery Protocol commands.

network ndp default-router commands

Manage default router entries

NDP default router commands.

network ndp default-router delete-all

Delete default routers on a given IPspace

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp default-router delete-all` command deletes default router lists from the specified IPspace.

Parameters

-ipSPACE <IPspace> - IPspace Name

Use this parameter to specify the IPspace where the default routers are to be deleted.

Examples

The following example deletes default routers from IPspace ips1.

```
cluster1::*> network ndp default-router delete-all -ipspace ips1
```

network ndp default-router show

Display default routers

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp default-router show` command displays Neighbor Discovery Protocol (NDP) default routers learned on a specified port.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Displays the NDP default routers from the specified node.

[-ipspace <IPspace>] - IPspace name

Displays the NDP default routers from the specified IPspace.

[-port {<netport>/<ifgrp>}] - Port

Displays the NDP default routers from the specified port.

[-router-addr <IP Address>] - Router Address

Displays the default routers that have the specified IPv6 addresses.

[-flag {none/managed-address-DHCPv6/other-DHCPv6}] - Flag

Displays the default routers that have the specified flag. The flag indicates whether addresses are available via DHCPv6 or other configuration information is available via DHCPv6.

[-expire-time { [<integer>d][<integer>h][<integer>m][<integer>s]/never/expired}] - Expire Time

Displays the default routers that have the specified expire time.

Examples

The following example displays NDP default routers on local port e0f.

```
cluster1::*> network ndp default-router show -port e0f -node local
```

```
Node: node1
IPspace: Default
Port      Router Address      Flag      Expire Time
-----
e0f       fe80::5:73ff:fea0:107     none      0d0h23m9s
```

network ndp neighbor commands

Manage neighbor entries

Neighbor Discovery Protocol (NDP) neighbor commands.

network ndp neighbor create

Create a static NDP neighbor entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor create` command creates a static Neighbor Discovery Protocol (NDP) neighbor entry within a Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the NDP neighbor is to be created.

-neighbor <IP Address> - Neighbor Address

Use this parameter to specify the neighbor's IPv6 address.

-mac-address <MAC Address> - MAC Address

Use this parameter to specify the neighbor's MAC address.

Examples

The following example creates a NDP neighbor entry within Vserver vs0.

```
cluster1::*> network ndp neighbor create -vserver vs0 -neighbor 20:20::20 -
mac-address 10:10:10:0:0:1
```

network ndp neighbor delete

Delete a static NDP neighbor entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor delete` command deletes a static Neighbor Discovery Protocol (NDP) neighbor from a Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the NDP neighbor is to be deleted.

-neighbor <IP Address> - Neighbor Address

Use this parameter to specify the neighbor's IPv6 address.

Examples

The following example deletes a NDP neighbor entry within Vserver vs0.

```
cluster1::*> network ndp neighbor delete -vserver vs0 -neighbor 20:20::20
```

network ndp neighbor show

Display static NDP neighbor entries

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor show` command displays a group of static Neighbor Discovery Protocol (NDP) neighbors within one or more Vservers. You can view static NDP neighbors within specified Vservers, neighbors with specified IPv6 address, and neighbors with specified MAC address.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Displays the static NDP neighbors that have the specified Vserver as their origin.

[-neighbor <IP Address>] - Neighbor Address

Displays the static NDP neighbors that have the specified IPv6 address.

[-mac-address <MAC Address>] - MAC Address

Displays the static NDP neighbors that have the specified MAC address.

Examples

The following example displays all of the static NDP neighbors configured on Vserver vs0.

```
cluster1::*> network ndp neighbor show -vserver vs0
Vserver      Neighbor      MAC Address
-----
vs0
              10:10::10      04:04:04:04:04:04
              20:20::20      01:01:01:01:01:01
2 entries were displayed.
```

network ndp neighbor active-entry commands

Manage neighbor active entries

NDP active neighbor commands.

network ndp neighbor active-entry delete

Delete active neighbor entry from a System or Admin Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor active-entry delete` command deletes a Network Discovery Protocol (NDP) neighbor entry on the specified port from a given Vserver's subnet group.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the node on which the neighbor entry is to be deleted.

-vserver <vserver> - System or Admin Vserver Name

Use this parameter to specify the System or Admin Vserver on which the neighbor entry is to be deleted.

-subnet-group <IP Address/Mask> - Subnet Group

Use this parameter to specify the subnet group from which the neighbor entry is to be deleted.

-neighbor <IP Address> - Neighbor

Use this parameter to specify the IPv6 address of the neighbor entry which is to be deleted.

-port {<netport>/<ifgrp>} - Port

Use this parameter to specify the port on which the neighbor entry is to be deleted.

Examples

The following example deletes a neighbor entry from the Admin Vserver cluster1:

```
cluster1::*> network ndp neighbor active-entry delete -vserver cluster1 -
node local -subnet-group ::/0 -neighbor fe80:4::5:73ff:fea0:107 -port e0d
```

network ndp neighbor active-entry show

Display active neighbor entries organized by Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor active-entry show` command displays Network Discovery Protocol (NDP) neighbor cache entries on one or more nodes. You can view ndp neighbors within specified nodes and within specified System or Admin Vservers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-verbose]

Displays the expire time, state, is-router, and probe count fields.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Displays the NDP neighbors from the specified node.

[-vserver <vserver>] - System or Admin Vserver Name

Displays the NDP neighbors from the specified System or Admin Vserver. Data and Node Vservers do not have dynamic NDP neighbors.

[-subnet-group <IP Address/Mask>] - Subnet Group

Displays the NDP neighbors in the specified subnet group.

[-neighbor <IP Address>] - Neighbor

Displays the NDP neighbors that have the specified IPv6 address.

[-port {<netport>/<ifgrp>}] - Port

Displays the NDP neighbors on the specified port.

[-mac-address <MAC Address>] - MAC Address

Displays the NDP neighbors have the specified MAC address.

[-expire-time { [<integer>d][<integer>h][<integer>m][<integer>s] / never / expired }] - Expire Time

Displays the NDP neighbors have the specified expire time.

[-state {<nostate/>incomplete/>reachable/>stale/>delay/>probe/>unknown>}] - State

Displays the NDP neighbors in the specified state.

[-is-router {true/false}] - Is Router

Displays the NDP neighbor which is a router.

[-probe-count <integer>] - Probe Count

Displays the NDP neighbors with the specified probe count. Probe count is the number of times that this neighbor's MAC address has been queried.

[-is-static {true/false}] - Is Static

Displays the NDP neighbors which are statically configured.

Examples

The following example displays NDP neighbors on the Admin Vserver cluster1:

```
cluster1::*> network ndp neighbor active-entry show -vserver cluster1

Node: node1
Vserver: cluster1
Subnet Group: ::/0
Neighbor                                     MAC Address                               Port
-----
fe80:4::5:73ff:fea0:107                     00:05:73:a0:01:07                       e0d
fe80:4::226:98ff:fe0c:b6c1                   00:26:98:0c:b6:c1                       e0d
fe80:4::4255:39ff:fe25:27c1                  40:55:39:25:27:c1                       e0d
3 entries were displayed.
```

network ndp prefix commands

Manage prefix entries

NDP prefix commands.

network ndp prefix delete-all

Delete IPv6 prefixes on a given IPspace

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network `ndp prefix delete-all` command deletes all prefixes learned from the specified IPspace.

Parameters

-ipSPACE <IPspace> - IPspace Name

Use this parameter to specify the IPspace where the IPv6 prefixes are to be deleted.

Examples

The following example deletes all IPv6 prefixes within IPspace ips1.

```
cluster1::*> network ndp prefix delete-all -ipSPACE ips1
```

network ndp prefix show

Display IPv6 prefixes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network `ndp prefix show` command displays IPv6 prefixes on one or more nodes.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-verbose]

Displays the valid-lifetime, preferred-lifetime, origin and advertising-router fields.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Displays the IPv6 prefixes from the specified node.

[-ipSPACE <IPspace>] - IPspace name

Displays the IPv6 prefixes from the specified IPspace.

[-port {<netport>/<ifgrp>}] - Port

Displays the IPv6 prefixes on the specified port.

[-prefix <IP Address/Mask>] - Prefix

Displays the IPv6 prefixes with the specified prefix value.

[-flag {none/on-link/autonomous/on-link-autonomous}] - Flag

Displays the IPv6 prefixes with the specified flag. The flag indicates whether a prefix is on-link and whether it can be used in autonomous address configuration.

[-valid-lifetime {<unsigned integer>/infinity}] - Valid Lifetime

Displays the IPv6 prefixes having the specified valid lifetime in seconds.

[-preferred-lifetime {<unsigned integer>/infinity}] - Preferred Lifetime

Displays the IPv6 prefixes having the specified preferred lifetime in seconds.

`[-expire-time { [<integer>d][<integer>h][<integer>m][<integer>s] / never / expired }]` - Expire Time

Displays the IPv6 prefixes having the specified expire time.

`[-origin { router-advertise / renumber-request / static / kernel / unknown }]` -

Origin of the Prefix

Displays the IPv6 prefixes with the specified origin.

`[-advertising-router <IP Address>, ...]` - Router that Advertised the Prefix

Displays the IPv6 prefixes which are propagated by the specified router list.

Examples

The following example displays IPv6 prefixes on port e0f.

```
cluster1::*> network ndp prefix show -port e0f -node local

Node: node1
IPspace: Default
Port      Prefix                                Flag                Expire Time
-----
e0f       fd20:8b1e:b255:814e::/64  on-link-autonomous  29d23h56m48s
```

network options commands

The options directory

network options cluster-health-notifications commands

The cluster-health-notifications directory

network options cluster-health-notifications modify

cluster health notification options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command enables or disables cluster health notifications on the specified node.

Parameters

`-node { <nodename> / local }` - Node

This parameter specifies the node for which the cluster health notification status will be modified.

`[-enabled { true / false }]` - Cluster Health Notifications Enabled

Setting this parameter to *true* enables cluster health notification. Setting it to *false* disables cluster health notification.

Examples

The following example modifies the cluster health notification status for a node:

```
cluster1::> network options cluster-health-notifications modify -
node node1 -enabled true
```

network options cluster-health-notifications show

Display cluster health notification options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network options cluster-health-notifications show` command displays whether the node's cluster health notifications are enabled.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

This parameter specifies the node for which the cluster health notification status will be displayed.

[-enabled {true/false}] - Cluster Health Notifications Enabled

Selects the entries that match this parameter value.

Examples

The following example displays the cluster health notification status for a node:

```
cluster1::> network options cluster-health-notifications show -
node node1
Node: node1
Cluster Health Notifications Enabled: true
```

network options detect-switchless-cluster commands

Manage capability to automatically detect switchless cluster configurations

network options detect-switchless-cluster modify

Modify the status of switchless cluster detection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command enables or disables the automatic detection of a switchless cluster. A switchless cluster consists of two nodes where the cluster ports are directly connected without a switch between them.

Parameters**`[-enabled {true/false}] - Enable Switchless Cluster Detection`**

This parameter specifies whether switchless cluster detection is enabled or not. Setting this parameter to *true* enables switchless cluster detection.

Examples

```
The following example enables switchless cluster detection:
cluster1::*> network options detect-switchless-cluster modify -
enabled true
```

network options detect-switchless-cluster show

Display the status of switchless cluster detection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network options detect-switchless-cluster show command displays whether switchless cluster detection is enabled.

Examples

```
The following example displays whether switchless cluster detection
is enabled:
cluster1::*> network options detect-switchless-cluster show
Enable Detect Switchless Cluster: true
```

network options ipv6 commands

The ipv6 directory

network options ipv6 modify

Modify IPv6 options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command sets the state of IPv6 options for the cluster.

Parameters**`[-enabled [true]] - IPv6 Enabled`**

Setting this parameter to *true* enables IPv6 for the cluster. IPv6 cannot be disabled once it is enabled for the cluster. Call technical support for guidance regarding disabling IPv6.

`[-is-ra-processing-enabled {true/false}] - Router Advertisement (RA)`**Processing Enabled**

Setting this parameter to *true* enables cluster to process IPv6 router advertisements. Setting it to *false* disables router advertisement processing by the cluster.

Examples

```

The following example enables IPv6 for the cluster:
cluster1::> network options ipv6 modify -enabled true

The following example enables IPv6 Router Advertisement processing for the
cluster:
cluster1::> network options ipv6 modify -is-ra-processing-enabled true

The following example disables IPv6 Router Advertisement processing for the
cluster:
cluster1::> network options ipv6 modify -is-ra-processing-enabled false

```

network options ipv6 show

Display IPv6 options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of IPv6 options for the cluster.

Examples

```

cluster1::> network options ipv6 show

IPv6 Enabled: false
Router Advertisement (RA) Processing Enabled: false

```

network options load-balancing commands

The network options load-balancing directory

network options load-balancing modify

Modify load balancing algorithm

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command sets the state of geometric mean algorithm for load balancing

Parameters

[-enable {true/false}] - Geometric Mean Algorithm for load balancing

Setting this parameter to *true* enables the geometric mean algorithm for load balancing. Setting it to *false* disables the geometric mean algorithm for the cluster.

Examples

```

load      The following example will enable the geometric mean algorithm for
          balancing.
          cluster1::> network options load-balancing modify -enable true

          The following example will disable the geometric mean algorithm for

```

```
load
    balancing.
cluster1::> network options load-balancing modify -enable false
```

network options load-balancing show

Display load balancing algorithm

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the use of geometric mean load balancing algorithm.

Examples

```
cluster1::> network options load-balancing show

Geometric Mean Algorithm for load balancing: false
```

network options multipath-routing commands

The multipath-routing directory

network options multipath-routing modify

Modify multipath-routing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network options multipath-routing modify` command is used to modify cluster-wide multipath routing configuration.

Parameters

`[-is-enabled {true/false}] - Is Multipath Routing Enabled`

This parameter specifies whether multipath routing configuration is enabled or not. Setting this parameter to *true* enables multipath routing for all nodes in the cluster.

Examples

```
cluster1::> network options multipath-routing modify -is-enabled true
```

network options multipath-routing show

Display multipath-routing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network options multipath-routing show` command displays the multipath routing configuration for the cluster.

Examples

```
cluster1::> network options multipath-routing show
Is Multipath Routing Enabled: false
```

network options port-health-monitor commands

Manage port health monitor

network options port-health-monitor disable-monitors

Disable one or more port health monitors

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command disables the given port health monitors for the given IPspaces in the cluster.

Parameters

-ipspace <IPspace> - IPspace Name

The name of the IPspace for which the specified port health monitors are disabled.

-health-monitors { l2-reachability/link-flapping/crc-errors/vswitch-link}, ... - List of Port Health Monitors to Disable

The port health monitors to disable.

Examples

The following example disables the "l2_reachability" health monitor for the "Default" IPspace.

Note: The status of the "link_flapping" monitor is unaffected by the command.

```
cluster1::*> network options port-health-monitor show

IPspace      Enabled Port Health Monitors
-----
Cluster      l2_reachability,
              link_flapping
Default      l2_reachability,
              link_flapping
2 entries were displayed.

cluster1::*> network options port-health-monitor disableMonitors -ipspace
Default -health-monitors l2_reachability

cluster1::*> network options port-health-monitor show

IPspace      Enabled Port Health Monitors
-----
Cluster      l2_reachability,
              link_flapping
Default      link_flapping
2 entries were displayed.
```

network options port-health-monitor enable-monitors

Enable one or more port health monitors

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command enables the given port health monitors for the given IPspaces in the cluster.

Parameters

-ipSPACE <IPspace> - IPspace Name

The name of the IPspace for which the specified port health monitors are enabled.

-health-monitors { l2-reachability/link-flapping/crc-errors/vswitch-link}, ... - List of Port Health Monitors to Enable

The port health monitors to enable. Upon enabling the *l2_reachability* health monitor, it runs in an "unpromoted" state. While in this state, the monitor does not mark any ports as unhealthy due to the *l2_reachability* health check. The monitor is promoted in the "Cluster" IPspace when the "Cluster" broadcast domain is found to have passed the *l2_reachability* health check. An EMS event called "vifmgr.hm.promoted" event is generated when the health monitor is promoted for the IPspace.

Examples

The following example enables the "l2_reachability" health monitor for the "Default" IPspace:

Note: The status of the "link_flapping" monitor is unaffected by the command.

```
cluster1::*> network options port-health-monitor show

IPspace           Enabled Port Health Monitors
-----
Cluster           l2_reachability,
                  link_flapping
Default           link_flapping
2 entries were displayed.

cluster1::*> network options port-health-monitor enableMonitors -ipSPACE
Default -health-monitors l2_reachability

cluster1::*> network options port-health-monitor show

IPspace           Enabled Port Health Monitors
-----
Cluster           l2_reachability,
                  link_flapping
Default           l2_reachability,
                  link_flapping
2 entries were displayed.
```

network options port-health-monitor modify

Modify port health monitors configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the enabled port health monitors for the given IPspaces in the cluster.

Parameters

-ipSPACE <IPspace> - IPspace Name

The name of the IPspace for which enabled port health monitors are modified.

`[-health-monitors { l2-reachability/link-flapping/crc-errors/vswitch-link}, ...] - List of Enabled Port Health Monitors`

All of the port health monitors that you want to enable. This command enables any port health monitors in this list that are currently disabled, and it disables any currently enabled monitors that are not in this list. Upon enabling the *l2_reachability* health monitor, it runs in an "unpromoted" state. While in this state, the monitor does not mark any ports as unhealthy due to the *l2_reachability* health check. The monitor is promoted in the "Cluster" IPspace when the "Cluster" broadcast domain is found to have passed the *l2_reachability* health check. An EMS event called "vifmgr.hm.promoted" event is generated when the health monitor is promoted for the IPspace.

Examples

The following example modifies the port health monitor configuration of the "Default" IPspace such that only the "link_flapping" port health monitor is enabled. enabled for all IPspaces in the cluster.

Note: Only the specified monitor is enabled after the modify command is issued.

```
cluster1::*> network options port-health-monitor show

IPspace      Enabled Port Health Monitors
-----
Cluster      l2_reachability,
              link_flapping
Default      l2_reachability,
              link_flapping
2 entries were displayed.

cluster1::*> network options port-health-monitor modify -ip-space Default -
health-monitors link_flapping

cluster1::*> network options port-health-monitor show

IPspace      Enabled Port Health Monitors
-----
Cluster      l2_reachability,
              link_flapping
Default      link_flapping
2 entries were displayed.
```

network options port-health-monitor show

Display port health monitors configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the enabled port health monitors for the IPspaces in the cluster.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the **`-fields <fieldname>, ...`** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance]`

If you specify the **`-instance`** parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - IPspace Name

Displays the port health monitors that are enabled only for the given IPspace name.

[-health-monitors {l2-reachability/link-flapping/crc-errors/vswitch-link}, ...] - List of Enabled Port Health Monitors

Displays the IPspaces that have the given monitors enabled.

Examples

The following example lists all port health monitors that are enabled for all IPspaces in the cluster.

```
cluster1::*> network options port-health-monitor show

IPspace           Enabled Port Health Monitors
-----
Cluster           l2_reachability,
                  link_flapping
Default           l2_reachability,
                  link_flapping
2 entries were displayed.
```

network options send-soa commands

Manage Send Start of Authority settings

network options send-soa modify

Modify Send SOA settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command sets the status of sending statement of authority record in the DNS response.

Parameters**[-enable {true/false}] - Enable sending SOA**

Setting this parameter to *true* enables sending the statement of authority (SOA) record in the DNS response. Setting it to *false* disables sending the statement of authority (SOA) record in the DNS response for the cluster.

Examples

```
The following example will enable the sending of statement of
authority (SOA)
in the DNS response.
cluster1::> network options send-soa modify -enable true

The following example will disable the sending of statement of
authority (SOA)
in the DNS response.
cluster1::> network options send-soa modify -enable false
```

network options send-soa show

Display Send SOA settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays whether sending the statement of authority record (SOA) in the DNS response is enabled or not.

Examples

```
cluster1::> network options send-soa show

Enable sending SOA: true
```

network options switchless-cluster commands

Manage switchless cluster options

network options switchless-cluster modify

Modify switchless cluster network options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command sets whether the cluster network is in switchless or switched mode. A switchless cluster is physically formed by connecting two nodes back-to-back, without a switch between them.

Parameters

[-enabled { *true/false* }] - Enable Switchless Cluster

This parameter specifies whether the switchless cluster is enabled or not. Setting this parameter to *true* enables the switchless cluster.

Examples

```
The following example enables the switchless cluster:
cluster1::*> network options switchless-cluster modify -enabled true
```

network options switchless-cluster show

Display switchless cluster network options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network options switchless-cluster show command displays the attributes of a switchless cluster.

Examples

```
The following example displays the attributes of the switchless
cluster:
cluster1::*> network options switchless-cluster show
Enable Switchless Cluster: true
```

network port commands

Manage network ports

network port delete

Delete a network port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network port delete` command deletes a network port that is no longer physically present on the storage system.

Parameters

-node {<nodename>/local} - Node

This specifies the node on which the port is located.

-port {<netport>/<ifgrp>} - Port

This specifies the port to delete.

Examples

The following example deletes port e0c from a node named node0. The command works only when the port does not physically exist on the storage system.

```
cluster1::*> network port delete -node node0 -port e0c
```

network port modify

Modify network port attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port modify` command enables you to change the maximum transmission unit (MTU) setting, autonegotiation setting, administrative duplex mode, and administrative speed of a specified network port.

The MTU of ports that belong to broadcast-domains must be updated through the `broadcast-domain modify` command.

Modification of a port's IPspace will only work before a node is added to a cluster, when the cluster version is below Data ONTAP 8.3, or when the node is offline. To change the IPspace of a port once the node is in a Data ONTAP 8.3 cluster, the port should be added to a broadcast-domain that belongs to that IPspace.

Parameters

-node {<nodename>/local} - Node

Use this parameter to specify the node on which the port is located.

-port {<netport>/<ifgrp>} - Port

Use this parameter to specify the port that you want to modify.

[-mtu <integer>] - MTU

The port's MTU setting. The default setting for ports in the "Cluster" IPspace is 9000 bytes. All other ports use a default value of 1500 bytes.

[-autonegotiate-admin {true/false}] - Auto-Negotiation Administrative

Whether the port uses Ethernet autonegotiation to determine the highest speed and duplex mode that the port and its endpoint can support. The default setting when you create a port is **true**.

[-duplex-admin {auto/half/full}] - Duplex Mode Administrative

The administrative setting for the port's duplex mode. This is the duplex mode that you prefer the port to use. Depending on network limitations, the operational value can be different from the administrative setting. The default setting when you create a port is **full**.

[-speed-admin {auto/10/100/1000/10000/100000/40000/25000}] - Speed Administrative

The administrative speed setting, in megabits per second. This is the speed setting that you prefer the port to use. Depending on network limitations, the operational value can be lower than the administrative setting.

[-flowcontrol-admin {none/receive/send/full}] - Flow Control Administrative

The administrative flow control setting of the port. this is the flow control setting that you prefer the port to use. Depending on network and port limitations, the operational value can be different from the administrative setting.

[-up-admin {true/false}] - Up Administrative (privilege: advanced)

The administrative state of the port. If set to **true**, the port is used if it is operational. If set to **false**, the port is configured down.

[-ipspace <IPspace>] - IPspace Name

Use this parameter to specify the IPspace the network port is assigned to. Modification of a port's IPspace will only work before a node is added to a cluster, when the cluster version is below Data ONTAP 8.3, or when the node is offline. To change the IPspace of a port once the node is in a Data ONTAP 8.3 cluster, the port should be added to a broadcast-domain that belongs to that IPspace. If there is an inconsistency between the broadcast-domain and IPspace, this parameter can be set to bring the IPspace into alignment with the broadcast-domain.

[-ignore-health-status {true/false}] - Ignore Port Health Status (privilege: advanced)

Use this parameter to specify that the system ignore network port health status of the specified port for the purpose of hosting a logical interface.

Examples

The following example modifies port e0a on a node named node0 not to use auto-negotiation, to preferably use half duplex mode, and to preferably run at 100 Mbps.

```
cluster1::> network port modify -node node0 -port e0a -autonegotiate-admin
false -duplex-admin half -speed-admin 100
```

network port show

Display network port attributes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network port show` command displays information about network ports. The command output indicates any inactive links, and lists the reason for the inactive status.

Some parameters can have "administrative" and "operational" values. The administrative setting is the preferred value for that parameter, which is set when the port is created or modified. The operational value is the actual current value of that parameter. For example, if the network is underperforming due to network problems, the operational speed value can be lower than the administrative setting.

If the operational duplex mode and speed of a port cannot be determined (for instance, if the link is down), that port's status is listed as *undef*, meaning undefined.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-health]

Use this parameter to display detailed health information for the specified network ports.

| [-instance {}]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the network ports that match this parameter value. Use this parameter with the **-port** parameter to select a port.

[-port {<netport>/<ifgrp>}] - Port

Selects the network ports that match this parameter value. If you do not use this parameter, the command displays information about all network ports.

[-link {off/up/down}] - Link

Selects the network ports that match this parameter value.

[-mtu <integer>] - MTU

Selects the network ports that match this parameter value.

[-autonegotiate-admin {true/false}] - Auto-Negotiation Administrative

Selects the network ports that match this parameter value.

[-autonegotiate-oper {true/false}] - Auto-Negotiation Operational

Selects the network ports that match this parameter value.

[-duplex-admin {auto/half/full}] - Duplex Mode Administrative

Selects the network ports that match this parameter value.

[-duplex-oper {auto/half/full}] - Duplex Mode Operational

Selects the network ports that match this parameter value.

[-speed-admin {auto/10/100/1000/10000/100000/40000/25000}] - Speed Administrative

Selects the network ports that match this parameter value.

[-speed-oper {auto/10/100/1000/10000/100000/40000/25000}] - Speed Operational

Selects the network ports that match this parameter value.

[-flowcontrol-admin {none/receive/send/full}] - Flow Control Administrative

Selects the network ports that match this parameter value.

[-flowcontrol-oper {none/receive/send/full}] - Flow Control Operational

Selects the network ports that match this parameter value.

[-mac <MAC Address>] - MAC Address

Selects the network ports that match this parameter value.

[-up-admin {true/false}] - Up Administrative (privilege: advanced)

Selects the network ports that match this parameter value.

[-type {physical/if-group/vlan/vip}] - Port Type

Selects the network ports that match this parameter value.

[-ifgrp-node <nodename>] - Interface Group Parent Node

Selects the network ports that match this parameter value.

[-ifgrp-port {<netport>/<ifgrp>}] - Interface Group Parent Port

Selects the network ports that match this parameter value.

[-ifgrp-distr-func {mac/ip/sequential/port}] - Distribution Function

Selects the network ports that match this parameter value.

[-ifgrp-mode {multimode/multimode_lacp/singlemode}] - Create Policy

Selects the network ports that match this parameter value.

[-vlan-node <nodename>] - Parent VLAN Node

Selects the network ports that match this parameter value.

[-vlan-port {<netport>/<ifgrp>}] - Parent VLAN Port

Selects the network ports that match this parameter value.

[-vlan-tag <integer>] - VLAN Tag

Selects the network ports that match this parameter value.

[-remote-device-id <text>] - Remote Device ID

Selects the network ports that match this parameter value.

[-ipspace <IPspace>] - IPspace Name

Use this parameter to display information only about the ports that match the IPspace you specify.

[-broadcast-domain <Broadcast Domain>] - Broadcast Domain

Use this parameter to display information only about the ports that match the broadcast-domain you specify.

[-mtu-admin <integer>] - MTU Administrative

Selects the network ports that match this parameter value.

[-health-status {healthy/degraded}] - Port Health Status

Use this parameter to display information only about the ports that match the health-status you specify.

[-ignore-health-status {true/false}] - Ignore Port Health Status

Use this parameter to display information only about the ports that match the ignore-health-status you specify.

`[-health-degraded-reasons {l2-reachability/link-flapping/crc-errors/vswitch-link}, ...] - Port Health Degraded Reasons`

Use this parameter to display information only about the ports that match the degraded-reason you specify.

`[-vm-network-name <text>] - Virtual Machine Network Name`

Use this parameter to display information only about the ports that match the network name you specify. Google Cloud Platform only.

Examples

The following example displays information about all network ports.

```
cluster1::> network port show

Node: node1
```

Port	IPspace	Broadcast	Domain	Link	MTU	Speed(Mbps) Admin/Oper	Health Status	Ignore Health Status
e0a	Cluster	Cluster		up	9000	auto/1000	healthy	false
e0b	Cluster	Cluster		up	9000	auto/1000	healthy	false
e0c	Default	Default		up	1500	auto/1000	degraded	false
e0d	Default	Default		up	1500	auto/1000	degraded	true

```

Node: node2
```

Port	IPspace	Broadcast	Domain	Link	MTU	Speed(Mbps) Admin/Oper	Health Status	Ignore Health Status
e0a	Cluster	Cluster		up	9000	auto/1000	healthy	false
e0b	Cluster	Cluster		up	9000	auto/1000	healthy	false
e0c	Default	Default		up	1500	auto/1000	healthy	false
e0d	Default	Default		up	1500	auto/1000	healthy	false

```

8 entries were displayed.
```

The following example displays health information about all network ports.

```
cluster1::> network port show -health
```

Node	Port	Link	Health Status	Ignore Health Status	Degraded Reasons
node1	e0a	up	healthy	false	-
	e0b	up	healthy	false	-
	e0c	up	degraded	false	l2_reachability, link_flapping
	e0d	up	degraded	false	l2_reachability
node2	e0a	up	healthy	false	-
	e0b	up	healthy	false	-
	e0c	up	healthy	false	-
	e0d	up	degraded	false	-

```

8 entries were displayed.
```

network port show-address-filter-info

Print the port's address filter information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port show-address-filter-info` command displays information about the port's address filter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

-node <nodename> - Node

Use this parameter to specify the node.

-port {<netport>/<ifgrp>} - Port

Use this parameter to specify the port. For example, e0c.

[-num-total <integer>] - Total Number Of Entries

Use this parameter to specify the total number of entries.

[-num-used <integer>] - Number Of Used Entries

Use this parameter to specify the number of used entries.

[-used-entries <text>, ...] - The Used Entries

Use this parameter to list the used entries.

Examples

The following example displays information of the given port's address filter on the specified node of the cluster.

```
cluster1::*> network port show-address-filter-info -node local -port e0c
```

```
Node: node1
Port      Total Number  Number of  Used Address
Name      of Address      Used Address  Filter Entries
-----
e0c              1328           3      U 0 a0 98 40 e 6
                                     M 1 80 c2 0 0 e
                                     M 1 0 5e 0 0 fb
```

Manage broadcast domains

Manage broadcast domains

Network port broadcast-domain commands. A broadcast domain object is used to define a layer 2 broadcast domain network configuration. It is used to group the ports which belong to the same layer 2 network.

network port broadcast-domain add-ports

Add ports to a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Add ports to a broadcast domain.

Note: The IPspace of the ports added will be updated to the IPspace of the broadcast-domain. The ports will be added to the failover-group of the broadcast-domain. The MTU of the ports will be updated to the MTU of the broadcast-domain.

Parameters

-ipSPACE <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The broadcast domain for this port assignment.

-ports <<node>:<port>>, ... - List of ports

The ports to be added to this broadcast domain.

Examples

The following example adds the port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" to broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> add-ports -ipSPACE Default -
broadcast-domain mgmt -ports cluster1-1:e0d, cluster1-2:e0d
```

network port broadcast-domain create

Create a new layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Create a new broadcast domain.

Note: The IPspace of the ports added will be updated to the IPspace of the broadcast-domain. A failover-group will be generated containing the ports of the broadcast-domain. The MTU of all of the ports in the broadcast-domain will be updated to the MTU specified for the broadcast-domain.

Parameters

[-ipSPACE <IPspace>] - IPspace Name

The IPspace to which the new broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain to be created. The name of the broadcast domain needs to be unique within the IPspace.

-mtu <integer> - Configured MTU

MTU of the broadcast domain.

[-ports <<node>:<port>>, ...] - Ports

The network ports to be added to the broadcast domain. Ports need to be added to the broadcast domain before interfaces can be hosted on the port. By default, no port will be added to the broadcast domain.

Examples

The following example creates broadcast domain "mgmt" in IPspace "Default" with an MTU of 1500 and network ports e0c from node "gx1" and node "gx2".

```
cluster1::> network port broadcast-domain create -ipspace Default -broadcast-domain mgmt -mtu 1500 -ports gx1:e0c,gx2:e0c
```

network port broadcast-domain delete

Delete a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete a broadcast domain that contains no ports.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain to be deleted.

Examples

The following example deletes the broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> delete -ipspace Default -broadcast-domain mgmt
```

network port broadcast-domain merge

Merges two layer 2 broadcast domains

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Merges a broadcast domain into an existing broadcast domain.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The merging broadcast domain.

-into-broadcast-domain <Broadcast Domain> - Merge with This Layer 2 Broadcast Domain

The target broadcast domain for the merge operation.

Examples

The following example merges broadcast domain "bd-mgmt" in IPspace "Default" to broadcast domain "bd-data".

```
cluster1::network port broadcast-domain> merge -ipspace Default -broadcast-domain bd-mgmt -into-broadcast-domain bd-data
```

network port broadcast-domain modify

Modify a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Modify a broadcast domain.

Parameters

-ipSPACE <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain.

[-mtu <integer>] - Configured MTU

MTU of the broadcast domain.

Examples

The following example modifies the mtu attribute of broadcast domain "mgmt" in IPspace "Default" to 1500

```
cluster1::network port broadcast-domain*> modify -ipSPACE Default -broadcast-domain mgmt -mtu 1500
```

network port broadcast-domain remove-ports

Remove ports from a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Remove port assignments from a broadcast domain.

Parameters

-ipSPACE <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The broadcast domain of the ports.

-ports <<node>:<port>>, ... - List of ports

The ports to removed from the broadcast-domain.

Examples

The following example removes port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" from broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> remove-ports -ipSPACE Default -broadcast-domain mgmt -ports cluster1-1:e0d, cluster1-2:e0d
```

network port broadcast-domain rename

Rename a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Rename a broadcast domain.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain.

-new-name <text> - New Name

The new name of the broadcast domain.

Examples

The following example renames the broadcast domain named "mgmt" to "mgmt2" in IPspace "Default".

```
cluster1::network port broadcast-domain> rename -ipspace Default -broadcast-domain mgmt -new-name mgmt2
```

network port broadcast-domain show

Display layer 2 broadcast domain information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display broadcast domain information.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - IPspace Name

Selects the broadcast domains that match the IPspace name.

[-broadcast-domain <Broadcast Domain>] - Layer 2 Broadcast Domain

Selects the broadcast domains that match the broadcast domain name.

[-mtu <integer>] - Configured MTU

Selects the broadcast domains that match the MTU value. This field is the MTU that was configured by the user, which might be different from the operational MTU.

[-ports <<node>:<port>>, ...] - Ports

Selects the broadcast domains that contain the network ports. For example, node1:e0a will display broadcast domains that contain node1:e0a network port.

[-port-update-status {complete/in-progress/error/overridden-while-offline}, ...] - Port Update Status

Selects the broadcast domains that contain the network port status. For example, specifying "error" will display broadcast domains that contain "Error" network port status.

[-port-update-status-details <text>, ...] - Status Detail Description

Selects the broadcast domains that contain the network port status detail text.

[-port-update-status-combined {complete/in-progress/error/overridden-while-offline}] - Combined Port Update Status

Selects the broadcast domains that contain the combined network port status. For example, specifying "error" will display broadcast domains that contain a combined network port status of "Error".

[-failover-groups <failover-group>, ...] - Failover Groups

Selects the broadcast domains that contain the failover groups.

[-subnet-names <subnet name>, ...] - Subnet Names

Selects the broadcast domains that contain the subnet name or names.

[-is-vip {true/false}] - Is VIP Broadcast Domain

Selects the broadcast domains that match a specific "is-vip" flag. Specifying "true" matches only broadcast domains associated with the Virtual IP feature; "false" matches only broadcast domains that do not.

Examples

The following example displays general information about broadcast domains.

```
cluster1:> network port broadcast-domain show
IPspace Broadcast
Name      Domain Name      MTU    Port List      Update
-----

```

network port broadcast-domain split

Splits a layer 2 broadcast domain into two layer 2 broadcast domains.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Splits ports from a broadcast domain into a new broadcast domain.

The following restrictions apply to this command:

- If the ports are in a failover group, all ports in the failover group must be provided. Use [network interface failover-groups show](#) to see which ports are in failover groups.
- If the ports have LIFs associated with them, the LIFs cannot be part of a subnet's ranges and the LIF's **curr-port** and **home-port** must both be provided. Use [network interface show -](#)

fields *subnet-name, home-node, home-port, curr-node, curr-port* to see which ports have LIFs associated with them and whether the LIFs are part of a subnet's ranges. Use [network subnet remove-ranges](#) with the LIF's IP address and **-force-update-lif-associations** set to *true* to remove the LIF's association with a subnet.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The broadcast domain to split.

-new-broadcast-domain <Broadcast Domain> - New Layer 2 Broadcast Domain Name

The new broadcast domain.

-ports <<node>:<port>>, ... - List of Ports

The ports to be split from this broadcast domain.

Examples

The following example splits port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" from broadcast domain "bd-mgmt" in IPspace "Default" to broadcast domain "bd-data".

```
cluster1::> network port broadcast-domain split -ipspace Default -broadcast-domain bd-mgmt -new-broadcast-domain bd-data -ports cluster1-1:e0d, cluster1-2:e0d
```

network port ifgrp commands

The network port ifgrp directory

network port ifgrp add-port

Add a port to an interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp add-port` command adds a network port to a port interface group. The port interface group must already exist. You can create a port interface group by using the [network port ifgrp create](#) command.

The following restrictions apply to port interface groups:

- A port that is already a member of a port interface group cannot be added to another port interface group.
- Cluster ports and management ports cannot be in a port interface group.
- A port to which a logical interface is already bound cannot be added to a port interface group.

- A port that already has an assigned failover role cannot be added to a port interface group.
- A VLAN port cannot be added to a port interface group.
- A port which attaches to a VLAN cannot be added to a port interface group.
- An interface group port cannot be added to a port interface group.
- A port that is assigned to a broadcast domain cannot be added to a port interface group.
- All ports in a port interface group must be physically located on the same node.

Parameters

-node {<nodename>/local} - Node

The node on which the port interface group is located.

-ifgrp <ifgrp name> - Interface Group Name

The port interface group to which a port is to be added.

-port <netport> - Specifies the name of port.

The network port that is to be added to the port interface group.

Examples

The following example adds port e0c to port interface group ala on a node named node1:

```
cluster1::> network port ifgrp add-port -node node1 -ifgrp ala -port e0c
```

Related references

[network port ifgrp create](#) on page 470

network port ifgrp create

Create a port interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp create` command creates a port interface group. See the documentation for the [network port ifgrp add-port](#) command for a list of restrictions on creating port interface groups.

Parameters

-node {<nodename>/local} - Node

The node on which the port interface group will be created.

-ifgrp <ifgrp name> - Interface Group Name

The name of the port interface group that will be created. Port interface groups must be named using the syntax "a<number><letter>", where <number> is an integer in the range [0-999] without leading zeros and <letter> is a lowercase letter. For example, "a0a", "a0b", "a1c", and "a2a" are all valid port interface group names.

-distr-func {mac/ip/sequential/port} - Distribution Function

The distribution function of the port interface group that will be created. Valid values are:

- `mac` - Network traffic is distributed based on MAC addresses

- `ip` - Network traffic is distributed based on IP addresses
- `sequential` - Network traffic is distributed in round-robin fashion from the list of configured, available ports
- `port` - Network traffic is distributed based on the transport layer (TCP/UDP) ports

-mode {*multimode/multimode_lacp/singlemode*} - Create Policy

The create policy for the interface group that will be created. Valid values are:

- `multimode` - Bundle multiple member ports of the interface group to act as a single trunked port
- `multimode_lacp` - Bundle multiple member ports of the interface group using Link Aggregation Control Protocol
- `singlemode` - Provide port redundancy using member ports of the interface group for failover

Examples

The following example creates a port interface group named `a0a` on node `node0` with a distribution function of `ip`:

```
cluster1::> network port ifgrp create -node node0 -ifgrp a0a -distr-func ip -
mode multimode
```

[network port ifgrp add-port](#) on page 469

network port ifgrp delete

Destroy a port interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp delete` command destroys a port interface group.

Note: When you delete an interface group port, it is automatically removed from failover rules and groups to which it belongs.

Parameters

-node {<nodename>/local} - Node

The node on which the port interface group is located.

-ifgrp <ifgrp name> - Interface Group Name

The port interface group that will be deleted.

Examples

The following example deletes port interface group `a0b` from a node named `node0`.

```
cluster1::> network port ifgrp delete -node node0 -ifgrp a0b
```

network port ifgrp remove-port

Remove a port from an interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp remove-port` command removes a network port from a port interface group.

Parameters

-node {<nodename>/local} - Node

The node on which the port interface group is located.

-ifgrp <ifgrp name> - Interface Group Name

The port interface group from which a port will be removed.

-port <netport> - Specifies the name of port.

The network port that will be removed from the port interface group.

Examples

The following example removes port e0d from port interface group ala on a node named nodel:

```
cluster1::> network port ifgrp remove-port -node nodel -ifgrp ala -port e0d
```

network port ifgrp show

Display port interface groups

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp show` command displays information about port interface groups. By default, it displays information about all port interface groups on all nodes in the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the port interface groups that match this parameter value. Use this parameter with the **-ifgrp** parameter to select information about a specific port interface group.

[-ifgrp <ifgrp name>] - Interface Group Name

Selects the port interface groups that match this parameter value. Use this parameter with the **-node** parameter, to select information about a specific port interface group.

[-distr-func {*mac/ip/sequential/port*}] - Distribution Function

Selects the port interface groups that match this parameter value.

[-mode {*multimode/multimode_lacp/singlemode*}] - Create Policy

Selects the port interface groups that match this parameter value.

[-mac <MAC Address>] - MAC Address

Selects the port interface groups that match this parameter value.

[-activeports {*full/partial/none*}] - Port Participation

Selects the port interface groups that match this parameter value. The value "partial" indicates that some but not all of the port interface group's ports are active. the value "full" indicates that all of the port interface group's ports are active.

[-ports {<netport>/<ifgrp>}, ...] - Network Ports

Selects the port interface groups that match this parameter value.

[-up-ports {<netport>/<ifgrp>}, ...] - Up Ports

Selects the port interface groups that match this parameter value. Displays only the ports that are up.

[-down-ports {<netport>/<ifgrp>}, ...] - Down Ports

Selects the port interface groups that match this parameter value. Displays only the ports that are down.

Examples

The following example displays information about all port interface groups.

```
cluster1::> network port ifgrp show
```

Node	Port ifgrp	Distribution Function	MAC Address	Active Ports	Ports
node0	a0a	ip	b8:f8:7a:20:00	partial	e0c
node1	ala	ip	07:26:60:02:00	full	e0d

network port vip commands

Manage VIP ports

network port vip create

Create a VIP port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network port vip create` command creates a VIP port in the specified IPspace on the specified node. Only one VIP port can be created per IPspace on the given node.

Parameters**-node {<nodename>/local} - Node**

The node where the VIP port should be created.

-port <netport> - Network Port

The name of the VIP port to be created in the format v<slot-number><port-letter>

-ipSPACE <IPSPACE> - IPspace Name

The IPspace where the VIP port should be created. The default value for this parameter is "Default", which identifies the default IPspace.

Examples

This example shows how to create a VIP port named v0a in ipSPACE ips on node1.

```
cluster1::> network port vip create -node node1 -port v0a -ipSPACE ips
```

network port vip delete

Delete a VIP port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network port vip delete` command deletes a VIP port.

Parameters**-node {<nodename>/local} - Node**

The node associated with the VIP port to be deleted.

-port <netport> - Network Port

The name of the VIP port to be deleted.

Examples

This example shows how to delete VIP Port v0a on node1.

```
cluster1::> network port vip delete -node node1 -port v0a
```

network port vip show

Display VIP ports

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vip show` command displays information about VIP ports.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

This parameter selects the VIP ports that match the specified node.

[-port <netport>] - Network Port

This parameter selects the VIP ports that match the specified port.

[-ipspace <IPspace>] - IPspace Name

This parameter selects the VIP ports that match the specified IPspace.

Examples

The example below shows VIP port v0a is created in IPspace ips on node1.

```
cluster1::> network port vip show
Node   VIP Port IPspace
-----
node1  v0a     ips
```

network port vlan commands

The network port vlan directory

network port vlan create

Create a virtual LAN (VLAN)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vlan create` command attaches a VLAN to a network port on a specified node.

Parameters

-node {<nodename>/local} - Node

The node to which the VLAN is to be attached.

Note: You cannot attach a VLAN to a cluster port.

{ -vlan-name {<netport>/<ifgrp>} - VLAN Name

The name of the VLAN that is to be attached. This name should be a combination of the name of the port or interface group and the VLAN ID, with a hyphen between, such as "e1c-80".

| -port {<netport>/<ifgrp>} - Associated Network Port

The network port to which the VLAN is to be attached.

-vlan-id <integer>} - Network Switch VLAN Identifier

The ID tag of the created VLAN.

Examples

This example shows how to create VLAN e1c-80 attached to network port e1c on node1.

```
cluster1::> network port vlan create -node node1 -vlan-name e1c-80
```

network port vlan delete

Delete a virtual LAN (VLAN)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vlan delete` command deletes a VLAN from a network port.

Note: When you delete a VLAN port, it is automatically removed from all failover rules and groups that use it.

Parameters

-node {<nodename>/local} - Node

The node from which the VLAN is to be deleted.

{ -vlan-name {<netport>/<ifgrp>} - VLAN Name

The name of the VLAN that is to be deleted

| -port {<netport>/<ifgrp>} - Associated Network Port

The network port to which the VLAN is to be attached.

-vlan-id <integer>} - Network Switch VLAN Identifier

The ID tag of the deleted VLAN.

Examples

This example shows how to delete VLAN e1c-80 from network port e1c on node1.

```
cluster1::> network port vlan delete -node node1 -vlan-name e1c-80
```

network port vlan show

Display virtual LANs (VLANs)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vlan show` command displays information about network ports that are attached to VLANs. The command output indicates any inactive links and lists the reason for the inactive status.

If the operational duplex mode and speed cannot be determined (for instance, if the link is down), they are listed as **undef**, meaning undefined.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the VLAN network ports that match this parameter value.

{ [-vlan-name {<netport>/<ifgrp>}] - VLAN Name

Selects the VLAN network ports that match this parameter value.

| [-port {<netport>/<ifgrp>}] - Associated Network Port

Selects the VLAN network ports that match this parameter value. If neither this parameter nor **-name** are used, the command displays information about all network ports.

[-vlan-id <integer>] - Network Switch VLAN Identifier

Selects the VLAN network ports that match this parameter value.

[-mac <MAC Address>] - MAC address

Selects the VLAN network ports that match this parameter value.

Examples

```
cluster1::> network port vlan show
              Network Network
Node  VLAN Name Port  VLAN ID  MAC Address
-----
node1  e1b-70   e1b    70      00:15:17:76:7b:69
```

network qos-marking commands

The qos-marking directory

network qos-marking modify

Modify the QoS marking values

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network qos-marking modify` command modifies the QoS marking values for different protocols, for each IPspace.

Parameters**-ipspace <IPspace> - IPspace name**

Use this parameter to specify the IPspace for which the QoS marking entry is to be modified.

-protocol <text> - Protocol

Use this parameter to specify the protocol for which the QoS marking entry is to be modified. The possible values are NFS, CIFS, iSCSI, SnapMirror, SnapMirror-Sync, NDMP, FTP, HTTP-admin, HTTP-filesrv, SSH, Telnet, and SNMP.

[-dscp <integer>] - DSCP Marking Value

Use this parameter to specify the DSCP value. The possible values are 0 to 63.

[-is-enabled {true/false}] - Is QoS Marking Enabled

Use this parameter to enable or disable the QoS marking for the specified protocol and IPspace.

Examples

The following example modifies the QoS marking entry for the NFS protocol in the Default IPspace:

```
cluster1::> network qos-marking modify -ipspace Default -protocol NFS -dscp
10 -is-enabled true
```

network qos-marking show

Display the QoS marking values

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network qos-marking show` command displays the QoS marking values for different protocols, for each IPspace.

Parameters

{ [-fields <fieldname>, ...]

Use this parameter to display only certain fields of the QoS marking table.

| [-instance]}

Use this parameter to display all the fields of the QoS marking table.

[-ipspace <IPspace>] - IPspace name

Use this parameter to display the QoS marking entries for the specified IPspace.

[-protocol <text>] - Protocol

Use this parameter to display the QoS marking entries for the specified protocol. The possible values are NFS, CIFS, iSCSI, SnapMirror, SnapMirror-Sync, NDMP, FTP, HTTP-admin, HTTP-filesrv, SSH, Telnet, and SNMP.

[-dscp <integer>] - DSCP Marking Value

Use this parameter to display the QoS marking entries matching the specified DSCP value. The possible values are 0 to 63.

[-is-enabled { true/false}] - Is QoS Marking Enabled

Use this parameter to display the QoS marking entries matching the specified flag.

Examples

The following example displays the QoS marking entries for the Default IPspace.

```
cluster1::> network qos-marking show -ipspace Default
IPspace      Protocol      DSCP  Enabled?
-----
Default
              CIFS          10    false
              FTP          48    false
              HTTP-admin   48    false
              HTTP-filesrv 10    false
              NDMP        10    false
              NFS         10    true
              SNMP        48    false
              SSH         48    false
              SnapMirror  10    false
              SnapMirror-Sync 10    false
              Telnet      48    false
              iSCSI       10    false
12 entries were displayed.
```

network route commands

Manage routing tables

Network route commands.

network route create

Create a static route

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route create` command creates a static route within a Vserver.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the route is to be created.

-destination <IP Address/Mask> - Destination/Mask

Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash ("/"), mask. `0.0.0.0/0` is a valid destination value to create default IPv4 route. And `::/0` is a valid destination value to create default IPv6 route

-gateway <IP Address> - Gateway

Use this parameter to specify the IP address of the gateway server leading to the route's destination.

[-metric <integer>] - Metric

Use this parameter to specify the metric of the route.

Examples

The following example creates default routes within Vserver vs0 for IPv4 and IPv6.

```
cluster1::> network route create -vserver vs0 -destination 0.0.0.0/0 -
gateway 10.61.208.1
cluster1::> network route create -vserver vs0 -destination ::/0 -gateway
3ffe:1::1
```

network route delete

Delete a static route

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route delete` command deletes a static route from a Vserver.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the route is to be deleted.

-destination <IP Address/Mask> - Destination/Mask

Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash ("/"), mask. For example, 0.0.0.0/0 is a correctly formatted value for the -destination parameter.

-gateway <IP Address> - Gateway

Use this parameter to specify the gateway on which the route is to be deleted.

Examples

The following example deletes a route within Vserver vs0 for destination 0.0.0.0/0.

```
cluster1::network route delete -vserver vs0 -destination 0.0.0.0/0
```

network route show

Display static routes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route show` command displays a group of static routes within one or more Vservers. You can view routes within specified Vservers, routes with specified destinations, and routes with specified gateways.

Parameters

{ [-fields <fieldname>, ...]

Use this parameter to display only certain fields of the routing tables.

| [-instance]}

Use this parameter to display all fields of the routing tables.

[-vserver <vserver>] - Vserver Name

Use this parameter to display only routes that have the specified Vserver as their origin.

[-destination <IP Address/Mask>] - Destination/Mask

Use this parameter to display only routes that have the specified IP address and subnet mask as their destination. The format for this value is: address, slash ("/"), mask. The example below has 0.0.0.0/0 as a valid value for the -destination parameter.

[-gateway <IP Address>] - Gateway

Use this parameter to display only routes that have the specified IP address as their gateway.

[-metric <integer>] - Metric

Use this parameter to display only routes that have the specified metric.

[-ipspace <IPspace>] - IPspace Name

Use this parameter to optionally specify the IPspace associated with the Vserver. This parameter can be used in conjunction with the Vserver parameter in order to configure the same route across multiple Vservers within an IPspace.

[-address-family { ipv4 / ipv6 / ipv6z }] - Address family of the route

Use this parameter to display only the routes that have the specified address-family.

Examples

The following example displays information about all routing groups.

```
cluster1::> network route show
(network route show)
Server          Destination      Gateway          Metric
-----
node1           0.0.0.0/0       10.61.208.1     20
node2           0.0.0.0/0       10.61.208.1     20
vs0             0.0.0.0/0       10.61.208.1     20
3 entries were displayed.
```

network route show-lifs

Show the Logical Interfaces for each route entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route show-lifs` command displays the association of static routes and Logical Interfaces (LIFs) within one or more Vservers. You can view routes within specified Vservers, routes with specified destinations, and routes with specified gateways.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name

Use this parameter to display only routes that have the specified Vserver as their origin.

[-destination <IP Address/Mask>] - Destination/Mask

Use this parameter to display only routes that have the specified IP address and subnet mask as their destination. The format for this value is: address, slash ("/"), mask. For example, `0.0.0.0/0` is a valid value for the **-destination** parameter.

[-gateway <IP Address>] - Gateway

Use this parameter to display only routes that have the specified IP address as their gateway.

[-lifs <lif-name>, ...] - Logical Interfaces

Use this parameter to display only the routes that are associated with the specified Logical Interfaces (LIFs).

[-address-family { ipv4 / ipv6 / ipv6z }] - Address Family

Use this parameter to display only the routes that belong to specified address family.

network route active-entry commands

Active routes

Dynamic network route commands.

network route active-entry show

Display active routes

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network route active-entry show` command displays installed routes on one or more nodes. You can view routes within specified nodes, within specified Vservers, routes in specified subnet groups, and routes with specified destinations.

Parameters

[`-fields <fieldname>, ...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-verbose`]

Use this parameter to display the reference count, use, interface, and Path MTU fields.

[`-instance`]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver>`] - Vserver Name

Displays the routes that have the specified Vserver as their origin.

[`-node {<nodename>/local}`] - Node

Displays the routes from the specified node.

[`-address-type {ipv4/ipv6/ipv6z}`] - Address Family

Displays the routes that have the specified IP address type.

[`-subnet-group <IP Address/Mask>`] - Subnet Group

Displays the group of routes that belong to the specified subnet. Routes within the specified subnet group are used first before the default set. The "default" subnet group is a system-provided set of default routes.

[`-destination <text>`] - Destination

Displays the routes that have the specified IP address or subnet as their destination. The format for the subnet is: `<address>/<mask>`. IPv6 address includes the scope value after percentage ("%"). 0.0.0.0/0, 169.254.4.60, ff02::%e0a/32 and fe80::250:56ff:fea6:db7c%e0b are valid values for this parameter.

[`-interface <text>`] - Interface Name

Displays the routes that use the specified interface to transmit packets to the destination. A valid interface has the format of `{<netport>|<ifgrp>}`, such as "e0a", "e0a-1" and "a0a", or it can be a loopback interface, such as "lo" and "losk".

[`-route-interface-address <text>`] - Route Interface Address

Displays the routes that use the specified IP address on the transmit interface.

[-gateway <text>] - Gateway

Displays the routes that have the specified gateway. The gateway can be an IP address, such as "10.10.2.1" and "fe80::1%lo", MAC address, such as "0:5:73:a0:1:7" or refer to a local link, such as "link#3".

[-metric <integer>] - Metric

Displays the routes that have the specified metric.

[-flags <text>] - Flags

Displays the routes that have the specified flags. The type string for "-flags" needs to be one or more of the following {U|G|H|R|D|S|1|2|L|C} in the order shown.

- U - Usable
- G - Gateway
- H - Host
- R - Reject
- D - Dynamic
- S - Static
- 1 - Protocol1
- 2 - Protocol2
- L - Linfo
- C - Clone

Multiple values can be specified (for example: UHL).

[-reference-count <integer>] - Reference Count

Displays the routes that have the specified reference count in the system.

[-lookup-count <integer>] - Lookup Count

Displays the routes that have the specified use count (the count of lookups for the route).

[-path-mtu <integer>] - Path MTU

Displays the routes that have the specified path maximum transmission unit.

Examples

The following example displays active routes on all nodes in Vserver vs0 with subnet-group 10.10.10.0/24.

```
cluster1::*> network route active-entry show -vserver vs0 -subnet-group
10.10.10.0/24
(network route active-entry show)
```

Vserver: vs0
Node: node1
Subnet Group: 10.10.10.0/24

Destination	Gateway	Interface	Metric	Flags
default	10.10.10.1	e0c	0	UGS

Vserver: vs0
Node: node2
Subnet Group: 10.10.10.0/24

network subnet commands

The subnet directory

Network Subnet commands. These commands are used to define a subnet with its gateway and groups of IP addresses. The IP addresses can be used to create interfaces.

network subnet add-ranges

Add new address ranges to a subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Add new address ranges to a subnet.

Note: All addresses in a range must be the same address family (IPv4 or IPv6) and must have the same subnet mask. Ranges that overlap or are next to existing ranges will be merged with the existing ranges.

Parameters

-ipSPACE <IPSPACE> - IPspace Name

The IPspace in which the range resides.

-subnet-name <subnet name> - Subnet Name

The name of the subnet.

-ip-ranges {<ipaddr>/<ipaddr>-<ipaddr>}, ... - IP Ranges

The list of ranges to add to the subnet.

[-force-update-lif-associations [true]] - Force Update LIF Associations

This command will fail if any service processor interfaces or network interfaces are using the IP addresses in the ranges provided. Using this parameter will associate any manually addressed interfaces with the subnet and will allow the command to succeed.

Examples

The following example allocates addresses for subnet *s1* in IPspace *Default*.

```
cluster1::> network subnet add-ranges -ipSPACE Default -subnet-name s1
-ip-ranges "10.98.1.20-10.98.1.30, 10.98.1.35, 10.98.1.40-10.98.1.49"
```

network subnet create

Create a new layer 3 subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Create a new subnet.

Parameters

`[-ipSPACE <IPspace>] - IPspace Name`

The IPspace to which the new subnet belongs.

`-subnet-name <subnet name> - Subnet Name`

The name of the subnet to be created. The name of the subnet needs to be unique within the IPspace.

`-broadcast-domain <Broadcast Domain> - Broadcast Domain`

The broadcast domain to which the new subnet belongs.

`-subnet <IP Address/Mask> - Layer 3 Subnet`

The address and mask of the subnet.

`[-gateway <IP Address>] - Gateway`

The gateway of the subnet.

`[-ip-ranges {<ipaddr>/<ipaddr>-<ipaddr>}, ...] - IP Addresses or IP Address Ranges`

The IP ranges associated with this subnet.

`[-force-update-lif-associations [true]] - Change the subnet association`

This command will fail if any service processor interfaces or network interfaces are using the IP addresses in the ranges provided. Using this parameter will associate any manually addressed interfaces with the subnet and will allow the command to succeed.

Examples

The following examples create subnets named *s1* and *s6* in IPspace *Default*.

```
cluster1::> network subnet create -ipSPACE Default -broadcast-domain bd1 -
subnet-name s1
-subnet 192.168.1.0/24 -gateway 192.168.1.1 -ip-ranges
"192.168.1.1-192.168.1.100, 192.168.1.112, 192.168.1.145"
```

```
cluster1::> network subnet create -ipSPACE Default -broadcast-domain bd1 -
subnet-name s6
-subnet 3FFE::/64 -gateway 3FFE::1 -ip-ranges "3FFE::10-3FFE::20"
```

network subnet delete

Delete an existing subnet object

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete a subnet that contains no ports.

Parameters

`-ipSPACE <IPspace> - IPspace Name`

The IPspace to which the subnet belongs.

`-subnet-name <subnet name> - Subnet Name`

The name of the subnet to be deleted.

`[-force-update-lif-associations [true]] - Change the subnet association`

This command will fail if the subnet has ranges containing any existing service processor interface or network interface IP addresses. Setting this value to true will remove the network interface associations with the subnet and allow the command to succeed. However, it will not affect service processor interfaces.

Examples

The following example deletes subnet *s1* in IPspace *Default*.

```
cluster1::> network subnet delete -ipSpace Default -subnet-name s1
```

network subnet modify

Modify a layer 3 subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Modify a subnet.

Parameters

`-ipSpace <IPspace> - IPspace Name`

The IPspace to which the subnet belongs.

`-subnet-name <subnet name> - Subnet Name`

The name of the subnet to modify.

`[-subnet <IP Address/Mask>] - Layer 3 Subnet`

The new address and mask of the subnet.

`[-gateway <IP Address>] - Gateway`

The new gateway address.

`[-ip-ranges {<ipaddr>/<ipaddr>-<ipaddr>}, ...] - IP Addresses or IP Address Ranges`

The new IP ranges for this subnet.

`[-force-update-lif-associations [true]] - Change the subnet association`

This command will fail if any existing service processor interfaces or network interfaces are using IP addresses in the IP ranges being added. It will also fail if any existing service processor interfaces or network interfaces are using IP addresses in the IP ranges being removed. Using this parameter will associate the interfaces with the IP addresses in the ranges being added to the subnet. It will also remove the subnet's association with the interfaces with IP addresses in the IP ranges being removed and will allow the command to succeed.

Examples

The following example modifies the subnet address and gateway.

```
cluster1::> network subnet modify -ipSpace Default -subnet-name s1 -subnet
192.168.2.0/24 -gateway 192.168.2.1
```

network subnet remove-ranges

Remove address ranges from a subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Remove address ranges from a subnet.

Parameters

-ip-space <IPspace> - IPspace Name

The IPspace in which the range resides.

-subnet-name <subnet name> - Subnet Name

The name of the subnet.

-ip-ranges {<ipaddr>/<ipaddr>-<ipaddr>}, ... - IP Ranges

IP ranges to remove.

[-force-update-lif-associations [true]] - Force Update LIF Associations

This command will fail if any existing service processor interfaces or network interfaces are using IP addresses in the ranges provided. Using this parameter will remove the subnet's association with those interfaces and allow the command to succeed.

Examples

The following example removes an address range with starting address of *10.98.1.1* from subnet *s1* in IPspace *Default*.

```
cluster1::> network subnet remove-ranges -ip-space Default -subnet-name s1
-ip-ranges "10.98.1.1-10.98.1.30"
```

network subnet rename

Rename a layer 3 subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Rename a Subnet.

Parameters

-ip-space <IPspace> - IPspace Name

The IPspace to which the subnet belongs.

-subnet-name <subnet name> - Subnet Name

The name of the subnet to rename.

-new-name <text> - New Name

The new name for the subnet.

Examples

The following example renames subnet *s1* to *s3*.

```
cluster1::> network subnet rename -ipspace Default -subnet s1 -new-name s3
```

network subnet show

Display subnet information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display subnet information.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>**, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - **IPspace Name**

Selects the subnets that match the given IPspace name.

[-subnet-name <subnet name>] - **Subnet Name**

Selects the subnets that match the given subnet name.

[-broadcast-domain <Broadcast Domain>] - **Broadcast Domain**

Selects the subnets that match the given broadcast domain name.

[-subnet <IP Address/Mask>] - **Layer 3 Subnet**

Selects the subnets that match the given address and mask.

[-gateway <IP Address>] - **Gateway**

Selects the subnets that match the given gateway address.

[-ip-ranges {<ipaddr>/<ipaddr>-<ipaddr>}, ...] - **IP Addresses or IP Address Ranges**

Selects the subnets that match the given IP range.

[-total-count <integer>] - **Total Address Count**

Selects the subnets that match the given total address count.

[-used-count <integer>] - **Used Address Count**

Selects the subnets that match the given number of addresses allocated.

[-available-count <integer>] - **Available Address Count**

Selects the subnets that match the given number of addresses available.

Examples

The following example displays general information about the subnets.

```
cluster1::> network subnet show

IPspace: Default
Subnet
Name      Subnet      Broadcast      Avail/
-----  -----  -----  -----
Domain    Gateway    Total    Ranges
-----  -----  -----  -----
-----
```

```

s4      192.168.4.0/24  bd4      192.168.4.1      5/5
192.168.5.6-192.168.5.10
s6      192.168.6.0/24  bd4      192.168.6.1      5/5
192.168.6.6-192.168.6.10

IPspace: ips1
Subnet
Name      Subnet      Broadcast
-----
Domain    Gateway    Avail/
-----
Total     Ranges
-----
s10      192.168.6.0/24  bd10     192.168.6.1      0/0      -
3 entries were displayed.

```

network tcpdump commands

Run tcpdump operations

Network tcpdump commands. The trace files generated during tcpdump packet captures could be located in /mroot/etc/log/packet_traces/.

network tcpdump show

Show running tcpdump instances

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network tcpdump show` command shows currently running packet traces (via tcpdump) on a matching node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node Name

Use this parameter optionally to show the details of running packet traces on a matching node.

[-port {<netport>/<ifgrp>}] - Port

Use this parameter optionally to show the details of running packet trace on a matching network interface.

Examples

The following example shows the details of running packet traces on nodes "node1" and "node2":

```

cluster1::> network tcpdump show
Node      Port
-----
node1

```

```
node2      e0a
           e0c
```

network tcpdump start

tcpdump start

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network tcpdump start` command starts packet tracing (via tcpdump) with the given parameters.

Parameters

-node {<nodename>/local} - Node Name

Use this parameter to specify the node on which the packet trace should run.

-port {<netport>/<ifgrp>} - Port

Use this parameter to specify the network interface for packet tracing.

[-address <IP Address>] - IP Address

Use this parameter to optionally specify the address for packet tracing.

[-protocol-port <integer>] - Protocol Port Number

Use this parameter to optionally specify the protocol port number for packet tracing.

[-buffer-size <integer>] - Buffer Size in KB

Use this parameter to optionally specify the buffer size for packet tracing. The default buffer size is 4 KB.

[-file-size <integer>] - Trace File Size in MB

Use this parameter to optionally specify the trace file size for packet tracing. The default trace file size is 1 GB.

[-rolling-traces <integer>] - Number of Rolling Trace Files

Use this parameter to optionally specify the number of rolling trace files for packet tracing. The default number of rolling trace files is 2.

Examples

The following example starts packet tracing on node "node1" with address "10.98.16.164", network interface "e0c", buffer size "10 KB", and protocol port number "10000":

```
cluster1::> network tcpdump start -node node1
          -address 10.98.16.164 -port e0c -buffer-size 10 -protocol-port 10000
```

network tcpdump stop

Stop an active tcpdump trace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network tcpdump stop` command stops a running packet trace (via `tcpdump`) on a given network interface. The trace files could be located in `/mroot/etc/log/packet_traces/`.

Parameters

-node {<nodename>/local} - Node Name

Use this parameter to specify the node on which the packet tracing must be stopped.

-port {<netport>/<ifgrp>} - Port

Use this parameter to specify the network interface on which the packet tracing must be stopped.

Examples

The following example stops a packet trace on network interface "e0a" from node "node1":

```
cluster1::> network tcpdump stop -node node1 -port e0a
```

network tcpdump trace commands

The trace directory

Network `tcpdump` trace commands.

network tcpdump trace delete

Delete a `tcpdump` tracefile

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network tcpdump trace delete` command deletes the `tcpdump` trace file from a matching node.

Parameters

-node {<nodename>/local} - Node Name

Use this parameter to delete the `tcpdump` trace file from a matching node.

-trace-file <text> - Trace File

Use this parameter to specify the `tcpdump` trace file to be deleted.

Examples

The following example deletes the list of `tcpdump` trace files from node "node1" using wildcard pattern:

```
cluster1::> network tcpdump trace delete -node node1 -trace-file *
```

network tcpdump trace show

Show list of `tcpdump` trace files

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network tcpdump trace show` command shows the list of tcpdump trace files. The trace files could be located in `/mroot/etc/log/packet_traces/`.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance]}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>/local}] - Node Name`

Use this parameter to show the list of traces files of a matching node.

`[-trace-file <text>] - Trace File`

Use this parameter optionally to show the list of trace files with a matching trace-file name.

Examples

The following example shows the list of trace files on nodes "node1" and "node2":

```
cluster1::> network tcpdump trace show
Node          Trace File
-----
node1
              e0a_20170314_115624.trc0
node2
              e0c_20170314_115624.trc0
```

network test-link commands

The test-link directory

network test-link run-test

Test link bandwidth

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link run-test` command runs a performance test between two nodes. The command requires a source node, Vserver, and destination address.

Before executing the `network test-link run-test` command, the `network test-link start-server` command must be run to start a server on the node hosting the destination LIF. After all tests to that node are complete the `network test-link stop-server` command must be run to stop the server.

The test results are stored non-persistently and can be viewed using the `network test-link show` command. Results include input parameters, the bandwidth achieved, and the date and time of the test.

Parameters**-node {<nodename>/local} - Node Name**

Use this parameter to specify the node which initiates the test.

-vserver <vserver> - Vserver

Use this parameter to specify the Vserver to access the destination LIF. DC (Data Channel) Vserver option is available only in an ONTAP Select or ONTAP Cloud cluster. It is a special vservers that hosts LIFs that are used to mirror data aggregates to partner node.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the destination IP address.

Examples

The following example runs a test between the cluster LIFs, including the start and stop of the server side of the test:

```
cluster1::*> network test-link start-server -node node1

cluster1::*> network test-link run-test -node node2 -vserver Cluster -
destination 172.31.112.173

      Node: node2
      Vserver: Cluster
      Destination: 172.31.112.173
      Time of Test: 4/22/2016 15:33:18
      MB/s: 41.2678

cluster1::*> network test-link stop-server -node node1

cluster1::*> network test-link show
```

Node Test	MB/s	Vserver	Destination	Time of
node2		Cluster	172.31.112.173	4/22/2016
15:33:18	41.2678

network test-link show

Display test results

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link show` command displays the results of prior [network test-link run-test](#) commands.

The test results are stored non-persistently and can be viewed using the `network test-link show` command. Results include input parameters, the bandwidth achieved, and the date and time of the test.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[[-instance]]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

-node {<nodename>/local} - Node

Selects the nodes that match this parameter value. Use this parameter to display the test results specific to a node. By default, the test results across all nodes are shown.

-vserver <vserver> - Vserver

Use this parameter to display the test results specific to a Vserver. Use DC (Data Channel) Vserver option only in an ONTAP Select or ONTAP Cloud cluster to show network performance of links hosting DC LIFs. DC Vserver is a special Vserver that hosts LIFs that are used to mirror data aggregates to partner node

[-destination <Remote InetAddress>] - Destination

Use this parameter to display the test results associated with the specified destination.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Test

Use this parameter to display the test results with the specified timestamp.

[-bandwidth <double>] - MB/s

Use this parameter to display the test results only matching the specified bandwidth.

Examples

The following example runs a test between the cluster LIFs twice and then demonstrates the show command results:

```
cluster1::*> network test-link run-test -node node2 -vserver Cluster -
destination 172.31.112.173
```

```
Node: node2
Vserver: Cluster
Destination: 172.31.112.173
Time of Test: 4/25/2016 10:37:52
MB/s: 29.9946
```

```
cluster1::*> network test-link run-test -node node2 -vserver Cluster -
destination 172.31.112.173
```

```
Node: node2
Vserver: Cluster
Destination: 172.31.112.173
Time of Test: 4/25/2016 10:38:32
MB/s: 39.8192
```

```
cluster1::network test-link*> show
Node          Vserver      Destination   Time of
Test          MB/s
-----
-----
```

node2	Cluster	172.31.112.173	4/25/2016
10:38:32	39.8192

network test-link start-server

Start server for bandwidth test

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link start-server` command starts the server side of the [network test-link](#) test on the designated node.

Only one server at a time can be running for the [network test-link](#) command on a given node. If the `network test-link start-server` command is issued and a server is already running on the node, then the command is ignored, and the existing server continues to run.

The server started is listening on port 5201.

Parameters

-node {<nodename>/local} - Node Name

Use this parameter to specify the node where the server is to be started.

Examples

The following example starts a server:

```
cluster1::*> network test-link start-server -node node1
```

[network test-link stop-server](#) on page 495

[network test-link show](#) on page 493

network test-link stop-server

Stop server for bandwidth test

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link stop-server` command stops the [network test-link](#) server running on the designated node.

Parameters**-node {<nodename>/local} - Node Name**

Use this parameter to specify the node where the server is to be stopped.

Examples

The following example starts a server and stops it:

```
cluster1::*> network test-link start-server -node node1
cluster1::*> network test-link stop-server -node node1
```

network tuning commands

Manage network tuning options

network tuning icmp commands

Manage ICMP tuning setting

network tuning icmp modify

Modify ICMP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.**Description**

This command displays options which can be used to fine tune icmp protocol behavior.

Parameters**-node {<nodename>/local} - Node**

Sets this parameter to indicate on which node the ICMP tuning options are modified.

[-is-drop-redirect-enabled {true/false}] - Drop redirect ICMP

Sets this parameter to drop redirect ICMP message.

[-tx-icmp-limit <integer>] - Maximum number of ICMP packets sent per second

Sets the maximum number of ICMP messages including TCP RSTs can be sent per second.

[-redirect-timeout <integer>] - Maximum seconds for route redirect timeout

Sets this parameter to indicate the number of seconds after which the route is deleted. Value of zero means infinity. The default value is 300 seconds.

Examples

```
cluster1::> network tuning icmp modify -node node1 -is-drop-redirect-enabled
false
```

network tuning icmp show

Show ICMP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of the ICMP tuning options for the given node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

Displays all ICMP tuning options.

[-node {<nodename>/local}] - Node

Specifies the node for which the ICMP tuning options are displayed.

[-is-drop-redirect-enabled {true/false}] - Drop redirect ICMP

Displays all entries that match the "is-drop-redirect-enabled" value.

[-tx-icmp-limit <integer>] - Maximum number of ICMP packets sent per second

Displays all entries that match the "tx-icmp-limit" value.

[-redirect-timeout <integer>] - Maximum seconds for route redirect timeout

Displays all the entries that match the "redirect-timeout" value.

Examples

```
cluster1::> network tuning icmp show
```

Node	Drop Redirect ICMP	Maximum ICMP Sends per Second	Redirect Timeout in Seconds
node1	true	100	300

network tuning icmp6 commands

Manage ICMPv6 tuning setting

network tuning icmp6 modify

Modify ICMPv6 tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays options which can be used to fine tune icmpv6 protocol behavior.

Parameters

-node {<nodename>/local} - **Node**

Sets this parameter to indicate on which node the ICMPv6 tuning options are modified.

[-is-v6-redirect-accepted {true/false}] - **Accept redirects via ICMPv6**

Sets this parameter to indicate whether or not redirect ICMPv6 messages are accepted.

[-redirect-v6-timeout <integer>] - **Maximum seconds for route redirect timeout**

Sets this parameter to indicate the number of seconds after which the route is deleted. Value of zero means infinity. The default value is 300 seconds.

Examples

```
cluster1::> network tuning icmp6 modify -node node1 -is-v6-redirect-accepted false
```

network tuning icmp6 show

Show ICMPv6 tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of the ICMPv6 tuning options for the given node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]}

Displays all ICMPv6 tuning options.

[-node {<nodename>/local}] - **Node**

Specifies the node for which the ICMPv6 tuning options are displayed.

[-is-v6-redirect-accepted {true/false}] - **Accept redirects via ICMPv6**

Displays all entries that match the "is-v6-redirect-accepted" value.

[-redirect-v6-timeout <integer>] - **Maximum seconds for route redirect timeout**

Displays all the entries that match the "redirect-v6-timeout" value.

Examples

```
cluster1::> network tuning icmp6 show

Node      Accept Redirect Redirect Timeout
          ICMPv6      in Seconds
-----
```

```
node1      true      300
```

network tuning tcp commands

Manage TCP tuning setting

network tuning tcp modify

Modify TCP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This commands sets TCP tuning options on the node.

Parameters

-node {<nodename>/local} - Node

Indicates on which node the TCP tuning options will be modified.

[-is-path-mtu-discovery-enabled {true/false}] - Path MTU discovery enabled

Enables path MTU discovery feature.

[-is-rfc3465-enabled {true/false}] - RFC3465 enabled

Enables the rfc3465 feature.

[-max-cwnd-increment <integer>] - Maximum congestion window segments incrementation

Sets the maximum congestion window increment segments during slow start.

[-is-rfc3390-enabled {true/false}] - RFC3390 enabled

Enables the rfc3390 feature.

[-is-sack-enabled {true/false}] - SACK support enabled

Enables the selective ACK feature.

Examples

```
cluster1::> network tuning tcp modify -node node1 -is-path-mtu-discovery-enabled false
```

network tuning tcp show

Show TCP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of the TCP tuning options for the given node.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

Displays all TCP tuning options.

[-node {<nodename>/local}] - Node

Specifies the node for which the TCP tuning options will be displayed.

[-is-path-mtu-discovery-enabled {true/false}] - Path MTU discovery enabled

Displays all entries that match the "is-path-mtu-discovery-enabled" value.

[-is-rfc3465-enabled {true/false}] - RFC3465 enabled

Displays all entries that match the "is-rfc3465-enabled" value.

[-max-cwnd-increment <integer>] - Maximum congestion window segments incrementation

Displays all entries that match the "max-cwnd-increment" value.

[-is-rfc3390-enabled {true/false}] - RFC3390 enabled

Displays all entries that match the "is-rfc3390-enabled" value.

[-is-sack-enabled {true/false}] - SACK support enabled

Displays all entries that match the "is-sack-enabled" value.

Examples

```
cluster1::> network tuning tcp show
      Path MTU           Maximum           Selective
Node   Discovery  RFC3465  Congestion Window  RFC3390 Ack
      Enabled    Enabled  Incrementation  Enabled Enabled
-----
node1
      true       true     2                true     true
```

pod commands

Manage pod configuration

pod status commands

The status directory

pod status show

Get the pod status.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `pod status show` command displays the current status of the pod.

Examples

The following example displays the pod status show:

```
cluster1::> pod status show
uuid                               name      status
-----
1cd8a442-86d1-11e0-ae1c-123478563412  pod1      running

1 entries was displayed.

cluster1::>
```

protection-type commands

Manage Protection Types and RPOs

protection-type show

Display the supported protection types and available RPOs

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the protection types available for application provisioning.

Parameters

{ [-fields <fieldname>, ...]

Specifies fields that you want included in the output. You can use **-fields ?** to display the available fields.

[-instance]}

Specifies the display of all available fields for each selected protection type.

[-vserver <vserver name>] - Vserver

Selects the protection types of Vservers that match the parameter value.

[-protection-type {local/remote}] - Protection Type

Selects the protection types that match the parameter value.

[-rpo-list <text>, ...] - List of available RPOs

Selects the protection types whose list of available RPOs matches the parameter value.

[-rpo-list-description <text>, ...] - List of descriptions of available RPOs

Selects the protection types whose list of description of available RPOs matches the parameter value.

[-description <text>] - Description of Protection Type

Selects the protection types with a description that matches the parameter value.

Examples

The following example displays the protection types and the associated available RPOs for all Vservers in the cluster.

```
cluster1::*> protection-type show
Vserver Protection Type RPO List
-----
vs1
    local          hourly, none
    remote         none
vs2
    local          hourly, none
    remote         none, zero
```

qos commands

QoS settings

qos adaptive-policy-group commands

The adaptive-policy-group directory

qos adaptive-policy-group create

Create an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group create` command creates a new adaptive policy group. After the adaptive policy group is created, you can assign one or more storage objects to the policy. When a storage object is assigned to an adaptive policy group, the maximum throughput QoS setting automatically adjusts based on the storage object used space or the storage object allocated space. QoS minimum throughput setting is calculated from the `expected-iops` parameter and the storage object allocated size. It is set only for the storage objects that reside on AFF platforms.

After you create an adaptive policy group, use the storage object create command or storage object modify command to apply the adaptive policy group to a storage object.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character. Use the `qos adaptive-policy-group rename` command to change the adaptive policy group name.

-vserver <vserver name> - Vserver

Specifies the data Vserver to which this adaptive policy group belongs to. You can apply this adaptive policy group to only the storage objects contained in the specified Vserver. If the system has only one Vserver, then the command uses that Vserver by default.

-expected-iops {<integer>[IOPS[/{GB/TB}]] (default: TB)} - Expected IOPS

Specifies the minimum expected IOPS per TB or GB allocated based on the storage object allocated size.

-peak-iops {<integer>[IOPS[/{GB/TB}]] (default: TB)} - Peak IOPS

Specifies the maximum possible IOPS per TB or GB allocated based on the storage object allocated size or the storage object used size.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS

Specifies the absolute minimum IOPS which is used as an override when the expected IOPS is less than this value. The default value is computed as follows:

if `expected-iops` \geq 6144/TB, then `absolute-min-iops` = 1000IOPS; if `expected-iops` \geq 2048/TB and `expected-iops` $<$ 6144/TB, then `absolute-min-iops` =

500IOPS; if expected-iops \geq 1/MB and expected-iops $<$ 2048/TB, then absolute-min-iops = 75IOPS.

`[-expected-iops-allocation {used-space/allocated-space}] - Expected IOPS Allocation`

Specifies the expected IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the expected-iops-allocation policy is set to *allocated-space*, the expected IOPS is calculated based on the size of the storage object. When the expected-iops-allocation policy is set to *used-space*, the expected IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *allocated-space*.

`[-peak-iops-allocation {used-space/allocated-space}] - Peak IOPS Allocation`

Specifies the peak IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the peak-iops-allocation policy is set to *allocated-space*, the peak IOPS is calculated based on the size of the storage object. When the peak-iops-allocation policy is set to *used-space*, the peak IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *used-space*.

`[-block-size {ANY/4K/8K/16K/32K/64K/128K}] - Block Size`

Specifies the I/O block size for the QoS adaptive policy group. The default value is "ANY". When block-size of "ANY" is specified, then control is by IOPS. When block-size other than "ANY" is specified, then control is by IOPS and bytes per second(bps). bps is the product of IOPS and block-size.

Examples

```
cluster1::> qos adaptive-policy-group create p1 -vserver vs1
               -expected-iops 100IOPS/TB -peak-iops 1000/TB
```

Creates the "p1" adaptive policy group which belongs to Vserver "vs1" with expected-iops of 100IOPS/TB and peak-iops of 1000IOPS/TB with default value for absolute-min-iops

```
cluster1::> qos adaptive-policy-group create p2 -vserver vs1
               -expected-iops 100IOPS/GB -peak-iops 1000IOPS/GB
               -absolute-min-iops 200IOPS
```

[qos adaptive-policy-group rename](#) on page 506

qos adaptive-policy-group delete

Delete an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group delete` command deletes an adaptive policy group from a cluster. You cannot delete a policy group if a QoS workload associated with a storage object is assigned to it unless you use the **-force** parameter. Using the **-force** parameter will delete all the QoS workloads for storage objects associated with the specified adaptive policy groups.

Only user created adaptive policy groups can be deleted. Default adaptive policy groups are read only and cannot be deleted.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group that you want to delete.

[-force [true]] - Force Delete Workloads for the QoS adaptive policy group (privilege: advanced)

Specifies whether to delete an adaptive policy group along with any underlying workloads.

Examples

The following example deletes "p1" adaptive policy group:

```
cluster1::> qos adaptive-policy-group delete p1
```

Deletes the "p1" adaptive policy group along with any underlying QoS workloads.

```
cluster1::> qos adaptive-policy-group delete p1 -force
```

qos adaptive-policy-group modify

Modify an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group modify` command modifies an adaptive policy group.

Only user-created adaptive policy groups can be modified. Default adaptive policy groups are read-only and cannot be modified.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character. Use the `qos adaptive-policy-group rename` command to change the adaptive policy group name.

[-expected-iops {<integer>[IOPS[/{GB/TB}]] (default: TB)}] - Expected IOPS

Specifies the minimum expected IOPS per TB or GB allocated based on the storage object allocated size. QoS minimum throughput setting is calculated from the expected-iops parameter. It is set only for the storage objects that reside on AFF platforms.

[-peak-iops {<integer>[IOPS[/{GB/TB}]] (default: TB)}] - Peak IOPS

Specifies the maximum possible IOPS per TB or GB allocated based on the storage object allocated size or the storage object used size.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS

Specifies the absolute minimum IOPS which is used as an override when the expected IOPS is less than this value. The default value is computed as follows:

if expected-iops \geq 6144/TB, then absolute-min-iops = 1000IOPS; if expected-iops \geq 2048/TB and expected-iops $<$ 6144/TB, then absolute-min-iops = 500IOPS; if expected-iops \geq 1/MB and expected-iops $<$ 2048/TB, then absolute-min-iops = 75IOPS.

`[-expected-iops-allocation {used-space/allocated-space}] - Expected IOPS Allocation`

Specifies the expected IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the expected-iops-allocation policy is set to *allocated-space*, the expected IOPS is calculated based on the size of the storage object. When the expected-iops-allocation policy is set to *used-space*, the expected IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *allocated-space*.

`[-peak-iops-allocation {used-space/allocated-space}] - Peak IOPS Allocation`

Specifies the peak IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the peak-iops-allocation policy is set to *allocated-space*, the peak IOPS is calculated based on the size of the storage object. When the peak-iops-allocation policy is set to *used-space*, the peak IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *used-space*.

`[-block-size {ANY/4K/8K/16K/32K/64K/128K}] - Block Size`

Specifies the I/O block size for the QoS adaptive policy group. The default value is "ANY". When block-size of "ANY" is specified, then control is by IOPS. When block-size other than "ANY" is specified, then control is by IOPS and bytes per second(bps). bps is the product of IOPS and block-size.

Examples

The following example modifies the "p1" adaptive policy group with specified values.

```
cluster1::> qos adaptive-policy-group modify -policy-group p1
              -expected-iops 200IOPS/TB -peak-iops 2000IOPS/TB
              -absolute-min-iops 100IOPS
```

[qos adaptive-policy-group rename](#) on page 506

qos adaptive-policy-group rename

Rename an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group rename` command changes the name of an existing adaptive policy group.

Parameters

`-policy-group <text>` - Name

Specifies the existing name of the adaptive policy group that you want to rename.

`-new-name <text>` - New adaptive policy group name

Specifies the new name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character.

Examples

```
cluster1::> qos adaptive-policy-group rename -policy-group pl -new-name
pl_new
```

qos adaptive-policy-group show

Display a list of adaptive policy groups

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group show` command shows the current settings of the adaptive policy groups on a cluster. You can view the list of adaptive policy groups and also the detailed information about a specific adaptive policy group.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-policy-group <text>] - Name

Selects the adaptive policy groups that match this parameter value.

Adaptive policy groups define measurable service level objectives (SLOs) that adjust based on the storage object used space or the storage object allocated space.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information only about the adaptive policy groups with a matching vservers.

[-uuid <UUID>] - Uuid

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified UUID.

[-pgid <integer>] - ID

If this parameter is specified, the command displays information only about the adaptive policy groups that match the given policy group ID, which is an integer that uniquely identifies the adaptive policy group.

[-expected-iops {<integer>[IOPS[/{GB/TB}]] (default: TB)}] - Expected IOPS

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified minimum expected IOPS per TB or GB.

[-peak-iops {<integer>[IOPS[/{GB/TB}]] (default: TB)}] - Peak IOPS

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified maximum possible IOPS per TB or GB.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified absolute minimum IOPS.

`[-expected-iops-allocation {used-space/allocated-space}] - Expected IOPS Allocation`

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified expected IOPS allocation policy used to compute the expected IOPS per TB or GB.

`[-peak-iops-allocation {used-space/allocated-space}] - Peak IOPS Allocation`

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified peak IOPS allocation policy used to compute the maximum possible IOPS per TB or GB.

`[-block-size {ANY/4K/8K/16K/32K/64K/128K}] - Block Size`

Specifies the I/O block size for the QoS adaptive policy group. The default value is "ANY". When block-size of "ANY" is specified, then control is by IOPS. When block-size other than "ANY" is specified, then control is by IOPS and bytes per second(bps). bps is the product of IOPS and block-size.

`[-num-workloads <integer>] - Number of Workloads`

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified number of workloads.

Examples

The example above displays all adaptive policy groups on the cluster.

```
cluster1::> qos adaptive-policy-group show
qos adaptive-policy-group show
```

Name	Vserver	Wklds	Expected IOPS	Peak IOPS	Minimum IOPS	Block Size
apg1	vs1	1	100IOPS/MB	1000IOPS/MB	75IOPS	8K
apg2	vs1	1	100IOPS/MB	1000IOPS/MB	75IOPS	4K
extreme	clus-1	0	6144IOPS/TB	12288IOPS/TB	1000IOPS	ANY
performance	clus-1	0	2048IOPS/TB	4096IOPS/TB	500IOPS	ANY
value	clus-1	0	128IOPS/TB	512IOPS/TB	75IOPS	ANY

5 entries were displayed.

qos policy-group commands

The policy-group directory

qos policy-group create

Create a policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group create` command creates a new policy group. You can use a QoS policy group to control a set of storage objects known as "workloads" - LUNs, volumes, files, or Vservers. Policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated.

After you create a policy group, you use the storage object create command or the storage object modify command to apply the policy group to a storage object.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group. Policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Policy group names must start with an alphanumeric character. You use the `qos policy-group rename` command to change the policy group name.

-vserver <vserver name> - Vserver

Specifies the data Vserver to which this policy group belongs. You can apply this policy group to only the storage objects contained in the specified Vserver. For example, if you want to apply this policy group to a volume, that volume must belong to the specified Vserver. Using this parameter does not apply the policy group's SLOs to the Vserver. You need to use the `vserver modify` command if you want to apply this policy group to the Vserver. If the system has only one Vserver, then the command uses that Vserver by default.

[-max-throughput <qos_tput>] - Maximum Throughput

Specifies the maximum throughput for the policy group. A maximum throughput limit specifies the throughput that the policy group must not exceed. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s. The range is one to infinity. A value of zero is accepted but is internally treated as infinity.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for max-throughput is infinity, which can be specified by the special value "INF". Note that there is no default unit - all numbers except zero require explicit specification of the units.

Two reserved keywords, "none" and "INF", are available for the situation that requires removal of a value, and the situation that needs to specify the maximum available value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", "100iops", "100iops,400KB/s", and "800KB/s,100iops"

[-min-throughput <qos_tput>] - Minimum Throughput

Specifies the minimum throughput for the policy group. A minimum throughput specifies the desired performance level for a policy group. It is specified in terms of IOPS.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for min-throughput is "0". The default unit is IOPS.

One reserved keyword, 'none' is available for the situation that requires removal of a value.

Examples of valid throughput specifications are: "100iops" and "100".

[-is-shared {true/false}] - Is Shared

Specifies whether the policy group can be shared or not. The default value is "true". This parameter specifies if the SLOs of the policy group are shared between the workloads or if the SLOs are applied separately to each workload.

Examples

```
cluster1::> qos policy-group create p1 -vserver vs1
```

Creates the "p1" policy group which belongs to Vserver "vs1" with default policy values.

```
cluster1::> qos policy-group create p2 -vserver vs1 -max-throughput 500MB/s
```

Creates the "p2" policy group which belongs to Vserver "vs1" with the maximum throughput set to 500 MB/s.

```
cluster1::> qos policy-group create p3 -vserver vs1 -max-throughput 500MB/s -
is-shared false
```

Related references

[qos policy-group rename](#) on page 511

qos policy-group delete

Delete an existing QoS Policy Group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group delete` command deletes a policy group from a cluster. You cannot delete a policy group if a qos workload associated with storage object is assigned to it unless you use "-force". Using "-force" will delete all the qos workloads for storage objects associated with the specified policy groups.

You can only delete user-defined policy groups. You cannot delete preset policy groups.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group that you want to delete.

[-force [true]] - Force Delete Workloads for the QoS Policy Group (privilege: advanced)

Specifies whether to delete a policy group along with any underlying workloads.

Examples

```
cluster1::> qos policy-group delete p1
```

```
cluster1::> qos policy-group delete p1 -force
```

qos policy-group modify

Modify a policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group modify` command modifies a user-created policy group.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group that you want to modify.

[-max-throughput <qos_tput>] - Maximum Throughput

Specifies the maximum throughput for the policy group. A maximum throughput limit specifies the throughput that the policy group must not exceed. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s. The range is one to infinity. A value of zero is accepted but is internally treated as infinity.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for max-throughput is infinity, which can be specified by the special value "INF". Note there is no default unit - all numbers except zero require explicit specification of the units.

Two reserved keywords, "none" and "INF", are available for the situation that requires removal of a value, and the situation that needs to specify the maximum available value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", and "100iops".

[-min-throughput <qos_tput>] - Minimum Throughput

Specifies the minimum throughput for the policy group. A minimum throughput specifies the desired performance level for a policy group. It is specified in terms of IOPS.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for min-throughput is "0". The default unit is IOPS.

One reserved keyword, 'none' is available for the situation that requires removal of a value.

Examples of valid throughput specifications are: "100iops" and "100".

Examples

```
cluster1::> qos policy-group modify pl -max-throughput 10IOPS
```

qos policy-group rename

Rename a policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group rename` command changes the name of an existing policy group.

Parameters**-policy-group <text> - Policy Group Name**

Specifies the existing name of the policy group that you want to rename.

-new-name <text> - New Policy Group Name

Specifies the new name of the policy group. Policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Policy group names must start with an alphanumeric character.

Examples

```
cluster1::> qos policy-group rename -policy-group pl -new-name pl_new
```

qos policy-group show

Display a list of policy groups

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group show` command shows the current settings of the policy groups on a cluster. You can display a list of the policy groups and you can view detailed information about a specific policy group.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-policy-group <text>] - Policy Group Name

Selects the policy groups that match this parameter value

Policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated.

[-vserver <vserver name>] - Vserver

Selects the policy groups that match this parameter value

[-uuid <UUID>] - Uuid

Selects the policy groups that match this parameter value

[-class <QoS Configuration Class>] - Policy Group Class

Selects the policy groups that match this parameter value

[-pgid <integer>] - Policy Group ID

Selects the policy groups that match this parameter value

This uniquely identifies the policy group

[-max-throughput <qos_tput>] - Maximum Throughput

Selects the policy groups that match this parameter value

A maximum throughput limit specifies the throughput (in IOPS or MB/s) that the policy group must not exceed.

[-min-throughput <qos_tput>] - Minimum Throughput

Selects the policy groups that match this parameter value

A minimum throughput specifies the desired performance level for a policy group.

[-num-workloads <integer>] - Number of Workloads

Selects the policy groups that match this parameter value.

[-throughput-policy <text>] - Throughput Policy

Selects the policy groups that match this parameter value. You can specify the throughput range in terms of IOPS or data rate. For example, **0-*INF***, **0-400IOPS**, **0-200KB/s**, **0-400MB/s**.

[-is-shared {true/false}] - Is Shared

Selects the policy groups that match this parameter value.

The shared value specifies whether the policy group is a shared policy group or not.

[-is-auto-generated {true/false}] - Is Policy Auto Generated

Selects the policy groups that match this parameter value.

The auto-generated value specifies whether the policy group is an automatically generated policy group or not.

Examples

```
cluster1::> qos policy-group show
Name      Vserver      Class      Wklds  Throughput
-----
pg1        vs4           user-defined 0      0-200IOPS
pg2        vs0           user-defined 0      0-500IOPS
pg5        vs0           user-defined 0      0-300IOPS
pg6        vs0           user-defined 0      0-INF
4 entries were displayed.
```

qos settings commands

QoS settings

qos settings cache commands

Cache QoS settings

qos settings cache modify

Modify the cache policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos settings cache modify` command modifies the existing default caching-policy. The list of caching policies can be obtained from the `qos setting cache show -fields cache-setting` command.

Parameters**-cache-setting <text> - Cache Policy Name**

Valid inputs to this parameter include any one of the listed caching-policies. This command is to be used together with the default parameter. If you use this parameter, the command modifies the specified caching-policy based on the default parameter.

`[-default {true/false}] - Is Default?`

Valid inputs to this parameter are true and false. Together with cache-setting, this parameter helps set or unset a caching-policy as default.

Examples

```
cluster1::> qos settings cache modify -default true -cache-setting
random_read_write-random_write
```

qos settings cache show

Display list of cache policies

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos settings cache show` shows the current caching-policies, class to which they belong, the number of workloads associated with each of the policies, and whether or not they are set to default. The following external-cache policies are available:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- all - Read caches all data blocks read and written. It does not do any write caching.
- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read-random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read, and randomly written user data blocks. It also write caches randomly overwritten user data blocks.

Note: Note that in a caching-policy name, a hyphen (-) separates read and write caching policies.

Parameters

{ [-fields <fieldname>, ...]

The input to this parameter is one of the following: {cache-setting|class|default|num-workloads}. If you use this parameter, the command displays information related to the specified input field.

| [-instance]}

If you use this parameter, the command displays information about the caching-policies in a list format.

[-cache-setting <text>] - Cache Policy Name

The input to this parameter is any one of the above listed caching-policies. If you use this parameter, the command displays information corresponding to the specified caching-policy.

[-class <QoS Configuration Class>] - Cache Policy Class

The input to this parameter is one of the following: {undefined|preset|user-defined|system-defined|autovolume}. If you use this parameter, the command displays information corresponding to the specified policy-group class.

[-default { true/false}] - Is Default?

The input to this parameter is true and false. If you use this parameter, the command displays information corresponding to entries that have the specified default value.

[-num-workloads <integer>] - Number Of Workloads With This Policy

The input to this parameter is an integer. If you use this parameter, the command displays information about policy-groups matching the specified number of workloads.

Examples

```
cluster1::> qos settings cache show
Policy Name  Class      Num Workloads  Default
-----
all          preset     0              false
all-random_write
              preset     0              false
all_read     preset     0              false
all_read-random_write
              preset     0              false
all_read_random_write
              preset     0              false
all_read_random_write-random_write
              preset     0              false
auto         preset     2              false
meta         preset     0              false
meta-random_write
              preset     0              false
none         preset     0              false
noread-random_write
              preset     0              false
random_read  preset     25             false
random_read_write
              preset     0              false
random_read_write-random_write
              preset     28             true
14 entries were displayed.
```

qos statistics commands

Qos Statistics

qos statistics characteristics commands

Policy Group characterization

qos statistics characteristics show

Display QoS policy group characterization

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics characteristics show` command displays data that characterizes the behavior of QoS policy groups.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Input/output operations performed per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total I/O (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS policy groups. Other columns in this row are either totals or averages.

Parameters

[`-node {<nodename>/local}`] - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[`-iterations <integer>`] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [`-rows <integer>`] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[`-policy-group <text>`] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics characteristics show -iterations 100 -rows 4
```

Policy Group	IOPS	Throughput	Request size	Read	Concurrency
-total-	31	304.00KB/s	10041B	0%	16
_System-Best-Effort	15	0KB/s	0B	0%	0
voll	11	44.00KB/s	4096B	0%	40
vol2	4	256.00KB/s	65536B	0%	14
vslvol0	1	4.00KB/s	4096B	0%	4
-total-	37	808.00KB/s	22361B	2%	3
_System-Best-Effort	15	0KB/s	0B	0%	0
vol2	12	768.00KB/s	65536B	0%	9
vslvol0	8	32.00KB/s	4096B	12%	1
voll	2	8.00KB/s	4096B	0%	1

The example above displays the characteristics of the 4 QoS policy groups with the highest IOPS values and refreshes the display 100 times before terminating.

```
cluster1::> qos statistics characteristics show -iterations 100 -policy-group pgl
```

Policy Group	IOPS	Throughput	Request size	Read	Concurrency
-total-	293	3.02MB/s	10783B	54%	0
pgl	118	470.67KB/s	4096B	100%	0
-total-	181	478.14KB/s	2700B	65%	0
pgl	117	469.33KB/s	4096B	100%	0
-total-	226	525.78KB/s	2382B	60%	1
pgl	110	440.00KB/s	4096B	100%	1
-total-	233	1.67MB/s	7527B	49%	1
pgl	112	446.67KB/s	4096B	100%	1

qos statistics latency commands

Latency breakdown

qos statistics latency show

Display latency breakdown data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics latency show` command displays the average latencies for QoS policy groups across the various Data ONTAP subsystems.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the Network subsystem (Network)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)

- Latency observed per I/O operation in the Data management subsystem (Data)
- Latency observed per I/O operation in the Storage subsystem (Disk)
- Latency observed per I/O operation for QoS Policy Group Ceiling (QoS Max)
- Latency observed per I/O operation for QoS Policy Group Floor (QoS Min)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store (Cloud) operations
- Latency observed per I/O operation for FlexCache (FlexCache) operations
- Latency observed per I/O operation for Synchronous Snapmirror (SM Sync) operations
- Latency observed per I/O operation for Volume Activation (VA) operations

The results displayed per iteration are sorted by the Latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms), observed across all QoS policy groups.

Parameters

`[-node {<nodename>/local}] - Node`

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

`[-policy-group <text>] - QoS Policy Group Name`

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

`[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics latency show -iterations 100 -rows 3
Policy Group      Latency      Network      Cluster      Data

qos statistics performance commands

System performance

qos statistics performance show

Display system performance data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics performance show` command shows the current system performance levels that QoS policy groups are achieving.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS policy groups. Other columns in this row are either totals or averages.

Parameters

`[-node {<nodename>/local}] - Node`

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

`[-policy-group <text>] - QoS Policy Group Name`

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

`[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics performance show -iterations 100 -rows 4
Policy Group          IOPS      Throughput      Latency
-----

qos statistics resource commands

Resource utilization

qos statistics resource cpu commands

CPU utilization

qos statistics resource cpu show

Display CPU resource utilization data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics resource cpu show` command displays the CPU utilization for QoS policy groups per node.

The command displays the following data:

- The QoS policy group name (Policy Group)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all QoS policy groups.

Parameters

-node {<nodename>/local} - Node

Selects the policy groups that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[*-policy-group* <text>]] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[*-refresh-display* { *true*/*false* }]] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics resource cpu show -node nodeA -
iterations 100 -rows 3
Policy Group          CPU
-----
-total- (100%)       9%
fast                  1%
slow                  3%

qos statistics resource disk commands

Disk utilization

qos statistics resource disk show

Display disk resource utilization data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics resource disk show` command displays the disk utilization for QoS policy groups per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command displays disk utilization for system-defined policy groups; however, their disk utilization is not included in the total utilization. The command only supports hard disks.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all QoS policy groups.

Parameters

-node {<nodename>/local} - Node

Selects the policy groups that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```

cluster1::> qos statistics resource disk show -node nodeA -
iterations 100 -rows 3
Policy Group      Disk Number of HDD Disks
-----

```

```

-total-          40%          27
pg1              22%          5
slow            10%          10
fast             8%           12
_System_Default  7%           20
-total-          42%          27
pg1              22%          5
slow            12%          10
fast             8%           12
_System_Default  7%           20

```

The example above displays the total disk utilization for the 3 QoS policy groups with the highest disk utilization and it refreshes the display *100* times before terminating.

```

cluster1::> qos statistics resource disk show -node local -
iterations 100 -policy-group pg1
Policy Group      Disk Number of HDD Disks
-----
-total-          3%           10
pg1              1%           24
-total-          3%           10
pg1              1%           24
-total-          3%           10
pg1              1%           24
-total-          3%           10
pg1              1%           24

```

qos statistics volume commands

The volume directory

qos statistics volume characteristics commands

The characteristics directory

qos statistics volume characteristics show

Display volume characteristics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume characteristics show` command displays data that characterizes the behavior of volumes.

The command displays the following data:

- QoS volume name (Workload)
- QoS workload ID (ID)
- Input/output operations per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total IOPS (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all volumes. Other columns in this row are either totals or averages.

Parameters

`[-node <nodename>/local]` - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`{ [-rows <integer>] }` - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

`| -vserver <vserver name> - Vserver Name`

Specifies the Vserver to which the volume belongs.

`-volume <volume name> - Volume Name`

Selects the characteristic data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`[-refresh-display { true/false }] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`[-show-flexgroup-as-constituents { true/false }] - Display Flexgroups as Constituents`

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume characteristics show -iterations 100 -

qos statistics volume latency commands

The latency directory

qos statistics volume latency show

Display latency breakdown data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume latency show` command displays the average latencies for volumes on Data ONTAP subsystems.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the Network subsystem (Network)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
- Latency observed per I/O operation in the Data management subsystem (Data)
- Latency observed per I/O operation in the Storage subsystem (Disk)
- Latency observed per I/O operation for QoS Policy Group Ceiling (QoS Max)

- Latency observed per I/O operation for QoS Policy Group Floor (QoS Min)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store(Cloud) operations
- Latency observed per I/O operation for FlexCache (FlexCache) operations
- Latency observed per I/O operation for Synchronous Snapmirror (SM Sync) operations
- Latency observed per I/O operation for Volume Activation (VA) operations

The results displayed per iteration are sorted by the total latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms) observed across all volumes.

Parameters

`[-node <nodename>/local]` - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

`| -vserver <vserver name> - Vserver Name`

Specifies the Vserver to which the volume belongs.

`-volume <volume name> - Volume Name`

Selects the latency data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times that the command refreshes the display with updated data before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`[-refresh-display { true/false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`[-show-flexgroup-as-constituents { true/false}] - Display Flexgroups as Constituents`

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume latency show -iterations 100 -rows 3

qos statistics volume performance commands

The performance directory

qos statistics volume performance show

Display system performance data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume performance show` command shows the current system performance that each volume is achieving.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all volumes. Other columns in this row are either totals or averages.

Parameters

`[-node {<nodename>/local}] - Node`

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

`[-vserver <vserver name> - Vserver Name`

Specifies the Vserver to which the volume belongs.

`-volume <volume name> - Volume Name`

Selects the performance data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`[-show-flexgroup-as-constituents {true/false}] - Display Flexgroups as Constituents`

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume performance show -iterations 100 -rows
3

qos statistics volume resource commands

The resource directory

qos statistics volume resource cpu commands

The cpu directory

qos statistics volume resource cpu show

Display CPU resource utilization data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume resource cpu show` command displays the CPU utilization for volumes per node.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all volumes.

Parameters

-node {<nodename>/local} - Node

Selects the volumes that match this parameter value.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name

Specifies the Vserver to which the volume belongs.

-volume <volume name> - Volume Name

Selects the CPU utilization data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display { true/false }] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-show-flexgroup-as-constituents { true/false }] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics volume resource cpu show -node nodeA -
iterations 100 -rows 3
Workload          ID    CPU
-----
--total- (100%)   -    9%
vs0vol1-wid-102   102   5%
vs0vol2-wid-121   121   2%
vs2_vol0-wid-..   212   2%
-total- (100%)   -    8%
vs0vol1-wid-102   102   5%
vs0vol2-wid-121   121   2%
vs2_vol0-wid-..   212   1%
```

The example above displays total CPU utilization for the 3 volumes with the highest CPU utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics volume resource cpu show -node local -vserver
vs0 -volume vs0_vol1 -iterations 100
Workload          ID    CPU
-----
-total- (100%)   -    2%
vs0_vol1-wid7..  7916   2%
-total- (100%)   -    2%
vs0_vol1-wid7..  7916   2%
-total- (100%)   -    1%
vs0_vol1-wid7..  7916   1%
-total- (100%)   -    2%
vs0_vol1-wid7..  7916   1%
-total- (100%)   -    2%
vs0_vol1-wid7..  7916   2%
```

The following example shows the output when the session privilege level is "diagnostic".

```

cluster1::*> qos statistics volume resource cpu show -node nodeB -
iterations 100 -rows 3
Workload          ID    CPU Waf1_exempt Kahuna Network Raid  Exempt

qos statistics volume resource disk commands

The disk directory

qos statistics volume resource disk show

Display disk resource utilization data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume resource disk show` command displays the disk utilization for volumes per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command only supports hard disks.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all volumes.

Parameters

-node {<nodename>/local} - Node

Selects the volumes that match this parameter value.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name

Specifies the Vserver to which the volume belongs.

-volume <volume name> - Volume Name

Selects the disk utilization data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-show-flexgroup-as-constituents {true/false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1:> qos statistics volume resource disk show -node nodeB
-iterations 100 -rows 3
Workload          ID  Disk Number of HDD Disks
-----
-total- (100%)    -   30%                      4
vs0vol1-wid101    101  12%                      2
vs0vol2-wid121    121  10%                      1
vol0-wid1002      1002  8%                       1
-total- (100%)    -   30%                      4
vs0vol1-wid101    101  12%                      2
vs0vol2-wid121    121  10%                      1
vol0-wid1002      1002  8%                       1
```

The example above displays total disk utilization for the 3 volumes with the highest disk utilization and it refreshes the display 100 times before terminating.

```
cluster1:> qos statistics volume resource disk show -node local
-vserver vs0 -volume vs0_vol0 -iterations 100
Workload          ID  Disk Number of HDD Disks
-----
-total-           -   5%                      10
vs0_vol0-wid1..  15658  1%                      6
-total-           -   5%                      10

qos statistics workload commands

Detail by workload

qos statistics workload characteristics commands

Workload characterization

qos statistics workload characteristics show

Display QoS workload characterization

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload characteristics show` command displays data that characterizes the behavior of QoS workloads.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total IOPS (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS workloads. Other columns in this row are either totals or averages.

Parameters

`[-node {<nodename>/local}] - Node`

Selects the QOS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

`[-policy-group <text>] - QoS Policy Group Name`

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[`-workload <text>`] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[`-workload-id <integer>`]] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[`-show-flexgroup-as-constituents { true/false }`] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics workload characteristics show -iterations 100
-rows 4

qos statistics workload latency commands

Latency breakdown

qos statistics workload latency show

Display latency breakdown data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload latency show` command displays the average latencies for QoS workloads on Data ONTAP subsystems.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the Network subsystem (Network)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)

- Latency observed per I/O operation in the Data management subsystem (Data)
- Latency observed per I/O operation in the Storage subsystem (Disk)
- Latency observed per I/O operation for QoS Policy Group Ceiling (QoS Max)
- Latency observed per I/O operation for QoS Policy Group Floor (QoS Min)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store(Cloud) operations
- Latency observed per I/O operation for FlexCache (FlexCache) operations
- Latency observed per I/O operation for Synchronous Snapmirror (SM Sync) operations
- Latency observed per I/O operation for Volume Activation (VA) operations

The results displayed per iteration are sorted by the total latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms) observed across all QoS workloads.

Parameters

`[-node <nodename>/local]` - Node

Selects the QOS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`[-iterations <integer>]` - Number of Iterations

Specifies the number of times that the command refreshes the display with updated data before terminating. If you do not specify this parameter, the command continues to run until you interrupt it by pressing Ctrl-C.

`[-refresh-display {true/false}]` - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`{ [-rows <integer>]}` - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

`[-policy-group <text>]` - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`| [-workload <text>]` - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`| [-workload-id <integer>]` - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

`[-show-flexgroup-as-constituents {true/false}]` - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics workload latency show -iterations 100 -rows 3
Workload      ID Latency      Network Cluster      Data      Disk Qos

qos statistics workload performance commands

System performance

qos statistics workload performance show

Display system performance data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload performance show` command shows the current system performance that each QoS workload is achieving.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS workloads. Other columns in this row are either totals or averages.

Parameters**`[-node {<nodename>/local}] - Node`**

Selects the QoS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

`[-policy-group <text>] - QoS Policy Group Name`

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`[-workload <text>] - QoS Workload Name`

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`[-workload-id <integer>] - QoS Workload ID`

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

`[-show-flexgroup-as-constituents {true/false}] - Display Flexgroups as Constituents`

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1:> qos statistics workload performance show -iterations 100 -
rows 4
Workload          ID      IOPS      Throughput      Latency

qos statistics workload resource commands

Resource utilization

qos statistics workload resource cpu commands

CPU utilization

qos statistics workload resource cpu show

Display CPU resource utilization data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload resource cpu show` command displays the CPU utilization for QoS workloads per node.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all QoS workloads.

Parameters**-node {<nodename>/local} - Node**

Selects the QoS workloads that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

[-workload-id <integer>] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents {true/false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1::> qos statistics workload resource cpu show -node nodeA -
iterations 100 -rows 3
Workload      ID      CPU
-----
--total- (100%) -      9%

qos statistics workload resource disk commands

Disk utilization

qos statistics workload resource disk show

Display disk resource utilization data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload resource disk show` command displays the disk utilization for QoS workloads per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command displays disk utilization for system-defined

workloads; however, their disk utilization is not included in the total utilization. The command only supports hard disks.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all QoS workloads.

Parameters

-node {<nodename>/local} - Node

Selects the QOS workloads that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true/false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload-id <integer>] - QoS Workload ID

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents {true/false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVols and Flexgroup Constituents. Otherwise it will display data for FlexVols and Flexgroups.

Examples

```
cluster1:>> qos statistics workload resource disk show -node
nodeB -iterations 100 -rows 3
Workload          ID  Disk  Number of HDD Disks
-----
-total- (100%)    -   30%                4
_RAID              -   20%                4
vs0-wid101        101  12%                2
file-1-wid121     121  10%                1
```

```

vol0-wid1002      1002      8%          1
_WAFL             -        7%          3
-total- (100%)    -       30%          4
vs0-wid101        101      12%          2
file-1-wid121     121      10%          1
_RAID             -       10%          4
vol0-wid1002      1002      8%          1
_WAFL             -        7%          3

```

The example above displays total disk utilization for the 3 QoS workloads with the highest disk utilization and it refreshes the display 100 times before terminating.

```

cluster1::> qos statistics workload resource disk show -node local -
iterations 100 -rows 2 -policy-group pgl

```

qos workload commands

QoS workload settings

qos workload show

Display a list of workloads

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Shows the current status of workloads on a cluster. Use this command to determine the types of workloads that are currently on a cluster. The types of workloads include: system-defined, preset, and user-defined. The system generates system-defined and preset workloads. You cannot create, modify, or delete these workloads. Also, you can only modify or delete a user-defined workload, but cannot create one.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-workload <text>] - Workload Name

If you use this parameter, the command displays the workloads that contain the specified workload name.

[-uuid <UUID>] - Workload UUID (privilege: advanced)

If you use this parameter, the command displays the workloads that contain the specified UUID.

[-class <QoS Configuration Class>] - Workload Class

If you use this parameter, the command displays the workloads that contain the specified class. The Class options include system-defined, preset, and user-defined.

[-wid <integer>] - Workload ID

If you use this parameter, the command displays the workloads that contain the specified internal workload ID.

[-category <text>] - Workload Category

If you use this parameter, the command displays the workloads that contain the specified category. The category options include Scanner and Efficiency.

[-policy-group <text>] - Policy Group Name

If you use this parameter, the command displays the workloads that match the specified policy group name.

[-read-ahead <text>] - Read-ahead Tunables

If you use this parameter, the command displays the workloads that contain the specified read-ahead cache tunable.

[-vserver <vserver name>] - Vserver

If you use this parameter, the command displays the workloads that match the specified Vserver.

[-volume <volume name>] - Volume

If you use this parameter, the command displays the workloads that match the specified volume.

[-qtree <qtree name>] - Qtree Name

If you use this parameter, the command displays the workloads that match the specified Qtree name.

[-lun <text>] - LUN Name

If you use this parameter, the command displays the workloads that match the specified LUN name.

[-file <text>] - File Path

If you use this parameter, the command displays the workloads that match the specified file path.

[-max-throughput <qos_tput>] - Maximum Throughput

Selects the workloads that match this parameter value

A maximum throughput limit specifies the throughput in IOPS that the workload must not exceed.

[-min-throughput <qos_tput>] - Minimum Throughput

Selects the workloads that match this parameter value

A minimum throughput specifies the desired performance level for a workload in IOPS.

[-is-adaptive {true/false}] - Adaptive

If you use this parameter, the command displays only adaptive workloads.

[-is-constituent {true/false}] - Is Constituent Volume

If this parameter is specified, the command displays information only about storage objects that either are or are not constituents of a FlexGroup, depending on the value provided.

Examples

```
cluster1::> qos workload show -class user-defined
Workload      Wid    Policy Group Vserver  Volume  LUN    Qtree  File Path
-----
vs2-widl100   100    pg1          vs2      -        -      -      -
```

san commands

The san directory

san config commands

SAN cluster-wide configuration directory

san config show

Show SAN configuration options for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The command displays cluster SAN configuration options.

Examples

The following example displays the cluster SAN configuration.

```
cluster1::> san config show
All SAN Array: true
```

Security Commands

The security directory

The `security` commands enable you to manage security for the management interface.

security snmpusers

Show SNMP users

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security snmpusers` displays the following information about SNMP users:

- User name
- Authentication method
- Hexadecimal engine ID
- Authentication protocol
- Privacy protocol
- Security group

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver Name>] - Vserver

If this parameter is specified, the command displays information only about the SNMP user or users that belong to the specified Vserver.

[-username <text>] - User Name

If this parameter is specified, the command displays information only about the SNMP user with the specified user name.

[-authmethod <text>] - Authentication Method

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified authentication method. Possible values include the following:

- community-SNMP community strings
- usm-SNMP user security model

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

If this parameter is specified, the command displays information only about the remote SNMP user or users that belong to the specified remote switch.

`[-engineid <Hex String>] - Engine Id`

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified engine ID, specified in hexadecimal format.

`[-authprotocol <text>] - Authentication Protocol`

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified authentication protocol.

`[-privprotocol <text>] - Privacy Protocol`

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified privacy protocol.

`[-securitygroup <text>] - Security Group`

If this parameter is specified, the command displays information only about the SNMP user or users that belong to the specified security group.

Examples

The following example displays information about all SNMP users:

```
cluster1::> security snmpusers
```

Vserver	UserName	AuthMethod	EngineId	Protocols Auth Priv Group	Security Group	Remote Switch IP
cluster1	comml	community	8000031504312d38302d313233343536	-	-	-
cluster1	private	community	8000031504312d38302d313233343536	-	-	readwrite
-	-	-	-	-	-	readwrite
cluster1	snmpuser1	usm	80000634b21000000533296869	-	-	readwrite
172.2.20.91	vs1	snmpuser2	community	8000031504312d38302d31323334353632	-	-
-	-	-	-	-	-	readwrite
vs1	snmpuser3	usm	8000031504312d38302d31323334353632	-	-	readwrite
-	-	-	-	-	-	readwrite -

security audit commands

Manage administrative audit logging settings

security audit modify

Set administrative audit logging settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security audit modify` command modifies the following audit-logging settings for the management interface:

- Whether get requests for the CLI are audited
- Whether get requests for the Data ONTAP API (ONTAPI) are audited

Parameters**[-cliget {on/off}] - Enable Auditing of CLI Get Operations**

This specifies whether get requests for the CLI are audited. The default setting is *off*.

[-httpget {on/off}] - Enable Auditing of HTTP Get Operations

This specifies whether get requests for the web (HTTP) interface are audited. The default setting is *off*.

[-ontapiget {on/off}] - Enable Auditing of Data ONTAP API Get Operations

This specifies whether get requests for the Data ONTAP API (ONTAPI) interface are audited. The default setting is *off*.

Examples

The following example turns off auditing of get requests for the CLI interface:

```
cluster1::> security audit modify -cliget off
```

security audit show

Show administrative audit logging settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security audit show` command displays the following audit-logging settings for the management interface:

- Whether get requests for the CLI are audited
- Whether get requests for the web (HTTP) interface are audited
- Whether get requests for the Data ONTAP API (ONTAPI) are audited

Audit log entries are written to the 'audit' log, viewable via the 'security audit log show' command.

Examples

The following example displays the audit-logging settings for the management interface:

```
cluster1::> security audit show
      Auditing State for
Operation Get Requests
-----
      CLI off
      HTTP off
      ONTAPI off
```

security audit log commands

Display administrative audit logging entries

security audit log show

Display audit entries merged from multiple nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security audit log show` command displays cluster-wide audit log messages. Messages from each node are interleaved in chronological order.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-detail]

This display option shows the individual fields of the audit record.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-timestamp <Date>] - Log Entry Timestamp

Selects the entries that match the specified input for timestamp. This will be in a human-readable format <day> <month> <day of month> <hour>:<min>:<sec> <year> in the local timezone.

[-node {<nodename>/local}] - Node

Selects the entries that match the specified input for node.

[-entry <text>] - Log Message Entry

Selects the entries that match the specified input for entry.

[-session-id <text>] - Session ID

This is the "session id" for this audit record. Each ssh/console session is assigned a unique session ID. Each ZAPI/HTTP/SNMP request is assigned a unique session ID.

[-command-id <text>] - Command ID

This is useful with ssh/console sessions. Each command in a session is assigned a unique command ID. Each ZAPI/HTTP/SNMP request does not have a command ID.

[-application <text>] - Protocol

This the application the used

[-location <text>] - Remote user location

The remote IP address or remote access point.

[-vserver <text>] - Vserver name

Storage Virtual Machine name

[-username <text>] - Username

Username

[-input <text>] - Command being executed

The operation being attempted

[-state {<Pending>/<Success>/<Error>}] - State of this audit request

State of this request

[-message <text>] - Additional information and/or error message

Additional information which may be error or informative message.

Show Commands

Manage Digital Certificates

Field description for all the certificate show commands.

security certificate create

Create and Install a Self-Signed Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security certificate create` command creates and installs a self-signed digital certificate, which can be used for server authentication, for signing other certificates by acting as a certificate authority (CA), or for Data ONTAP as an SSL client. The certificate function is selected by the `-type` field. Self-signed digital certificates are not as secure as certificates signed by a CA. Therefore, they are not recommended in a production environment.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the name of the Vserver on which the certificate will exist.

-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name

This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - creates and installs a self-signed digital certificate and intermediate certificates to be used for server authentication
- *root-ca* - creates and installs a self-signed digital certificate to sign other certificates by acting as a certificate authority (CA)
- *client* - includes a self-signed digital certificate and private key to be used for Data ONTAP as an SSL client

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It must be unique within a Vserver. If not provided, it is automatically generated by the system.

-size <size of requested certificate in bits> - Size of Requested Certificate in Bits

This specifies the number of bits in the private key. The larger the value, the more secure is the key. The default is 2048. Possible values include *512*, *1024*, *1536*, *2048* and *3072* when the "FIPS Mode" in "security config" is false. When the "FIPS Mode" is true, the possible values are *2048* and *3072*.

-country <text> - Country Name

This specifies the country where the Vserver resides. The country name is a two-letter code. The default is US. Here is the list of country codes: [Country Codes](#)

-state <text> - State or Province Name

This specifies the state or province where the Vserver resides.

-locality <text> - Locality Name

This specifies the locality where the Vserver resides. For example, the name of a city.

-organization <text> - Organization Name

This specifies the organization where the Vserver resides. For example, the name of a company.

-unit <text> - Organization Unit

This specifies the unit where the Vserver resides. For example, the name of a section or a department within a company.

-email-addr <mail address> - Contact Administrator's Email Address

This specifies the email address of the contact administrator for the Vserver.

-expire-days <integer> - Number of Days until Expiration

This specifies the number of days until the certificate expires. The default value is 365 days. Possible values are between *1* and *3652*.

-protocol <protocol> - Protocol

This specifies the protocol type. This parameter currently supports only the SSL protocol type. The default is SSL.

-hash-function <hashing function> - Hashing Function

This specifies the cryptographic hashing function for signing the certificate. The default is SHA256. Possible values include *SHA1*, *SHA256*, *MD5*, *SHA224*, *SHA384* and *SHA512* when the "FIPS Mode" in "security config" is false. When the "FIPS Mode" is true, the possible values are *SHA224*, *SHA256*, *SHA384* and *SHA512*

Examples

This example creates a server type, self-signed digital certificate for a Vserver named vs0 at a company whose custom common name is *www.example.com* and whose Vserver name is vs0.

```
cluster1::> security certificate create -vserver vs0 -common-name
www.example.com -type server
```

This example creates a root-ca type, self-signed digital certificate with a 2048-bit private key generated by the SHA256 hashing function that will expire in 365 days for a Vserver named vs0 for use by the Software group in IT at a company whose custom common name is

`www.example.com`, located in Sunnyvale, California, USA. The email address of the contact administrator who manages the Vserver is `web@example.com`.

```
cluster1::> security certificate create -vserver vs0 -common-name
www.example.com -type root-ca -size 2048 -country US -state California -
locality Sunnyvale -organization IT -unit Software -email-addr
web@example.com -expire-days 365 -hash-function SHA256
```

This example creates a client type of self-signed digital certificate for a Vserver named `vs0` at a company that uses Data ONTAP as an SSL client. The company's custom common name is `www.example.com` and its Vserver name is `vs0`.

```
cluster1::> security certificate create -vserver vs0 -common-name
www.example.com -type client -size 2048 -country US -state California -
locality Sunnyvale -organization IT -unit Software -email-addr
web@example.com -expire-days 365 -hash-function SHA256
```

security certificate delete

Delete an Installed Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an installed digital security certificate.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the Vserver that contains the certificate.

-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name

This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

[-serial <text>] - Serial Number of Certificate

This specifies the certificate serial number.

-ca <text> - Certificate Authority

This specifies the certificate authority (CA).

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - includes server certificates and intermediate certificates
- *root-ca* - includes a self-signed digital certificate to sign other certificates by acting as a certificate authority (CA)

- *client-ca* - includes the public key certificate for the root CA of the SSL client. If this client-ca certificate is created as part of a root-ca, it will be deleted along with the corresponding deletion of the root-ca.
- *server-ca* - includes the public key certificate for the root CA of the SSL server to which Data ONTAP is a client. If this server-ca certificate is created as part of a root-ca, it will be deleted along with the corresponding deletion of the root-ca.
- *client* - includes a public key certificate and private key to be used for Data ONTAP as an SSL client

`[-subtype <kmip-cert>]` - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

`[-cert-name <text>]` - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

Examples

This example deletes a root-ca type digital certificate for a Vserver named vs0 in a company named *www.example.com* with serial number 4F57D3D1.

```
cluster1::> security certificate delete -vserver vs0 -common-name
www.example.com -ca www.example.com -type root-ca -serial 4F57D3D1
```

security certificate generate-csr

Generate a Digital Certificate Signing Request

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command generates a digital certificate signing request and displays it on the console. A certificate signing request (CSR or certification request) is a message sent securely to a certificate authority (CA) via any electronic media, to apply for a digital identity certificate.

Parameters

`-common-name <FQDN or Custom Common Name>` - FQDN or Custom Common Name

This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

`[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits`

This specifies the number of bits in the private key. The higher the value, the more secure is the key. The default is 2048. Possible values include 512, 1024, 1536 and 2048.

`[-country <text>] - Country Name`

This specifies the country where the Vserver resides. The country name is a two-letter code. The default is US. Here is the list of country codes: [Country Codes](#)

`[-state <text>] - State or Province Name`

This specifies the state or province where the Vserver resides.

`[-locality <text>] - Locality Name`

This specifies the locality where the Vserver resides. For example, the name of a city.

`[-organization <text>] - Organization Name`

This specifies the organization where the Vserver resides. For example, the name of a company.

`[-unit <text>] - Organization Unit`

This specifies the unit where the Vserver resides. For example, the name of a section or a department within a company.

`[-email-addr <mail address>] - Contact Administrator's Email Address`

This specifies the email address of the contact administrator for the Vserver.

`[-hash-function <hashing function>] - Hashing Function`

This specifies the cryptographic hashing function for signing the certificate. The default is SHA256. Possible values include *SHA1*, *SHA256* and *MD5*.

Examples

This example creates a certificate-signing request with a 2048-bit private key generated by the SHA256 hashing function for use by the Software group in IT at a company whose custom common name is *www.example.com*, located in Sunnyvale, California, USA. The email address of the contact administrator who manages the Vserver is *web@example.com*.

```
cluster1::> security certificate generate-csr -common-name
www.example.com-size 2048 -country US -state California -locality
Sunnyvale -organization IT -unit Software
-email-addr web@example.com -hash-function SHA256
```

security certificate install

Install a Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security certificate install` command installs digital security certificates signed by a certificate authority (CA) and the public key certificate of the root CA. Digital security certificates also include the intermediate certificates to construct the chain for server certificates (the *server* type), client-side root CA certificates (the *client-ca* type), or server-side root CA certificates (the *server-ca* type). with FIPS enabled, the following restrictions apply to the certificate getting installed. *server/client/server-ca/client-ca*: Key size \geq 2048, *server/client*: Hash function (No MD-5, No SHA-1), *server-ca/client-ca*: (Intermediate CA), Hash Function (No MD-5, No SHA-1), *server-ca/client-ca*: (Root CA), Hash Function (No MD-5)

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the Vserver that contains the certificate.

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - includes server certificates and intermediate certificates.
- *client-ca* - includes the public key certificate for the root CA of the SSL client
- *server-ca* - includes the public key certificate for the root CA of the SSL server to which Data ONTAP is a client
- *client* - includes a self-signed or CA-signed digital certificate and private key to be used for Data ONTAP as an SSL client

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-kmip-server-ip <IP Address>] - (DEPRECATED)-IPv4 and IPv6 address

Note: This parameter is deprecated and might be removed in the future releases of Data ONTAP.

This parameter is applicable only to the *kmip-cert* subtype. It specifies the IP address of the KMIP server.

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It must be unique within a Vserver. If not provided, it is automatically generated by the system.

Examples

This example installs a CA-signed certificate (along with intermediate certificates) for a Vserver named vs0.

```
cluster1::> security certificate install -vserver vs0 -type server

```

You should keep a copy of the CA-signed digital certificate for future reference.

This example installs a CA certificate for server authentication for a Vserver named vs0. In this case, Data ONTAP acts as an SSL client.

```
cluster1::> security certificate install -vserver vs0 -type server-ca
```

```
Please enter Certificate: Press <Enter> when done
```

```

You should keep a copy of the CA-signed digital certificate for future reference.

security certificate print

Display the contents of a certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the details of either an installed certificate or by reading a certificate from user input.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver that has the certificate installed.

{ [-cert-name <text>] - Installed Certificate Name

Use this parameter to specify the unique name of the installed certificate to read and display.

| [-cert-uuid <UUID>]] - Installed Certificate UUID

Use this parameter to specify the unique UUID of the installed certificate to read and display. With no name or UUID specified, the certificate will read and display from user input.

Examples

The following example reads and prints the details of the certificate.

```

cluster1:> security certificate print -vserver vs0 -cert-name
AAACertificateServices

security certificate rename

Rename a certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows the user to modify the system's identifier for an installed digital certificate. It does not alter the certificate itself.

Parameters

-vserver <Vserver Name> - Vserver Name

This specifies the name of the Vserver on which the certificate exists.

-cert-name <text> - Existing Certificate Name

This specifies the current system identifier for the certificate.

-new-name <text> - New Certificate Name

This specifies the desired system identifier for the certificate. It must be unique among certificates in the Vserver.

Examples

```
cluster1::> security certificate rename -vserver vs0 -cert-name
AAACertificateServices -new-nameAAACertServ
```

security certificate show

Display Installed Digital Certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the installed digital certificates. Some details are displayed only when you use the command with the *-instance* parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true/false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true/false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

Examples

The examples below display information about digital certificates.

```
cluster1::> security certificate show

security certificate show-generated

Display ONTAP generated certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the Data ONTAP generated digital digital certificates. Some details are displayed only when you use the command with the *-instance* parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true/false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true/false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

security certificate show-truststore

Display default truststore certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the default CA certificates that come pre-installed with Data ONTAP. Some details are displayed only when you use the command with the *-instance* parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true/false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true/false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

Examples

The examples below display information about the pre-installed truststore digital certificates.

```
cluster1::> security certificate show-truststore

security certificate show-user-installed

Display user installed certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the user installed digital certificates. Some details are displayed only when you use the command with the *-instance* parameter. In systems upgraded to Data ONTAP 9.4 or later, existing Data ONTAP generated certificates will also be shown as part of this command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Note: This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of Data ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true/false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true/false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

security certificate sign

Sign a Digital Certificate using Self-Signed Root CA

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command signs a digital certificate signing request and generates a certificate using a Self-Signed Root CA certificate in either PEM or PKCS12 format. You can use the [security certificate generate-csr](#) command to generate a digital certificate signing request.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the name of the Vserver on which the signed certificate will exist.

-ca <text> - Certificate Authority to Sign

This specifies the name of the Certificate Authority that will sign the certificate.

-ca-serial <text> - Serial Number of CA Certificate

This specifies the serial number of the Certificate Authority that will sign the certificate.

[-expire-days <integer>] - Number of Days until Expiration

This specifies the number of days until the signed certificate expires. The default value is 365 days. Possible values are between 1 and 3652.

[-format <certificate format>] - Certificate Format

This specifies the format of signed certificate. The default value is PEM. Possible values include *PEM* and *PKCS12*.

[-destination {(ftp/http)://(hostname/IPv4 Address/'['IPv6 Address']')...}] - Where to Send File

This specifies the destination to upload the signed certificate. This option can only be used when the format is PKCS12.

[-hash-function <hashing function>] - Hashing Function

This specifies the cryptographic hashing function for the self-signed certificate. The default value is SHA256. Possible values include *SHA1*, *SHA256* and *MD5*.

Examples

This example signs a digital certificate for a Vserver named vs0 using a Certificate Authority certificate that has a ca of *www.ca.com* and a ca-serial of 4F4EB629 in PEM format using the SHA256 hashing function.

```

cluster1::> security certificate sign -vserver vs0 -ca www.ca.com -ca-serial 4F4EB629 -expire-days 36 -format PEM -hash-function SHA256

```

Please enter Certificate Signing Request(CSR): Press <Enter> when done

security certificate ca-issued commands

Show Digital Certificates Issued by Self-Signed CA

security certificate ca-issued revoke

Revoke a Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command revokes a digital certificate signed by a Self-Signed Root CA.

Parameters

-vserver <Vserver Name> - Vserver

This specifies the name of the Vserver on which the certificate is stored.

-serial <text> - Serial Number of Certificate

This specifies the serial number of the certificate.

-ca <text> - Certificate Authority

This specifies the name of the Certificate Authority whose certificate will be revoked.

-ca-serial <text> - Serial Number of CA Certificate

This specifies the serial number of Certificate Authority.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

This specifies a fully qualified domain name (FQDN) or custom common name or the name of a person. This field is optional if ca-serial is specified.

Examples

This example revokes a signed digital certificate for a Vserver named vs0 with serial as 4F5A2DF2 for a Certificate Authority certificate that has a ca of *www.ca.com* and a ca-serial of 4F4EB629.

```
cluster1::> security certificate ca-issued revoke -vserver vs0 -serial
4F5A2DF2 -ca www.ca.com -ca-serial 4F4EB629
```

security certificate ca-issued show

Display CA-Issued Digital Certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the following information about the digital certificates issued by the self-signed root-ca:

- Vserver
- Serial number of certificate

- FQDN or custom common name or the name of a person
- Serial number of CA certificate
- Status (**active**, **revoked**)
- Certificate Authority
- Expiration date
- Revocation date

To display more details, run the command with the **-instance** parameter. This will add the following information:

- Country name
- State or province name
- Locality name
- Organization name
- Organization unit
- Contact administrator's email address

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-ca-serial <text>] - Serial Number of CA Certificate

Selects the certificates that match this parameter value.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-status <status of certificate>] - Status of Certificate

Selects the certificates that match this parameter value. Possible values include active and revoked.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-revocation <Date>] - Certificate Revocation Date

Selects the certificates that match this parameter value.

[-country <text>] - Country Name (2 letter code)

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name (full name)

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name (e.g. city)

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name (e.g. company)

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit (e.g. section)

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Email Address (Contact Name)

Selects the certificates that match this parameter value.

Examples

The examples below display information about CA issued digital certificates.

```
cluster1::> security certificate ca-issued show
```

Vserver Status	Serial Number	Common Name	Serial Number of CA's Certificate
vs0 active	4F5A2C90	example.com	4F4EB629
Certificate Authority: vs0.cert			
Expiration Date: Sat Apr 14 16:15:13 2012			
Revocation Date: -			
vs0 revoked	4F5A2DF2	example.com	4F4EB629
Certificate Authority: vs0.cert			
Expiration Date: Sat Apr 14 16:21:06 2012			
Revocation Date: Fri Mar 09 17:08:30 2012			

2 entries were displayed.

```
cluster1::> security certificate ca-issued show -instance
```

```

Vserver: vs0
Serial Number of Certificate: 4F5A2C90
Certificate Authority: vs0.cert
Serial Number of CA Certificate: 4F4EB629
FQDN or Custom Common Name: example.com
Status of Certificate: active
Certificate Expiration Date: Sat Apr 14 16:15:13 2012
Certificate Revocation Date: -
Country Name (2 letter code): US
State or Province Name (full name): California
Locality Name (e.g. city): Sunnyvale
Organization Name (e.g. company): example
Organization Unit (e.g. section): IT
Email Address (Contact Name): web@example.com
```

security certificate config commands

The config directory

security certificate config modify

Modify the certificate management configurations

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the certificate management configuration information for the cluster.

Parameters

[-min-security-strength <bits of security strength>] - Minimum Security Strength

Use this parameter to modify the allowed minimum security strength for certificates. The security bits mapping to RSA and ECDSA key length are as follows:

Security Bits	Asymmetric Key Length
Elliptic Curve Key Length	
112	2048
128	3072
192	4096

FIPS supported values are restricted to 112 and 128.

Note: This does not affect root CA certificates.

[-expiration-warn-threshold <integer>] - Minimum Days to EMS for Expiring Certificates

Use this parameter to modify the number of days prior to certificate expiration the system sends a warning EMS event.

Examples

The following example modifies the minimum security strength allowed for certificates.

```
cluster-1::> security certificate config modify -min-security-strength 192
```

security certificate config show

Displays the certificate management configurations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the certificate management configuration information for the cluster.

"min-security-strength" - If you specify this parameter, the command displays the minimum allowed security strength for certificates.

"expiration-warn-threshold" - If you specify this parameter, the command displays the minimum number of days before expiration date configured for event management system (EMS) notification of expiring certificates.

Examples

The following example lists minimum security strength certificate management configuration.

```
cluster-1::> security certificate config show -fields min-security-strength
Minimum Security Strength
-----
112
```

Show Commands

truststore

Field description for all the certificate show commands.

security certificate truststore check

Initiate a TLS connection and identify the root CA certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command allows the user to check if the node can use the installed set of CA certificates to establish a secure connection with the specified server. If the connection attempt fails, the system reports which expected certificates are missing. If the attempt succeeds, the system displays details of the certificates used.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver that needs the connectivity check.

-server <Hostname and Port> - Server Name

Use this parameter to specify the server to establish a connection with and look up the required CA certificate.

Examples

The following example demonstrates a missing CA certificate:

```
cluster1::*> security certificate truststore check -vserver cluster1 -server
example.com:443

Error: command failed: Missing certificate with subject name: "CN =
ExampleRoot, C = US"
```

The following example demonstrates the required certificate being present:

```
cluster1::*> security certificate truststore check -server example.com:443

CA certificate with cert-name "ExampleRoot" is already installed in the
truststore. Use "security certificate show -cert-name ExampleRoot" to see
the details of the CA certificate.
```

security certificate truststore clear

Clear the default root certificates from truststore

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security certificate truststore clear` command deletes the pre-installed certificates of the type 'server-ca'. If you delete these certificates, some of the applications performing SSL communication can fail.

Examples

The following example removes the default certificate bundle:

```
cluster1::> security certificate truststore clear
```

security certificate truststore load

Load the default root certificates to truststore

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security certificate truststore load` command installs default root certificates in the certificate table of type 'server-ca'. These are the certificates required to validate any incoming server certificate during the SSL handshake process.

Parameters

[-path <text>] - File to load certificates from

This specifies the path to the certificate bundle. This optional parameter can have an empty value (the default).

[-ontap-version <ontap_version>] - Certificates from specific ONTAP version

This specifies the ONTAP version in which the certificates were introduced. Only those certificates will be loaded. This optional parameter can have an empty value (the default) which indicates that no filtering on version is done.

Examples

The following example installs the default certificate bundle:

```
cluster1::> security certificate truststore load
```

security certificate truststore show

Display default truststore certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the default CA certificates that come pre-installed with Data ONTAP. Some details are displayed only when you use the command with the `-instance` parameter.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true/false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true/false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

Examples

The examples below display information about the pre-installed truststore digital certificates.

```
cluster1::> security certificate truststore show
```

Vserver	Serial Number	Certificate Name	Type
vs0	4F4E4D7B	www.example.com	server-ca
	Certificate Authority: www.example.com		
	Expiration Date: Thu Feb 28 16:08:28 2013		

```
cluster1::> security certificate truststore show -instance
```

```

Vserver: vs0
Certificate Name: www.example.com

security config commands

Manage Cluster Security Configuration

security config modify

Modify Security Configuration Options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config modify` command modifies the existing cluster-wide security configuration. If you enable FIPS-compliant mode, the cluster will automatically select only compliant TLS protocols (currently TLSv1.2 and TLSv1.1). Non-compliant protocols are not enabled when FIPS-compliant mode is disabled. Use the **-supported-protocols** parameter to include or exclude TLS protocols independently from the FIPS mode. All protocols at or above the lowest version specified will be enabled, even those not explicitly specified. By default, FIPS mode is disabled, and Data ONTAP supports the TLSv1.2, TLSv1.1 and TLSv1 protocols. For backward compatibility, Data ONTAP supports adding SSLv3 to the supported-protocols list when FIPS mode is disabled. Use the **-supported-ciphers** parameter to configure only AES, or AES and 3DES, or disable weak ciphers such as RC4 by specifying `!RC4`. By default the supported-cipher setting is `ALL:!LOW:!aNULL:!EXP:!eNULL`. This setting means that all supported cipher suites for the protocols are enabled, except the ones with no authentication, no encryption, no exports, and low encryption cipher suites (currently those using 64-bit or 56-bit encryption algorithms). Select a cipher suite which is available with the corresponding selected protocol. An invalid configuration may cause some functionality to fail to operate properly. Refer to "<https://www.openssl.org/docs/apps/ciphers.html>" published by the OpenSSL software foundation for the correct cipher string syntax. After modifying the security configuration, reboot all the nodes manually.

Parameters**-interface <SSL> - FIPS-Compliant Interface**

Selects the FIPS-compliant interface. Default is `SSL`.

[-is-fips-enabled {true/false}] - FIPS Mode

Enables or disables FIPS-compliant mode for the entire cluster. Default is `false`.

[-supported-protocols {TLSv1.2/TLSv1.1/TLSv1/SSLv3}, ...] - Supported Protocols

Selects the supported protocols for the selected interface. Default is

`TLSv1.2,TLSv1.1,TLSv1`

[-supported-ciphers <Cipher String>] - Supported Ciphers

Selects the supported cipher suites for the selected interface. Default is `ALL:!LOW:!aNULL:!EXP:!eNULL`.

`LOW:!aNULL:!EXP:!eNULL`.

Examples

The following command enables FIPS mode in the cluster. (Default setting for FIPS mode is `false`)

```
cluster1::> security config modify -interface SSL -is-fips-enabled true
```

The following command modifies supported protocols to TLSv1.2 and TLSv1.1 in the cluster. (Default setting for supported protocols is `TLSv1.2,TLSv1.1,TLSv1`)

```
cluster1::*> security config modify -interface SSL -supported-protocols
TLSv1.2, TLSv1.1
```

The following command modifies supported ciphers to ALL:!LOW:!aNULL:!EXP:!eNULL:!RC4 in the cluster. (Default setting for supported ciphers is *ALL:!LOW:!aNULL:!EXP:!eNULL*)

```
cluster1::*> security config modify -interface SSL -supported-ciphers ALL:!
LOW:!aNULL:!EXP:!eNULL:!RC4
```

security config show

Display Security Configuration Options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config show` command displays the security configurations of the cluster in advanced privilege mode.

Default values are as follows:

- SSL FIPS mode: disabled
- Supported protocols: TLSv1.2,TLSv1.1,TLSv1
- Supported ciphers: ALL:!LOW:!aNULL:!EXP:!eNULL

The default cipher suites represent all suites for the listed protocols except those that have no authentication, no encryption, no exports, and low encryption (below 64 or 56 bit).

Enabling FIPS mode will cause the entire cluster to use FIPS-compliant crypto operations only.

Use the `security config modify` command to change the protocols and ciphers that the cluster will support. When all the nodes in the cluster are updated with the modified settings, the cluster security config ready value will be shown as *yes*.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface <SSL>] - FIPS-Compliant Interface

Displays configurations that match the specified value for the interface.

[-is-fips-enabled { true/false}] - FIPS Mode

Display configurations that match the specified value for FIPS mode.

[-supported-protocols { TLSv1.2/TLSv1.1/TLSv1/SSLv3}, ...] - Supported Protocols

Displays configurations that match the specified protocols.

[-supported-ciphers <Cipher String>] - Supported Ciphers

Displays the configurations that match the specified supported ciphers.

Examples

The following example shows the default security configurations for a cluster.

```
cluster1::> security config show
Cluster
Security
Interface FIPS Mode Supported Protocols Supported Ciphers Config Ready
-----
SSL false TLSv1.2, TLSv1.1, TLSv1 ALL:!LOW:
!aNULL:!EXP:
!eNULL yes
```

The following example shows the security configuration after FIPS mode has been enabled.

```
cluster1::> security config show
Cluster
Security
Interface FIPS Mode Supported Protocols Supported Ciphers Config Ready
-----
SSL true TLSv1.2, TLSv1.1 ALL:!LOW:
!aNULL:!EXP:
!eNULL:!RC4 yes
```

security config ocsf commands

Manage OCSP Support for SSL Applications

security config ocsf disable

Disable OCSP for one or more selected applications

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config ocsf disable` command disables the OCSP-based certificate status check for applications supporting SSL/TLS communications. For more information about the OCSP-based certificate status check for applications supporting SSL/TLS communications, see the [security config ocsf show](#) command.

Parameters

-application <*Application supporting SSL/TLS protocol*>, ... - **Application Name**

Use this parameter to specify the application to disable the OCSP support. To disable all applications, the value 'all' can be used. Note: You cannot specify the value 'all' with other applications.

Examples

The following example disables the OCSP support for AutoSupport and EMS applications:

```
cluster1::*> security config ocsf disable -application autosupport,ems
cluster1::> security config ocsf show
Application OCSF Enabled?
```

```

-----
autosupport          false
audit_log            true
fabricpool           true
ems                  false
kmip                  true
ldap                  true
6 entries were displayed.

```

The following example disables the OCSF support for all applications:

```

cluster1::*> security config ocsf disable -application all
Warning: OCSF will be disabled for all applications. Any previous
modifications
will be ignored.
Do you want to continue? {y|n}: y

cluster1::*> security config ocsf show
Application          OCSF Enabled?
-----
autosupport          false
audit_log            false
fabricpool           false
ems                  false
kmip                  false
ldap                  false
6 entries were displayed.

```

Related references

[security config ocsf show](#) on page 586

security config ocsf enable

Enable OCSF for one or more selected applications

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config ocsf enable` command enables the OCSF-based certificate status check for applications supporting SSL/TLS communications. For more information about the OCSF-based certificate status check for applications supporting SSL/TLS communications, see the [security config ocsf show](#) command.

Parameters

-application <Application supporting SSL/TLS protocol>, ... - List of Applications

Use this parameter to specify the application to enable the OCSF support. To enable all applications, the value 'all' can be used. Note: You cannot specify the value 'all' with other applications.

Examples

The following example enables the OCSF support for AutoSupport and EMS applications:

```

cluster1::*> security config ocsf enable -application autosupport,ems

cluster1::*> security config ocsf show
Application          OCSF Enabled?
-----
autosupport          true
audit_log            false
fabricpool           false

```

```
ems                true
kmip               false
ldap              false
6 entries were displayed.
```

The following example enables the OSCP support for all applications:

```
cluster1::*> security config ocsf enable -application all
Warning: OSCP will be enabled for all applications. Any previous
modifications
will be ignored.
Do you want to continue? {y|n}: y

cluster1::*> security config ocsf show
Application          OSCP Enabled?
-----
autosupport          true
audit_log            true
fabricpool           true
ems                  true
kmip                  true
ldap                 true
6 entries were displayed.
```

[security config ocsf show](#) on page 586

security config ocsf show

Show Online Certificate Status Protocol (OCSP) settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config ocsf show` command displays the support status of the OCSP-based certificate status check for applications supporting SSL/TLS communications. If the OCSP support is enabled for an application, this check is done in addition to the certificate chain validation as part of the SSL handshake process. The OCSP-based certificate status check is done for all the certificates in the chain, provided that each certificate has the OCSP URI access points mentioned in them. If no access points are specified, the OCSP-based certificate revocation status check is ignored for that certificate and checking continues for the rest of the certificates in the chain.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-application <Application supporting SSL/TLS protocol>] - **Application Name**

Selects the application that matches this parameter value. Applications include:

- autosupport - AutoSupport
- audit_log - Audit Logging
- fabricpool - External capacity tiers

- `ems` - Event Management System
- `kmip` - Key Management Interoperability Protocol
- `ldap_ad` - Lightweight Directory Access Protocol - Active Directory (query and modify items in Active Directory)
- `ldap_nis_namemap` - Lightweight Directory Access Protocol - NIS and Name Mapping (query Unix user, group, netgroup and name mapping information)

`[-is-ocsp-enabled {true/false}]` - Is OCSP-based Certificate Status Check Enabled?

Selects the application that matches this parameter value.

Examples

The following example displays the OCSP support for the applications supporting SSL/TLS communications:

```
cluster1::> security config ocsp show
Application          OSCP Enabled?
-----
autosupport          true
audit_log             false
fabricpool            false
ems                   true
kmip                  false
ldap                  false
6 entries were displayed.
```

The following example displays the OCSP support for AutoSupport:

```
cluster1::*> security config ocsp show -application autosupport
Application Name: autosupport
Is OCSP-based Certificate Status Check Enabled?: true
```

security config status commands

The status directory

security config status show

Display Security Configuration Status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config status show` command displays the required reboot status of the nodes in the cluster after security configuration settings have been modified using the `security config modify` command. Use this command to monitor the status of the required reboot process. When all nodes have rebooted, the cluster is ready to use the new security configuration settings.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-node* {<nodename>/local}] - Node Name

Select the node whose reboot-status you want to display.

[*-reboot-needed* {true/false}] - Reboot Needed

reboot-needed status of the node that tells if the node requires a reboot for security configuration to take effect.

Examples

The following example displays the status of a configuration change in a four-node cluster.

```
cluster1::> security config status show
Nodes in Cluster      Reboot Needed
-----
node1                  true
node2                  true
node3                  false
node4                  false
4 entries were displayed.
```

The following example shows the output of the command after the cluster reboot process is complete.

```
cluster1::> security config status show
Nodes in Cluster      Reboot Needed
-----
node1                  false
node2                  false
node3                  false
node4                  false
4 entries were displayed.
```

security key-manager commands

Manage Key Management Servers

security key-manager add

(DEPRECATED)-Add a key management server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager external add-servers](#) instead.

This command adds a key management server at the indicated IP address to its list of four possible active key management servers. The command fails if there are already four key management servers configured. This command is not supported when onboard key management is enabled.

Parameters**-address <IP Address> - IP Address**

This parameter specifies the IP address of the key management server you want to use to store keys.

[-server-port <integer>] - Server TCP Port

This parameter specifies the TCP port on which the key management server will listen for incoming connections.

Examples

The following example adds the key management server with address 10.233.1.98, listening for incoming connections on the default TCP port 5696, to the list of key management servers used by the external key manager:

```
cluster-1:> security key-manager add -address 10.233.1.98
```

The following example adds the key management server with address 10.233.1.98, listening for incoming connections on TCP port 15696, to the list of key management servers used by the external key manager:

```
cluster-1:> security key-manager add -address 10.233.1.98 -server-port 15696
```

Related references

[security key-manager external add-servers](#) on page 604

security key-manager create-key

(DEPRECATED)-Create a new authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager key create](#) instead.

This command creates a new authentication key (AK) and stores it on the configured key management servers. The command fails if the configured key management servers are already storing more than 128 AKs. If command fails due to more than 128 keys in cluster, delete unused keys on your key management servers and try the command again. This command is not supported when onboard key management is enabled.

Parameters**[-key-tag <text>] - Key Tag**

This parameter specifies the key tag that you want to associate with the new authentication key (AK). The default value is the node name. This parameter can be used to help identify created authentication keys (AKs). For example, the key-manager query command key-tag parameter can be used to query for a specific key-tag value.

`[-prompt-for-key {true/false}] - Prompt for Authentication Passphrase`

If you specify this parameter as true, the command prompts you to enter an authentication passphrase manually instead of generating it automatically. For security reasons, the authentication passphrase you entered is not displayed at the command prompt. You must enter the authentication passphrase a second time for verification. To avoid errors, copy and paste authentication passphrases electronically instead of entering them manually. Data ONTAP saves the resulting authentication key/key ID pair automatically on the configured key management servers.

Examples

The following example creates an authentication key with the node name as the default key-tag value:

```
cluster-1::> security key-manager create-key

Verifying requirements...

Node: node1
Creating authentication key...
Authentication key creation successful.
Key ID: 00000000000000000200000000000100D0F7C2462D626B739FE81B89F29A092F.

Node: node2
Key manager restore operation initialized.
Successfully restored key information.
```

The following example creates an authentication key with key-tag "disk1-key":

```
cluster-1::> security key-manager create-key -key-tag disk1-key

Verifying requirements...

Node: node1
Creating authentication key...
Authentication key creation successful.
Key ID: 00000000000000000200000000000100B8297A6189BC24B9B84C1916ED576857.

Node: node2
Key manager restore operation initialized.
Successfully restored key information.
```

The following example creates an authentication key with a user-specified authentication passphrase:

```
cluster-1::> security key-manager create-key -prompt-for-key true

Enter a new passphrase::

Reenter the passphrase::

Verifying requirements...

Node: node1
Creating authentication key...
Authentication key creation successful.
Key ID: 000000000000000002000000000001006268333F870860128FBE17D393E5083B.

Node: node2
Key manager restore operation initialized.
Successfully restored key information.
```

Related references

[security key-manager key create](#) on page 615

security key-manager delete

(DEPRECATED)-Delete a key management server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager external remove-servers](#) instead.

This command removes the key management server at the indicated IP address from the list of active key management servers. If the indicated key management server is the sole storage location for any key that is in use by Data ONTAP, you will be unable to remove the key server. This command is not supported when onboard key management is enabled.

Parameters

-address <IP Address> - IP Address

This parameter specifies the IP address of the key management server you want to remove from use.

Examples

The following example removes the key server at IP address 10.233.1.198 from the set of configured key management servers:

```
cluster-1::> security key-manager delete -address 10.233.1.198
```

Related references

[security key-manager external remove-servers](#) on page 607

security key-manager delete-key-database

(DEPRECATED)-Deletes the key hierarchy for onboard key manager

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Note: This command is deprecated and might be removed in a future release. Use [security key-manager onboard disable](#) instead.

The `security key-manager delete-key-database` command permanently deletes the onboard key-management configuration from all nodes of the cluster.

Examples

The following example deletes the onboard key-management configuration from all nodes of the cluster:

```
cluster-1::*> security key-manager delete-key-database

Warning: This command will permanently delete all keys from onboard key
management.
Do you want to continue? {y|n}: y
```

Related references

[security key-manager onboard disable](#) on page 622

security key-manager delete-kmip-config

(DEPRECATED)-Deletes the KMIP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager external disable](#) instead.

The `security key-manager delete-kmip-config` command permanently deletes the Key Management Interoperability Protocol (KMIP) server configuration from all nodes of the cluster.

Note: The keys stored by the external KMIP servers cannot be deleted by Data ONTAP, and must be deleted by using external tools.

Examples

The following example deletes the KMIP-server configuration from all nodes of the cluster:

```
cluster-1::*> security key-manager delete-kmip-config

Warning: This command will permanently delete the KMIP-server configuration
        from all nodes of the cluster.
Do you want to continue? {y|n}: y
The KMIP-server configuration has been successfully deleted from all nodes
of the
cluster. The keys stored by the external KMIP servers cannot be deleted by
Data ONTAP,
and must be deleted by using external tools.
```

Related references

[security key-manager external disable](#) on page 605

security key-manager prepare-to-downgrade

(DEPRECATED)-Disables onboard keymanagement features for unsupported versions

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Note: This command is deprecated and might be removed in a future release.

The `security key-manager prepare-to-downgrade` command disables the onboard key management features that are not supported in releases prior to ONTAP 9.1.0. The features that are

disabled are onboard key management support for Metrocluster configurations and Volume Encryption (VE).

Examples

The following example disables the onboard key management support for Metrocluster configurations and Volume Encryption (VE):

```
cluster1::*> security key-manager prepare-to-downgrade
```

security key-manager query

(DEPRECATED)-Displays the key IDs stored in a key management server.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager key query](#) instead.

This command displays the IDs of the keys that are stored on the key management servers. This command does not update the key tables on the node. To refresh the key tables on the nodes with the key management server key tables, run the [security key-manager restore](#) command. This command is not supported when onboard key management is enabled.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance {}]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - **Node**

This parameter specifies the name of the node that queries the specified key management servers. If this parameter is not specified, then all nodes will query the specified key management servers.

[-address <IP Address>] - **IP Address**

This parameter specifies the IP address of the key management server that you want to query.

[-key-id <key id>] - **Key ID**

If you specify this parameter, then the command displays only the key IDs that match the specified value.

[-key-tag <text>] - **Key Tag**

If you specify this parameter, then the command displays only the key IDs that match the specified value. The key-tag for Volume Encryption Keys (VEKs) is set to the UUID of the encrypted volume.

[-key-type <Key Usage Type>] - **Key Type**

If you specify this parameter, then the command displays only the key IDs that match the specified value.

[-count <integer>] - (DEPRECATED)-Key Server's Total Key Count

The value `count` is deprecated and may be removed in a future release of Data ONTAP. This parameter specifies the total number of keys stored in the key management servers. If you specify this parameter, then the command displays only the key IDs retrieved from the key management servers whose total key count matches the specified count number.

[-restored {yes/no}] - Key/Key ID Pair Present in Node's Key Table?

This parameter specifies whether the key corresponding to the displayed key ID is present in the specified node's internal key table. If you specify 'yes' for this parameter, then the command displays the key IDs of only those keys that are present in the system's internal key table. If you specify 'no' for this parameter, then the command displays the key IDs of only those keys that are not present in the system's internal key table.

[`-key-manager-server-status {available/not-responding/unknown}`] - Command Error Code

This parameter specifies the connectivity status of the key management server. If you specify this parameter, then the command displays only the key IDs retrieved from the key management servers with specified status.

Examples

The following example shows all the keys on all configured key servers, and whether those keys have been restored for all nodes in the cluster:

```

cluster-1:>> security key-manager query

Node: node1
Key Manager: 10.0.0.10
Server Status: available

Key Tag                                Key Type  Restored

Key Manager: 10.0.0.10
Server Status: available

Key Tag                                Key Type  Restored
-----
node1                                NSE-AK    yes
    Key ID:
000000000000000000002000000000001001d71f3b2468d7e16a6e6972d3e6645200000000000000
000
301a4e57-9efb-11e7-b2bc-0050569c227f  VEK      no
    Key ID:
000000000000000000002000000000005004d03aca5b72cd20b2f83eae1531c605e0000000000000
000

If any listed keys have "no" in the "Restored" column, run "security key-
manager
restore" to restore those keys.

```

The following example shows all keys stored on the key server with address "10.0.0.10" from node "node1" with key-tag "node1":

```
cluster-1::> security key-manager query -address 10.0.0.10 -node node1 -key-
tag node1

      Node: node1
    Key Manager: 10.0.0.10
  Server Status: available

Key Tag                                Key Type  Restored
-----
node1                                NSE-AK    yes
      Key ID:
00000000000000000000000000000000000000000000000000000000000000000000
000

If any listed keys have "no" in the "Restored" column, run "security key-
manager
restore" to restore those keys.
```

The following example shows the Volume Encryption Key (VEK) with key-tag (i.e., volume UUID) "301a4e57-9efb-11e7-b2bc-0050569c227f" on nodes where that key has not been restored:

```
cluster-1::*> security key-manager query -key-type VEK -key-tag
301a4e57-9efb-11e7-b2bc-0050569c227f -restored no

      Node: node2
    Key Manager: 10.0.0.10
  Server Status: available

Key Tag                                Key Type  Restored

security key-manager restore

(DEPRECATED)-Restore the key ID pairs from the key management servers.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager external restore](#) instead.

This command retrieves and restores any current unrestored keys associated with the storage controller from the specified key management servers. This command is not supported when onboard key management is enabled.

`security key-manager setup` command with the new passphrase on the partner site before proceeding with any key-manager operations.

Parameters

`[-node <nodename>]` - Node Name

This parameter is used only with onboard key management when a refresh operation is required (see command description). This parameter is ignored when configuring external key management and during the initial setup of onboard key management.

`[-cc-mode-enabled {yes/no}]` - Enable Common Criteria Mode?

When configuring onboard key management, this parameter is used to specify that Common Criteria (CC) mode should be enabled. When CC mode is enabled, you will be required to provide a cluster passphrase that is between 64 and 256 ASCII character long, and you will be required to enter that passphrase each time a node reboots.

`[-sync-metrocluster-config {yes/no}]` - Sync MetroCluster Configuration from Peer

When configuring onboard key management in a MetroCluster configuration, this parameter is used to indicate that the `security key-manager setup` command has been performed on the peer cluster, and that the `security key-manager setup` command on this cluster should import the peer's configuration.

Examples

The following example creates a configuration for external key management:

```
cluster-1:> security key-manager setup
Welcome to the key manager setup wizard, which will lead you through
the steps to add boot information.

Enter the following commands at any time
"help" or "?" if you want to have a question clarified,
"back" if you want to change your answers to previous questions, and
"exit" if you want to quit the key manager setup wizard. Any changes
you made before typing "exit" will be applied.

Restart the key manager setup wizard with "security key-manager setup". To
accept a default or omit a question, do not enter a value.

Would you like to configure onboard key management? {yes, no} [yes]: no
Would you like to configure the KMIP server environment? {yes, no} [yes]: yes
```

The following example creates a configuration for onboard key management:

```
cluster-1:> security key-manager setup
Welcome to the key manager setup wizard, which will lead you through
the steps to add boot information.

Enter the following commands at any time
"help" or "?" if you want to have a question clarified,
"back" if you want to change your answers to previous questions, and
"exit" if you want to quit the key manager setup wizard. Any changes
you made before typing "exit" will be applied.

Restart the key manager setup wizard with "security key-manager setup". To
accept a default or omit a question, do not enter a value.

Would you like to configure onboard key management? {yes, no} [yes]: yes
Enter the cluster-wide passphrase for onboard key management. To continue the
configuration, enter the passphrase, otherwise type "exit":
Re-enter the cluster-wide passphrase:
After configuring onboard key management, save the encrypted configuration
```

```
data
in a safe location so that you can use it if you need to perform a manual
recovery
operation. To view the data, use the "security key-manager backup show"
command.
```

The following example creates a configuration for onboard key management with Common Criteria mode enabled:

```
cluster-1:> security key-manager setup -cc-mode-enabled yes
Welcome to the key manager setup wizard, which will lead you through
the steps to add boot information.

Enter the following commands at any time
"help" or "?" if you want to have a question clarified,
"back" if you want to change your answers to previous questions, and
"exit" if you want to quit the key manager setup wizard. Any changes
you made before typing "exit" will be applied.

Restart the key manager setup wizard with "security key-manager setup". To
accept a default or omit a question, do not enter a value.

Would you like to configure onboard key management? {yes, no} [yes]: yes
Enter the cluster-wide passphrase for onboard key management. To continue the
configuration, enter the passphrase, otherwise type "exit":
Re-enter the cluster-wide passphrase:
After configuring onboard key management, save the encrypted configuration
data
in a safe location so that you can use it if you need to perform a manual
recovery
operation. To view the data, use the "security key-manager backup show"
command.
```

security key-manager show

(DEPRECATED)-Display key management servers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and may be removed in a future release. Use [security key-manager external show](#) instead.

This command displays the key management servers configured on the cluster. This command is not supported when onboard key management is enabled.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

|| [-status]

If you specify this parameter, the command displays the status of each key management server.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-node* {<nodename>/local}] - Node

This parameter specifies the name of the node that you want to retrieve key management server status for. If parameter is not specified, all nodes will retrieve the key management servers status.

[*-address* <IP Address>] - IP Address

Shows only a key management server registered with the input address. It is also possible to show multiple key management servers.

[*-server-port* <integer>] - Server TCP Port

If you specify this parameter, the command displays only key servers listening on this port.

Examples

The following example lists all configured key management servers:

```
cluster-1::> security key-manager show
```

Node	Registered Key Manager
node1	10.225.89.33
node2	10.225.89.33

The following example lists all configured key management servers, the TCP port on which those servers are expected to listen for incoming KMIP connections, and their server status:

```
cluster-1::> security key-manager show -status
```

Node	Port	Registered Key Manager	Status
node1	5696	10.225.89.33	available
node2	5696	10.225.89.33	available

Related references

[security key-manager external show](#) on page 609

security key-manager show-key-store

Displays the configured key manager key stores.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the list of configured key managers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, then the command will list the key manager configured for the given Vserver.

[-key-store <Key Store>] - Key Store

If you specify this parameter, then the command displays only the vservers that have the given key-store configured.

Examples

The following example shows all configured key managers in the cluster. In the example, the admin vserver has onboard key management configured and the data vserver "datavs1" has external key management configured:

```
cluster-1::> security key-manager show-key-store

Vserver          Key Store
-----
cluster-1        onboard
datavs1           external
```

security key-manager update-passphrase

(DEPRECATED)-Update cluster-wide passphrase

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Note: This command is deprecated and might be removed in a future release. Use [security key-manager onboard update-passphrase](#) instead.

The `security key-manager update-passphrase` command provides a way to update the cluster-wide passphrase, created initially by running the [security key-manager setup](#) command, that is used for onboard key management. This command prompts for the existing passphrase, and if that passphrase is correct then the command prompts for a new passphrase.

When the `security key-manager update-passphrase` command is executed in a MetroCluster configuration, then run the [security key-manager setup](#) command with the new passphrase on the partner site before proceeding with any key-manager operations. This allows the updated passphrase to be replicated to the partner site.

Examples

The following example updates the cluster-wide passphrase used for onboard key management:

```
cluster-1::*> security key-manager update-passphrase

Warning: This command will reconfigure the cluster passphrase for onboard
```

```
key-management.  
Do you want to continue? {y|n}: y  
  
Enter current passphrase:  
  
Enter new passphrase:  
  
Reenter the new passphrase:  
Update passphrase has completed. Save the new encrypted configuration data in  
a safe location so that you can use it if you need to perform a manual  
recovery  
operation. To view the data, use the "security key-manager backup show"  
command.
```

security key-manager backup commands

The backup directory

security key-manager backup show

(DEPRECATED)-Show salt and wrapped keys as a hex dump

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Note: This command is deprecated and might be removed in a future release. Use `security key-manager onboard show-backup` instead.

This command displays the backup information for onboard key management, which would be used to recover the cluster in case of catastrophic situations. The information displayed is for the cluster as a whole (not individual nodes). This command is not supported for an external key management configuration.

Examples

The following example displays the onboard key management backup data for the cluster:

[illegible]

```

AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAE5ldEFwcCBL

security key-manager config commands

The config directory

security key-manager config modify

Modify key management configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the key management configuration options.

Parameters

[-cc-mode-enabled {true/false}] - Enable Common Criteria Mode

This parameter modifies the configuration state of the Onboard Key Manager (OKM) Common Criteria (CC) mode. CC mode enforces some of the policies required by the Common Criteria "Collaborative Protection Profile for Full Drive Encryption-Authorization Acquisition" (FDE-AA cPP) and "Collaborative Protection Profile for Full Drive Encryption-Encryption Engine" documents.

Examples

The following command enables Common Criterial mode in the cluster:

```
cluster-1::*> security key-manager config modify -cc-mode-enabled true
```

security key-manager config show

Display key management configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the key management configuration options.

The "cc-mode-enabled" option reflects the current configuraton state for Common-Criteria (CC) mode for onboard key management. CC mode is an operational mode that enforces some of the policies required by the Common Criteria "Collaborative Protection Profile for Full Drive Encryption-Authorization Acquisition" (FDE-AA cPP) and "Collaborative Protection Profile for Full Drive Encryption-Encryption Engine" documents. The feature can be enabled when the onboard key

manager is configured using the [security key-manager setup](#) command or after the onboard key manager is configured using the [security key-manager config modify](#) command.

Examples

The following example displays the state of all key-manager configuration options:

```
cluster-1::*> security key-manager config show
CC-Mode
Enabled
-----
true
```

security key-manager external commands

Manage Configured External Key Managers

security key-manager external add-servers

Add External Key Management Servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds the key management servers of the given hosts and ports to the given Vserver's external key manager's list of four possible key management servers. This command is not supported when external key management is not enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which to add the key management servers.

-key-servers <Hostname and Port>, ... - External Key Management Servers

Use this parameter to specify the list of additional key management servers that the external key manager uses to store keys.

Examples

The following example adds two key management servers to the list of servers used by the external key manager for Vserver cluster-1. The first key management server's hostname is keyserver1.local and is listening on the default port 5696, and the second key management server's IP is 10.0.0.20 and is listening on port 15696:

```
cluster-1::> security key-manager external add-servers -vserver cluster-1 -
key-servers keyserver1.local, 10.0.0.20:15696
```

security key-manager external disable

Disable External Key Management

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the external key manager associated with the given Vserver. If the key manager is in use by Data ONTAP, you cannot disable it. This command is not supported when onboard key management is enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the external key manager is to be disabled.

Examples

The following example removes the external key manager for Vserver cluster-1:

```
cluster-1::*> security key-manager external disable -vserver cluster-1

Warning: This command will permanently delete the external key management
configuration for Vserver "cluster-1".
Do you want to continue? {y|n}: y
```

security key-manager external enable

Enable External Key Management

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command enables the external key manager associated with the given Vserver. This command is not supported when a key manager for the given Vserver is already enabled.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the external key manager is to be enabled.

-key-servers <Hostname and Port>, ... - List of External Key Management Servers

Use this parameter to specify the list of up to four key management servers that the external key manager uses to store keys.

-client-cert <text> - Name of the Client Certificate

Use this parameter to specify the unique name of the client certificate that the key management servers use to ensure the identity of Data ONTAP.

-server-ca-certs <text>, ... - Names of the Server CA Certificates

Use this parameter to specify the unique names of server-ca certificates that Data ONTAP uses to ensure the identity of the key management servers.

Examples

The following example enables the external key manager for Vserver cluster-1. The command includes three key management servers. The first key server's hostname is `ks1.local` and is listening on port 15696. The second key server's IP address is 10.0.0.10 and is listening on the default port 5696. The third key server's IPv6 address is `fd20:8b1e:b255:814e:32bd:f35c:832c:5a09`, and is listening on port 1234.

```
cluster-1::> security key-manager external enable -vserver cluster-1 -key-
servers ks1.local:15696,10.0.0.10,[fd20:8b1e:b255:814e:32bd:f35c:832c:5a09]:
1234 -client-cert AdminVserverClientCert -server-ca-certs
ServerCaCert1,ServerCaCert2
```

security key-manager external modify

Modify External Key Management

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies the external key manager configuration associated with the given Vserver. This command is not supported when external key management is not enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the key manager to be modified is located.

[-client-cert <text>] - Name of the Client Certificate

Use this parameter to modify the name of the client certificate that the key management servers use to ensure the identity of Data ONTAP. If the keys of the new certificate do not match the keys of the existing certificate, or if the TLS connectivity with key-management servers fails with the new certificate, the operation fails. Running this command in the diagnostic privilege mode ignores failures and allows the command to complete.

[-server-ca-certs <text>, ...] - Names of the Server CA Certificates

Use this parameter to modify the names of server-ca certificates that Data ONTAP uses to ensure the identity of the key management servers. Note that the list provided completely replaces the existing list of certificates. If the TLS connectivity with key-management servers fails with the new list of server-ca certificates, the operation fails. Running this command in the diagnostic privilege mode ignores failures and allows the command to complete.

Examples

The following example updates the client certificate used with the key management servers:

```
cluster-1::> security key-manager external modify -vserver cluster-1 -client-
cert NewClientCert
```

security key-manager external modify-server

Modify Key Server Properties

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command modifies configuration information for configured key management servers. This command is supported only when external key manager has been enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which to modify the key management server configuration.

-key-server <Hostname and Port> - External Key Server

Use this parameter to specify the key management server for which the command modifies the configuration.

[-timeout <integer>] - Key Server I/O Timeout

Use this parameter to specify the I/O timeout, in seconds, for the selected key management server.

[-username <text>] - Authentication User Name

Use this parameter to specify the username with which Data ONTAP authenticates with the key management server.

Examples

The following example modifies the I/O timeout to 45 seconds for Vserver cluster-1, key server keyserver1.local:

```
cluster-1::*> security key-manager modify-server -vserver cluster-1 -key-
server keyserver1.local -timeout 45
```

The following example modifies the username and passphrase used to authenticate with key server keyserver1.local:

```
cluster-1::*> security key-manager modify-server -vserver cluster-1 -key-
server keyserver1.local -username ksuser
Enter the password:
Reenter the password:
```

security key-manager external remove-servers

Remove External Key Management Servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes the key management servers at the given hosts and ports from the given Vserver's external key manager's list of key management servers. If any of the specified key management servers is the sole storage location for any key that is in use by Data ONTAP, then you

are unable to remove the key server. This command is not supported when external key management is not enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the external key manager is to be removed.

-key-servers <Hostname and Port>, ... - External Key Management Servers

Use this parameter to specify the list of key management servers that you want to remove from the external key manager.

Examples

The following example removes the key management server `keyserver1.local`, listening on the default port of 5696 and the key management server at IP 10.0.0.20, listening on port of 15696.

```
cluster-1::*> security key-manager external remove-servers -vserver cluster-1
-key-servers keyserver1.local,10.0.0.20:15696
```

security key-manager external restore

Restore the key ID pairs from the key management servers.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command retrieves and restores any current unrestored keys associated with the storage controller from the specified key management servers. This command is not supported when external key management has not been enabled for the Vserver.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

This parameter specifies the name of the node that will load unrestored key IDs into its internal key table. If not specified, all nodes retrieve unrestored keys into their internal key table.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver for which to list the keys. If not specified, this command restores key for all Vservers.

[-key-server <Hostname and Port>] - Key Server

If this parameter is specified, this command restores keys from the key management server identified by the host and port. If not specified, this command restores keys from all available key management servers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If you specify this parameter, then the command displays the key management servers for only the given Vserver.

[-key-server <text>] - Key Server Name with port

If you specify this parameter, then the command displays only the given key management server with the given host name or IP address listening on the given port.

[-client-cert <text>] - Name of the Client Certificate

If you specify this parameter, then the command displays only the key management servers using a client certificate with the given name.

[-server-ca-certs <text>, ...] - Names of the Server CA Certificates

If you specify this parameter, then the command displays only the key management servers using server-ca certificates with the given names.

[-timeout <integer>] - Server I/O Timeout

If you specify this parameter, then the command displays only the key management servers using the given I/O timeout.

[-username <text>] - Authentication User Name

If you specify this parameter, then the command displays only the key management servers using the given authentication username.

Examples

The following example lists all configured key management servers for all Vservers:

```
cluster-1::> security key-manager external show

      Vserver: datavs
      Client Certificate: datavsClientCert
      Server CA Certificates: datavsServerCaCert1, datavsServerCaCert2

Key Server
-----
keyserver.datavs.com:5696

      Vserver: cluster-1
      Client Certificate: AdminClientCert
      Server CA Certificates: AdminServerCaCert

Key Server
-----
10.0.0.10:1234
fd20:8b1e:b255:814e:32bd:f35c:832c:5a09:1234
ks1.local:1234
4 entries were displayed.
```

The following example lists all configured key management servers with more detail, including timeouts and usernames:

```
cluster-1::> security key-manager external show -instance

      Vserver: datavs
      Client Certificate: datavsClientCert
      Server CA Certificates: datavsServerCaCert1, datavsServerCaCert2
      Key Server: keyserver.datavs.com:5696
      Timeout: 25
      Username: datavuser

      Vserver: cluster-1
      Client Certificate: AdminClientCert
      Server CA Certificates: AdminServerCaCert
      Key Server: 10.0.0.10:1234
      Timeout: 25
      Username:

      Vserver: cluster-1
      Client Certificate: AdminClientCert
      Server CA Certificates: AdminServerCaCert
      Key Server: fd20:8ble:b255:814e:32bd:f35c:832c:5a09:1234
      Timeout: 25
      Username:

      Vserver: cluster-1
      Client Certificate: AdminClientCert
      Server CA Certificates: AdminServerCaCert
      Key Server: ksl.local:1234
      Timeout: 45
      Username:
4 entries were displayed.
```

security key-manager external show-status

Show the set of configured external key management servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays connectivity information between Data ONTAP nodes and configured external key management servers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node Name

If you specify this parameter, then the command displays the connectivity information for only the given node.

[-vserver <vserver name>] - Vserver Name

If you specify this parameter, then the command displays the key management servers for only the given Vserver.

`[-key-server <Hostname and Port>] - Key Server`

If you specify this parameter, then the command displays the connectivity information for only the given key management server with the given name listening on the given port.

`[-key-server-status {available/not-responding/unknown}] - Key Server Status`

If you specify this parameter, then the command displays the connectivity information for only the key management servers with the given status.

Examples

The following example lists all configured key management servers for all Vservers:

```
cluster-1::> security key-manager external show-status

Node  Vserver  Key Server                                     Status
-----
node1
  datavs
    keyserver.datavs.com:5696                  available
  cluster-1
    10.0.0.10:5696                             available
    fd20:8b1e:b255:814e:32bd:f35c:832c:5a09:1234 available
    ks1.local:15696                            available
node2
  datavs
    keyserver.datavs.com:5696                  available
  cluster-1
    10.0.0.10:5696                             available
    fd20:8b1e:b255:814e:32bd:f35c:832c:5a09:1234 available
    ks1.local:15696                            available
8 entries were displayed.
```

security key-manager external boot-interfaces commands

The boot-interfaces directory

security key-manager external boot-interfaces modify

Modify external key manager logical interfaces

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command enables cluster administrators to modify the IP address and route information that the external key manager uses at boot time to restore keys from external key servers.

Parameters

`-node {<nodename>/local} - Node`

Use this parameter to modify information on the node that you specify.

`-address-type {ipv4/ipv6/ipv6z} - Address Type`

Use this parameter to modify information for the address-type that you specify.

`[-address <IP Address>] - Local Interface Address`

Use this parameter to modify the IP address that the system will use at boot time to restore keys from external key servers. This parameter implies **`-override-default true`**.

{ [-netmask <IP Address>] - Network Mask

Use this parameter to modify the IP netmask that the system will use at boot time to restore keys from external key servers. This parameter can be used only with address-type ipv4. This parameter implies **-override-default true**.

[-netmask-length <integer>] - Bits in Network Mask

Use this parameter to modify the IP netmask length that the system will use at boot time to restore keys from external key servers. This parameter implies **-override-default true**.

[-gateway <IP Address>] - Gateway

Use this parameter to modify the IP gateway that the system will use at boot time to restore keys from external key servers. This parameter implies **-override-default true**.

[-port <Port Name>] - Network Port

Use this parameter to modify the port that the system will use at boot time to restore keys from external key servers. The value that you specify cannot be a vlan or ifgrp port. This parameter implies **-override-default true**.

[-override-default {true/false}] - Override Default Setting?

Use this parameter to modify the system's selection of boot time IP address and route information. When this value is **false**, the system will use the information associated with a node management LIF. When this value is **true**, then the administrator has chosen to override the defaults.

Examples

The following shows how to modify the port used by node "node2" at boot time to restore keys from external IPv4 key servers. In the example, IPv6 is not enabled in the cluster, so the **-address-type** parameter defaults to ipv4.

```
cluster-1::*> security key-manager external boot-interfaces modify -node
node2 -port e0d
```

The following example shows how to modify the IP address and gateway parameters used by node "node1" at boot time to restore keys from external IPv6 key servers.

```
cluster-1::*> security key-manager external boot-interfaces modify -node
node1 -address-type ipv6 -address fd20:8b1e:b255:814e:749e:11a3:3bff:5820 -
gateway fd20:8b1e:b255:814e::1
```

security key-manager external boot-interfaces show

Show external key manager logical interfaces

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command enables cluster administrators to view the IP address and route information that the external key manager uses at boot time to restore keys from external key servers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about boot-time IP address and route information for the node that you specify.

[-address-type {ipv4/ipv6/ipv6z}] - Address Type

Use this parameter to display information only about boot-time IP address and route information for the address-type that you specify.

[-address <IP Address>] - Local Interface Address

Use this parameter to display information only about boot-time IP address and route information for the IP address that you specify.

[-netmask <IP Address>] - Network Mask

Use this parameter to display information only about boot-time IP address and route information for the network mask that you specify.

[-netmask-length <integer>] - Bits in Network Mask

Use this parameter to display information only about boot-time IP address and route information for the network mask length that you specify.

[-gateway <IP Address>] - Gateway

Use this parameter to display information only about boot-time IP address and route information for the gateway that you specify.

[-port <Port Name>] - Network Port

Use this parameter to display information only about boot-time IP address and route information for the port that you specify.

[-override-default {true/false}] - Override Default Setting?

Use this parameter to display information only about boot-time IP address and route information with the override-default setting that you specify.

Examples

The following example shows how to display the IP address and route information that the external key manager uses at boot time to restore keys. In the example, IPv6 is not enabled in the cluster and, as a result, the command displays information for only the IPv4 address-type. The override-default value is false for all rows, which indicates that the system automatically configured the values based on the node management LIF configuration on the nodes.

```
cluster-1::*> security key-manager external boot-interfaces show
      Address Network
Node  Type    Address/Mask      Gateway      Port      Override
-----
node1  ipv4    10.224.113.159/24  10.224.113.1  e0M      false
node2  ipv4    10.224.113.160/24  10.224.113.1  e0M      false
2 entries were displayed.
```

The following example shows how to display the IP address and route information that the external key manager uses at boot time to restore keys. In the example, IPv6 is enabled in the cluster and, as a result, the command displays information for both the IPv4 and IPv6 address-types. The override-default value is false for most rows, which indicates that the system automatically configured the values based on the node management LIF configuration on the nodes. The override-default value for node1 and address-type ipv4 is true, which indicates an administrator has used the [security key-manager external boot-interfaces modify](#) command to override one or more fields, and that the values may differ from the corresponding node management LIF.

```
cluster-1::*> security key-manager external boot-interfaces show
```

Node	Address Type	Network Address/Mask	Gateway	Port	Override Default?
node1	ipv4	10.224.113.159/24	10.224.113.1	e0d	true
	ipv6	fd20:8ble:b255:814e::1	32bd:f35c:832c:5a09/64	e0M	false
node2	ipv4	10.224.113.160/24	10.224.113.1	e0M	false
	ipv6	fd20:8ble:b255:814e::1	749e:11a3:3bff:5820/64	e0M	false

4 entries were displayed.

security key-manager key commands

The key directory

security key-manager key create

Create a new authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command creates a new authentication key (AK) and stores it on the the admin Vserver's key management servers. The command fails if the configured key management servers are already storing more than 256 AKs. If this command fails because there are more than 256 AKs in the cluster, delete unused keys on the Vserver's key management servers and retry the command. This command is not supported when external key management is not enabled for the admin Vserver.

Parameters

[*-key-tag* <text>] - Key Tag

This parameter specifies the key tag to associate with the new authentication key (AK). The default value is the node name. This parameter can be used to help identify created authentication keys (AKs). For example, the [security key-manager key query](#) command's key-tag parameter can be used to query for a specific key-tag value.

[*-prompt-for-key* {*true*/*false*}] - Prompt for Authentication Passphrase

If you specify this parameter as true, then the command prompts you to enter an authentication passphrase manually instead of generating it automatically. For

security key-manager key migrate

Migrate keys from the admin Vserver's onboard key manager to a data Vserver's external key manager and vice versa

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command provides a mechanism to migrate the existing keys of a data Vserver from the admin Vserver's key manager to their own key manager or vice versa. The keys stay the same and the data is not rekeyed, only the keys are migrated from one Vserver's key manager to another. After a successful migration to the new key manager, the data Vserver keys are deleted from the previous key manager.

Note: This command currently only supports key migration from the Admin Vserver's onboard key manager to a Data Vserver's external key manager and vice versa.

Parameters

-from-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the Vserver whose key manager the keys are migrated from.

-to-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the Vserver whose key manager the keys are migrated to.

Examples

The following example migrates the keys of "datavs" data Vserver from "cluster-1" admin Vserver's key manager to "datavs" data Vserver's key manager:

```
cluster-1::> security key-manager key migrate -from-vserver cluster-1 -to-vserver datavs
```

The following example migrates the keys of "datavs" data Vserver from "datavs" data Vserver's key manager to "cluster-1" admin Vserver's key manager:

```
cluster-1::> security key-manager key migrate -from-vserver datavs -to-vserver cluster-1
```

security key-manager key query

Displays the key IDs stored in a key management server.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the IDs of the keys that are stored in the configured key managers. This command does not update the key tables on the node.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to specify the name of the node that queries the specified key management servers. If this parameter is not specified, then all nodes query the specified key management servers.

[-vserver <vserver name>] - Vserver Name

Use this parameter to specify the Vserver for which to list the keys.

[-key-server <Hostname and Port>] - Key Server

This parameter specifies the host and port of the key management server that you want to query. This parameter is used only with external key managers.

[-key-id <Hex String>] - Key Identifier

If you specify this parameter, then the command displays only the key IDs that match the specified value.

[-key-tag <text>] - Key Tag

If you specify this parameter, then the command displays only the key IDs that match the specified value. The key-tag for Volume Encryption Keys (VEKs) is set to the UUID of the encrypted volume.

[-key-type <Key Usage Type>] - Key Type

If you specify this parameter, then the command displays only the key IDs that match the specified value.

[-restored {true/false}] - Restored

This parameter specifies whether the key corresponding to the displayed key ID is present in the specified node's internal key table. If you specify 'yes' for this parameter, then the command displays the key IDs of only those keys that are present in the system's internal key table. If you specify 'no' for this parameter, then the command displays the key IDs of only those keys that are not present in the system's internal key table.

[-key-store <Key Store>] - Key Store

Use this parameter to specify the key manager type from which to list the keys.

[-key-user <vserver name>] - Key User

If you specify this parameter, then the command displays only the key IDs that are used by the specified Vserver.

Examples

The following example shows all of the keys on all configured key servers, and whether or not those keys have been restored for all nodes in the cluster:

```
cluster-1:> security key-manager key query

Vserver: cluster-1
Key Manager: onboard
Node: node1
```

[-key-location <text>] - Key Location

If this parameter is specified, the command displays information only about key IDs that are located on the specified key location. For example, use *local-cluster* for onboard key management.

[-used-by <Key Usage Type>] - Used By

If this parameter is specified, the command displays information only about key IDs that are associated with the specified application usage of the keys. For example, "NSE-AK" would display key IDs only for NSE drives.

[-restored {yes/no}] - Restored

If this parameter is specified, the command displays information only about key IDs that have the specified value of restored keys. If `restored` is `yes`, then the corresponding key is available (normal). If `restored` is `no`, use the `security key-manager setup` command to restore the key. See the man page for `security key-manager setup` for details.

Examples

The following example shows all keys stored in the onboard key manager:

```

cluster-1::> security key-manager key show

Node: node1
Key Store: onboard
Used By
-----
NSE-AK
  Key ID:
0000000000000000000020000000000001001bc4c708e2a89a312e14b6ce6d4d49d400000000000000
000
NSE-AK
  Key ID:
0000000000000000000020000000000001005e89099721f8817e65e3aeb68be1bfca00000000000000
000
SVM-KEK
  Key ID:
000000000000000000002000000000000a0046df92864d4cece662b93beb7f5366100000000000000

  Key ID:
000000000000000000002000000000000a0046df92864d4cece662b93beb7f5366100000000000000
000
6 entries were displayed.

```

The following example shows a detailed view of all keys stored in the onboard key manager:

```
Cluster-1::> security key-manager key show -detail
```

Node: node1			
Key Store: onboard			
Key ID	Key Tag	Used By	Stored In
Restored			

Description

This command enables the onboard key manager for the admin Vserver.

Parameters

`[-cc-mode-enabled {yes/no}]` - Enable Common Criteria Mode?

Use this parameter to specify whether the Common Criteria (CC) mode should be enabled or not. When CC mode is enabled, you are required to provide a cluster passphrase that is between 64 and 256 ASCII character long, and you are required to enter that passphrase each time a node reboots. CC mode cannot be enabled in a MetroCluster configuration.

Examples

The following example enables the Onboard Key Manager for the admin Vserver cluster-1:

```
cluster-1::> security key-manager onboard enable

Enter the cluster-wide passphrase for onboard key management:

Re-enter the cluster-wide passphrase:

After configuring onboard key management, save the encrypted configuration
data in a safe location so that you can use it if you need to perform a
manual recovery operation. To view the data, use the "security key-manager
onboard show-backup" command.
```

security key-manager onboard show-backup

Show salt and wrapped keys for the admin Vserver as a hex dump

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the backup information for onboard key management for the admin Vserver, which can be used to recover the cluster in case of catastrophic situations. The information displayed is for the cluster as a whole (not individual nodes).

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the **`-fields <fieldname>, ...`** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance]`

If you specify the **`-instance`** parameter, the command displays detailed information about all fields.

Examples

The following example displays the onboard key management backup data for the admin Vserver:

```
cluster-1::> security key-manager onboard show-backup
-----BEGIN BACKUP-----
TmV0QXBwIEtleSB0bG9iAAEAAAAEAAAAcAEAAAAAADuD+byAAAAACEAAAAAAAAA
QAAAAAAAAABv0LH0AAAAAMh7qDLRyH1DBz12piVdy9ATSFMT0C0T1YFss4PDjTaV
dzRYkLd1PhQLxAWJwOIyqSr8qY1SEBgm1IWge5DLRqkiAAAAAAAACgAAAAAAA
```

[illegible]

security key-manager onboard sync

Sync onboard key management keys

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command synchronizes missing onboard keys on any node in the cluster. For example, if you add a node to a cluster that has onboard key management configured, you should then run this command to synchronize the keys. In a MetroCluster configuration, if the `security key-manager onboard enable` command is used to enable onboard key management on one site, then run the `security key-manager onboard sync` command on the partner site. In a MetroCluster configuration, if the `security key-manager onboard update-passphrase` command is used to update the passphrase on one site, then run this command with the new passphrase on the partner site before proceeding with any key management operations.

Examples

The following example synchronizes the onboard key manager key database across all nodes in the cluster. In a MetroCluster configuration, this command synchronizes nodes in the local site.

```
cluster-1::> security key-manager onboard sync
```

Related references

security key-manager onboard enable on page 622

security key-manager onboard update-passphrase on page 625

security key-manager onboard update-passphrase

Update the Onboard Key Management Passphrase

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command provides a way to update the cluster-wide passphrase that is used for onboard key management and initially created by running the [security key-manager onboard enable](#) command. This command prompts for the existing passphrase, and if that passphrase is correct then the command prompts for a new passphrase. When onboard key management is enabled for the admin Vserver, run the [security key-manager onboard show-backup](#) command after updating the passphrase and save the output for emergency recovery scenarios. When the `security key-manager onboard update-passphrase` command is executed in a MetroCluster configuration, then run the [security key-manager onboard sync](#) command with the new passphrase on the partner site before proceeding with any key-manager operations. This allows the updated passphrase to be replicated to the partner site.

Examples

The following example updates the cluster-wide passphrase used for onboard key management:

```
cluster-1::*> security key-manager onboard update-passphrase

Warning: This command will reconfigure the cluster passphrase for onboard
         key management.
Do you want to continue? {y|n}: y

Enter current passphrase:

Enter new passphrase:

Reenter the new passphrase:
Update passphrase has completed. Save the new encrypted configuration data in
a safe location so that you can use it if you need to perform a manual
recovery
operation. To view the data, use the "security key-manager onboard show-
backup"
command.
```

[security key-manager onboard show-backup](#) on page 623

[security key-manager onboard sync](#) on page 624

security key-manager onboard verify-backup

Verify the Onboard Key Management backup and its passphrase

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command verifies the backup data and the passphrase of the onboard key management for the admin Vserver.

Parameters

-vserver <Vserver Name> - Vserver

This specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name or Active Directory, LDAP, or NIS group name of the login method. The Active Directory, LDAP, or NIS group name can be specified only with the *domain* or *nsswitch* authentication method and *ontapi* and *ssh* application. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

-application <text> - Application

This specifies the application of the login method. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

Setting this parameter to *service-processor* grants the user access to the Service Processor (SP). Because the SP supports only password authentication, when you set this parameter to *service-processor*, you must also set the *-authentication-method* parameter to *password*. Vserver user accounts cannot access the SP. Therefore, you cannot use the *-vserver* parameter when you set this parameter to *service-processor*.

-authentication-method <text> - Authentication Method

This specifies the authentication method for login. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication
- nsswitch - LDAP or NIS authentication
- password - Password
- publickey - Public-key authentication
- usm - SNMP user security model
- saml - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is *snmp* and authentication method is *usm* (SNMP user security model).

-role <text> - Role Name

This specifies an access-control role name for the login method.

[-comment <text>] - Comment Text

This specifies comment text for the user account, for example, "Guest account". The maximum length is 128 characters.

[-is-ns-switch-group {yes/no}] - Whether Ns-switch Group

This specifies whether *user-or-group-name* is an LDAP or NIS group. Possible values are yes or no. Default value is no.

`[-second-authentication-method {none/publickey/password/nsswitch}] -`
Second Authentication Method2

This specifies the authentication method for the login. It will be used as the second factor for authentication. Possible values include the following:

- `password` - Password
- `publickey` - Public-key authentication
- `nsswitch` - NIS or LDAP authentication
- `none` - default value

Examples

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *password*, and the access-control role *guest* for Vserver *vs*:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor
               -application ssh -authentication-method password -role guest
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ontapi*, the authentication method *password*, and the access-control role *vsadmin* for Vserver *vs*:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor
               -application ontapi -authentication-method password -role vsadmin
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *publickey*, and the access-control role *guest* for Vserver *vs*:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor
               -application ssh -authentication-method publickey -role guest
```

The following example illustrates how to create a login that has the user name *monitor*, the application *http*, the authentication method *cert*, and the access-control role *admin* for Vserver *vs*:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor
               -application http -authentication-method cert -role admin
```

The following example illustrates how to create a login that has the Active Directory group name *adgroup* in *DOMAIN1*, the application *ssh*, the authentication method *domain*, and the access-control role *vsadmin* for Vserver *vs*:

```
cluster1::> security login create -vserver vs
               -user-or-group-name DOMAIN1\adgroup -application ssh
               -authentication-method domain -role vsadmin
```

The following example illustrates how to create a login that has a group name *nssgroup* in the LDAP or NIS server, the application *ontapi*, the authentication method *nsswitch*, and the access-control role *vsadmin* for Vserver *vs*. Here *is-ns-switch-group* must be set to *yes*:

```
cluster1::> security login create -vserver vs -user-or-group-name nssgroup
-application ontapi -authentication-method nsswitch -role vsadmin
-is-ns-switch-group yes
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *password*, the second authentication method *publickey* and the access-control role *vsadmin* for Vserver *vs*:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor
-application ssh -authentication-method password
-second-authentication-method publickey -role vsadmin
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *password*, the second authentication method *none* and the access-control role *vsadmin* for Vserver *vs*:

```
cluster1::> security login create -vserver vs -user-or-group-name monitor
-application ssh -authentication-method password
-second-authentication-method none -role vsadmin
```

security login delete

Delete a login method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login delete` command deletes a login method.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name or Active Directory, LDAP, or NIS group name of the login method that is to be deleted. A user name can be associated with multiple applications.

-application <text> - Application

This specifies the application of the login method. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

-authentication-method <text> - Authentication Method

This specifies the authentication method of the login method. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication
- nsswitch - LDAP or NIS authentication
- password - Password
- publickey - Public-key authentication

- `usm` - SNMP user security model
- `saml` - SAML authentication

`[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address`

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is `snmp` and authentication method is `usm` (SNMP user security model).

Examples

The following example illustrates how to delete a login that has the username `guest`, the application `ssh`, and the authentication method `password` for Vserver `vs`:

```
cluster1::> security login delete -user-or-group-name guest
           -application ssh -authentication-method password -vserver vs
```

The following example illustrates how to delete a login that has the username `guest`, the application `ontapi`, and the authentication method `cert` for Vserver `vs`:

```
cluster1::> security login delete -user-or-group-name guest
           -application ontapi -authentication-method cert -vserver vs
```

The following example illustrates how to delete a login that has the Active Directory group name `adgroup` in `DOMAIN1`, the application `ssh`, and the authentication method `domain` for Vserver `vs`:

```
cluster1::> security login delete -user-or-group-name DOMAIN1\adgroup
           -application ssh -authentication-method domain -vserver vs
```

The following example illustrates how to delete a login that has a group name `nssgroup` in the LDAP or NIS server, the application `ontapi`, and the authentication method `nsswitch` for Vserver `vs`:

```
cluster1::> security login delete -user-or-group-name nssgroup
           -application ontapi -authentication-method nsswitch -vserver vs
```

security login expire-password

Expire user's password

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

The `security login expire-password` command expires a specified user account password, forcing the user to change the password upon next login.

Parameters

`-vserver <Vserver Name> - Vserver`

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account whose password you want to expire.

[-hash-function {sha512/sha256}] - Password Hash Function

This optionally specifies the password-hashing algorithm used for encrypting the passwords that you want to expire. The supported values include are as follows:

- sha512 - Secure hash algorithm (512 bits)
- sha256 - Secure hash algorithm (256 bits)
- md5 - Message digest algorithm (128 bits)

[-lock-after <integer>] - Lock User Account After N days (privilege: advanced)

This optionally specifies the number of days after which the new password hash policy will be enforced. The enforcement will lock all user accounts that are still compliant with the provided hash algorithm using **-hash-function** parameter.

Examples

The following command expires the password of the 'jdoe' user account which belongs to the 'vs1' Vserver.

```
cluster1::> security login expire-password -vserver vs1 -username jdoe
```

The following command expires all user account passwords that are encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver * -username * -hash-function md5
```

The following command expires the password of any Vserver's user account named 'jdoe' that is encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver * -username jdoe -hash-function md5
```

The following command expires the password of the 'vs1' Vserver user account named 'jdoe' that is encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver vs1 -username jdoe -hash-function md5
```

The following command expires all user account passwords that are encrypted with the MD5 hash function and enforce the new password hash policy after 180 days.

```
cluster1::> security login expire-password -vserver * -username * -hash-function md5 -lock-after 180
```

security login lock

Lock a user account with password authentication method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login lock` command locks a specified account, preventing it from accessing the management interface.

Parameters**-vserver <Vserver Name> - Vserver**

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account that is to be locked.

Examples

The following example locks a user account named 'jdoe' which belongs to the Vserver 'vs1'.

```
cluster1::> security login lock -vserver vs1 -username jdoe
```

security login modify

Modify a login method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login modify` command modifies the access-control role name of a login method. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

Parameters**-vserver <Vserver Name> - Vserver**

This specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name, Active Directory, LDAP, or NIS group name of the login method that is to be modified. A user name can be associated with multiple applications. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

-application <text> - Application

This specifies the application of the login method. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

-authentication-method <text> - Authentication Method

This specifies the authentication method of the login method. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication
- nsswitch - LDAP or NIS authentication
- password - Password
- publickey - Public-key authentication
- usm - SNMP user security model
- saml - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is *snmp* and authentication method is *usm* (SNMP user security model).

[-role <text>] - Role Name

This modifies the access-control role name for the login method.

[-comment <text>] - Comment Text

This specifies comment text for the user account, for example, "Guest account". The maximum length is 128 characters.

[-is-ns-switch-group {yes/no}] - Whether Ns-switch Group

This specifies if *user-or-group-name* is an LDAP or NIS group. Possible values are yes or no. Default value is no.

[-second-authentication-method {none/publickey/password/nsswitch}] - Second Authentication Method2

This specifies the authentication method for the login method. It will be used as the second factor for authentication. Possible values include the following:

- password - Password
- publickey - Public-key authentication
- nsswitch - NIS or LDAP authentication
- none - default value

Examples

The following example illustrates how to modify a login method that has the user name *guest*, the application *ontapi*, and the authentication method *password* to use the access-control role *guest* for Vserver *vs*:

```
cluster1::> security login modify -user-or-group-name guest
           -application ontapi -authentication-method password -role guest
           -vserver vs
```

The following example illustrates how to modify a login method that has the user name *guest*, the application *ssh*, and the authentication method *publickey* to use the access-control role *vsadmin* for Vserver *vs*:

```
cluster1::> security login modify -user-or-group-name guest
           -application ssh -authentication-method publickey -role vsadmin
           -vserver vs
```

The following example illustrates how to modify a login method that has the group name *nssgroup*, the application *ontapi*, and the authentication method *nsswitch* to use the access-control role *readonly* for Vserver *vs*. Here *is-ns-switch-group* must be set to *yes*:

```
cluster1::> security login modify -user-or-group-name nssgroup
           -application ontapi -authentication-method nsswitch -role readonly
           -vserver vs -is-ns-switch-group yes
```

The following example illustrates how to modify a login method that has the user name *guest*, the application *ssh*, and the authentication method *publickey* to use the second-authentication-method *password* for Vserver *vs*:

```
cluster1::> security login modify -user-or-group-name guest
            -application ssh -authentication-method publickey
            -second-authentication-method password -vserver vs
```

The following example illustrates how to modify a login method to have individual authentication methods that have the user name *guest*, the application *ssh*, and the authentication method *publickey* to use the second-authentication-method *none* for Vserver *vs*:

```
cluster1::> security login modify -user-or-group-name guest
            -application ssh -authentication-method publickey
            -second-authentication-method none -vserver vs
```

security login password

Modify a password for a user

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login password` command resets the password for a specified user. The command prompts you for the user's old and new password.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name of the login method.

-username <text> - Username

This optionally specifies the user name whose password is to be changed. If you do not specify a user, the command defaults to the user name you are currently using.

Examples

The following command initiates a password change for the 'admin' user account of the 'vs' Vserver.

```
cluster1::> security login password -username admin -vserver vs
```

The following command initiates a password change for the 'vs' Vserver user account named 'admin'. The new password will be encrypted by using the SHA512 password-hashing algorithm.

```
cluster1::*> security login password -username admin -vserver vs -hash-
function sha512
```

The following command initiates a password change for the 'vs' Vserver user account named 'admin'. The new password will be encrypted by using the SHA256 password-hashing encryption algorithm.

```
cluster1::*> security login password -username admin -vserver vs -hash-
function sha256
```

security login password-prepare-to-downgrade

Reset password features introduced in the Data ONTAP version

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

If the password of the system administrator is not encrypted with an encryption type supported by releases earlier than ONTAP 9.0, this command prompts the administrator for a new password and encrypt it using a supported encryption type on each cluster or at each site in a MetroCluster configuration. In a MetroCluster configuration, this command must be run on both sites. The password for all other users are marked as "expired". This causes them to be re-encrypted using a compatible encryption type. The expired passwords are changed with an internally generated password. The administrator must change the passwords for all users before the users can login. The users are prompted to change their password upon login. This command disables the logging of unsuccessful login attempts. The command must be run by a user with the cluster admin role from a clustershell session on the console device. This user must be unlocked. If you fail to run this command, the revert process fails.

Parameters

-disable-feature-set <downgrade version> - Data ONTAP Version

This parameter specifies the Data ONTAP version that introduced the password feature set.

Examples

The following command disables the logging of unsuccessful login attempts.

```
cluster1::*> security login password prepare-to-downgrade -disable-
feature-set 8.3.1

Warning: This command will disable the MOTD feature that prints
unsuccessful login attempts.
Do you want to continue? {y|n}: y

cluster1::*>
```

The following command prompts system administrator to enter password and encrypt it with the hashing algorithm supported by releases earlier than Data ONTAP 9.0.

```
cluster1::*> security login password prepare-to-downgrade -disable-feature-
set 9.0.0

Warning: If your password is not encrypted with an encryption type
supported by
releases earlier than Data ONTAP 9.0.0, this command will
prompt you
for a new password and encrypt it using a supported
encryption type on
each cluster or at each site in a MetroCluster configuration. In a
MetroCluster configuration, this command must be run on both sites.
The password for all other users are marked as "expired" and
changed to an internally generated password. The administrator must
change
the passwords for all users before the users can login. The users
are
prompted to change their password upon login.
Do you want to continue? {y|n}:
```

```

Enter a new password:
Enter it again:

cluster1::*>

```

security login show

Show user login methods

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login show` command displays the following information about user login methods:

- User name
- Application (console, http, ontapi, rsh, snmp, service-processor, ssh, or telnet)
- Authentication method (community, password, publickey, or usm)
- Role name
- Whether the account is locked
- Whether the user name refers to *nsswitch* group
- Password hash function

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Displays the login methods that match the specified Vserver name.

[-user-or-group-name <text>] - User Name or Group Name

Displays the login methods that match this parameter value. Value can be a user name or Active Directory, LDAP, or NIS group name.

[-application <text>] - Application

Displays the login methods that match the specified application type. Possible values include console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

[-authentication-method <text>] - Authentication Method

Displays the login methods that match the specified authentication method. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication

- `nsswitch` - LDAP or NIS authentication
- `password` - Password
- `publickey` - Public-key authentication
- `usm` - SNMP user security model
- `saml` - SAML authentication

`[-remote-switch-ipaddress <IP Address>]` - Remote Switch IP Address

Displays the login methods that match the specified IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is `snmp` and authentication method is `usm` (SNMP user security model).

`[-role <text>]` - Role Name

Displays the login methods that match the specified role.

`[-is-account-locked {yes/no}]` - Account Locked

Displays the login methods that match the specified account lock status.

`[-comment <text>]` - Comment Text

Displays the login methods that match the specified comment text.

`[-is-ns-switch-group {yes/no}]` - Whether Ns-switch Group

This specifies whether `user-or-group-name` is an LDAP or NIS group. Possible values are `yes` or `no`.

`[-hash-function {sha512/sha256}]` - Password Hash Function (privilege: advanced)

Displays the login methods that match the specified password-hashing algorithm. Possible values are:

- `sha512` - Secure hash algorithm (512 bits)
- `sha256` - Secure hash algorithm (256 bits)
- `md5` - Message digest algorithm (128 bits)

`[-second-authentication-method {none/publickey/password/nsswitch}]` - Second Authentication Method2

Displays the login methods that match the specified authentication method to be used as the second factor. Possible values include the following:

- `password` - Password
- `publickey` - Public-key authentication
- `nsswitch` - NIS or LDAP authentication
- `none` - default value

Examples

The example below illustrates how to display information about all user login methods:

```
cluster1::> security login show

Vserver: cluster1

User/Group      Authentication      Acct      Second
Authentication
```

Name	Application	Method	Role Name	Locked	Method
-----	-----	-----	-----	-----	-----
admin	console	password	admin	no	none
admin	http	password	admin	no	none
admin	ontapi	password	admin	no	none
admin	service-processor	password	admin	no	none
admin	ssh	password	admin	no	none
autosupport	console	password	autosupport	no	none
Vserver: vs1.netapp.com					
User/Group		Authentication		Acct	
Authentication				Second	
Name	Application	Method	Role Name	Locked	Method
-----	-----	-----	-----	-----	-----
vsadmin	http	password	vsadmin	yes	none
vsadmin	ontapi	password	vsadmin	yes	none
vsadmin	ssh	password	vsadmin	yes	none
9 entries were displayed.					

security login unlock

Unlock a user account with password authentication method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login unlock` command unlocks a specified account, enabling it to access the management interface.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account that is to be unlocked.

Examples

The following command unlocks a user account named `jdoe` which belongs to the Vserver `vs1`.

```
cluster1::> security login unlock -vserver vs1 -username jdoe
```

security login whoami

Show the current user and role of this session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login whoami` command displays the name and role of the user logged in at the current console session. It takes no options or other parameters.

Examples

The following example shows that the current session is logged in by using the 'admin' user account:

```
cluster1::> whoami
(security login whoami)

User: admin
Role: admin
```

SSH login banner

Manage the login banner

The SSH login banner management commands.

security login banner modify

Modify the login banner message

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login banner modify` command modifies the login banner. The login banner is printed just before the authentication step during the SSH and console device login process.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver whose banner will be modified. Use the name of the cluster admin Vserver to modify the cluster-level message. The cluster-level message is used as the default for data Vservers that do not have a message defined.

{ [-message <text>] - Login Banner Message

This optional parameter can be used to specify a login banner message. If the cluster has a login banner message set, the cluster login banner will be used by all data Vservers as well. Setting a data Vserver's login banner will override the display of the cluster login banner. To reset a data Vserver's login banner to use the cluster login banner, use this parameter with the value `" - "`.

If you use this parameter, the login banner cannot contain newlines (also known as end of lines (EOLs) or line breaks). To enter a login banner message with newlines, do not specify any parameter. You will be prompted to enter the message interactively. Messages entered interactively can contain newlines.

Non-ASCII characters must be provided as Unicode UTF-8.

| [-uri {(ftp/http)://(hostname/IPv4 Address/'['IPv6 Address']')...}] -

Download URI for the Banner Message

Use this parameter to specify the URI from where the login banner will be downloaded. Note that the message must not exceed 2048 bytes in length. Non-ASCII characters must be provided as Unicode UTF-8.

Examples

This example shows how to enter a login banner interactively:

```

cluster1::> security login banner modify
Enter the login banner for Vserver "cluster1".
Max size: 2048. Enter a blank line to terminate input. Press Ctrl-C to abort.
0          1          2          3          4          5          6
7          8
1234567890123456789012345678901234567890123456789012345678901234567
890
Authorized users only!

cluster1::>

```

security login banner show

Display the login banner message

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login banner show` command displays the login banner.

Parameters

[`-fields <fieldname>`, ...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`]]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <Vserver Name>`] - Vserver Name

Selects login banners that match the specified value. Use the name of the admin Vserver to specify the cluster-level login banner.

[`-message <text>`] - Login Banner Message

Selects login banners that match the specified value. By default, this command will not display unconfigured, or empty, login banners. To display all banners, specify `-message *`.

Examples

The following shows sample output from this command:

```

cluster1::> security login banner show
Message
-----
Authorized users only!

cluster1::>

```

security login domain-tunnel commands

The domain-tunnel directory

security login domain-tunnel create

Add authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command establishes a gateway (tunnel) for authenticating Windows Active Directory (AD) domain users' access to the cluster.

Before using this command to establish the tunnel, the following must take place:

- You must use the [security login create](#) command to create one or more AD domain user accounts that will be granted access to the cluster.
 - The `-authmethod` parameter of the [security login create](#) command must be set to 'domain'.
 - The `-username` parameter of the [security login create](#) command must be set to a valid AD domain user account that is defined in a Windows Domain Controller's Active Directory. The user account must be specified in the format of `<domainname>\<username>`, where "domainname" is the name of the CIFS domain server.
- You must identify or create a CIFS-enabled data Vserver that will be used for Windows authentication with the Active Directory server. This Vserver is the tunnel Vserver, and it must be running for this command to succeed.

Only one Vserver can be used as the tunnel. If you attempt to specify more than one Vserver for the tunnel, Data ONTAP returns an error. If the tunnel Vserver is stopped or deleted, AD domain users' authentication requests to the cluster will fail.

Parameters

-vserver <vserver> - Authentication Tunnel Vserver

This parameter specifies a data Vserver that has been configured with CIFS. This Vserver will be used as the tunnel for authenticating AD domain users' access to the cluster.

Examples

The following commands create an Active Directory domain user account ('DOMAIN1\Administrator') for the 'cluster1' cluster, create a data Vserver ('vs'), create a CIFS server ('vscifs') for the Vserver, and specify 'vs' as the tunnel for authenticating the domain user access to the cluster.

```
cluster1::> security login create -vserver cluster1 -username
DOMAIN1\Administrator -application ssh -authmethod domain -role admin
cluster1::> vservers create -vserver vs -rootvolume vol -aggregate
aggr -rootvolume-security-style mixed
cluster1::> vservers cifs create -vserver vs -cifs-server vscifs -
domain companyname.example.com -ou CN=Computers
cluster1::> security login domain-tunnel create -vserver vs
```

security login domain-tunnel delete

Delete authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login domain-tunnel delete` command deletes the tunnel established by the `security login domain-tunnel create` command. An error message will be generated if no tunnel exists.

Examples

The following command deletes the tunnel established by `security login domain-tunnel create`.

```
cluster1::> security login domain-tunnel delete
```

Related references

[security login domain-tunnel create](#) on page 641

security login domain-tunnel modify

Modify authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login domain-tunnel modify` command modifies or replaces the tunnel Vserver. If a tunnel Vserver is not already specified, it sets the current tunnel Vserver with this Vserver, otherwise, it replaces the current tunnel Vserver with the Vserver that you specify. If the tunnel Vserver is changed, authentication requests via previous Vserver will fail. See [security login domain-tunnel create](#) for more information.

Parameters

[-vserver <vserver>] - Authentication Tunnel Vserver

This parameter specifies a Vserver that has been configured with CIFS and is associated with a Windows Domain Controller's Active Directory authentication.

This Vserver will be used as an authentication tunnel for login accounts so that they can be used with administrative Vservers.

Examples

The following command modifies the tunnel Vserver for administrative Vserver.

```
cluster1::> security login domain-tunnel modify -vserver vs
```

Related references

[security login domain-tunnel create](#) on page 641

security login domain-tunnel show

Show authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login domain-tunnel show` command shows the tunnel Vserver that was specified by the `security login domain-tunnel create` or `security login domain-tunnel modify` command.

Examples

The example below shows the tunnel Vserver, *vs*, that is currently used as an authentication tunnel. The output informs you that the table is currently empty if tunnel Vserver has not been specified.

```
cluster1::> security login domain-tunnel show
Tunnel Vserver: vs
```

security login motd commands

Manage the message of the day (MOTD)

Manage the clustershell message of the day (MOTD).

security login motd modify

Modify the message of the day

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login motd modify` command updates the message of the day (MOTD).

There are two categories of MOTDs: the cluster-level MOTD and the data Vserver-level MOTD. A user logging in to a data Vserver's clustershell will potentially see two messages: the cluster-level MOTD followed by the Vserver-level MOTD for that Vserver. The cluster administrator can enable or disable the cluster-level MOTD on a per-Vserver basis. If the cluster administrator disables the cluster-level MOTD for a Vserver, a user logging into the Vserver will not see the cluster-level message. Only a cluster administrator can enable or disable the cluster-level message.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver whose MOTD will be modified. Use the name of the cluster admin Vserver to modify the cluster-level message.

{ [-message <text>] - Message of the Day (MOTD)

This optional parameter can be used to specify a message. If you use this parameter, the MOTD cannot contain newlines (also known as end of lines (EOLs) or line breaks). If you do not specify any parameter other than the **-vserver**

parameter, you will be prompted to enter the message interactively. Messages entered interactively can contain newlines. Non-ASCII characters must be provided as Unicode UTF-8.

The message may contain dynamically generated content using the following escape sequences:

- `\` - A single backslash character.
- `\b` - No output: supported for compatibility with Linux only.
- `\c` - Cluster name.
- `\d` - Current date as set on the login node.
- `\t` - Current time as set on the login node.
- `\I` - Incoming LIF IP address (prints 'console' for a console login).
- `\l` - Login device name (prints 'console' for a console login).
- `\L` - Last login for the user on any node in the cluster.
- `\m` - Machine architecture.
- `\n` - Node or data Vserver name.
- `\N` - Name of user logging in.
- `\o` - Same as `\O`. Provided for Linux compatibility.
- `\O` - DNS domain name of the node. Note that the output is dependent on the network configuration and may be empty.
- `\r` - Software release number.
- `\s` - Operating system name.
- `\u` - Number of active clustershell sessions on the local node. For the cluster admin: all clustershell users. For the data Vserver admin: only active sessions for that data Vserver.
- `\U` - Same as `\u`, but has 'user' or 'users' appended.
- `\v` - Effective cluster version string.
- `\W` - Active sessions across the cluster for the user logging in ('who').

A backslash followed by any other character is emitted as entered.

`| [-uri {(ftp/http)://(hostname/IPv4 Address/'[IPv6 Address]')...}]}` - Download URI for the MOTD

Use this parameter to specify the URI from where the message of the day will be downloaded. Note that the message must not exceed 2048 bytes in length. Non-ASCII characters must be provided as Unicode UTF-8.

`[-is-cluster-message-enabled {true/false}]` - Is Cluster-level Message Enabled?

Use this parameter to enable or disable the display of the cluster-level MOTD for the specified Vserver.

Examples

This example shows how to enter a MOTD interactively:

```

cluster1::> security login motd modify -vserver vs0

Enter the message of the day for Vserver "vs0".
Max size: 2048. Enter a blank line to terminate input. Press Ctrl-C to abort.
0          1          2          3          4          5          6

Welcome to the Vserver!

cluster1::>

```

security login motd show

Display the message of the day

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login motd show` command displays information about the cluster-level and data Vserver clustershell message of the day (MOTD).

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the message of the day entries that match this parameter value. Use the name of the cluster admin Vserver to see the cluster-level MOTD.

[-message <text>] - Message of the Day (MOTD)

Selects the message of the day entries that match this parameter value.

[-is-cluster-message-enabled { true/false}] - Is Cluster-level Message Enabled?

Selects the message of the day entries that match this parameter value.

Examples

The following example displays all message of the day entries:

```

cluster1::> security login motd show
Vserver: cluster1
Is the Cluster MOTD Displayed?: true
Message
-----
The cluster is running normally.

Vserver: vs0
Is the Cluster MOTD Displayed?: true
Message

```

```
-----
Welcome to the Vserver!

2 entries were displayed.
```

security login publickey commands

Manage public keys

security login publickey create

Add a new public key

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey create` associates an existing public key with a user account. This command requires that you enter a valid OpenSSH-formatted public key, a user name, index number, and optionally, a comment.

Parameters

-vserver <Vserver Name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are adding the public key.

-username <text> - Username

This parameter specifies the name of the user for whom you are adding the public key. If you do not specify a user, the user named `admin` is specified by default.

[-index <integer>] - Index

This parameter specifies an index number for the public key. The default value is the next available index value, starting with zero if it is the first public key created for the user.

-publickey <certificate> - Public Key

This specifies the OpenSSH public key, which must be enclosed in double quotation marks.

[-comment <text>] - Comment

This optionally specifies comment text for the public key. Note that comment text should be enclosed in quotation marks.

Examples

The following command associates a public key with a user named `tsmith` for Vserver `vs1`. The public key is assigned index number 5 and the comment text is "This is a new key".

```
cluster1::> security login publickey create -vserver vs1 -username tsmith -
index 5 -publickey
"ssh-rsa AAAAB3NzaClyc2EAAAABIwAAAIEAsph64CYbUsDQCdW22JnK6J
/vU9upnKzd2zAk9C1f7YaWRUAFNs2Qe5lUmQ3ldi8AD0Vfbr5T6HZPCixNAIza
FciDy7hgnmdj9eNGedGr/JNrftQbLDlhZybX+72DpQB0tYWBhe6eDJloPLob
ZBGfMlPXh8VjeU44i7W4+s0hG0E=tsmith@publickey.example.com"
-comment "This is a new key"
```

security login publickey delete

Delete a public key

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey delete` command deletes a public key for a specific user. To delete a public key, you must specify a user name and index number.

Parameters

-vserver <Vserver Name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are adding the public key.

-username <text> - Username

This parameter specifies the name of the user for whom you are deleting a public key. If you do not specify a user, the user named *admin* is specified by default.

-index <integer> - Index

This parameter specifies an index number for the public key.

Examples

The following command deletes the public key for the user named *tsmith* with the index number 5.

```
cluster1::> security login publickey delete -username tsmith -index 5
```

security login publickey load-from-uri

Load one or more public keys from a URI

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey load-from-uri` command loads one or more public keys from a Universal Resource Identifier (URI). To load public keys from a URI, you must specify a user name, the URI from which to load them, and optionally, whether you want to overwrite the existing public keys.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver for the user associated with the public keys.

-username <text> - Username

This parameter specifies the username for the public keys. If you do not specify a username, the username "*admin*" is used by default.

-uri {(ftp/http)://(hostname/IPv4 Address/'[IPv6 Address]')...} - URI to load from

This parameter specifies the URI from which the public keys will be loaded.

-overwrite {true/false} - Overwrite Entries

This parameter optionally specifies whether you want to overwrite existing public keys. The default value for this parameter is *false*. If the value is *true* and you confirm to overwrite, then the existing public keys are overwritten with the new public keys. If you use the value *false* or do not confirm the overwrite, then newly loaded public keys are appended to the list of existing public keys using the next available index.

Examples

The following command shows how to load public keys for the user named tsmith from the URI ftp://ftp.example.com/identity.pub. This user's existing public keys are not overwritten.

```
cluster1::> security login publickey load-from-uri -username tsmith
            -uri ftp://ftp.example.com/identity.pub -overwrite false
```

The following command shows how to load public keys for the user named tsmith from the URI ftp://ftp.example.com/identity.pub. This user's existing public keys are overwritten if user entered the option 'y' or 'Y'. The user's existing public keys are not overwritten if user entered the option 'n' or 'N' and the newly loaded public keys are appended to the list of existing public keys using the next available index. The user and password credentials that you provide when you use this command are the credentials to access the server specified by the URI.

```
cluster1::> security login publickey load-from-uri -username
            tsmith -uri ftp://ftp.example.com/identity.pub -overwrite true -vserver
            vs0

Enter User:
Enter Password:

Warning: You are about to overwrite the existing publickeys for the user
"tsmith" in Vserver "vs0". Do you want to proceed? {y|n}:
```

security login publickey modify

Modify a public key

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey modify` command modifies a public key and optionally its comment text.

Parameters**-vserver <Vserver Name> - Vserver**

Specifies the Vserver for the user associated with the public key.

-username <text> - Username

Specifies the username for the public key. If you do not specify a username, the username 'admin' is used by default.

-index <integer> - Index

Specifies the index number of the public key. The index number of the public key can be found by using the `security login publickey show` command.

[-publickey <certificate>] - Public Key

Specifies the new public key. You must enclose the new public key in double quotation marks.

[-comment <text>] - Comment

Specifies the new comment text for the public key.

Examples

The following command modifies the public key at index number 10 for the user named tsmith of Vserver vs1.

```
cluster1:> security login publickey modify -vserver vs1 -username tsmith -
index 10 -publickey
"ssh-rsa AAAAB3NzaClyc2EAAAADAQABAAQDDDD+pFzFgV/2dlowKRFgym9K910H/u

security login publickey show

Display public keys

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey show` command displays information about public keys.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Selects the public keys that match this parameter value.

[-username <text>] - Username

Selects the public keys that match this parameter value.

[-index <integer>] - Index

Selects the public keys that match this parameter value.

[-publickey <certificate>] - Public Key

Selects the public keys that match this parameter value.

[-fingerprint <text>] - Hex Fingerprint

Selects the public keys that match this parameter value.

[-bubblebabble <text>] - Bubblebabble Fingerprint

Selects the public keys that match this parameter value.

[-comment <text>] - Comment

Selects the public keys that match this parameter value.

Examples

The example below displays public key information for the user named tsmith.

```
cluster1::> security login publickey show -username tsmith
UserName: tsmith Index: 5
Public Key:
ssh-rsa AAAAB3NzaClyc2EAAAABIAAAIEAsph64CYbUsDQCdW22JnK6J

```

security login rest-role commands

Manage access control rest roles

security login rest-role create

Add an access control REST role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role create` command creates an access-control role. An access-control role consists of a role name and a api to which the role has access. It optionally includes an access level (none, readonly, or all) for api. After you create an access-control role, you can apply it to a management-utility login account by using the `security login modify` or `security login create` commands.

Parameters**-vserver <Vserver Name> - Vserver**

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be created.

-api <text> - api path

This specifies the api to which the role has access.

-access <Access> - Access Level

This optionally specifies an access level for the role. Possible access level settings are none, readonly, and all. The default setting is **all**.

Examples

The following command creates an access-control role named "admin" for the vs1.example.com Vserver. The role has all access to the api "/api/storage/volume" but only within the "aggr0" aggregate.

```
cluster1::> security login rest-role create -role admin -api /api/storage/
volume -access all -vserver vs1.example.com
```

[security login create](#) on page 626

security login rest-role delete

Delete an access REST control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role delete` command deletes an access-control role.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be deleted.

-api <text> - api path

This specifies the api to which the role has access.

Examples

The following command deletes an access-control role with the role name readonly and the api "/api/storage/volume" for Vserver vs.example.com.

```
cluster1::> security login rest-role delete -role readonly -api /api/storage/
volume -vserver vs.example.com
```

security login rest-role modify

Modify an access REST control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role modify` command modifies an access-control role.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be modified.

-api <text> - api path

This specifies the api to which the role has access.

[-access <Access>] - Access Level

This optionally specifies a new access level for the role. Possible access level settings are none, readonly, and all. The default setting is **all**.

Examples

The following command modifies an access-control role with the role name `readonly` and the api access `/api/storage/volume` to have the access level `readonly` for Vserver `vs.example.com`:

```
cluster1::> security login rest-role modify -role readonly -api /api/storage/
volume -access readonly -vservers vs.example.com
```

security login rest-role show

Show access control REST roles

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role show` command displays the following information about access-control roles:

- vservers
- Role name
- api to which the role has access
- Access level (none, read-only, or all)

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vservers <Vserver Name>] - Vserver

Selects the roles that match this parameter value.

[-role <text>] - Role Name

Selects the roles that match this parameter value. If this parameter and the **-api** parameter are both used, the command displays detailed information about the specified access-control role.

[-api <text>] - api path

Selects the roles that match this parameter value. If this parameter and the **-role** parameter are both used, the command displays detailed information about the specified access-control role.

[-access <Access>] - Access Level

Selects the roles that match this parameter value.

Examples

The example below displays information about all access-control roles:

```
cluster1::> security login rest-role show
```

Vserver	Role	Name	Access API	Level
vs	vsadmin		/api	none
cluster1	readonly		/api/storage	none

security login role commands

Manage access control roles

security login role create

Add an access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role create` command creates an access-control role. An access-control role consists of a role name and a command or directory to which the role has access. It optionally includes an access level (`none`, `readonly`, or `all`) and a query that applies to the specified command or command directory. After you create an access-control role, you can apply it to a management-utility login account by using the `security login modify` or `security login create` commands.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be created.

-cmddirname <text> - Command / Directory

This specifies the command or command directory to which the role has access. To specify the default setting, use the special value **"DEFAULT"**.

[-access <Access>] - Access Level

This optionally specifies an access level for the role. Possible access level settings are `none`, `readonly`, and `all`. The default setting is **all**.

[-query <query>] - Query

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by `-cmddirname`. The query object must be enclosed in double quotation marks (`"`), and it must be a valid field name.

Examples

The following command creates an access-control role named "admin" for the `vs1.example.com` Vserver. The role has all access to the "volume" command but only within the "aggr0" aggregate.

```
cluster1::> security login role create -role admin -cmddirname volume -query
"-aggr aggr0" -access all -vserver vs1.example.com
```

security login role delete

Delete an access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role delete` command deletes an access-control role.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be deleted.

-cmddirname <text> - Command / Directory

This specifies the command or command directory to which the role has access. To specify the default setting, use the special value **"DEFAULT"**.

Examples

The following command deletes an access-control role with the role name `readonly` and the command access `"volume"` for Vserver `vs.example.com`.

```
cluster1::> security login role delete -role readonly -cmddirname volume -
vserver vs.example.com
```

security login role modify

Modify an access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role modify` command modifies an access-control role.

Parameters

-vserver <Vserver Name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be modified.

-cmddirname <text> - Command / Directory

This specifies the command or command directory to which the role has access. To specify the default setting for a role, use the special value **"DEFAULT"**. This value can be modified only for the roles created for the `admin` Vserver.

[-access <Access>] - Access Level

This optionally specifies a new access level for the role. Possible access level settings are none, readonly, and all. The default setting is **all**.

[-query <query>] - Query

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by -cmddirname. The query object must be enclosed in double quotation marks (""), and it must be a valid field name.

Examples

The following command modifies an access-control role with the role name readonly and the command access "volume" to have the access level readonly for Vserver vs.example.com:

```
cluster1::> security login role modify -role readonly -cmddirname volume -
access readonly -vservers vs.example.com
```

security login role prepare-to-downgrade

Update role configurations so that they are compatible with earlier releases of Data ONTAP

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security login role prepare-to-downgrade` command restores predefined roles of all Vservers earlier than Data ONTAP 8.3.2. You must run this command in advanced privilege mode when prompted to do so during the release downgrade.

Examples

The following command restores predefined roles of all Vservers earlier than Data ONTAP 8.3.2.

```
cluster1::*> security login role prepare-to-downgrade
```

security login role show

Show access control roles

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role show` command displays the following information about access-control roles:

- Role name
- Command or command directory to which the role has access
- Access level (none, read-only, or all)
- Query (detailed view only)

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Selects the roles that match this parameter value.

[-role <text>] - Role Name

Selects the roles that match this parameter value. If this parameter and the **-cmddirname** parameter are both used, the command displays detailed information about the specified access-control role.

[-cmddirname <text>] - Command / Directory

Selects the roles that match this parameter value. If this parameter and the **-role** parameter are both used, the command displays detailed information about the specified access-control role.

[-access <Access>] - Access Level

Selects the roles that match this parameter value.

[-query <query>] - Query

Selects the roles that match this parameter value.

Examples

The example below displays information about all access-control roles:

```
cluster1::> security login role show
```

Vserver	RoleName	Command/Directory	Query	AccessLevel
vs	vsadmin	DEFAULT		none
vs	vsadmin	dashboard health vsadmin		readonly
vs	vsadmin	job		readonly
vs	vsadmin	job schedule		none
vs	vsadmin	lun		all
vs	vsadmin	network connections		readonly
cluster1	admin	DEFAULT		all
cluster1	readonly	DEFAULT		readonly
cluster1	readonly	volume		none

security login role show-ontapi

Display the mapping between Data ONTAP APIs and CLI commands

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login role show-ontapi` command displays Data ONTAP APIs (ONTAPIs) and the CLI commands that they are mapped to.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-ontapi <text>] - **ONTAPI Name**

Use this parameter to view the corresponding CLI command for the specified API.

[-command <text>] - **CLI Command**

Use this parameter to view the corresponding API or APIs for the specified CLI command.

Examples

The following command displays all Data ONTAP APIs and their mapped CLI commands:

```
cluster1::> security login role show-ontapi
ONTAPI          Command
-----
aggr-add          storage aggregate add-disks
aggr-check-spare-low storage aggregate check_spare_low
aggr-create       storage aggregate create
aggr-destroy      storage aggregate delete
aggr-get-filer-info aggr
aggr-get-iter     storage aggregate show-view
aggr-offline      storage aggregate offline
aggr-online       storage aggregate online
aggr-options-list-info storage aggregate show
aggr-rename       storage aggregate rename
aggr-restrict     storage aggregate restrict
aggr-set-option   storage aggregate modify
autosupport-budget-get system node autosupport budget show
autosupport-budget-get-iter system node autosupport budget show
autosupport-budget-get-total-records
system node autosupport budget show
autosupport-budget-modify system node autosupport budget modify
autosupport-config-get system node autosupport show
autosupport-config-get-iter system node autosupport show
autosupport-config-get-total-records
system node autosupport show
autosupport-config-modify system node autosupport modify
Press <space> to page down, <return> for next line, or 'q' to quit...
```

The following example displays all Data ONTAP APIs which are mapped to the specified CLI command:

```
cluster1::> security login role show-ontapi -command version
ONTAPI          Command
-----
system-get-ontapi-version version
system-get-version version
2 entries were displayed.
```

The following example displays the CLI command that is mapped to the specified Data ONTAP API:

```
cluster1::> security login role show-ontapi -ontapi aggr-create
ONTAPI Name: aggr-create
Command: storage aggregate create
```

security login role config commands

Manage the configuration of login roles

security login role config modify

Modify local user account restrictions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role config modify` command modifies user account and password restrictions.

For the password character restrictions documented below (uppercase, lowercase, digits, etc.), the term "characters" refers to ASCII-range characters only - not extended characters.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver name associated with the profile configuration.

-role <text> - Role Name

This specifies the role whose account restrictions are to be modified.

[-username-minlength <integer>] - Minimum Username Length Required

This specifies the required minimum length of the user name. Supported values are 3 to 16 characters. The default setting is 3 characters.

[-username-alphanum {enabled/disabled}] - Username Alpha-Numeric

This specifies whether a mix of alphabetic and numeric characters are required in the user name. If this parameter is enabled, a user name must contain at least one letter and one number. The default setting is *disabled*.

[-passwd-minlength <integer>] - Minimum Password Length Required

This specifies the required minimum length of a password. Supported values are 3 to 64 characters. The default setting is 8 characters.

[-passwd-alphanum {enabled/disabled}] - Password Alpha-Numeric

This specifies whether a mix of alphabetic and numeric characters is required in the password. If this parameter is enabled, a password must contain at least one letter and one number. The default setting is *enabled*.

[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password

This specifies the minimum number of special characters required in a password. Supported values are from 0 to 64 special characters. The default setting is 0, which requires no special characters.

[-passwd-expiry-time <unsigned32_or_unlimited>] - Password Expires In (Days)

This specifies password expiration in days. A value of 0 means all passwords associated with the accounts in the role expire now. The default setting is *unlimited*, which means the passwords never expire.

`[-require-initial-passwd-update {enabled/disabled}] - Require Initial Password Update on First Login`

This specifies whether users must change their passwords when logging in for the first time. Initial password changes can be done only through SSH or serial-console connections. The default setting is *disabled*.

`[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts`

This specifies the allowed maximum number of consecutive invalid login attempts. When the failed login attempts reach the specified maximum, the account is automatically locked. The default is *0*, which means failed login attempts do not cause an account to be locked.

`[-lockout-duration <integer>] - Maximum Lockout Period (Days)`

This specifies the number of days for which an account is locked if the failed login attempts reach the allowed maximum. The default is *0*, which means the accounts will be locked for 1 day.

`[-disallowed-reuse <integer>] - Disallow Last 'N' Passwords`

This specifies the number of previous passwords that are disallowed for reuse. The default setting is six, meaning that the user cannot reuse any of their last six passwords. The minimum allowed value is *6*.

`[-change-delay <integer>] - Delay Between Password Changes (Days)`

This specifies the number of days that must pass between password changes. The default setting is *0*.

`[-delay-after-failed-login <integer>] - Delay after Each Failed Login Attempt (Secs)`

This specifies the amount of delay observed by the system in seconds upon invalid login attempts. The default setting is *4* seconds.

`[-passwd-min-lowercase-chars <integer>] - Minimum Number of Lowercase Alphabetic Characters Required in the Password`

This specifies the minimum number of lowercase characters required in a password. Supported values are from 0 to 64 lowercase characters. The default setting is *0*, which requires no lowercase characters.

`[-passwd-min-uppercase-chars <integer>] - Minimum Number of Uppercase Alphabetic Characters Required in the Password`

This specifies the minimum number of uppercase characters required in a password. Supported values are from 0 to 64 uppercase characters. The default setting is *0*, which requires no uppercase characters.

`[-passwd-min-digits <integer>] - Minimum Number of Digits Required in the Password`

This specifies the minimum number of digits required in a password. Supported values are from 0 to 64 digits characters. The default setting is *0*, which requires no digits.

`[-passwd-expiry-warn-time <unsigned32_or_unlimited>] - Display Warning Message Days Prior to Password Expiry (Days)`

This specifies the warning period for password expiry in days. A value of *0* means warn user about password expiry upon every successful login. The default setting is *unlimited*, which means never warn about password expiry.

`[-account-expiry-time <unsigned32_or_unlimited>] - Account Expires in (Days)`

This specifies account expiration in days. The default setting is *unlimited*, which means the accounts never expire. The account expiry time must be greater than account inactive limit.

`[-account-inactive-limit <unsigned32_or_unlimited>]` - Maximum Duration of Inactivity before Account Expiration (Days)

This specifies inactive account expiry limit in days. The default setting is *unlimited*, which means the inactive accounts never expire. The account inactive limit must be less than account expiry time.

Examples

The following command modifies the user-account restrictions for an account with the role name `admin` for a Vserver named `vs`. The minimum size of the password is set to 12 characters.

```
cluster1::> security login role config modify -role admin -vserver vs
-passwd-minlength 12
```

security login role config reset

Reset RBAC characteristics supported on releases later than Data ONTAP 8.1.2

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security login role config reset` command resets the following role based access control (RBAC) characteristics to their default values. The system prompts you to run this command if you revert to Data ONTAP 8.1.2 or earlier. If you do not reset these characteristics, the revert process will fail.

- Minimum number of special characters required in password ("0")
- Password-expiration time, in days ("unlimited")
- Whether the password must be changed at the initial login ("disabled")
- Maximum number of failed login attempts permitted before the account is locked out ("0")
- Number of days that the user account is locked out after the maximum number of failed login attempts is reached ("0")

Examples

The following command resets the above mentioned RBAC characteristics of all cluster and Vserver roles to their default values.

```
cluster1::> security login role config reset
```

security login role config show

Show local user account restrictions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role config show` command displays the following information about account restrictions for management-utility user accounts:

- Role name **-role**
- Minimum size of the password, in characters **-passwd-minlength**

- Whether the password requires alphanumeric characters **-passwd-alphanum**
- Number of previous passwords that cannot be reused **-disallowed-reuse**
- Minimum number of days that must elapse before users can change their passwords **-change-delay**

You can display detailed information about the restrictions on a specific account by specifying the **-role** parameter. This adds the following information:

- Minimum length of the user name, in characters **-username-minlength**
- Whether the user name requires alphanumeric characters **-username-alphanum**
- Minimum length of the password, in characters **-passwd-minlength**
- Whether the password requires alphanumeric characters **-passwd-alphanum**
- Minimum number of special characters required in password **-passwd-min-special-chars**
- Minimum number of lowercase characters required in password **-passwd-min-lowercase-chars**
- Minimum number of uppercase characters required in password **-passwd-min-uppercase-chars**
- Minimum number of digits required in password **-passwd-min-digits**
- Minimum number of days that must elapse before users can change their passwords **-change-delay**
- Whether the password must be changed at the initial login **-require-initial-passwd-update**
- Password-expiration time, in days **-passwd-expiry-time**
- Display warning message days prior to password expiry **-passwd-expiry-warn-time**
- Number of previous passwords that cannot be reused **-disallowed-reuse**
- Maximum number of failed login attempts permitted before the account is locked out **-max-failed-login-attempts**
- Number of days for which the user account is locked after the maximum number of failed login attempts is reached **-lockout-duration**
- Account-expiration time, in days **-account-expiry-time**
- Maximum duration of inactivity before account expiration, in days **-account-inactive-limit**
- Delay after each failed login attempt, in secs **-delay-after-failed-login**

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the profile configurations that match this parameter value

[-role <text>] - Role Name

If this parameter is specified, the command displays detailed information about restrictions for the specified user account.

[-username-minlength <integer>] - Minimum Username Length Required

Selects the profile configurations that match this parameter value.

[-username-alphanum {enabled/disabled}] - Username Alpha-Numeric

Selects the profile configurations that match this parameter value. Enabled means a user name must contain both letters and numbers.

[-passwd-minlength <integer>] - Minimum Password Length Required

Selects the profile configurations that match this parameter value.

[-passwd-alphanum {enabled/disabled}] - Password Alpha-Numeric

Selects the profile configurations that match this parameter value. Enabled means a password must contain both letters and numbers.

[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-expiry-time <unsigned32_or_unlimited>] - Password Expires In (Days)

Selects the profile configurations that match this parameter value.

[-require-initial-passwd-update {enabled/disabled}] - Require Initial Password Update on First Login

Selects the profile configurations that match this parameter value.

[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts

Selects the profile configurations that match this parameter value.

[-lockout-duration <integer>] - Maximum Lockout Period (Days)

Selects the profile configurations that match this parameter value.

[-disallowed-reuse <integer>] - Disallow Last 'N' Passwords

Selects the profile configurations that match this parameter value.

[-change-delay <integer>] - Delay Between Password Changes (Days)

Selects the profile configurations that match this parameter value.

[-delay-after-failed-login <integer>] - Delay after Each Failed Login Attempt (Secs)

Selects the profile configurations that match this parameter value.

[-passwd-min-lowercase-chars <integer>] - Minimum Number of Lowercase Alphabetic Characters Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-min-uppercase-chars <integer>] - Minimum Number of Uppercase Alphabetic Characters Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-min-digits <integer>] - Minimum Number of Digits Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-expiry-warn-time <unsigned32_or_unlimited>] - Display Warning Message Days Prior to Password Expiry (Days)

Selects the profile configurations that match this parameter value.

[-account-expiry-time <unsigned32_or_unlimited>] - Account Expires in (Days)

Selects the profile configurations that match this parameter value.

[-account-inactive-limit <unsigned32_or_unlimited>] - Maximum Duration of Inactivity before Account Expiration (Days)

Selects the profile configurations that match this parameter value.

Examples

The example below displays restriction information about all user accounts:

```
cluster1::> security login role config show
----- Password Restrictions -----
Vserver      RoleName      Size AlphaNum NoReuse ChangeDelay
-----
vs            vsadmin       8    enabled      6      0 days
vs            vsadmin-protocol 8    enabled      6      0 days
vs            vsadmin-readonly 8    enabled      6      0 days
vs            vsadmin-volume 8    enabled      6      0 days
cluster1     admin         6    enabled      6      0 days
cluster1     readonly      6    enabled      6      0 days
```

security protocol commands

Manage application configuration

security protocol modify

Modify application configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol modify` command modifies the existing cluster-wide configuration of RSH and Telnet. Enable RSH and Telnet in the cluster by setting the `enabled` field as *true*.

Parameters

-application <text> - application

Selects the application. Supported values are *rsh* and *telnet*.

[-enabled {true/false}] - enabled

Enables or disables the corresponding application. The default value is *false*.

Examples

The following command enables RSH in the cluster. The default setting for RSH is *false*:

```
cluster1::> security protocol modify -application rsh -enabled true
```

The following command enables Telnet in the cluster. The default setting for Telnet is *false*:

```
cluster1::> security protocol modify -application telnet -enabled true
```

security protocol show

Show application configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol show` command displays the cluster-wide configuration of RSH and Telnet in the cluster in advanced privilege mode. RSH and Telnet are disabled by default. Use the [security protocol modify](#) command to change the RSH and Telnet configuration that the cluster supports.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-application <text>] - application

Displays the insecure applications in the cluster.

[-enabled {true/false}] - enabled

Displays whether the application is enabled or disabled in the cluster.

Examples

The following example shows the default security protocol configurations for a cluster:

```
cluster1::> security protocol show

Application      Enabled
-----
rsh              false
telnet          false
```

The following example shows the security protocol configuration after RSH and Telnet have been enabled:

```
cluster1::> security protocol show

Application      Enabled
-----
rsh              true
telnet          true
```

security protocol ssh commands

Manage SSH global configuration

security protocol ssh modify

Modify the SSH configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol ssh modify` command modifies the existing cluster-wide configuration of SSH

Parameters**`[-per-source-limit <integer>]` - Per-Source Limit**

Modifies the maximum number of SSH instances per source IP address on a per-node basis.

`[-max-instances <integer>]` - Maximum Number of Instances

Modifies the maximum number of SSH instances that can be handled on a per-node basis.

`[-connections-per-second <integer>]` - Connections Per Second

Modifies the maximum number of SSH connections per second on a per-node basis.

Examples

The following example modifies cluster-wide SSH configuration:

```
cluster1::*> security protocol ssh modify -per-source-limit 30 -max-
instances 60 -connections-per-second 5
```

security protocol ssh show

Show the SSH configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol ssh show` command displays the cluster-wide SSH configuration in advanced privilege mode. Use the [security protocol ssh modify](#) command to change the SSH configuration that the cluster supports.

Examples

The following example displays cluster-wide SSH configuration:

```
cluster1::*> security protocol ssh show

      Per-Source Limit: 32
Maximum Number of Instances: 64
      Connections Per Second: 10
```

Manage SAML authentication single sign-on configuration

Manage SAML authentication single sign-on configuration

These commands configure the Security Assertion Markup Language (SAML) Service Provider (SP) single sign-on configuration. SAML SP functionality provides the ability for Data ONTAP to use an Identity Provider (IdP) for authentication.

security saml-sp create

Configure SAML service provider for authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp create` command configures ONTAP with Security Assertion Markup Language (SAML) Service Provider (SP) for single sign-on authentication. This command does not enable SAML SP, it just configures it. Configuring and enabling SAML SP is a two-step process:

- Create a SAML SP configuration using `security saml-sp create` command.
- Enable SAML SP by using `security saml-sp modify -is-enabled true`

After the SAML SP configuration is created, it cannot be modified. It must be deleted and created again to change any settings.

Note: This restarts the web server. Any HTTP/S connections that are active will be disrupted.

Parameters

`-idp-uri {(ftp/http):(hostname/IPv4 Address/'[IPv6 Address]')...}` -

Identity Provider (IdP) Metadata Location

This is the URI of the desired identity provider's (IdP) metadata.

`[-sp-host <Remote InetAddress>]` - **SAML Service Provider Host**

This specifies the SAML service provider host IP address.

`{ -cert-ca <text>}` - **Server Certificate Issuing CA**

This specifies the service provider's certificate issuing CA.

`-cert-serial <text>` - **Server Certificate Serial Number**

This specifies the service provider's certificate's serial number.

`[-cert-common-name <FQDN or Custom Common Name>]` - **Server Certificate Common Name**

This specifies the service provider certificate's common name.

`[-verify-metadata-server {true/false}]` - **Verify IdP Metadata Server Identity**

When the IdP metadata is downloaded, the identity of the server hosting the metadata is verified using transport layer security (TLS), validating the server's X.509 certificate against the list of certificate authorities (CAs) in Data ONTAP, and verifying that the host in the server certificate matches the host in the URI (the `idp-uri` field). This verification can be bypassed by setting this field to *false*. Bypassing the server verification is not recommended as the server can not be trusted that way, but will be necessary to use non-TLS URIs, e.g. with the "http" scheme, or when the server certificates are self-signed. If the server's certificate was signed by a CA that is not installed in Data ONTAP, the `security certificate install -type server-ca` command can be used to install it.

`[-foreground {true/false}] - Foreground Process`

When this parameter is set to *false* the command runs in the background as a job. The default is *true*, which causes the command to return after the operation completes.

Examples

The following example configures ONTAP with SAML SP IdP information:

```
cluster1::> security saml-sp create -idp-uri http://public-idp-uri -sp-
host 1.1.1.1
[Job 9] Job succeeded.
cluster1::>
```

Related references

[security saml-sp modify](#) on page 667

security saml-sp delete

Delete SAML service provider for authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp delete` command is used to remove the Security Access Markup Language (SAML) Service Provider (SP). Running this command frees resources used by the SP. SAML SP services will no longer be available after the SP is removed.

If the SAML SP is currently enabled, it is necessary to first use `security saml-sp modify -is-enabled false` prior to `security saml-sp delete`. The `security saml-sp modify -is-enabled false` command must be issued by a password authenticated console application user or from a SAML authenticated command interface.

Note: This restarts the web server. Any HTTP/S connections that are active will be disrupted.

Examples

The following example unconfigures SAML SP:

```
cluster1::> security saml-sp delete
cluster1::>
```

Related references

[security saml-sp modify](#) on page 667

security saml-sp modify

Modify SAML service provider authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp modify` command modifies the Security Assertion Markup Language (SAML) Service Provider (SP) configuration for single sign-on authentication. This command is used to enable or disable an existing SAML SP, `security saml-sp modify -is-enabled true` or `false` respectively.

This command will check the validity of the current SAML SP configuration before enabling the SP. Also, it is necessary to use this command with the `-is-enabled false` parameter prior to deleting an existing SAML SP configuration. SAML SP can only be disabled in this way by a password authenticated console application user or from a SAML authenticated command interface. The delete command must be used if the SAML configuration settings are to be changed, as only the `is-enabled` parameter can be modified.

Note: This may restart the web server. Any HTTP/S connections that are active may be disrupted.

Parameters

`[-is-enabled {true/false}] - SAML Service Provider Enabled`

Use this paramater to enable or disable the SAML SP.

Examples

The following example enables SAML SP:

```
cluster1::> security saml-sp modify -is-enabled true
cluster1::>
```

security saml-sp repair

Repair a failed SAML SP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security saml-sp repair` command attempts to repair a failed SAML SP configuration on a given node. The status of the individual nodes can be viewed using the `security saml-sp status show` command.

Note: This restarts the web server. Any active HTTP/S requests to the web server will be disrupted.

Parameters

`-node {<nodename>/local} - Node`

This identifies a single node that matches the input. The repair job will run on this node.

`[-foreground {true/false}] - Foreground Process`

When this parameter is set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes.

Examples

The following example repairs a failed SAML SP configuration:

```

cluster1:> security saml-sp repair -node node-2

Warning: This restarts the web server. Any active HTTP/S requests to
the web          server will be disrupted

Do you want to continue? {y|n}: y
[Job 1321] Job succeeded.

cluster1:>

```

[security saml-sp status show](#) on page 669

security saml-sp show

Display SAML service provider for authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp show` command displays the Security Assertion Markup Language (SAML) Service Provider (SP) configuration.

The **Identity Provider (IdP) URI** indicates the URI of the desired IdP's metadata.

The **Service Provider (SP) host** indicates the IP address containing SAML SP metadata.

The **Certificate Common Name** indicates the SAML SP certificate's common name.

The **Certificate Serial** indicates the SAML SP certificate's serial number.

Examples

The following example displays the SAML SP configuration:

```

cluster1::> security saml-sp show

Identity Provider URI: https://www.my.idp.com
Service Provider Host: 1.1.1.1
Certificate Name: mycert
Certificate Serial: 1234abcd
Is SAML Enabled: false

```

security saml-sp status commands

The status directory

security saml-sp status show

Display SAML service provider configuration status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security saml-sp status show` command displays the SAML Service Provider (SP) status for all nodes in the cluster.

Parameters

[*-fields* <fieldname>, ...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use *-fields ?* to display the fields to specify.

[*-instance*]}

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node* {<nodename>/local}] - Node

This identifies the node in the cluster.

[*-status* {not-configured/config-in-progress/config-failed/config-success}] - Update Status

This identifies the SAML SP status on the specified node.

[*-error-text* <text>] - Error Text

This identifies the error text associated with the latest saml SP update for this node.

[*-is-enabled* {true/false}] - SAML Service Provider Enabled

When this parameter is set to *true* it indicates that the SAML SP is enabled on this node. Similarly, when this parameter is set to *false*, it indicates that the SAML SP is not enabled on this node.

Examples

The following example displays the SAML SP status information for all nodes in the cluster.

```
cluster::security saml-sp status> show
Node                               SAML SP Status      Enabled
-----
cluster-node1                     not-configured       false
cluster-node2                     not-configured       false
2 entries were displayed.

cluster::*>
```

Security Session Commands

Manage CLI, ONTAPI, and REST sessions and view request statistics

The `security session` commands provide statistics to monitor management session activity and limit configurations to control management session activity for specific categories.

security session kill-cli

Kill a CLI session

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session kill-cli` command is used to terminate CLI sessions. If the session being killed is actively processing a non-read command, the kill will wait until the command is complete before terminating the session. If the session being killed is actively processing a read (show) command, the kill will wait until the current row is returned before terminating the session.

Parameters**-node {<nodename>/local} - Node**

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that is processing the session.

[-start-time <MM/DD HH:MM:SS>] - Start Time

Selects the sessions that match this parameter value. This identifies the start time of the current active session.

-session-id <integer> - Session ID

Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-application <text>] - Client Application

Selects the sessions that match this parameter value. This identifies the calling application by name.

[-location <text>] - Client Location

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

[-state {pending/active/idle}] - Session State

Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

[-request <text>] - Active Command

Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

Examples

The following example illustrates killing a CLI session by specifying the node and the session id.

```
cluster1::> security session show -node node1
```

```
Node: node1           Interface: cli
Idle
Start Time           Sess ID Application Location           Vserver Username
Seconds
```

```

security session show

Show current CLI, ONTAPI, and REST sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session show` command displays all active management sessions across the cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that is processing the session.

[-start-time <MM/DD HH:MM:SS>] - Start Time

Selects the sessions that match this parameter value. This identifies the start time of the current active session.

[-session-id <integer>] - Session ID

Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-application <text>] - Client Application

Selects the sessions that match this parameter value. This identifies the calling application by name.

[-location <text>] - Client Location

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-ipspace <IPspace>] - IPspace of Location

Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made thus far in the active session. The following commands are not counted: top, up, cd, rows, history, exit.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that have failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took for this session.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took for this session.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that has been taken by all completed requests for the current session; it does not include session idle time.

[-state {pending/active/idle}] - Session State

Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

[-request <text>] - Request Input

Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

[-active-seconds <integer>] - Active Seconds

Selects the sessions that match this parameter value. When a session is actively executing a command request, this indicates the time (in seconds) since the current request started.

Examples

The following example illustrates displaying all active sessions across the cluster. In this example, we see one active session on node *node2* from the *console* application. We also see three active sessions on node *node1*. One is from the *console* application and two are from the *ssh* application. Also one of the *ssh* sessions is from user *diag* and the other *ssh* session is from user *admin*.

```
cluster1::> security session show

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location          Vserver Username
Seconds
-----
03/27 16:58:13 1358    console    console              cluster1
admin
Active Seconds: 0 Request: security session show
03/27 17:17:04 1514    ssh        10.98.16.164         cluster1 admin

Security Session Limit Commands

Manage management session limits

These commands allow management session limits to be configured for specific categories, including application, location, request, user, and Vserver. The default limits can be overridden for specific values within each category by using advanced privilege level commands.

security session limit create

Create default session limit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows creation of a default management session limit that does not yet exist. The default limits can be overridden for specific values within each category by using advanced privilege level commands.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-category {application/location/request/user/vserver} - Category

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and category.

Examples

The following example illustrates creating a default limit for management sessions using the same application.

```
cluster1::> security session limit create -interface ontapi -category
application -max-active-limit 8
```

security session limit delete

Delete default session limit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows deletion of a default management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-category {application/location/request/user/vserver} - Category

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

Examples

The following example illustrates deleting all default limits for CLI management sessions.

```
cluster1::> security session limit delete -interface cli -category *
3 entries were deleted.
```

security session limit modify

Modify default session limit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows modification of a default management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-category {application/location/request/user/vserver} - Category

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and category.

Examples

The following example illustrates modifying the default limit for CLI management sessions from the same location.

```
cluster1::> security session limit modify -interface cli -category location -
max-active-limit 4
```

security session limit show

Show default session limits

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command shows the default management session limits that have been configured for each interface and category.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-category {application/location/request/user/vserver}] - Category

Selects the sessions that match this parameter value. This identifies the category for the limit. The following categories are supported: application, location, request, user, and Vserver.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the default limits for management sessions.

```
cluster1::> security session limit show
Interface Category    Max-Active
-----
cli      user           2
cli      vserver          4
ontapi   vserver          2
3 entries were displayed.
```

Security Session Application Limit Commands

Manage per-application session limits

These commands allow management session limits to be configured for specific applications.

security session limit application create

Create per-application session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-application management session limit that does not yet exist.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-application <text> - Application

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and application.

Examples

The following example illustrates creating a limit for management sessions from a custom application.

```
cluster1::*> security session limit application create -interface ontapi -
application "custom_app" -max-active-limit 8
```

security session limit application delete

Delete per-application session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-application management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-application <text> - Application

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

Examples

The following example illustrates deleting a limit for management sessions from a custom application.

```
cluster1::*> security session limit application delete -interface ontapi -
application "custom_app"
```

security session limit application modify

Modify per-application session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-application management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-application <text> - Application

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and application.

Examples

The following example illustrates modifying management session limits for some custom applications.

```
cluster1::*> security session limit application modify -interface ontapi -
application custom* -max-active-limit 4
2 entries were modified.
```

security session limit application show

Show per-application session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-application management session limits that have been configured for each interface and application.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-application <text>] - Application

Selects the sessions that match this parameter value. This identifies the application for the limit. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-application limits for ONTAPI management sessions.

```
cluster1::*> security session limit application show -interface ontapi
Interface Application          Max-Active
-----
ontapi    -default-              5
ontapi    custom_app            10
2 entries were displayed.
```

Security Session Location Limit Commands

Manage per-location session limits

These commands allow management session limits to be configured for specific locations.

security session limit location create

Create per-location session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-location management session limit that does not yet exist.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-location <text> - Location

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and location.

Examples

The following example illustrates creating a CLI limit for specific location.

```
cluster1::*> security session limit location create -interface cli -location
10.98.16.164 -max-active-limit 1
```

security session limit location delete

Delete per-location session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-location management session limit.

Parameters**-interface {cli/ontapi/rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-location <text> - Location

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

Examples

The following example illustrates deleting limits for management sessions from a specific set of locations.

```
cluster1::*> security session limit location delete -interface * -location
10.98.*
3 entries were deleted.
```

security session limit location modify

Modify per-location session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-location management session limit.

Parameters**-interface {cli/ontapi/rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-location <text> - Location

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and location.

Examples

The following example illustrates modifying management sessions limits for specific locations.

```
cluster1::*> security session limit location modify -interface * -location
10.98.* -max-active-limit 2
3 entries were modified.
```

security session limit location show

Show per-location session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-location management session limits that have been configured for each interface and location.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-location <text>] - Location

Selects the sessions that match this parameter value. This identifies the location for the limit. The limit with the location name *-default-* (only in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location

Selects the sessions that match this parameter value. This identifies the IPspace of the client location. The default IPspace is *Default*.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-location limits for management sessions.

```
cluster1::*> security session limit location show
Interface Location      IPspace      Max-Active
-----
cli      -default-      Default      16
cli      10.98.16.164   Default      0
ontapi   -default-      Default      6
ontapi   10.98.16.164   Default      0
4 entries were displayed.
```

Security Session Request Limit Commands

Manage per-request session limits

These commands allow management session limits to be configured for specific requests.

security session limit request create

Create per-request session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-request management session limit that does not yet exist.

Parameters**-interface {cli/ontapi/rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-request <text> - Request Name

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and request.

Examples

The following example illustrates creating a limit for number of clients executing a specific API.

```
cluster1::*> security session limit request create -interface ontapi -
request storage-disk-get-iter -max-active-limit 2
```

security session limit request delete

Delete per-request session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-request management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-request <text> - Request Name

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

Examples

The following example illustrates deleting custom limits for that were configured for the volume commands and APIs.

```
cluster1::*> security session limit request delete -interface * -request
volume*
4 entries were deleted.
```

security session limit request modify

Modify per-request session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-request management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-request <text> - Request Name

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and request.

Examples

The following example illustrates modifying the limit of the number of clients simultaneously executing a specific API.

```
cluster1::*> security session limit request modify -interface ontapi -
request storage-disk-get-iter -max-active-limit 4
```

security session limit request show

Show per-request session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-request management session limits that have been configured for each interface and request.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-request <text>] - Request Name

Selects the sessions that match this parameter value. This identifies the request (command or API) for the limit. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-request limits for management sessions.

```
cluster1::*> security session limit request show
Interface Request                               Max-Active
-----
cli          -default-                          10
ontapi       -default-                          5
ontapi       storage-disk-get-iter               2
3 entries were displayed.
```

Security Session User Limit Commands

Manage per-user session limits

These commands allow management session limits to be configured for specific Vserver users.

security session limit user create

Create per-user session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-user management session limit that does not yet exist.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-user <text> - User

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

Examples

The following example illustrates creating a per-user limit override for ONTAPI requests for the *admin* user in the admin Vserver.

```
cluster1::*> security session limit user create -interface ontapi -vserver
cluster1 -username admin -max-active-limit 16
```

security session limit user delete

Delete per-user session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-user management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-user <text> - User

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

Examples

The following example illustrates deleting all user-specific limits for CLI management sessions.

```
cluster1::*> security session limit user delete -interface cli -user !"-
default-"
2 entries were deleted.
```

security session limit user modify

Modify per-user session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-user management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-user <text> - User

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

Examples

The following example illustrates modifying the admin user's limit for CLI management sessions.

```
cluster1::*> security session limit user modify -interface cli -vserver
cluster1 -username admin -max-active-limit 30
```

security session limit user show

Show per-user session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-user management session limits that have been configured for each interface, Vserver, and user.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[-user <text>] - User

Selects the sessions that match this parameter value. This identifies the user for the limit. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-user limits for CLI management sessions. In this example, there is a default limit of 4 sessions for each user. That limit is expanded to 8 for the admin Vserver. That limit is further expanded to 20 for the *admin* user in the admin Vserver.

```
cluster1::*> security session limit user show -interface cli
Interface Vserver      User      Max-Active
-----
cli        Cluster      -default-  4
cli        cluster1     -default-  8
cli        cluster1     admin      20
3 entries were displayed.
```

Security Session Vserver Limit Commands

Manage per-vserver session limits

These commands allow management session limits to be configured for specific Vservers.

security session limit vsver create

Create per-vserver session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-Vserver management session limit that does not yet exist.

Parameters**-interface {cli/ontapi/rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and Vserver.

Examples

The following example illustrates creating a per-Vserver limit override for ONTAPI requests on the admin Vserver.

```
cluster1::*> security session limit vsriver create -interface ontapi -
vserver cluster1 -max-active-limit 4
```

security session limit vsriver delete

Delete per-vserver session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-Vserver management session limit. The "Cluster" vsriver is used when the specific Vserver doesn't have a configured limit.

Parameters**-interface {cli/ontapi/rest} - Interface**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

Examples

The following example illustrates deleting all per-Vserver limits for management sessions except the default limit.

```
cluster1::*> security session limit vsriver delete -interface * -vserver !
Cluster
1 entries was deleted.
```

security session limit vsriver modify

Modify per-vserver session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-Vserver management session limit.

Parameters

-interface {cli/ontapi/rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and Vserver.

Examples

The following example illustrates modifying the admin Vserver's limit for CLI management sessions.

```
cluster1::*> security session limit vserver modify -interface cli -vserver
cluster1 -max-active-limit 40
```

security session limit vserver show

Show per-vserver session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-Vserver management session limits that have been configured for each interface and Vserver.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-Vserver limits for management sessions.

```
cluster1::*> security session limit vsrver show
Interface Vserver                      Max-Active
-----
cli      Cluster                        4
ontapi   Cluster                        2
ontapi   cluster1                       16
3 entries were displayed.
```

Security Session Request-Statistics Commands

View session request statistics

These commands provide historical statistics surrounding management session activity for specific categories, including application, location, request, user, and Vserver.

security session request-statistics show-by-application

Show session request statistics by application

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-application` command shows historical statistics for management session activity, categorized by application name. CLI sessions connections will have an application name based on the connection method, i.e.: *ssh*, *telnet*, *rsh*, *console*, or *ngsh*. ONTAPI sessions will extract the application name from the ZAPI request. ONTAP looks for the application name in the following three locations, in the following order of precedence:

1. The "X-Dot-Client-App" HTTP header;
2. The "app-name" attribute of the "netapp" element, within the ZAPI XML request;
3. The "User-Agent" HTTP header.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-application <text>] - Application

Selects the sessions that match this parameter value. This identifies the calling application by name.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[-last-active-seconds <integer>] - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by application name.

```
cluster1::> security session request-statistics show-by-application
```

Node: node1	Interface: cli					Idle	Total
Application	Total	Now	Max	Pass	Fail	Seconds	Seconds
(ms)							Avg
-----	-----	---	---	---	---	-----	-----
console	2126	0	6	95%	96	68	361
170							
ssh	6	2	3	100%	0	-	794
132444							

Node: node1	Interface: ontapi					Idle	Total
Application	Total	Now	Max	Pass	Fail	Seconds	Seconds
(ms)							Avg

security session request-statistics show-by-location

Show session request statistics by location

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-location` command shows historical statistics for management session activity, categorized by client location.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-location <text>] - Client Location

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-ipSPACE <IPspace>] - IPspace of Location

Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

security session request-statistics show-by-request

Show session request statistics by request name

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-request` command shows historical statistics for management session activity, categorized by request (command or API name).

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-request <text>] - Request Name

Selects the sessions that match this parameter value. This identifies the command associated with these requests.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active requests.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active requests.

[-last-active-seconds <integer>] - Seconds Since Last Request Start

Selects the sessions that match this parameter value. When requests are active, this indicates the time (in seconds) since the last request started.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When no requests are active, this indicates the time (in seconds) since the last request ended.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity on a specific node, with a specific request query.

```
cluster1::> security session request-statistics show-by-request -node node1 -

security session request-statistics show-by-user

Show session request statistics by username

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-user` command shows historical statistics for management session activity, categorized by username. Entries for username 'autosupport' reflect commands that are executed by the AutoSupport OnDemand feature.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[-last-active-seconds <integer>] - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by username.

```
cluster1::> security session request-statistics show-by-user
```

Node: node1		Interface: cli					Idle	Total

security session request-statistics show-by-vserver

Show session request statistics by Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-vserver` command shows historical statistics for management session activity, categorized by vservers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli/ontapi/rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: `top`, `up`, `cd`, `rows`, `history`, `exit`.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[-last-active-seconds <integer>] - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by Vserver.

```
cluster1::> security session request-statistics show-by-vserver

security ssh commands

Manage SSH Configuration

security ssh add

Add SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh add` command adds additional SSH key exchange algorithms or ciphers or MAC algorithms to the existing configurations of the cluster or a Vserver. The added algorithms or ciphers or MAC algorithms are enabled on the cluster or Vserver. If you change the cluster configuration settings, it is used as the default for all newly created Vservers. The existing SSH key exchange algorithms, ciphers, and MAC algorithms remain unchanged in the configuration. If the SSH key exchange algorithms or ciphers or MAC algorithms are already enabled in the current configuration, the command will not fail. Data ONTAP supports the *diffie-hellman-group-exchange-sha256* key exchange algorithm for SHA-2. Data ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. Data ONTAP also supports

ecdh-sha2-nistp256, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, and *curve25519-sha256*. Data ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm*, and *3des-cbc*. Data ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *hmac-ripemd160*, *umac-64*, *umac-64*, *umac-128*, *hmac-sha2-256*, *hmac-sha2-512*, *hmac-sha1-etm*, *hmac-sha1-96-etm*, *hmac-sha2-256-etm*, *hmac-sha2-512-etm*, *hmac-md5-etm*, *hmac-md5-96-etm*, *hmac-ripemd160-etm*, *umac-64-etm*, and *umac-128-etm*.

Parameters

-vserver <Vserver Name> - Vserver

Identifies the Vserver to which you want to add additional SSH key exchange algorithms or ciphers.

[-key-exchange-algorithms <algorithm name>, ...] - List of SSH Key Exchange Algorithms to Add

Adds the specified SSH key exchange algorithm or algorithms to the Vserver.

[-ciphers <cipher name>, ...] - List of SSH Ciphers to Add

Adds the specified cipher or ciphers to the Vserver.

[-mac-algorithms <MAC name>, ...] - List of SSH MAC Algorithms to Add

Adds the specified MAC algorithm or algorithms to the Vserver.

Examples

The following command adds the *diffie-hellman-group-exchange-sha256* and *diffie-hellman-group-exchange-sha1* key exchange algorithms for the cluster1 Vserver. It also adds the *aes256-cbc* and *aes192-cbc* ciphers and the *hmac-sha1* and *hmac-sha2-256* MAC algorithms to the cluster1 Vserver.

```
cluster1::> security ssh add -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group-exchange-sha256,diffie-hellman-group-exchange-sha1 -
ciphers aes256-cbc,aes192-cbc -mac-algorithms hmac-sha1,hmac-sha2-256
```

security ssh modify

Modify SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh modify` command replaces the existing configurations of the SSH key exchange algorithms or ciphers or MAC algorithms for the cluster or a Vserver with the configuration settings you specify. If you modify the cluster configuration settings, it will be used as the default for all newly created Vservers. Data ONTAP supports the *diffie-hellman-group-exchange-sha256* key exchange algorithm for SHA-2. Data ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. Data ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm*, and *3des-cbc*. Data ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *hmac-ripemd160*, *umac-64*, *umac-64*, *umac-128*, *hmac-sha2-256*, *hmac-sha2-512*, *hmac-sha1-etm*, *hmac-sha1-96-etm*, *hmac-sha2-256-*

etm, *hmac-sha2-512-etm*, *hmac-md5-etm*, *hmac-md5-96-etm*, *hmac-ripemd160-etm*, *umac-64-etm*, and *umac-128-etm*.

Parameters

-vserver <Vserver Name> - Vserver

Identifies the Vserver for which you want to replace the existing SSH key exchange algorithm and cipher configurations.

[-key-exchange-algorithms <algorithm name>, ...] - Key Exchange Algorithms

Enables the specified SSH key exchange algorithm or algorithms for the Vserver. This parameter also replaces all existing SSH key exchange algorithms with the specified settings.

[-ciphers <cipher name>, ...] - Ciphers

Enables the specified cipher or ciphers for the Vserver. This parameter also replaces all existing ciphers with the specified settings.

[-mac-algorithms <MAC name>, ...] - MAC Algorithms

Enables the specified MAC algorithm or algorithms for the Vserver. This parameter also replaces all existing MAC algorithms with the specified settings.

[-max-authentication-retry-count <integer>] - Max Authentication Retry Count

Modifies the maximum number of authentication retry count for the Vserver.

Examples

The following command enables the *diffie-hellman-group-exchange-sha256* and *diffie-hellman-group14-sha1* key exchange algorithms for the cluster1 Vserver. It also enables the *aes256-ctr*, *aes192-ctr* and *aes128-ctr* ciphers, *hmac-sha1* and *hmac-sha2-256* MAC algorithms for the cluster1 Vserver. It also modifies the maximum authentication retry count to 3 for the cluster1 Vserver:

```
cluster1::> security ssh modify -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group-exchange-sha256,diffie-hellman-group14-sha1 -ciphers
aes256-ctr,aes192-ctr,aes128-ctr -mac-algorithms hmac-sha1,hmac-sha2-256 -
max-authentication-retry-count 3
```

security ssh prepare-to-downgrade

Downgrade the SSH configuration to be compatible with releases earlier than Data ONTAP 9.2.0.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command downgrades the SSH configurations of all Vservers and the cluster to settings compatible with releases earlier than Data ONTAP 9.2.0. This command also disables the max-authentication-retry feature. You must run this command in advanced privilege mode when prompted to do so during the release downgrade. Otherwise, the release downgrade process will fail.

Examples

The following command downgrades the SSH security configurations of all Vservers and the cluster to settings compatible with releases earlier than Data ONTAP 9.2.0.

```
cluster1::*> security ssh prepare-to-downgrade
```

security ssh remove

Remove SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh remove` command removes the specified SSH key exchange algorithms or ciphers from the existing configurations of the cluster or a Vserver. The removed algorithms or ciphers are disabled on the cluster or Vserver. If you changed the cluster configuration settings, it will be used as the default for all newly created Vservers. If the SSH key exchange algorithms or ciphers that you specify with this command are not currently enabled, the command will not fail. Data ONTAP supports the *diffie-hellman-group-exchange-sha256* key exchange algorithm for SHA-2. Data ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. Data ONTAP also supports *ecdh-sha2-nistp256*, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, and *curve25519-sha256*. Data ONTAP also supports the AES and 3DES symmetric encryption (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm* and *3des-cbc*. Data ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *hmac-ripemd160*, *umac-64*, *umac-128*, *hmac-sha2-256*, *hmac-sha2-512*, *hmac-sha1-etm*, *hmac-sha1-96-etm*, *hmac-sha2-256-etm*, *hmac-sha2-512-etm*, *hmac-md5-etm*, *hmac-md5-96-etm*, *hmac-ripemd160-etm*, *umac-64-etm*, and *umac-128-etm*.

Parameters

-vserver <Vserver Name> - Vserver

Identifies the Vserver from which you want to remove the SSH key exchange algorithms or ciphers.

[-key-exchange-algorithms <algorithm name>, ...] - List of SSH Key Exchange Algorithms to Remove

Removes the specified key exchange algorithm or algorithms from the Vserver.

[-ciphers <cipher name>, ...] - List of SSH Ciphers to Remove

Removes the specified cipher or ciphers from the Vserver.

[-mac-algorithms <MAC name>, ...] - List of SSH MAC algorithms to Remove

Removes the specified MAC algorithm or algorithms from the Vserver.

Examples

The following command removes the *diffie-hellman-group1-sha1* and *diffie-hellman-group-exchange-sha1* key exchange algorithms from the cluster1 Vserver. It also removes the *aes128-cbc* and *3des-cbc* ciphers and the *hmac-sha1-96* and *hmac-sha2-256* MAC algorithms from the cluster1 Vserver.

```
cluster1::> security ssh remove -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group1-sha1,diffie-hellman-group-exchange-sha1 -ciphers
aes128-cbc,3des-cbc -mac-algorithms hmac-sha1-96,hmac-sha2-256
```

security ssh show

Display SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh show` command displays the configurations of the SSH key exchange algorithms, ciphers, MAC algorithms and maximum authentication retry count for the cluster and Vservers. The SSH protocol uses a Diffie-Hellman based key exchange method to establish a shared secret key during the SSH negotiation phrase. The key exchange method specifies how one-time session keys are generated for encryption and authentication and how the server authentication takes place. Data ONTAP supports the *diffie-hellman-group-exchange-sha256* key exchange algorithm for SHA-2. Data ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* key exchange algorithms for SHA-1. Data ONTAP also supports *ecdh-sha2-nistp256*, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, *curve25519-sha256*. Data ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm* and *3des-cbc*. Data ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *hmac-ripemd160*, *umac-64*, *umac-128*, *hmac-sha2-256*, *hmac-sha2-512*, *hmac-sha1-etm*, *hmac-sha1-96-etm*, *hmac-sha2-256-etm*, *hmac-sha2-512-etm*, *hmac-md5-etm*, *hmac-md5-96-etm*, *hmac-ripemd160-etm*, *umac-64-etm*, *umac-128-etm*

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance {}]

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Identifies the Vserver for which you want to display the SSH key exchange algorithm, cipher, and MAC algorithm configurations.

[-key-exchange-algorithms <algorithm name>, ...] - Key Exchange Algorithms

Displays the Vserver or Vservers that have the specified key exchange algorithms enabled.

[-ciphers <cipher name>, ...] - Ciphers

Displays the Vserver or Vservers that have the specified ciphers enabled.

[-mac-algorithms <MAC name>, ...] - MAC Algorithms

Displays the Vserver or Vservers that have the specified MAC algorithm or algorithms.

[-max-authentication-retry-count <integer>] - Max Authentication Retry Count

Displays Vservers with a matching maximum authentication retry count value.

Examples

The following command displays the enabled SSH key exchange algorithms, ciphers, MAC algorithms and maximum number of authentication retry count for the cluster and all Vservers. The cluster settings are used as the default for all newly created Vservers:

```
cluster-1::> security ssh show
```

Vserver	Ciphers	Key Exchange Algorithms	MAC Algorithms	Max Authentication Retry Count
cluster-1	3des-cbc	diffie-hellman-group-exchange-sha256	hmac-shal	4
vs1	aes256-ctr, aes192-ctr, aes128-ctr, aes256-cbc, aes192-cbc, aes128-cbc, 3des-cbc, aes128-gcm, aes256-gcm	diffie-hellman-group-exchange-sha256, diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, ecdh-sha2-nistp256, ecdh-sha2-nistp384, ecdh-sha2-nistp521, curve25519-sha256	hmac-shal, hmac-shal-96, hmac-sha2-256, hmac-sha2-512, hmac-sha1-etm, hmac-sha1-96-etm, hmac-sha2-256-etm, hmac-sha2-512-etm, hmac-md5, hmac-md5-96, hmac-ripemd160, umac-64, umac-128, hmac-md5-etm, hmac-md5-96-etm, hmac-ripemd160-etm, umac-64-etm, umac-128-etm	6

2 entries were displayed.

Virtual Server SSL Management

Manage the SSL configurations for a Vserver

These commands control the use of encrypted HTTP on Vservers, including whether SSL is available, which certificate is used for communication, and whether OCSP checks are enabled.

security ssl modify

Modify the SSL configuration for HTTP servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the [vserver services web show](#) command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

Parameters

-vserver <Vserver Name> - Vserver

Identifies a Vserver for hosting SSL-encrypted web services.

[-ca <text>] - Server Certificate Issuing CA

Identifies a Certificate Authority (CA) of a certificate to be associated with the instance of a given Vserver. If this parameter, along with serial, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

[-serial <text>] - Server Certificate Serial Number

Identifies a serial number of a certificate to be associated with the instance of a given Vserver. If this parameter, along with ca, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

[-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name

Identifies the common name (CN) of a certificate to be associated with the instance of a given Vserver. This parameter becomes optional if serial and ca are specified. You can use the [security certificate create](#) and [security certificate install](#) commands to add new certificates to Vservers.

Note: The use of self-signed SSL certificates exposes users to man-in-the-middle security attacks. Where possible, obtain a certificate that is signed by a reputable certificate authority (CA) and use the [security certificate install](#) command to configure it before enabling SSL on a Vserver.

[-server-enabled {true/false}] - SSL Server Authentication Enabled

Defines the working condition of SSL server authentication in an instance of the Vserver. Any Vserver with a valid certificate of type server is server-enabled.

[-client-enabled {true/false}] - SSL Client Authentication Enabled

Defines the working condition of SSL client authentication in an instance of the Vserver. Any Vserver with a valid certificate of type client-ca is client-enabled. It can only be enabled if server-enabled is true.

[-ocsp-enabled {true/false}] - Online Certificate Status Protocol Validation Enabled

This parameter enables OCSP validation of the client certificate chain. When this parameter is enabled, certificates in the certificate chain of the client will be validated against an OCSP responder after normal verification (including CRL checks) has occurred. The OCSP responder used for validation process is either extracted from the certificate itself, or it is derived by configuration.

[-ocsp-default-responder <text>] - URI of the Default Responder for OCSP Validation

This parameter sets the default OCSP responder to use. If this parameter is not enabled, the URI given will be used only if no responder URI is specified in the certificate that are being verified.

[-ocsp-override-responder {true/false}] - Force the Use of the Default Responder URI for OCSP Validation

This parameter forces the configured default OCSP responder to be used during OCSP certificate validation, even if the certificate that is being validated references an OCSP responder.

[-ocsp-responder-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for OCSP Queries

Use this parameter to specify the timeout in seconds for OCSP responders. Specify zero for the minimum possible timeout. The default value is 10 seconds.

[-ocsp-max-response-age <unsigned32_or_unlimited>] - Maximum Allowable Age for OCSP Responses (secs)

This parameter sets the maximum allowable age (freshness) in seconds for the OCSP responses. The default value for this parameter is unlimited, which does not

enforce a maximum age and the OCSP responses are considered valid as long as their expiration date field is in the future.

`[-ocsp-max-response-time-skew <[<integer>h][<integer>m][<integer>s]>]` -

Maximum Allowable Time Skew for OCSP Response Validation

This parameter sets the maximum allowable time difference for OCSP responses (when validating their `ThisUpdate` and `NextUpdate` fields).

`[-ocsp-use-request-nonce {true/false}]` - **Use a NONCE within OCSP Queries**

This parameter determines whether the queries to the OCSP responders should contain a NONCE or not. By default, a query NONCE is always used and checked against the OCSP response. When the responder does not use NONCEs, this parameter should be disabled.

Note: A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

Examples

The following example enables SSL server authentication for a Vserver named `vs0` with a certificate that has `ca` as `www.example.com` and serial as `4F4EB629`.

```
cluster1::> security ssl modify -vserver vs0 -ca www.example.com -serial
4F4EB629 -server-enabled true
```

The following example disables SSL server authentication for a Vserver name `vs0`.

```
cluster1::> security ssl modify -vserver vs0 -server-enabled false
```

The following example enables SSL client authentication for a Vserver named `vs0`.

```
cluster1::> security ssl modify -vserver vs0 -client-enabled true
```

The following example disables SSL client authentication for a Vserver named `vs0`.

```
cluster1::> security ssl modify -vserver vs0 -client-enabled false
```

security ssl show

Display the SSL configuration for HTTP servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the [vserver services web show](#) command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-ocsp]

If you specify the **-ocsp** parameter, the command displays the Online Certificate Status Protocol configuration.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Identifies a Vserver for hosting SSL-encrypted web services.

[-ca <text>] - Server Certificate Issuing CA

Filters the display of SSL configuration by specifying the Certificate Authority (CA) that issued the server certificate.

[-serial <text>] - Server Certificate Serial Number

Filters the display of SSL configuration by specifying the serial number of a server certificate.

[-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name

Filters the display of SSL configuration by specifying the common name for the server certificate.

[-server-enabled { true/false }] - SSL Server Authentication Enabled

Filters the display of SSL configuration according to whether the SSL server authentication is enabled or disabled. Vservers have self-signed certificates automatically generated during their creation. These Vserver self-signed certificates are server-enabled by default.

[-client-enabled { true/false }] - SSL Client Authentication Enabled

Filters the display of SSL configuration according to whether the SSL client authentication is enabled or disabled. You can enable client authentication only when server authentication is enabled.

[-ocsp-enabled { true/false }] - Online Certificate Status Protocol Validation Enabled

Filters the display of SSL configuration when the Online Certificate Status Protocol validation is enabled.

[-ocsp-default-responder <text>] - URI of the Default Responder for OCSP Validation

Filters the display of SSL configuration according to the URI of the default responder for OCSP validation.

[-ocsp-override-responder { true/false }] - Force the Use of the Default Responder URI for OCSP Validation

Filters the display of SSL configuration, which forces the use of the default responder URI for OCSP validation.

[-ocsp-responder-timeout <[<integer>h][<integer>m][<integer>s]>] - Timeout for OCSP Queries

Filters the display of SSL configuration according to the timeout for queries to OCSP responders.

`[-ocsp-max-response-age <unsigned32_or_unlimited>]` - Maximum Allowable Age for OCSP Responses (secs)

Filters the display of SSL configuration according to the maximum allowable age (freshness) in seconds for the OCSP responses.

`[-ocsp-max-response-time-skew <[<integer>h][<integer>m][<integer>s]>]` - Maximum Allowable Time Skew for OCSP Response Validation

Filters the display of SSL configuration according to the maximum allowable time difference for OCSP responses (when validating their ThisUpdate and NextUpdate fields).

`[-ocsp-use-request-nonce {true/false}]` - Use a NONCE within OCSP Queries

Filters the display of SSL configuration by specifying whether the queries to the OCSP responders should contain a NONCE or not.

Note: A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

Examples

The following example displays the configured certificates for Vservers.

```
cluster1::security ssl> show
      Serial
Vserver  Number  Common Name                Server  Client
-----  -
cluster1 516C3CB3                cluster1.company.com      true   true
vs0      516816D4                vs0.company.com          true   false
2 entries were displayed.
```

SnapLock Commands

Manages SnapLock attributes in the system

The `snaplock` commands manage compliance-related functionality in the system. A volume created using the `volume create` command becomes a SnapLock volume when it is created on a SnapLock aggregate. A SnapLock aggregate is created using the `storage aggr create` command when the `snaplock-type` is specified as either `compliance` or `enterprise`.

The `snaplock compliance-clock` command can be used to manage the ComplianceClock in the system.

The `snaplock log` command can be used to manage SnapLock log infrastructure.

[snaplock log](#) on page 729

SnapLock Clock commands

Manages ComplianceClock of nodes

The `snaplock compliance-clock` manages the ComplianceClock of the system.

ComplianceClock determines the expiry time of the SnapLock objects in the system.

ComplianceClock can be initialized only once by the user and once it is set, it cannot be changed or altered by the user. There are two types of ComplianceClocks in the system:

- System ComplianceClock
- Volume ComplianceClock

System ComplianceClock (SCC) is maintained per node. SCC is used to update the Volume ComplianceClock and to provide a base value for Volume ComplianceClock for new SnapLock volumes. The SCC is initialized once by the user and takes the initial base value from the system clock. `snaplock compliance-clock show` can be used to check the value of the System ComplianceClock.

Volume ComplianceClock (VCC) is maintained per volume and is used as the time reference to calculate the expiry time of SnapLock objects in the SnapLock volume, such as files and the expiry date of the volume. `volume snaplock show` can be used to check the value of the Volume ComplianceClock.

snaplock compliance-clock initialize

Initializes the node ComplianceClock

Availability: This command is available to `cluster` administrators at the `admin` privilege level.

Description

`snaplock compliance-clock initialize` command is used to initialize System ComplianceClock from the system clock. System ComplianceClock can be initialized only once by the user. Once initialized, user cannot make any changes to the System ComplianceClock. Hence, user should ensure that system clock is correct before initializing the System ComplianceClock.

Parameters

-node {<nodename>/local} - Node

Specifies the name of the node on which System ComplianceClock needs to be initialized.

[-force [true]] - Forces Initialization

If you use this parameter, it will suppress the warning message during `snaplock compliance-clock initialize` operation.

Examples

```
cluster-1:> snaplock compliance-clock initialize -node node1

Warning: You are about to initialize the secure ComplianceClock of the node
node1 to the current value of the node's system clock. This
procedure can be performed only once on a given node, so you should
ensure that the system time is set correctly before proceeding.
The current node's system clock is: Wed Nov 26 16:18:30 IST 2014

Do you want to continue? {y|n}: y

cluster-1:>
```

[snaplock compliance-clock show](#) on page 714

snaplock compliance-clock show

Displays the node ComplianceClock

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `snaplock compliance-clock show` command will display System ComplianceClock of the nodes in the cluster. It will display the following information:

- Node name
- ComplianceClock Time

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If this parameter is specified, the command will display ComplianceClock for that particular node only.

[-time <text>] - ComplianceClock Time of the Node

If this parameter is specified, the command will display nodes having the same - **time** value.

Examples

```
cluster1::> snaplock compliance-clock show
Node          ComplianceClock Time
-----
node1         Mon Jan 12 11:34:15 IST 2015 +05:30
node2         Mon Jan 12 11:34:10 IST 2015 +05:30
2 entries were displayed.
```

```
cluster1::> snaplock compliance-clock show -node node1
Node          ComplianceClock Time
-----
node1         Mon Jan 12 11:34:45 IST 2015 +05:30
```

The following example shows the output when the session privilege level is "diagnostic".

```
cluster1::*> snaplock compliance-clock show
Node          ComplianceClock Time          Node ID    ID
-----
node1         Mon Jan 12 11:37:13 IST 2015 +05:30 4040216954 1418640203778
node2         ComplianceClock is not configured.
2 entries were displayed.
```

The following example shows the output when the session privilege level is "diagnostic".

```
cluster1::*> snaplock compliance-clock show -node node1

Node: node1
ComplianceClock Time: Mon Jan 12 11:37:55 IST 2015 +05:30
Node ID: 4040216954
ID: 1418640203778
ComplianceClock Time (secs): 1419002188
ComplianceClock Skew (secs): 1014
```

snaplock compliance-clock ntp commands

The ntp directory

snaplock compliance-clock ntp modify

Modify SnapLock ComplianceClock synchronization setting

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snaplock compliance-clock ntp modify` command modifies the option to enable or disable the SnapLock ComplianceClock synchronization with the system time. The ComplianceClock is synchronized only when an NTP server has been configured so that the system time follows the NTP time and the skew between the ComplianceClock time and the system time is greater than 1 day.

Parameters

`[-is-sync-enabled {true/false}]` - Enable ComplianceClock sync to NTP system time

Specifies whether synchronization should be enabled or not. This is a cluster wide option.

Examples

```
cluster1::> snaplock compliance-clock ntp modify -is-sync-enabled true
```

snaplock compliance-clock ntp show

Display SnapLock ComplianceClock synchronization setting

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snaplock compliance-clock ntp show` command will display ComplianceClock synchronization setting. It will display the following information:

- `is-sync-enabled` - Displays if the option to synchronize the ComplianceClock with system time has been enabled or not.

Examples

```
cluster1::> snaplock compliance-clock ntp show
Enable clock sync to NTP system time: true
```

snaplock event-retention commands

SnapLock Event Based Retention commands

snaplock event-retention abort

Abort an Event Based Retention policy operation.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention abort` is used to abort an ongoing Event Based Retention (EBR) operation. This command only aborts the operations that have not yet completed. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the vservers on which the EBR operation is running.

-operation-id <integer> - Operation ID

Specifies the operation ID of the EBR operation that needs to be aborted.

Examples

The following example aborts an ongoing EBR operation with operation-id `16842754`:

```
vs1::> snaplock event-retention abort -operation-id 16842754
vs1::>
```

snaplock event-retention apply

Apply an Event Based Retention policy on all files within a user specified path.

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `snaplock event-retention apply` command starts a new operation to apply the specified Event Based Retention (EBR) policy to all files in the specified path. If a file is a regular file, it will be made a WORM file and retained for a retention-period as defined by the specified policy name. If a file is already WORM, its retention time will be extended to a retention-period as defined by the specified policy name, starting from the current time. The retention time of a file will be extended only if the file's current retention time is less than the new retention time value to be set. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver which has the EBR policy defined to be applied on one or more files.

-policy-name <text> - Policy Name

Specifies the name of the EBR policy to be applied on one or more files.

-volume <volume name> - Volume

Specifies the name of the SnapLock volume containing a file path or a directory path as specified by the path parameter. The specified EBR policy is applied to one or more files depending on the value of path.

-path <text> - Path

Specifies the path relative to the output volume root, of the form `"/path"`. The path can be path to a file or a directory. The EBR policy is applied to all files under the specified path. To apply the EBR policy to all files in a volume, specify the path as `"/"`.

Examples

The following example starts an EBR operation to apply a policy on files for specified volume:

```
vsl:> snaplock event-retention apply -policy-name p1 -
volume slc -path /
SnapLock event based retention operation is queued. Run
"snaplock event-retention show -operation-id 16842754 -instance" to view the
operation status.
```

snaplock event-retention show

Show status of Event Based Retention operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention show` command displays the status of an Event Based Retention (EBR) operation. Information about completed operations will be cleaned up after an hour after completion. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays all EBR operations that match the specified Vserver.

[-operation-id <integer>] - Operation ID

If this parameter is specified, the command displays all EBR operations that match the specified operation ID.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays all EBR operations that match the specified volume. The parameter specifies the volume on which EBR operation is running or has completed.

[-path <text>] - Path

If this parameter is specified, the command displays all EBR operations that match the specified path. The parameter specifies the path on which EBR operation is running or has completed.

[-policy-name <text>] - Policy Name

If this parameter is specified, the command displays all EBR operations that match the specified policy name. The parameter specifies the EBR policy name.

`[-retention-period {<integer> seconds/minutes/hours/days/months/years} / infinite]` - Retention Period

If this parameter is specified, the command displays all EBR operations that match the specified retention period. The parameter specifies the retention period of the EBR policy.

`[-num-files-processed <integer>]` - Number of Files Processed

If this parameter is specified, the command displays all EBR operations that match the specified number of processed files. The parameter specifies the number of files on which EBR policy was applied successfully.

`[-num-files-failed <integer>]` - Number of Files Failed

If this parameter is specified, the command displays all EBR operations that match the specified number of failed files. The parameter specifies the number of files on which the application of EBR policy failed.

`[-num-files-skipped <integer>]` - Number of Files Skipped

If this parameter is specified, the command displays all EBR operations that match the specified number of skipped files. The parameter specifies the number of files on which the application of EBR policy was skipped. A file that is under legal-hold will be skipped. If the retention time of a file is being shortened as a result of applying the EBR policy, that file will also be skipped.

`[-num-inodes-ignored <integer>]` - Number of Inodes Ignored

If this parameter is specified, the command displays all EBR operations that match the specified number of ignored inodes. The parameter specifies the number of inodes on which the application of EBR policy was not attempted because they were not regular files.

`[-operation-status {Unknown/In-Progress/Failed/Aborting/Completed}]` -

Operation Status

If this parameter is specified, the command displays all EBR operations that match the specified operation status. The parameter specifies the operation status of an EBR operation.

`[-status-details <text>]` - Status Details

If this parameter is specified, the command displays all EBR operations that match the specified status details. The parameter specifies the status details of an EBR operation.

Examples

The following examples show the status of EBR operations for Vserver "vs1" and volume "slc" and the status of event-retention operation for operation ID 16842753 respectively.

```
vs1::*> snaplock event-retention operation show -volume slc
Operation ID  Vserver      Volume      Operation Status
-----
16842753      vs1             slc         Completed
16842754      vs1             slc         In-progress

vs1::*> snaplock event-retention operation show -operation-id
16842753

Operation ID: 16842753
Vserver: vs1
Volume: slc
Path: /vol/slc/d1
Policy Name: p1
Retention Period: 10 years
Number of Files Processed: 50
Number of Files Failed: 0
```

```

Number of Inodes Ignored: 2
Operation Status: Completed
Status Details: No error

```

snaplock event-retention show-vservers

Show Vservers with SnapLock Event Based Retention policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention show-vservers` command is used to display the Vservers that have SnapLock Event Based Retention (EBR) policies created.

Parameters

[-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

Examples

The following example displays all Vservers that have SnapLock EBR policies:

```

cluster-1::*> snaplock event-retention show-vservers
Vserver
-----
vs1

```

snaplock event-retention policy commands

SnapLock Event Based Retention policy commands

snaplock event-retention policy create

Create SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy create` command is used to create Event Based Retention (EBR) policies for a Vserver. A policy consists of a *policy-name* and a *retention-period*. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which a policy needs to be created.

-name <text> - Policy Name

Specifies the name of the EBR policy to be created.

-retention-period `{{<integer> seconds/minutes/hours/days/months/years} / infinite}` - **Event Retention Period**

Specifies the retention period for an EBR policy.

Examples

The following example creates a new EBR policy "p1" for Vserver "vs1" with a retention period of "10 years":

```
vs1::> snaplock event-retention policy create -name p1 -
retention-period "10 years"
```

snaplock event-retention policy delete

Delete SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy delete` command is used to delete Event Based Retention (EBR) policies for a Vserver. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver `<vserver name>` - **Vserver Name**

If this parameter is specified, the command deletes all EBR policies that match the specified Vserver.

-name `<text>` - **Policy Name**

If this parameter is specified, the command deletes all EBR policies that match the specified *name*.

Examples

The following example deletes retention policy "p1" for Vserver "vs1":

```
vs1::> snaplock event-retention policy delete -name p1
```

snaplock event-retention policy modify

Modify SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy modify` command is used to modify the retention period of an Event Based Retention (EBR) policy for a Vserver. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which retention period of a policy needs to be modified.

-name <text> - Policy Name

Specifies the name of the EBR policy for which the retention period needs to be modified.

[-retention-period {{<integer> seconds/minutes/hours/days/months/years} / infinite}] - Event Retention Period

Specifies the new value of retention period.

Examples

The following example modifies the retention period of policy "p1" for Vserver "vs1" to "5 years":

```
vs1::> snaplock event-retention policy modify -name p1 -
retention-period "5 years"
```

snaplock event-retention policy show

Show SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy show` command is used to show Event Based Retention (EBR) policies for a Vserver. A policy consists of a *policy-name* and a *retention-period*. The command output depends on the parameter or parameters specified. If no parameters are specified, all policies for all vservers will be displayed. If one or more parameters are specified, only those entries matching the specified values will be displayed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays all EBR policies that match the specified Vserver.

[-name <text>] - Policy Name

If this parameter is specified, the command displays all EBR policies that match the specified *name*.

[*-retention-period* {<*integer*> *seconds/minutes/hours/days/months/years*> / *infinite*>}] - Event Retention Period

If this parameter is specified, the command displays all EBR policies that match the specified *retention-period*.

Examples

The following example displays all event-retention policies for vserver "vs1":

```
vs1::> snaplock event-retention policy show
Vserver      Name      Retention Period
-----
vs1          p1        10 years
vs1          p2        5 years
```

snaplock legal-hold commands

Snaplock legal-hold related commands

snaplock legal-hold abort

Abort Snaplock legal-hold operation.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold abort` is used to abort an ongoing legal-hold operation. The type of legal-hold operations that can be aborted using this command are begin, end and dump-files. This command only aborts operations that have not yet completed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <*vserver name*> - Vserver Name

Specifies the vserver on which the legal-hold operation is running.

-operation-id <*integer*> - Operation ID

Specifies the operation ID of the legal-hold operation to be aborted.

Examples

The following example aborts an ongoing legal-hold operation with operation-id *16842754*:

```
vs1::> snaplock legal-hold abort -operation-id 16842754
vs1::>
```

snaplock legal-hold begin

Starts an operation to place files under legal-hold in the user specified path on a SnapLock compliance volume.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold begin` command is used to place specified file or files under legal-hold for a given litigation. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver which owns the volume. The specified file or files to be placed under legal-hold reside on this volume.

-litigation-name <text> - Litigation Name

Specifies the name of the litigation for which the file or files have to be placed under legal-hold.

-volume <volume name> - Volume

Specifies the name of the SnapLock compliance volume on which the file or files to be placed under legal-hold reside.

-path <text> - Path

Specifies a path relative to the volume root. The path can be either a file path of the single file to be placed under legal-hold or a directory path where all regular files under it must be placed under legal-hold.

Examples

The following example starts a legal-hold begin operation on file *file1* in volume *slc_voll*:

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume
slc_voll -path /file1
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold show
-operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold begin operation on all files in the volume *slc_voll*:

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume
slc_voll -path /
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold show
-operation-id 16842775 -instance" to view the operation status.
```

snaplock legal-hold dump-files

Dump list of files under legal-hold to specified output path.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold dump-files` is used to dump the list of files under legal-hold for a given vservers, volume and litigation to an auto-generated file in the user specified path. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters

-vservers <vservers name> - Vserver Name

Specifies the name of the Vserver for which the list of files under legal-hold is to be dumped.

-litigation-name <text> - Litigation Name

Specifies the name of the litigation for which the list of files under legal-hold is to be dumped.

-volume <volume name> - Volume Name

Specifies the name of the SnapLock compliance volume for which the list of files under legal-hold is to be dumped.

-output-volume <volume name> - Output Volume Name

Specifies the name of the output volume containing the output directory path where the list of files under legal-hold is to be dumped. The output volume must be a regular read-write volume.

-output-directory-path <text> - Path Relative to Output Volume Root

Specifies the output directory path relative to the output volume root, where the list of files under legal-hold is to be dumped. The output directory path should be of the form `"/directory-path"`. If output needs to be dumped on the volume root, specify the path as `"/"`.

Examples

The following example starts a legal-hold dump-files operation:

```
vs1::> snaplock legal-hold dump-files -volume voll_slc -
litigation-name lit1 -output-volume voll -output-directory-path /dl
SnapLock legal-hold dump-files operation is queued. Run
"snaplock legal-hold show -operation-id 16842754 -instance" to view the
operation status.
vs1::>
```

snaplock legal-hold dump-litigations

Dump list of litigations for a given Vserver to specified output path.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold dump-litigations` is used to dump the list of litigations for a given vservers to a user specified path. Under the user specified path, we create a directory with a unique name. Under the user specified path, a directory with an auto-generated name is created. Under this directory, multiple files are created. Each file represents a unique litigation name that was found in the given vservers. Each file contains a list of volume names that have files under legal-hold for that given litigation. For example, if the file name is "lit1" and the contents of the file are "volume1" and "volume2", then it indicates that both these volumes have files under legal-hold for litigation "lit1". Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver for which the list of litigations is to be dumped.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays the list of litigations for volume that matches the specified value. The volume must be of type SnapLock compliance.

-output-volume <volume name> - Output Volume Name

Specifies the name of the output volume containing the output directory path where the list of litigations is to be dumped. The output volume must be a regular read-write volume.

-output-directory-path <text> - Path Relative to Output Volume Root

Specifies the output directory path relative to the volume root, where the list of litigations is to be dumped. The output directory path should be of the form "/directory-path". If output needs to be dumped to the volume root, specify the path as "/".

Examples

The following example starts a legal-hold dump-litigations job:

```
vs1:> snaplock legal-hold dump-litigations -output-volume voll -
output-directory-path /dl
Dump Litigations job for Vserver "vs1" has been queued. Run "job
show -id 22 -instance" to view the status.
vs1:>
```

snaplock legal-hold end

Starts an operation to release legal-hold on files in the user specified path on a SnapLock compliance volume.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold end` command is used to release legal-hold on specified file or files for a given litigation. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters**-vserver <vserver name> - Vserver Name**

Specifies the name of the Vserver which owns the volume. The specified file or files to be released from legal-hold reside on this volume.

-litigation-name <text> - Litigation Name

Specifies the name of the litigation for which the file or files have to release from legal-hold.

-volume <volume name> - Volume

Specifies the name of the SnapLock compliance volume on which the file or files to be released from legal-hold reside.

-path <text> - Path

Specifies a path relative to the volume root. The path can be either a file path of the single file to be released from legal-hold or a directory path where all regular files under it must be released from legal-hold.

Examples

The following example starts a legal-hold end operation on file *file1* in volume *slc_voll*:

```
vs1::> snaplock legal-hold end -litigation-name litigation1 -volume slc_voll
-path /file1
SnapLock legal-hold end operation is queued. Run "snaplock legal-hold show -
operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold end operation on all files in the volume *slc_voll*:

```
vs1::> snaplock legal-hold end -litigation-name litigation1 -volume slc_voll
-path /
SnapLock legal-hold end operation is queued. Run "snaplock legal-hold show -
operation-id 16842775 -instance" to view the operation status.
```

snaplock legal-hold show

Show status of a legal-hold operation.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold show` command displays the status of a legal-hold operation. Information about completed operations will be cleaned up after an hour of completion. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays all legal-hold operations that match the specified Vserver.

[-operation-id <integer>] - Operation ID

If this parameter is specified, the command displays all legal-hold operations that match the specified operation ID.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays all legal-hold operations that match the specified volume. The parameter specifies the volume on which legal-hold operation is running or has completed.

[-path <text>] - Path

If this parameter is specified, the command displays all legal-hold operations that match the specified path. The parameter specifies the path on which legal-hold operation is running or has completed.

[-litigation-name <text>] - Litigation Name

If this parameter is specified, the command displays all legal-hold operations that match the specified litigation name. The parameter specifies the legal-hold litigation name.

[-operation-type {unknown/begin/end/dump-files}] - Operation Type

If this parameter is specified, the command displays all legal-hold operations that match the specified operation type. The parameter specifies the type of legal-hold operation.

[-operation-status {Unknown/In-Progress/Failed/Aborting/Completed}] - Operation Status

If this parameter is specified, the command displays all legal-hold operations that match the specified operation status. The parameter specifies the status of legal-hold operation.

[-num-files-processed <integer>] - Number of Files Processed

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files processed. The parameter specifies the number of files on which legal-hold operation was successful.

[-num-files-failed <integer>] - Number of Files Failed

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files failed. The parameter specifies the number of files on which legal-hold operation failed.

[-num-files-skipped <integer>] - Number of Files Skipped

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files skipped.

The parameter specifies the number of files on which legal-hold begin operation was skipped. The legal-hold begin operation is skipped on a file if it is already under hold for a given litigation or if it is a hard link to a file that is already under hold for a given litigation.

[-num-inodes-ignored <integer>] - Number of Inodes Ignored

If this parameter is specified, the command displays all legal-hold operations that match the specified number of inodes ignored. The parameter specifies the number of inodes on which the legal-hold operation was not attempted because they were not regular files.

[-status-details <text>] - Status Details

If this parameter is specified, the command displays all legal-hold operations that match the specified status details. The parameter specifies the status details of an legal-hold operation.

Examples

The following examples show the status of legal-hold operations for Vserver *vs1* and volume *slc_vol1* and the status of legal-hold operation for operation ID *16842786* respectively:

```
vs1::> snaplock legal-hold show -volume slc_vol1
```

Operation	Operation ID	Vserver	Volume	Operation Status
-----	-----	-----	-----	-----

```

begin      16842784      vs1      slc_voll      Completed
begin      16842786      vs1      slc_voll      Completed
begin      16842788      vs1      slc_voll      In-Progress
dump-files  16842790      vs1      slc_voll      Completed
end         16842794      vs1      slc_voll      Completed
5 entries were displayed.

vs1::> snaplock legal-hold show -operation-id 16842786

      Vserver: vs1
      Volume: slc_voll
      Operation ID: 16842786
      Litigation Name: litigation1
      Path: /
      Operation Type: begin
      Status: Completed
      Number of Files Processed: 100
      Number of Files Failed: 15
      Number of Files Skipped: 20
      Number of Inodes Ignored: 0
      Status Details: No error

```

SnapLock Log commands

Create and manage audit log configuration for a Vserver.

The `snaplock log` commands manage SnapLock log infrastructure for the SnapLock feature. This infrastructure provides the capability to record events that are required to provide an audit trail. These commands enable you to create and initialize the SnapLock log configuration for the Vserver, modify attributes associated with the SnapLock log configuration, and delete the auditlog configuration. Attributes of a SnapLock log configuration include the following:

- SnapLock log volume
- Maximum log size
- Default retention period

The SnapLock log volume is a SnapLock Compliance volume or a SnapLock Enterprise volume. If a SnapLock Enterprise volume is chosen as the log volume, the volume and the hosting aggregate cannot be deleted until the volume expires. The SnapLock log infrastructure creates directories and files in this volume to store the SnapLock log records.

The maximum log size specifies the maximum size of a log file that stores SnapLock log records. Once the file reaches this size, it is archived and a new log file is created.

The default retention period is the time period for which the log file is retained, if the SnapLock log records that are stored in the file do not carry any retention period.

snaplock log create

Create audit log configuration for a Vserver.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log create` command is used to create a SnapLock log configuration for the Vserver. A SnapLock log configuration consists of volume to store the log, the maximum size of the log file, and the default period of time for which the log file should be retained.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which the configuration needs to be created.

-volume <volume name> - Log Volume Name

Specifies the name of the volume that is used for logging. This must be a SnapLock Compliance volume.

[-max-log-size {<integer>[KB/MB/GB/TB/PB]}] - Maximum Size of Log File

Specifies the maximum size of the log file. Once a log file reaches this limit, it is archived and a new log file is created. This parameter is optional. The default value is *10MB*.

[-default-retention-period {{<integer> seconds/minutes/hours/days/ months/years} | infinite}] - Default Log Record Retention Period

Specifies the default period of time a record (which is logged) is retained. This parameter is optional. The default value is *"6 months"*.

Examples

```
cluster1::> snaplock log create -volume voll -max-log-size 50MB -
default-retention-period "1 year" -vserver vs1
[Job 47] Job succeeded: SnapLock log created for Vserver "vs1".
```

snaplock log delete

Delete audit log configuration for a Vserver.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log delete` command deletes the SnapLock log configuration associated with the Vserver. This command closes all the active log files in the log volume and mark the volume as disabled for SnapLock logging.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver whose SnapLock log configuration is deleted.

Examples

```
cluster1::> snaplock log delete -vserver vs1
[Job 47] Job succeeded: SnapLock log deleted for Vserver "vs1".
```

snaplock log modify

Modify audit log configuration for a Vserver.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log modify` command modifies the SnapLock log configuration of the Vserver. Log volume, maximum size of log file, and default retention period can be modified. If the log volume is modified, then the active log files in the existing log volume is closed and the log volume is marked as disabled for logging. The new log volume is enabled for logging.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which the SnapLock log configuration needs to be modified.

[-volume <volume name>] - Log Volume Name

Specifies the new log volume that is configured for this Vserver for logging.

[-max-log-size {<integer>[KB/MB/GB/TB/PB]}] - Maximum Size of Log File

Specifies the new value for maximum log file size.

[-default-retention-period {{<integer> seconds/minutes/hours/days/ months/years} | infinite}] - Default Log Record Retention Period

Specifies the new value for default retention period.

Examples

```
cluster1::> snaplock log modify -volume voll -vserver vs1 -max-
log-size 15MB
[Job 48] Job succeeded: SnapLock log modified for Vserver "vs1".
```

snaplock log show

Display audit log configuration.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log show` command displays the following information about the SnapLock log infrastructure:

- Vserver name
- Volume name
- Maximum log size
- Default retention period

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays the log information for Vservers that match the specified value.

[-volume <volume name>] - Log Volume Name

If this parameter is specified, the command displays the log configuration for volumes that match the specified value.

[-max-log-size {<integer>[KB/MB/GB/TB/PB]}] - Maximum Size of Log File

If this parameter is specified, the command displays the log configuration with a matching **-max-log-size** value.

[-default-retention-period {{<integer> seconds/minutes/hours/days/ months/years} / infinite}] - Default Log Record Retention Period

If this parameter is specified, the command displays the log configuration with a matching **-default-retention-period** value.

Examples

```
cluster1::> snaplock log show -vserver vs1

Vserver Name           : vs1
Log Volume Name        : 15MB
Maximum Size of Log File : 15MB
Default Log Record Retention Period : 6 months
```

```
cluster1::> snaplock log show
Vserver      Volume      Maximum Size

SnapLock Log File commands

Manage Audit Log files of a Vserver.

The `snaplock log file` commands manage the log files used for recording events that need to be logged. Commands in this directory enable you to archive and close log files and display active log files.

snaplock log file archive

Archive Active Log Files in Log Volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log file archive` command archives the currently active log file by closing it and creating a new active log file. If base-name is not provided, the command archives all active log files associated with the Vserver. Otherwise, the command archives the active log file associated with the base-name provided.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which active log files need to be archived.

[-base-name {privileged-delete / system / legal-hold}] - Base Name of Log File

Specifies the log base-name, whose active log file needs to be archived. The base-name is the name of the source of log records. Valid base-names are *system*, *privileged-delete* and *legal-hold*. Each base-name has its own directory in which log files containing log records generated by base-name are stored.

Examples

```
cluster1::> snaplock log archive -vserver vs1
[Job 48] Job succeeded: SnapLock log archived for Vserver "vs1".
```

snaplock log file show

Display audit log file information.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log file show` command displays the following information about the log files:

- Vserver name
- Volume name
- File path
- Expiry time of the file
- File size

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-vserver <vserver name>*] - Vserver Name

If this parameter is specified, then log files in the Vserver that match the specified value is displayed.

[*-base-name {privileged-delete / system / legal-hold}*] - Base Name of Log File

If this parameter is specified, then the log files having a matching **-base-name** is displayed.

[*-volume <volume name>*] - Log Volume Name

If this parameter is specified, then the log files in volumes that match the specified value are shown.

[*-file-path <text>*] - Log File Path

If this parameter is specified, then the log files that match the specified value are displayed.

[*-expiry-time <text>*] - Log File Expiry Time

If this parameter is specified, then the log files having a matching **-expiry-time** value are displayed.

[*-file-size {<integer>[KB/MB/GB/TB/PB]}*] - File Size

If this parameter is specified, then the log files having a matching **-file-size** value are displayed.

Examples

```
cluster1::> snaplock log file show
Path          Vserver      Volume      Base Name      File
-----
vol1/snaplock_log/system_logs/20160120_183756_GMT-present
vs1           voll         system      /vol/
```

```
cluster1::> snaplock log file show -vserver vs1 -base-name system
Vserver      : vs1
Volume       : voll
Base Name    : system
File Path    : /vol/voll/snaplock_log/system_logs/
20160120_183756_GMT-present
Expiry Time  : Wed Jul 20 18:37:56 GMT 2016
File Size    : 560B
```

SnapMirror Commands

Manage SnapMirror

The `snapmirror` commands enable you to create and manage data protection mirrors, extended data protection relationships, and load-sharing mirrors.

These commands are available to the cluster and Vserver administrators.

Note that there are "Pre 8.2" relationships: (1) load-sharing relationships; (2) data protection relationships with the source volume on a storage system running clustered Data ONTAP 8.1; (3) data protection relationships that existed before the source and destination storage systems were upgraded from clustered Data ONTAP 8.1 to clustered Data ONTAP 8.2 and later and have not yet been converted to ones with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on Data ONTAP 8.1. In particular, only `snapmirror` commands present on Data ONTAP 8.1 can be used for these relationships. The "Relationship Capability" field, as shown in the output of the `snapmirror show` command, is set to "Pre 8.2" for these relationships. "Pre 8.2" data protection relationships can only be created and managed by the cluster administrator; load-sharing relationships which are all "Pre 8.2" can be created and managed by either a cluster or Vserver administrator.

Data protection relationships that existed before the source and destination storage systems were upgraded from Data ONTAP 8.1 will be auto-converted to "8.2 and above" with full capabilities when a Vserver peering relationship is set up between the source and destination Vservers. Relationships that have both the source and destination in the same Vserver and therefore require no Vserver peering relationship will be converted on the first boot when all nodes in the storage system are running Data ONTAP 8.2 or later. Note that since there is no "8.2 and above" implementation of load-sharing relationships, there is no conversion of load-sharing relationships to "8.2 and above".

When a SnapMirror relationship is created with the type of the relationship specified as data protection (DP), an extended data protection (XDP) relationship will be created. This relationship will provide the same functional behavior as the DP type in terms of Snapshot copy selection and retention. This is achieved by using a policy which has the rule to replicate all Snapshot copies. There is an exception to this relationship creation behavior of overriding of the type DP. If a relationship of type DP in the opposite direction already exists, the new relationship will also be of type DP. The type DP will eventually be deprecated and applications should not use this type when creating new relationships. When the type is specified as DP or when no type is specified, if a policy of type `async-mirror` is specified that does not have the rule to replicate all Snapshot copies, the `snapmirror create` command will fail.

snapmirror abort

Abort an active transfer

Availability: This command is available to `cluster` and `Vserver` administrators at the `admin` privilege level.

Description

The `snapmirror abort` command stops SnapMirror transfers that might have started and not completed. A SnapMirror transfer is an operation on a given SnapMirror relationship and the relationship is identified by its destination endpoint, which can be a volume, a Vserver, or a non-Data ONTAP endpoint. You identify the SnapMirror relationship with this command and the command aborts the transfer for the relationship. For load-sharing mirrors, the command also aborts transfers for other relationships that are part of the same load-sharing set. For SolidFire destination endpoints, the `snapmirror abort` command is only supported if the endpoint is in a SnapMirror relationship.

Load-sharing mirrors are either up to date and serving data to clients, or they are lagging and not serving data to clients. If the `snapmirror abort` command identifies an up-to-date load-sharing mirror, then SnapMirror transfers to the up-to-date load-sharing mirror and associated up-to-date load-sharing mirrors in the set of load-sharing mirrors are aborted. If the `snapmirror abort` command identifies a lagging load-sharing mirror, then only the SnapMirror transfer associated with the lagging load-sharing mirror is aborted.

After the `snapmirror abort` command successfully completes its operation, the volume on the receiving side of the transfer might contain a restart checkpoint. The restart checkpoint can be used by a subsequent transfer to restart and continue the aborted SnapMirror transfer.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

The use of wildcards in parameter values is not supported from the source Vserver or cluster for relationships with *"Relationship Capability"* of *"8.2 and above"*.

You can use this command from the source or the destination Vserver or cluster for FlexVol volume relationships.

For SnapMirror Synchronous relationships, this command aborts any ongoing transfer and takes the relationship OutOfSync. This can result in primary client IO failure for relationships with a policy of type *strict-sync-mirror*. Instead, the best practice recommendation is to use the `snapmirror quiesce` command.

For Vserver SnapMirror relationships, this command must be run only from the cluster containing the destination Vserver.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[[-source-cluster <cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating

in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path {<[vserver:]<volume>>|<[[cluster:]//vserver/]<volume>>|<hostip:/lun/name>|<hostip:/share/share-name>} -

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name>] - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-hard | -h [true]] - Discard Restart Checkpoint

If this option is specified true, the restart checkpoint is discarded and the destination volume is restored to the last Snapshot copy that was successfully transferred. You can use the **-hard** option to discard the restart checkpoint of a

previous transfer attempt which forces the subsequent transfer to start with a fresh Snapshot copy on the destination volume. This option can only be used from the destination Vserver or cluster. This parameter is not supported for relationships with non-Data ONTAP endpoints.

`[-foreground | -w [true]] - Foreground Process`

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

Examples

To stop the active SnapMirror replication to the destination volume *vs2.example.com:dept_eng_dp_mirror1*, type the following command:

```
vs2.example.com:> snapmirror abort -destination-path
vs2.example.com:dept_eng_dp_mirror1
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to stop the active SnapMirror replication to the destination volume *cluster2://vs2.example.com/dept_eng_dp_mirror1*, type the following command:

```
cluster2:> snapmirror abort -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror1
```

To stop the active SnapMirror replication to the destination Vserver *dvs1.example.com*, type the following command:

```
cluster2:> snapmirror abort -destination-path
dvs1.example.com:
```

Under PVR control to stop user-initiated active SnapMirror replication to the destination Consistency Group *cg_dst* in Vserver *vs2.example.com*, type the following command:

```
vs2.example.com:> snapmirror abort -destination-path
vs2.example.com:/cg/cg_dst
```

snapmirror break

Make SnapMirror destination writable

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror break` command breaks a SnapMirror relationship between a source and destination endpoint of a data protection mirror. The destination endpoint can be a Vserver, volume

or SolidFire endpoint. When Data ONTAP breaks the relationship, if the endpoint is a volume or SolidFire endpoint, the destination is made read/write and can diverge from the source volume, client redirection is turned off on the destination, the restart checkpoint is cleared, and the clients can see the latest Snapshot copy. If the endpoint is a Vserver, the subtype of the destination Vserver is changed to *default*, volumes in the destination Vserver are made read/write and the clients can now access the Vserver namespace for modifications. For SolidFire destination endpoints, the `snapmirror break` command is only supported if the endpoint is in a SnapMirror relationship.

Subsequent manual or scheduled SnapMirror updates to the broken relationship will fail until the SnapMirror relationship is reestablished using the `snapmirror resync` command.

This command applies to data protection mirrors. For vault relationships, this command is only intended for use when preparing for a Data ONTAP revert operation (see the `-delete-snapshots` parameter in advanced privilege level). This command is not intended for use with load-sharing mirrors.

For relationships with a policy of type *strict-sync-mirror* or *sync-mirror*, the relationship must be *Quiesced* before running the `snapmirror break` command.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

The `snapmirror break` command must be used from the destination Vserver or cluster.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}]} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be

specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```
{ -destination-path {<[vserver:][volume]>|<[[cluster:]]//  
vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} -  
Destination Path
```

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "*Relationship Capability*" of "*Pre 8.2*", a format which also includes the name of the cluster (cluster) is provided. The "*Pre 8.2*" format cannot be used when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

```
| [-destination-cluster <Cluster name>] - Destination Cluster
```

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

```
-destination-vserver <vserver name> - Destination Vserver
```

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

```
-destination-volume <volume name>} - Destination Volume
```

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

```
[-force | -f [true]] - Force
```

If this parameter is specified, the command proceeds without prompting for confirmation.

```
[-foreground | -w [true]] - Foreground Process
```

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

```
[-delete-snapshots [true]] - Delete Snapshots for Revert (privilege: advanced)
```

Using this parameter causes break to delete Snapshot copies on a vault destination so that the system can be reverted. Note that the only Snapshot copies that will be deleted are those that were created with the current version of Data ONTAP. Any Snapshot copies that might be present created with a different version will not be deleted. This parameter is not supported for SnapLock Compliance destinations.

`[-restore-destination-to-snapshot | -s <text>]` - Restore Destination to Snapshot Copy

This optional parameter specifies the Snapshot copy to which the destination volume is restored after a successful break operation. If the parameter is not specified, the destination is restored to the latest Snapshot copy. This parameter is not supported for Vserver or FlexGroup relationships or SnapLock Compliance destinations.

`[-recover [true]]` - Recover (privilege: advanced)

When a SnapMirror break operation fails on a FlexGroup relationship, a subset of the destination FlexGroup constituents could have been made writable and subsequently user data could have been written to these constituents. To recover from this failure, you can execute the `snapmirror break` command again specifying the `-recover` parameter. All constituents will be restored to the latest Snapshot copy, and any writes to the read-write constituents will be lost. This parameter is applicable only for SnapMirror relationships with FlexGroup endpoints.

Examples

To stop the SnapMirror replication to the destination volume `vs2.example.com:dept_eng_dp_mirror1`, type the following command:

```
vs2.example.com::> snapmirror break -destination-path
vs2.example.com:dept_eng_dp_mirror1
```

For relationships with "Relationship Capability" of "Pre 8.2", to stop the SnapMirror replication to the destination volume `cluster2://vs2.example.com/dept_eng_dp_mirror1`, type the following command:

```
cluster2::> snapmirror break
-destination-path cluster2://vs2.example.com/dept_eng_dp_mirror1
```

To stop replication to the destination Vserver `dvs1.example.com` of a Vserver SnapMirror relationship, type the following command:

```
cluster2::> snapmirror break -destination-path dvs1.example.com:
```

Under PVR control to stop synchronous SnapMirror replication to the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com::> snapmirror break -destination-path
vs2.example.com:/cg/cg_dst
```

snapmirror create

Create a new SnapMirror relationship

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror create` command creates a SnapMirror relationship between a source and destination endpoint. You can use this command to create a data protection relationship, an extended data protection relationship, or a load-sharing relationship between FlexVol volumes. You can also use it to create a data protection relationship between Vservers. A SnapMirror relationship between Vservers can only be created if the system containing the source Vserver is also running Data ONTAP 8.3 or later. You can also use the `snapmirror create` command to create an extended data protection relationship between FlexGroups. FlexGroups only support extended data protection relationships. A SnapMirror relationship between FlexGroups is only supported if the system containing the source FlexGroup volume is also running Data ONTAP 9.1.0 or later. The source or destination of a FlexGroup SnapMirror relationship cannot be the source or destination of any other SnapMirror relationship.

You can use the `snapmirror create` command to create a data protection relationship or an extended data protection relationship between SnapLock source and SnapLock destination endpoints. When the cluster containing the source is running ONTAP 9.5.0 or later, the default relationship type is extended data protection (XDP), otherwise it is data protection (DP).

A SnapMirror relationship can also be created between a non-SnapLock source and a SnapLock destination to WORM-protect Snapshot copies. In this case, the relationship type is always set to extended data protection (XDP).

The `snapmirror create` command can be used to create an extended data protection (XDP) relationship between a Data ONTAP volume and a non-Data ONTAP endpoint that supports SnapMirror (AltaVault, Solidfire). AltaVault endpoints can only be used as destinations. SolidFire endpoints can be used as sources or destinations.

The `snapmirror create` command can be used to create a synchronous relationship between FlexVol volumes, which provides zero RPO data protection. SnapMirror Synchronous supports two policy types, *sync-mirror* and *strict-sync-mirror*. Upon a permanent replication failure, the *strict-sync-mirror* variant restricts further client IO on the primary, whereas the *sync-mirror* variant does not.

Before using this command to create a SnapMirror relationship between Vservers, you typically create a source and destination Vserver using the `vserver create` command. The source Vserver should be of *subtype default* and the destination Vserver of *subtype dp-destination*. Also, before creating the relationship between Vservers, you must setup Vserver peer by using the `vserver peer create` command between the source and destination Vservers. A Vserver relationship cannot be created between two Vservers within the same cluster. The root volume of the destination Vserver will be read-write and data from the source Vserver's root volume will not be replicated. Therefore there will be no volume level relationship created between the root volumes of the two Vservers.

After creating the relationship, the destination Vserver must be initialized by using the `snapmirror initialize` command.

Before using this command to create a volume SnapMirror relationship, you typically create a source and destination volume using the `volume create` command. The source volume should be in the online state and a read-write (RW) type. The destination volume should be in the online state and a data protection (DP) type. For FlexGroup SnapMirror relationships, the source and destination FlexGroups must be spread over the same number of aggregates as specified in the `-aggr-list` parameter with the same number of constituents per aggregate as specified in the `-aggr-list-multiplier` parameter of the `volume create` command.

When a FlexGroup SnapMirror relationship is created, normally hidden relationships are also created for the constituent volumes. These relationships can be seen by using the `-expand` parameter of the `snapmirror show` command. Source information for these relationships can be seen using the `-expand` parameter of the `snapmirror list-destinations` command. Other SnapMirror commands are disabled for FlexGroup constituent relationships and FlexGroup constituent volumes.

If all systems involved are running Data ONTAP version 8.2 and later, a Vserver peering relationship must be set up using the `vserver peer create` command between the source and the destination Vservers to create a relationship between the source and destination volumes. To enable interoperability with Data ONTAP 8.1, if the source volume is on a storage system running clustered Data ONTAP 8.1, the cluster administrator can create a data protection relationship between the source and destination volumes without a Vserver peering relationship between the source and destination Vservers. These relationships are managed the same way as on Data ONTAP 8.1 and the *"Relationship Capability"* field, as shown in the output of the `snapmirror show` command, is set to *"Pre 8.2"*.

Note: SnapMirror relationships, except load-sharing relationships, which are created between two volumes which are both on a storage system running Data ONTAP version 8.2 and later have the *"Relationship Capability"* field set to *"8.2 and above"*.

Load-sharing mirrors must be confined to a single Vserver; they are not allowed to span Vservers. Load-sharing relationships are created with the *"Relationship Capability"* field set to *"Pre 8.2"* even if both the source and destination volumes are on a storage system running Data ONTAP version 8.2 and later. There is no *"8.2 and above"* implementation for load-sharing relationships.

A set of load-sharing mirrors can have one or more destination volumes. You create separate SnapMirror relationships between the common source volume and each destination volume to create the set of load-sharing mirrors.

The source or destination of a load-sharing relationship cannot be the source or destination of any other SnapMirror relationship.

After creating the relationship, the destination volume can be initialized using the `snapmirror initialize` command. The destination volumes in a set of load-sharing mirrors are initialized using the `snapmirror initialize-ls-set` command.

The `snapmirror create` command must be used from the destination Vserver or cluster.

Parameters

`{ -source-path | -S {[vserver:] [volume]} > / < [[cluster:] // vserver /] volume > / < hostip: / lun / name > | < hostip: / share / share-name > } - Source Path`

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip: / share / share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip: / lun / name*.

`| [-source-cluster <Cluster name>] - Source Cluster`

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

`-source-vserver <vserver name> - Source Vserver`

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, -

source-cluster must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path {<[vserver:]<volume>|<[[cluster:]//vserver/]<volume>|<hostip:/lun/name>|<hostip:/share/share-name>} - Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

| [-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name>] - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-type <snapmirrorType>] - Relationship Type

This parameter specifies the type of SnapMirror relationship that will be created. You can create a data protection (DP) relationship, an extended data protection (XDP) relationship, a transition data protection relationship between a Data ONTAP operating in 7-Mode system and a clustered Data ONTAP system (TDP), or a load-sharing (LS) relationship. The default value is XDP for all relationships except for Vserver DR relationships. FlexGroup volumes and non-Data ONTAP endpoints support only XDP relationships. For FlexVol volume relationships, when DP is specified as the type, an XDP relationship will be created unless a relationship of type DP in the opposite direction already exists. In that case the new relationship will be of type DP.

[-vserver <vserver name>] - Managing Vserver

If this optional parameter is specified, it designates the managing Vserver. The managing Vserver is authorized to use SnapMirror commands to manage the SnapMirror relationship. The **-vserver** parameter is currently a reserved parameter.

[-schedule <text>] - SnapMirror Schedule

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the [snapmirror update](#) command or, in the case of a set of load-sharing mirrors, using the [snapmirror update-ls-set](#) command.

Note: You define and name a schedule using the [job schedule cron create](#) command.

[-policy <sm_policy>] - SnapMirror Policy

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. For FlexVol volume relationships, the default policy when the data protection (DP) type is specified is *MirrorAllSnapshots* and the default policy when no type is specified or when the extended data protection (XDP) type is specified is *MirrorAndVault*. For FlexGroup volume relationships, the *MirrorAndVault* policy is applied. For SnapMirror relationships between SnapLock volumes, if no policy is specified the default policy *MirrorAllSnapshots* is applied. For relationships with a SolidFire endpoint, there is no default policy. For these relationships a policy as described below must be specified. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2".

In clustered Data ONTAP 8.2 data protection (DP) relationships were used for mirroring, while extended data protection (XDP) relationships were used for vaulting. In clustered Data ONTAP 8.3 extended data protection (XDP) relationships support two more use cases, mirroring and unified mirror-vault. The exact behavior of an extended data protection (XDP) relationship is governed by the [snapmirror policy](#) associated with that relationship. In clustered Data ONTAP 8.3 the [snapmirror policy](#) has a new field *type* to indicate how the relationships with that policy will behave. The supported types are *async-mirror* (mirroring), *vault* (vaulting) and *mirror-vault* (unified mirroring and vault). For XDP relationships between a Data ONTAP source volume and an AltaVault destination endpoint, only policies of type *vault* are supported. For XDP relationships between a Data ONTAP source volume and a SolidFire destination endpoint, only policies of type *async-mirror* without an *all_source_snapshots* rule are supported. For XDP relationships between a SolidFire source endpoint and a Data ONTAP destination volume, only policies of type *async-mirror* without an *all_source_snapshots* rule, and policies of type *mirror-vault* are supported. SnapMirror policies of type *async-mirror* associated with FlexVol volume relationships when relationship type DP is specified or when no relationship type is specified, must include the label *all_source_snapshots*. Refer to the man page for the [snapmirror policy create](#) command for more information.

Note: You define and name a policy using the [snapmirror policy create](#) command.

[-tries <unsigned32_or_unlimited>] - Tries Limit

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight

times. The **-tries** parameter can be set to 0 to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2". For relationships with "8.2 and above" capability, the tries limit is controlled by the value of tries in the SnapMirror policy that is associated with the relationship.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to *unlimited* or 0. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as 4. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The **-throttle** parameter does not affect load-sharing mirrors and other SnapMirror relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

[-identity-preserve {true/false}] - Identity Preserve Vserver DR

Specifies whether or not the identity of the source Vserver is replicated to the destination Vserver of the Vserver SnapMirror relationship that will be created. If this parameter is set to true, the source Vserver's configuration will additionally be replicated to the destination. If the parameter is set to false, then only the source Vserver's volumes and RBAC configuration are replicated to the destination. This parameter is applicable only for SnapMirror relationships with Vserver endpoints. The default value is false.

[-is-auto-expand-enabled {true/false}] - Is Auto Expand Enabled

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup volume should be auto-expanded if the source FlexGroup volume is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. The default value is true.

Examples

To create an extended data protection relationship between the source endpoint *vs1.example.com:dept_eng*, and the destination endpoint *vs2.example.com:dept_eng_dp_mirror2*, with the default policy of *MirrorAndVault*, type the following command:

```
vs2.example.com:> snapmirror create -destination-path
vs2.example.com:dept_eng_dp_mirror2 -source-path
vs1.example.com:dept_eng
```

To create an extended data protection relationship between the source FlexGroup *vs1.example.com:fg_src* and the destination FlexGroup *vs2.example.com:fg_dst*, with the default policy of *MirrorAndVault*, type the following command:

```
vs2.example.com:> snapmirror create -destination-path
vs2.example.com:fg_dst -source-path
vs1.example.com:fg_src
```

To create a synchronous SnapMirror relationship between the source Flexvol *vs1.example.com:vol_log*, and the destination Flexvol *vs2.example.com:vol_log_sync_dp* when the source cluster is running ONTAP 9.5 or above, type the following command:

```
vs2.example.com::> snapmirror create -destination-path
vs2.example.com:vol_log_sync_dp -source-path
vs1.example.com:vol_log -policy Sync
```

To create a strict synchronous SnapMirror relationship between the source Flexvol *vs1.example.com:vol_log*, and the destination Flexvol *vs2.example.com:vol_log_sync_dp* when the source cluster is running ONTAP 9.5 or above, type the following command:

```
vs2.example.com::> snapmirror create -destination-path
vs2.example.com:vol_log_sync_dp -source-path
vs1.example.com:vol_log -policy StrictSync
```

To create a data protection mirror between the source endpoint *cluster1://vs1.example.com/dept_eng*, and the destination endpoint *cluster2://vs2.example.com/dept_eng_dp_mirror2* when the source cluster is running Data ONTAP 8.1 software, type the following command:

```
cluster2::> snapmirror create -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror2 -source-path
cluster1://vs1.example.com/dept_eng
-type DP
```

To create a load-sharing mirror between the source endpoint *cluster1://vs1.example.com/mkt1*, and the destination endpoint *cluster1://vs1.example.com/mkt1_ls1* with the schedule named *5min* used to update the relationship, type the following command:

```
cluster1::> snapmirror create
-destination-path cluster1://vs1.example.com/mkt1_ls1
-source-path      cluster1://vs1.example.com/mkt1 -type LS -schedule
5min
```

To create a SnapMirror relationship between the source Vserver *vs1.example.com*, and the destination Vserver *dvsl.example.com* with the schedule named *hourly* used to update the relationship, type the following command:

```
cluster2::> snapmirror create
-destination-path dvsl.example.com:
-source-path vs1.example.com:
-schedule hourly
```

To create an extended data protection (XDP) relationship between the Data ONTAP source endpoint *vs1.example.com:data_ontap_vol*, and the AltaVault destination endpoint *10.0.0.11:/share/share1*, type the following command:

```
vs1.example.com::> snapmirror create -destination-path
10.0.0.11:/share/share1 -source-path
vs1.example.com:data_ontap_vol
-type XDP
```

To create an extended data protection (XDP) relationship between the SolidFire source endpoint *10.0.0.12:/lun/0001*, and the Data ONTAP destination endpoint *vs2.example.com:data_ontap_vol2*, type the following command:

```
vs2.example.com::> snapmirror create -source-path
10.0.0.12:/lun/0001 -destination-path
vs2.example.com:data_ontap_vol2
-type XDP -policy MirrorLatest
```

Under PVR control to create a SnapMirror synchronous Consistency Group relationship with the following attributes:

- It is between the source Consistency Group *cg_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg_dst* in Vserver *vs2.example.com*.
- It has item mappings between *lun1* and *lun2* on volume *srcvol* and *lun1* and *lun2* on volume *dstvol*.
- It uses a policy named *SmgrSync* that has a policy type of *smgr-mirror* that the user has previously created.

type the following command:

```
vs2.example.com::> snapmirror create -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src -type XDP -policy SmgrSync
-cg-item-mappings /vol/srcvol/lun1:@/vol/dstvol/lun1,
/vol/srcvol/lun2:@/vol/dstvol/lun2
```

Under PVR control to create a new item mapping between *lun3* on volume *srcvol* and *lun3* on volume *dstvol* in the existing SnapMirror synchronous Consistency Group relationship that was created above, type the following command:

```
vs2.example.com::> snapmirror create -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src -type XDP -policy SmgrSync
-cg-item-mappings /vol/srcvol/lun3:@/vol/detvol/lun3
```

snapmirror delete

Delete a SnapMirror relationship

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror delete` command removes the SnapMirror relationship between a source endpoint and a destination endpoint. The destination endpoint can be a Vserver, a volume, or a non-Data ONTAP endpoint. The Vservers, volumes and non-Data ONTAP destinations are not destroyed and Snapshot copies on the volumes are not removed.

For relationships with SolidFire endpoints, the SnapMirror source commands `snapmirror release` and `snapmirror list-destinations` are not supported. Therefore, Snapshot copies that are locked by SnapMirror on the source container cannot be cleaned up using the `snapmirror release` command. If the source container is a Data ONTAP volume, in order to reclaim space captured in the base Snapshot copy on the volume, issue a `snapshot delete` command specifying the `-ignore-owners` parameter in diag privilege level. To reclaim space captured in a Snapshot copy locked by SnapMirror on a SolidFire system, refer to SolidFire documentation.

The `snapmirror delete` command fails if a SnapMirror transfer for the SnapMirror relationship is in progress for relationships with "Relationship Capability" of "Pre 8.2". For relationships with "8.2 and above" capability the delete will succeed even if a transfer is in progress and the transfer will ultimately stop.

A set of load-sharing mirrors can contain multiple destination volumes, each destination volume having a separate SnapMirror relationship with the common source volume. When used on one of the SnapMirror relationships from the set of load-sharing mirrors, the `snapmirror delete` command deletes the specified SnapMirror relationship from the set of load-sharing mirrors.

The `snapmirror delete` command preserves the read-write or read-only attributes of the volumes of a SnapMirror relationship after the relationship is deleted. Therefore, a read-write volume that was the source of a SnapMirror relationship retains its read-write attributes, and a data protection volume or a load-sharing volume that was a destination of a SnapMirror relationship retains its read-only attributes. Similarly, the *subtype* attribute of source and destination Vservers is not modified when a Vserver SnapMirror relationship is deleted.

Note: When a SnapMirror relationship from a set of load-sharing mirrors is deleted, the destination volume becomes a data protection volume and retains the read-only attributes of a data protection volume.

For relationships with a policy of type *strict-sync-mirror* or *sync-mirror*, the relationship must be *Quiesced* before it can be deleted.

This command is supported for SnapMirror relationships with the field "Relationship Capability" showing as either "8.2 and above" or "Pre 8.2" in the output of the `snapmirror show` command.

For relationships with "Relationship Capability" of "8.2 and above", the `snapmirror delete` command must be used from the destination Vserver or cluster. The SnapMirror relationship information is deleted from the destination Vserver, but no cleanup or deletion is performed on the source Vserver. The `snapmirror release` command must be issued on the source Vserver to delete the source relationship information.

For relationships with "Relationship Capability" of "Pre 8.2", you can use this command from the source or from the destination cluster. When used from the destination cluster, the SnapMirror relationship information on the source and destination clusters is deleted. When used from the source cluster, only the SnapMirror relationship information on the source cluster is deleted.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} -

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-force | -f [true]] - Force

If specified, the delete proceeds even if it cannot clean up all artifacts of the relationship.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

Examples

To delete the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror4`, type the following command:

```
vs2.example.com:> snapmirror delete -destination-path
vs2.example.com:dept_eng_dp_mirror4
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to delete the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror4`, type the following command:

```
cluster2:> snapmirror delete -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror4
```

To delete the SnapMirror relationship with destination endpoint `dvs1.example.com:`, type the following command:

```
cluster2:> snapmirror delete -destination-path
dvs1.example.com:
```

Under PVR control to delete the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com` and all item mappings, type the following command:

```
vs2.example.com:> snapmirror delete -destination-path
vs2.example.com:/cg/cg_dst
```

Under PVR control to delete the item mapping between `lun3` on volume `srcvol` and `lun3` on volume `dstvol` in the SnapMirror synchronous Consistency Group relationship with the

destination Consistency Group *cg_dst* in Vserver *vs2.example.com*, type the following command:

```
vs2.example.com::> snapmirror delete -destination-path
vs2.example.com:/cg/cg_dst
-cg-item-mappings /vol/srcvol/lun3:@/vol/dstvol/lun3
```

snapmirror initialize

Start a baseline transfer

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror initialize` command initializes the destination Vserver, volume or a non-Data ONTAP endpoint of a SnapMirror relationship. The command behaves differently between data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships.

If you specify a *sync-mirror* or *strict-sync-mirror* type policy, the `snapmirror initialize` command creates and initializes a synchronous relationship and brings it InSync, providing zero RPO data protection.

For data protection (DP) and extended data protection (XDP) relationships, the `snapmirror initialize` command initializes the destination volume.

For load-sharing (LS) relationships, the `snapmirror initialize` command initializes a new load-sharing mirror in an existing set of load-sharing mirrors. If the command finishes before the start of a scheduled or manual transfer of the set of load-sharing mirrors, the load-sharing mirror is up to date with the set of load-sharing mirrors; otherwise, the load-sharing mirror will be brought up to date at the next scheduled or manual transfer of the set of load-sharing mirrors.

The initial transfer to an empty destination volume is called a baseline transfer. During a baseline transfer for a data protection (DP) or extended data protection (XDP) relationship, the `snapmirror initialize` command takes a Snapshot copy on the source volume to capture the current image of the source volume. For data protection relationships, the `snapmirror initialize` command transfers all of the Snapshot copies up to and including the Snapshot copy created by it from the source volume to the destination volume. For extended data protection (XDP) relationships, the `snapmirror initialize` command behavior depends on the [snapmirror policy](#) associated with the relationship. If the policy type is *async-mirror* then depending on the rules in the policy it can transfer either all the Snapshot copies up to and including the Snapshot copy created by it or only the Snapshot copy created by it from the source volume to the destination volume. For extended data protection (XDP) relationships with policy type *vault* or *mirror-vault* the `snapmirror initialize` transfers only the Snapshot copy created by it.

After the `snapmirror initialize` command successfully completes, the last Snapshot copy transferred is made the exported Snapshot copy on the destination volume.

You can use the `snapmirror initialize` command to initialize a specific load-sharing mirror that is new to the set of load-sharing mirrors. An initialize of the new load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

Note: Using the `snapmirror initialize` command to initialize a set of load-sharing mirrors will not work. Use the `snapmirror initialize-ls-set` command to initialize a set of load-sharing mirrors.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror initialize` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before initializing the relationship. This implicit create feature is not supported for Vservers.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, you can track the progress of the operation using the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror initialize` command must be used from the destination Vserver or cluster.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with

"*Relationship Capability*" of "*Pre 8.2*", **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```
{ -destination-path {<[vserver:][volume]>|<[[cluster:]]//
vserver/[volume]>|<hostip:/lun/name>|<hostip:/share/share-name>} -
```

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "*Relationship Capability*" of "*Pre 8.2*", a format which also includes the name of the cluster (cluster) is provided. The "*Pre 8.2*" format cannot be used when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[**-destination-cluster** <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[**-source-snapshot** | **-s** <text>] - Source Snapshot

This optional parameter specifies the Snapshot copy that `snapmirror initialize` will use for the baseline transfer. For data protection (DP) relationships, the baseline transfer will include all of the Snapshot copies up to and including the specified Snapshot copy. For extended data protection (XDP) relationships, the `snapmirror initialize` command behavior depends on the *snapmirror policy* associated with the relationship. If the policy type is *async-mirror* then depending on the rules in the policy it can transfer either all the Snapshot copies up to and including the specified Snapshot copy or only the specified Snapshot copy from the source volume to the destination volume. For extended data protection (XDP) relationships with policy type *vault* or *mirror-vault* the `snapmirror initialize` transfers only the specified Snapshot copy. This parameter is not supported for SnapMirror Synchronous relationships and relationships with "*Relationship Capability*" of "*Pre 8.2*".

[-type <snapmirrorType>] - Snapmirror Relationship Type

Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the [snapmirror create](#) command.

[-policy <sm_policy>] - SnapMirror Policy

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2".

Note: You define and name a policy using the [snapmirror policy create](#) command.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for the initialize transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the [snapmirror create](#) or [snapmirror modify](#) command will be used. To fully use the network bandwidth available, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as if you specified *4*. For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. For SnapMirror Synchronous relationships the throttle value is applicable only for asynchronous transfers performed as part of user-initiated operations. The **-throttle** parameter does not affect load-sharing transfers and transfers for other relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

[-transfer-priority {low/normal}] - Transfer Priority

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a "Relationship Capability" of "Pre 8.2".

[-is-auto-expand-enabled {true/false}] - Is Auto Expand Enabled

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If this initialize is creating a new Snapmirror relationship, the default value is *true*. If it is not creating a new relationship, if a value is specified, it must match the current value for the existing relationship. If the parameter is not specified the existing value will be retained.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground).

When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "Relationship Capability" of "Pre 8.2".

Examples

To start the initial transfer for the SnapMirror relationship with the destination endpoint *vs2.example.com:dept_eng_dp_mirror2* after the relationship has been created with the [snapmirror create](#) command, type the following command:

```
vs2.example.com:> snapmirror initialize -destination-path
vs2.example.com:dept_eng_dp_mirror2
```

For relationships with "Relationship Capability" of "Pre 8.2", to start the initial transfer for the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror2` after the relationship has been created with the `snapmirror create` command, type the following command:

```
cluster2:> snapmirror initialize -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror2
```

To create a data protection mirror relationship between the source endpoint `vs1.example.com:dept_mkt`, and the destination endpoint `vs2.example.com:dept_mkt_dp_mirror`, and start the initial transfer, type the following command:

```
vs2.example.com:> snapmirror initialize -destination-path
vs.example.com:dept_mkt_dp_mirror
-source-path vs1.example.com:dept_mkt
```

To create a data protection mirror relationship between the source endpoint `cluster1://vs1.example.com/dept_mkt`, and the destination endpoint `cluster2://vs2.example.com/dept_mkt_dp_mirror`, and start the initial transfer when the source cluster is running Data ONTAP 8.1 software, type the following command:

```
cluster2:> snapmirror initialize -destination-path
cluster2://vs2.example.com/dept_mkt_dp_mirror
-source-path cluster1://vs1.example.com/dept_mkt
```

To create an extended data protection (XDP) relationship between the Data ONTAP source endpoint `vs1.example.com:data_ontap_vol`, and the AltaVault destination endpoint `10.0.0.11:/share/share1`, and start the initial transfer, type the following command:

```
vs1.example.com:> snapmirror initialize -destination-path
10.0.0.11:/share/share1
-source-path vs1.example.com:data_ontap_vol -type XDP
```

To start the initial transfer for the Vserver SnapMirror relationship with destination endpoint `dvs1.example.com:` after the relationship was created with the `snapmirror create` command, type the following command:

```
cluster2:> snapmirror initialize -destination-path
dvs1.example.com:
```

To initialize the SnapMirror Synchronous relationship between FlexVols `vol_log` and `vol_log_sync_dp` and bring it to InSync, after it is created using the `snapmirror create` command, type the following command:

```
vs2.example.com:> snapmirror initialize -destination-path
vs2.example.com:vol_log_sync_dp
```

To create a strict SnapMirror Synchronous relationship between FlexVols `vol_log` and `vol_log_sync_dp`, to initialize it and bring it to InSync, type the following command:

```
vs2.example.com:> snapmirror initialize -destination-path
vs2.example.com:vol_log_sync_dp -source-path
vs1.example.com:vol_log -policy StrictSync
```

Under PVR control to create a SnapMirror synchronous Consistency Group relationship with the following attributes:

- It is between the source Consistency Group *cg_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg_dst* in Vserver *vs2.example.com*.
- It has item mappings between *lun1* and *lun2* on volume *srcvol* and *lun1* and *lun2* on volume *dstvol*.
- It uses a policy named *SmgrSync* that has a policy type of *smgr-mirror* that the user has previously created.

and initialize it and bring it InSync, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src -type XDP -policy SmgrSync
-cg-item-mappings /vol/srcvol/lun1:@/vol/dstvol/lun1,
                  /vol/srcvol/lun2:@/vol/dstvol/lun2
```

Under PVR control to initialize the relationship with destination Consistency Group *cg_dst* in Vserver *vs2.example.com* that has been created with the [snapmirror create](#) command and bring it InSync, type the following command:

```
vs2.example.com::> snapmirror initialize -destination-path
vs2.example.com:/cg/cg_dst
```

snapmirror initialize-ls-set

Start a baseline load-sharing set transfer

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror initialize-ls-set` command initializes and updates a set of load-sharing mirrors. This command is usually used after the [snapmirror create](#) command is used to create a SnapMirror relationship for each of the destination volumes in the set of load-sharing mirrors. The initial transfers to empty load-sharing mirrors are baseline transfers done in parallel. During a baseline transfer Data ONTAP takes a Snapshot copy on the source volume to capture the current image of the source volume and transfers all of the Snapshot copies on the source volume to each of the destination volumes.

After the `snapmirror initialize-ls-set` command successfully completes, the last Snapshot copy transferred is made the exported Snapshot copy on the destination volumes.

The parameter that identifies the set of load-sharing mirrors is the source volume. Data and Snapshot copies are transferred from the source volume to all up-to-date destination volumes in the set of load-sharing mirrors.

Use the `snapmirror initialize` command to add and initialize a new destination volume to an existing set of load-sharing mirrors.

Note: Even if the load-sharing set only has one mirror, you still need to use the `snapmirror initialize-ls-set` command to initialize the set. The `snapmirror initialize` command can only be used to initialize a new destination volume, if the load-sharing set has already been initialized.

This command is only supported for SnapMirror relationships with the field *"Relationship Capability"* showing as *"Pre 8.2"* in the output of the `snapmirror show` command.

Parameters

{ -source-path | -S {<[vserver:][volume]>|<[[cluster:]/[vserver/][volume]>|<hostip:/lun/name>|<hostip:/share/share-name>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[-source-cluster <cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-source-vserver <vserver name> - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

-source-volume <volume name> - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

Examples

To initialize the group of load-sharing mirrors for the source endpoint `//vs1.example.com/dept_eng`, type the following command:

```
cluster1::> snapmirror initialize-ls-set -source-path
//vs1.example.com/dept_eng
```

snapmirror list-destinations

Display a list of destinations for SnapMirror sources

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror list-destinations` command displays information including the destination endpoints, the relationship status, and transfer progress, for SnapMirror relationships whose source endpoints are in the current Vserver if you are in a Vserver context, or the current cluster if you are in a cluster context.

The command might display several relationships that have the same source and destination endpoints, but have different relationship IDs. If this is the case, some of the information is stale. It corresponds to relationships that have been deleted on the destination Vserver or cluster, and have not been released yet on the source Vserver or source cluster.

The relationships and the information displayed are controlled by the parameters that you specify. If no parameters are specified, the command displays the following information associated with each SnapMirror relationship whose source endpoint is in the current Vserver if you are in a Vserver context, or the current cluster if you are in a cluster context:

- Source path
- Relationship Type
- Destination Path
- Relationship Status
- Transfer Progress
- Progress Last Updated
- Relationship ID

Note the following limitations on the information displayed by the `snapmirror list-destinations` command:

- The *"Relationship Status"* field is not valid after the node hosting the source volume joins the cluster quorum, until at least one transfer is performed on the SnapMirror relationship.

- *"Transfer Progress"* and *"Progress Last Updated"* fields are only valid if a Snapshot copy transfer is in progress.
- The *"Relationship ID"* field is not valid for Vserver SnapMirror relationships.
- The *"Relationship Status"*, *"Transfer Progress"*, and *"Progress Last Updated"* fields are not valid for FlexGroup relationships, but they are valid for FlexGroup constituent relationships.

The **-instance** and **-fields** parameters are mutually exclusive and select the fields that are displayed. The **-instance** parameter if specified, displays detailed information about the relationships. The **-fields** parameter specifies what fields should be displayed. The other parameters of the `snapmirror list-destinations` command, select the SnapMirror relationships for which the information is displayed.

This command is not supported for SnapMirror relationships with non-Data ONTAP endpoints.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command only displays the fields that you have specified.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all relationships selected.

{ [-source-path | -S {<[vserver:][volume]>/<[[cluster:]/[vserver/][volume]>/<hostip:/lun/name>/<hostip:/share/share-name>}}] - Source Path

Selects SnapMirror relationships that have a matching source path name.

| [-source-vserver <vserver name>] - Source Vserver

Selects SnapMirror relationships that have a matching source Vserver name.

[-source-volume <volume name>}] - Source Volume

Selects SnapMirror relationships that have a matching source volume name.

{ [-destination-path {<[vserver:][volume]>/<[[cluster:]/[vserver/][volume]>/<hostip:/lun/name>/<hostip:/share/share-name>}}] - Destination Path

Selects SnapMirror relationships that have a matching destination path name.

| [-destination-vserver <vserver name>] - Destination Vserver

Selects SnapMirror relationships that have a matching destination Vserver name.

[-destination-volume <volume name>}] - Destination Volume

Selects SnapMirror relationships that have a matching destination volume name.

[-relationship-id <UUID>] - Relationship ID

Selects SnapMirror relationships that have a matching relationship identifier. This parameter is not supported for Vserver SnapMirror relationships.

[-type <snapmirrorType>] - Relationship Type

Selects SnapMirror relationships that have a matching relationship type. Possible values are:

- DP
- XDP
- RST

`[-relationship-group-type {none/vserver/consistencygroup/flexgroup}]` -

Relationship Group Type

Selects SnapMirror relationships that have a matching relationship group type.
Possible values are:

- none
- vserver
- flexgroup

`[-policy-type {vault/async-mirror/mirror-vault/strict-sync-mirror/sync-mirror}]` - SnapMirror Policy Type

Selects SnapMirror relationships that have a matching SnapMirror policy type.
Possible values are:

- async-mirror
- vault
- mirror-vault

`[-status <mirror status>]` - Relationship Status

Selects SnapMirror relationships that have a matching relationship status. Possible values are:

- Idle
- Transferring

This parameter is not supported for FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

`[-transfer-progress {<integer>[KB/MB/GB/TB/PB]}]` - Transfer Progress

Selects SnapMirror relationships that have a matching transfer progress. This parameter is not supported for FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

`[-progress-last-updated <MM/DD HH:MM:SS>]` - Timestamp of Last Progress Update

Selects SnapMirror relationships that have a matching transfer progress last updated timestamp. This parameter is not supported for FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

`[-source-volume-node <nodename>]` - Source Volume Node Name

Selects SnapMirror relationships that have a matching source volume node name. For FlexGroup relationships, it is the node which owns the root constituent source volume. This parameter is not supported for Vserver SnapMirror relationships.

`[-expand [true]]` - Show Constituents of the Group

Specifies whether to display constituent relationships of Vserver and FlexGroup SnapMirror relationships. By default, the constituents are not displayed.

Examples

To display summary information about all relationships whose source endpoints are in the current cluster, type the following command:

```
cluster1::> snapmirror list-destinations
```

Source		Destination		Transfer	Progress	Relationship
Path	Type	Path	Status	Progress	Last Updated	ID

```

-----
vserver1.example.com:dp_s1
      DP      vserver2.example.com:dp_d1
              Idle      -      -

snapmirror modify

Modify a SnapMirror relationship

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror modify` command allows you to change one or more properties of SnapMirror relationships. The key parameter that identifies any SnapMirror relationship is the destination endpoint. The destination endpoint can be a Vserver, a volume, or a non-Data ONTAP endpoint.

For load-sharing mirrors, a change to a property affects all of the SnapMirror relationships in the set of load-sharing mirrors. Destination volumes in a set of load-sharing mirrors do not have individual property settings.

Changes made by the `snapmirror modify` command do not take effect until the next manual or scheduled update of the SnapMirror relationship. Changes do not affect updates that have started and have not finished yet.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the [snapmirror show](#) command.

The `snapmirror modify` command must be used from the destination Vserver or cluster.

Parameters

`{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path`

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/*

share-name. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[*-source-cluster* <cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

[*-source-vserver* <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[*-source-volume* <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```
{ -destination-path {<[vserver:]<volume>>/<[[cluster:]//
vserver/]volume>/<hostip:/lun/name>/<hostip:/share/share-name>} -
```

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "*Relationship Capability*" of "*Pre 8.2*", a format which also includes the name of the cluster (cluster) is provided. The "*Pre 8.2*" format cannot be used when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[*-destination-cluster* <cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

***-destination-vserver* <vserver name> - Destination Vserver**

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

***-destination-volume* <volume name> - Destination Volume**

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with

"*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-vserver <vserver name>] - Managing Vserver

If this optional parameter is specified, designates the managing Vserver. The managing Vserver is authorized to use some snapmirror commands to manage the SnapMirror relationship. The **-vserver** option is currently a reserved option.

[-schedule <text>] - SnapMirror Schedule

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationship. If you do not designate a schedule, updates are not scheduled, so you must update the SnapMirror relationship manually using the `snapmirror update` command or, in the case of a set of load-sharing mirrors, using the `snapmirror update-ls-set` command.

Note: You define and name a schedule using the `job schedule cron create` command.

[-policy <sm_policy>] - SnapMirror Policy

This optional parameter designates the name of the snapmirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. Modification of the policy is not supported for relationships with a policy of type *strict-sync-mirror* or *sync-mirror*. If you want to use a different policy for SnapMirror Synchronous relationships, you need to delete the relationship and create it again with the new policy. This parameter is not applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

Note: You define and name a policy using the `snapmirror policy create` command.

[-tries <unsigned32_or_unlimited>] - Tries Limit

This optional parameter specifies the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The default is eight times. The **-tries** parameter can be set to 0 to disable manual and scheduled updates for the SnapMirror relationship. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*". For relationships with "*8.2 and above*" capability, the tries limit is controlled by the value of tries in the SnapMirror policy that is associated with the relationship.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for transfers. It configures for the relationship the maximum rate (in Kbytes/sec) at which data can be transferred. If no throttle is configured, by default the SnapMirror relationship fully utilizes the network bandwidth available. You can also configure the relationship to fully use the network bandwidth available by explicitly setting the throttle to *unlimited* or 0. The minimum effective throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as 4. For FlexGroup volume relationships, the throttle value is applied individually to each constituent relationship. The **-throttle** parameter does not affect load-sharing mirrors and other SnapMirror relationships with "*Relationship Capability*" of "*Pre 8.2*" confined to a single cluster.

[-is-auto-expand-enabled {true/false}] - Is Auto Expand Enabled

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup

SnapMirror relationships. If you do not specify the parameter, the current value of `auto expand` will be retained.

`[-foreground | -w [true]] - Foreground Process`

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

Examples

To change the schedule to *halfhour* for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror2`, type the following command:

```
vs2.example.com:> snapmirror modify -destination-path
vs2.example.com:dept_eng_dp_mirror2 -schedule halfhour
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to change the schedule to *halfhour* for the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_dp_mirror2`, type the following command:

```
cluster2:> snapmirror modify -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror2
-schedule halfhour
```

To change the schedule to *halfhour* for the Vserver SnapMirror relationship with destination endpoint `dvs1.example.com:`, type the following command:

```
cluster2:> snapmirror modify -destination-path
dvs1.example.com: -schedule halfhour
```

To change the policy associated with the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com` to the policy `Sync2`, type the following command:

```
vs2.example.com:> snapmirror modify -destination-path
vs2.example.com:/cg/cg_dst -policy Sync2
```

snapmirror promote

Promote the destination to read-write

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror promote` command performs a failover to the destination volume of a SnapMirror relationship. This command changes the destination volume from a read-only volume to a read-write volume and makes the destination volume assume the identity of the source volume. The command then destroys the original source volume. The destination volume must be a load-sharing volume. Note that you can promote a load-sharing volume that has been left in read-write state by a previously failed promote operation.

Client accesses are redirected from the original source volume to the promoted destination volume. The view clients see on the promoted destination volume is the latest transferred Snapshot copy, which might lag behind the view clients had of the original source volume before the promote.

The SnapMirror relationship is always deleted as part of the promotion process.

It is possible that the original source volume is the source of multiple SnapMirror relationships. For such a configuration, the promoted destination volume becomes the new source volume of the other SnapMirror relationships.

This command is only supported for SnapMirror relationships with the field *"Relationship Capability"* showing as *"Pre 8.2"* in the output of the `snapmirror show` command.

The `snapmirror promote` command fails if a SnapMirror transfer is in progress for any SnapMirror relationship with *"Relationship Capability"* of *"Pre 8.2"* involving the original source volume. It does not fail if a SnapMirror transfer is in progress for a relationship with *"Relationship Capability"* of *"8.2 and above"*.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/[vserver]/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

| [-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with

"*Relationship Capability*" of "*Pre 8.2*", **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```
{ -destination-path {<[vserver:][volume]>|<[[cluster:]]//
vserver/[volume]>|<hostip:/lun/name>|<hostip:/share/share-name>} -
```

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with "*Relationship Capability*" of "*Pre 8.2*", a format which also includes the name of the cluster (cluster) is provided. The "*Pre 8.2*" format cannot be used when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*". For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

```
| [-destination-cluster <Cluster name>] - Destination Cluster
```

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

```
-destination-vserver <vserver name> - Destination Vserver
```

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

```
-destination-volume <volume name>} - Destination Volume
```

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

```
[-force | -f [true]] - Force
```

If this parameter is specified, the command proceeds without prompting for confirmation.

Examples

To promote a mirror named *dept_eng_ls_mirror1* to be the source read-write volume for mirroring and client access, type the following command:

```
cluster1::> snapmirror promote -destination-path
//vs1.example.com/dept_eng_ls_mirror1
-source-path //vs1.example.com/dept_eng -f true
```

snapmirror protect

Start protection for Vservers and volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror protect` command establishes SnapMirror protection for the specified Vserver or a list of volumes. For each endpoint, the command creates a data protection destination endpoint in the Vserver specified by the **-destination-vserver** parameter, creates an extended data protection (XDP) SnapMirror relationship, and starts the initialization of the SnapMirror relationship. This command must be used from the destination Vserver or cluster. This command is not supported for FlexGroup volume constituents or non ONTAP endpoints.

Parameters

[-source-cluster <Cluster name>] - Source Cluster

This optional parameter specifies the source cluster name. This parameter is valid only when only a single Vserver is specified in the path-list parameter.

-path-list {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}, ... - Path List

This parameter specifies the list of source endpoints to be protected. The list is a comma separated list of paths of the form `vserver:volume` or `vserver:`, for example `vs1.example.com:dept_eng1`, `vs1.example.com:dept_eng2` or `vs1.example.com:`. If the list contains a Vserver endpoint, then the Vserver is the only endpoint that can be specified, and the list cannot contain a mixture of volume and Vserver endpoints.

[-destination-vserver <vserver name>] - Destination Vserver

This parameter specifies the Vserver in which to create the destination volumes of the SnapMirror relationships. When protecting a single Vserver, this parameter specifies the destination Vserver endpoint for protection.

[-destination-vserver-ipSpace <IPspace>] - Destination Vserver IPspace Name

This optional parameter specifies the IPspace the Vserver will be assigned to. If left unspecified, the Vserver will be assigned to the default IPspace. This parameter is supported while protecting a Vserver.

[-schedule <text>] - SnapMirror Schedule

This optional parameter designates the name of the schedule which is used to update the SnapMirror relationships.

-policy <sm_policy> - SnapMirror Policy

This parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationships.

[-auto-initialize {true/false}] - Auto Initialize

This optional parameter specifies whether or not initializes of the SnapMirror relationships should be started after the relationships are created. The default value for this parameter is *true*.

[-destination-volume-prefix <text>] - Destination Volume Name Prefix

This optional parameter designates the prefix for the destination volume name. For example if the source path is of the form `vserver:volume` and the destination-

volume-prefix specified is *prefix_* and no destination-volume-suffix is specified, then the destination volume name will be *prefix_volume_dst* or possibly *prefix_volume_1_dst* if a name conflict is encountered. If both prefix and suffix are specified as *prefix_* and *_suffix*, then the destination volume name will be *prefix_volume_suffix* or *prefix_volume_1_suffix*, if a name conflict is encountered. This parameter is not supported for Vserver endpoints.

`[-destination-volume-suffix <text>] - Destination Volume Name Suffix`

This optional parameter designates the suffix for the destination volume name. If you do not designate a suffix, a destination volume name with suffix *_dst* will be used. For example if the source path is of the form *vserver:volume*, and the suffix specified is *_DP*, the destination volume will be created with the name *volume_DP* or *volume_1_DP* if a name conflict is encountered. If both prefix and suffix are specified as *prefix_* and *_suffix*, then the destination volume name will be *prefix_volume_suffix* or *prefix_volume_1_suffix*, if a name conflict is encountered. This parameter is not supported for Vserver endpoints.

`[-support-tiering {true/false}] - Provision Destination Volumes on FabricPools`

This optional parameter specifies whether or not FabricPools are selected when provisioning a FlexVol volume or a FlexGroup volume during protection workflows. When this parameter is set to true, only FabricPools are used; when set to false, only non-FabricPools are used. Tiering support for a FlexVol volume can be changed by moving the volume to the required aggregate. Tiering support for a FlexGroup volume can be changed by moving all of the constituents to the required aggregates. The default value is *false*. This parameter is supported only for FlexVol volumes and FlexGroup volumes.

`[-tiering-policy {snapshot-only/auto/none/all}] - Destination Volume Tiering Policy`

This optional parameter specifies the tiering policy to apply to the destination FlexVol volume or FlexGroup volume. This policy determines whether the user data blocks of a FlexVol volume or FlexGroup volume in a FabricPool will be tiered to the capacity tier when they become cold. FabricPool combines flash (performance tier) with an object store (external capacity tier) into a single aggregate. The default tiering policy is 'snapshot-only' for a FlexVol volume and 'none' for a FlexGroup volume. The temperature of a FlexVol volume or FlexGroup volume block increases if it is accessed frequently and decreases when it is not.

The available tiering policies are:

- **snapshot-only** - This policy allows tiering of only the FlexVol volume or FlexGroup volume Snapshot copies not associated with the active file system. The default minimum cooling period is 2 days. The **-tiering-minimum-cooling-days** parameter can be used to override the default using the **volume modify** command after the destination FlexVol volume or FlexGroup volume has been created.
- **auto** - This policy allows tiering of both snapshot and active file system user data to the capacity tier. The default cooling period is 31 days. The **-tiering-minimum-cooling-days** parameter can be used to override the default using the **volume modify** command after the destination FlexVol volume or FlexGroup volume has been created.
- **none** - FlexVol volume or FlexGroup volume blocks will not be tiered to the capacity tier.
- **backup** - On a DP FlexVol volume or FlexGroup volume this policy allows all transferred user data blocks to start in the capacity tier.

This parameter is supported only for FlexVol volumes and FlexGroup volumes.

Examples

To establish SnapMirror protection for the source volumes `vs1.example.com:dept_eng1` and `vs1.example.com:dept_eng2` using destination-vserver `vs2.example.com` and policy `MirrorAllSnapshots` type the following command:

```
vs2.example.com:> snapmirror protect -path-list
vs1.example.com:dept_eng1,vs1.example.com:dept_eng2 -destination-
vserver
vs2.example.com -policy MirrorAllSnapshots
```

To establish SnapMirror protection for the source Vserver `vs1.example.com` which is on cluster `cluster1` creating a destination-vserver named `vs1dp.example.com` and using policy `MirrorAllSnapshots` type the following command:

```
cluster2:> snapmirror protect -source-cluster cluster1 -path-list
vs1.example.com: -destination-vserver vs1dp.example.com -policy
MirrorAllSnapshots
```

snapmirror quiesce

Disable future transfers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror quiesce` command disables future transfers for a SnapMirror relationship. If there is no transfer in progress, the relationship becomes "*Quiesced*".

If there is a transfer in progress, it is not affected, and the relationship becomes "*Quiescing*" until the transfer completes. If the current transfer aborts, it will be treated like a future transfer and will not restart.

If applied to a load-sharing (LS) SnapMirror relationship, all the relationships in the load-sharing set will be quiesced.

If applied to a relationship with a policy of type *strict-sync-mirror* or *sync-mirror*, any ongoing operation is aborted, and if the relationship is *InSync*, synchronous replication is stopped. If the replication policy type is "strict-sync-mirror", then the primary client I/O disruption is not enforced. A new common Snapshot copy is created if the relationship is *InSync*, unless a recent one exists. The relationship becomes "*Quiescing*" until these operations complete.

When a SnapMirror relationship is quiesced, it remains quiesced across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field "*Relationship Capability*" showing as either "*8.2 and above*" or "*Pre 8.2*" in the output of the `snapmirror show` command.

The `snapmirror quiesce` command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror quiesce`, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} -

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name>} - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with "*Relationship Capability*" of "*Pre 8.2*", **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

Examples

To quiesce the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_mirror2`, type the following command:

```
vs2.example.com:> snapmirror quiesce -destination-path
vs2.example.com:dept_eng_mirror2
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to quiesce the SnapMirror relationship with the destination endpoint `cluster2://vs2.example.com/dept_eng_mirror2`, type the following command:

```
cluster2:> snapmirror quiesce -destination-path
cluster2://vs2.example.com/dept_eng_mirror2
```

To quiesce the Vserver SnapMirror relationship with the destination endpoint `dvs1.example.com:`, type the following command:

```
cluster2:> snapmirror quiesce -destination-path
dvs1.example.com:
```

Under PVR control to quiesce the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com:> snapmirror quiesce -destination-path
vs2.example.com:/cg/cg_dst
```

snapmirror release

Remove source information for a SnapMirror relationship

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror release` command removes the relationship information from the source Vserver. The command also removes any Snapshot copy owner tags and any Snapshot copies which were created for the specified relationship from the source volumes. It does not destroy any volumes or Vservers. This command must be used from the source Vserver or cluster.

For relationships with a policy of type *strict-sync-mirror*, it additionally resumes primary volume access if the IO was restricted because the relationship was *OutOfSync*.

You can use the `snapmirror list-destinations` command to display source Vservers' relationship information. This information is populated during the first SnapMirror transfer, not when the `snapmirror create` command is issued.

This command is not supported for SnapMirror relationships with the field "*Relationship Capability*" showing as "*Pre 8.2*" in the output of the `snapmirror show` command.

This command is not supported for SnapMirror relationships with non-Data ONTAP endpoints.

The `snapmirror release` operation fails if a SnapMirror transfer for the SnapMirror relationship is in a data phase of the transfer.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

Specifies the source endpoint of the SnapMirror relationship in one of two formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other snapmirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context.

| [-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter `-source-volume` must also be specified.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameter `-source-vserver` must also be specified.

{ -destination-path {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}} -

Destination Path

Specifies the destination endpoint of the SnapMirror relationship in one of two formats. The normal format includes the names of the Vserver (vserver), and/or volume (volume). A format which also includes the name of the cluster (cluster) is also provided for consistency with other snapmirror commands. The form of the pathname which includes the cluster name cannot be used when operating in a Vserver context.

| -destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameter `-destination-volume` must also be specified.

[-destination-volume <volume name>]] - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameter `-destination-vserver` must also be specified.

`[-relationship-info-only [true]]` - Remove relationship info only (skip cleanup of snapshots)

If this parameter is specified, the cleanup of Snapshot copies is bypassed and only the source relationship information is removed. It is recommended to specify this parameter only when the source volume is not accessible.

`[-relationship-id <UUID>]` - Relationship ID

This optional parameter specifies the relationship identifier of the relationship. It must be specified when information for more than one relationship with the same source and destination paths is present. This parameter is not supported for Vserver SnapMirror relationships.

`[-force | -f [true]]` - Force

If this parameter is specified, the command proceeds without prompting for confirmation.

Examples

To release the source information for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror4`, type the following command:

```
vs1.example.com:> snapmirror release
  -destination-path vs2.example.com:dept_eng_dp_mirror4
```

To release the source information for the SnapMirror relationship with the destination endpoint `vs2.example.com:dept_eng_dp_mirror4`, and relationship-id `5f91a075-6a72-11e1-b562-123478563412`, type the following command:

```
vs1.example.com:> snapmirror release
  -destination-path vs2.example.com:dept_eng_dp_mirror4
  -relationship-id 5f91a075-6a72-11e1-b562-123478563412
```

To release the source information for the SnapMirror relationship with the destination endpoint `dvs1.example.com:`, type the following command:

```
cluster1:> snapmirror release
  -destination-path dvs1.example.com:
```

Under PVR control to release the source information for the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com:> snapmirror release
  -destination-path vs2.example.com:/cg/cg_dst
```

Under PVR control to release just the source information but not remove the Snapshot copies that might be needed for a subsequent resync for the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group `cg_dst` in Vserver `vs2.example.com`, type the following command:

```
vs2.example.com:> snapmirror release
  -destination-path vs2.example.com:/cg/cg_dst
  -relationship-info-only true
```

snapmirror restore

Restore a Snapshot copy from a source volume to a destination volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror restore` command restores the entire contents of a Snapshot copy or one or more files, LUNs or NVMe namespaces of a Snapshot copy from one volume to another volume.

The source of the restore can be a volume that is:

- the destination volume of a extended data protection (XDP) relationship
- the destination volume of a data protection (DP) relationship with "*Relationship Capability*" of "*8.2 and above*"
- a data-protection volume which is not the destination endpoint of any SnapMirror relationship
- a read-write volume.
- an AltaVault endpoint. In this case the destination must be an empty Data ONTAP volume.

The following cannot be used as either the source or destination volume of a restore:

- a volume that is the source or destination endpoint of a SnapMirror load-sharing relationship.
- a volume that is the destination endpoint of a SnapMirror relationship with the "*Relationship Capability*" of "*Pre 8.2*".
- a SolidFire endpoint.

A SnapMirror relationship of type *RST* is created from the source volume to the destination volume by the `snapmirror restore` command. This relationship lasts for the duration of the restore operation and is deleted when the command completes successfully.

The following paragraphs describe the behavior when restoring the entire contents of a Snapshot copy to a destination volume.

By default the `snapmirror restore` will copy the latest Snapshot copy from the source volume to the destination volume. A specific Snapshot copy can be selected with the **-source-snapshot** parameter.

Any quota rules defined for the destination volume are deactivated prior to restoring the entire contents of a Snapshot copy. Run the command `volume quota modify -vserver destination-volume-vserver -volume destination-volume-name -state on` to reactivate quota rules after the entire contents of the Snapshot copy have been restored.

If the destination volume is an empty data protection volume, the `snapmirror restore` command performs a baseline restore. For a baseline restore the following steps are performed:

- Create the *RST* SnapMirror relationship.
- The entire contents of the Snapshot copy selected to be restored are copied to the active file system of the destination volume.

- The destination volume is made read-write.
- The *RST* SnapMirror relationship is deleted.

If the destination volume is a read-write volume, an incremental restore is performed. The incremental restore fails if it cannot find a common Snapshot copy between the source and destination volumes. Restoring a Snapshot copy to an empty read-write volume is not supported. Incremental restore from a non-Data ONTAP endpoint to a Data ONTAP volume is not supported.

An incremental restore preserves all Snapshot copies on the destination volume but does not preserve changes to the active file system since the latest Snapshot copy. To preserve changes to the destination volume since the latest Snapshot copy use the `volume snapshot create` command. Restore is a disruptive operation so client access of the destination volume is not advised for the duration of the operation.

For an incremental restore the following steps are performed:

- Create the *RST* SnapMirror relationship.
- The active file system of the destination volume is reverted to the latest Snapshot copy on the destination volume and the destination volume is made read-only.
- This Snapshot copy is the exported Snapshot copy and it is the view to which clients are redirected when accessing the destination volume.
- The contents of the Snapshot copy selected to be restored are copied to the active file system of the destination volume.
- The destination volume is made read-write.
- The *RST* SnapMirror relationship is deleted.

If `snapmirror restore` fails or is aborted, the *RST* relationship remains. Use the `snapmirror show` command with the destination volume name to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use the original command with `-clean-up-failure` to cancel the request.

When specifying `-clean-up-failure` to cancel an incremental restore request, the following steps are performed:

- If the Snapshot copy has not been restored to the destination volume, all data copied to the active file system by `snapmirror restore` to the destination volume is reverted.
- The destination volume is made read-write.
- The *RST* SnapMirror relationship is deleted.

When specifying `-clean-up-failure` to cancel a baseline restore request, the following steps are performed:

- If the Snapshot copy has been restored to the destination volume, the volume is made read-write.
- The *RST* SnapMirror relationship is deleted.

The following paragraphs describe the behavior and requirements when restoring one or more files, LUNs or NVMe namespaces to the destination volume.

The destination volume must be a read-write volume. Restoring files, LUNs or NVMe namespaces to a data protection volume is not supported. When restoring files, LUNs or NVMe namespaces the source and destination volumes are not required to have a common Snapshot copy. If a common

Snapshot copy exists, an incremental restore is performed for those files, LUNs or NVMe namespaces being restored which exist in the common Snapshot copy.

The contents of the files, LUNs or NVMe namespaces to which data is being restored on the destination volume are not preserved by this command. To preserve the contents of the destination files, LUNs or NVMe namespaces, create a Snapshot copy on the destination volume prior to running this command. Client I/O is not allowed to a file, LUN or NVMe namespace to which data is being restored on the destination volume.

The **-source-snapshot** parameter is required when restoring files, LUNs or NVMe namespaces. It identifies the Snapshot copy on the source volume from which the files, LUNs or NVMe namespaces to be restored are copied. If all files, LUNs or NVMe namespaces to be restored do not exist in this Snapshot copy the command fails.

The source path for each file, LUN or NVMe namespace being restored is required. The source path of a file, LUN or NVMe namespace is from the root of the source Snapshot copy of the source volume. The file is restored to the same path on the destination volume unless an optional destination path is specified. The destination path is from the root of the destination volume. If a file, LUN or NVMe namespace to which data is being restored on the destination volume does not exist, the file, LUN or NVMe namespace is created. If any directory in the path of the file, LUN or NVMe namespace being restored does not exist on the destination volume, the command fails. Overwriting the contents of an existing file with the contents of a different file is supported. Similarly, overwriting the contents of an existing LUN or NVMe namespace with the contents of a different LUN or NVMe namespace is supported. However, overwriting a file with the contents of a LUN or NVMe namespace is not supported. Overwriting a LUN with the contents of a file or NVMe namespace is not supported. Overwriting an NVMe namespace with the contents of a file or LUN is not supported. Client I/O is not allowed to all files, LUNs and NVMe namespaces to which data is being restored on the destination volume.

If quota rules have been defined for the destination volume, resource usage is updated during file restore, but limits of quota rules are not enforced. Therefore, resource limits might be exceeded during a file restore.

Multiple concurrent `snapmirror restore` commands, restoring one or more files, LUNs or NVMe namespaces to the same destination volume, are not supported. The destination volume of a `snapmirror restore` to which one or more files, LUNs or NVMe namespaces are being restored, can simultaneously be the source volume of a `snapmirror update`.

For a file, LUN or NVMe namespace restore the following steps are performed:

- Create the *RST* SnapMirror relationship.
- If any file, LUN or NVMe namespace being restored does not exist on the destination volume, create all such files, LUNs or NVMe namespaces.
- Prevent client I/O to files, LUNs or NVMe namespaces to which data is being restored on the destination volume.
- Revoke locks and space reservations held by NAS clients for files being restored.
- Copy the contents of all source files, LUNs or NVMe namespaces to the corresponding file, LUN or NVMe namespace on the destination volume.
- Allow client I/O to files, LUNs or NVMe namespaces to which data has been restored on the destination volume.
- Delete the *RST* SnapMirror relationship.

Note: Some file restore operations require a Snapshot copy to be created. This Snapshot copy is temporary, it is deleted before the operation completes.

Since client I/O is not allowed to files, LUNs or NVMe namespaces being restored, client I/O to files, LUNs or NVMe namespaces being restored should be quiesced. Mapped LUNs or NVMe namespaces remain mapped throughout the operation. SAN clients do not need to rediscover a mapped LUN that has been restored. Restoring an NVMe namespace on top of another NVMe namespace with a different attribute relevant to NVMe protocol accessibility (like size) is not supported.

If `snapmirror restore` fails or is aborted, the *RST* relationship remains. Use the `snapmirror show` command with the destination volume to display the reason for the error. An EMS is also generated when a failure occurs. There are two options to recover when restore fails or is aborted:

- Take corrective action suggested by the EMS and reissue the original command.
- Use `snapmirror restore -clean-up-failure` along with specifying the destination volume to cancel the request.

When specifying `-clean-up-failure` to cancel a file restore request, the following steps are performed:

- Any files to which client I/O is not allowed are removed.
- Any Snapshot copy created for use during a file restore operation is deleted.
- The *RST* SnapMirror relationship is deleted.

Note: LUNs to which client I/O is not allowed remain. For LUNs to which client I/O is not allowed, do one of the following:

- Use the `snapmirror restore` command to restore data to the LUN. Once the command completes successfully, client I/O to the LUN is allowed.
- Delete the LUN using the `lun delete` command with the `-force-fenced` parameter.

Note: Similarly, NVMe namespaces to which client I/O is not allowed remain. For NVMe namespaces to which client I/O is not allowed, do one of the following:

- Use the `snapmirror restore` command to restore data to the NVMe namespace. Once the command completes successfully, client I/O to the NVMe namespace is allowed.
- Delete the NVMe namespace using the `vserver nvme namespace delete` command with the `-skip-mapped-check` parameter.

The `snapmirror restore` command must be used from the destination Vserver or cluster.

Parameters

`{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]]/vserver/[volume]>|<hostip:/lun/name>|<hostip:/share/share-name>}}] - Source Path`

Specifies the source endpoint in one of three formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format which also includes the name of the cluster (cluster) is supported for consistency with other `snapmirror` commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context. A non-Data ONTAP source endpoint (for example, AltaVault) can be specified in the form `hostip:/share/share-name`.

`[-source-cluster <cluster name>] - Source Cluster`

Specifies the cluster in which the source volume resides. This parameter is not needed; it is provided for consistency with other `snapmirror` commands. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is not valid when operating in a Vserver

context. This parameter is not supported if the source is a non-Data ONTAP endpoint.

`[-source-vserver <vserver name>] - Source Vserver`

Specifies the source Vserver of the SnapMirror relationship. If this parameter is specified, the `-source-volume` parameter must also be specified. This parameter is not supported if the source is a non-Data ONTAP endpoint.

`[-source-volume <volume name>] - Source Volume`

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` parameter must also be specified. This parameter is not supported if the source is a non-Data ONTAP endpoint.

`{ -destination-path {<[vserver:]<volume>|<[[cluster:]//vserver/]<volume>|<hostip:/lun/name>|<hostip:/share/share-name>} - Destination Path`

Specifies the destination endpoint in one of two formats. The basic format includes the names of the Vserver (vserver) and volume (volume). A format that also includes the name of the cluster (cluster) is supported for consistency with other *snapmirror* commands. The form of the pathname which includes the cluster name is not valid when operating in a Vserver context.

`[-destination-cluster <cluster name>] - Destination Cluster`

Specifies the cluster in which the destination volume resides. This parameter is not needed; it is provided for consistency with other *snapmirror* commands. If this parameter is specified, the `-destination-vserver` and `-destination-volume` parameters must also be specified. This parameter is not valid when operating in a Vserver context. This parameter is only applicable for relationships with "Relationship Capability" of "Pre 8.2".

`-destination-vserver <vserver name> - Destination Vserver`

Specifies the destination Vserver. If this parameter is specified, the `-destination-volume` parameter must also be specified.

`-destination-volume <volume name> - Destination Volume`

Specifies the destination volume. If this parameter is specified, the `-destination-vserver` parameter must also be specified.

`[-source-snapshot | -s <text>] - Source Snapshot`

When restoring the entire contents of a Snapshot copy, this optional parameter identifies the Snapshot copy to be restored from the source volume to the destination volume. The default value is the latest snapshot on the source volume. When restoring one or more files, LUNs or NVMe namespaces from a Snapshot copy, this parameter is required.

`[-throttle | -k <throttleType>] - Throttle (KB/sec)`

This optional parameter limits the network bandwidth used for the restore transfer when the source and destination volumes belong to different clusters. It sets the maximum rate (in Kbytes/sec) at which data can be transferred between the clusters during the operation. To fully use the network bandwidth available between the clusters, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between *1* and *4*, it will be treated as if you specified *4*.

`[-transfer-priority {low/normal}] - Transfer Priority`

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is *normal*.

[-disable-storage-efficiency [true]] - Disable Storage Efficient Transfer

The default behavior of restore is to preserve storage efficiency when possible. Use this optional parameter to turn off storage efficiency for data transferred over the wire and written to the destination volume.

[-clean-up-failure [true]] - Clean up after Failure

Use this optional parameter to recover from an aborted or failed restore operation. Any temporary *RST* relationship is removed from the destination Vserver. An attempt is made to remove any temporary *RST* relationship from the source Vserver. If cleaning up an incomplete restore of the entire contents of a Snapshot copy and the destination volume was read-write prior to the failed or aborted restore operation, it is converted back to read-write if necessary, while removing all data transferred or copied during the restore operation. If cleaning up an incomplete restore of one or more files, LUNs or NVMe namespaces of a Snapshot copy, any file to which client I/O is not allowed is deleted.

[-tries <unsigned32_or_unlimited>] - Tries Limit

Specifies the total number of attempts to transfer data in cases where a transfer is interrupted by an error that SnapMirror can recover from. The value of this parameter must be a positive integer or *unlimited*.

[-force | -f [true]] - Force

If this parameter is specified, the command proceeds without prompting for confirmation.

[-file-list <<source path>[,@<destination path>]>, ...] - File List

Specifies the files, LUNs or NVMe namespaces to be restored. The list can contain specifications for up to 8 files, LUNs or NVMe namespaces. Specification for each file, LUN or NVMe namespace consists of a *source_path* and an optional *destination_path*, and is of the form

'*source_path*[@*destination_path*]'. *source_path* is required and is the path of the file from the source Snapshot copy, e.g. /dira/file1 or /lun1. The source path does not include the Snapshot name nor the source volume name. The path to each file to be restored in the active file system of the destination volume is the same as the path specified by *source_path*, unless an optional *destination_path* is specified. *destination_path* begins with the @ symbol followed by the path of the file from the root of the active file system of the destination volume, e.g. @/file1 or @/dira/lun1. Each *source_path* and *destination_path* is a separate entity in the list of paths. A *destination_path* is associated with the *source_path* that immediately precedes it. If this parameter is specified, **-source-snapshot** must also be specified. Examples:

```
/dira/file1
```

```
/dira/file1,@/dirb/file2
```

```
/dira/file1,@/dirb/file2,/dirc/file3
```

[-use-network-compression [true]] - Use Network Compression

Use this optional parameter to use network compression for data transfer over the wire. This parameter is not supported for relationships with non-Data ONTAP endpoints.

Examples

The following example does an incremental restore between the restore source volume *vs2.example.com:dept_eng_dp_mirror2* and the restore destination volume *vs1.example.com:dept_eng*:

```
vs1.example.com:> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
Warning: All data newer than Snapshot copy snap6 on volume
        vs1.example.com:dept_eng will be deleted.
Do you want to continue? {y|n}: y
[Job 34] Job is queued: snapmirror restore from source
vs2.example.com:dept_eng_dp_mirror2 for the snapshot snap3.
vs1.example.com:>
```

The following example restores */file3* from the source Snapshot copy *snap3* on the source volume *vs2.example.com:dept_eng_dp_mirror2* to the active file system of the restore destination volume *vs1.example.com:dept_eng*:

```
vs1.example.com:> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file3
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 35] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com:>
```

The following example restores */file3* from the source Snapshot copy *snap3* on the source volume *vs2.example.com:dept_eng_dp_mirror2* to */file3.new* in the active file system of the restore destination volume *vs1.example.com:dept_eng*:

```
vs1.example.com:> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 36] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com:>
```

The following example restores */file1*, */file2*, and */file3* from the source Snapshot copy *snap3* on the source volume *vs2.example.com:dept_eng_dp_mirror2* respectively to */file1.new*, */file2*, and */file3.new* in the active file system of the restore destination volume *vs1.example.com:dept_eng*:

```
vs1.example.com:> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -source-path vs2.example.com:dept_eng_dp_mirror2
  -source-snapshot snap3
  -file-list /file1,@/file1.new,/file2,/file3,@/file3.new
Warning: This command will overwrite any file on destination
"vs1.example.com:dept_eng" that has the same path as any of
the files to be restored.
Do you want to continue? {y|n}: y
[Job 36] Job is queued: snapmirror restore from source
"vs2.example.com:dept_eng_dp_mirror2" for the snapshot snap3.
vs1.example.com:>
```

The following example deletes data from an incomplete file restore, captured in a Snapshot copy which was later promoted to the active file system of a volume.

```
vs1.example.com::> snapmirror restore
  -destination-path vs1.example.com:dept_eng
  -file-restore-clean-up
Operation is queued: snapmirror restore with "-file-restore-clean-up"
on volume "vs1.example.com:dept_eng".
vs1.example.com::>
```

snapmirror resume

Enable future transfers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror resume` command enables future transfers for a SnapMirror relationship that has been quiesced.

If there is a scheduled transfer for the relationship, it will be triggered on the next schedule. If there is a restart checkpoint, it will be re-used if possible.

If applied on a load-sharing (LS) SnapMirror relationship, it enables future transfers for all the relationships in the load-sharing set.

If applied on a relationship with a policy of type *strict-sync-mirror* or *sync-mirror*, it enables future resync operations and initiates an Auto Resync.

When a quiesced SnapMirror relationship is resumed, future transfers remain enabled across reboots and fail-overs.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the [snapmirror show](#) command.

The `snapmirror resume` command must be used from the destination Vserver or cluster.

The relationship must exist on the destination Vserver or cluster. When issuing `snapmirror resume`, you must specify the destination endpoint. The specification of the source endpoint of the relationship is optional.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the **-source-vserver** and **-source-volume** parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-source-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

{ -destination-path {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} -

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name>} - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

Examples

To re-enable future transfers for the SnapMirror relationship with the destination endpoint *vs2.example.com:dept_eng_dp_mirror2* that has been previously quiesced, type the following command:

```
vs2.example.com:> snapmirror resume -destination-path
vs2.example.com:dept_eng_dp_mirror2
```

To re-enable future transfers for the SnapMirror relationship with the destination endpoint *cluster2://vs2.example.com/dept_eng_dp_mirror2* that has been previously quiesced, type the following command:

```
cluster2:> snapmirror resume -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror2
```

To re-enable future transfers for the Vserver SnapMirror relationship with the destination endpoint *dvs1.example.com:* that has been previously quiesced, type the following command:

```
cluster2:> snapmirror resume -destination-path
dvs1.example.com:
```

Under PVR control to re-enable future transfers and initiate an Auto Resync of the synchronous SnapMirror Consistency Group relationship with the destination Consistency Group *cg_dst* in Vserver *vs2.example.com*, type the following command:

```
vs2.example.com:> snapmirror resume -destination-path
vs2.example.com:/cg/cg_dst
```

snapmirror resync

Start a resynchronize operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror resync` command establishes or reestablishes a mirroring relationship between a source and a destination endpoint. The endpoints can be Vservers, volumes or non-Data ONTAP endpoints that support SnapMirror. `snapmirror resync` for a SnapMirror relationship with volumes as endpoints is typically executed in the following cases:

- The destination mirror is broken (that is, the destination volume is a read-write volume and no longer a data protection mirror). After the `snapmirror resync` command completes, the destination volume is made a data protection mirror and the mirror can be manually updated or scheduled for updates.
- `snapmirror update` command failed because the required common Snapshot copy was deleted on the source volume.
- The volumes are the first and third endpoints in a cascade chain of relationships and they have a common Snapshot copy. In this case, `snapmirror resync` might implicitly create the SnapMirror relationship between them.

Attention: The `snapmirror resync` command can cause data loss on the destination volume because the command can remove the exported Snapshot copy on the destination volume.

The default behavior of the `snapmirror resync` command for volume relationships is defined as follows:

- Finds the most recent common Snapshot copy between the source and destination volumes, removes Snapshot copies on the destination volume that are newer than the common Snapshot copy and mounts the destination volume as a DP volume with the common Snapshot copy as the exported Snapshot copy.
- For data protection (DP) relationships, takes a Snapshot copy of the source volume to capture the current image and transfers Snapshot copies that are newer than the common Snapshot copy from the source volume to the destination volume. For extended data protection (XDP) relationships, transfers Snapshot copies newer than the common Snapshot copy according to the relationship policy, i.e., Snapshot copies will match rules associated with the policy as defined by the `snapmirror policy` commands. For relationships associated with `snapmirror policy` of type *async-mirror* and *mirror-vault* the `snapmirror resync` first takes a Snapshot copy of the source volume and includes it in the Snapshot copies selected for transfer.
- For a SnapLock Compliance volume in an XDP relationship with SnapMirror policy of type *async-mirror*, if SnapMirror resync operation detects data divergence between the common Snapshot copy and the AFS on the destination volume, the resync operation preserves the data changes in a locked Snapshot copy for the duration of the current volume expiry time. If the volume expiry time is in the past or has not been set, then the Snapshot copy is locked for a duration of 30 days. The common Snapshot copy is also locked for the same duration.

For Vserver SnapMirror relationships, a resync operation is typically executed when the relationship is broken-off, the *subtype* of the destination Vserver is *default* and the destination volumes are of type read-write. Once the command is queued, the subtype of the destination Vserver changes from *default* to *dp-destination*. A successful resync operation also makes the destination Vserver's volumes data protection volumes.

If the `resync` command is executed on a Vserver SnapMirror relationship, and the corresponding source and destination Vservers have volumes with volume level SnapMirror relationships, then the volume level SnapMirror relationships will be converted to volumes under the Vserver SnapMirror relationship. This conversion is supported only for source and destination Vservers which have been transitioned from a 7-Mode vFiler into a C-Mode Vserver. Some basic pre-requisites for the conversion are that the destination Vserver should be in a *stopped* state and all the destination Vserver volumes except the root volume should be in a volume level SnapMirror relationship with volumes of the source Vserver. The state of these volume level SnapMirror relationships should be *Snapmirrored* and status should be *Idle*.

`snapmirror resync` for a relationship with a policy of type *strict-sync-mirror* or *sync-mirror* is typically executed in the following case:

- The destination mirror is broken (that is, the destination volume is read-write and no longer read-only). After the `snapmirror resync` command completes, the destination volume changes to read-only and the relationship to InSync.

Note: The `snapmirror resync` command is typically not required to return a relationship that has fallen out of sync due to an error condition to InSync because SnapMirror has Auto Resync for synchronous relationships. When SnapMirror detects that the relationship has fallen out of sync for any reason other than a `snapmirror quiesce`, `snapmirror break` or `snapmirror delete` command was executed on the relationship, it will automatically initiate a resync operation.

The default behavior of the `snapmirror resync` command for relationships with a policy of type *strict-sync-mirror* or *sync-mirror* is defined as follows:

- Creates a Snapshot copy on the destination of the current image of the destination file system. This Snapshot copy becomes the exported Snapshot copy for the volume during the resync operation.
- Finds the most recent common Snapshot copy between the source and destination volumes. Performs a local rollback transfer to give the active file system the same data as the common Snapshot copy. It then loops through a sequence, creating a Snapshot copy on the source volume, transferring the data captured in that Snapshot copy, creating a Snapshot copy of the data on the destination, and repeating until the relationship is close to InSync. After the last transfer, it enters cutover to bring the relationship to InSync.
- User-created Snapshot copies are not replicated by a resync operation.
- At the conclusion of the resync operation, the exported Snapshot copy on the destination is removed and the client will then see the active file system on the destination volume. The relationship will be InSync and periodic creation of common Snapshot copies will resume.

The `snapmirror resync` command supports an optional parameter *"preserve"*. The parameter *"preserve"* is only supported for extended data protection (XDP) relationships. It is not supported for relationships with a non-Data ONTAP endpoint. It is not supported for relationships with a policy of type *strict-sync-mirror* and *sync-mirror*. When used, the parameter *"preserve"* changes the behavior of the `snapmirror resync` command. The changed behavior of the command can be described as follows:

- Finds the most recent common Snapshot copy between the source and destination volumes, preserves all Snapshot copies on the destination volume that are newer than the common Snapshot copy, and mounts the destination volume as a DP volume with the common Snapshot copy as the exported Snapshot copy.
- Performs a local rollback transfer to make a copy of the common Snapshot copy on the destination volume and establish it as the latest Snapshot copy on the destination volume. The command then transfers all Snapshot copies that are newer than the common Snapshot copy, from the source volume to the destination volume. The command only transfers Snapshot copies that

match the relationship's policy, i.e., Snapshot copies will match rules associated with the policy as defined by the `snapmirror policy` commands.

If a SnapMirror relationship does not already exist, that is, the relationship was not created using the `snapmirror create` command, the `snapmirror resync` command will implicitly create the SnapMirror relationship, with the same behaviors as described for the `snapmirror create` command before resyncing it.

For Vservers, you must create SnapMirror relationships between Vservers by using the `snapmirror create` command before you run the `snapmirror resync` command. The `snapmirror resync` command does not implicitly create the relationship.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, you can track the progress of the operation using the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

The `snapmirror resync` command fails if the destination volume does not have a Snapshot copy in common with the source volume.

The `snapmirror resync` command does not work on load-sharing mirrors.

The `snapmirror resync` command must be used from the destination Vserver or cluster.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] } - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

[-source-cluster <cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>]] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters **-source-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-source-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```
{ -destination-path {<[vserver:][volume]>|<[[cluster:]]//
vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} -
```

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name>] - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-source-snapshot | -s <text>] - Source Snapshot

This optional parameter specifies a Snapshot copy to transfer. The default behavior for a data protection relationship with a read-write source is that Data ONTAP creates a new Snapshot copy and uses it as the basis for determining what data are replicated; with this option, the specified Snapshot copy will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified Snapshot copy must be newer than the latest common Snapshot copy. For an extended data protection relationship, the specified Snapshot copy can be newer or older than the common Snapshot copy. This parameter is not supported for relationships with *"Relationship Capability"* of *"Pre 8.2"*.

[-type <snapmirrorType>] - Snapmirror Relationship Type

Specifies the type of SnapMirror relationship if a relationship is implicitly created. This parameter is the same as the one used in the `snapmirror create` command.

[-policy <sm_policy>] - SnapMirror Policy

This optional parameter designates the name of the SnapMirror policy which is associated with the SnapMirror relationship. If you do not designate a policy, the current policy will be retained. This parameter is not applicable to relationships with "Relationship Capability" of "Pre 8.2".

Note: You define and name a policy using the `snapmirror policy create` command.

[-force | -f [true]] - Force

If this parameter is specified, the command proceeds without prompting for confirmation.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for the resync transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the `snapmirror create` or `snapmirror modify` command will be used. To fully use the network bandwidth available, set the throttle value to `unlimited` or `0`. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4. For FlexGroup relationships, the throttle value is applied individually to each constituent relationship. For relationships with a policy of type `strict-sync-mirror` or `sync-mirror`, the throttle value is applicable only for the asynchronous transfers of the resync operation. The `-throttle` parameter does not affect load-sharing transfers and transfers for other relationships with "Relationship Capability" of "Pre 8.2" confined to a single cluster.

[-transfer-priority {low/normal}] - Transfer Priority

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a "Relationship Capability" of "Pre 8.2".

[-preserve [true]] - Preserve

This parameter is only supported for extended data protection (XDP) relationships with policies of type `vault`, and `mirror-vault`. It is not supported for relationships with a policy of type `async-mirror` and data protection and load-sharing relationships. This parameter is not supported for relationships with non-Data ONTAP endpoints. It is not supported for relationships with a policy of type `strict-sync-mirror` and `sync-mirror`. When specified, it changes the behavior of the `snapmirror resync` command to preserve Snapshot copies on the destination volume that are newer than the latest common Snapshot copy. This parameter is not supported for relationships with "Relationship Capability" of "Pre 8.2".

[-quick-resync [true]] - Quick Resync

This parameter is only supported for extended data protection (XDP) relationships. This parameter is not supported for relationships with non-Data ONTAP endpoints. It is not supported for relationships with a policy of type `strict-sync-mirror` and `sync-mirror`. Specifying this optional parameter reduces the resync time because the resync does not incur storage efficiency overhead before the transfer of new data. Specifying this parameter is recommended if the source of the resync does not have volume efficiency enabled or if reducing resync time is more

important than preserving all possible storage efficiency. When this parameter is specified, resync does not preserve the storage efficiency of the new data with existing data over the wire and on the destination.

`[-is-auto-expand-enabled {true/false}] - Is Auto Expand Enabled`

This optional parameter specifies whether or not a FlexGroup SnapMirror relationship and its destination FlexGroup should be auto-expanded if the source FlexGroup is expanded. This parameter is supported only for FlexGroup SnapMirror relationships. If this resync is creating a new Snapmirror relationship, the default value is `true`. If it is not creating a new relationship, if a value is specified, it must match the current value for the existing relationship. If the parameter is not specified, the existing value will be retained.

`[-foreground | -w [true]] - Foreground Process`

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is `true` (the operation runs in the foreground). When set to `true`, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

Examples

To reestablish mirroring for the destination endpoint `vs2.example.com:dept_mkt_mirror` that has been previously broken off with the `snapmirror break` command, type the following command:

```
vs2.example.com:> snapmirror resync -destination-path
vs2.example.com:dept_mkt_dp_mirror
```

For relationships with "*Relationship Capability*" of "*Pre 8.2*", to reestablish mirroring for the destination endpoint `cluster2://vs2.example.com/dept_mkt_mirror` that has been previously broken off with the `snapmirror break` command, type the following command:

```
cluster2:> snapmirror resync -destination-path
cluster2//vs2.example.com/dept_mkt_dp_mirror
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named `vs2.example.com:dept_eng_dp_mirror2` and the source endpoint named `vs1.example.com:dept_eng`, type the following command:

```
vs2.example.com:> snapmirror resync -destination-path
vs2.example.com:dept_eng_dp_mirror2
-source-path vs1.example.com:dept_eng
```

To create a SnapMirror relationship and reestablish mirroring between the destination endpoint named `cluster2://vs2.example.com/dept_eng_dp_mirror2` and the source endpoint named `cluster1://vs1.example.com/dept_eng` when the source cluster is running Data ONTAP 8.1 software, type the following command:

```
cluster2:> snapmirror resync -destination-path
cluster2//vs2.example.com/dept_eng_dp_mirror2
-source-path cluster1://vs1.example.com/dept_eng
```

To create and reestablish an extended data protection (XDP) relationship between the Data ONTAP source endpoint `vs1.example.com:data_ontap_vol`, and the non-Data ONTAP (for example, AltaVault) destination endpoint `10.0.0.11:/share/share1`, and start the initial transfer, type the following command:

```
vs1.example.com:> snapmirror resync -destination-path
10.0.0.11:/share/share1
-source-path vs1.example.com:data_ontap_vol -type XDP
```

To reestablish mirroring for the destination endpoint *dvs1.example.com*: of a Vserver relationship that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
cluster2:> snapmirror resync -destination-path
dvs1.example.com:
```

Under PVR control to create a SnapMirror synchronous Consistency Group relationship with the following attributes:

- It is between the source Consistency Group *cg_src* in Vserver *vs1.example.com*, and the destination Consistency Group *cg_dst* in Vserver *vs2.example.com*.
- It has item mappings between *lun1* and *lun2* on volume *srcvol* and *lun1* and *lun2* on volume *dstvol*.
- It uses a policy named Sync that has a policy type of *smgr-mirror* that the user has previously created.

and reestablish mirroring, type the following command:

```
vs2.example.com:> snapmirror resync -destination-path
vs2.example.com:/cg/cg_dst -source-path
vs1.example.com:/cg/cg_src -type XDP -policy Sync
-cg-item-mappings /vol/srcvol/lun1:@/vol/dstvol/lun1,
/vol/srcvol/lun2:@/vol/dstvol/lun2
```

Under PVR control to reestablish mirroring to the destination Consistency Group *cg_dst* in Vserver *vs2.example.com* that has been previously broken off with the [snapmirror break](#) command, type the following command:

```
vs2.example.com:> snapmirror resync -destination-path
vs2.example.com:/cg/cg_dst
```

snapmirror set-options

Display/Set SnapMirror options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `snapmirror set-options` command can be used to display or set snapmirror options.

Parameters

`[-dp-source-xfer-reserve-pct {0/25%/50%/75%/100%}] - Percentage Reserved for DP Source Transfers`

Specifies the percentage of maximum allowed concurrent transfers reserved for source DP transfers

`[-xdp-source-xfer-reserve-pct {0/25%/50%/75%/100%}] - Percentage Reserved for XDP Source Transfers`

Specifies the percentage of maximum allowed concurrent transfers reserved for source XDP transfers

`[-dp-destination-xfer-reserve-pct {0/25%/50%/75%/100%}] - Percentage Reserved for DP Destination Transfers`

Specifies the percentage of maximum allowed concurrent transfers reserved for destination DP transfers

`[-xdp-destination-xfer-reserve-pct {0/25%/50%/75%/100%}] - Percentage Reserved for XDP Destination Transfers`

Specifies the percentage of maximum allowed concurrent transfers reserved for destination XDP transfers

Examples

The following example displays SnapMirror options:

```
cluster1::> snapmirror set-options
  Percentage Reserved for DP Source Transfers: 0
  Percentage Reserved for XDP Source Transfers: 0
  Percentage Reserved for DP Destination Transfers: 0
  Percentage Reserved for XDP Destination Transfers: 0

cluster1::> snapmirror set-options -dp-source-xfer-reserve-pct 25
  -xdp-source-xfer-reserve-pct 50 -dp-destination-xfer
  reserve-pct 0 -xdp-destination-xfer-reserve-pct 50

cluster1::> snapmirror set-options
  Percentage Reserved for DP Source Transfers: 25
  Percentage Reserved for XDP Source Transfers: 50
  Percentage Reserved for DP Destination Transfers: 0
  Percentage Reserved for XDP Destination Transfers: 50
```

snapmirror show

Display a list of SnapMirror relationships

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror show` command displays information associated with SnapMirror relationships. By default, the command displays the following information:

- Source path
- Relationship Type
- Destination Path
- Mirror State
- Relationship Status
- Total Progress
- Healthy
- Progress Last Updated

For backward compatibility with clustered Data ONTAP 8.1, and to accommodate load-sharing relationships which are only supported in a Data ONTAP 8.1 compatible way, SnapMirror relationships, which match one of the following conditions are managed as on clustered Data ONTAP 8.1: (1) The relationship is of type load-sharing; (2) The source endpoint of the relationship is on a remote Data ONTAP 8.1 cluster; (3) The local cluster was upgraded from clustered Data ONTAP 8.1, the relationship was created before the upgrade, and the relationship has not yet been converted to one with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on clustered Data ONTAP 8.1. Especially, they support the same set of information fields. The "*Relationship Capability*" field is set to "*Pre 8.2*" for these relationships.

The `snapmirror show` command displays information for SnapMirror relationships whose destination endpoints are in the current Vserver if you are in a Vserver context, or in the current cluster if you are in a cluster context, or on a non-Data ONTAP endpoint that supports SnapMirror (for example, AltaVault). For backward compatibility with clustered Data ONTAP 8.1, the command also displays information for SnapMirror relationships with the "*Relationship Capability*" of "*Pre 8.2*", and whose source endpoints are in the current Vserver or cluster, and destination endpoints are in different Vservers or clusters. You must use the `snapmirror list-destinations` command to display information for SnapMirror relationships whose source endpoints are in the current Vserver or current cluster.

Some of the SnapMirror relationship information is cached. The `snapmirror show` command only returns the cached information, therefore there is a delay after the information is changed before it is reflected in the `snapmirror show` output. Other information, such as progress metrics during a transfer, is only updated periodically and can be very delayed in the `snapmirror show` output.

The **-instance** and **-fields** parameters are mutually exclusive and select the information fields that are displayed. The other parameters to the `snapmirror show` command select the SnapMirror relationships for which information is displayed. The **-instance** displays detailed information fields including:

```

Source Path: Path of the source endpoint.
Destination Path: Path of the destination endpoint.
Relationship Type: Type of the SnapMirror relationship. Can be
one of the following:
- DP: Data protection relationship.
- LS: Load-sharing relationship.
- XDP: Extended data protection
relationship.
- RST: Temporary relationship created
during a restore operation, and
deleted if the operation completes
successfully.
```

Relationship Group Type: For FlexVol relationships, specifies the type of the group relationship that includes

- TDP: 7-mode to clustered Data ONTAP transition data protection relationship.
- this FlexVol. For group relationships, specifies the type of the group relationship. Can be one of the following:
 - none: No group relationship.
 - vserver: Vserver relationship.
 - flexgroup: FlexGroup relationship.

Relationship Status: Status of the SnapMirror relationship. Can be one of the following:

- Idle: No transfer operation is in progress and future transfers are not disabled.
- Queued: A transfer operation has been accepted and queued in the system, and future transfers are not disabled.
- Transferring: A transfer operation is in progress and future transfers are not disabled.
- Preparing: Pre-transfer phase for Vault incremental transfers. For Vault relationships only.
- Finalizing: Post-transfer phase for Vault incremental transfers. Network traffic will be low as processing is primarily on the destination volume. For Vault relationships only.
- Aborting: A transfer abort operation that might include the removal of the checkpoint is underway. Future transfers are not disabled. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.
- Quiesced: No transfer operation is in progress and future transfers are disabled.
- Quiescing: A transfer operation is in progress and future transfers are disabled.
- Checking: Destination volume is undergoing a diagnostic check, no transfer is in progress, and future transfers are not disabled. Only for relationships with *"Relationship Capability"* of *"Pre 8.2"*.
- Breaking: The SnapMirror relationship is being broken off and no transfer is in progress.

The following values are only applicable to relationships with policy type *sync-mirror* or *strict-sync-mirror*:

- OutOfSync: The SnapMirror relationship is not InSync and no async transfer

```

relationship is
    operation is in progress.
    - Transitioning: The SnapMirror
      transitioning to InSync.
    - InSync: The SnapMirror relationship is
      InSync.

Mirror State: State of the destination volume. Can be one
of the following:
    - Uninitialized: Destination volume has not
      been initialized.
    - Snapmirrored: Destination volume has been
      initialized and is ready to
      receive SnapMirror updates.
    - Broken-off: Destination volume is RW
      and snapshots are present.
Healthy: Condition of the relationship. Can be one
of the following:
    - true: The SnapMirror relationship is
      healthy. It has not missed a
      scheduled transfer, or experienced
      a manual update failure.
    - false: The SnapMirror relationship is not
      healthy. It has missed a scheduled
      transfer, or has experienced a
      manual update failure.

Unhealthy Reason: Reason the SnapMirror relationship is not
healthy. Only for relationships with
"Relationship Capability"
of "8.2 and above"

Newest Snapshot: Name of the newest Snapshot copy on the
destination volume.

Newest Snapshot Timestamp: Timestamp of the newest Snapshot copy.

Exported Snapshot: Name of the exported Snapshot copy on the
destination volume.

Exported Snapshot Timestamp: Timestamp of the exported Snapshot copy.

Lag Time: Time since the exported Snapshot copy
was created. It is displayed in the
format: hours:minutes:seconds.
Only for relationships with
"Relationship Capability"
of "8.2 and above".

Transfer Type: Type of the current transfer operation.
Can be one of the following:
    - initialize
    - update
    - resync
    - restore
Only for relationships with
"Relationship Capability"
of "8.2 and above".

Transfer Snapshot: Name of the Snapshot copy being
transferred.

Snapshot Progress: Amount of data transferred for the transfer
snapshot. This parameter is not supported
for SnapMirror FlexGroup relationships, but
it is supported for FlexGroup constituent
relationships.

Total Progress: Total amount of data transferred for the
current transfer operation. This parameter
is not supported for SnapMirror FlexGroup
relationships, but it is supported for
FlexGroup constituent relationships.

Network Compression Ratio: The compression ratio achieved for the data
sent over the wire as a part of the current
transfer operation. The ratio is not
maintained across checkpoint restarts. If

```

network compression is disabled for the transfer, the ratio will be set to 1:1. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*. This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

Snapshot Checkpoint: The amount of data transferred as recorded in the restart checkpoint of the current or most recent transfer snapshot. If a restart checkpoint is present the next transfer will continue from the checkpoint. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Transfer Error: Possible transient error condition if any, encountered by the current transfer operation. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Current Throttle: The maximum transfer rate in Kilobytes per second, used for the current transfer between clusters. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Current Transfer Priority: Priority assigned to the current transfer. Possible values are:

- low
- normal

Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer Type: Type of the previous transfer operation:

- initialize
- update
- resync
- restore

Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer Size: Total amount of data transferred during the previous transfer operation if it was successful. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Last Transfer Network Compression Ratio: The compression ratio achieved for the data sent over the wire as a part of the previous transfer operation. If network compression was disabled for the transfer, the ratio will be set to 1:1. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*. This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent

relationships.

Last Transfer Duration: Duration of the previous transfer operation if it was successful. Only for relationships with "Relationship Capability" of "8.2 and above".

Last Transfer From: Source endpoint of the previous transfer operation. Only for relationships with "Relationship Capability" of "8.2 and above".

Last Transfer End Timestamp: Timestamp of the end of the previous transfer operation. Only for relationships with "Relationship Capability" of "8.2 and above".

Last Transfer Error: Cause of the failure of the previous transfer operation. Only for relationships with "Relationship Capability" of "8.2 and above".

Relationship Capability: Management and control compatibility:

- "Pre 8.2": Management and control of the relationship is compatible with clustered Data ONTAP 8.1.
- "8.2 and above": Full support of clustered Data ONTAP 8.2 or later SnapMirror relationship management and control. This parameter is not supported for Vserver SnapMirror relationships.

Relationship ID: The unique identifier of the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Current Operation ID: Operation unique identifier of the currently executing SnapMirror operation. Only for relationships with "Relationship Capability" of "8.2 and above".

Throttle (KB/sec): Configured maximum transfer rate for cross-cluster transfers.

SnapMirror Policy Type: Type of the SnapMirror policy associated with the relationship. Can be one of the following:

- async-mirror
- vault
- mirror-vault

Refer to the man page for the [snapmirror policy create](#) command for a description of what these types mean. Only for relationships with "Relationship Capability" of "8.2 and above".

SnapMirror Policy: Name of the SnapMirror policy associated with the relationship. Only for relationships with "Relationship Capability" of "8.2 and above".

SnapMirror Schedule: Name of the schedule (empty if there is no schedule) associated with the relationship.

Tries Limit: Maximum number of times a transfer will be tried. Only for relationships with

```

"Relationship Capability"
of "Pre 8.2".
This parameter is not supported for Vserver
SnapMirror relationships.
Destination Volume Node: Node which owns the destination volume
of the relationship. For FlexGroup
relationships it is the node which owns
the root constituent destination volume.
Only for relationships with
"Relationship Capability"
of "8.2 and above".
This parameter is not supported for Vserver
SnapMirror relationships.
Identity Preserve Vserver DR: Whether or not the identity of the source
Vserver is replicated to the destination
Vserver. Can be:
- true: Source Vserver's configuration
will
                                additionally be replicated to the
                                destination, along with the
                                Vserver's volumes and RBAC
                                configuration.
- false: Only volumes and RBAC
configuration
                                of the source Vserver is
replicated
                                to the destination.
This parameter is supported only for
Vserver
SnapMirror relationships.
Volume MSIDs Preserved: Whether or not the MSIDs of the source
volumes are retained while creating
destination volumes.
Can be:
- true: MSIDs of source Vserver volumes
and
                                destination Vserver volumes match.
- false: MSIDs of source Vserver volumes
and
                                destination Vserver volumes do
not
                                match.
This parameter is supported only for
Vserver
SnapMirror relationships.
Is Auto Expand Enabled: Whether or not the auto expand is enabled.
Can be:
- true: Auto Expand is enabled.
- false: Auto Expand is disabled.
This parameter is supported only for FlexGroup
SnapMirror relationships.
Is Adaptive Enabled: Whether or not adaptive is enabled.
Can be:
- true: Adaptive is enabled.
- false: Adaptive is disabled.
This parameter is supported only for FlexVol
SnapMirror relationships between Data ONTAP
endpoints.
Number of Successful Updates: The number of successful SnapMirror update
operations for the relationship.
Only for relationships with
"Relationship Capability"
of "8.2 and above".
This parameter is not supported for Vserver
SnapMirror relationships.
Number of Failed Updates: The number of failed SnapMirror update
operations for the relationship.
Only for relationships with
"Relationship Capability"
of "8.2 and above".
This parameter is not supported for Vserver

```

	SnapMirror relationships.
Number of Successful Resyncs:	The number of successful SnapMirror resync operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.
Number of Failed Resyncs:	The number of failed SnapMirror resync operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.
Number of Successful Breaks:	The number of successful SnapMirror break operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.
Number of Failed Breaks:	The number of failed SnapMirror break operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.
Total Transfer Bytes:	Cumulative bytes transferred for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.
Total Transfer Time:	Cumulative total transfer time in seconds for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

{ [-source-path | -S {<[vserver:]<volume>|<[[cluster:]//vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] } - Source Path

Select SnapMirror relationships that have a matching source path name.

| [-source-cluster <cluster name>] - Source Cluster

Select SnapMirror relationships that have a matching source cluster name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

`[-source-vserver <vserver name>] - Source Vserver`

Select SnapMirror relationships that have a matching source Vserver name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

`[-source-volume <volume name>]] - Source Volume`

Select SnapMirror relationships that have a matching source volume name. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

`{ [-destination-path {<[vserver:][volume]>/<[[cluster:]]//vserver/]volume>/<hostip:/lun/name>/<hostip:/share/share-name>}] - Destination Path`

Select SnapMirror relationships that have a matching destination path name.

Note: Using wildcards with this parameter:

- To match all Vserver Snapmirror relationships, use: **`-destination-path *`**;
- To match all the Snapmirror relationships except Vserver Snapmirror relationships in the cluster, use: **`-destination-path *`**

`[-destination-cluster <Cluster name>] - Destination Cluster`

Select SnapMirror relationships that have a matching destination cluster name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

`[-destination-vserver <vserver name>] - Destination Vserver`

Select SnapMirror relationships that have a matching destination Vserver name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

`[-destination-volume <volume name>]] - Destination Volume`

Select SnapMirror relationships that have a matching destination volume name. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

`[-type <snapmirrorType>] - Relationship Type`

Select SnapMirror relationships that have a matching relationship type. Vservers support only DP SnapMirror relationships. Possible values are:

- DP
- LS
- XDP
- TDP
- RST

`[-relationship-group-type {none/vserver/consistencygroup/flexgroup}] - Relationship Group Type`

Select SnapMirror relationships that have a matching relationship group type. Possible values are:

- none
- vserver

- flexgroup

[*-vserver* <*vserver name*>] - Managing Vserver

Select SnapMirror relationships that have a matching managing Vserver name. The *-vserver* option is currently a reserved option.

[*-schedule* <*text*>] - SnapMirror Schedule

Select SnapMirror relationships that have a matching schedule.

[*-policy-type* {*vault/async-mirror/mirror-vault/strict-sync-mirror/sync-mirror*}] - SnapMirror Policy Type

Selects SnapMirror relationships that have a matching SnapMirror policy type. Possible values are:

- *async-mirror*
- *vault*
- *mirror-vault*

[*-policy* <*sm_policy*>] - SnapMirror Policy

Select SnapMirror relationships that have a matching SnapMirror policy.

[*-tries* <*unsigned32_or_unlimited*>] - Tries Limit

Select SnapMirror relationships that have a matching tries limit.

[*-throttle* | *-k* <*throttleType*>] - Throttle (KB/sec)

Select SnapMirror relationships that have a matching throttle.

[*-current-throttle* <*throttleType*>] - Current Transfer Throttle (KB/sec)

Select SnapMirror relationships that have a matching current throttle.

[*-state* <*mirror state*>] - Mirror State

Select SnapMirror relationships that have a matching mirror state. Possible values are:

- Uninitialized
- Snapmirrored
- Broken-off

[*-status* <*mirror status*>] - Relationship Status

Select SnapMirror relationships that have a matching relationship status. Possible values are:

- Idle
- Queued
- Transferring
- Preparing
- Finalizing
- Aborting
- Quiesced
- Quiescing
- Checking

Status values Finalizing, Checking, Waiting and Preparing are not supported for Vserver SnapMirror relationships.

`[-file-restore-file-count <integer>] - File Restore File Count`

The number of files being restored by file restore.

`[-file-restore-file-list <text>, ...] - File Restore File List`

List of the destination file names of the files being restored by file restore.

`[-transfer-snapshot <text>] - Transfer Snapshot`

Select SnapMirror relationships that have a matching transfer Snapshot copy.

`[-snapshot-progress {<integer>[KB/MB/GB/TB/PB]}] - Snapshot Progress`

Select SnapMirror relationships that have a matching Snapshot progress.

`[-total-progress {<integer>[KB/MB/GB/TB/PB]}] - Total Progress`

Select SnapMirror relationships that have a matching total progress.

`[-network-compression-ratio <text>] - Network Compression Ratio`

Select SnapMirror relationships that have a matching network compression ratio.
This parameter is not supported for Vserver SnapMirror relationships.

`[-snapshot-checkpoint {<integer>[KB/MB/GB/TB/PB]}] - Snapshot Checkpoint`

Select SnapMirror relationships that have a matching Snapshot copy checkpoint.
This parameter is not supported for Vserver SnapMirror relationships.

`[-newest-snapshot <text>] - Newest Snapshot`

Select SnapMirror relationships that have a matching newest Snapshot copy.

`[-newest-snapshot-timestamp <MM/DD HH:MM:SS>] - Newest Snapshot Timestamp`

Select SnapMirror relationships that have a matching newest Snapshot copy timestamp.

`[-exported-snapshot <text>] - Exported Snapshot`

Select SnapMirror relationships that have a matching exported Snapshot copy name. For load-sharing mirror relationships, if the exported-snapshot field for a relationship has a dash (-), the load-sharing mirror is lagging behind the up-to-date mirrors in the set.

`[-exported-snapshot-timestamp <MM/DD HH:MM:SS>] - Exported Snapshot Timestamp`

Select SnapMirror relationships that have a matching exported Snapshot copy timestamp.

`[-healthy {true/false}] - Healthy`

Select SnapMirror relationships that have a matching healthy condition.

`[-relationship-id <UUID>] - Relationship ID`

Select SnapMirror relationships that have a matching relationship ID. This parameter is not supported for Vserver SnapMirror relationships.

`[-current-operation-id <UUID>] - Current Operation ID`

Select SnapMirror relationships that have a matching operation unique identifier of the currently executing SnapMirror operation.

`[-current-transfer-type {initialize/update/resync/restore/check/file_restore/cggrs_initialize/cggrs_resync/cg_update/cg_initialize/cg_resync/cg_restore/catalog_metadata}] - Transfer Type`

Select SnapMirror relationships that have a matching current transfer type.

[-current-transfer-error <text>] - Transfer Error

Select SnapMirror relationships that have a matching current transfer error.

[-last-transfer-type {*initialize/update/resync/restore/check/file_restore/cggrs_initialize/cggrs_resync/cg_update/cg_initialize/cg_resync/cg_restore/catalog_metadata*}] - Last Transfer Type

Select SnapMirror relationships that have a matching last transfer type.

[-last-transfer-error <text>] - Last Transfer Error

Select SnapMirror relationships that have a matching last transfer error.

[-last-transfer-size {<integer>[KB/MB/GB/TB/PB]}] - Last Transfer Size

Select SnapMirror relationships that have a matching last transfer size.

[-last-transfer-network-compression-ratio <text>] - Last Transfer Network Compression Ratio

Select SnapMirror relationships that have a matching last transfer network compression ratio. This parameter is not supported for Vserver SnapMirror relationships.

[-last-transfer-duration <[[<hours>:]<minutes>:]<seconds>>] - Last Transfer Duration

Select SnapMirror relationships that have a matching last transfer duration.

[-last-transfer-from <text>] - Last Transfer From

Select SnapMirror relationships that have a matching last transfer source.

[-last-transfer-end-timestamp <MM/DD HH:MM:SS>] - Last Transfer End Timestamp

Select SnapMirror relationships that have a matching last transfer end timestamp.

[-unhealthy-reason <text>] - Unhealthy Reason

Select SnapMirror relationships that have a matching unhealthy reason.

[-progress-last-updated <MM/DD HH:MM:SS>] - Progress Last Updated

Select SnapMirror relationships that have a matching progress last updated.

[-relationship-capability <text>] - Relationship Capability

Select SnapMirror relationships that have a matching relationship capability. This parameter is not supported for Vserver SnapMirror relationships.

[-lag-time <[[<hours>:]<minutes>:]<seconds>>] - Lag Time

Select SnapMirror relationships that have a matching lag time.

[-current-transfer-priority {*low/normal*}] - Current Transfer Priority

Select SnapMirror relationships that have a matching current transfer priority.

[-is-smtape-op {*true/false*}] - SMTape Operation

Select SnapMirror relationships that have a matching smtape operation.

[-destination-volume-node <nodename>] - Destination Volume Node Name

Select SnapMirror relationships that have a matching destination volume node name. This parameter is not supported for Vserver SnapMirror relationships.

[-identity-preserve {*true/false*}] - Identity Preserve Vserver DR

Select SnapMirror relationships that have a matching value for identity-preserve. This parameter is valid only for Vserver SnapMirror relationships.

[-expand [*true*]] - Show Constituents of the Group

Specifies whether to display constituent relationships of Vserver and FlexGroup SnapMirror relationships. By default, the constituents are not displayed.

`[-update-successful-count <integer>]` - Number of Successful Updates

Select SnapMirror relationships that have a matching number of successful updates.
This parameter is not supported for Vserver SnapMirror relationships.

`[-update-failed-count <integer>]` - Number of Failed Updates

Select SnapMirror relationships that have a matching number of failed updates.
This parameter is not supported for Vserver SnapMirror relationships.

`[-resync-successful-count <integer>]` - Number of Successful Resyncs

Select SnapMirror relationships that have a matching number of successful resyncs.
This parameter is not supported for Vserver SnapMirror relationships.

`[-resync-failed-count <integer>]` - Number of Failed Resyncs

Select SnapMirror relationships that have a matching number of failed resyncs.
This parameter is not supported for Vserver SnapMirror relationships.

`[-break-successful-count <integer>]` - Number of Successful Breaks

Select SnapMirror relationships that have a matching number of successful breaks.
This parameter is not supported for Vserver SnapMirror relationships.

`[-break-failed-count <integer>]` - Number of Failed Breaks

Select SnapMirror relationships that have a matching number of failed breaks. This parameter is not supported for Vserver SnapMirror relationships.

`[-total-transfer-bytes <integer>]` - Total Transfer Bytes

Select SnapMirror relationships that have a matching total transfer bytes. This parameter is not supported for Vserver SnapMirror relationships.

`[-total-transfer-time-secs <integer>]` - Total Transfer Time in Seconds

Select SnapMirror relationships that have a matching total transfer time in seconds.
This parameter is not supported for Vserver SnapMirror relationships.

`[-msid-preserve {true/false}]` - Source Volume MSIDs Preserved

This parameter specifies whether the volume MSIDs are preserved at the destination. This parameter is applicable only for Vserver SnapMirror relationships.

`[-is-auto-expand-enabled {true/false}]` - Is Auto Expand Enabled

Select SnapMirror relationships that have a matching value for auto expand. This parameter is supported only for FlexGroup SnapMirror relationships. Possible values are:

- true
- false

Examples

The `snapmirror show` command displays information associated with SnapMirror relationships. By default, the command displays the following information:

- Source path
- Relationship Type
- Destination Path
- Mirror State
- Relationship Status
- Total Progress

- Healthy
- Progress Last Updated

For backward compatibility with clustered Data ONTAP 8.1, and to accommodate load-sharing relationships which are only supported in a Data ONTAP 8.1 compatible way, SnapMirror relationships, which match one of the following conditions are managed as on clustered Data ONTAP 8.1: (1) The relationship is of type load-sharing; (2) The source endpoint of the relationship is on a remote Data ONTAP 8.1 cluster; (3) The local cluster was upgraded from clustered Data ONTAP 8.1, the relationship was created before the upgrade, and the relationship has not yet been converted to one with Data ONTAP 8.2 capabilities. These relationships have the same limitations as on clustered Data ONTAP 8.1. Especially, they support the same set of information fields. The *"Relationship Capability"* field is set to *"Pre 8.2"* for these relationships.

The `snapmirror show` command displays information for SnapMirror relationships whose destination endpoints are in the current Vserver if you are in a Vserver context, or in the current cluster if you are in a cluster context, or on a non-Data ONTAP endpoint that supports SnapMirror (for example, AltaVault). For backward compatibility with clustered Data ONTAP 8.1, the command also displays information for SnapMirror relationships with the *"Relationship Capability"* of *"Pre 8.2"*, and whose source endpoints are in the current Vserver or cluster, and destination endpoints are in different Vservers or clusters. You must use the `snapmirror list-destinations` command to display information for SnapMirror relationships whose source endpoints are in the current Vserver or current cluster.

Some of the SnapMirror relationship information is cached. The `snapmirror show` command only returns the cached information, therefore there is a delay after the information is changed before it is reflected in the `snapmirror show` output. Other information, such as progress metrics during a transfer, is only updated periodically and can be very delayed in the `snapmirror show` output.

The **-instance** and **-fields** parameters are mutually exclusive and select the information fields that are displayed. The other parameters to the `snapmirror show` command select the SnapMirror relationships for which information is displayed. The **-instance** displays detailed information fields including:

```

Source Path: Path of the source endpoint.
Destination Path: Path of the destination endpoint.
Relationship Type: Type of the SnapMirror relationship. Can be
                  one of the following:
                  - DP: Data protection relationship.
                  - LS: Load-sharing relationship.
                  - XDP: Extended data protection relationship.
                  - RST: Temporary relationship created
                        during a restore operation, and
                        deleted if the operation completes
                        successfully.
                  - TDP: 7-mode to clustered Data ONTAP
                        transition data protection
                        relationship.
Relationship Group Type: For FlexVol relationships, specifies the
                        type of the group relationship that includes
                        this FlexVol. For group relationships,
                        specifies the type of the group
                        relationship. Can be one of the following:
                        - none: No group relationship.
                        - vservers: Vserver relationship.
                        - flexgroup: FlexGroup relationship.

```

```

Under PVR control the following group type
is available:
- consistencygroup: Consistency Group
                    relationship.

```

There are no Flexvol relationships with group type of consistencygroup, only Consistency Group relationships and item-level relationships.

Only for relationships with "Relationship Capability" of "8.2 and above".

Relationship Status: Status of the SnapMirror relationship. Can be one of the following:

- Idle: No transfer operation is in progress and future transfers are not disabled.
- Queued: A transfer operation has been accepted and queued in the system, and future transfers are not disabled.
- Transferring: A transfer operation is in progress and future transfers are not disabled.
- Preparing: Pre-transfer phase for Vault incremental transfers. For Vault relationships only.
- Finalizing: Post-transfer phase for Vault incremental transfers. Network traffic will be low as processing is primarily on the destination volume. For Vault relationships only.
- Aborting: A transfer abort operation that might include the removal of the checkpoint is underway. Future transfers are not disabled. Only for relationships with "Relationship Capability" of "8.2 and above".
- Quiesced: No transfer operation is in progress and future transfers are disabled.
- Quiescing: A transfer operation is in progress and future transfers are disabled.
- Checking: Destination volume is undergoing a diagnostic check, no transfer is in progress, and future transfers are not disabled. Only for relationships with "Relationship Capability" of "Pre 8.2".
- Breaking: The SnapMirror relationship is being broken off and no transfer is in progress.

The following values are only applicable to relationships with policy type *sync-mirror* or *strict-sync-mirror*:

- OutOfSync: The SnapMirror relationship is not InSync and no async transfer operation is in progress.
- Transitioning: The SnapMirror relationship is transitioning to InSync.
- InSync: The SnapMirror relationship is InSync.

The following values are only applicable to relationships with policy type *smgr-mirror* under PVR control:

- PreCutover: The SnapMirror relationship is

- setting up for the last transfer prior Cutover to InSync.
- Cutover: The SnapMirror relationship is transitioning to InSync.

Mirror State: State of the destination volume. Can be one of the following:

- Uninitialized: Destination volume has not been initialized.
- Snapmirrored: Destination volume has been initialized and is ready to receive SnapMirror updates.
- Broken-off: Destination volume is RW and snapshots are present.

Healthy: Condition of the relationship. Can be one of the following:

- true: The SnapMirror relationship is healthy. It has not missed a scheduled transfer, or experienced a manual update failure.
- false: The SnapMirror relationship is not healthy. It has missed a scheduled transfer, or has experienced a manual update failure.

Unhealthy Reason: Reason the SnapMirror relationship is not healthy. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*

Newest Snapshot: Name of the newest Snapshot copy on the destination volume.

Newest Snapshot Timestamp: Timestamp of the newest Snapshot copy.

Exported Snapshot: Name of the exported Snapshot copy on the destination volume.

Exported Snapshot Timestamp: Timestamp of the exported Snapshot copy.

Lag Time: Time since the exported Snapshot copy was created. It is displayed in the format: hours:minutes:seconds. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Transfer Type: Type of the current transfer operation. Can be one of the following:

- initialize
- update
- resync
- restore

Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Transfer Snapshot: Name of the Snapshot copy being transferred.

Snapshot Progress: Amount of data transferred for the transfer snapshot. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Total Progress: Total amount of data transferred for the current transfer operation. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Network Compression Ratio: The compression ratio achieved for the data sent over the wire as a part of the current transfer operation. The ratio is not maintained across checkpoint restarts. If network compression is disabled for the transfer, the ratio will be set to 1:1. Only for relationships with *"Relationship Capability"* of *"8.2 and above"*. This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

Snapshot Checkpoint: The amount of data transferred as recorded in the restart checkpoint of the current or most recent transfer snapshot. If a restart checkpoint is present the next transfer will

continue from the checkpoint. This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Transfer Error: Possible transient error condition if any, encountered by the current transfer operation.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Current Throttle: The maximum transfer rate in Kilobytes per second, used for the current transfer between clusters.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Current Transfer Priority: Priority assigned to the current transfer. Possible values are:
- low
- normal
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer Type: Type of the previous transfer operation:
- initialize
- update
- resync
- restore
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer Size: Total amount of data transferred during the previous transfer operation if it was successful.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.
This parameter is not supported for SnapMirror FlexGroup relationships, but it is supported for FlexGroup constituent relationships.

Last Transfer Network Compression Ratio: The compression ratio achieved for the data sent over the wire as a part of the previous transfer operation. If network compression was disabled for the transfer, the ratio will be set to 1:1.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.
This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

Last Transfer Duration: Duration of the previous transfer operation if it was successful.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer From: Source endpoint of the previous transfer operation.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer End Timestamp: Timestamp of the end of the previous transfer operation.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Last Transfer Error: Cause of the failure of the previous transfer operation.
Only for relationships with *"Relationship Capability"* of *"8.2 and above"*.

Relationship Capability: Management and control compatibility:
- "Pre 8.2": Management and control of the relationship is compatible with clustered Data ONTAP 8.1.
- "8.2 and above": Full support of clustered

	Data ONTAP 8.2 or later SnapMirror relationship management and control. This parameter is not supported for Vserver SnapMirror relationships.
Relationship ID:	The unique identifier of the relationship. Only for relationships with <i>"Relationship Capability"</i> of <i>"8.2 and above"</i> . This parameter is not supported for Vserver SnapMirror relationships.
Current Operation ID:	Operation unique identifier of the currently executing SnapMirror operation. Only for relationships with <i>"Relationship Capability"</i> of <i>"8.2 and above"</i> .
Throttle (KB/sec):	Configured maximum transfer rate for cross-cluster transfers.
SnapMirror Policy Type:	Type of the SnapMirror policy associated with the relationship. Can be one of the following: <ul style="list-style-type: none"> - async-mirror - vault - mirror-vault

	Under PVR control the following type is available: <ul style="list-style-type: none"> - sync-mirror
--	--

	Refer to the man page for the snapmirror policy create command for a description of what these types mean. Only for relationships with <i>"Relationship Capability"</i> of <i>"8.2 and above"</i> .
SnapMirror Policy:	Name of the SnapMirror policy associated with the relationship. Only for relationships with <i>"Relationship Capability"</i> of <i>"8.2 and above"</i> .
SnapMirror Schedule:	Name of the schedule (empty if there is no schedule) associated with the relationship.
Tries Limit:	Maximum number of times a transfer will be tried. Only for relationships with <i>"Relationship Capability"</i> of <i>"Pre 8.2"</i> . This parameter is not supported for Vserver SnapMirror relationships.
Destination Volume Node:	Node which owns the destination volume of the relationship. For FlexGroup relationships it is the node which owns the root constituent destination volume. Only for relationships with <i>"Relationship Capability"</i> of <i>"8.2 and above"</i> . This parameter is not supported for Vserver SnapMirror relationships.
Identity Preserve Vserver DR:	Whether or not the identity of the source Vserver is replicated to the destination Vserver. Can be: <ul style="list-style-type: none"> - true: Source Vserver's configuration will additionally be replicated to the destination, along with the Vserver's volumes and RBAC configuration. - false: Only volumes and RBAC configuration of the source Vserver is replicated to the destination. This parameter is supported only for Vserver SnapMirror relationships.
Volume MSIDs Preserved:	Whether or not the MSIDs of the source volumes are retained while creating destination volumes.

Can be:

- true: MSIDs of source Vserver volumes and destination Vserver volumes match.
- false: MSIDs of source Vserver volumes and destination Vserver volumes do not match.

This parameter is supported only for Vserver SnapMirror relationships.

Is Auto Expand Enabled: Whether or not the auto expand is enabled.

Can be:

- true: Auto Expand is enabled.
- false: Auto Expand is disabled.

This parameter is supported only for FlexGroup SnapMirror relationships.

Is Adaptive Enabled: Whether or not adaptive is enabled.

Can be:

- true: Adaptive is enabled.
- false: Adaptive is disabled.

This parameter is supported only for FlexVol SnapMirror relationships between Data ONTAP endpoints.

Number of Successful Updates: The number of successful SnapMirror update operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Updates: The number of failed SnapMirror update operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Number of Successful Resyncs: The number of successful SnapMirror resync operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Resyncs: The number of failed SnapMirror resync operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Number of Successful Breaks: The number of successful SnapMirror break operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Number of Failed Breaks: The number of failed SnapMirror break operations for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Total Transfer Bytes: Cumulative bytes transferred for the relationship. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver or FlexGroup SnapMirror relationships, but it is supported for FlexGroup constituent relationships.

Total Transfer Time: Cumulative total transfer time in seconds for the relationship. Only for relationships with "Relationship Capability"

of "8.2 and above".
This parameter is not supported for Vserver
SnapMirror relationships.

The following fields are available only under PVR control for relationships with policy type *sync-mirror*.

Number of Successful PCS: The number of successful Pseudo Common Snapshot copy creation operations for the relationship. Pseudo Common Snapshot copies are created periodically for use by SnapMirror so that there is always a comparatively recent common Snapshot copy that can be used to get a relationship with policy type *sync-mirror* back InSync quickly.

Number of Failed PCS: The number of failed Pseudo Common Snapshot copy creation operations for the relationship.

Average Time of Resync Operations: Average duration in seconds of resync operations on relationships with policy type *sync-mirror*.

The following fields are available only at the diagnostic privilege level:

Last Transfer Error Codes: Set of Data ONTAP internal error codes providing information on the context of the previous transfer failure. Only for relationships with "Relationship Capability" of "8.2 and above". This parameter is not supported for Vserver SnapMirror relationships.

Source Vserver UUID: The unique identifier of the source Vserver. Only for relationships with "Relationship Capability" of "8.2 and above".

Destination Vserver UUID: The unique identifier of the destination Vserver. Only for relationships with "Relationship Capability" of "8.2 and above".

Source Endpoint UUID: The unique identifier of the non-Data ONTAP source endpoint of a relationship. Only for relationships with a non-Data ONTAP source endpoint.

Destination Endpoint UUID: The unique identifier of the non-Data ONTAP destination endpoint of a relationship. Only for relationships with a non-Data ONTAP destination endpoint.

The example below displays summary information for all SnapMirror relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show
Source      Destination  Mirror  Relationship  Total  Last
Path        Type  Path      State   Status   Progress Healthy Updated
-----

snapmirror show-history

Displays history of SnapMirror operations.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror show-history` command displays the history of SnapMirror operations. This command is not supported for relationships with non-Data ONTAP endpoints.

By default, the command displays the following information:

- Destination Path
- Source Path
- Operation
- Start Time

- End Time
- Result

The `snapmirror show-history` command displays - in reverse chronological order - the history of completed SnapMirror operations whose destination endpoints are in the current Vserver for Vserver administrators, or the current cluster for cluster administrators. This command does not return information on the following operations and relationships:

- Operations that happened prior to installing Data ONTAP 8.3.
- Relationships with the "*Relationship Capability*" field, as shown in the output of the `SnapMirror show` command, set to "*Pre 8.2*".
- Operations on FlexGroup relationships that happened prior to installing Data ONTAP 9.5.
- Operations on FlexGroup constituent relationships.

The `-instance` parameter displays the following detailed information:

```

Destination Path: Path of the destination endpoint.
Source Path: Path of the source endpoint.
Relationship ID: The unique identifier of the relationship.
                  This parameter is not supported for
                  Vserver SnapMirror relationships.
Relationship Group Type: For FlexVol relationships, specifies the
                        type of the group relationship that
                        includes this FlexVol. For group
                        relationships, specifies the type of the
                        group relationship. Can be one of the
                        following:
                        - none: No group relationship.
                        - vservers: Vserver relationship.
                        - flexgroup: FlexGroup relationship.
Operation: Type of the operation.
            Can be one of the following:
            - create
            - modify
            - quiesce
            - resume
            - delete
            - initialize
            - manual update
            - scheduled update
            - break
            - resync
            - abort
            - restore
Operation ID: The unique identifier of the operation.
Start Time: Timestamp of the start of the operation.
End Time: Timestamp of the end of the operation.
Result: Result of the SnapMirror operation.
        Can be one of the following:
        - success
        - failure
Transfer Size: Total amount of data transferred during
the
Additional Information: A message describing the cause of the
                        failure or additional information about a
                        successful operation, such as if a
checkpoint
                        was cleared as part of an abort operation.
```

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

{ [-destination-path {<[vserver:][volume]>/<[[cluster:]]//vserver/]volume>/<hostip:/lun/name>/<hostip:/share/share-name>}] -

Destination Path

Select SnapMirror operations that have a matching destination path name.

| [-destination-vserver <vserver name>] - Destination Vserver

Select SnapMirror operations that have a matching destination Vserver name.

[-destination-volume <volume name>]} - Destination Volume

Select SnapMirror operations that have a matching destination volume name.

[-operation-id <UUID>] - Operation ID

Select SnapMirror operations that have a matching operation ID.

[-source-path {<[vserver:][volume]>/<[[cluster:]]//vserver/]volume>/<hostip:/lun/name>/<hostip:/share/share-name>}] - Source Path

Select SnapMirror operations that have a matching source path name.

[-source-vserver <vserver name>] - Source Vserver

Select SnapMirror operations that have a matching source Vserver name.

[-source-volume <volume name>] - Source Volume

Select SnapMirror operations that have a matching source volume name.

[-operation-type {create/modify/quiesce/resume/delete/initialize/manual-update/scheduled-update/break/resync/abort/restore}] - Operation

Type

Select SnapMirror operations that have a matching operation type. Possible values are:

- create
- modify
- quiesce
- resume
- delete
- initialize
- manual-update
- scheduled-update
- break
- resync
- abort
- restore

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

Select SnapMirror operations that have a matching start time.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time

Select SnapMirror operations that have a matching end time.

[-relationship-id <UUID>] - Relationship ID

Select SnapMirror operations that have a matching relationship ID.

[-relationship-group-type {none/vserver/consistencygroup/flexgroup}] - Relationship Group Type

Select SnapMirror relationships that have a matching relationship group type.

Possible values are:

- none
- vservers
- flexgroup

[-result {success/failure}] - Result of the Operation

Select SnapMirror operations that have a matching result. Possible values are:

- success
- failure

[-transfer-size {<integer>[KB/MB/GB/TB/PB]}] - Transfer Size

Select SnapMirror operations that have a matching transfer size.

[-additional-info <text>] - Additional Information

Select SnapMirror operations that have matching additional information.

[-max-rows-per-relationship <integer>] - Maximum Number of Rows per Relationship

Select a matching number of SnapMirror operations per relationship.

[-expand [true]] - Show Constituents of the Group.

Select SnapMirror operations on relationships that are constituents and non-constituents of a group.

Examples

The example below displays summary information for all SnapMirror operations on relationships with destination endpoints in the current cluster:

```
cluster2::> snapmirror show-history

snapmirror update

Start an incremental transfer

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror update` command updates the destination volume or non-Data ONTAP endpoint of a SnapMirror relationship. The `snapmirror update` command behaves differently for data protection (DP), extended data protection (XDP) and load-sharing (LS) relationships. Refer to the **-type** parameter of the `snapmirror create` command to understand different types of relationships supported by SnapMirror.

The `snapmirror update` command performs an incremental transfer.

Before using this command, the relationship must be initialized using the `snapmirror initialize` or `snapmirror initialize-ls-set` commands.

For data protection SnapMirror relationships with volumes as endpoints, the `snapmirror update` command makes the destination volume an up-to-date mirror of the source volume with the following steps:

- If the source volume is read-write, takes a Snapshot copy on the source volume to capture the current image of the source volume
- Finds the most recent Snapshot copy on the destination volume and validates that the corresponding Snapshot copy is still present on the source
- Incrementally transfers Snapshot copies that are newer than the corresponding Snapshot copy to the destination volume

You can use the `snapmirror update` command to update a specific load-sharing mirror that lags behind up-to-date destination volumes in the set of load-sharing mirrors. An update to the lagging load-sharing mirror should bring it up to date with the other up-to-date destination volumes in the set of load-sharing mirrors.

Note: Using the `snapmirror update` command to update a set of load-sharing mirrors will not work. Use the `snapmirror update-ls-set` command to update a set of load-sharing mirrors.

For extended data protection (XDP) relationships with a *snapmirror policy* of type *async-mirror*, a `snapmirror update` always creates a new Snapshot copy on the source volume. Depending on the rules in the policy, the command might transfer just the newly created Snapshot copy or all Snapshot copies that are newer than the common Snapshot copy including the newly created Snapshot copy to the destination volume.

For extended data protection (XDP) relationships with a *snapmirror policy* of type *vault*, a `snapmirror update` does not create a new Snapshot copy on the source volume but transfers only selected Snapshot copies that are newer than the common Snapshot copy to the destination volume. (Those older than the common copy can be transferred by using the `-source-snapshot` parameter.) Snapshot copies are selected by matching the value of `-snapmirror-label` of a Snapshot copy with the value of `-snapmirror-label` of one of the rules from the corresponding SnapMirror policy associated with the SnapMirror relationship. All matching Snapshot copies are incrementally transferred to the destination volume.

For extended data protection (XDP) relationships with a *snapmirror policy* of type *mirror-vault*, a `snapmirror update` always creates a new Snapshot copy on the source volume and transfers only selected Snapshot copies that are newer than the common snapshot copy. The newly created Snapshot copy is always selected.

For extended data protection (XDP) relationships with a *snapmirror policy* of type *vault* or *mirror-vault*, the `snapmirror update` command also manages expiration of Snapshot copies on the destination volume. It does so by deleting Snapshot copies that have exceeded the value of `-keep` for the matching rule from the corresponding SnapMirror policy associated with the SnapMirror relationship. Snapshot copies that match the same `-snapmirror-label` will be deleted in oldest-first order.

For relationships with a policy of type *strict-sync-mirror* or *sync-mirror*, this command creates a new common Snapshot copy and designates it as the exported Snapshot copy on the destination volume. It updates the destination read-only view because IO is redirected to the new exported Snapshot copy. Clients could experience a brief latency spike during this process as the primary IO is temporarily fenced. This command is allowed only when the relationship-status is InSync. The command retains two pairs of common Snapshot copies and deletes the older ones.

For data protection relationships, the parameter `-source-snapshot` is optional and only allows for the transfer of Snapshot copies newer than the common Snapshot copy up to the specified `-source-snapshot`.

For extended data protection (XDP) relationships the parameter `-source-snapshot` is optional.

For extended data protection (XDP) relationships with a *snapmirror policy* of type *vault* or *mirror-vault*, the parameter `-source-snapshot` allows transfer of a Snapshot copy that is older than the common Snapshot copy and/or might not be selected for transfer based on policy-based selection of a scheduled update transfer.

For extended data protection (XDP) relationships with a *snapmirror policy* of type *async-mirror*, the `snapmirror update` with parameter `-source-snapshot` does not create a new Snapshot copy on the source volume. Depending on the rules in the policy, the command might transfer just the specified Snapshot copy or Snapshot copies that are newer than the common Snapshot copy upto and including the specified Snapshot copy to the destination volume.

After the `snapmirror update` command successfully completes, the last Snapshot copy transferred is designated as the new exported Snapshot copy on the destination volume. If an update to an extended data protection (XDP) relationship specifies a Snapshot copy using the `-source-snapshot` parameter that is older than the common snapshot, after the `snapmirror update` successfully completes, the exported Snapshot copy on the destination volume will remain unchanged.

If the `snapmirror update` does not finish successfully--for example, due to a network failure or because a *snapmirror abort* command was issued--a restart checkpoint might be recorded on the destination volume. If a restart checkpoint is recorded, the next update restarts and continues the

transfer from the restart checkpoint. For extended data protection (XDP) relationships, the next update will restart and continue the old transfer regardless of whether the Snapshot copy being transferred is a matching Snapshot copy or not.

This command is supported for SnapMirror relationships with the field *"Relationship Capability"* showing as either *"8.2 and above"* or *"Pre 8.2"* in the output of the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"8.2 and above"*, you can track the progress of the operation using the `snapmirror show` command.

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, a job will be spawned to operate on the SnapMirror relationship, and the job id will be shown in the command output. The progress of the job can be tracked using the `job show` and `job history show` commands.

For Vserver SnapMirror relationships, the `snapmirror update` command makes the destination Vserver an up-to-date mirror of the source Vserver.

The `snapmirror update` command must be used from the destination Vserver or cluster.

Parameters

{ [-source-path | -S {<[vserver:][volume]>|<[[cluster:]/vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>}] - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form `hostip:/share/share-name`. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form `hostip:/lun/name`.

[[-source-cluster <Cluster name>] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

[-source-vserver <vserver name>] - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[-source-volume <volume name>] - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

```
{ -destination-path {<[vserver:][volume]>|<[[cluster:]]//
vserver/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} -
```

Destination Path

This parameter specifies the destination endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with AltaVault destinations, the destination endpoint is specified in the form *hostip:/share/share-name*. For relationships with SolidFire destinations, the destination endpoint is specified in the form *hostip:/lun/name*.

[[-destination-cluster <Cluster name>] - Destination Cluster

Specifies the destination cluster of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and **-destination-volume** must also be specified. This parameter is only applicable for relationships with *"Relationship Capability"* of *"Pre 8.2"*. This parameter cannot be specified when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*.

-destination-vserver <vserver name> - Destination Vserver

Specifies the destination Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters **-destination-volume** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

-destination-volume <volume name> - Destination Volume

Specifies the destination volume of the SnapMirror relationship. If this parameter is specified, parameters **-destination-vserver** and for relationships with *"Relationship Capability"* of *"Pre 8.2"*, **-destination-cluster** must also be specified. This parameter is not supported for relationships with non-Data ONTAP destination endpoints.

[-source-snapshot | -s <text>] - Source Snapshot

This optional parameter specifies a Snapshot copy to transfer. The default behavior for a data protection relationship with a read-write source is that Data ONTAP creates a new Snapshot copy and uses it as the basis for determining what data are replicated; with this option, the specified Snapshot copy will be used instead. The default behavior for an extended data protection relationship depends on the relationship's policy type. For a data protection relationship, the specified Snapshot copy must be newer than the latest common Snapshot copy. For an extended data protection relationship, the specified Snapshot copy can be newer or older than the common Snapshot copy. This parameter is not supported for relationships with *"Relationship Capability"* of *"Pre 8.2"*.

[-throttle | -k <throttleType>] - Throttle (KB/sec)

This optional parameter limits the network bandwidth used for the update transfer. It sets the maximum rate (in Kbytes/sec) at which data can be transferred during the operation. If this parameter is not specified, the throttle value configured for the relationship with the *snapmirror create* or *snapmirror modify* command will be used. To fully use the network bandwidth available, set the throttle value to *unlimited* or *0*. The minimum throttle value is four Kbytes/sec, so if you specify a throttle value between 1 and 4, it will be treated as if you specified 4. For

FlexGroup relationships, the throttle value is applied individually to each constituent relationship. The **-throttle** parameter does not affect load-sharing transfers and transfers for other relationships with *"Relationship Capability"* of *"Pre 8.2"* confined to a single cluster.

[-transfer-priority {low/normal}] - Transfer Priority

This optional parameter specifies the priority at which the transfer runs. The default value for this parameter is the value in the SnapMirror policy associated with this relationship. This parameter is not applicable to relationships with a *"Relationship Capability"* of *"Pre 8.2"*.

[-enable-storage-efficiency [true]] - Enable Storage Efficient Transfers

This is an optional parameter. For an extended data protection (XDP) relationship that is currently not storage efficient, set this parameter to true to enable storage efficient transfers. Storage efficient in this context refers to both over the wire efficiency and how the data is written to the destination volume. The transfer fails if storage efficiency cannot be achieved. If the transfer succeeds, future transfers will continue being storage efficient as long as it is still feasible, but will not fail if the transfer is not storage efficient. The default value is false. This parameter is not supported for relationships with non-Data ONTAP endpoints.

[-foreground | -w [true]] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground).

When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with *"Relationship Capability"* of *"Pre 8.2"*.

Examples

To update the mirror relationship between the destination endpoint

vs2.example.com:dept_eng_dp_mirror3 and its source endpoint, type the following command:

```
vs2.example.com::> snapmirror update -destination-path
vs2.example.com:dept_eng_dp_mirror3
```

For relationships with *"Relationship Capability"* of *"Pre 8.2"*, to update the mirror relationship between the destination endpoint *cluster2://vs2.example.com/dept_eng_dp_mirror3* and its source endpoint, type the following command:

```
cluster2::> snapmirror update -destination-path
cluster2://vs2.example.com/dept_eng_dp_mirror3
```

To update the Vserver SnapMirror relationship between destination endpoint *dvs1.example.com:* and its source endpoint, type the following command:

```
cluster2::> snapmirror update -destination-path
dvs1.example.com:
```

snapmirror update-ls-set

Start an incremental load-sharing set transfer

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror update-ls-set` command updates a set of load-sharing mirrors. The command makes destination volumes, in the group of load-sharing mirrors, up-to-date mirrors of the source volume.

The key parameter that identifies the set of load-sharing mirrors is the source volume. SnapMirror transfers are performed from the source volume to each of the up-to-date destination volumes in the set of load-sharing mirrors.

The `snapmirror update-ls-set` command performs an incremental transfer to each of the destination volumes. During an incremental transfer, Data ONTAP takes a Snapshot copy on the source volume to capture the current image of the source volume, finds the most recent common Snapshot copy between the source and destination volumes, and incrementally transfers Snapshot copies that are newer than the common Snapshot copy to the destination volume.

Note: You still need to use the `snapmirror update-ls-set` command to manually update the set of load-sharing mirrors even if the set only has one destination mirror. The [snapmirror update](#) command can only be used to bring up to date a specific destination mirror that is lagging to the set.

After an update using the `snapmirror update-ls-set` command successfully completes, the last Snapshot copy transferred is made the new exported Snapshot copy on the destination volumes.

This command is only supported for SnapMirror relationships with the field *"Relationship Capability"* showing as *"Pre 8.2"* in the output of the [snapmirror show](#) command.

Parameters

{ -source-path | -S {<[vserver:][volume]>|<[[cluster:]/[vserver]/]volume>|<hostip:/lun/name>|<hostip:/share/share-name>} - Source Path

This parameter specifies the source endpoint of the SnapMirror relationship in one of four path formats. The normal format includes the names of the Vserver (vserver) and/or the volume (volume). To support relationships with *"Relationship Capability"* of *"Pre 8.2"*, a format which also includes the name of the cluster (cluster) is provided. The *"Pre 8.2"* format cannot be used when operating in a Vserver context on relationships with *"Relationship Capability"* of *"8.2 and above"*. For SnapMirror relationships with an AltaVault source, the source endpoint is specified in the form *hostip:/share/share-name*. For SnapMirror relationships with a SolidFire source, the source endpoint is specified in the form *hostip:/lun/name*.

[`-source-cluster <cluster name>`] - Source Cluster

Specifies the source cluster of the SnapMirror relationship. If this parameter is specified, the `-source-vserver` and `-source-volume` parameters must also be specified. This parameter is only applicable for relationships with "*Relationship Capability*" of "*Pre 8.2*". This parameter cannot be specified when operating in a Vserver context on relationships with "*Relationship Capability*" of "*8.2 and above*".

`-source-vserver <vserver name>` - Source Vserver

Specifies the source Vserver of the SnapMirror relationship. For relationships with volumes as endpoints, if this parameter is specified, parameters `-source-volume` and for relationships with "*Relationship Capability*" of "*Pre 8.2*", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

`-source-volume <volume name>` - Source Volume

Specifies the source volume of the SnapMirror relationship. If this parameter is specified, parameters `-source-vserver` and for relationships with "*Relationship Capability*" of "*Pre 8.2*", `-source-cluster` must also be specified. This parameter is not supported for relationships with non-Data ONTAP source endpoints.

[`-foreground` | `-w [true]`] - Foreground Process

This specifies whether the operation runs as a foreground process. If this parameter is specified, the default setting is *true* (the operation runs in the foreground). When set to *true*, the command will not return until the process completes. This parameter is only applicable to relationships with "*Relationship Capability*" of "*Pre 8.2*".

Examples

To update the group of load-sharing mirrors for the source endpoint named `//vs1.example.com/dept_eng`, type the following command:

```
cluster1::> snapmirror update-ls-set -source-path //vs1.example.com/dept_eng
```

snapmirror config-replication commands

The config-replication directory

snapmirror config-replication cluster-storage-configuration commands

The cluster-storage-configuration directory

snapmirror config-replication cluster-storage-configuration modify

Modify SnapMirror storage configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snapmirror config-replication cluster-storage-configuration modify` command modifies the configuration of storage used for configuration replication.

Parameters

`[-disallowed-aggregates <aggregate name>, ...]` - Disallowed Aggregates

Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

Examples

The following example disallows two aggregates named `aggr1` and `aggr2`:

```
cluster1::*> snapmirror config-replication cluster-storage-configuration
modify -disallowed-aggregates aggr1,aggr2
```

snapmirror config-replication cluster-storage-configuration show

Display SnapMirror storage configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snapmirror config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- Disallowed Aggregates - The list of storage aggregates that are configured as not allowed to host storage areas.
- Auto-Repair - Displays *true* if the automatic repair of storage areas used by configuration replication is enabled.
- Auto-Recreate - Displays *true* if the automatic recreation of storage volumes used by configuration replication is enabled.
- Use Mirrored Aggregate - Displays *true* if storage areas for configuration replication are to be hosted on a mirrored aggregate.

Examples

The following is an example of the `snapmirror config-replication cluster-storage-configuration show` command:

```
cluster1::*> snapmirror config-replication cluster-storage-configuration show

Disallowed Aggregates: -
    Auto-Repair: true
    Auto-Recreate: true
Use Mirrored Aggregate: true
```

snapmirror config-replication status commands

SnapMirror configuration replication status information

snapmirror config-replication status show

Display SnapMirror configuration replication status information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `snapmirror config-replication status show` command displays the current SnapMirror configuration replication status.

The command displays the following aspects of SnapMirror configuration replication:

- **Enabled:** Verifies that SnapMirror configuration replication is enabled on the cluster.
- **Running:** Verifies that SnapMirror configuration replication is running on the cluster.
- **Storage Status:** Verifies that SnapMirror configuration replication storage is healthy.
- **Storage In Use:** Prints the location of SnapMirror configuration replication storage.
- **Storage Remarks:** Prints the underlying root cause for non-healthy SnapMirror configuration storage.
- **Vserver Streams:** Verifies that SnapMirror configuration replication Vserver streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

[`-instance`]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example shows the execution of the command:

```
clus1::*> snapmirror config-replication status show
      Enabled: true
      Running: true
      Storage Status: ok
      Storage In Use: Cluster-wide Volume:
MDV_CRS_3d47e9106b7d11e4a77b000c29f810a2_A
      Storage Remarks: -
      Vserver Streams: ok
```

snapmirror config-replication status show-aggregate-eligibility

Display the SnapMirror configuration replication aggregate eligibility

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `snapmirror config-replication status show-aggregate-eligibility` command displays the SnapMirror configuration replication aggregate eligibility.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate

Display only rows that have a matching aggregate name.

[-hosted-configuration-replication-volumes <volume name>, ...] - Currently

Hosted Configuration Replication Volumes

Display only rows that have matching configuration replication volumes hosted on this aggregate.

[-is-eligible-to-host-additional-volumes { true/false}] - Eligibility to Host

Another Configuration Replication Volume

Display only rows that have a matching eligibility of the aggregate to host additional configuration replication volumes.

[-comment <text>] - Comment for Eligibility Status

Display only rows that have a matching comment regarding the eligibility of the aggregate to host configuration replication volumes.

Examples

The following example shows the execution of the command in a SnapMirror configuration with thirteen aggregates in the cluster:

```
clusA::snapmirror config-replication status> show-aggregate-eligibility
Aggregate      Hosted Config Replication Vols      Eligible to

snapmirror config-replication status show-communication

Display SnapMirror configuration replication communication status information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `snapmirror config-replication status show-communication` command displays the current SnapMirror configuration replication communication status.

The command displays the following aspects of SnapMirror configuration replication for each peer cluster:

- Remote Heartbeat: Verifies that the SnapMirror configuration replication heartbeat with the remote cluster is healthy.
- Last Heartbeat Sent: Prints the timestamp of the last SnapMirror configuration replication heartbeat sent to the remote cluster.
- Last Heartbeat Received: Prints the timestamp of the last SnapMirror configuration replication heartbeat received from the remote cluster.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster-uuid <UUID>] - Remote Cluster

Display only rows that have a matching peer cluster UUID.

[-cluster <text>] - Peer Cluster Name

Display only rows that have matching peer cluster name.

[-remote-heartbeat {ok/warning/not-run/not-applicable}] - Remote Heartbeat

Display only rows that have a matching remote heartbeat status.

[-last-heartbeat-sent <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Sent Time

Display only rows that have a matching timestamp of the last heartbeat sent.

[`-last-heartbeat-received` <MM/DD/YYYY HH:MM:SS>] - Last Heartbeat Received Time

Display only rows that have a matching timestamp of the last heartbeat received.

[`-heartbeat-recovery-steps` <text>] - Heartbeat Recovery Steps

Display only rows that have matching heartbeat recovery steps.

Examples

The following example shows the execution of the command in a SnapMirror configuration with two peer clusters:

```
clus1::*> snapmirror config-replication status show-communication
  Peer Cluster: clus2
    Remote Heartbeat: ok
    Last Heartbeat Sent: 11/11/2014 11:11:45
    Last Heartbeat Received: 11/11/2014 11:11:46

  Peer Cluster: clus3
    Remote Heartbeat: ok
    Last Heartbeat Sent: 11/11/2014 11:11:26
    Last Heartbeat Received: 11/11/2014 11:11:27

2 entries were displayed.
```

snapmirror object-store commands

The object-store directory

snapmirror object-store profiler commands

The profiler directory

snapmirror object-store profiler abort

Abort Object Store Profiler

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snapmirror object-store profiler abort` command will abort an ongoing object store profiler run. This command requires two parameters - an object store configuration and a node on which the profiler is currently running.

Parameters

-node {<nodename>/local} - Node on Which the Profiler Should Run

This parameter specifies the node on which the object store profiler is running.

-object-store-name <text> - Object Store Configuration Name

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

Examples

The following example aborts the object store profiler :

```
cluster1::>snapmirror object-store profiler abort -object-store-name my-
store -node my-node
```

Related references

[storage aggregate object-store profiler abort](#) on page 1017

snapmirror object-store profiler show

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snapmirror object-store profiler show` command is used to monitor progress and results of the [snapmirror object-store profiler start](#) command.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

[-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name

This parameter specifies the node on which the profiler was started.

[-object-store-name <text>] - ONTAP Name for this Object Store Configuration

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

[-profiler-status <text>] - Profiler Status

Current status of the profiler.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Profiler Start Time

Time at which profiler run started.

[-op-name <text>] - Operation Name - PUT/GET

Name of the operation. Possible values are PUT or GET.

[-op-size {<integer>[KB/MB/GB/TB/PB]}] - Size of Operation

Size of the PUT or GET operation.

[-op-count <integer>] - Number of Operations Performed

Number of operations issued to the object store.

[-op-failed <integer>] - Number of Operations Failed

Number of operations that failed.

[-op-latency-minimum <integer>] - Minimum Latency for Operation in Milliseconds

Minimum latency of the operation in milliseconds, as measured from the filesystem layer.

[-op-latency-maximum <integer>] - Maximum Latency for Operation in Milliseconds

Maximum latency of the operation in milliseconds, as measured from the filesystem layer.

[-op-latency-average <integer>] - Average Latency for Operation in Milliseconds

Average latency of the operation in milliseconds, as measured from the filesystem layer.

[-op-throughput {<integer>[KB/MB/GB/TB/PB]}] - Throughput per Second for the operation

Throughput per second for the operation.

[-op-errors <text>, ...] - Error Reasons and Count

Error reasons and count for failed operation.

[-op-latency-histogram <text>, ...] - Latency Histogram

Latency histogram for the operation.

Examples

The following example displays the results of `snapmirror object-store profiler start`:

```
cluster1::>snapmirror object-store profiler show
```

snapmirror object-store profiler start

Start the object store profiler to measure latency and throughput

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snapmirror object-store profiler start` command writes objects to an object store and reads those objects to measure latency and throughput of an object store. This command requires two parameters - an object store configuration and node from which to send the PUT/GET/DELETE operations. This command verifies whether the object store is accessible through the intercluster LIF of the node on which it runs. The command fails if the object store is not accessible. The command will create a 10GB dataset by doing 2500 PUTs for a maximum time period of 60 seconds. Then it will issue GET operations of different sizes - 4KB, 8KB, 32KB, 256KB for a maximum time period of 180 seconds. Finally it will delete the objects it created. This command can result in additional charges to your object store account. This is a CPU intensive command. It is recommended to run this command when the system is under 50% CPU utilization.

Parameters**-node {<nodename>/local} - Node on Which the Profiler Should Run**

This parameter specifies the node from which PUT/GET/DELETE operations are sent.

-object-store-name <text> - Object Store Configuration Name

This parameter specifies the object store configuration that describes the object store. The object store configuration has information about the object store server name, port, access credentials, and provider type.

Examples

The following example starts the object store profiler :

```
cluster1::>snapmirror object-store profiler start -object-store-name my-
store -node my-node
```

snapmirror policy commands

Manage SnapMirror policies

The `snapmirror policy` command enables you to manage SnapMirror policies.

snapmirror policy add-rule

Add a new rule to SnapMirror policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy add-rule` command adds a rule to a SnapMirror policy. Rules define which Snapshot copies are protected by vault relationships or define the schedule at which Snapshot copies are created on the SnapMirror destination. Rules which do not include a schedule are rules for protecting Snapshot copies. Rules which include a schedule are rules for creating Snapshot copies on the SnapMirror destination. A rule with a schedule can only be added to SnapMirror policies of type *vault* or *mirror-vault*. A rule must not be added to a policy that will be associated with a SnapMirror data protection relationship. A policy that will be associated with a SnapMirror vault relationship must have at least one rule and at most ten rules. A SnapMirror policy with rules must have at least one rule without a schedule.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name

Specifies the SnapMirror policy name.

-snapmirror-label <text> - Snapshot Copy Label

This parameter is primarily used for the purpose of Snapshot copy selection for extended data protection (XDP) relationships. Only Snapshot copies that have a SnapMirror label that matches this parameter will be transferred to the SnapMirror destination. However, when this parameter is associated with a rule containing a schedule, Snapshot copies will be created on the SnapMirror destination using this `snapmirror-label` parameter. The label can be 31 or fewer characters in length. SnapMirror policies of type *async-mirror* and *mirror-vault* have a rule added for label `sm_created` at the time of policy creation. This rule cannot be removed or modified by the user. This rule when coupled with `create-snapshot` field set to `true` indicates that the SnapMirror relationship using this policy shall create a new Snapshot copy and transfer it as part of a [snapmirror update](#) operation. SnapMirror policies of type *async-mirror* support one additional rule with

SnapMirror label *all_source_snapshots*. This rule along with the rule for SnapMirror label *sm_created* indicates that *all* new Snapshot copies on the primary volume along with the newly created Snapshot copy are transferred as a part of a *snapmirror update* or *snapmirror initialize* operation. Rules with any other SnapMirror labels cannot be added to SnapMirror policies of type *async-mirror*. The rule for label *sm_created* when added to a *snapmirror policy* of type *vault* indicates that all SnapMirror created Snapshot copies of the primary volume are selected for transfer.

-keep <text> - Snapshot Copy Retention Count

Specifies the maximum number of Snapshot copies that are retained on the SnapMirror destination volume for a rule. The total number of Snapshot copies retained for all the rules in a policy cannot exceed 1019. For all the rules in SnapMirror policies of type *async-mirror*, this parameter must be set to value *1*.

[-preserve {true/false}] - Snapshot Copy Preserve Enabled

Specifies the behavior when the Snapshot copy retention count is reached on the SnapMirror vault destination for the rule. The default value is *false*, which means that the oldest Snapshot copy will be deleted to make room for new ones only if the number of Snapshot copies has exceeded the retention count specified in the "keep" parameter. When set to *true*, and when the Snapshot copies have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, Snapshot copies will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type *async-mirror* this parameter must be set to value *false*.

[-warn <integer>] - Warning Threshold Count

Specifies the warning threshold count for the rule. The default value is *0*. When set to a value greater than zero, an event is generated after the number of Snapshot copies (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be *true* to set the warn parameter to a value greater than zero.

[-schedule <text>] - Snapshot Copy Creation Schedule

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type *vault* or *mirror-vault*. When this parameter is specified, Snapshot copies are directly created on the SnapMirror destination. The Snapshot copies created will have the same content as the latest Snapshot copy already present on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is *-*.

Note: You define and name a schedule using the *job schedule cron create* command.

[-prefix <text>] - Snapshot Copy Creation Prefix

This optional parameter specifies the prefix for the Snapshot copy name to be created as per the schedule. If no value is specified, then the *snapmirror-label* will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

Examples

The following example adds a rule named *nightly* to the SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com*. The rule will retain a maximum of 5 *nightly* Snapshot copies.

```
vs0.example.com:> snapmirror policy add-rule -vserver vs0.example.com
-policy TieredBackup -snapmirror-label nightly -keep 5
```

The following example adds a rule named *SyncProtectMe* to the SnapMirror policy named *Smgr* on Vserver *vs0.example.com*. The rule will retain the same *SyncProtectMe* snapshots on the destination as are present on the source when the relationship is InSync.

```
vs0.example.com:> snapmirror policy add-rule -vserver vs0.example.com
-policy Smgr -snapmirror-label SyncProtectMe -keep 1
```

snapmirror policy create

Create a new SnapMirror policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy create` command creates a SnapMirror policy. When applied to a SnapMirror relationship, the SnapMirror policy controls the behavior of the relationship and specifies the configuration attributes for that relationship. The policies *DPDefault*, *MirrorAllSnapshots*, *MirrorAndVault*, *MirrorLatest*, *Unified7year* and *XDPEndpoint* are created by the system for asynchronous replication. The policies *Sync* and *StrictSync* are created by the system for synchronous replication.

Note: All SnapMirror policies have a field *create-snapshot*. This field specifies whether SnapMirror creates a new Snapshot copy on the primary volume at the beginning of a [snapmirror update](#) or [snapmirror resync](#) operation. Currently this field cannot be set or modified by the user. It is set to *true* for SnapMirror policies of type *async-mirror* and *mirror-vault* at the time of creation. SnapMirror policies of type *vault* have *create-snapshot* set to *false* at the time of creation.

Note: Use the [snapmirror policy add-rule](#) command to add a rule to a policy.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name

This parameter specifies the SnapMirror policy name. A policy name can be made up of the characters A to Z, a to z, 0 to 9, ".", "-", and "_". The name can be up to 256 characters in length.

[-type {vault/async-mirror/mirror-vault/strict-sync-mirror/sync-mirror}]

- Snapmirror Policy Type

This parameter specifies the SnapMirror policy type. The supported values are *async-mirror*, *vault*, *mirror-vault*, *sync-mirror* and *strict-sync*.

mirror. Data protection (DP) relationships support only *async-mirror* policy type, while extended data protection (XDP) relationships support all policy types.

If the type is set to *async-mirror* then the policy is for Disaster Recovery. When the policy type is associated with extended data protection (XDP) relationships, *snapmirror update* and *snapmirror resync* operations transfer selected Snapshot copies from the primary volume to the secondary volume. The selection of Snapshot copies is governed by the rules in the policy. However *snapmirror initialize* and *snapmirror update* operations on data protection (DP) relationships ignore the rules in the policy and transfer *all* Snapshot copies of the primary volume which are newer than the common Snapshot copy on the destination. For both data protection (DP) and extended data protection (XDP) relationships, the Snapshot copies are kept on the secondary volume as long as they exist on the primary volume. Once a protected Snapshot copy is deleted from the primary volume, it is deleted from the secondary volume as part of the next transfer. The policy type supports rules with certain pre-defined label names only. Refer to the man page for the *snapmirror policy add-rule* command for the details.

If the type is set to *vault* then the policy is used for Backup and Archive. The rules in this policy type determine which Snapshot copies are protected and how long they are retained on the secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to *mirror-vault* then the policy is used for unified data protection which provides both Disaster Recovery and Backup using the same secondary volume. This policy type is supported by extended data protection (XDP) relationships only.

If the type is set to *sync-mirror* or *strict-sync-mirror* then the policy is used for synchronous Disaster Recovery. These are supported only by extended data protection (XDP) relationships between FlexVol volumes. Once the relationship is initialized with *snapmirror initialize*, the relationship will be InSync such that all writes to the primary will be replicated to the secondary before the write is acknowledged to the client. Upon a replication failure, relationship falls OutOfSync. Upon an OutOfSync event, the *strict-sync-mirror* variant restricts further client IO on the primary, whereas the *sync-mirror* variant does not. SnapMirror will automatically trigger resync to bring the OutOfSync relationships back InSync as soon as it can, unless the relationship is *Quiesced* or *Broken-off*. Once a relationship is initialized, you normally use the *snapmirror quiesce* command to stop synchronous replication and the *snapmirror resume* command to resume synchronous replication. These policy types do not support replication of user Snapshot copies.

`[-comment <text>] - Comment`

Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

`[-tries <unsigned32_or_unlimited>] - Tries Limit`

Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or *unlimited*. The default value is 8.

`[-transfer-priority {low/normal}] - Transfer Scheduling Priority`

Specifies the priority at which a transfer runs. The supported values are *normal* or *low*. The *normal* transfers are scheduled before the *low* priority transfers. The default is *normal*.

`[-ignore-atime {true/false}] - Ignore File Access Time`

This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are *true* or *false*. The default is *false*.

`[-restart {always/never/default}] - Restart Behavior`

This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are *always*, *never*, or *default*. If the value is set to *always*, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror Snapshot copy is created which will then be transferred. If the value is set to *never*, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror Snapshot copy will still be created and transferred. Data ONTAP version 8.2 will interpret a value of *default* as being the same as *always*. Vault transfers will always resume based on a restart checkpoint, provided the Snapshot copy still exists on the source volume.

`[-is-network-compression-enabled {true/false}] - Is Network Compression Enabled`

Specifies whether network compression is enabled for transfers. The supported values are *true* or *false*. The default is *false*.

`[-always-replicate-snapshots {true/false}] - This prioritizes replication of app-consistent snapshots over synchronous replication`

If this parameter is set to true, it specifies that SnapMirror Synchronous relationships will lose the zero RPO protection upon failure in replicating application created snapshots. The default value is false.

`[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous (privilege: advanced)`

Specifies the common Snapshot creating schedule. This parameter is only supported for SnapMirror Synchronous relationships.

`[-are-data-ops-sequentially-split {true/false}] - Is Sequential Splitting of Data Operations Enabled?`

This parameter specifies whether I/O, such as write, copy-offload and punch-holes, are split sequentially, rather than being run in parallel on the source and destination. Splitting I/O sequentially will make the system more robust, and less prone to I/O errors. However, it will also make I/O performance slower. The default value for the parameter `-are-data-ops-sequentially-split` is *false*. The parameter `-are-data-ops-sequentially-split` should only be used if too frequent I/O timeout or OutOfSync has happened. The parameter `-are-data-ops-sequentially-split` requires an effective cluster version of Data ONTAP 9.6.0 or later on both the source and destination clusters.

`[-discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR`

Specifies the configuration to be dropped during replication. The supported values are:

- *network* - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type *async-mirror* and applicable only for identity-preserve Vserver SnapMirror relationships.

Examples

The following example creates a SnapMirror policy named *TieredBackup* on a Vserver named *vs0.example.com*.

```
vs0.example.com::> snapmirror policy create -vserver vs0.example.com
-policy TieredBackup -type vault -tries 10 -restart never
```

The following example executed under PVR control creates a SnapMirror policy named *Sync* on a Vserver named *vs0.example.com* with **-always-replicate_snapshots** set to *true* to be used for a relationship between items in Consistency Groups.

```
vs0.example.com::> snapmirror policy create -vserver vs0.example.com
-policy Smgr -type smgr-mirror -always-replicate-snapshots true
```

snapmirror policy delete

Delete a SnapMirror policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy delete` command deletes a SnapMirror policy. A policy that is to be deleted must not be associated with any SnapMirror relationship. The built-in policies cannot be deleted.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name

Specifies the SnapMirror policy name.

Examples

The following example deletes a SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com*:

```
vs0.example.com::> snapmirror policy delete -vserver vs0.example.com
-policy TieredBackup
```

snapmirror policy modify

Modify a SnapMirror policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy modify` command can be used to modify the policy attributes.

Note: Use the `snapmirror policy modify-rule` command to modify a rule in a SnapMirror policy.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name

Specifies the SnapMirror policy name.

[-comment <text>] - Comment

Specifies a text comment for the SnapMirror policy. If the comment contains spaces, it must be enclosed within quotes.

[-tries <unsigned32_or_unlimited>] - Tries Limit

Determines the maximum number of times to attempt each manual or scheduled transfer for a SnapMirror relationship. The value of this parameter must be a positive integer or *unlimited*. The default value is 8.

[-transfer-priority {low/normal}] - Transfer Scheduling Priority

Specifies the priority at which a transfer runs. The supported values are *normal* or *low*. The *normal* transfers are scheduled before the *low* priority transfers. The default is *normal*.

[-ignore-atime {true/false}] - Ignore File Access Time

This parameter applies only to extended data protection (XDP) relationships. It specifies whether incremental transfers will ignore files which have only their access time changed. The supported values are *true* or *false*. The default is *false*.

[-restart {always/never/default}] - Restart Behavior

This parameter applies only to data protection relationships. It defines the behavior of SnapMirror if an interrupted transfer exists. The supported values are *always*, *never*, or *default*. If the value is set to *always*, an interrupted SnapMirror transfer always restarts provided it has a restart checkpoint and the conditions are the same as they were before the transfer was interrupted. In addition, a new SnapMirror Snapshot copy is created which will then be transferred. If the value is set to *never*, an interrupted SnapMirror transfer will never restart, even if a restart checkpoint exists. A new SnapMirror Snapshot copy will still be created and transferred. Data ONTAP version 8.2 will interpret a value of *default* as being the same as *always*. Vault transfers will always resume based on a restart checkpoint, provided the Snapshot copy still exists on the source volume.

[-is-network-compression-enabled {true/false}] - Is Network Compression Enabled

Specifies whether network compression is enabled for transfers. The supported values are *true* or *false*. The default is *false*.

`[-always-replicate-snapshots {true/false}]` - This prioritizes replication of app-consistent snapshots over synchronous replication

If this parameter is set to true, it specifies that SnapMirror Synchronous relationships will lose the zero RPO protection upon failure in replicating application created snapshots. The default value is false.

`[-common-snapshot-schedule <text>]` - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous (privilege: advanced)

Specifies the common Snapshot creating schedule. This parameter is only supported for Snapmirror Synchronous relationships.

`[-are-data-ops-sequentially-split {true/false}]` - Is Sequential Splitting of Data Operations Enabled?

This parameter specifies whether I/O, such as write, copy-offload and punch-holes, are split sequentially, rather than being run in parallel on the source and destination. Splitting the I/O sequentially will make the system more robust, and less prone to I/O errors. However, it will also make I/O performance slower. The default value of parameter `-sequential-split-data-ops` is `false`. The parameter `-are-data-ops-sequentially-split` should only be used if too frequent I/O timeout or OutOfSync has happened. Changes made by the `snapmirror policy modify -sequential-split-data-ops` command do not take effect until the next resync. Changes do not affect resync or initialize operations that have started and have not finished yet. The parameter `-are-data-ops-sequentially-split` requires an effective cluster version of Data ONTAP 9.6.0 or later on both the source and destination clusters.

`[-discard-configs <network>, ...]` - Configurations Not Replicated During Identity Preserve Vserver DR

Specifies the configuration to be dropped during replication. The supported values are:

- `network` - Drops network interfaces, routes, and kerberos configuration.

This parameter is supported only for policies of type `async-mirror` and applicable only for identity-preserve Vserver SnapMirror relationships.

Examples

The following example changes the "transfer-priority" and the "comment" text of a snapmirror policy named `TieredBackup` on Vserver `vs0.example.com`:

```
vs0.example.com::> snapmirror policy modify -vserver vs0.example.com -policy
TieredBackup -transfer-priority low -comment "Use for tiered backups"
```

[snapmirror policy modify-rule](#) on page 844

snapmirror policy modify-rule

Modify an existing rule in SnapMirror policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy modify-rule` command can be used to modify the retention count, preserve setting, warning threshold count, schedule, and prefix for a rule in a SnapMirror policy. Reducing the retention count or disabling the preserve setting for a rule in a SnapMirror policy might result in the deletion of Snapshot copies on the vault destination when the next transfer by the `snapmirror update` command occurs or when the next scheduled Snapshot copy creation on the destination for the rule occurs. Modifying a rule to add a schedule will enable creation of Snapshot copies on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. Schedule and prefix can only be modified for rules associated with SnapMirror policies of type *vault* or *mirror-vault*. A SnapMirror policy with rules must have at least one rule without a schedule.

Note: The rules in SnapMirror policies of type *async-mirror* cannot be modified.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name

Specifies the SnapMirror policy name.

-snapmirror-label <text> - Snapshot Copy Label

This parameter specifies the rule that is to be modified in a SnapMirror policy.

[-keep <text>] - Snapshot Copy Retention Count

Specifies the maximum number of Snapshot copies that are retained on the SnapMirror destination volume for a rule. The total number of Snapshot copies retained for all the rules in a policy cannot exceed 1019. For all the rules in SnapMirror policies of type *async-mirror*, this parameter must be set to value *1*.

[-preserve { true/false}] - Snapshot Copy Preserve Enabled

Specifies the behavior when the Snapshot copy retention count is reached on the SnapMirror vault destination for the rule. The default value is *false*, which means that the oldest Snapshot copy will be deleted to make room for new ones only if the number of Snapshot copies has exceeded the retention count specified in the "keep" parameter. When set to *true*, and when the Snapshot copies have reached the retention count, then an incremental SnapMirror vault update transfer will fail or if the rule has a schedule, Snapshot copies will no longer be created on the SnapMirror destination. For all the rules in SnapMirror policies of type *async-mirror* this parameter must be set to value *false*.

[-warn <integer>] - Warning Threshold Count

Specifies the warning threshold count for the rule. The default value is *0*. When set to a value greater than zero, an event is generated after the number of Snapshot copies (for the particular rule) retained on a SnapMirror vault destination reaches the specified warn limit. The preserve parameter for the rule must be *true* to set the warn parameter to a value greater than zero.

[-schedule <text>] - Snapshot Copy Creation Schedule

This optional parameter specifies the name of the schedule associated with a rule. This parameter is allowed only for rules associated with SnapMirror policies of type *vault* or *mirror-vault*. When this parameter is specified, Snapshot copies are directly created on the SnapMirror destination. The Snapshot copies created will have the same content as the latest Snapshot copy already present on the SnapMirror destination. Snapshot copies on the source that have a SnapMirror label matching this rule will not be selected for transfer. The default value is `-`.

Note: You define and name a schedule using the `job schedule cron create` command.

[-prefix <text>] - Snapshot Copy Creation Prefix

This optional parameter specifies the prefix for the Snapshot copy name to be created as per the schedule. If no value is specified, then the `snapmirror-label` will be used as the prefix. The prefix parameter can only be specified for rules which have a schedule.

Examples

The following example changes the retention count for *nightly* Snapshot copies to 6 for a rule named *nightly* on a SnapMirror policy named *TieredBackup* on Vserver `vs0.example.com`:

```
vs0.example.com::> snapmirror policy modify-rule -vserver vs0.example.com
                    -policy TieredBackup -snapmirror-label nightly -keep 6
```

[snapmirror update](#) on page 822

snapmirror policy remove-rule

Remove a rule from SnapMirror policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy remove-rule` command removes a rule from a SnapMirror policy. On the destination of a SnapMirror relationship with `snapmirror policy` of type *vault* or *mirror-vault*, all Snapshot copies with a SnapMirror label matching the rule being removed are no longer processed by SnapMirror and might need to be deleted manually. A `snapmirror policy` of type *vault* must have at least one rule if that policy is associated with a SnapMirror relationship. A SnapMirror policy with rules must have at least one rule without a schedule.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the Vserver for the SnapMirror policy.

-policy <sm_policy> - SnapMirror Policy Name

Specifies the SnapMirror policy name.

-snapmirror-label <text> - Snapshot Copy Label

This parameter specifies the rule that is removed from the SnapMirror policy.

The rule for SnapMirror label *sm_created* cannot be removed from SnapMirror policies of type *async-mirror* or *mirror-vault*.

Examples

The following example removes a rule named *nightly* from a SnapMirror policy named *TieredBackup* on Vserver *vs0.example.com*:

```
vs0.example.com:> snapmirror policy remove-rule -vserver vs0.example.com -
policy TieredBackup -snapmirror-label nightly
```

Related references

[snapmirror policy](#) on page 836

snapmirror policy show

Show SnapMirror policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror policy show` command displays the following information about SnapMirror policies:

- Vserver Name
- SnapMirror Policy Name
- SnapMirror Policy Type
- Number of Rules in the policy
- Tries
- Transfer Priority
- Comment for the policy
- Individual Rule Names
- Keep value for the Rule
- Total of Keep values across all Rules in the policy

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

Selects the policies that match this parameter value.

[-policy <sm_policy>] - SnapMirror Policy Name

Selects the policies that match this parameter value.

[-type {vault/async-mirror/mirror-vault/strict-sync-mirror/sync-mirror}]

- Snapmirror Policy Type

Selects the policies that match this parameter value. A policy can be of type *async-mirror*, *vault* or *mirror-vault*.

[-owner {cluster-admin/vserver-admin}] - Owner of the Policy

Selects the policies that match this parameter value. A policy can be owned by either the "Cluster Admin" or a "Vserver Admin".

[-comment <text>] - Comment

Selects the policies that match this parameter value.

[-tries <unsigned32_or_unlimited>] - Tries Limit

Selects the policies that match this parameter value.

[-transfer-priority {low/normal}] - Transfer Scheduling Priority

Selects the policies that match this parameter value.

[-ignore-atime {true/false}] - Ignore File Access Time

Selects the policies that match this parameter value.

[-restart {always/never/default}] - Restart Behavior

Selects the policies that match this parameter value.

[-is-network-compression-enabled {true/false}] - Is Network Compression Enabled

Selects the policies that match this parameter value.

[-create-snapshot {true/false}] - Create a New Snapshot Copy

Selects the policies that match this parameter value.

[-always-replicate-snapshots {true/false}] - This prioritizes replication of app-consistent snapshots over synchronous replication

Selects the policies that match this parameter value.

[-snapmirror-label <text>, ...] - Snapshot Copy Label

Selects the policies that match this parameter value.

[-keep <text>, ...] - Snapshot Copy Retention Count

Selects the policies that match this parameter value.

[-preserve {true/false}, ...] - Snapshot Copy Preserve Enabled

Selects the policies that match this parameter value.

[-warn <integer>, ...] - Warning Threshold Count

Selects the policies that match this parameter value.

[-schedule <text>, ...] - Snapshot Copy Creation Schedule

Selects the policies that match this parameter value.

[-prefix <text>, ...] - Snapshot Copy Creation Prefix

Selects the policies that match this parameter value.

[-total-rules <integer>] - Total Rules in the Policy

Selects the policies that match this parameter value.

[-total-keep <integer>] - Total Retention Count for All Rules in the Policy

Selects the policies that match this parameter value.

[-common-snapshot-schedule <text>] - Common Snapshot Copy Creation Schedule for SnapMirror Synchronous (privilege: advanced)

Selects the policies that match this parameter value.

[-are-data-ops-sequentially-split {true/false}] - Is Sequential Splitting of Data Operations Enabled?

Selects the policies that match this parameter value.

[-discard-configs <network>, ...] - Configurations Not Replicated During Identity Preserve Vserver DR

Selects the policies that match this parameter value.

Examples

The following example displays information about all SnapMirror policies:

```
cs::> snapmirror policy show
Vserver Policy          Policy Number      Transfer
Name      Name          Type    Of Rules Tries Priority Comment
-----
cs        DPDefault      async-mirror  2      8  normal Asynchronous
SnapMirror policy for mirroring all Snapshot copies and the latest active
file system.
  SnapMirror Label: sm_created                      Keep:      1
                  all_source_snapshots              1
                  Total Keep:                        2

cs        MirrorAllSnapshots async-mirror  2      8  normal Asynchronous
SnapMirror policy for mirroring all Snapshot copies and the latest active
file system.
  SnapMirror Label: sm_created                      Keep:      1
                  all_source_snapshots              1

cs           MirrorAllSnapshots
              normal
cs           MirrorAndVault
              normal
cs           MirrorLatest
              normal
vs0.example.com
  TieredBackup
              normal
cs           Unified7year
              normal
cs           XDPDefault
              normal
7 entries were displayed.

```

snapmirror snapshot-owner commands

Manage Snapshot Copy Preservation

The `snapmirror snapshot-owner` command enables management of user-created owners for a Snapshot copy.

snapmirror snapshot-owner create

Add an owner to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror snapshot-owner create` command adds an owner on the specified Snapshot copy. A Snapshot copy can have at most one owner. An owner can only be added to a Snapshot copy on a read-write volume. The Snapshot copy must have a valid SnapMirror label.

Note: Refer to the *ONTAP Data Protection Guide* for valid use cases to add an owner on a Snapshot copy.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume.

-snapshot <snapshot name> - Snapshot Copy Name

This parameter specifies the name of the Snapshot copy.

[-owner <owner name>] - Snapshot Copy Owner Name

This parameter specifies the name of the owner for the Snapshot copy. The owner name can be made up of the characters A to Z, a to z, 0 to 9, and "_". The name can be up to 32 characters in length. When not specified, an owner will be added with a system-generated default name.

Examples

The following example adds owner `app1` on Snapshot copy `snap1` on volume `vol1` in Vserver `vs0.example.com`.

```
cluster1::> snapmirror snapshot-owner create -vserver vs0.example.com
              -volume voll -snapshot snap1 -owner appl
```

The following example adds a default owner on Snapshot copy *snap2* on volume *voll* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner create -vserver vs0.example.com
              -volume voll -snapshot snap2
```

snapmirror snapshot-owner delete

Delete an owner used to preserve a Snapshot copy for a SnapMirror mirror-to-vault cascade configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror snapshot-owner delete` command removes an owner on the specified Snapshot copy, which was added using the `snapmirror snapshot-owner create` command.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume.

-snapshot <snapshot name> - Snapshot Copy Name

This parameter specifies the name of the Snapshot copy.

[-owner <owner name>] - Snapshot Copy Owner Name

This parameter specifies the name of the owner for the Snapshot copy. When not specified, the owner with the system-generated default name will be removed.

Examples

The following example removes owner *appl* on Snapshot copy *snap1* on volume *voll* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com
              -volume voll -snapshot snap1 -owner appl
```

The following example removes the default owner on Snapshot copy *snap2* on volume *voll* in Vserver *vs0.example.com*.

```
cluster1::> snapmirror snapshot-owner delete -vserver vs0.example.com
              -volume voll -snapshot snap2
```

snapmirror snapshot-owner show

Display Snapshot Copies with Owners

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snapmirror snapshot-owner show` command is used to list all Snapshot copies with owners that were added using the `snapmirror snapshot-owner create` command.

Parameters

`{ [-fields <fieldname>, ...]`

If this parameter is specified, the command displays information about the specified fields.

`| [-instance]}`

If this parameter is specified, the command displays detailed information about all fields.

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume.

[-snapshot <snapshot name>] - Snapshot Copy Name

If this parameter is specified, the command displays the owner name for the specified Snapshot copy.

Examples

The following example lists all Snapshot copies with owners on volume `vol1` in Vserver `vs0`. The system-generated default owner name is displayed as "-".

```
cluster1::> snapmirror snapshot-owner show
-vserver vs0.example.com -volume vol1
Vserver Volume Snapshot Owner Names
-----
vs0.example.com
      vol1      snap2      -
              snap1      appl
```

The following example displays the owner name for Snapshot copy `snap1` on volume `vol1` in Vserver `vs0.example.com`.

```
cluster1::> snapmirror snapshot-owner show
-vserver vs0.example.com -volume vol1 -snapshot snap1

Vserver: vs0.example.com
Volume: vol1
Snapshot: snap1
Owner Names: appl
```

statistics-v1 commands

The statistics-v1 directory

statistics-v1 nfs commands

Monitor NFS statistics

statistics-v1 nfs show-mount

Display mount statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `statistics-v1 nfs show-mount` command displays the following statistics about the NFS mounts on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of mount operations
- Total number of dump operations
- Total number of unmount operations
- Total number of unmountall operations
- Total number of export operations
- Total number of exportall operations
- Total number of pathconf operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`| [-instance]}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>/local}] - Node`

If you specify this parameter, the command displays statistics only for the specified node.

[-result {*success/failure/all*}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-mount <Counter with Delta>] - Mount Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

[-dump <Counter with Delta>] - Dump Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

[-unmnt <Counter with Delta>] - UnMount Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmount operations.

[-unmntall <Counter with Delta>] - UnMountAll Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmountall operations.

[-export <Counter with Delta>] - Export Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

[-exportall <Counter with Delta>] - ExportAll Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

[-pathconf <Counter with Delta>] - PathConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics-v1 nfs show-mount -node node1
```

Node	Value	Delta
node1	-----success-----	
Null Ops:	2	0/s:16s
Mount Ops:	1	0/s:16s
Dump Ops:	0	-
Unmount Ops:	1	0/s:16s
Unmount All Ops:	0	-
Export Ops:	0	-
ExportAll Ops	0	-
PathConf Ops:	0	-
Total Ops:	4	0/s:16s

Node	Value	Delta
node1	-----failure-----	
Null Ops:	0	-
Mount Ops:	0	-
Dump Ops:	0	-
Unmount Ops:	0	-
Unmount All Ops:	0	-

Export Ops:	0	-
ExportAll Ops	0	-
PathConf Ops:	0	-
Total Ops:	0	-

statistics-v1 nfs show-nlm

(DEPRECATED)-Display NLM statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `statistics-v1 nfs show-nlm` command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations
- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Note: This command requires an effective cluster version earlier than Data ONTAP 9.0. Data for nodes running Data ONTAP 9.0 or later is not collected, and will not be displayed. Use the `statistics show-object nlm` command instead.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance]}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>/local}] - Node`

If you specify this parameter, the command displays statistics only for the specified node.

[-result {*success/failure/all*}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-test <Counter with Delta>] - Test Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

[-lock <Counter with Delta>] - Lock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

[-cancel <Counter with Delta>] - Cancel Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

[-unlock <Counter with Delta>] - Unlock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

[-granted <Counter with Delta>] - Granted Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

[-share <Counter with Delta>] - Share Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

[-unshare <Counter with Delta>] - Unshare Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

[-nmlock <Counter with Delta>] - NmLock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

[-freeall <Counter with Delta>] - FreeAll Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics-v1 nfs show-nlm -node node1
```

Node	Value	Delta
node1	-----success-----	
Null:	0	-
Test:	0	-
Lock:	2	0/s:23s
Cancel:	0	-
Unlock:	1	0/s:23s
Granted:	0	-

```

Share:          0      -
Unshare:        0      -
NmLock:         0      -
FreeAll:        0      -
Total:          3      0/s:23s

Node      Value      Delta
-----failure-----
Null:      0          -
Test:      0          -
Lock:      0          -
Cancel:    0          -
Unlock:    0          -
Granted:    0          -
Share:      0          -
Unshare:    0          -
NmLock:     0          -
FreeAll:    0          -
Total:      0          -

```

statistics-v1 nfs show-statusmon

Display status monitor statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `statistics-v1 nfs show-statusmon` command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If you specify this parameter, the command displays statistics only for the specified node.

[-result {success/failure/all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-stat <Counter with Delta>] - Stat Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

[-monitor <Counter with Delta>] - Monitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

[-unmonitor <Counter with Delta>] - Unmonitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

[-unmonall <Counter with Delta>] - Unmonitor All Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

[-simucrash <Counter with Delta>] - SimuCrash Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

[-notify <Counter with Delta>] - Notify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics-v1 nfs show-statusmon -node node1
```

Node	Value	Delta
node1	-----success-----	
Null Ops:	0	-
Stat Ops:	0	-
Monitor Ops:	0	-
Unmonitor Ops:	0	-
Unmon All Ops:	0	-
SimuCrash Ops:	0	-
Notify Ops:	0	-
Total Ops:	0	-

Node	Value	Delta
node1	-----failure-----	
Null Ops:	0	-
Stat Ops:	0	-
Monitor Ops:	0	-
Unmonitor Ops:	0	-

Unmon All Ops:	0	-
SimuCrash Ops:	0	-
Notify Ops:	0	-
Total Ops:	0	-

statistics-v1 nfs show-v3

Display NFSv3 statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `statistics-v1 nfs show-v3` command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of readsymlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations
- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations
- Percent of null operations

- Percent of getattr operations
- Percent of setattr operations
- Percent of lookup operations
- Percent of access operations
- Percent of readsymlink operations
- Percent of read operations
- Percent of write operations
- Percent of create operations
- Percent of mkdir operations
- Percent of symlink operations
- Percent of mknod operations
- Percent of remove operations
- Percent of rmdir operations
- Percent of rename operations
- Percent of link operations
- Percent of readdir operations
- Percent of readdirplus operations
- Percent of fsstat operations
- Percent of fsinfo operations
- Percent of pathconf operations
- Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

[-result {success/failure/all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-gattr <Counter with Delta>] - GetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

[-sattr <Counter with Delta>] - SetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

[-lookup <Counter with Delta>] - LookUp Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-access <Counter with Delta>] - Access Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

[-rsym <Counter with Delta>] - ReadSymLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

[-read <Counter with Delta>] - Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-write <Counter with Delta>] - Write Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

[-create <Counter with Delta>] - Create Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

[-mkdir <Counter with Delta>] - Mkdir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

[-symln <Counter with Delta>] - SymLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

[-mknod <Counter with Delta>] - Mknod Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

[-remove <Counter with Delta>] - Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rmdir <Counter with Delta>] - Rmdir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

[-rename <Counter with Delta>] - Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

[-link <Counter with Delta>] - Link Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

[-rdir <Counter with Delta>] - ReadDir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

[-rdirp <Counter with Delta>] - ReadDirPlus Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

[-fsstat <Counter with Delta>] - FsStat Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

[-fsinfo <Counter with Delta>] - FsInfo Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

[-pconf <Counter with Delta>] - PathConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

[-commit <Counter with Delta>] - Commit Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

[-null-pct <Counter with Delta>] - Percent Null Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

[-sattr-pct <Counter with Delta>] - Percent SetAttr Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[-lookup-pct <Counter with Delta>] - Percent LookUp Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

[-access-pct <Counter with Delta>] - Percent Access Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsymlink operations.

[-read-pct <Counter with Delta>] - Percent Read Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[-write-pct <Counter with Delta>] - Percent Write Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[-create-pct <Counter with Delta>] - Percent Create Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

[-mkdir-pct <Counter with Delta>] - Percent Mkdir Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

[-symlink-pct <Counter with Delta>] - Percent SymLink Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

[-mknod-pct <Counter with Delta>] - Percent Mknod Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

[-remove-pct <Counter with Delta>] - Percent Remove Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

[-rmdir-pct <Counter with Delta>] - Percent Rmdir Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

[-rename-pct <Counter with Delta>] - Percent Rename Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[-link-pct <Counter with Delta>] - Percent Link Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsstat operations.

[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

[-pconf-pct <Counter with Delta>] - Percent PathConf Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

[-commit-pct <Counter with Delta>] - Percent Commit Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

Examples

The following example displays statistics about the NFSv3 operations for a node named node1:

```
cluster1::> statistics-v1 nfs show-v3 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1			success	
Null Ops:	4	-	7%	-
GetAttr Ops:	10	-	19%	-
SetAttr Ops:	2	-	4%	-
Lookup Ops:	2	-	4%	-
Access Ops:	14	-	26%	-
ReadSymlink Ops:	0	-	0%	-
Read Ops:	0	-	0%	-
Write Ops:	0	-	0%	-
Create Ops:	2	-	4%	-
Mkdir Ops:	1	-	2%	-
Symlink Ops:	0	-	0%	-
Mknod Ops:	0	-	0%	-
Remove Ops:	1	-	2%	-
Rmdir Ops:	0	-	0%	-
Rename Ops:	0	-	0%	-
Link Ops:	0	-	0%	-
ReadDir Ops:	2	-	4%	-
ReadDirPlus Ops:	10	-	19%	-
FsStat Ops:	1	-	2%	-
FsInfo Ops:	5	-	9%	-
PathConf Ops:	0	-	0%	-
Commit Ops:	0	-	0%	-
Total Ops:	54	-		

Node	Value	Delta	Percent Ops	Delta
node1			failure	
Null Ops:	0	-	0%	-
GetAttr Ops:	0	-	0%	-
SetAttr Ops:	0	-	0%	-
Lookup Ops:	2	-	100%	-
Access Ops:	0	-	0%	-
ReadSymlink Ops:	0	-	0%	-
Read Ops:	0	-	0%	-
Write Ops:	0	-	0%	-
Create Ops:	0	-	0%	-

Total Ops:	56	-		

statistics-v1 nfs show-v4

Display NFSv4 statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `statistics-v1 nfs show-v4` command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations
- Total number of putpubfh operations

- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of setattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations
- Percent of nverify operations

- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations
- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

[-result {success/failure/all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-cmpnd <Counter with Delta>] - Compound Procedure

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

[-access <Counter with Delta>] - Access Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

[-close <Counter with Delta>] - Close Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

[-commit <Counter with Delta>] - Commit Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

[-create <Counter with Delta>] - Create Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

[-delpur <Counter with Delta>] - Delempurge Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempurge operations.

[-delrtn <Counter with Delta>] - Delegrt Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delegrt operations.

[-gattr <Counter with Delta>] - GetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

[-getfh <Counter with Delta>] - GetFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

[-link <Counter with Delta>] - Link Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

[-lock <Counter with Delta>] - Lock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

[-lockt <Counter with Delta>] - LockT Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

[-locku <Counter with Delta>] - LockU Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

[-lookup <Counter with Delta>] - Lookup Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-lookpp <Counter with Delta>] - LookupP Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

[-nverify <Counter with Delta>] - Nverify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

[-open <Counter with Delta>] - Open Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

[-opatrr <Counter with Delta>] - OpenAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

[-opconf <Counter with Delta>] - OpenConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

[-opndg <Counter with Delta>] - OpenDowng Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

[-putfh <Counter with Delta>] - PutFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

[-putpfh <Counter with Delta>] - PutPubFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

[-putrfh <Counter with Delta>] - PutRootFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

[-read <Counter with Delta>] - Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-readdr <Counter with Delta>] - ReadDir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

[-rlink <Counter with Delta>] - ReadLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

[-remove <Counter with Delta>] - Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rename <Counter with Delta>] - Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

[-renew <Counter with Delta>] - Renew Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

`[-restfh <Counter with Delta>] - RestoreFh Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

`[-savefh <Counter with Delta>] - SaveFh Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

`[-secinf <Counter with Delta>] - SecInfo Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

`[-setattr <Counter with Delta>] - SetAttr Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

`[-sclid <Counter with Delta>] - SetCliId Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

`[-scidc <Counter with Delta>] - SetCliIdConf Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

`[-verify <Counter with Delta>] - Verify Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

`[-write <Counter with Delta>] - Write Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

`[-relovn <Counter with Delta>] - RelLockOwn Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

`[-total <Counter64 with Delta>] - Total Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

`[-null-pct <Counter with Delta>] - Percent Null Procedure`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

`[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

`[-access-pct <Counter with Delta>] - Percent Access Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

`[-close-pct <Counter with Delta>] - Percent Close Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

`[-commit-pct <Counter with Delta>] - Percent Commit Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

[-create-pct <Counter with Delta>] - Percent Create Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

[-delpur-pct <Counter with Delta>] - Percent Delempurge Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempurge operations.

[-delrtn-pct <Counter with Delta>] - Percent Delegret Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delegret operations.

[-gattr-pct <Counter with Delta>] - Percent GetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

[-getfh-pct <Counter with Delta>] - Percent GetFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

[-link-pct <Counter with Delta>] - Percent Link Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

[-lock-pct <Counter with Delta>] - Percent Lock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

[-lockt-pct <Counter with Delta>] - Percent LockT Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

[-locku-pct <Counter with Delta>] - Percent LockU Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

[-lookup-pct <Counter with Delta>] - Percent Lookup Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

[-lookpp-pct <Counter with Delta>] - Percent LookupP Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

[-nverify-pct <Counter with Delta>] - Percent Nverify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

[-open-pct <Counter with Delta>] - Percent Open Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

[-opattr-pct <Counter with Delta>] - Percent OpenAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openattr operations.

[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

[-putfh-pct <Counter with Delta>] - Percent PutFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

[-read-pct <Counter with Delta>] - Percent Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

[-remove-pct <Counter with Delta>] - Percent Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

[-rename-pct <Counter with Delta>] - Percent Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[-renew-pct <Counter with Delta>] - Percent Renew Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[-scld-pct <Counter with Delta>] - Percent SetCliId Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliid operations.

[-scidc-pct <Counter with Delta>] - Percent SetCliIdConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliidconf operations.

[-verify-pct <Counter with Delta>] - Percent Verify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

[-write-pct <Counter with Delta>] - Percent Write Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[-relockown-pct <Counter with Delta>] - Percent RelLockOwn Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

Examples

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics-vl nfs show-v4 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1		success		
Null Procs:	2	-	1%	-
Cmpnd Procs:	92	-		-
Access Ops:	16	-	6%	-
Close Ops:	8	-	3%	-
Commit Ops:	0	-	0%	-
Create Ops:	0	-	0%	-
Delpur Ops:	0	-	0%	-
Delrtn Ops:	0	-	0%	-
Getattr Ops:	76	-	27%	-
Getfh Ops:	22	-	8%	-
Link Ops:	0	-	0%	-
Lock Ops:	0	-	0%	-
Lockt Ops:	0	-	0%	-
Locku Ops:	0	-	0%	-
Lookup Ops:	13	-	5%	-
Lookupp Ops:	0	-	0%	-
Nverify Ops:	0	-	0%	-
Open Ops:	8	-	3%	-
Openattr Ops:	0	-	0%	-
Openconf Ops:	0	-	0%	-
Opendowng Ops:	0	-	0%	-
Putfh Ops:	92	-	32%	-
Putpubfh Ops:	0	-	0%	-
Putrootfh Ops:	2	-	1%	-
Read Ops:	0	-	0%	-
Readdir Ops:	2	-	1%	-
Readlink Ops:	0	-	0%	-
Remove Ops:	5	-	2%	-
Rename Ops:	3	-	1%	-
Renew Ops:	0	-	0%	-

statistics-v1 protocol-request-size commands

The protocol-request-size directory

statistics-v1 protocol-request-size show

Display size statistics for CIFS and NFS protocol read and write requests

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays size statistics for CIFS and NFS protocol read and write requests. The output of the command includes the following information:

- Node name
- Statistic type
- Average size of request
- Total request count
- Current number of requests in each category of request size
- Number of requests after the command was last executed

Parameters

[*-fields* <fieldname>, ...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*]]

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node* {<nodename>/local}] - Node

If this parameter is specified, the command displays statistics only for the specified node.

[*-stat-type* <Protocol Type>] - RW Request Stat Type

If this parameter is specified, the command displays only the statistics of the specified protocol type. Protocol types include the following: *cifs_read*, *cifs_write*, *nfs2_read*, *nfs2_write*, *nfs3_read*, and *nfs3_write*.

[*-total-req-count* <Counter64 with Delta>] - Total Request Count

If this parameter is specified, the command displays only statistics with the specified total number of requests.

[*-average-size* <Counter64 with Delta>] - Average Request Size

If this parameter is specified, the command displays only statistics with the specified average request size.

[*-histo08* <Counter64 with Delta>] - 0 - 511

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo09 <Counter64 with Delta>] - 512 - 1023

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo10 <Counter64 with Delta>] - 1024 - 2047

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo11 <Counter64 with Delta>] - 2048 - 4096

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo12 <Counter64 with Delta>] - 4096 - 8191

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo13 <Counter64 with Delta>] - 8192 - 16K

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo14 <Counter64 with Delta>] - 16K - 32K

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo15 <Counter64 with Delta>] - 32K - 64K

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo16 <Counter64 with Delta>] - 64K - 128K

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

[-histo17 <Counter64 with Delta>] - Greater than 128K

If this parameter is specified, the command displays only statistics with the specified number of requests in this size range.

Examples

The following example displays the number of NFS v3 requests in each size range for only one node in the cluster.

```
cluster1::> statistics protocol-request-size show -stat-type nfs3_* -node
node0

Node:                                node0

Statistics Commands

The statistics directory

The `statistics` commands display performance statistics.

statistics show

Display performance data for a time interval

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays performance data for a period of time.

To display data for a period of time, collect a sample using the `statistics start` and `statistics stop` commands. The data that displays is calculated data based on the samples the cluster collects. To view the sample, specify the `-sample-id` parameter.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-tab]}`

If this parameter is specified, the command displays performance data in tabular format.

`[-object <text>] - Object`

Selects the objects for which you want to display performance data. To view a list of valid object names, type `statistics show -object ?` or `statistics catalog object show`. To specify multiple objects, use `"|"` between each object.

Caution: You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

`[-instance <text>] - Instance`

Selects the instances for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the instances associated with the specified objects. To specify multiple instances, use `"|"` between each instance.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command displays statistics for all disks in the system.

`[-counter <text>] - Counter`

Selects the counters for which you want to display performance data. To specify multiple counters, use `"|"` between each counter.

[-preset <text>] - Preset

If this parameter is specified, the command displays statistics for the specified preset.

[-node {<nodename>/local}] - Node

Selects the nodes for which you want to display performance data.

[-vserver <vserver name>] - Vserver

Selects the Vserver for which you want to display performance data.

[-value <text>] - Text Value

Selects the performance data that matches the specified counter value.

[-labels <text>, ...] - List of Labels

Selects the performance data that matches the specified label.

[-values <text>, ...] - List of Values

Displays only the statistics that have the specified values.

[-filter <text>] - Filter Data

Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances that match a value of greater than 50 for the total_ops counter, specify **-filter "total_ops>50"**.

[-sample-id <text>] - Sample Identifier

Displays performance data for the specified sample. You collect a sample by using the statistics start and statistics stop commands.

[-interval <integer>] - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

[-iterations <integer>] - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

[-sort-key <text>] - Counter Used For Sorting

If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

[-sort-order {ascending/descending}] - Sort Order

This parameter may be used in conjunction with the **-sort-key** parameter. This parameter changes the order in which statistics are sorted. Possible values are *ascending* and *descending*. The default setting is *descending*.

[-max <integer>] - Tracker Size

Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

Examples

The following example starts collecting statistics and displays statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```
cluster1::*> statistics start -object system -counter avg_processor_busy|
cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
```

```

Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1

```

Counter	Value
avg_processor_busy	6%
cpu_busy	6%

The following example starts and stops data collection and displays statistics for the sample named `smpl_1` for counters: `avg_processor_busy` and `cpu_busy`

```

cluster1::*> statistics start -object system -counter avg_processor_busy|
cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1

cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1

cluster1::*> statistics show -sample-id smpl_1
Object: system
Instance: cluster
Start-time: 8/2/2012 18:27:53
End-time: 8/2/2012 18:27:56
Cluster: cluster1

```

Counter	Value
avg_processor_busy	6%
cpu_busy	6%

The following example displays raw statistics:

```

cluster1::*> statistics show -raw -object system
Object: system
Instance: cluster
Start-time: 9/13/2012 18:18:18
End-time: 9/13/2012 18:18:18
Cluster: cluster1

```

Counter	Value
avg_processor_busy	249876451
cifs_ops	0
cpu_busy	303355441
disk_data_read	51453952
disk_data_written	486117376
fcp_data_recv	0
fcp_data_sent	0
fcp_ops	0
hdd_data_read	51453952
hdd_data_written	486117376
hostname	node-name1
http_ops	0
instance_name	cluster
iscsi_ops	0
net_data_recv	35034112
net_data_sent	3177472
nfs_ops	0
node_name	node-name1
node_uuid	
[...]	

The following example displays raw statistics for counters "`avg_processor_busy`" and "`cpu_busy`":

```

cluster1::*> statistics show -raw -object system -counter avg_processor_busy|
cpu_busy
Object: system
Instance: cluster
Start-time: 9/13/2012 18:18:18
End-time: 9/13/2012 18:18:18
Cluster: cluster1

```

Counter	Value
---------	-------

```
-----
avg_processor_busy                249876451
cpu_busy                          303355441
[ ... ]
```

statistics show-periodic

Continuously display current performance data at regular interval

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command continuously displays specified performance data at a regular interval. The command output displays data in the following columns:

Note: This command has been deprecated and may be removed from a future version of Data ONTAP. Use the "statistics show" command with the tabular format instead.

- `cpu avg`: Average processor utilization across all processors in the system.
- `cpu busy`: Overall system utilization based on CPU utilization and subsystem utilization. Examples of subsystems include the storage subsystem and RAID subsystem.
- `total ops`: Number of total operations per second.
- `nfs-ops`: Number of NFS operations per second.
- `cifs-ops`: Number of CIFS operations per second.
- `fcache ops`: Number of 7M flexcache operations per second.
- `pkts rcv`: Number of packets received over physical ports per second.
- `pkts sent`: Number of packets sent over physical ports per second.
- `total rcv`: Total network traffic received over physical ports per second (KBps).
- `total sent`: Total network traffic sent over physical ports per second (KBps).
- `data busy`: The percentage of time that data ports sent or received data.
- `data rcv`: Network traffic received on data ports (KBps).
- `data sent`: Network traffic sent on data ports (KBps).
- `cluster busy`: The percentage of time that cluster ports sent or received data.
- `cluster rcv`: Network traffic received on cluster ports (KBps).
- `cluster sent`: Network traffic sent on cluster ports (KBps).
- `disk read`: Data read from disk (KBps).
- `disk write`: Data written to disk (KBps).

Parameters

[-object <text>] - Object

Selects the object for which you want to display performance data. The default object is *"cluster"*.

[-instance <text>] - Instance

Selects the instance for which you want to display performance data. This parameter is required if you specify the **-object** parameter and enter any object other than *"cluster"*. Multiple values for this parameter are not supported.

For example, if you want to display disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view.

[-counter <text>] - Counter

Selects the counters for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the counters in the specified objects. To specify multiple counters, use *"|"* between each counter.

[-preset <text>] - Preset

If this parameter is specified, the command displays statistics for the specified preset.

[-node {<nodename>/local}] - Node

Selects the nodes for which you want to display performance data. The default node is *"cluster:summary"*.

[-vserver <vserver name>] - Vserver

Selects the Vserver for which you want to display performance data. If you do not specify this parameter, the command displays statistics for all of the Vservers in the cluster.

[-interval <integer>] - Interval in Seconds

Specifies, in seconds, the interval between statistics updates. The default setting is 1 second.

[-iterations <integer>] - Number of Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 0 (zero); this means that the command continues to run until you interrupt it by pressing Ctrl-C.

[-summary {true/false}] - Print Summary

Specifies whether the command prints a final summary of statistics after the command has gone through all of its iterations. The default setting is **true**.

[-filter <text>] - Filter Data

Selects instances that match the specified filter criteria. For example, to display instances from node1, specify **-filter "node_name=node1"**.

Examples

The following example displays the "cluster" statistics for a node named node1. Because no number of iterations is specified, this command will continue to run until you interrupt it by pressing Ctrl-C.

```
cluster1::*> statistics show-periodic -node node1
cpu   cpu   cpu   total          fcache      pkts      pkts
total  total  data    data          data cluster  cluster  cluster  disk
disk
avg busy total      ops  nfs-ops cifs-ops      ops    recv    sent
recv  sent busy    recv    sent    busy    recv    sent    read
write

      5%      1245
      4%      1128
[...]
```

statistics start

Start data collection for a sample

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command starts the collection of performance data. Use the `statistics stop` command to stop the collection. You view the sample of performance data by using the `statistics show` command. You can collect more than one sample at a time.

Parameters

`[-object <text>] - Object`

Selects the objects for which you want to collect performance data. This parameter is required. To view a list of valid object names, type `statistics catalog object show` at the command prompt. To specify multiple objects, use "|" between each object.

Caution: You should limit the scope of this command to only a few objects at a time to avoid a potentially significant impact on the performance of the system.

`[-instance <text>] - Instance`

Selects the instances for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the instances associated with the specified objects. To specify multiple instances, use "|" between each instance.

For example, if you want to collect disk object statistics, you can use this parameter to specify the name of a specific disk whose statistics you want to view. If you do not specify this parameter, the command will collect statistics for all disks in the system.

`[-counter <text>] - Counter`

Selects the counters for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the counters in the specified objects. To specify multiple counters, use "|" between each counter.

`[-preset <text>] - Preset`

If this parameter is specified, the command displays statistics for the specified preset.

`[-sample-id <text>] - Sample Identifier`

Specifies an identifier for the sample. Identifiers must be unique and are restricted to the characters 0-9, a-z, A-Z, and "_". If you do not specify this parameter, the command generates a sample identifier for you and defines this sample as the default sample for the CLI session. When you run the `statistics show` command without specifying the `-sample-id` parameter, data from the default sample displays. If you run this command during the same CLI session and do not specify the `-sample-id` parameter, the command overwrites the previous sample. The command does not delete the default sample when you close your session.

`[-vserver <vserver name>] - Vserver`

Selects the vservers for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the Vservers in the cluster.

`[-node {<nodename>/local}] - Node`

Selects the node for which you want to collect performance data. If you do not specify this parameter, the command collects statistics for all of the nodes in the cluster.

[-filter <text>] - Filter

Selects performance data for the instance that matches the specified filter criteria. For example, to display the instances from node1, specify **-filter "node_name=node1"**.

[-duration <integer>] - Sample Duration in Minutes

If this parameter is specified, the command will collect the closing sample after the time specified. Duration can be specified in minutes.

[-max <integer>] - Tracker Size

Specifies the number of most active instances of an active object to display. The default setting is to display all of the instances.

[-sort-key <text>] - Counter Used For Sorting

If this parameter is specified, the command displays statistics sorted by the specified counter. Only one counter can be specified.

[-sort-order {ascending/descending}] - Sort Order

This parameter may be used in conjunction with the -sort-key parameter. This parameter changes the order in which statistics are sorted. Possible values are ascending and descending. The default setting is descending.

Examples

The following example starts statistics collection for sample "smpl_1":

```
cluster1::*> statistics start -object system -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1
```

The following example starts collecting statistics for the sample named smpl_1 for counters: avg_processor_busy and cpu_busy

```
cluster1::*> statistics start -object system -counter avg_processor_busy|
cpu_busy -sample-id smpl_1
Statistics collection is being started for Sample-id: smpl_1
```

[statistics stop](#) on page 884

statistics stop

Stop data collection for a sample

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command stops the collection of performance data. You view the sample of performance data by using the [statistics show](#) command.

Parameters**[-sample-id <text>] - Sample Identifier**

Specifies the identifier of the sample for which you want to stop data collection. If you do not specify this parameter, the command stops data collection for the last sample that you started by running the *statistics start* command without the *-sample-id* parameter.

Examples

The following example stops data collection for sample "smpl_1":

```
cluster1::*> statistics stop -sample-id smpl_1
Statistics collection is being stopped for Sample-id: smpl_1
```

statistics aggregate commands

Aggregate throughput and latency metrics

statistics aggregate show

Aggregate throughput and latency metrics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for aggregates at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.
- Node - node name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.

Parameters**[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

[-node {<nodename>/local}] - Node

Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies maximum number of aggregates to display. The default setting is 25.

Examples

The following example displays aggregate statistics:

```
cluster1::> statistics aggregate show
cluster-1 : 12/31/1969 16:00:04
```

Aggregate	Node	*Total Ops	Read Ops	Write Ops

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for flash pool caches at a regular interval. The command output displays data in the following columns:

- Aggregate - aggregate name.
- Vserver - vservers name.
- Volume - volume name.
- Read Hit - percent of IOs serviced from a cache level.
- Write Hit - percent of IOs serviced from a cache level.
- Cache Used - percent of cache used.
- Read Blocks - read blocks.
- Write Blocks - write blocks.
- Rejects - cache rejects.

Parameters**[-aggregate <text>] - Aggregate**

Selects the aggregate for which you want to display performance data.

[-vserver <vserver name>] - Vserver

Selects the vservers for which you want to display performance data.

[-volume <text>] - Volume

Selects the volume for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of flash pools to display. The default setting is 25.

Examples

The following example displays flash pool statistics:

```
cluster1::> statistics cache flash-pool show
cluster1 : 12/31/2013 16:00:04
```

Aggregate	Vserver	Volume	Read Hit (%)	Write Hit (%)	Cache Used (%)	Read Blocks	Write Blocks	Rejects
aggr1	-	-total-	0	0	0	0	0	0
aggr2	vs1	vol1	0	0	0	0	0	0

0

statistics catalog directory

The catalog directory

The `statistics catalog` commands provide access to performance catalog data.

statistics catalog counter commands

The counter directory

statistics catalog counter show

Display the list of counters in an object

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the names and descriptions of counters. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **'-fields ?'** to display the fields to specify.

[-describe]}

Displays detailed information about each counter, including privilege level, label, and whether the counter is a key counter.

-object <text> - Object

Selects the object for which you want to display the list of counters. This parameter is required. To view a list of valid object names, type `statistics catalog counter show -object ?` or `statistics catalog object show`.

[-counter <text>] - Counter

Selects the counters that match this parameter value. If you do not specify this parameter, the command displays details for all counters.

[-filter <text>] - Filter Data

Selects the counters that match this parameter value. For example, to display counters from node1, specify **-filter "node_name=node1"**.

[-label <text>, ...] - Labels for Array Counters

Selects the counters that match this parameter value. A label is the name of the bucket to which an array counter belongs.

[-description <text>] - Description

Selects the counters that match this parameter value.

[-privilege <text>] - Privilege Level

Selects the counters that match this parameter value.

[-is-key-counter {true/false}] - Is Key Counter

Selects the counters that are key counters (true) or are not key counters (false). A key counter is a counter that uniquely identifies an instance across the cluster. The default setting is false. For example, "vserver_name" and "node_name" are key counters because they identify the specific Vserver or node to which the instance belongs.

[-is-deprecated {true/false}] - Is Counter Deprecated

Selects the counters that are deprecated (true) or are not deprecated (false).

[-replaced-by <text>] - Replaced By Counter If Deprecated

Selects all deprecated counters that are replaced by the counter provided to this parameter.

Examples

The following example displays the list of counters in the processor object.

```
cluster1::> statistics catalog counter show -object processor
Object: processor
Counter          Description
-----
instance_name    Instance Name
```

instance_uuid	Instance UUID
node_name	System node name
node_uuid	System node id
process_name	Ontap process that provided this instance
processor_busy	Percentage of elapsed time that the processor is executing non-idle processes
processor_elapsed_time	Wall-clock time since boot used for calculating processor utilization
sk_switches	Number of sk switches per second
8 entries were displayed.

statistics catalog instance commands

The instance directory

statistics catalog instance show

Display the list of instances associated with an object

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the names of instances associated with the specified object. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

Parameters

[-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use **-fields ?** to display the fields to specify.

-object <text> - Object

Selects the object for which you want to display the list of instances. This parameter is required. To view a list of valid object names, type `statistics catalog instance show -object ?` or [statistics catalog object show](#).

[-instance <text>] - Instance Name

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays all the instances.

[-filter <text>] - Filter Data

Selects the instances that match this parameter value. For example, to display instances from vservers1, specify **-filter "vserver_name=vserver1"**.

[-vserver <vserver name>, ...] - Vserver Name

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays instances for all of the Vservers in the cluster.

[-node {<nodename>/local}, ...] - Node Name

Selects the instances that match this parameter value. If you do not specify this parameter, the command displays instances for all of the nodes in the cluster.

Examples

The following example displays the list of instances associated with the processor object.

```
cluster1::> statistics catalog instance show -object processor
Object: processor
processor0
processor0
processor1
processor1
4 entries were displayed.
```

statistics catalog object commands

The object directory

statistics catalog object show

Display the list of objects

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the names and descriptions of objects from which you can obtain performance data. The displayed data is either node-specific or cluster-wide, depending on the objects specified.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-describe]}

Displays detailed information about each object, including privilege level.

[-object <text>] - Object

Selects the objects for which you want to display information. If you do not specify this parameter, the command displays details for all of the objects.

[-privilege <text>] - Privilege Level

Selects the objects that match this parameter value.

[-is-deprecated {true/false}] - Is Object Deprecated

Selects the objects that are deprecated (true) or are not deprecated (false).

[-replaced-by <text>] - Replaced By Object If Deprecated

Selects all deprecated objects that are replaced by the object provided to this parameter.

[-is-statistically-tracked {true/false}] - Is Object Statistically Tracked

Specifies if the object is statistically tracked

[-description <text>] - Description

Selects the objects that match this parameter value.

Examples

The following example displays descriptions of all objects in the cluster:

```
cluster1::> statistics catalog object show
  aggregate          CM object for exporting aggregate performance
                      counters
  audit_ng           CM object for exporting audit_ng performance
                      counters
  cifs               These counters report activity from both SMB
                      and SMB2 revisions of the CIFS protocol. For
                      information isolated to SMB, see the 'smb1'
                      object. For SMB2, see the 'smb2' object.
  cifs:node          These counters report activity from both SMB
                      and SMB2 revisions of the CIFS protocol. For
                      information isolated to SMB, see the 'smb1'
                      object. For SMB2, see the 'smb2' object.
  cifs:vserver       These counters report activity from both SMB
                      and SMB2 revisions of the CIFS protocol. For
                      information isolated to SMB, see the 'smb1'
                      object. For SMB2, see the 'smb2' object.
  cluster_peer       The cluster peer object contains peer
                      counters.

statistics disk commands

Disk throughput and latency metrics

statistics disk show

Disk throughput and latency metrics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command continuously displays performance data for disks at a regular interval. The command output displays data in the following columns:

- Disk - disk name.
- Node - node name.
- Busy (%) - percentage of time there was at least one outstanding request to the disk.
- Total Ops - total operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.

Parameters**[-disk <text>] - Disk**

Selects the disk for which you want to display performance data.

[-node {<nodename>/local}] - Node

Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of disks to display. The default setting is 25.

Examples

The following example displays disk statistics:

```
cluster1::> statistics disk show
cluster1 : 12/31/1969 16:00:04
```

Disk	Node	Busy (%)	*Total Ops	Read Ops	Write Ops
VMw-1.31	node2	0	2	2	0
VMw-1.30	node2	0	3	0	3
VMw-1.3	node1	0	0	0	0
VMw-1.29	node2	0	1	0	1

statistics lif commands

Logical network interface throughput and latency metrics

statistics lif show

Logical network interface throughput and latency metrics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for LIFs at a regular interval. The command output displays data in the following columns:

- LIF - logical interface name.
- Vserver - vservers name.
- Recv Packet - packets received per second.
- Recv Data (Bps) - bytes received per second.
- Recv Errors - receive errors per second.
- Sent Packet - packets sent per second.
- Sent Data (Bps) - bytes sent per second.

- Sent Errors - transfer errors per second.
- Current Port - current use port.

Parameters

[-lif <text>] - LIF

Selects the LIF for which you want to display performance data.

[-vserver <vserver name>] - Vserver

Selects the vservers for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of LIFs to display. The default setting is 25.

Examples

The following example displays LIFs statistics:

```
cluster1::> statistics lif show
cluster1 : 12/31/1969 16:00:04
```

LIF	Vserver	Recv Packet	Recv Data (Bps)	Recv Errors	Sent Packet	Sent Data (Bps)	Sent Errors	Current Port
node2_clus_1	Cluster	3	536	0	3	338	0	e0a
node2_clus_2	Cluster	3	398	0	3	287	0	e0b

statistics namespace commands

Namespace throughput and latency metrics

statistics namespace show

Namespace throughput and latency metrics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for Namespaces at a regular interval. The command output displays data in the following columns:

- Namespace - Namespace name.
- Vserver - vservers name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(ms) - average latency for an operation in milliseconds.

Parameters

[-namespace <text>] - Namespace

Selects the Namespace for which you want to display performance data.

[-vserver <vserver name>] - Vserver

Selects the vservers for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of Namespaces to display. The default setting is 25.

Examples

The following example displays Namespace statistics:

```
cluster1::> statistics namespace show
cluster1 : 12/31/2017 16:00:04
```

Namespace	Vserver	*Total Ops	Read Ops	Write Ops	Other Ops	Read (Bps)	Write (Bps)	Latency (ms)
ns1	vs1	58	13	15	29	310585	3014	39

statistics lun commands

LUN throughput and latency metrics

statistics lun show

LUN throughput and latency metrics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for LUNs at a regular interval. The command output displays data in the following columns:

- Lun - LUN name.
- Vserver - vservers name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(ms) - average latency for an operation in milliseconds.

Parameters

[-vserver <vserver name>] - Vserver

Selects the vservers for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of LUNs to display. The default setting is 25.

Examples

The following example displays LUN statistics:

```
cluster1::> statistics lun show
cluster1 : 12/31/2013 16:00:04
```

Lun	Vserver	*Total Ops	Read Ops	Write Ops	Other Ops	Read (Bps)	Write (Bps)	Latency (ms)
lun1	vs1	58	13	15	29	310585	3014	39

```

lun0      vs2      56      0      11      45      8192 28826      47

statistics nfs commands

Monitor NFS statistics

statistics nfs show-mount

Display mount statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `statistics nfs show-mount` command displays the following statistics about the NFS mounts on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of mount operations
- Total number of dump operations
- Total number of unmount operations
- Total number of unmountall operations
- Total number of export operations
- Total number of exportall operations
- Total number of pathconf operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If you specify this parameter, the command displays statistics only for the specified node.

[-result {success/failure/all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-mount <Counter with Delta>] - Mount Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mount operations.

[-dump <Counter with Delta>] - Dump Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of dump operations.

[-unmnt <Counter with Delta>] - UnMount Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmount operations.

[-unmntall <Counter with Delta>] - UnMountAll Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmountall operations.

[-export <Counter with Delta>] - Export Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of export operations.

[-exportall <Counter with Delta>] - ExportAll Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of exportall operations.

[-pathconf <Counter with Delta>] - PathConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the NFS mounts for a node named node1:

```
cluster1::*> statistics nfs show-mount -node node1
```

Node	Value	Delta
node1	-----success-----	
Null Ops:	2	0/s:16s
Mount Ops:	1	0/s:16s
Dump Ops:	0	-
Unmount Ops:	1	0/s:16s
Unmount All Ops:	0	-
Export Ops:	0	-
ExportAll Ops	0	-
PathConf Ops:	0	-
Total Ops:	4	0/s:16s

Node	Value	Delta
node1	-----failure-----	
Null Ops:	0	-
Mount Ops:	0	-
Dump Ops:	0	-
Unmount Ops:	0	-
Unmount All Ops:	0	-
Export Ops:	0	-

```
ExportAll Ops          0          -
PathConf Ops:         0          -
Total Ops:            0
-
```

statistics nfs show-nlm

(DEPRECATED)-Display NLM statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `statistics nfs show-nlm` command displays the following statistics about the Network Lock Manager (NLM) on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of test operations
- Total number of lock operations
- Total number of cancel operations
- Total number of unlock operations
- Total number of granted operations
- Total number of share operations
- Total number of unshare operations
- Total number of nmlock operations
- Total number of freeall operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Note: This command requires an effective cluster version earlier than Data ONTAP 9.0. Data for nodes running Data ONTAP 9.0 or later is not collected, and will not be displayed. Use the `statistics show-object nlm` command instead.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance]}`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>/local}] - Node`

If you specify this parameter, the command displays statistics only for the specified node.

[-result {*success/failure/all*}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-test <Counter with Delta>] - Test Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of test operations.

[-lock <Counter with Delta>] - Lock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

[-cancel <Counter with Delta>] - Cancel Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of cancel operations.

[-unlock <Counter with Delta>] - Unlock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unlock operations.

[-granted <Counter with Delta>] - Granted Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of granted operations.

[-share <Counter with Delta>] - Share Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of share operations.

[-unshare <Counter with Delta>] - Unshare Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unshare operations.

[-nmlock <Counter with Delta>] - NmLock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nmlock operations.

[-freeall <Counter with Delta>] - FreeAll Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of freeall operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the NLM for a node named node1:

```
cluster1::*> statistics nfs show-nlm -node node1
```

Node	Value	Delta
node1	-----success-----	
Null:	0	-
Test:	0	-
Lock:	2	0/s:23s
Cancel:	0	-
Unlock:	1	0/s:23s
Granted:	0	-

```
Share:          0          -
Unshare:        0          -
NmLock:         0          -
FreeAll:        0          -
Total:          3          0/s:23s

Node      Value      Delta
-----failure-----
Null:      0          -
Test:      0          -
Lock:      0          -
Cancel:    0          -
Unlock:    0          -
Granted:   0          -
Share:     0          -
-
Unshare:   0          -
-
NmLock:    0          -
FreeAll:   0          -
Total:     0          -
```

statistics nfs show-statusmon

Display status monitor statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `statistics nfs show-statusmon` command displays the following statistics about the Status Monitor on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of stat operations
- Total number of monitor operations
- Total number of unmonitor operations
- Total number of unmonitor all operations
- Total number of simucrash operations
- Total number of notify operations
- Total number of all the above operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[*-node* {<nodename>/local}] - Node

If you specify this parameter, the command displays statistics only for the specified node.

[*-result* {<success/failure/all>}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[*-null* <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[*-stat* <Counter with Delta>] - Stat Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of stat operations.

[*-monitor* <Counter with Delta>] - Monitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of monitor operations.

[*-unmonitor* <Counter with Delta>] - Unmonitor Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor operations.

[*-unmonall* <Counter with Delta>] - Unmonitor All Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of unmonitor all operations.

[*-simucrash* <Counter with Delta>] - SimuCrash Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of simucrash operations.

[*-notify* <Counter with Delta>] - Notify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of notify operations.

[*-total* <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total operations.

Examples

The following example displays statistics about the status monitor for a node named node1:

```
cluster1::*> statistics nfs show-statusmon -node node1
```

Node	Value	Delta
node1	-----success-----	
Null Ops:	0	-
Stat Ops:	0	-
Monitor Ops:	0	-
Unmonitor Ops:	0	-
Unmon All Ops:	0	-
SimuCrash Ops:	0	-
Notify Ops:	0	-
Total Ops:	0	-

Node	Value	Delta
node1	-----failure-----	

Null Ops:	0	-
Stat Ops:	0	-
Monitor Ops:	0	-
Unmonitor Ops:	0	-

statistics nfs show-v3

Display NFSv3 statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `statistics nfs show-v3` command displays the following statistics about the NFSv3 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of getattr operations
- Total number of setattr operations
- Total number of lookup operations
- Total number of access operations
- Total number of readsymlink operations
- Total number of read operations
- Total number of write operations
- Total number of create operations
- Total number of mkdir operations
- Total number of symlink operations
- Total number of mknod operations
- Total number of remove operations
- Total number of rmdir operations
- Total number of rename operations
- Total number of link operations
- Total number of readdir operations
- Total number of readdirplus operations
- Total number of fsstat operations
- Total number of fsinfo operations
- Total number of pathconf operations
- Total number of commit operations
- Total number of nfsv3 operations

- Percent of null operations
- Percent of getattr operations
- Percent of setattr operations
- Percent of lookup operations
- Percent of access operations
- Percent of readsymlink operations
- Percent of read operations
- Percent of write operations
- Percent of create operations
- Percent of mkdir operations
- Percent of symlink operations
- Percent of mknod operations
- Percent of remove operations
- Percent of rmdir operations
- Percent of rename operations
- Percent of link operations
- Percent of readdir operations
- Percent of readdirplus operations
- Percent of fsstat operations
- Percent of fsinfo operations
- Percent of pathconf operations
- Percent of commit operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If you specify this parameter, the command displays NFSv3 statistics only for the specified node.

[-result {success/failure/all}] - Result

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

[-null <Counter with Delta>] - Null Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

[-gattr <Counter with Delta>] - GetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

[-sattr <Counter with Delta>] - SetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

[-lookup <Counter with Delta>] - LookUp Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-access <Counter with Delta>] - Access Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

[-rsym <Counter with Delta>] - ReadSymLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readsymlink operations.

[-read <Counter with Delta>] - Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-write <Counter with Delta>] - Write Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

[-create <Counter with Delta>] - Create Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

[-mkdir <Counter with Delta>] - Mkdir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mkdir operations.

[-symln <Counter with Delta>] - SymLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of symlink operations.

[-mknod <Counter with Delta>] - Mknod Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of mknod operations.

[-remove <Counter with Delta>] - Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rmdir <Counter with Delta>] - Rmdir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rmdir operations.

[-rename <Counter with Delta>] - Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

[-link <Counter with Delta>] - Link Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

[-rdir <Counter with Delta>] - ReadDir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

[-rdirp <Counter with Delta>] - ReadDirPlus Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdirplus operations.

[-fsstat <Counter with Delta>] - FsStat Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsstat operations.

[-fsinfo <Counter with Delta>] - FsInfo Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of fsinfo operations.

[-pconf <Counter with Delta>] - PathConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of pathconf operations.

[-commit <Counter with Delta>] - Commit Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

[-total <Counter64 with Delta>] - Total Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total NFSv3 operations.

[-null-pct <Counter with Delta>] - Percent Null Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

[-gattr-pct <Counter with Delta>] - Percent GetAttr Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

[-sattr-pct <Counter with Delta>] - Percent SetAttr Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[-lookup-pct <Counter with Delta>] - Percent LookUp Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

[-access-pct <Counter with Delta>] - Percent Access Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

[-rsym-pct <Counter with Delta>] - Percent ReadSymlink Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readsymlink operations.

[-read-pct <Counter with Delta>] - Percent Read Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[-write-pct <Counter with Delta>] - Percent Write Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[-create-pct <Counter with Delta>] - Percent Create Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

[-mkdir-pct <Counter with Delta>] - Percent Mkdir Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mkdir operations.

[-symlink-pct <Counter with Delta>] - Percent SymLink Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of symlink operations.

[-mknod-pct <Counter with Delta>] - Percent Mknod Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of mknod operations.

[-remove-pct <Counter with Delta>] - Percent Remove Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

[-rmdir-pct <Counter with Delta>] - Percent Rmdir Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rmdir operations.

[-rename-pct <Counter with Delta>] - Percent Rename Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[-link-pct <Counter with Delta>] - Percent Link Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

[-rdir-pct <Counter with Delta>] - Percent ReadDir Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdir operations.

[-rdirp-pct <Counter with Delta>] - Percent ReadDirPlus Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdirplus operations.

[-fsstat-pct <Counter with Delta>] - Percent FsStat Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsstat operations.

[-fsinfo-pct <Counter with Delta>] - Percent FsInfo Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of fsinfo operations.

[-pconf-pct <Counter with Delta>] - Percent PathConf Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of pathconf operations.

[-commit-pct <Counter with Delta>] - Percent Commit Ops

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

Examples

The following example displays statistics about the NFSv3 operations for a node named node1:

```
cluster1::> statistics nfs show-v3 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1			success	
Null Ops:	4	-	7%	-
GetAttr Ops:	10	-	19%	-
SetAttr Ops:	2	-	4%	-
Lookup Ops:	2	-	4%	-
Access Ops:	14	-	26%	-
ReadSymlink Ops:	0	-	0%	-
Read Ops:	0	-	0%	-
Write Ops:	0	-	0%	-
Create Ops:	2	-	4%	-
Mkdir Ops:	1	-	2%	-
Symlink Ops:	0	-	0%	-
Mknod Ops:	0	-	0%	-
Remove Ops:	1	-	2%	-
Rmdir Ops:	0	-	0%	-
Rename Ops:	0	-	0%	-
Link Ops:	0	-	0%	-
ReadDir Ops:	2	-	4%	-
ReadDirPlus Ops:	10	-	19%	-
FsStat Ops:	1	-	2%	-
FsInfo Ops:	5	-	9%	-
PathConf Ops:	0	-	0%	-
-				
Commit Ops:	0	-	0%	-
Total Ops:	54	-		

Node	Value	Delta	Percent Ops	Delta
node1			failure	
Null Ops:	0	-	0%	-
GetAttr Ops:	0	-	0%	-
SetAttr Ops:	0	-	0%	-
Lookup Ops:	2	-	100%	-
Access Ops:	0	-	0%	-
ReadSymlink Ops:	0	-	0%	-
Read Ops:	0	-	0%	-

PathConf Ops:	0	-	0%	-
Commit Ops:	0	-	0%	-
Total Ops:	56	-		

statistics nfs show-v4

Display NFSv4 statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `statistics nfs show-v4` command displays the following statistics about the NFSv4 operations on each node in the cluster:

- Result of the operations (success or failure)
- Total number of null operations
- Total number of compound operations
- Total number of access operations
- Total number of close operations
- Total number of commit operations
- Total number of create operations
- Total number of delegpurge operations
- Total number of delegret operations
- Total number of getattr operations
- Total number of getfh operations
- Total number of link operations
- Total number of lock operations
- Total number of lockt operations
- Total number of locku operations
- Total number of lookup operations
- Total number of lookupp operations
- Total number of nverify operations
- Total number of open operations
- Total number of openattr operations
- Total number of openconf operations
- Total number of opendowng operations
- Total number of putfh operations

- Total number of putpubfh operations
- Total number of putrootfh operations
- Total number of read operations
- Total number of readdir operations
- Total number of readlink operations
- Total number of remove operations
- Total number of rename operations
- Total number of renew operations
- Total number of restorefh operations
- Total number of savefh operations
- Total number of secinfo operations
- Total number of setattr operations
- Total number of setcliid operations
- Total number of setcliidconf operations
- Total number of verify operations
- Total number of write operations
- Total number of rellockown operations
- Total number of total operations
- Percent of null operations
- Percent of compound operations
- Percent of access operations
- Percent of close operations
- Percent of commit operations
- Percent of create operations
- Percent of delegpurge operations
- Percent of delegret operations
- Percent of setattr operations
- Percent of getfh operations
- Percent of link operations
- Percent of lock operations
- Percent of lockt operations
- Percent of locku operations
- Percent of lookup operations
- Percent of lookupp operations

- Percent of nverify operations
- Percent of open operations
- Percent of openattr operations
- Percent of openconf operations
- Percent of opendowng operations
- Percent of putfh operations
- Percent of putpubfh operations
- Percent of putrootfh operations
- Percent of read operations
- Percent of readdir operations
- Percent of readlink operations
- Percent of remove operations
- Percent of rename operations
- Percent of renew operations
- Percent of restorefh operations
- Percent of savefh operations
- Percent of secinfo operations
- Percent of setattr operations
- Percent of setcliid operations
- Percent of setCliidconf operations
- Percent of verify operations
- Percent of write operations
- Percent of rellockown operations

This command is designed to be used to analyze performance characteristics and to help diagnose issues.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

If you specify this parameter, the command displays NFSv4 statistics only for the specified node.

`[-result {success/failure/all}] - Result`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified result (success/failure/all).

`[-null <Counter with Delta>] - Null Procedure`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of null operations.

`[-cmpnd <Counter with Delta>] - Compound Procedure`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of compound operations.

`[-access <Counter with Delta>] - Access Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of access operations.

`[-close <Counter with Delta>] - Close Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of close operations.

`[-commit <Counter with Delta>] - Commit Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of commit operations.

`[-create <Counter with Delta>] - Create Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of create operations.

`[-delpur <Counter with Delta>] - Delempurge Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delempurge operations.

`[-delrtn <Counter with Delta>] - Delegret Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of delegret operations.

`[-gattr <Counter with Delta>] - GetAttr Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getattr operations.

`[-getfh <Counter with Delta>] - GetFh Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of getfh operations.

`[-link <Counter with Delta>] - Link Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of link operations.

`[-lock <Counter with Delta>] - Lock Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lock operations.

`[-lockt <Counter with Delta>] - LockT Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lockt operations.

`[-locku <Counter with Delta>] - LockU Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of locku operations.

[-lookup <Counter with Delta>] - Lookup Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookup operations.

[-lookpp <Counter with Delta>] - LookupP Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of lookupp operations.

[-nverify <Counter with Delta>] - Nverify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of nverify operations.

[-open <Counter with Delta>] - Open Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of open operations.

[-opattr <Counter with Delta>] - OpenAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openattr operations.

[-opconf <Counter with Delta>] - OpenConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of openconf operations.

[-opndg <Counter with Delta>] - OpenDowng Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of opendowng operations.

[-putfh <Counter with Delta>] - PutFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putfh operations.

[-putpfh <Counter with Delta>] - PutPubFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putpubfh operations.

[-putrfh <Counter with Delta>] - PutRootFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of putrootfh operations.

[-read <Counter with Delta>] - Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of read operations.

[-readdir <Counter with Delta>] - ReadDir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readdir operations.

[-rlink <Counter with Delta>] - ReadLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of readlink operations.

[-remove <Counter with Delta>] - Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of remove operations.

[-rename <Counter with Delta>] - Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rename operations.

`[-renew <Counter with Delta>] - Renew Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of renew operations.

`[-restfh <Counter with Delta>] - RestoreFh Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of restorefh operations.

`[-savefh <Counter with Delta>] - SaveFh Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of savefh operations.

`[-secinf <Counter with Delta>] - SecInfo Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of secinfo operations.

`[-sattn <Counter with Delta>] - SetAttr Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setattr operations.

`[-scld <Counter with Delta>] - SetCliId Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliid operations.

`[-scldc <Counter with Delta>] - SetCliIdConf Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of setcliidconf operations.

`[-verify <Counter with Delta>] - Verify Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of verify operations.

`[-write <Counter with Delta>] - Write Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of write operations.

`[-relown <Counter with Delta>] - RelLockOwn Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of rellockown operations.

`[-total <Counter64 with Delta>] - Total Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified number of total nfsv4 operations.

`[-null-pct <Counter with Delta>] - Percent Null Procedure`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of null operations.

`[-cmpnd-pct <Counter with Delta>] - Percent Compound Procedure`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of compound operations.

`[-access-pct <Counter with Delta>] - Percent Access Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of access operations.

`[-close-pct <Counter with Delta>] - Percent Close Operations`

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of close operations.

`[-commit-pct <Counter with Delta>]` - Percent Commit Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of commit operations.

`[-create-pct <Counter with Delta>]` - Percent Create Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of create operations.

`[-delpur-pct <Counter with Delta>]` - Percent Delempurge Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of delempurge operations.

`[-delrtn-pct <Counter with Delta>]` - Percent Deleget Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of deleget operations.

`[-gattr-pct <Counter with Delta>]` - Percent GetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getattr operations.

`[-getfh-pct <Counter with Delta>]` - Percent GetFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of getfh operations.

`[-link-pct <Counter with Delta>]` - Percent Link Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of link operations.

`[-lock-pct <Counter with Delta>]` - Percent Lock Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lock operations.

`[-lockt-pct <Counter with Delta>]` - Percent LockT Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lockt operations.

`[-locku-pct <Counter with Delta>]` - Percent LockU Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of locku operations.

`[-lookup-pct <Counter with Delta>]` - Percent Lookup Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookup operations.

`[-lookpp-pct <Counter with Delta>]` - Percent LookupP Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of lookupp operations.

`[-nverfy-pct <Counter with Delta>]` - Percent Nverify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of nverify operations.

`[-open-pct <Counter with Delta>]` - Percent Open Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of open operations.

`[-opattn-pct <Counter with Delta>]` - Percent OpenAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opattn operations.

[-opconf-pct <Counter with Delta>] - Percent OpenConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of openconf operations.

[-opndg-pct <Counter with Delta>] - Percent OpenDowng Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of opendowng operations.

[-putfh-pct <Counter with Delta>] - Percent PutFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putfh operations.

[-putpfh-pct <Counter with Delta>] - Percent PutPubFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putpubfh operations.

[-putrfh-pct <Counter with Delta>] - Percent PutRootFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of putrootfh operations.

[-read-pct <Counter with Delta>] - Percent Read Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of read operations.

[-readdr-pct <Counter with Delta>] - Percent ReadDir Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readdr operations.

[-rlink-pct <Counter with Delta>] - Percent ReadLink Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of readlink operations.

[-remove-pct <Counter with Delta>] - Percent Remove Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of remove operations.

[-rename-pct <Counter with Delta>] - Percent Rename Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of rename operations.

[-renew-pct <Counter with Delta>] - Percent Renew Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of renew operations.

[-restfh-pct <Counter with Delta>] - Percent RestoreFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of restorefh operations.

[-savefh-pct <Counter with Delta>] - Percent SaveFh Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of savefh operations.

[-secinf-pct <Counter with Delta>] - Percent SecInfo Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of secinfo operations.

[-sattr-pct <Counter with Delta>] - Percent SetAttr Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setattr operations.

[-sclid-pct <Counter with Delta>] - Percent SetCliId Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliid operations.

[-scidc-pct <Counter with Delta>] - Percent SetCliIdConf Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of setcliidconf operations.

[-verify-pct <Counter with Delta>] - Percent Verify Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of verify operations.

[-write-pct <Counter with Delta>] - Percent Write Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of write operations.

[-relockown-pct <Counter with Delta>] - Percent RelLockOwn Operations

If you specify this parameter, the command displays statistics only about the node or nodes that have the specified percentage of relockown operations.

Examples

The following example displays statistics about the NFSv4 operations for a node named node1:

```
cluster1::> statistics nfs show-v4 -node node1
```

Node	Value	Delta	Percent Ops	Delta
node1			success	
Null Procs:	2	-	1%	-

statistics node commands

System utilization metrics for each node in the cluster

statistics node show

System utilization metrics for each node in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for nodes at a regular interval. The command output displays data in the following columns:

- Node - node name.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(ms) - average latency for an operation in milliseconds.

Parameters

[-node {<nodename>/local}] - Node

Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of aggregates to display. The default setting is 25.

Examples

The following example displays node statistics:

```
cluster1::> statistics node show
cluster1 : 12/31/2013 16:00:04

      CPU *Total Latency
Node  (%)   Ops   (ms)
-----
```

```
node2  76    113    -
node1  58     10    -
[...]
```

statistics oncrpc commands

Monitor ONC RPC statistics

statistics oncrpc show-rpc-calls

Display ONC RPC Call Statistics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Attention: This command is deprecated and will be removed in a future major release.

The `statistics oncrpc show-rpc-calls` command displays information about the Open Network Computing Remote Procedure Call (ONC RPC) calls performed by the nodes of a cluster.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance]}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>/local}] - Node

Use this parameter to display information only about the RPC calls performed by the node you specify.

[-protocol {TCP/UDP}] - Transport Protocol

Use this parameter to display information only about the RPC calls performed using the network protocol you specify.

[-badproc <Counter with Delta>] - Bad Procedure Calls

Use this parameter to display information only about the RPC calls that have the number of bad procedure calls you specify. Bad procedure calls are RPC requests that contain invalid procedure numbers and cannot be completed.

[-badlen <Counter with Delta>] - Bad Length Calls

Use this parameter to display information only about the RPC calls that have the number of bad length calls you specify.

[-badhdr <Counter with Delta>] - Bad Header Calls

Use this parameter to display information only about the RPC calls that have the number of bad header calls you specify.

[-badcalls <Counter with Delta>] - Bad Calls

Use this parameter to display information only about the RPC calls that have the number of bad calls you specify.

`[-badprogcalls <Counter with Delta>] - Bad Program Calls`

Use this parameter to display information only about the RPC calls that have the number of bad program calls you specify.

`[-calls <Counter64 with Delta>] - Total Calls`

Use this parameter to display information only about the RPC calls that have the total number of bad calls you specify.

Examples

```
cluster1::> statistics oncrpc show-rpc-calls
```

Node	Value	Delta
node1	-----tcp-----	
Bad Proc:	0	-
Bad Len:	0	-
Bad Hdr:	0	-
Bad Calls:	0	-
Bad Prog Calls:	0	-
Total Calls:	0	-

Node	Value	Delta
node1	-----udp-----	
Bad Proc:	0	-
Bad Len:	0	-
Bad Hdr:	0	-
Bad Calls:	0	-
Bad Prog Calls:	0	-
Total Calls:	0	-

Node	Value	Delta
node2	-----tcp-----	
Bad Proc:	0	-
Bad Len:	0	-
Bad Hdr:	0	-
Bad Calls:	0	-
Bad Prog Calls:	0	-
Total Calls:	0	-

Node	Value	Delta
node2	-----udp-----	
Bad Proc:	0	-
Bad Len:	0	-
Bad Hdr:	0	-
Bad Calls:	0	-
Bad Prog Calls:	0	-
Total Calls:	0	-

4 entries were displayed.

statistics port commands

Displays performance data for ports

statistics port fcp commands

FCP port interface throughput and latency metrics

statistics port fcp show

FCP port interface throughput and latency metrics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for FCP ports at a regular interval. The command output displays data in the following columns:

- Port - port name.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.

Parameters

[-port <text>] - Port

Selects the port for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of ports to display. The default setting is 25.

Examples

The following example displays port statistics:

```
cluster1::> statistics port fcp show
cluster1 : 12/31/2013 16:00:04

  *Total Read Write
Port   Ops  Ops  Ops
-----
port1   2    2    0
port2   3    0    3
[...]
```

Performance Preset configuration directory

The preset directory

Directory contains commands to delete, modify, import, and display Performance Preset configurations and their details. A Performance Preset declares a list of one or more Performance Object names and a list of Performance Counter names (for each Object). Preset configurations expected to be used by the Performance Archive will specify sample periods for each Counter, declaring how often each Counter is to be archived. To create a new Performance Preset configuration, the *perf-preset-create* API or `statistics preset import` command must be used.

statistics preset delete

Delete an existing Performance Preset

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Deletes a performance preset configuration and all of its associated details.

Parameters

-preset <text> - Preset Name

Specifies the name of the performance presets that you want to delete.

Examples

```
cluster1::*> statistics preset show
  Preset Name: asup-event
  Preset UUID: 55c03699-01db-11e2-8e3e-123478563412
  Comment: The event-based AutoSupport Data ONTAP Performance
Archive
  preset configuration. This preset configuration is used
  whenever an event-based AutoSupport is triggered.
  Privilege: diagnostic
  Read-Only: true
  Archive Enabled: false
  Generation ID: 0

  Preset Name: asup-hourly
  Preset UUID: 56178a2a-01db-11e2-8e3e-123478563412
  Comment: The hourly AutoSupport Data ONTAP Performance Archive
  preset configuration. This preset configuration is used
by
  the hourly AutoSupport collection events.
  Privilege: diagnostic
  Read-Only: true
  Archive Enabled: true
  Generation ID: 0

  Preset Name: default
  Preset UUID: 55ac6297-01db-11e2-8e3e-123478563412
  Comment: The default Data ONTAP Performance Archive preset
  configuration. This preset configuration includes
  essential counters to assist in general troubleshooting
of
  system performance.
  Privilege: diagnostic

```

statistics preset modify

Modify an existing Performance Preset

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Modifies an existing performance preset configuration. The command modifies the global properties of a preset, but does not modify the details of the preset, such as specific objects and counters sampled.

Parameters

-preset <text> - Preset Name

Name of the performance preset to be modified.

[-new-name <text>] - New Preset Name

Set preset name to the given new name.

[-comment <text>] - Preset Description

Set comment to the given value.

[-privilege <PrivilegeLevel>] - Preset Privilege Level

Set privilege level at which this preset can be viewed or modified to the given value. Possible values: admin, advanced, diagnostic.

Examples

```
cluster1::*> statistics preset show
Preset Name: delta
Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
Comment: custom preset description
Privilege: diagnostic
Read-Only: false
Archive Enabled: false
Generation ID: 0

1 entry was displayed.

cluster1::*> statistics preset modify -preset delta -comment "new comment"

cluster1::*> statistics preset show
Preset Name: delta
Preset UUID: 7a04f19d-02a7-11e2-8e40-123478563412
Comment: new comment
Privilege: diagnostic
Read-Only: false
Archive Enabled: false
Generation ID: 0

1 entry was displayed.
```

statistics preset show

Display information about Performance Presets

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Displays information about performance preset configurations.

Parameters

{ [-fields <fieldname>, ...]

Selects which performance preset attributes to display.

| [-instance]}

Shows details of all attributes of performance preset configuration.

[-preset <text>] - **Preset Name**

Selects the performance presets that match the specified preset name.

[-comment <text>] - **Preset Description**

Selects the performance presets that match the specified comment.

[-privilege <PrivilegeLevel>] - **Preset Privilege Level**

Selects the performance presets that are available with the specified privilege.

[-is-read-only {true/false}] - **Is Preset Read-Only?**

Selects the performance presets that are read-only (true) or are not read-only (false). Read-only presets cannot be modified.

[-store <text>] - Name of Store Where Data is Saved

Selects the store where data is saved.

Examples

```
cluster1::*> statistics preset show
Preset Name      Privilege  Read-Only  Comment
-----
aggregate_overview  admin      true      This preset configuration is used by
                                     statistics aggregate show command.
                                     Provides overview of aggregate
object.
disk_overview      advanced   true      This preset configuration is used by
                                     statistics disk show command.
                                     Provides overview of disk object.
fcp_port_overview  admin      true      This preset configuration is used by
                                     statistics port fcp show command.
                                     Provides overview of fcp port
object.
flash_pool_overview admin      true      This preset configuration is used by
                                     statistics cache flash-pool show
                                     command. Provides overview of flash
                                     pool object.

[...]
```

Performance Preset Detail directory

The detail directory

Directory contains commands to display Performance Preset Details for Performance Preset configurations.

statistics preset detail show

Display information about Performance Preset Details

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Displays the specific details of each preset, including the objects sampled, the counter sample periods, and the counters sampled.

Parameters

{ [-fields <fieldname>, ...]

Selects which performance preset detail attributes to display.

| [-instance]}

Displays all of the performance preset detail attributes.

[-preset <text>] - **Preset Name**

Selects the performance preset details that match the specified preset name.

[-object <text>] - **Performance Object**

Selects the performance preset details that match the specified object name.

[-sample-period <sample_period>] - **Archive Sample period**

Selects the performance preset details that are collected at the specified sample period.

[-counter-set <text>, ...] - **Performance Counter Name Set**

Selects the performance preset details that match the specified counters in the counter set. Use "|" to separate multiple counters.

[-instance-filters <text>, ...] - Performance Instance Filters

Selects the performance preset details that match the specified instance filters. Use "|" to separate multiple instance filters. This field is reserved for future use.

Examples

```
cluster1::*> statistics preset detail show
Preset Name Object      Sample Counter      Instance
-----
asup-event  aggregate  1w      instance_name, -
                                     node_name,
                                     process_name,
                                     parent_host,
                                     total_
                                     transfers,
                                     user_reads,
                                     user_writes,
                                     cp_reads,
                                     user_read_
                                     blocks,
                                     user_write_
                                     blocks,
                                     cp_read_
                                     blocks,
                                     wv_fsid,
                                     wv_vol_type,
                                     wv_fsinfo_fs_
                                     version,
                                     wv_volininfo_fs_
                                     options,
. . .
```

statistics qtree commands

Qtree I/O operation rates

statistics qtree show

Qtree I/O operation rates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for qtrees at a regular interval. The command output displays data in the following columns:

- Qtree - Qtree name.
- Vserver - Vserver name.
- Volume - Volume name.
- NFS Ops - NFS operations per second.
- CIFS Ops - CIFS operations per second.
- Internal Ops - Internal operations per second.
- Total Ops - Total number of operations per second.

Parameters**[-qtree <text>] - Qtree**

Selects the qtree for which you want to display performance data. The qtree name has to be given in the format "vol_name/qtree_name"

[-vserver <vserver name>] - Vserver

Selects the Vserver for which you want to display performance data.

[-volume <text>] - Volume

Selects the volume for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of qtrees to display. The default setting is 25.

Examples

The following example displays qtree statistics:

```
C1_sti20-vsim-ucs429g_1520278254::> statistics qtree show
C1_sti20-vsim-ucs429g_1520278254 : 3/14/2018 15:40:46
```

Qtree	Vserver	Volume	NFS ops	CIFS ops	Internal ops	*Total ops
flexvol/qt1	vs0	flexvol	7	0	0	7
dp_vol/qt9	vs0	dp_vol	7	0	0	7
dp_vol/qt8	vs0	dp_vol	7	0	0	7

[...]

statistics samples directory

The samples directory

The `statistics samples` commands provide information about samples.

statistics samples delete

Delete statistics samples

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command deletes samples that you created using the `statistics start` command.

Parameters**-vserver <vserver name> - Vserver**

Selects the Vserver for which you want to delete the sample. The default Vserver is admin Vserver.

-sample-id <text> - Sample Identifier

Specifies the sample that you want to delete. This is a required parameter.

Examples

The following example deletes the sample "smpl_1":

```
cluster1::*> statistics samples delete -sample-id smpl_1
```

[statistics start](#) on page 882

statistics samples show

Display statistics samples

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays information about the samples that you created using the [statistics start](#) command.

Parameters**{ [-fields <fieldname>, ...]**

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-describe]}

Displays detailed information about each sample.

[-vserver <vserver name>] - Vserver

Selects the samples that match this parameter value. If you omit this parameter, the command displays details for all samples.

[-sample-id <text>] - Sample Identifier

Selects the samples that match this parameter value. If you do not specify this parameter, the command will display information about all the samples in the cluster.

Examples

The following example displays information for sample "smpl_1":

```
cluster1::*> statistics samples show -sample-id smpl_1
```

Vserver	Sample ID	Start Time	Stop Time	Status
cluster-d1	smpl_1	09/13 18:06:46	-	Ready

The following example displays detailed information for sample "smp1_1":

```
cluster1::*> statistics samples show -sample-id smp1_1 -describe

Vserver: vs1
Sample ID: smp1_1
Object: processor
Instance: -
Counter: -
Start Time: 09/13 18:06:46
Stop Time: -
Status: Ready      - -
Privilege: admin
```

statistics settings commands

Manage the displaying of statistics

statistics settings modify

Modify settings for the statistics commands

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the settings for all of the [statistics](#) commands.

Parameters

`[-display-rates {true/false}] - Display Rates`

Specifies whether the [statistics](#) commands display rate counters in rates/second. The default is true.

`[-client-stats {enabled/disabled}] - Collect Per-Client Statistics`

Specifies whether [statistics](#) commands display per-client information. The default is disabled.

Note: If you enable this setting, you might significantly impact system performance.

`[-counter-display-units {B/KB/MB/GB}] - Counter Display Units`

Specifies display units for the counters. The default setting is MB.

`[-display-count-exponent <integer>] - Display Count Exponent`

Specifies display exponent value for the counters representing counts. The default setting is 3 (thousand).

Examples

The following example sets the value of the **`-display-rates`** parameter to false:

```
cluster1::*> statistics settings modify -display-rates false
```

statistics settings show

Display settings for the statistics commands

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the current settings for all of the [statistics](#) commands.

Examples

The following example displays the current settings for all [statistics](#) commands:

```
cluster1::*> statistics settings show
Display rate Counters in rate/sec: true

Counter Display: full
Counter Display Units: MB
Display Count Exponent: 3
```

statistics system commands

System utilization metrics for the cluster

statistics system show

System utilization metrics for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for cluster at a regular interval. The command output displays data in the following columns:

- System - cluster name.
- CPU (%) - CPU utilization.
- Total Ops - total number of operations per second.
- Latency(ms) - average latency for an operation in milliseconds.

Parameters

`[-system <text>]` - System

Selects the cluster for which you want to display performance data.

`[-sort-key <text>]` - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of systems to display. The default setting is 25.

Examples

The following example displays system statistics:

```
cluster1::> statistics system show
cluster1 : 12/31/2013 16:00:04

      CPU *Total Latency
System (%)   Ops   (ms)
-----
Cluster  76    113    -
[...]
```

statistics top commands

Displays performance data for statistically tracked objects

statistics top client commands

Most active NFS and CIFS clients

statistics top client show

Most active NFS and CIFS clients

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for the top NFS and CIFS clients at a regular interval. The command output displays data in the following columns:

- Client - client name.
- Vserver - vservers name.
- Node - node name.
- Total Ops - total number of operations per second.
- Total (Bps) - total throughput in bytes per second.

Parameters

[*-node* {<nodename>/local}] - Node

Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies maximum number of top clients to display. The default setting is 10.

Examples

The following example displays top client statistics:

```
cluster1::> statistics top client show
cluster-1 : 12/31/1969 16:00:04
```

Client	Vserver	Node	*Total Ops	Total (Bps)
172.17.236.53:938	vserver01	cluster-node2	9	80
172.17.236.160:898	vserver02	cluster-node1	6	50

statistics top file commands

Most actively accessed files

statistics top file show

Most actively accessed files

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for top files at a regular interval. The command output displays data in the following columns:

- File - file name.
- Volume - volume name.
- Vserver - vserver name.
- Aggregate - aggregate name.
- Node - node name.
- Total Ops - total number of operations per second.
- Total (Bps) - total throughput in bytes per second.

Parameters**[-node {<nodename>/local}] - Node**

Selects the node for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies maximum number of top files to display. The default setting is 10.

Examples

The following example displays top files statistics:

```
cluster1::> statistics top file show
cluster-1 : 12/31/1969 16:00:04
```

Total	File	Volume	Vserver	Aggregate	Node	*Total Ops

statistics volume commands

Volume throughput and latency metrics

statistics volume show

Volume throughput and latency metrics

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.**Description**

This command continuously displays performance data for volumes at a regular interval. The command output displays data in the following columns:

- Volume - volume name.
- Vserver - vserver name.
- Aggregate - aggregate name.

- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

Parameters

[-volume <text>] - Volume

Selects the volume for which you want to display performance data.

[-vserver <vserver name>] - Vserver

Selects the vservers for which you want to display performance data.

[-aggregate <text>] - Aggregate

Selects the aggregate for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of volumes to display. The default setting is 25.

Examples

The following example displays volume statistics:

```
cluster1::> statistics volume show
cluster1 : 12/31/2013 16:00:04
```

Volume	Vserver	Aggregate	*Total Ops	Read Ops	Write Ops	Other Ops	Read (Bps)	Write (Bps)	Latency (us)

statistics vservers commands

Vserver throughput and latency metrics

statistics vsriver show

Vserver throughput and latency metrics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command continuously displays performance data for Vservers at a regular interval. The command output displays data in the following columns:

- Vserver - Vserver name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

Parameters

[-vserver <vserver name>] - Vserver

Selects the vsriver for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of Vservers to display. The default setting is 25.

Examples

The following example displays Vserver statistics:

```
cluster1::> statistics vsriver show
cluster1 : 12/31/2013 16:00:04
```

statistics workload commands

QoS workload throughput and latency metrics

statistics workload show

QoS workload throughput and latency metrics

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command continuously displays performance data for workloads at a regular interval. The command output displays data in the following columns:

- Workload - workload name.
- Total Ops - total number of operations per second.
- Read Ops - read operations per second.
- Write Ops - write operations per second.
- Other Ops - other operations per second.
- Read (Bps) - read throughput in bytes per second.
- Write (Bps) - write throughput in bytes per second.
- Latency(us) - average latency for an operation in microseconds.

Parameters

[-workload <text>] - Workload

Selects the workload for which you want to display performance data.

[-sort-key <text>] - Column to Sort By

If this parameter is specified, the command displays statistics sorted by the specified column.

-interval <integer> - Interval

Specifies, in seconds, the interval between statistics updates. The default setting is 5 seconds.

-iterations <integer> - Iterations

Specifies the number of iterations the command runs before terminating. The default setting is 1. If the number is 0 (zero), the command continues to run until you interrupt it by pressing Ctrl-C.

-max <integer> - Maximum Number of Instances

Specifies the maximum number of workloads to display. The default setting is 25.

Examples

The following example displays workload statistics:

```
cluster1::> statistics workload show
cluster1 : 12/31/2013 16:00:04

```

storage-service commands

Manage Storage Services

storage-service show

Display the available storage services

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the available storage services.

Note: The available storage services are defined by the type of storage making up an aggregate.

Parameters

{ [-fields <fieldname>, ...]

If you specify the **-fields <fieldname>, ...** parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance]}

If you specify the **-instance** parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - **Vserver**

Selects the available storage services for Vservers that match the parameter value.

[-storage-service <text>] - **Storage Service**

Selects the available storage services whose name matches the parameter value.

[-description <text>] - **Description**

Selects the available storage services whose description matches the parameter value. This field is a text description of the storage service.

[-expected-iops-per-tb <integer>] - **Expected IOPS per TB**

Selects the available storage services whose expected IOPS per TB matches the parameter value. When multiplied by a number of TB, this field yields the number of IOPS nominally guaranteed by the storage service. The multiplier is either the logical used space or the provisioned size of the storage object, depending on the value of **expected-iops-allocation**.

[-expected-iops-allocation {used-space/allocated-space}] - **Expected IOPS Allocation**

Selects the available storage services whose expected IOPS allocation policy matches the parameter value. The allocation policy is either *allocated-space* or *used-space*. When the expected-iops-allocation policy is *allocated-space*, the expected IOPS is calculated based on the size of the storage object. When the expected-iops-allocation policy is set to *used-space*, the expected IOPS is calculated based on the amount of data logically stored in the storage object.

`[-peak-iops-per-tb <integer>]` - Peak IOPS per TB

Selects the available storage services whose peak IOPS per TB matches the parameter value. When multiplied by a number of TB, this field yields the number of IOPS for the maximum Quality of Service (QoS) throttle. The multiplier is either the logical used space or the provisioned size of the storage object, depending on the value of **peak-iops-allocation**. Selects the available storage services whose peak IOPS per TB matches the parameter value. This field is the number of IOPS per provisioned TB used as the maximum Quality of Service (QoS) throttle. Selects the available storage services whose peak IOPS per TB matches the parameter value. This field is the number of IOPS per provisioned TB used as the maximum Quality of Service (QoS) throttle. Selects the available storage services whose peak IOPS per TB matches the parameter value. This field is the number of IOPS per provisioned TB used as the maximum Quality of Service (QoS) throttle.

`[-peak-iops-allocation {used-space/allocated-space}]` - Peak IOPS Allocation

Selects the available storage services whose peak IOPS allocation policy matches the parameter value. The allocation policy is either *allocated-space* or *used-space*. When the peak-iops-allocation policy is *allocated-space*, the peak IOPS is calculated based on the size of the storage object. When the peak-iops-allocation policy is set to *used-space*, the peak IOPS is calculated based on the amount of data logically stored in the storage object.

`[-absolute-min-iops <integer>]` - Absolute Minimum IOPS

Selects the available storage services whose absolute minimum IOPS matches the parameter value. This field is the minimum number of IOPS used as the Quality of Service (QoS) throttle, if larger than the values calculated using the IOPS per TB parameters.

`[-target-latency <integer>]` - Target Latency (ms)

Selects the available storage service whose target latency matches the parameter value.

`[-aggr-list <aggregate name>, ...]` - Aggregate List

Selects the available storage services whose aggregate list matches the parameter value. The aggregates shown are the only ones used for provisioning when the corresponding Vserver and storage service are selected.

Examples

```
cluster1::*> storage-service show
Vserver Storage Service  Description
-----
vs1
    extreme             Extreme Performance
    performance         Performance
    value               Value
3 entries were displayed.
```

Storage Commands

Manage physical storage, including disks, aggregates, and failover

The `storage` commands enable you to manage physical and logical storage, including disks and storage aggregates. They also enable you to manage storage failover.

Storage aggregate Commands

Manage storage aggregates

The `storage aggregate` command family manages aggregates. The storage aggregate commands can create new aggregates, add more disks to an aggregate, delete the existing ones, change aggregate status and apply options to an aggregate. Aggregate commands often affect the volumes contained within aggregates.

An aggregate name can contain letters, numbers, and the underscore character(`_`), but the first character must be a letter or underscore. A maximum of 100 aggregates can be created on each node.

An aggregate may be online, restricted, iron_restricted, or offline. When an aggregate is offline, no read or write access is allowed. When an aggregate is restricted, certain operations are allowed (parity recomputation or RAID reconstruction) but data access is not allowed.

Aggregates can be in combinations of the following raid status:

`normal`

The aggregate is in a normal state.

`copying`

The aggregate is currently the target aggregate of an active aggr copy operation.

`ironing`

A WAFL consistency check is being performed on this aggregate.

`degraded`

The aggregate contains at least one degraded RAID group that is not being reconstructed.

`mirror degraded`

The aggregate is a mirrored aggregate, and one of its plexes is offline or resyncing.

`growing`

Disks are in the process of being added to the aggregate.

`initializing`

The aggregate is in the process of being initialized.

`invalid`

The aggregate does not contain any volume and no volume can be added to it. Typically, this happens after an aborted aggregate copy operation.

`needs check`

A WAFL consistency check needs to be performed on the aggregate.

`partial`

The aggregate contains at least one disk, however, two or more disks are missing.

reconstruct

At least one RAID group in the aggregate is being reconstructed.

raid0

The aggregate consists of RAID-0 (no parity) RAID groups (V-Series and NetCache only).

raid4

The aggregate consists of RAID-4 RAID groups.

raid_dp

The aggregate consists of RAID-DP (Double Parity) RAID groups.

raid_tec

The aggregate consists of RAID-TEC (Triple Erasure Code) RAID groups.

redirect

A reallocation process optimized the layout of blocks in the aggregate. You cannot clear this status.

wafl inconsistent

The aggregate has been marked corrupted. Please contact technical support if you see an aggregate in this state.

storage aggregate add-disks

Add disks to an aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate add-disks` command adds disks to an existing aggregate. You must specify the number of disks or provide a list of disks to be added. If you specify the number of disks without providing a list of disks, the system selects the disks.

Parameters

-aggregate <aggregate name> - Aggregate

This parameter specifies the aggregate to which disks are to be added.

[-diskcount <integer>] - Disk Count

This parameter specifies the number of disks that are to be added to the aggregate.

{ [-disktype | -T {ATA / BSAS / FCAL / FSAS / LUN / MSATA / SAS / SSD / VMDISK / SSD-NVM}] - Disk Type

This parameter specifies the type of disk that is to be added. It must be specified with the `-diskcount` parameter when adding disks to a Flash Pool.

Use this parameter when adding spare SSDs to an aggregate to convert it to a Flash Pool.

Note: Only the aggregates marked as **hybrid-enabled** can be converted to Flash Pools. Use `storage aggregate modify` command to mark the aggregate as **hybrid-enabled**.

Note: When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`. Only disks of the specified type are considered eligible for selection.

[[-diskclass | -C {*capacity* / *performance* / *archive* / *solid-state* / *array* / *virtual*}] - Disk Class

This parameter specifies the class of disk that is to be added. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- *capacity* = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- *performance* = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- *archive* = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- *solid-state* = Solid-state drives. Includes disk type SSD and SSD-NVM.
- *array* = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- *virtual* = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Note: When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`.

[--chksumstyle <aggrChecksumStyle>] - Checksum Style

This parameter specifies the checksum style for the disks to be added to an aggregate. It is not applicable if `-disklist` or `-mirror-disklist` is specified. The possible values are *block* for block checksum and *advanced_zoned* for advanced zoned checksum (AZCS). By default, disks with the same checksum style as the aggregate are selected. This behavior can be overridden by using this parameter to create a mixed checksum aggregate. A mixed checksum aggregate can support only the *block* and *advanced_zoned* checksum styles.

[--disksize <integer>] - Disk Size(GB)

This parameter specifies the size, in GB, of the disks that are to be added to the aggregate. Disks with a usable size between 90% and 105% of the specified size are selected.

[[-disklist | -d <disk path name>, ...] - Disks

This parameter specifies a list of disks to be added. If you specify the `-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style, size or type.

[--mirror-disklist <disk path name>, ...] - Disks for Mirrored Plex

This parameter specifies a list of mirror disks to be added. It must contain the same number of disks specified in `-disklist` parameter. If you specify the `-mirror-disklist` parameter, you cannot further qualify the list of disks to be added by count, checksum style or type.

{ [-ignore-pool-checks [true]] - Don't Enforce Plex Pool Best Practices

The disks in a plex are normally required to come from the same SyncMirror pool. This behavior can be overridden with this parameter when it is set to *true*.

[--allow-mixed-rpm | -f [true]] - Allow Disks With Different RPM Values

This parameter specifies whether disks that have different RPM values can be added. For example, SAS disks can rotate at 10,000 or 15,000 RPM. If this parameter is set to *true* and a list of disks are provided by using the `-disklist`

parameter, the disks will be added even if the SAS disks you specify have different RPM values. This parameter works similarly for ATA disks, which can rotate at 5,400 or 7,200 RPM.

Note: This parameter is applicable only when the `-disklist` or `-mirror-disklist` parameter is used.

`[-allow-same-carrier [true]] - Allow Same RAID Group Within Carrier`

This parameter can be used to allow two disks housed in the same carrier to be in the same RAID group when you add disks to an aggregate.

Having disks in the same carrier in the same RAID group is not desirable because a carrier failure can cause a simultaneous outage for two disks in the same RAID group. You can add a disk to an aggregate that causes this situation, but when an alternate disk becomes available, Data ONTAP automatically initiates a series of disk copy operations to put the disks into different RAID groups. For this reason, you should use this parameter only when necessary. When possible, allow Data ONTAP to choose disks that need to be added to the aggregate.

This parameter affects only the add-disks operation. It is not a persistent attribute of the aggregate.

`[-storage-pool <storage pool name>] - Storage Pool`

This parameter specifies the name of the SSD storage pool from which available allocation units are added to a given aggregate. This parameter cannot be used with the `-disk-list` or `-disk-count` parameters.

`[-allocation-units <integer>]] - Allocation Units`

This parameter specifies the number of allocation units to be added to a given aggregate from an SSD storage pool. Number of allocation units available and size of each unit can be found using the `storage pool show-available-capacity` command. This parameter works only when you also use the `-storage-pool` parameter.

`[-simulate | -n [true]] - Simulate Addition of Disks`

This parameter is used with the `disktype` and `diskcount` parameters to determine which disks would be added without actually performing the addition of disks operation.

`[-raidgroup | -g {new/all/<raidgroup>}] - RAID Group`

This parameter enables the administrator to specify which RAID group will receive the added disks. If this parameter is not used, the disks are added to the most recently created RAID group until it is full, then new RAID groups are created and filled until all the disks are added. If a RAID group name `rgX` is specified, the disks are added to that RAID group. If `new` is specified, the disks are added to a new RAID group, even if the disks would fit into an existing RAID group. If `all` is specified, the disks are added to existing RAID groups until all existing RAID groups are full. Then Data ONTAP creates one or more new RAID groups and adds the remaining disks to the new groups. If the disk type or checksum style parameters are specified with this parameter, the command operates only on the RAID groups with the matching disk type or checksum style, even if `all` is specified.

`[-cache-raid-group-size <integer>] - RAID Group Size for Cache Tier`

This parameter specifies the maximum number of disks that can be included in an SSD RAID group for this aggregate.

Note: This parameter is applicable only when adding SSDs for the first time to a hybrid-enabled aggregate. If this parameter is not used when the first SSDs are

added to the aggregate, the maximum RAID group size for the SSD cache is set to the default SSD RAID group size for the RAID type of the SSD cache.

`[-raidtype | -t {raid_tec/raid_dp/raid4}] - RAID Type`

This parameter specifies the type for the new RAID groups that would be created while adding disks to the aggregate. Use this parameter when you add the first RAID group comprised of SSDs to a hybrid-enabled aggregate. The values are *raid4* for RAID4, *raid_dp* for RAID Double Parity, and *raid_tec* for RAID-TEC. The default value is the type of RAID groups of the aggregate, except for RAID-TEC hybrid-enabled aggregates where the SSD tier will default to *raid_dp*. An aggregate might include a mix of different RAID types.

Examples

The following example adds 10 disks to an aggregate named `aggr0`. The disks are added to a RAID group named `rg1`:

```
cluster1::> storage aggregate add-disks -aggregate aggr0 -diskcount 10 -
raidgroup rg1
```

In this example, an aggregate is converted to a Flash Pool aggregate using SSD capacity from a storage pool. The aggregate was created using RAID-DP for the hard disks and the SSDs are added using RAID4.

```
cluster1::> storage aggregate add-disks -aggregate FlashPool -storage-pool
SP1 -allocation-units 1 -raidtype raid4
```

storage aggregate auto-provision

Recommend and create new aggregates in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command analyzes available spare disks in the cluster, and it provides a recommendation how spare disks should be used to create aggregates according to best practices. The command prints the summary of recommended aggregates including their names and usable size. It then prompts the user whether the aggregates should be created as recommended. On positive response, ONTAP creates aggregates as described in the recommendation.

The command parameters allow to restrict the command to some nodes in the cluster, print more details about recommended aggregates, and to skip the prompt.

Parameters

`[-nodes {<nodename>/loc1}, ...] - List of Nodes`

Comma separated list of node names to which the command applies. If this parameter is not used, the command applies to all nodes in the cluster.

[-verbose [true]] - Report More Details

Report additional details about recommended aggregates and spare disks. Per node summary shows number and total size of aggregates to create, discovered spares, and also remaining spare disks and partitions after aggregate creation. RAID group layout shows how spare disks and partitions will be used in new data aggregates to be created. The last table shows spare disks and partitions remaining unused after aggregate creation.

[-skip-confirmation [true]] - Skip the Confirmation and Create Recommended Aggregates

When this parameter is used, the command automatically creates the recommended aggregates. When this parameter is not used, the command checks to proceed with aggregate creation or not.

Note: The command is not affected by the CLI session setting: `set - confirmations on/off`.

Examples

```
cluster1::storage aggregate> auto-provision
```

Node	New Data Aggregate	Usable Size
node1	node1_SSD_1	3.66TB
node2	node2_SSD_1	3.66TB
Total:	2 new data aggregates	7.32TB

```
Do you want to create recommended aggregates? {y|n}: n

cluster1::storage aggregate> auto-provision -verbose
Per node summary of new aggregates to create, discovered spares, and also
remaining spare disks and partitions after aggregate creation:
```

Node	New Aggrs	Total New Usable Size	-Discovered Disks	Spare-Partitions	-Remaining Spare-Disks	Spare-Partitions
node1	1	3.66TB	6	48	1	0
node2	1	3.66TB	6	48	1	0
Total:	2	7.32TB	12	96	2	0

New data aggregates to create with counts of disks and partitions to be used:

Node	New Data Aggregate	Usable Size	-Devices To Use-Disks	Partitions
node1	node1_SSD_1	3.66TB	5	48
node2	node2_SSD_1	3.66TB	5	48

RAID group layout showing how spare disks and partitions will be used in new data aggregates to be created:

RAID Group In New Count---	Data Aggregate To Be Created	Disk Type	Usable Size	Disk Or Partition	---
2	/node1_SSD_1/plex0/rg0	SSD	81.97GB	partition	22
2	/node1_SSD_1/plex0/rg1	SSD	81.97GB	partition	22
2	/node1_SSD_1/plex0/rg2	SSD	185.5GB	disk	3
2	/node2_SSD_1/plex0/rg0	SSD	81.97GB	partition	22
2	/node2_SSD_1/plex0/rg1	SSD	81.97GB	partition	22
2	/node2_SSD_1/plex0/rg2	SSD	185.5GB	disk	3

```
Details about spare disks and partitions remaining after aggregate creation:
```

Node	Disk Type	Device Usable Size	Disk Or Partition	Remaining Spares
node1	SSD	185.5GB	disk	1
node2	SSD	185.5GB	disk	1

```
Do you want to create recommended aggregates? {y|n}: y
```

```
Info: Aggregate auto provision has started. Use the "storage aggregate
show-auto-provision-progress" command to track the progress.

storage aggregate create

Create an aggregate

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `storage aggregate create` command creates an aggregate. An aggregate consists of disks. You must specify the number of disks or provide a list of disks to be added to the new aggregate. If you specify the number of disks without providing a list of disks, the system selects the disks.

When creating an aggregate, you can optionally specify the aggregate's home node, the RAID type for RAID groups on the aggregate, and the maximum number of disks that can be included in a RAID group.

Parameters

-aggregate <aggregate name> - Aggregate

This parameter specifies the name of the aggregate that is to be created.

[-checksumstyle <aggrChecksumStyle>] - Checksum Style

This parameter specifies the checksum style for the aggregate. The values are *block* for Block Checksum and *advanced_zoned* for Advanced Zoned Checksum (AZCS).

-diskcount <integer> - Number Of Disks

This parameter specifies the number of disks that are to be included in the aggregate, including the parity disks. The disks in this newly created aggregate come from the pool of spare disks. The smallest disks in this pool are added to the aggregate first, unless you specify the **-disksize** parameter.

`[-diskrpm | -R <integer>] - Disk RPM`

This parameter specifies the RPM of the disks on which the aggregate is to be created. The possible values include 5400, 7200, 10000, and 15000.

`[-disksize <integer>] - Disk Size(GB)`

This parameter specifies the size, in GB, of the disks on which the aggregate is to be created. Disks with a usable size between 90% and 105% of the specified size are selected.

`{ [-disktype | -T {ATA / BSAS / FCAL / FSAS / LUN / MSATA / SAS / SSD / VMDISK / SSD-NVM}] - Disk Type`

This parameter specifies the type of disk on which the aggregate is to be created.

Note: When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`. Only disks of the specified type are considered eligible for selection.

`[[-diskclass | -C {capacity / performance / archive / solid-state / array / virtual}] - Disk Class`

This parameter specifies the class of disks on which the aggregate is to be created. All disks that belong to the specified class are considered eligible for selection. The possible values are:

- `capacity` = Capacity-oriented, near-line disk types. Includes disk types FSAS, BSAS and ATA.
- `performance` = Performance-oriented, enterprise class disk types. Includes disk types FCAL and SAS.
- `archive` = Archive class SATA disks in multi-disk carrier storage shelves. Includes disk type MSATA.
- `solid-state` = Solid-state drives. Includes disk type SSD and SSD-NVM.
- `array` = Logical storage devices backed by storage arrays and used by Data ONTAP as disks. Includes disk type LUN.
- `virtual` = Virtual disks that are formatted and managed by the hypervisor. Includes disk type VMDISK.

Note: When this parameter is used, disk selection is not influenced by RAID options `raid.mix.hdd.disktype.capacity`, `raid.mix.hdd.disktype.performance`, or `raid.mix.disktype.solid_state`.

`[-mirror | -m [true]] - Mirror`

This parameter specifies that the new aggregate be mirrored (have two plexes). If this parameter is set to `true`, the specified disks are split between the two plexes. By default, the new aggregate will not be mirrored. You cannot use the `-mirror` parameter when supplying a specific list of disks with either the `-disklist` or `-mirror-disklist` parameters.

`[-pool <aggrSparePool>] - Spare Pool`

This parameter specifies the SyncMirror pool to be used to supply the disks for the aggregate. Valid values are `Pool0` or `Pool1`.

| -disklist | -d <disk path name>, ... - Disks for First Plex

This parameter specifies a list of disks to be added to the new aggregate. If you specify the **-disklist** parameter, you cannot further qualify the list of disks to be added by count, checksum style, type, size, or RPM. You cannot use the **-disklist** parameter when the **-mirror** parameter is set to *true*.

[-mirror-disklist <disk path name>, ...] - Disks for Mirrored Plex
