Dell SmartFabric OS10 User Guide

Release 10.5.4

12 2022
Rev. A05

DELL Technologies

Notes, cautions, and warnings

NOTE: A NOTE indicates important information that helps you make better use of your product.

CAUTION: A CAUTION indicates either potential damage to hardware or loss of data and tells you how to avoid the problem.

WARNING: A WARNING indicates a potential for property damage, personal injury, or death.

Contents

About this guide

This guide is intended for system administrators who are responsible for configuring and maintaining networks. It covers the following details:

- Installation and setup of Dell SmartFabric OS10.
- Description, configuration information, limitations and restrictions, and examples of features that SmartFabric OS10 supports.
- Reference information and examples on configuring protocols. For complete information about protocols, see the related documentation, including Internet Engineering Task Force (IETF) and Request For Comments (RFC).
- Command reference information for all the SmartFabric OS10 CLI commands.

To use this guide, you must have a good knowledge of Layer 2 (L2) and Layer 3 (L3) networking technologies.

This document may contain language that is not consistent with current guidelines of Dell Technologies. There are plans to update this document over subsequent releases to revise the language accordingly.

Conventions

This guide uses the following conventions to describe command syntax.

`Keyword`	Keywords are in Courier (a monospaced font) and must be entered in the CLI as listed.
`parameter`	Parameters are in italics and require a number or word to be entered in the CLI.
{X}	Keywords and parameters within braces must be entered in the CLI.
[X]	Keywords and parameters within brackets are optional.
x|y	Keywords and parameters separated by a bar require you to choose one option.

Related Documents

Dell SmartFabric OS10 is part of various networking solution deployments including PowerEdge MX, VxRail, and so on. SmartFabric Services (SFS) is an application suite that provides network fabric automation and API-based programmability. The following tables list all the available documentation for SmartFabric OS10 and SFS.

Documentation Feedback

Dell Technologies strives to provide accurate and comprehensive documentation and welcomes your suggestions and comments. You can provide feedback in the following ways:

- Online feedback form—Rate the documentation or provide your feedback on any of our documentation pages at www.dell.com/support.
- Email—Send your feedback to networkingpub.feedback@dell.com. Include the document title, release number, chapter title, and section title of the text corresponding to the feedback.

To get answers to your questions related to Dell SmartFabric OS10 through email, chat, or call, please visit our Technical Support page.

2

Change history

The following table provides an overview of the changes to this guide from a previous OS10 release to the 10.5.4.5 release. For more information about the new features, see the respective sections.

Table 3. New in 10.5.4.5

Revision	Date	Feature	Description
A05	2022-12-23	Support for GEN3 10GBASE-T SFP+ active copper modules	The following port types support GEN3 at 100M, 1G, and 10G speeds: • 10G SFP+ fiber ports in S5232F platform The following port types support GEN3 at 1G and 10G speeds: • 10G SFP+ fiber ports in the S4128F-ON and S4148F-ON platforms • 40G QSFP+ fiber ports in the S4128F-ON and S4148F-ON platforms • 25G SFP28 fiber ports in the S5212F-ON, S5224F-ON, S5248F-ON, and S5296F-ON platforms • 100G QSFP28 fiber ports in 4x10G breakout mode with QSA28 in the S4128F-ON, S4148FON, S5212F-ON, S5224F-ON, S5248F-ON, and S5296F-ON platforms

Table 4. New in 10.5.4.4

Revision	Date	Feature	Description
A04	2022-10-27	SNMP traps for BGP	Triggers SNMP traps when the state of BGP session changes to UP or DOWN from any other state. The `snmp-server host` command has been enhanced to enable traps of BGP session state changes for a specific SNMP host.
		SNMP traps for BFD	Triggers SNMP traps when the state of BFD session changes to UP or DOWN from any other state. The `snmp-server host` command has been enhanced to enable traps of BFD session state changes for a specific SNMP host.
		Support for privilege-level attribute through RADIUS server	The RADIUS client can now process the privilege level attribute. Previously, OS10 allowed to process only the

Table 4. New in 10.5.4.4 (continued)

Revision	Date	Feature	Description
			role attribute from the RADIUS server.
		Default MTU value	The default MTU value has been changed from 1532 to 9216 bytes.
		Disable dynamic MAC address learning	Allows to disable MAC address learning on the physical, LAG, and virtual interfaces.

Table 5. New in 10.5.4.3

Revision	Date	Feature	Description
A03	2022-09-16	Support for cables	The following cables are supported: • QSFP56-DD 400GBASE-CR8-x.xM • QSFP56-DD 4x(100GBASE-CR2)-x.xM • QSFP56-DD 400GBASE-CR8-x.xM

Table 6. New in 10.5.4.1

Revision	Date	Feature	Description
A02	2022-08-29	Support for PowerEdge MX Ethernet I/O modules	For latest information on the features and functionality of the PowerEdge MX networking switches, see Dell PowerEdge MX Networking Deployment Guide.

Table 7. New in 10.5.4.2

Revision	Date	Feature	Description
A01	2022-08-26	PTP two-step clock mode	PTP two-step clock sends the accurate timestamp in a Follow_Up message after the synchronization message is sent.
		Disable dynamic MAC address learning	Support for a new CLIs to disable MAC address learning on the physical and LAG interfaces.
		PowerSwitch Z9664F-ON	Added support for PowerSwitch Z9664F-ON platform.
		SNMP trap logs for configuration changes	SNMP trap logs are triggered when the startup configuration is modified and saved.
		ESE 2.1 to 2.4 upgrade	Upgrading ESE resolves the certificate changes automatically. After the ESE upgrade, you do not require to regenerate the universal key.
		PowerSwitch E3224F-ON	Added support for PowerSwitch E3224F-ON platform.

Table 7. New in 10.5.4.2 (continued)

Revision	Date	Feature	Description
		Support for FIPS on NTP	Enables support for FIPS-validated keyed-Hash Message Authentication Code (HAMC) on NTP.
		Password enablement	Enables the password text to appear as a string of asterisks instead of plain text.

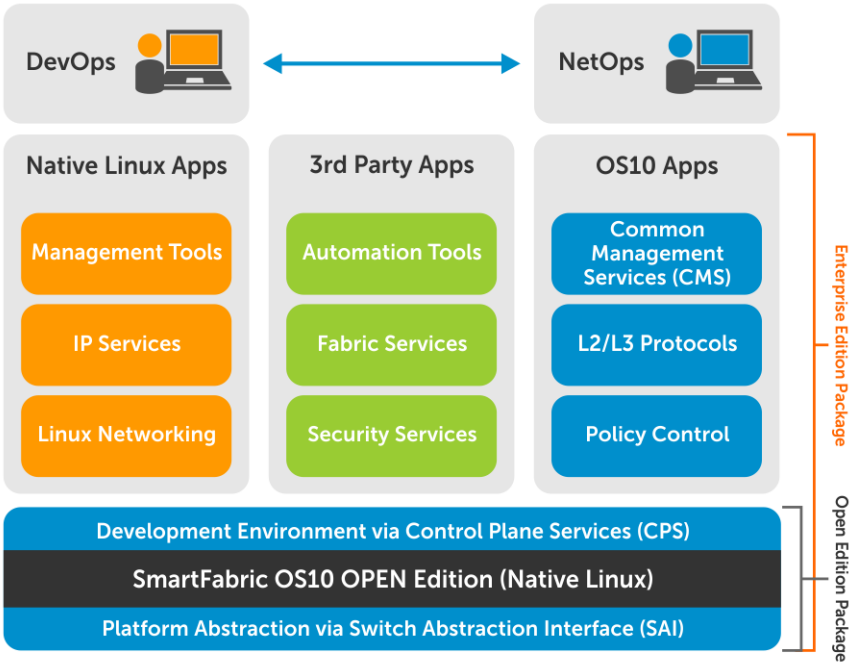
Table 8. New in 10.5.4.0

Revision	Date	Feature	Description
A00	2022-06-27	Clean reset	Using this feature, you can boot the system with predefined defaults.
		VLAN stacking	VLAN stacking enables service providers to offer separate VLANs to customers with no coordination between customers, with minimal coordination between customers and the provider.
		Layer 3 IPv6 Multicast Routing	Support for the following Layer 3 IPv6 Multicast features: MLD, PIM Sparse Mode (PIM-SM), and PIM Source Specific Multicast (PIM-SSM).
		CLI enhancement: show system	The `show system` command displays the following additional information on all platforms: • Firmware details of the switch. • Input power, average input power, and average power start time per power supply unit (PSU).
		SyncE and hybrid clocking	Support for SyncE and hybrid clocking on PowerSwitch Z9432F-ON. **NOTE:** The residence time update in end-to-end transparent clock is supported only with Layer 2 and IP unicast traffic, and it is not supported with multicast traffic.
		ARP suppression	Starting from this release, ARP suppression is disabled internally by default.

3

Getting Started with Dell SmartFabric OS10

Dell SmartFabric OS10 is a network operating system (NOS) supporting multiple architectures and environments. The SmartFabric OS10 solution allows multi-layered disaggregation of network functionality. SmartFabric OS10 bundles industry-standard management, monitoring, and Layer 2 and Layer 3 networking stacks over CLI, SNMP, and REST interfaces. Users can choose their own third-party networking, monitoring, management, and orchestration applications. To develop scalable L2 and L3 networks, the SmartFabric OS10 delivers a modular and disaggregated solution in a single-binary image.



SmartFabric OS10 key features

- Standard networking features, interfaces, and scripting functions for legacy network operations integration
- Standards-based switching hardware abstraction through the Switch Abstraction Interface (SAI)
- Pervasive, unrestricted developer environment through Control Plane Services (CPS)
- Layer 2 switching and Layer 3 routing protocols with integrated IP services, quality of service, manageability, and automation features
- Increase VM Mobility region by extending L2 VLAN within or across two DCs with unique VLT capabilities
- Programmatic APIs and CLI automation using batch and aliases to simplify configuration management
- Converged network support for Data Center Bridging, with priority flow control (802.1Qbb), ETS (802.1Qaz), DCBx, and iSCSI TLV

Supported platforms: For a list of currently supported Dell switches for your SmartFabric OS10 release, see the *SmartFabric OS10 Release Notes*. The SmartFabric OS10 Release Notes are stored in the Dell Digital Locker (DDL) with SmartFabric OS10 software updates.

Third-party software: Dell Technologies does not support third-party software and drivers, community projects, code development, or implementation and development of security rules and policies.

NOTE: For the latest installation, upgrade, and downgrade information for SmartFabric OS10, see Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide.

Switch deployment options

OS10 supports the following methods to deploy a switch:

- Manually by using the command-line interface.
- Automatically using zero-touch deployment (ZTD).
- Automatically using customized scripts with Ansible.

Manual CLI configuration

Use the OS10 command-line interface to enter commands to monitor and configure an OS10 switch. Set up your switch by performing basic and advanced CLI tasks — CLI basics and Advanced CLI tasks. Then proceed with other configuration settings according to how you deploy the switch in your network. For detailed configuration and CLI information, refer to the appropriate chapter.

ZTD-automated switch deployment

Automate OS10 switch deployment using zero-touch deployment, including:

- Upgrade an existing OS10 image.
- Execute a CLI batch file to configure the switch.
- Execute a post-ZTD script to perform additional functions.

See Zero-touch deployment.

Ansible-automated switch provisioning

Automate OS10 switch configuration using Ansible, a third-party DevOps tool. Create and execute Ansible playbooks to configure multiple devices. For more information, see Using Ansible.

Feature limitation on the Z9100-ON and S5200-ON series switches

On the Z9100-ON and S5200-ON series switches, system flow is enabled by default. You can also enable iSCSI and any three of the following features simultaneously:

- IPv4 user ACL
- IPv4 PBR ACL
- IPv4 QoS
- IPv6 user ACL
- IPv6 PBR
- IPv6 QoS
- L2 user ACL
- Dynamic ARP Inspection
- FCoE
- FIP snooping

Feature limitations on Z9332F-ON switch

The Z9332F-ON switch does not support the following:

- VXLAN
- UFT Mode
- Resilient hashing for port channels
- Storm control
- Port monitoring and remote port monitoring session with destination over port channel interface
- Location LED

Remote access

After you install or upgrade OS10 and log in, you can set up remote access to the OS10 command-line interface and the Linux shell. Connect to the switch using the serial port. Serial port settings are 115200 baud, 8 data bits, and no parity.

Configure remote access

1. Configure the Management IP address.
2. Configure Management route.
3. Configure user name and password.

Configure Management IP address

To remotely access OS10, assign an IP address to the management port. Use the management interface for out-of-band (OOB) switch management.

1. Configure the management interface from CONFIGURATION mode.

```
interface mgmt 1/1/1
```

2. By default, DHCP client is enabled on the Management interface. Disable the DHCP client operations in INTERFACE mode.

```
no ip address dhcp
```

3. Configure an IPv4 or IPv6 address on the Management interface in INTERFACE mode.

```
ip address A.B.C.D/mask
```

```
ipv6 address A:B/prefix-length
```

4. Enable the Management interface in INTERFACE mode.

```
no shutdown
```

Configure Management interface

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# no ip address dhcp
OS10(conf-if-ma-1/1/1)# ip address 10.1.1.10/24
OS10(conf-if-ma-1/1/1)# no shutdown
```

Configure Management route

To set up remote access to OS10, configure a management route after you assign an IPv4 or IPv6 address to the Management port. The Management port uses the default management route to communicate with a different network. The management route allows you to separate Management traffic from data traffic.

1. (Optional) Ensure that the DHCP client is disabled on the Management interface in INTERFACE mode.

```
no ip address dhcp
```

2. Configure a management route for the Management port in CONFIGURATION mode. Repeat the command to configure multiple routes.

```
management route {ipv4-address/mask | ipv6-address/prefix-length}
{forwarding-router-address | managementethernet}
```

- *ipv4-address/mask* — Enter an IPv4 network address in dotted-decimal format (A.B.C.D), then a subnet mask in /prefix-length format (*/x*).
- *ipv6-address/prefix-length* — Enter an IPv6 address in x:x:x:x::x format with the prefix length in /x format. The prefix range is /0 to /128.
- *forwarding-router-address* — Enter the next-hop IPv4/IPv6 address of a forwarding router that serves as a management gateway to connect to a different subnet.

- `managementethernet` — Send traffic on the Management port for the configured IPv4/IPv6 subnet.

NOTE: Management routes are separate from IPv4 and IPv6 routes and are only used to manage the switch through the Management port.

NOTE: Do not configure the same prefix in both the static route and management route. If the same prefix has to be used, use management VRF.

Configure management route

```
OS10(config)# management route 10.10.20.0/24 10.1.1.1
OS10(config)# management route 172.16.0.0/16 managementethernet
```

Configure username and password

To set up remote access to OS10, create a username and password after you configure the management port and default route. The user role is a mandatory entry.

Enter the password in clear text. It is converted to SHA-512 format in the running configuration. A password must have at least nine characters, including alphanumeric and special characters, and at least five different characters from the password that is previously used for the same username. For example:

```
OS10(config)# username admin password alpha404! role sysadmin
```

NOTE: While configuring your user account and password or while resetting your old password with a new one, you must ensure that you specify a strongly typed password. Otherwise, the system does not allow you to configure a weak password. For example, when you upgrade to SmartFabric OS10 10.5.3.0 and you have configured a weak password in the previous release, the system accepts this weak password during the upgrade. However, after upgrading to the 10.5.3.0 release, if you try to reset this weak password without specifying a strongly typed password, the system does not accept the new password.

For backward compatibility with OS10 release 10.3.1E and earlier, passwords entered in MD-5, SHA-256, and SHA-512 format are supported. To increase the required password strength, use the `password-attributes` command.

- Create a username and password in CONFIGURATION mode.

  ```
  username username password password role role
  ```

  - `username` *username*—Enter a text string. A maximum of 32 alphanumeric characters; one character minimum.
  - `password` *password*—Enter a text string. A maximum of 32 alphanumeric characters; nine characters minimum.
  - `role` *role*—Enter a user role:

    NOTE: SmartFabric OS10 allows you to create a minimum of 10 accounts for each user role, such as User, Operator, Admin, and so on.

    - `sysadmin`—Full access to all commands in the system, exclusive access to commands that manipulate the file system, and access to the system shell. A system administrator can create user IDs and user roles. The default privilege level is 15.
    - `secadmin`—Full access to configuration commands that set security policy and system access, such as password strength, AAA authorization, and cryptographic keys. A security administrator can display security information, such as cryptographic keys, login statistics, and log information. The default privilege level is 15.
    - `netadmin`—Full access to configuration commands that manage traffic flow through the switch, such as routes, interfaces, and ACLs. A network administrator cannot access configuration commands for security features or view security information. The default privilege level is 15.
    - `netoperator`—Access to EXEC mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch. The default privilege level is 1.

NOTE: To change a system administrator password, reenter the command for the administrator username with a new password.

```
OS10(config)# username admin password beta@1 role sysadmin
```

HTTPS support for HTTP services

OS10 switches support the HTTP protocol for services such as file copy, image upgrade, and so on. This feature provides a secure HTTP (HTTPS) option for all services.

The HTTPS option supports self-signed, third-party CA signed, and Public or Renowned CA certified certificates. You must install self-signed and third-party CA-signed certificates on the OS10 switch.

This feature also introduces an insecure option to all the HTTPS services. Use this option to skip the peer verification process if the server is running self-signed certificates for HTTPS.

Restrictions and Limitations

Following are the restrictions and limitations that apply for this feature:

- If the remote end is using a third-party CA certificate, you must install that certificate in the OS10 switch.
- If the remote end is using a self-signed certificate, you must install certificate of the CA that signed the remote end's certificate on the OS10 switch to complete HTTPS operations using the trusted-host option on the `crypto ca-cert install` command.

NOTE: For Debian certificate store operation: The Debian certificate store is enhanced to link the local CA certificate directory (`/usr/local/share/ca-certficates`) to the existing OS10 CA certificate directory (`/config/certs/ca-certificates`). This enhancement allows you to install or remove OS10 CA certificates from the Debian certificate store. There is no management of individual files.

Updating HTTP certificates

This section describes the procedure to update the HTTP certificates.

NOTE: You may need to update the HTTP certificates if the existing certificate has expired rendering it invalid. It may also be that the peer in the remote communications may not consider self-signed certificates to be trustworthy. If that is true, then you should generate a certificate signing request instead of a self-signed certificate, then sign the certificate on a Certificate Authority (CA) before installing the signed certificate or key pair.

To extend the validity period of self-signed certificate, perform the following steps:

1. Use the `crypto cert generate` command to create a self-signed certificate with a validity period of maximum 10 years.

```
OS10# crypto cert generate self-signed
You are about to be asked to enter information that will be incorporated into
your certificate request. What you are about to enter is what is called a
Distinguished Name or a DN. There are quite a few fields but you can leave
some blank. For some fields there will be a default value.

Certificate file name (home://{filename}, usb://{filename}) : home://Dell.pem
Key file name (home://{filename}, usb://{filename}, private) [private]: home://
Dell.key
Common Name (eg, FQDN): www.dell.com
Subject Alternative Name (e.g. IP:A.B.C.D or DNS:domain.name): 192.168.2.38
Email Address: support@dell.com
Organization Name (eg, company): DELL
Organizational Unit Name (eg, section): DELL
Locality Name (eg, city): Austin
State or Province Name (full name): TX
Country Name (2 letter code): US
Key Length, 512-4096 [2048]: 2048
Certificate validity in days, 1-10000 [3650]: 3650
Processing file ...
Successfully created certificate file and key
```

2. Install the self-signed certificate that you have created using the `crypto cert install` command.

```
OS10# crypto cert install cert-file home://Dell.pem key-file home://Dell.key
Processing file ...
```

```
Certificate and keys were successfully installed as "Dell.crt" that may be used in a
security profile. CN = 100.104.54.76/O=DELL/OU=DELL/L=CHENNAI/ST=TAMILNADU
```

3. Login into Linux shell and link the newly installed certificate and key.

```
OS10# system "sudo -i"
[sudo] password for admin:
root@OS10:~# cd /etc/nginx/ssl/
root@OS10:/etc/nginx/ssl# ls
dhparam.pem  nginx-selfsigned.crt  nginx-selfsigned.key
root@OS10:/etc/nginx/ssl# cp nginx-selfsigned.key nginx-selfsigned.key.bak
root@OS10:/etc/nginx/ssl# cp nginx-selfsigned.crt nginx-selfsigned.crt.bak
root@OS10:/etc/nginx/ssl# rm /etc/nginx/ssl/nginx-selfsigned.crt
root@OS10:/etc/nginx/ssl# ln -s /config/certs/Dell.crt /etc/nginx/ssl/nginx-
selfsigned.crt
root@OS10:/etc/nginx/ssl# rm /etc/nginx/ssl/nginx-selfsigned.key
root@OS10:/etc/nginx/ssl# ln -s /config/certs/private/Dell.key /etc/nginx/ssl/nginx-
selfsigned.key
root@OS10:/etc/nginx/ssl# ls
dhparam.pem  nginx-selfsigned.crt  nginx-selfsigned.crt.bak  nginx-selfsigned.key
nginx-selfsigned.key.bak
root@OS10:/etc/nginx/ssl# ls -l
total 12
rw-rr- 1 root root  424 Mar  8  2020 dhparam.pem
lrwxrwxrwx 1 root root   22 Nov  3 21:57 nginx-selfsigned.crt -> /config/certs/
Dell.crt
rw-rr- 1 root root 1135 Nov  3 21:56 nginx-selfsigned.crt.bak
lrwxrwxrwx 1 root root   30 Nov  3 21:58 nginx-selfsigned.key -> /config/certs/
private/Dell.key
rw------ 1 root root 1708 Nov  3 21:55 nginx-selfsigned.key.bak
```

4. Check the `nginx` service status.

```
root@OS10:/etc/nginx/ssl# service nginx status
â— nginx.service - A high performance web server and a reverse proxy server
   Loaded: loaded (/lib/systemd/system/nginx.service; enabled; vendor preset: enabled)
   Active: active (running) since Tue 2020-10-20 18:32:25 UTC; 2 weeks 0 days ago
     Docs: man:nginx(8)
  Process: 2451 ExecReload=/usr/sbin/nginx -g daemon on; master_process on; -s reload
(code=exited, status=0/SUCCESS)
 Main PID: 641 (nginx)
   CGroup: /system.slice/nginx.service
           â”œâ”€ 641 nginx: master process /usr/sbin/nginx -g daemon on;
master_process on;
           â”œâ”€2456 nginx: worker process
           â””â”€2462 nginx: worker process
Warning: Journal has been rotated since unit was started. Log output is incomplete or
unavailable.
```

5. Restart the `nginx` service.

```
root@OS10:/etc/nginx/ssl# service nginx restart
```

Scheduled reload

Use the scheduled reload feature to schedule a switch reload. You can schedule the switch reload after a specific amount of time or at a particular date and time.

The scheduled reload configuration is ignored if you reload the switch before the scheduled time. You can cancel the scheduled reload, if required. You can also view the scheduled reload status.

Restrictions and Limitations

Scheduled reload restrictions and limitations:

- Scheduled reload is not supported when zero touch deployment (ZTD) is in progress.
- Scheduled reload is not performed when an image install is in progress at the specified time.

- Scheduled reload is not performed when the secure boot feature is enabled and the startup configuration is not protected or the startup configuration is modified after protecting it.
- When you change the system time, using the network time protocol (NTP) commands, after configuring a scheduled reload at specific date and time, the scheduled reload completes at the configured time. You can cancel and reconfigure the scheduled reload if required. For example, if system time is 10:00 and scheduled reload time is at the 18:00 on same day, changing the system time to 11:00 does not impact the scheduled reload time.
- When you change the system time, using the NTP commands, after configuring scheduled reload for a specific time interval, the remaining reload time adjusts according to the time change. You can cancel and reconfigure the scheduled reload if required. For example, if the system time is 10:00 and the scheduled reload is in 5 hours, changing the system time to 11:00 changes the remaining time to 4 hours.
- When you change the system time zone, the scheduled reload time also changes in accordance with the time zone change.
- if you change the system time to a time later than the configured reload time, the scheduled reload cancels and system logs generate to notify you to reschedule the reload.
- Dell Technologies recommends saving the running configuration before the scheduled reload. Changes that are made in the running configuration are lost unless you save the running configuration before the scheduled reload time.
- Perform the scheduled reload within 30 days from the time of configuration.
- The scheduled reload configuration is not persistent across reloads if you reload the switch before the scheduled time, then the scheduled reload is ignored.
- You can only schedule a reload 30 days from the current date.
- Dell Technologies recommends enabling system log monitoring in SSH sessions when you schedule reload of the switch. This configuration notifies the other users of the scheduled reload time.

Scheduled reload use cases

This section describes use cases corresponding to the scheduled reload configuration.

Use case 1

If you need to schedule the reload of the switch after a specific time, use the `reload in [hhh:mm | mm]` command.

```
OS10# reload in 10:15
OS10# show reload
Reload scheduled at Fri Jan 8 13:43:01 2021 UTC (in 10 hours and 15 minutes)
```

Use case 2

If you need to schedule the reload of the switch at a specific date and time, use the `reload at [hh:mm] [YYYY-MM-DD]` command.

```
OS10# reload at 15:30 2021-03-10
OS10# show reload
Reload scheduled at Fri Mar 10 15:30:00 2021 UTC (in 10 hours and 15 minutes)
```

Use case 3

If you provide the time only using the `reload at` command, scheduled reload performs at the next occurrence of that time.

```
OS10# reload at 15:30
OS10# show reload
Reload scheduled at Fri Mar 10 15:30:00 2021 UTC (in 10 hours and 15 minutes)
```

Scheduled reload commands

reload in

Configures the scheduled reload in specified hours and minutes.

Syntax	`reload in [HH:MM]`
Parameters	• *HH:MM* - Specify the remaining time in *HH:MM* format. The maximum amount of time that you can specify is 720:00.
Default	None.
Command Mode	EXEC
Security and access	`sysadmin` and `netadmin`
Usage Information	Scheduled reload time must be within 30 days of the current device time. Use this command to schedule the reload of the switch at the specified time.
Example	`OS10# reload in 10:15` `OS10# reload in 120:00`
Supported Releases	10.5.3 or later

reload at

Configures the scheduled reload at a specific date and time.

Syntax	`reload at [HH:MM] [YYYY:MM:DD]`
Parameters	None.
Default	None.
Command Mode	EXEC
Security and access	`sysadmin` and `netadmin`
Usage Information	Scheduled reload time must be within 30 days of the current switch time. Use this command to schedule the reload of the switch at a specific date and time.
Example	`OS10# reload at 21:00` `OS10# reload at 15:30 2021-03-10`
Supported Releases	10.5.3 or later

reload cancel

Cancels the scheduled reload of the switch.

Syntax	`reload cancel`
Parameters	None.

Default	None.
Command Mode	EXEC
Security and access	`sysadmin` and `netadmin`
Usage Information	None.
Example	`OS10# reload cancel`
Supported Releases	10.5.3 or later

show reload

Displays the scheduled reload status of the switch.

Syntax	`show reload`
Parameters	None.
Default	None.
Command Mode	EXEC
Security and access	`sysadmin` and `netadmin`
Usage Information	None.

Example	`OS10# show reload`
	
	`Reload scheduled at Fri Jan 8 13:43:01 2021 UTC (in 10 hours and 15 minutes)`

Supported Releases	10.5.3 or later

Clean reset

Use the clean reset feature to boot the system with predefined defaults.

In clean reset mode, OS10 will not store any runtime information, syslogs, crash-dumps, config files, command history, or any such persistent information in non-volatile storage. When the system is rebooted, it comes up with the configuration as available at startup when the clean reset mode was initiated.

NOTE:

In clean reset mode, the system stores all the files in RAM. Enabling clean reset can cause instability in systems with low memory.

Supported platforms

- Clean reset is supported if the switch platform supports UEFI.
- VM supports the clean reset if the underlying BIOS supports UEFI.

Restrictions and Limitations

The following restrictions and limitations apply to this feature:

- You cannot save running configuration to startup configuration.
- Image installation (upgrade or downgrade) is not allowed when the device is in clean reset mode.
- Secure image installation (upgrade or downgrade) is not allowed when the device is in clean reset mode.
- If secure boot is enabled, the secure-boot file system integrity check is skipped.

Configure clean reset

Use the `clean-reset` command to enable or disable clean reset mode. Enabling or disabling the clean reset mode takes effect only after you reload the device.

Enable clean reset

1. Enable clean reset mode in EXEC mode.

```
OS10# clean-reset enable
Warning :
- clean reset feature, if enabled, will get effective only after a new reload is done.

- If enabled, it will lock the file system to read only mode, after next reload.

- Can be enabled only on platforms supporting UEFI BIOS

- Can use 'show clean-reset status' for displaying status

- Post reload,all features which require saving onto persistent storage will not work.

- Some of the features that may not work are given below, though this list may not be
  exhaustive:

        - Saving running configuration to startup configuration (write memory command)

        - Image Upgrade/downgrade (image install/uninstall command )

        - Secured Image Upgrade/downgrade (image secure-install command)

        - The secure-boot file system integrity check validation will be skipped, if
          secure boot were enabled (secure-boot enable)

For these features to work again, feature has to be disabled using clean reset
disable and device reloaded:

Do you still want to enable clean reset feature ? [yes/no(default)]:yes
OS10#
```

2. Reload the device.

```
OS10# reload
```

Disable clean reset

1. Disable clean reset mode in EXEC mode.

```
OS10# clean-reset disable
```

2. Reload the device.

```
OS10# reload
```

Clean reset commands

clean-reset

Configures the clean reset option.

Syntax `clean-reset {enable | disable}`

Parameters
- `enable`—Enable clean-reset mode during boot.
- `disable`—Disable clean-reset mode during boot.

Default Disabled by default.

Command Mode EXEC

Security and access `sysadmin` and `netadmin`

Usage Information After you enable the clean reset option and reload the device, the system will not store any runtime information, syslogs, crash-dumps, config files, command history, or any such persistent information in non-volatile storage.

Example

```
OS10# clean-reset enable
Warning :
- clean reset feature, if enabled, will get effective only after a new
  reload is done.

- If enabled, it will lock the file system to read only mode, after next
  reload.

- Can be enabled only on platforms supporting UEFI BIOS

- Can use 'show clean-reset status' for displaying status

- Post reload,all features which require saving onto persistent storage
  will not work.

- Some of the features that may not work are given below, though this
  list may not be exhaustive:

        - Saving running configuration to startup configuration (write
          memory command)

        - Image Upgrade/downgrade (image install/uninstall command )

        - Secured Image Upgrade/downgrade (image secure-install command)

        - The secure-boot file system integrity check validation will be
          skipped, if secure boot were enabled (secure-boot enable)

For these features to work again, feature has to be disabled using clean
reset disable and device reloaded:

Do you still want to enable clean reset feature ? [yes/no(default)]:yes
OS10#
```

```
OS10# clean-reset disable
```

Supported Releases 10.5.4.0 or later

show clean-reset status

Displays the status of clean reset mode.

Syntax	`show clean-reset status`
Parameters	None
Default	Not configured
Command Mode	EXEC
Security and access	`sysadmin` and `netadmin`
Usage Information	Use this command to display the status of clean reset mode.

Example	`OS10# show clean-reset status`
	`OS10 Clean Reset:`
	`----------------`
	`Last boot was via clean reset mode : yes`
	`Clean reset configured : yes`

Supported Releases	10.5.4.0 or later

4

CLI Basics

The OS10 CLI is the software interface you use to access a device running the software — from the console or through a network connection. The CLI is an OS10-specific command shell that runs on top of a Linux-based OS kernel. By leveraging industry-standard tools and utilities, the CLI provides a powerful set of commands that you can use to monitor and configure devices running OS10.

User accounts

OS10 defines two categories of user accounts:

- To log in to the CLI, use `admin` for the user name and password.
- To log in to the Linux shell, use `linuxadmin` for the user name and password.

NOTE: You cannot delete the default `linuxadmin` user name. You can delete the default `admin` user name only if at least one OS10 user with the `sysadmin` role is configured.

For example, to access the OS10 CLI using an SSH connection:

1. Open an SSH session using the IP address of the device. You can also use PuTTY or a similar tool to access the device remotely.

```
ssh admin@ip-address
password: admin
```

2. Enter `admin` for both the default user name and password to log into OS10. You are automatically placed in EXEC mode.

```
OS10#
```

For example, to access the Linux shell using an SSH connection, enter `linuxadmin` as the user name and password:

```
ssh linuxadmin@management-ip-address
password: linuxadmin
```

Key CLI features

Consistent command names	Commands that provide the same type of function have the same name, regardless of the portion of the system on which they are operating. For example, all `show` commands display software information and statistics, and all `clear` commands erase various types of system information.
Available commands	Information about available commands is provided at each level of the CLI command hierarchy. You can enter a question mark (`?`) at any level and view a list of the available commands, along with a short description of each command.
Command completion	Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially entered, click the **Tab** key or the **Spacebar**. If the partially entered letters are a string that uniquely identifies a command, the complete command name appears. A beep indicates that you have entered an ambiguous command, and the possible completions display. Completion also applies to other strings, such as interface names and configuration statements.

CLI command modes

The OS10 CLI has two top-level modes:

- EXEC mode — Monitor, troubleshoot, check status, and network connectivity.
- CONFIGURATION mode — Configure network devices.

When you enter CONFIGURATION mode, you are changing the current operating configuration, called the *running configuration*. By default, all configuration changes are automatically saved to the running configuration.

You can change this default behavior by switching to Transaction-Based Configuration mode. To switch to Transaction-Based Configuration mode, use the `start transaction` command. When you switch to the Transaction-Based Configuration mode and update the candidate configuration, changes to the candidate configuration are not added to the running configuration

until you commit them to activate the configuration. The `start transaction` command applies only to the current session. Changing the configuration mode of the current session to the Transaction-Based Configuration mode does not affect the configuration mode of other CLI sessions.

- After you explicitly enter the `commit` command to save changes to the candidate configuration, the session switches back to the default behavior of automatically saving the configuration changes to the running configuration.
- When a session terminates while in the Transaction-Based Configuration mode, and you have not entered the `commit` command, the changes are maintained in the candidate configuration. You can start a new Transaction-Based Configuration mode session and continue with the remaining configuration changes.
- All sessions in Transaction-Based Configuration mode update the same candidate configuration. When you use the `commit` command on any session in Transaction-Based Configuration mode or you make configuration changes on any session in Non-Transaction-Based mode, you also commit the changes made to the candidate configuration in all other sessions running in the transaction-based configuration mode. This implies that inconsistent configuration changes may be applied to the running configuration. Dell recommends only making configuration changes on a single CLI session at a time.
- When you enter the `lock` command in a CLI session, configuration changes are disabled on all other sessions, whether they are in Transaction-Based Configuration mode or Non-Transaction-Based Configuration mode. For more information, see Candidate configuration.

CLI command hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of hierarchy. For example, all commands that display information about the system and the system software are grouped under the `show system` command, and all commands that display information about the routing table are grouped under the `show ip route` command.

To move directly to EXEC mode from any sub-mode, enter the `end` command. To move up one command mode, enter the `exit` command.

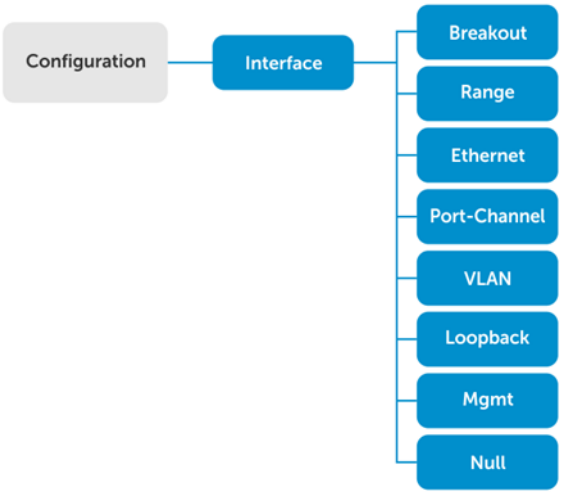
CONFIGURATION mode

When you initially log in to OS10, you are placed in EXEC mode. To access CONFIGURATION mode, enter the `configure terminal` command. Use CONFIGURATION mode to manage interfaces, protocols, and features.

```
OS10# configure terminal
OS10(config)#
```

Interface mode is a sub-mode of CONFIGURATION mode. In Interface mode, you configure Layer 2 (L2) and Layer 3 (L3) protocols, and IPv4 and IPv6 services on an interface:

- Physical interfaces include the Management interface and Ethernet ports.
- Logical interfaces include Loopback, port-channel, and virtual local area networks (VLANs).



From CONFIGURATION mode, you can also configure L2 and L3 protocols with a specific protocol-configuration mode, such as Spanning-Tree Protocol (STP) or Border Gateway Protocol (BGP).

Check device status

Use `show` commands to check the status of a device and monitor activities. Refer Related Videos section for more information.

- Enter `show ?` from EXEC mode to view a list of commands to monitor a device; for example:

```
OS10# show ?
  acl-table-usage          Show ACL table utilization
  alarms                   Display all current alarm situation in the system
  alias                    Show list of aliases
  bfd                      Show bfd session commands
  boot                     Show boot information
  candidate-configuration  Current candidate configuration
  class-map                Show QoS class-map configuration
  clock                    Show the system date and time
  ...
  users                    Show the current list of users logged into the system
                           and show the session id
  version                  Show the software version on the system
  virtual-network          Virtual-network info
  vlan                     Vlan status and configuration
  vlt                      Show VLT domain info
  vrrp                     VRRP group status
  ztd-status               Show ztd status
```

- Enter `show command-history` from EXEC mode to view trace messages for each executed command.

```
OS10# show command-history
    1    Thu Apr  20 19:44:38 UTC 2017  show vlan
    2    Thu Apr  20 19:47:01 UTC 2017  admin
    3    Thu Apr  20 19:47:01 UTC 2017  monitor hardware-components controllers view 0
    4    Thu Apr  20 19:47:03 UTC 2017  system general info system-version view
    5    Thu Apr  20 19:47:16 UTC 2017  admin
    6    Thu Apr  20 19:47:16 UTC 2017  terminal length 0
    7    Thu Apr  20 19:47:18 UTC 2017  terminal datadump
    8    Thu Apr  20 19:47:20 UTC 2017  %abc
    9    Thu Apr  20 19:47:22 UTC 2017  switchshow
   10    Thu Apr  20 19:47:24 UTC 2017  cmsh
```

- Enter `show system` from EXEC mode to view the system status information; for example:

```
OS10# show system

  vrrp                     Configure VRRP global attributes
  wred                     Configure WRED profile
```

Candidate configuration

When you use OS10 configuration commands in Transaction-based configuration mode, changes do not take effect immediately and are stored in the candidate configuration. The configuration changes become active only after you commit the changes using the `commit` command. Changes in the candidate configuration are validated and applied to the running configuration.

The candidate configuration allows you to avoid introducing errors during an OS10 configuration session. You can make changes and then check them before committing them to the active, running configuration on the switch.

To check differences between the running configuration and the candidate configuration, use the `show diff candidate-configuration running-configuration` command.

For example, before entering Transaction mode, you can check that no new configuration commands are entered. If the `show` command does not return output, the `candidate-configuration` and `running-configuration` files are the same. Then start Transaction mode, configure new settings, and view the differences between the candidate and running configurations. Decide if you want to commit the changes to the running configuration. To delete uncommitted changes, use the `discard` command.

View differences between candidate and running configurations

```
OS10# show diff candidate-configuration running-configuration
OS10#
OS10# start transaction
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# exit
OS10(config)# interface ethernet 1/1/15
OS10(conf-if-eth1/1/15)# switchport mode trunk
OS10(conf-if-eth1/1/15)# switchport trunk allowed vlan 100
OS10(conf-if-eth1/1/15)# end

OS10# show diff candidate-configuration running-configuration
!
interface ethernet1/1/15
switchport mode trunk
switchport trunk allowed vlan 100
!
interface vlan100
no shutdown
OS10#
```

Commit configuration changes in candidate configuration in Transaction mode

1. Change to Transaction-based configuration mode from EXEC mode.

   ```
   start transaction
   ```

2. Enter configuration commands. For example, enable an interface from INTERFACE mode.

   ```
   interface ethernet 1/1/1
   no shutdown
   ```

3. Save the configuration changes to the running configuration.

   ```
   do commit
   ```

   After you enter the `commit` command, the current OS10 session switches back to the default behavior of committing all configuration changes automatically.

```
OS10# start transaction
OS10# configure terminal
OS10(config)#
OS10(config)# interface ethernet 1/1/1
OS10(config-if-eth1/1/1)# no shutdown
OS10(config-if-eth1/1/1)# do commit
```

Compressed configuration views

To display only interface-related configurations in the candidate configuration, use the `show candidate-configuration compressed` and `show running-configuration compressed` commands. These views display only the configuration commands for VLAN and physical interfaces.

```
OS10# show candidate-configuration compressed
interface breakout 1/1/1 map 40g-1x
interface breakout 1/1/2 map 40g-1x
interface breakout 1/1/3 map 40g-1x

```

Prevent configuration changes

You can prevent configuration changes that are made on the switch in sessions other than the current CLI session using the `lock` command. To prevent and allow configuration changes in other sessions, use the `lock` and `unlock` commands in EXEC mode.

When you enter the `lock` command, users in other active CLI sessions cannot make configuration changes. When you close the CLI session in which you entered the `lock` command, configuration changes are automatically allowed in all other sessions.

```
OS10# lock
```

```
OS10# unlock
```

Conflicting interface ranges

After you apply one or more VLANs to an interface using the `switchport trunk allowed vlan` command, and try to delete some of the VLANs from the candidate configuration, the system displays an error message. For example, the following is a configuration without conflicts:

```
OS10# start transaction
OS10# configure terminal
OS10(config)# interface range vlan 2-3
OS10(conf-range-vl-2-3)# exit
OS10(config)# interface range vlan 40-45
OS10(conf-range-vl-40-45)# exit
OS10(config)#
OS10(config)# interface range port-channel 2-3
OS10(conf-range-po-2-3)# switchport mode trunk
OS10(conf-range-po-2-3)# switchport trunk allowed vlan 2-3
OS10(conf-range-po-2-3)# switchport trunk allowed vlan 40-45
OS10(conf-range-po-2-3)# exit
OS10(config)# no interface range vlan 20-30
OS10(config)# do commit
```

The system already contains the following configuration:

```
OS10(config)# do show running-configuration interface port-channel
!
interface port-channel3
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 2-3,40-45
OS10(config)#
OS10(config)# do show running-configuration interface vlan
!
interface vlan1
no shutdown
!
interface vlan2
no shutdown
!
interface vlan3
no shutdown
!
interface vlan4
no shutdown
!
interface vlan5
no shutdown
```

The following depicts a conflicting configuration wherein a few VLANs are created and applied to an interface and then a subset of VLANs are removed from the candidate configuration:

```
OS10(config)# do start transaction
OS10(config)# interface range port-channel 3
```

```
OS10(conf-range-po-3)# switchport trunk allowed vlan 2-5
OS10(conf-range-po-3)# exit
OS10(config)# no interface range vlan 2-4
OS10(conf-range-po-3)# % Error:  Range configuration conflict - the last command was not applied. Please commit (or discard) the rest of the configuration changes and retry.
```

If you see the error message in bold, commit the entire configuration and then delete a sub set of VLANs.

```
OS10(conf-range-po-3)#do commit
OS10(conf-range-po-3)# do show running-configuration interface port-channel
!
interface port-channel3
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 2-5
OS10(conf-range-po-3)# do show running-configuration interface vlan
!
interface vlan1
no shutdown
!
interface vlan2
no shutdown
!
interface vlan3
no shutdown
!
interface vlan4
no shutdown
!
interface vlan5
no shutdown
OS10(conf-range-po-3)# no interface range vlan 2-4
OS10(config)# do show running-configuration interface vlan
!
interface vlan1
no shutdown
!
interface vlan5
no shutdown
OS10(config)# do show running-configuration interface port-channel
!
interface port-channel3
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 5
```

Sometimes, partial removal of VLANs may fail and display the following error message:

```
% Error:  The command failure resulted in disintegrated candidate configuration. Please discard the current candidate configuration changes.
```

If you see this error message, discard the entire configuration using the `discard command`.

Copy running configuration

The running configuration contains the current OS10 system configuration and consists of a series of OS10 commands. Copy the running configuration to a remote server or local directory as a backup or for viewing and editing. The running configuration is copied as a text file that you can view and edit with a text editor.

Copy running configuration to local directory or remote server

```
OS10# copy running-configuration {config://filepath | home://filepath |
ftp://userid:passwd@hostip/filepath | scp://userid:passwd@hostip/filepath |
sftp://userid:passwd@hostip/filepath | tftp://hostip/filepath}
```

```
OS10# copy running-configuration scp://root:calvin@10.11.63.120/tmp/qaz.txt
```

Copy file to running configuration

To apply a set of commands to the current running configuration and execute them immediately, copy a text file from a remote server or local directory. The copied commands do not replace the existing commands. If the `copy` command fails, any commands that were successfully copied before the failure occurred are maintained.

```
OS10# copy {config://filepath | home://filepath |
ftp://userid:passwd@hostip/filepath | scp://userid:passwd@hostip/filepath |
sftp://userid:passwd@hostip/filepath | tftp://hostip/filepath | http://userid@hostip/
filepath}
running-configuration
```

```
OS10# copy scp://root:calvin@10.11.63.120/tmp/qaz.txt running-configuration
```

Copy running configuration to startup configuration

To display the configured settings in the current OS10 session, use the `show running-configuration`. To save new configuration settings across system reboots, copy the running configuration to the startup configuration file.

```
OS10# copy running-configuration startup-configuration
```

Restore startup configuration

The startup configuration file, `startup.xml`, is stored in the `config` system folder. To create a backup version, copy the startup configuration to a remote server or the local `config:` or `home:` directories.

To restore a backup configuration, copy a local or remote file to the startup configuration and reload the switch. After downloading a backup configuration, enter the `reload` command, otherwise the configuration does not take effect until you reboot.

NOTE: A non-default switch-port profile is not automatically restored. If the downloaded startup configuration you want to restore contains a non-default switch-port profile, you must manually configure and save the profile on the switch, and then reload the switch for the profile settings to take effect. If the backup startup file contains the default switch-port profile, you can simply copy the startup configuration file from the server and reload the switch.

Copy file to startup configuration

```
OS10# copy {config://filepath | home://filepath |
ftp://userid:passwd@hostip/filepath | scp://userid:passwd@hostip/filepath |
sftp://userid:passwd@hostip/filepath | tftp://hostip/filepath} config://startup.xml
```

Back up startup file

```
OS10# copy config://startup.xml config://backup-9-28.xml
```

Restore startup file from backup

```
OS10# copy config://backup-9-28.xml config://startup.xml
OS10# reload
System configuration has been modified. Save? [yes/no]:no
```

Back up startup file to server

```
OS10# copy config://startup.xml scp://userid:password@hostip/backup-9-28.xml
```

Restore startup file from server

```
OS10# copy scp://admin:admin@hostip/backup-9-28.xml config://startup.xml
OS10# reload
System configuration has been modified. Save? [yes/no]:no
```

Reload system image

Reboot the system manually using the `reload` command in EXEC mode. You are prompted to confirm the operation.

```
OS10# reload

System configuration has been modified. Save? [yes/no]:yes

Saving system configuration

Proceed to reboot the system? [confirm yes/no]:yes
```

To configure the OS10 image loaded at the next system boot, enter the `boot system` command in EXEC mode.

```
boot system {active | standby}
```

- Enter `active` to load the active OS10 image.
- Enter `standby` to load the standby OS10 image.

Set next boot image

```
OS10# boot system standby
OS10# show boot
Current system image information:
==================================
Type       Boot Type   Active          Standby         Next-Boot
-----------------------------------------------------------------------
Node-id 1  Flash Boot  [A] 10.2.9999E  [B] 10.2.9999E  [B] standby
```

Filter show commands

You can filter `show` command output to view specific information, or start the command output at the first instance of a regular expression or phrase.

- `display-xml` — Displays output in XML format.
- `except` — Displays only text that does not match a pattern.
- `find` — Searches for the first occurrence of a pattern and displays all further configurations.
- `grep` — Displays only the text that matches a specified pattern. Special characters in regular expressions, such as ^ (matches the beginning of a text string), $ (matches the end of a string), and .. (matches any character in the string) are supported.
- `no-more` — Does not paginate output.
- `save` — Saves the output to a file.

Display all output

```
OS10# show running-configuration | no-more
```

Common OS10 commands

boot

Configures the OS10 image to use the next time the system boots up.

Syntax	`boot system [active | standby]`
Parameters	• `active` — Reset the running image as the next boot image. • `standby` — Set the standby image as the next boot image.
Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to configure the OS10 image that is reloaded at boot time. Use the `show boot` command to verify the next boot image. The `boot system` command applies immediately.
Example	`OS10# boot system standby`
Supported Releases	10.2.0E or later

commit

Commits changes in the candidate configuration to the running configuration.

Syntax	`commit`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to save changes to the running configuration. Use the `do commit` command to save changes in CONFIGURATION mode.
Example	`OS10# commit`
Example (configuration)	`OS10(config)# do commit`
Supported Releases	10.2.0E or later

configure

Enters CONFIGURATION mode from EXEC mode.

Syntax	`configure {terminal}`
Parameters	`terminal` — Enters CONFIGURATION mode from EXEC mode.
Default	Not configured
Command Mode	EXEC
Usage Information	Enter `conf t` for auto-completion.

Example

```
OS10# configure terminal
OS10(config)#
```

Supported Releases 10.2.0E or later

copy

Copies the current running configuration to the startup configuration and transfers files between an OS10 switch and a remote device.

Syntax

```
copy running-configuration [startup-configuration [insecure] | config://
filepath [insecure]| coredump://filepath | ftp://filepath | home://filepath
[insecure] | scp://filepath | sftp://filepath | supportbundle://filepath
| severity-profile profile-name [insecure] | tftp://filepath | http://
filepath | https://filepath [insecure]| usb://filepath]
```

Parameters

- `running-configuration` *`startup-configuration`*—(Optional) Copy the current running configuration file to the startup configuration file. Use the `insecure` option to skip the peer certificate validation.
- `config://filepath [insecure]`—(Optional) Copy the running configuration from the configuration directory. Use the `insecure` option to skip the peer certificate validation.
- `coredump://filepath`—(Optional) Copy from the coredump directory
- `ftp://userid:passwd@hostip/filepath`—(Optional) Copy from a remote FTP server
- `home://username/filepath`—(Optional) Copy from the home directory Use the `insecure` option to skip the peer certificate validation.
- `scp://userid:passwd@hostip/filepath`—(Optional) Copy from a remote SCP server
- `sftp://userid:passwd@hostip/filepath`—(Optional) Copy from a remote SFTP server
- `supportbundle://filepath`—(Optional) Copy from the support-bundle directory
- `severity-profile://filepath [insecure]`—(Optional) Copy from the severity-profile directory Use the `insecure` option to skip the peer certificate validation.
- `tftp://hostip/filepath`—(Optional) Copy from a remote TFTP server
- `http://hostip/filepath`—(Optional) Copy from a remote HTTP server
- `https://hostip/filepath [insecure]`—(Optional) Copy from a remote HTTPS server Use the insecure option to skip the peer certificate validation.
- `usb:`*`filepath`*—(Optional) Copy from a USB file system

Default Not configured

Command Mode EXEC

Usage Information

Use this command to perform the following tasks:

- Save the running configuration to the startup configuration.
- Transfer coredump files to a remote location.
- Back up the startup configuration.
- Retrieve a previously backed-up configuration.
- Replace the startup configuration file.
- Transfer support bundles.

CAUTION: Dell Technologies recommends not using the `copy` command to download an OS10 image to the switch. The downloaded image occupies a large amount of disk space. Use the `image download` command to download an OS10 image.

When using the `scp` and `sftp` options, always enter an absolute file path instead of a path relative to the home directory of the user account; for example:

```
copy config://startup.xml scp://dellos10:password@10.1.1.1/home/dellos10/
backup.xml
```

Use the `copy` command with the `severity-profile` option to download or upload severity profiles from a remote location. When you copy a severity profile from a remote location to an OS10 switch, ensure that the name of the severity profile is different than that of the default profile (*default.xml*) or the currently active severity profile.

Example

```
OS10# dir coredump

Directory contents for folder: coredump
Date (modified)        Size (bytes)  Name
---------------------  ------------  ------------------
2017-02-15T19:05:41Z   12402278      core.netconfd-
pro.2017-02-15_19-05-09.gz

OS10# copy coredump://core.netconfd-pro.2017-02-15_19-05-09.gz scp://
os10user:os10passwd@10.11.222.1/home/os10/core.netconfd-pro.2017-02
-15_19-05-09.gz
```

Example: Copy startup configuration

```
OS10# dir config

Directory contents for folder: config
Date (modified)        Size (bytes)  Name
---------------------  ------------  ------------
2017-02-15T20:38:12Z   54525         startup.xml

OS10# copy config://startup.xml scp://os10user:os10passwd@10.11.222.1/
home/os10/backup.xml
```

Example: Retrieve backed-up configuration.

```
OS10# copy scp://os10user:os10passwd@10.11.222.1/home/os10/backup.xml
home://config.xml

OS10(conf-if-eth1/1/5)# dir home

Directory contents for folder: home
Date (modified)        Size (bytes)  Name
---------------------  ------------  -----------
…
2017-02-15T21:19:54Z   54525         config.xml

…
```

Example: Download custom severity profile from a remote location.

```
copy scp://username:password@a.b.c.d//file-path/mySevProf.xml severity-
profile://mySevProf_1.xml
```

Example: Replace startup configuration.

```
OS10# home://config.xml config://startup.xml
```

Example: Insecure option

```
OS10#copy https://100.104.93.171/upgrade/https_test config://https_test
insecure
OS10#copy config://https_test https://100.104.93.171/upgrade/https_test
insecure
OS10#copy home://https_test https://100.104.93.171/upgrade/https_test
insecure
OS10#copy running-configuration  https://100.104.93.171/upgrade/
https_test insecure
OS10#copy severity-profile://https_test  https://100.104.93.171/upgrade/
https_test insecure
```

Supported Releases

10.2.0E or later

delete

Removes or deletes a file, including the startup configuration file.

Syntax

```
delete [config://filepath | coredump://filepath | home://filepath |
image://filepath | startup-configuration | severity-profile profile-name |
supportbundle://filepath | usb://filepath]
```

Parameters

- `config://filepath` — (Optional) Delete from the configuration directory.
- `coredump://filepath` — (Optional) Delete from the coredump directory.
- `home://filepath` — (Optional) Delete from the home directory.
- `image://filepath` — (Optional) Delete from the image directory.
- `startup-configuration` — (Optional) Delete the startup configuration.
- `severity-profile` — (Optional) Delete from severity profile directory, severity-profile://*filepath*.
- `supportbundle://filepath` — (Optional) Delete from the support-bundle directory.
- `usb://filepath` — (Optional) Delete from the USB file system.

Default Not configured

Command Mode EXEC

Usage Information Use this command to remove a regular file, software image, or startup configuration. Removing the startup configuration restores the system to the factory default. You must reboot the switch using the `reload` command for the operation to take effect.

NOTE:

- Use caution when removing the startup configuration.
- When the system disk space is low, a syslog message displays:

```
SYS_STAT_LOW_DISK_SPACE: Warning! Configuration directory has 0.0%
free. Please delete unnecessary files from home directory.
```

When you see this error, delete unwanted files from the home directory or you may encounter degraded system performance.

Example

```
OS10# delete startup-configuration
```

```
OS10# delete severity-profile://mySevProf.xml
```

Supported Releases 10.2.0E or later

dir

Displays files stored in available directories.

Syntax

```
dir {config | coredump | home | image | severity-profile | supportbundle |
usb}
```

Parameters

- `config` — (Optional) Folder containing configuration files.
- `coredump` — (Optional) Folder containing coredump files.
- `home` — (Optional) Folder containing files in your home directory.
- `image` — (Optional) Folder containing image files.
- `severity-profile` — (Optional) Folder containing alarm severity profiles.
- `supportbundle` — (Optional) Folder containing support bundle files.
- `usb` — (Optional) Folder containing files on a USB drive.

Default Not configured

Command Mode EXEC

Usage Information The `dir` command requires at least one parameter. Use the `dir config` command to display configuration files.

Example

```
OS10# dir
  config           Folder containing configuration files
  coredump         Folder containing coredump files
  home             Folder containing files in user's home directory
  image            Folder containing image files
  severity-profile Folder containing severity profiles
  supportbundle    Folder containing support bundle files
```

Example (config)

```
OS10# dir config
Directory contents for folder: config
Date (modified)         Size (bytes)  Name
----------------------  ------------  -----------
2017-04-26T15:23:46Z    26704         startup.xml
```

```
OS10# dir severity-profile
Date (modified)       Size (bytes)  Name
--------------------- ------------  -------------
2019-03-27T15:24:06Z  46741         default.xml
2019-04-01T11:22:33Z  456           mySevProf.xml
```

Supported Releases 10.2.0E or later

discard

Discards changes made to the candidate configuration file.

Syntax `discard`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# discard
```

Supported Releases 10.2.0E or later

do

Executes most commands from all CONFIGURATION modes without returning to EXEC mode.

Syntax `do` *command*

Parameters *command* — Enter an EXEC-level command.

Default Not configured

Command Mode INTERFACE

Usage Information None

Example

```
OS10(config)# interface ethernet 1/1/7
OS10(conf-if-eth1/1/7)# no shutdown
```

```
OS10(conf-if-eth1/1/7)# do show running-configuration
...
!
interface ethernet1/1/7
 no shutdown
!
...
```

Supported Releases	10.2.0E or later

end

Returns to EXEC mode from any other command mode.

Syntax	`end`
Parameters	None
Default	Not configured
Command Mode	All
Usage Information	Use the `end` command to return to EXEC mode to verify currently configured settings with `show` commands.
Example	

```
OS10(config)# end
OS10#
```

Supported Releases	10.2.0E or later

exit

Returns to the next higher command mode.

Syntax	`exit`
Parameters	None
Default	Not configured
Command Mode	All
Usage Information	None
Example	

```
OS10(conf-if-eth1/1/1)# exit
OS10(config)#
```

Supported Releases	10.2.0E or later

hostname

Sets the system host name.

Syntax	`hostname` *name*
Parameters	*name*—Enter the host name of the switch, a maximum of 64 characters.
Default	OS10
Command Mode	CONFIGURATION

Usage Information	The host name is used in the OS10 command-line prompt. The `no` version of this command resets the host name to `OS10`.
Example	`OS10(config)# hostname R1` `R1(config)#`
Supported Releases	10.3.0E or later

license

Installs a license file from a local or remote location.

Syntax	`license install [ftp: | http: | https: | localfs: | scp: | sftp: | tftp: | usb:] filepath`
Parameters	• `ftp:`—(Optional) Install from the remote file system (`ftp://userid:passwd@hostip/filepath`) • `http:`—(Optional) Install from the remote file system (`http://hostip/filepath`) • `https:`—(Optional) Install from the remote file system {`https://filepath`) • `http:`—(Optional) Request from remote server (`http://hostip`) • `localfs:`—(Optional) Install from the local file system (`localfs://filepath`) • `scp:`—(Optional) Request from the remote file system (`scp://userid:passwd@hostip/filepath`) • `sftp:`—(Optional) Request from the remote file system (`sftp://userid:passwd@hostip/filepath`) • `tftp:`—(Optional) Request from the remote file system (`tftp://hostip/filepath`) • `usb:`—(Optional) Request from the USB file system (`usb://filepath`)
Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to install the license file. For more information, see *Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide*. OS10 requires a perpetual license to run beyond the 120-day trial period. The license file is installed in the */mnt/license* directory.
Example	`OS10# license install scp://user:userpwd/10.1.1.10/CFNNX42-NOSEnterprise-License.lic` `License installation success.`
Supported Releases	10.3.0E or later

lock

Locks the candidate configuration and prevents any configuration changes on any other CLI sessions, either in Transaction or Non-Transaction-Based Configuration mode.

Syntax	`lock`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	The `lock` command fails if there are uncommitted changes in the candidate configuration.

Example

```
OS10# lock
```

Supported Releases 10.2.0E or later

management route

Configures an IPv4/IPv6 static route the Management port uses. To configure multiple management routes, repeat the command.

Syntax `management route {ipv4-address/mask | ipv6-address/prefix-length} {forwarding-router-address | managementethernet}`

Parameters

- *ipv4-address/mask* — Enter an IPv4 network address in dotted-decimal format (A.B.C.D), then a subnet mask in prefix-length format (*/xx*).
- *ipv6-address/prefix-length* — Enter an IPv6 address in x:x:x:x::x format with the prefix length in /xxx format. The prefix range is /0 to /128.
- *forwarding-router-address* — Enter the next-hop IPv4/IPv6 address of a forwarding router (gateway) for network traffic from the Management port.
- `managementethernet` — Configure the Management port as the interface for the route and associates the route with the Management interface.

Default Not configured

Command Mode CONFIGURATION

Usage Information Management routes are separate from IP routes and are only used to manage the switch through the Management port. To display the currently configured IPv4 and IPv6 management routes, use the `show ip management-route` and `show ipv6 management-route` commands.

Example (IPv4)

```
OS10(config)# management route 10.10.20.0/24 10.1.1.1
OS10(config)# management route 172.16.0.0/16 managementethernet
```

Example (IPv6)

```
OS10(config)# management route 10::/64 10::1
```

Supported Releases 10.2.2E or later

move

Moves or renames a file in the configuration or home system directories.

Syntax `move [config: | home: | usb:]`

Parameters

- `config:` — Move from the configuration directory (`config://filepath`).
- `home:` — Move from the home directory (`home://filepath`).
- `usb:` — Move from the USB file system (`usb://filepath`).

Default Not configured

Command Mode EXEC

Usage Information Use the `dir config` command to view the directory contents.

Example

```
OS10# move config://startup.xml config://startup-backup.xml
```

Example (dir)

```
OS10# dir config

Directory contents for folder: config
```

```
Date (modified)        Size (bytes)  Name
---------------------  ------------  -----------
2017-04-26T15:23:46Z   26704         startup.xml
```

Supported Releases 10.2.0E or later

no

Disables or deletes commands in EXEC mode.

Syntax `no [alias | debug | support-assist-activity | terminal]`

Parameters

- `alias` — Remove an alias definition.
- `debug` — Disable debugging.
- `support-assist-activity` — SupportAssist-related activity.
- `terminal` — Reset terminal settings.

Default Not configured

Command Mode EXEC

Usage Information Use this command in EXEC mode to disable or remove a configuration. Use the `no ?` in CONFIGURATION mode to view available commands.

Example

```
OS10# no alias goint
```

Supported Releases 10.2.0E or later

ping

Tests network connectivity to an IPv4 device.

Syntax

```
ping [vrf {management | vrf-name}] [-4] [-aAbBdDfhLnOqrRUvV] [-c count]
[-i interval] [-I interface] [-m mark] [-M pmtudisc_option] [-l preload]
[-p pattern] [-Q tos] [-s packetsize] [-S sndbuf] [-t ttl] [-T
timestamp_option] [-w deadline] [-W timeout] [hop1 ...] destination
```

Parameters

- `vrf management` — (Optional) Pings an IPv4 address in the management virtual routing and forwarding (VRF) instance.
- `vrf` *`vrf-name`* — (Optional) Ping an IP address in a specified VRF instance.
- `-4` — (Optional) Uses the IPv4 route over the IPv6 route when both IPv4 as well as IPv6 default routes are configured, you must use the following option in the ping command: -4. For example, *OS10# ping vrf management -4 dell.com*.
- `-a` — (Optional) Audible ping.
- `-A` — (Optional) Adaptive ping. An inter-packet interval adapts to the round-trip time so that one (or more, if you set the preload option) unanswered probe is present in the network. The minimum interval is 200 msec for a non-super user, which corresponds to Flood mode on a network with a low round-trip time.
- `-b` — (Optional) Pings a broadcast address.
- `-B` — (Optional) Does not allow ping to change the source address of probes. The source address is bound to the address used when the ping starts.
- `-c` *`count`* — (Optional) Stops the ping after sending the specified number of ECHO_REQUEST packets until the timeout expires.
- `-d` — (Optional) Sets the SO_DEBUG option on the socket being used.
- `-D` — (Optional) Prints the timestamp before each line.
- `-h` — (Optional) Displays help for this command.

- `-i interval` — (Optional) Enter the interval in seconds to wait between sending each packet, the default is 1 second.
- `-I interface-name or interface-ip-address` — (Optional) Enter the source interface name without spaces or the interface IP address:
  - For a physical Ethernet interface, enter `ethernet`*node/slot/port*; for example, `ethernet1/1/1`.
  - For a VLAN interface, enter `vlan`*vlan-id*; for example, `vlan10`.
  - For a Loopback interface, enter `loopback`*id*; for example, `loopback1`.
  - For a port-channel interface, enter `port-channel`*channel-id*; for example, `port-channel`.
- `-l preload` — (Optional) Enter the number of packets that ping sends before waiting for a reply. Only a super user may preload more than three.
- `-L` — (Optional) Suppress the Loopback of multicast packets for a multicast target address.
- `-m mark` — (Optional) Tags the packets sent to ping a remote device. Use this option with policy routing.
- `-M pmtudisc_option` — (Optional) Enter the path MTU (PMTU) discovery strategy:
  - `do` prevents fragmentation, including local.
  - `want` performs PMTU discovery and fragments large packets locally.
  - `dont` does not set the Don't Fragment (DF) flag.
- `-p pattern` — (Optional) Enter a maximum of 16 pad bytes to fill out the packet you send to diagnose data-related problems in the network; for example, `-p ff` fills the sent packet with all 1's.
- `-Q tos` — (Optional) Enter a maximum of 1500 bytes in decimal or hex datagrams to set quality of service (QoS)-related bits.
- `-s packetsize` — (Optional) Enter the number of data bytes to send, from 1 to 65468, default 56.
- `-S sndbuf` — (Optional) Set the sndbuf socket. By default, the sndbuf socket buffers one packet maximum.
- `-t ttl` — (Optional) Enter the IPv4 time-to-live (TTL) value in seconds.
- `-T timestamp option` — (Optional) Set special IP timestamp options. Valid values for *timestamp option* — `tsonly` (only timestamps), `tsandaddr` (timestamps and addresses), or `tsprespec host1 [host2 [host3 [host4]]]` (timestamp pre-specified hops).
- `-v` — (Optional) Verbose output.
- `-V` — (Optional) Display the version and exit.
- `-w deadline` — (Optional) Enter the time-out value in seconds before the ping exits regardless of how many packets send or receive.
- `-W timeout` — (Optional) Enter the time to wait for a response in seconds. This setting affects the time-out only if there is no response, otherwise ping waits for two round-trip times (RTTs).
- *hop1* `...` (Optional) Enter the IPv4 addresses of the pre-specified hops for the ping packet to take.
- *destination* — Enter the IP address you are testing connectivity on.

Default Not configured

Command Mode EXEC

Usage Information

This command uses an ICMP ECHO_REQUEST datagram to receive an ICMP ECHO_RESPONSE from a network host or gateway. Each ping packet has an IPv4 and ICMP header, then a time value and a number of ''pad'' bytes used to fill out the packet. A ping operation sends a packet to a specified IP address and then measures the time that it takes to get a response from the address or device.

If the destination IP address is active, replies are sent back from the server including the IP address, number of bytes sent, lapse time in milliseconds, and TTL, which is the number of hops back from the source to the destination.

When you use the `-I` option and enter an IP address, OS10 considers it as the source address. If you use an interface name instead of the IP address, OS10 considers it as the egress interface.

With the `-I` option, if you ping a reachable IP address using the IP address of a loopback interface as the source interface, the ping succeeds. However, if you ping a reachable IP address using the name of the loopback interface as the source interface, the ping fails. This is because the system considers the loopback interface as the egress interface.

Example

```
OS10# ping 20.1.1.1
PING 20.1.1.1 (20.1.1.1) 56(84) bytes of data.
```

```
64 bytes from 20.1.1.1: icmp_seq=1 ttl=64 time=0.079 ms
64 bytes from 20.1.1.1: icmp_seq=2 ttl=64 time=0.081 ms
64 bytes from 20.1.1.1: icmp_seq=3 ttl=64 time=0.133 ms
64 bytes from 20.1.1.1: icmp_seq=4 ttl=64 time=0.124 ms
^C
--- 20.1.1.1 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 2997ms
rtt min/avg/max/mdev = 0.079/0.104/0.133/0.025 ms
```

Supported Releases 10.2.0E or later

ping6

Tests network connectivity to an IPv6 device.

Syntax

```
ping6 [vrf {management | vrf-name}] [-aAbBdDfhLnOqrRUvV] [-c count] [-i
interval] [-I interface] [-l preload] [-m mark] [-M pmtudisc_option] [-N
nodeinfo_option] [-p pattern] [-Q tclass] [-s packetsize] [-S sndbuf] [-t
ttl] [-T timestamp_option] [-w deadline] [-W timeout] destination
```

Parameters

- `vrf management` — (Optional) Pings an IPv6 address in the management VRF instance.
- `vrf vrf-name` — (Optional) Pings an IPv6 address in a specified VRF instance.
- `-a` — (Optional) Audible ping.
- `-A` — (Optional) Adaptive ping. An inter-packet interval adapts to the round-trip time so that one (or more, if you set the preload option) unanswered probe is present in the network. The minimum interval is 200 msec for a non-super user, which corresponds to Flood mode on a network with a low round-trip time.
- `-b` — (Optional) Pings a broadcast address.
- `-B` — (Optional) Does not allow ping to change the source address of probes. The source address is bound to the address used when the ping starts.
- `-c count` — (Optional) Stops the ping after sending the specified number of ECHO_REQUEST packets until the timeout expires.
- `-d` — (Optional) Sets the SO_DEBUG option on the socket being used.
- `-D` — (Optional) Prints the timestamp before each line.
- `-F flowlabel` — (Optional) Sets a 20-bit flow label on echo request packets. If value is zero, the kernel allocates a random flow label.
- `-h` — (Optional) Displays help for this command.
- `-i interval` — (Optional) Enter the interval in seconds to wait between sending each packet, the default is 1 second.
- `-I interface-name or interface-ip-address` — (Optional) Enter the source interface name without spaces or the interface IP address:
  - For a physical Ethernet interface, enter `ethernet`*node/slot/port*; for example, `ethernet1/1/1`.
  - For a VLAN interface, enter `vlan`*vlan-id*; for example, `vlan10`.
  - For a Loopback interface, enter `loopback`*id*; for example, `loopback1`.
  - For a port-channel interface, enter `port-channel`*channel-id*; for example, `port-channel`.
- `-l preload` — (Optional) Enter the number of packets that ping sends before waiting for a reply. Only a super-user may preload more than three.
- `-L` — (Optional) Suppress the Loopback of multicast packets for a multicast target address.
- `-m mark` — (Optional) Tags the packets sent to ping a remote device. Use this option with policy routing.
- `-M pmtudisc_option` — (Optional) Enter the path MTU (PMTU) discovery strategy:
  - `do` prevents fragmentation, including local.
  - `want` performs PMTU discovery and fragments large packets locally.
  - `dont` does not set the Don't Fragment (DF) flag.
- `-p pattern` — (Optional) Enter a maximum of 16 pad bytes to fill out the packet you send to diagnose data-related problems in the network; for example, `-p ff` fills the sent packet with all 1's.

- `-Q tos` — (Optional) Enter a maximum of 1500 bytes in decimal or hex datagrams to set the quality of service (QoS)-related bits.
- `-s packetsize` — (Optional) Enter the number of data bytes to send, from 1 to 65468, default 56.
- `-S sndbuf` — (Optional) Set the sndbuf socket. By default, the sndbuf socket buffers one packet maximum.
- `-t ttl` — (Optional) Enter the IPv6 time-to-live (TTL) value in seconds.
- `-T timestamp option` — (Optional) Set special IP timestamp options. Valid values for *timestamp option* — `tsonly` (only timestamps), `tsandaddr` (timestamps and addresses), or `tsprespec host1 [host2 [host3 [host4]]]` (timestamp pre-specified hops).
- `-v` — (Optional) Verbose output.
- `-V` — (Optional) Display the version and exit.
- `-w deadline` — (Optional) Enter the time-out value in seconds before the ping exits regardless of how many packets are sent or received.
- `-W timeout` — (Optional) Enter the time to wait for a response in seconds. This setting affects the time-out only if there is no response, otherwise ping waits for two round-trip times (RTTs).
- `hop1 ...` (Optional) Enter the IPv6 addresses of the pre-specified hops for the ping packet to take.
- `destination` — Enter the IPv6 destination address in A:B::C:D format, where you are testing connectivity.

Default Not configured

Command Mode EXEC

Usage Information

This command uses an ICMP ECHO_REQUEST datagram to receive an ICMP ECHO_RESPONSE from a network host or gateway. Each ping packet has an IPv6 and ICMP header, then a time value and a number of "pad" bytes used to fill out the packet. A pingv6 operation sends a packet to a specified IPv6 address and then measures the time it takes to get a response from the address or device.

When you use the `-I` option and enter an IP address, OS10 considers it as the source address. If you use an interface name instead of the IP address, OS10 considers it as the egress interface.

With the `-I` option, if you ping a reachable IP address using the IP address of a loopback interface as the source interface, the ping succeeds. However, if you ping a reachable IP address using the name of the loopback interface as the source interface, the ping fails. This is because the system considers the loopback interface as the egress interface.

Example

```
OS10# ping6 20::1
PING 20::1(20::1) 56 data bytes
64 bytes from 20::1: icmp_seq=1 ttl=64 time=2.07 ms
64 bytes from 20::1: icmp_seq=2 ttl=64 time=2.21 ms
64 bytes from 20::1: icmp_seq=3 ttl=64 time=2.37 ms
64 bytes from 20::1: icmp_seq=4 ttl=64 time=2.10 ms
^C
--- 20::1 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3005ms
rtt min/avg/max/mdev = 2.078/2.194/2.379/0.127 ms
```

Supported Releases 10.2.0E or later

reload

Reloads the software and reboots the ONIE-enabled device.

Syntax `reload [at | cancel | in | onie | ztd]`

Parameters

- `at`—Schedule reboot of the networking operating system to take place at the specified time.
- `cancel`—Cancel a scheduled reboot.
- `in`—Schedule reboot of the networking operating system after the specified time.
- `onie`—Reboot the networking operating system in the ONIE mode.
- `ztd`—Reboot the networking operating system in the ZTD-enabled mode.

Default Not configured

Command Mode EXEC

Usage Information **NOTE:** Use caution while using this command as it reloads the OS10 image and reboots the device.

Example

```
OS10# reload

Proceed to reboot the system? [confirm yes/no]:y
```

Supported Releases 10.2.0E or later

show boot

Displays detailed information about the boot image.

Syntax `show boot [detail]`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information The `Next-Boot` field displays the image that the next reload uses.

Example

```
OS10# show boot
Current system image information:
===================================
Type      Boot Type      Active                    Standby                  Next-Boo
-------------------------------------------------------------------------------------

        ---
Node-id 1 Flash Boot     [A] 10.5.0.4            [B] 10.5.1.0             [B] stand
```

Example (detail)

```
OS10# show boot detail
Current system image information detail:
==========================================
Type:                     Node-id 1
Boot Type:                Flash Boot
Active Partition:         A
Active SW Version:        10.5.0.4
Active SW Build Version:  10.5.0.4.650
Active Kernel Version:    Linux 4.9.189
Active Build Date/Time:   2020-02-11T11:13:08Z
Standby Partition:        B
Standby SW Version:       10.5.1.0
Standby SW Build Version: 10.5.1.0.123
Standby Build Date/Time:  2020-02-12T02:34:02Z
Next-Boot:                standby[B]
```

Supported Releases 10.2.0E or later

show candidate-configuration

Displays the current candidate configuration file.

Syntax

```
show candidate-configuration [aaa | access-list | as-path | bfd | bgp
| class-map | community-list | compressed | control-plane | dot1x |
extcommunity-list | evpn | fefd | igmp | interface [virtual-network vn-id]
| ip dhcp snooping | lacp | line | lldp | logging | management-route | mld
| monitor | ntp | nve | ospf | ospfv3 | password-attributes | pim | policy-
```

```
map | port-security | prefix-list | privilege | qos-map | radius-server |
route | route-map | sflow | smartfabric | snmp | spanning-tree | support-
assist | system-qos | tacacs-server | telemetry | trust-map | uplink-state-
group | userrole | users | virtual-network | vlt | vrf | wred-profile]
```

Parameters

- `aaa` — (Optional) Current operating AAA configuration.
- `access-list` — (Optional) Current operating access-list configuration.
- `as-path` — (Optional) Current operating as-path configuration.
- `bfd` — (Optional) Current operating BFD configuration.
- `bgp` — (Optional) Current operating BGP configuration.
- `class-map` — (Optional) Current operating class-map configuration.
- `community-list` — (Optional) Current operating community-list configuration.
- `compressed` — (Optional) Current operating configuration in compressed format.
- `control-plane` — (Optional) Current operating control-plane configuration.
- `dot1x` — (Optional) Current operating dot1x configuration.
- `evpn` — (Optional) Current operating EVPN configuration.
- `extcommunity-list` — (Optional) Current operating extcommunity-list configuration.
- `interface` — (Optional) Current operating interface configuration.
  - `virtual-network` *`vn-id`* — (Optional) Current virtual network configuration.
- `fefd` — (Optional) Current operating FEFD configuration.
- `igmp` — (Optional) Current operating IGMP configuration.
- `ip dhcp snooping` — (Optional) Current operating DHCP snooping information.
- `lacp` — (Optional) Current operating LACP configuration.
- `lldp` — (Optional) Current operating LLDP configuration.
- `logging` — (Optional) Current operating logging configuration.
- `management-route` — (Optional) Current operating management route configuration.
- `mld` — (Optional) Current operating MLD configuration.
- `monitor` — (Optional) Current operating monitor session configuration.
- `ntp` — (Optional) Current operating NTP configuration.
- `nve` — (Optional) Current operating NVE configuration.
- `ospf` — (Optional) Current operating OSPF configuration.
- `ospfv3` — (Optional) Current operating OSPFv3 configuration.
- `password-attributes` — (Optional) Current operating passwords attributes configuration.
- `pim` — (Optional) Current operating PIM configuration.
- `port-security` — (Optional) Current operating port security configuration.
- `policy-map` — (Optional) Current operating policy-map configuration.
- `prefix-list` — (Optional) Current operating prefix-list configuration.
- `privilege` — (Optional) Current operating user privilege configuration.
- `qos-map` — (Optional) Current operating qos-map configuration.
- `radius-server` — (Optional) Current operating radius-server configuration.
- `route` — (Optional) Current operating management route configuration.
- `route-map` — (Optional) Current operating route-map configuration.
- `sflow` — (Optional) Current operating sFlow® configuration.
- `smartfabric` — (Optional) Current operating SmartFabric configuration.
- `snmp` — (Optional) Current operating SNMP configuration.
- `spanning-tree` — (Optional) Current operating spanning-tree configuration.
- `support-assist` — (Optional) Current operating support-assist configuration.
- `system-qos` — (Optional) Current operating system-qos configuration.
- `tacacs-server` — (Optional) Current operating TACACS server configuration.
- `telemetry` — (Optional) Current operating telemetry configuration.
- `trust-map` — (Optional) Current operating trust-map configuration.
- `uplink-state-group` — (Optional) Current operating Uplink State Group configuration.
- `users` — (Optional) Current operating users configuration.
- `userrole` — (Optional) Current operating user role configuration.

- `virtual-network` — (Optional) Current operating virtual network configuration.
- `vlt` — (Optional) Current operating VLT domain configuration.
- `vrf` — (Optional) Current operating VRF configuration.
- `wred-profile` — (Optional) Current operating WRED profile configuration.

```

Supported Releases 10.2.0E or later

show ip management-route

Displays the IPv4 routes used to access the Management port.

Syntax `show ip management-route [all | connected | dynamic | static summary]`

Parameters

- `all` — (Optional) Display the IPv4 routes that the Management port uses.
- `connected` — (Optional) Display only routes directly connected to the Management port.
- `dynamic` — (Optional) Display active management routes that are learned by a routing protocol.
- `summary` — (Optional) Display the number of active and non-active management routes and their remote destinations.
- `static` — (Optional) Display active static management routes.

Default Not configured

Command Mode EXEC

Usage Information Use this command to view the IPv4 static and connected routes configured for the Management port. Use the `management route` command to configure an IPv4 or IPv6 management route.

Example

```
OS10# show ip management-route
 Destination        Gateway              State       Source
-------------------------------------------------------------------
192.168.10.0/24     managementethernet   Connected   Connected
```

Supported Releases 10.2.2E or later

show ipv6 management-route

Displays the IPv6 routes used to access the Management port.

Syntax `show ipv6 management-route [all | connected | static | summary]`

Parameters

- `all` — (Optional) Display the IPv6 routes that the Management port uses.
- `connected` — (Optional) Display only routes directly connected to the Management port.
- `summary` — (Optional) Display the number of active and non-active management routes and their remote destinations.
- `static` — (Optional) Display active static management routes.

Default Not configured

Command Mode EXEC

Usage Information Use this command to view the IPv6 static and connected routes configured for the Management port. Use the `management route` command to configure an IPv4 or IPv6 management route.

Example

```
OS10# show ipv6 management-route

Destination    Gateway                 State
-----------    -------                 -----
2001:34::0/64  ManagementEthernet 1/1  Connected
2001:68::0/64  2001:34::16             Active
```

Supported Releases 10.2.2E or later

show license status

Displays license status information.

Syntax `show license status`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Use the `show license status` command to verify the current license for running OS10, its duration, and the service tag assigned to the switch.

Example

```
OS10# show license status

System Information
---------------------------------------------------------

Supported Releases 10.3.0E or later

show running-configuration

Displays the configuration currently running on the device.

Syntax

```
show running-configuration [aaa | access-list | as-path | bfd | bgp
[vrf vrf-name] [neighbor {ip-address | interface interface-type | class-
map | community-list | compressed | control-plane | crypto | dot1x |
extcommunity-list | evpn | fefd | igmp | interface [virtual-network vn-id]
| ip dhcp snooping | lacp | line | lldp | logging | management-route | mld
| monitor | ntp | nve | ospf | ospfv3 | password-attributes | pim | policy-
map | port-security | prefix-list | privilege | qos-map | radius-server |
route | route-map | sflow | smartfabric | snmp | spanning-tree | support-
```

`assist | system-qos | tacacs-server | telemetry | trust-map | uplink-state-group | userrole | users | virtual-network | vlt | vrf | wred-profile]`

Parameters

- `aaa` — (Optional) Current operating AAA configuration.
- `access-list` — (Optional) Current operating access-list configuration.
- `as-path` — (Optional) Current operating as-path configuration.
- `bfd` — (Optional) Current operating BFD configuration.
- `bgp]` — (Optional) Current operating BGP configuration.
  - [vrf *vrf-name*] — Enter the VRF name.
  - [neighbor [*ip-address* | interface *interface-type* Enter the interface IP address or interface name.
- `class-map` — (Optional) Current operating class-map configuration.
- `community-list` — (Optional) Current operating community-list configuration.
- `compressed` — (Optional) Current operating configuration in compressed format.
- `control-plane` — (Optional) Current operating control-plane configuration.
- `crypto` — (Optional) Current operating cryptographic configuration.
- `dot1x` — (Optional) Current operating dot1x configuration.
- `evpn` — (Optional) Current operating EVPN configuration.
- `extcommunity-list` — (Optional) Current operating extcommunity-list configuration.
- `interface` — (Optional) Current operating interface configuration.
  - `virtual-network` *`vn-id`* — (Optional) Current virtual network configuration.
- `fefd` — (Optional) Current operating FEFD configuration.
- `igmp` — (Optional) Current operating IGMP configuration.
- `ip dhcp snooping` — (Optional) Current operating DHCP snooping information.
- `lacp` — (Optional) Current operating LACP configuration.
- `lldp` — (Optional) Current operating LLDP configuration.
- `logging` — (Optional) Current operating logging configuration.
- `management-route` — (Optional) Current operating management route configuration.
- `mld` — (Optional) Current operating MLD configuration.
- `monitor` — (Optional) Current operating monitor session configuration.
- `ntp` — (Optional) Current operating NTP configuration.
- `nve` — (Optional) Current operating NVE configuration.
- `ospf` — (Optional) Current operating OSPF configuration.
- `ospfv3` — (Optional) Current operating OSPFv3 configuration.
- `password-attributes` — (Optional) Current operating passwords attributes configuration.
- `pim` — (Optional) Current operating PIM configuration.
- `port-security` — (Optional) Current operating port security configuration.
- `policy-map` — (Optional) Current operating policy-map configuration.
- `prefix-list` — (Optional) Current operating prefix-list configuration.
- `privilege` — (Optional) Current operating user privilege configuration.
- `qos-map` — (Optional) Current operating qos-map configuration.
- `radius-server` — (Optional) Current operating radius-server configuration.
- `route` — (Optional) Current operating management route configuration.
- `route-map` — (Optional) Current operating route-map configuration.
- `sflow` — (Optional) Current operating sFlow® configuration.
- `smartfabric` — (Optional) Current operating SmartFabric configuration.
- `snmp` — (Optional) Current operating SNMP configuration.
- `spanning-tree` — (Optional) Current operating spanning-tree configuration.
- `support-assist` — (Optional) Current operating support-assist configuration.
- `system-qos` — (Optional) Current operating system-qos configuration.
- `tacacs-server` — (Optional) Current operating TACACS server configuration.
- `telemetry` — (Optional) Current operating telemetry configuration.
- `trust-map` — (Optional) Current operating trust-map configuration.
- `uplink-state-group` — (Optional) Current operating Uplink State Group configuration.
- `users` — (Optional) Current operating users configuration.

- `userrole` — (Optional) Current operating user role configuration.
- `virtual-network` — (Optional) Current operating virtual network configuration.
- `vlt` — (Optional) Current operating VLT domain configuration.
- `vrf` — (Optional) Current operating VRF configuration.
- `wred-profile` — (Optional) Current operating WRED profile configuration.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show running-configuration
! Version 10.2.9999E
! Last configuration change at Apr  11 01:25:02 2017
!

Supported Releases 10.2.0E or later

show startup-configuration

Displays the contents of the startup configuration file.

Syntax `show startup-configuration [compressed]`

Parameters `compressed` — (Optional) View a compressed version of the startup configuration file.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show startup-configuration
username admin
password $6$q9QBeYjZ$jfxzVqGhkxX3smxJSH9DDz7/3OJc6m5wjF8nnLD7/
VKx8SloIhp4NoGZs0I/UNwh8WVuxwfd9q4pWIgNs5BKH.

class-map type application class-iscsi
```

Supported Releases 10.2.0E or later

show system

Displays system information.

Syntax `show system [brief | node-id]`

Parameters

- `brief`—View an abbreviated list of the system information.
- `node-id`—View the node ID number.

Default Not configured

Command Mode EXEC

Usage Information Starting from Release 10.5.4.0, this command displays the following additional information:

- Firmware details of the switch such as ONIE version, ONIE firmware updater version, SSD version, DIAG OS vers version.
- Input power, average input power, and average power start time per power supply unit (PSU).

Example

```
OS10# show system

Node Id              : 1
MAC                  : 54:0f:64:bd:00:00
Number of MACs       : 384
Up Time              : 00:03:58
DiagOS               : 3.00.3.41-2

- Unit 1 -
Status                     : up
System Identifier          : 1

```

Supported Releases 10.2.0E or later

show version

Displays software version information.

Syntax `show version`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show version
Dell EMC Networking OS10 Enterprise
Copyright (c) 1999-2022 by Dell Inc. All Rights Reserved.
OS Version: 10.5.4.0
Build Version: 10.5.4.0.215
Build Time: 2022-04-12T21:35:41+0000
System Type: S5248F-ON
Architecture: x86_64
Up Time: 1 day 00:54:13
```

Supported Releases 10.2.0E or later

start

Activates Transaction-Based Configuration mode for the active session.

Syntax `start` *`transaction`*

Parameters `transaction` - Enables the transaction-based configuration.

Default Not configured

Command Mode EXEC

Usage Information Use the `start` command to save changes to the candidate configuration before applying configuration changes to the running configuration.

NOTE: Before you start a transaction, you must lock the session using the `lock` command in EXEC mode. Otherwise, the configuration changes from other sessions are committed.

Example

```
OS10# start transaction
```

Supported Releases	10.3.1E or later

system

Executes a Linux command from within OS10.

Syntax	`system` *command*
Parameters	*command* — Enter the Linux command to execute.
Default	Not configured
Command Mode	EXEC
Usage Information	None

Example	`OS10# system bash`
	`admin@OS10:~$ pwd`
	`/config/home/admin`
	`admin@OS10:~$ exit`
	`OS10#`

Supported Releases	10.2.0E or later

system-cli disable

Disables the `system` command.

Syntax	`system-cli disable`
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command enables OS10 `system` command.
Example	`OS10# configure terminal` `OS10(config)# system-cli disable`
Supported Releases	10.4.3.0 or later

system-user linuxadmin disable

Disables the `linuxadmin` account.

Syntax	`system-user linuxadmin disable`
Parameters	None
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `linuxadmin` account allows you to access the Linux shell. Use the `system-user linuxadmin disable` command to disable Linux shell access. You can still run Linux commands from the OS10 command-line interface using the `system` command. To disable the `system` command from executing Linux commands, use the `system-cli disable` command.

Example

```
OS10(config)# system-user linuxadmin disable
```

Supported Releases 10.4.3.0 or later

system identifier

Sets a non-default unit ID in a non-stacking configuration.

Syntax `system identifier system-id`

Parameters *system-id* — Enter the system ID, from 1 to 9.

Default Not configured

Command Mode CONFIGURATION

Usage Information The system ID displays in the stack LED on the switch front panel.

Example

```
OS10(config)# system identifier 1
```

Supported Releases 10.3.0E or later

terminal

Sets the number of lines to display on the terminal and enables logging.

Syntax `terminal {length lines | monitor}`

Parameters

- `length lines` — Enter the number of lines to display on the terminal from 0 to 512; default 24.
- `monitor` — Enables logging on the terminal.

Default 24 terminal lines

Command Mode EXEC

Usage Information Enter zero (`0`) for the terminal to display without pausing.

Example

```
OS10# terminal monitor
```

Supported Releases 10.2.0E or later

traceroute

Displays the routes that packets take to travel to an IP address.

Syntax

```
traceroute [vrf {management | vrf-name}] host [-46dFITnreAUDV] [-f
first_ttl] [-g gate,...] [-i device] [-m max_ttl] [-N squeries] [-p port]
[-t tos] [-l flow_label] [-w waittime] [-q nqueries] [-s src_addr] [-z
sendwait] [--fwmark=num] host [packetlen]
```

Parameters

- `vrf management`— (Optional) Traces the route to an IP address in the management VRF instance.
- `vrf vrf-name` — (Optional) Traces the route to an IP address in the specified VRF instance.
- *host* — Enter the host to trace packets from.
- `-i interface` — (Optional) Enter the IP address of the interface through which traceroute sends packets. By default, the interface is selected according to the routing table.

- `-m max_ttl` — (Optional) Enter the maximum number of hops for the maximum time-to-live value that traceroute probes. The default is 30.
- `-p port` — (Optional) Enter a destination port:
  - For UDP tracing, enter the destination port base that traceroute uses. The destination port number is incremented by each probe.
  - For ICMP tracing, enter the initial ICMP sequence value, incremented by each probe.
  - For TCP tracing, enter the constant destination port to connect.
  - `-P protocol` — (Optional) Use a raw packet of the specified protocol for traceroute. The default protocol is 253 (RFC 3692).
  - `-s source_address` — (Optional) Enter an alternative source address of one of the interfaces. By default, the address of the outgoing interface is used.
  - `-q nqueries` — (Optional) Enter the number of probe packets per hop. The default is 3.
  - `-N squeries` — (Optional) Enter the number of probe packets sent out simultaneously to accelerate traceroute. The default is 16.
  - `-t tos` — (Optional) For IPv4, enter the type of service (ToS) and precedence values to use. `16` sets a low delay; `8` sets a high throughput.
  - `-UL` — (Optional) Use UDPLITE for tracerouting. The default port is 53.
  - `-w waittime` — (Optional) Enter the time in seconds to wait for a response to a probe. The default is 5 seconds.
  - `-z sendwait` — (Optional) Enter the minimal time interval to wait between probes. The default is 0. A value greater than 10 specifies a number in milliseconds, otherwise it specifies a number of seconds. This option is useful when routers rate-limit ICMP messages.
  - `--mtu` — (Optional) Discovers the maximum transmission unit (MTU) from the path being traced.
  - `--back` — (Optional) Prints the number of backward hops when different from the forward direction.
  - `host` — (Required) Enter the name or IP address of the destination device.
  - `packet_len` — (Optional) Enter the total size of the probing packet. The default is 60 bytes for IPv4 and 80 for IPv6.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# traceroute www.dell.com
traceroute to www.dell.com (23.73.112.54), 30 hops max, 60 byte packets
 1  10.11.97.254 (10.11.97.254)  4.298 ms  4.417 ms  4.398 ms
 2  10.11.3.254 (10.11.3.254)  2.121 ms  2.326 ms  2.550 ms
 3  10.11.27.254 (10.11.27.254)  2.233 ms  2.207 ms  2.391 ms
 4  Host65.hbms.com (63.80.56.65)  3.583 ms  3.776 ms  3.757 ms
 5  host33.30.198.65 (65.198.30.33)  3.758 ms  4.286 ms  4.221 ms
 6  3.GigabitEthernet3-3.GW3.SCL2.ALTER.NET (152.179.99.173)  4.428 ms
2.593 ms  3.243 ms
 7  0.xe-7-0-1.XL3.SJC7.ALTER.NET (152.63.48.254)  3.915 ms  3.603 ms
3.790 ms
 8  TenGigE0-4-0-5.GW6.SJC7.ALTER.NET (152.63.49.254)  11.781 ms  10.600
ms  9.402 ms
 9  23.73.112.54 (23.73.112.54)  3.606 ms  3.542 ms  3.773 ms
```

Example (IPv6)

```
OS10# traceroute 20::1
traceroute to 20::1 (20::1), 30 hops max, 80 byte packets
 1  20::1 (20::1)  2.622 ms  2.649 ms  2.964 ms
```

Supported Releases 10.2.0E or later

unlock

Unlocks a previously locked candidate configuration file.

Syntax `unlock`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# unlock
```

Supported Releases 10.2.0E or later

username password role

Creates an authentication entry based on a user name and password, and assigns a role to the user.

Syntax `username` *`username`* `password` *`password`* `role` *`role`* `[priv-lvl` *`privilege-level`*`]`

Parameters

- `username` *`username`*—Enter a text string. A maximum of 32 alphanumeric characters; one character minimum.

  NOTE: While creating a user account using the `username password role` command, the username attribute must adhere to the following regular expression: `^[a-z_][a-z0-9_-]*[$]?$`
- `password` *`password`*—Enter a text string. A maximum of 32 alphanumeric characters; nine characters minimum. Password prefixes `$1$`, `$5$`, and`$6$` are not supported in clear-text passwords.
- `role` *`role`*—Enter a user role:
  - `sysadmin` — Full access to all commands in the system, exclusive access to commands that manipulate the file system, and access to the system shell. A system administrator can create user IDs and user roles.
  - `secadmin` — Full access to configuration commands that set security policy and system access, such as password strength, AAA authorization, and cryptographic keys. A security administrator can display security information, such as cryptographic keys, login statistics, and log information.
  - `netadmin` — Full access to configuration commands that manage traffic flowing through the switch, such as routes, interfaces, and ACLs. A network administrator cannot access configuration commands for security features or view security information.
  - `netoperator` — Access to EXEC mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch.
- `priv-lvl` *`privilege-level`* — Enter a privilege level, from 0 to 15. If you do not specify the `priv-lvl` option, the system assigns privilege level 1 for the `netoperator` role and privilege level 15 for the `sysadmin`, `secadmin`, and `netadmin` roles.

Default

- User name and password entries are in clear text.
- There is no default user role.
- The default privilege levels are level 1 for `netoperator`, and level 15 for `sysadmin`, `secadmin`, and `netadmin`.

Command Mode CONFIGURATION

Usage Information By default, the password must be at least nine alphanumeric characters. Only the following special characters are supported:

```
! # % & ' ( ) ; < = > [ ] * + - . / : ^ _
```

Enter the password in clear text. It is converted to SHA-512 format in the running configuration. For backward compatibility with OS10 releases 10.3.1E and earlier, passwords entered in MD-5, SHA-256, and SHA-512 format are supported.

NOTE: When you create or modify a password, the password string that you input appears as a string of asterisks instead of plain text.

You cannot assign a privilege level higher than privilege level 1 to a user with the `netoperator` role and higher than privilege level 2 for a `sysadmin`, `secadmin`, and `netadmin` roles.

To increase the required password strength, use the `password-attributes` command. The `no` version of this command deletes the authentication for a user.

Example

```
OS10(config)# username user05 password newpwd404 role sysadmin priv-lvl
10
```

Supported Releases 10.2.0E or later

write

Copies the current running configuration to the startup configuration file.

Syntax `write {memory}`

Parameters `memory` — Copy the current running configuration to the startup configuration.

Default Not configured

Command Mode EXEC

Usage Information This command has the same effect as the `copy running-configuration startup-configuration` command. The running configuration is not saved to a local configuration file other than the startup configuration. Use the `copy` command to save running configuration changes to a local file.

Example

```
OS10# write memory
```

Supported Releases 10.2.0E or later

5

Advanced CLI tasks

Command alias	Provides information to create shortcuts for commonly used commands, see Command alias.
Batch mode	Provides information to run a batch file to execute multiple commands, see Batch mode.
Linux shell commands	Provides information to run commands from the Linux shell, see Linux shell commands.
OS9 commands	Provides information to enter configuration commands using an OS9 command syntax, see Using OS9 commands.

Command alias

To create shortcuts for commonly used or long commands, use the `alias` command. A command alias executes long commands with parameters.

- To create a command alias that is persistent and available in other OS10 sessions, create the alias in CONFIGURATION mode.
- To create a command alias that is non-persistent and is used only in the current OS10 session, create the alias in EXEC mode. After you close the session, the alias is removed from the switch.
- Create a command alias in EXEC or CONFIGURATION mode.

```
alias alias-name alias-value
```

  - The *alias-name* is case-sensitive and has a maximum of 20 characters. It does not support existing keywords, parameters, and short form of keywords.
  - The *alias-value* is the CLI command executed by the alias name. To enter command parameters, enter `$n`, where *n* is a number from 1 to 9 or an asterisk (*). Enter `$*` to enter up to nine parameters with the alias name.
  - You cannot create a shortcut for the `alias` command.
  - To delete an alias, use the `no alias alias-name` command.
  - To view the currently configured aliases, use the `show alias [brief | detail]` command.

Create an alias

```
OS10# alias showint "show interface $*"
OS10(config)# alias goint "interface ethernet $1"
```

View alias output for `showint`

```
OS10# showint status
--------------------------------------------------------------------------------
Port            Description     Status   Speed    Duplex   Mode Vlan Tagged-Vlans
--------------------------------------------------------------------------------

```

Multi-line alias

You can create a multi-line alias where you save a series of multiple commands in an alias. Multi-line alias is supported only in the Configuration mode.

You cannot use the exiting CLI keywords as alias names. The alias name is case-sensitive and can have a maximum of 20 characters.

- Create a multi-line alias in CONFIGURATION mode. The switch enters the ALIAS mode.

  ```
  alias alias-name
  ```

- Enter the commands to execute prefixed by the `line n` command in ALIAS mode. Enter the commands in double quotation marks and use `$n` to enter input parameters. You can substitute `$n` with either numbers ranging from 1 to 9 or with an asterisk (*) and enter the parameters while executing the commands using the alias. When you are using asterisk (*), you can use all the input parameters. The maximum number of input parameters is 9.

  ```
  line nn command
  ```

- (Optional) You can enter the default values to use for the parameters defined as `$n` in ALIAS mode.

```
default n input-value
```

- (Optional) Enter a description for the multi-line alias in ALIAS mode.

```
description string
```

- Use the `no` form of the command to delete an alias in CONFIGURATION mode.

```
no alias alias-name
```

You can modify an existing multi-line alias by entering the corresponding ALIAS mode.

Create a multi-line alias

```
OS10(config)# alias mTest
OS10(config-alias-mTest)# line 1 "interface $1 $2"
OS10(config-alias-mTest)# line 2 "no shutdown"
OS10(config-alias-mTest)# line 3 "show configuration"
OS10(config-alias-mTest)# default 1 "ethernet"
OS10(config-alias-mTest)# default 2 "1/1/1"
OS10(config-alias-mTest)# description InterfaceDetails
```

View alias output for `mTest` with default values

```
OS10(config)# mTest
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
 no shutdown
 switchport access vlan 1
```

View alias output for `mTest` with different values

```
OS10(config)# mTest ethernet 1/1/10
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# no shutdown
OS10(conf-if-eth1/1/10)# show configuration
!
interface ethernet1/1/10
 no shutdown
 switchport access vlan 1
```

Modify an existing multi-line alias

```
OS10(config)# alias mTest
OS10(config-alias-mTest)# line 4 "exit"
```

View the commands saved in the multi-line alias

```
OS10(config-alias-mTest)# show configuration
!
alias mTest
 description InterfaceDetails
 default 1 ethernet
 default 2 1/1/1
 line 1 "interface $1 $2"
 line 2 "no shutdown"
 line 3 "show configuration"
 line 4 exit
```

View alias information

```
OS10# show alias
Name                 Type
----                 ----
mTest                Config
```

```
Number of config aliases : 1
Number of local aliases : 0
```

View alias information brief. Displays the first 10 characters of each line of each alias.

```
OS10# show alias brief
Name                 Type        Value
----                 ----        -----
mTest                Config      line 1 "interface ..."
                                 line 2 "no shutdow..."
                                 line 3 "show confi..."
                                 default 1 "ethernet"
                                 default 2 "1/1/1"

Number of config aliases : 1
Number of local aliases : 0
```

View alias detail. Displays the entire alias value.

```
OS10# show alias detail
Name                 Type        Value
----                 ----        -----
mTest                Config      line 1 "interface $1 $2"
                                 line 2 "no shutdown"
                                 line 3 "show configuration"
                                 default 1 "ethernet"
                                 default 2 "1/1/1"

Number of config aliases : 1
Number of local aliases : 0
```

Delete an alias

```
OS10(config)# no alias mTest
```

alias

Creates a command alias.

Syntax

`alias` *alias-name alias-value*

Parameters

- *alias-name* — Enter the name of the alias. A maximum of 20 characters.
- *alias-value* — Enter the command to execute in double quotation marks, then `$` followed by either numbers ranging from 1 to 9 or an asterisk (*) with the parameters to execute in the command. Use asterisk (*) to represent any number of parameters.

Default

Not configured

Command Mode

EXEC

CONFIGURATION

Usage Information

Use this command to create a shortcut to long commands along with arguments. Use the numbers 1 to 9 along with `$` to provide input parameters. The `no` version of this command deletes an alias.

Example

In this example, when you enter `showint status`, note that the text on the CLI changes to `show interface status`. The alias changes to the command specified in the alias definition.

```
OS10# alias showint "show interface $*"
OS10# showint status
--------------------------------------------------------------------------------
Port            Description     Status   Speed    Duplex   Mode Vlan Tagged-Vlans
--------------------------------------------------------------------------------
Eth 1/1/1                       up       40G              A    1    -
Eth 1/1/2                       up       40G              A    1    -
```

```
Eth 1/1/3                       up       40G                A    1    -
Eth 1/1/4                       up       40G                A    1    -
Eth 1/1/5                       up       40G                A    1    -
Eth 1/1/6                       up       40G                A    1    -
Eth 1/1/7                       up       40G                A    1    -
Eth 1/1/8                       up       40G                A    1    -
Eth 1/1/9                       up       40G                A    1    -
Eth 1/1/10                      up       40G                A    1    -
Eth 1/1/11                      up       40G                A    1    -
Eth 1/1/12                      up       40G                A    1    -
Eth 1/1/13                      up       40G                A    1    -
Eth 1/1/14                      up       40G                A    1    -
Eth 1/1/15                      up       40G                A    1    -
Eth 1/1/16                      up       40G                A    1    -
Eth 1/1/17                      up       40G                A    1    -
Eth 1/1/18                      up       40G                A    1    -
Eth 1/1/19                      up       40G                A    1    -
Eth 1/1/20                      up       40G                A    1    -
Eth 1/1/21                      up       40G                A    1    -
Eth 1/1/22                      up       40G                A    1    -
Eth 1/1/23                      up       40G                A    1    -
Eth 1/1/24                      up       40G                A    1    -
Eth 1/1/25                      up       40G                A    1    -
Eth 1/1/26                      up       40G                A    1    -
Eth 1/1/27                      up       40G                A    1    -
Eth 1/1/28                      up       40G                A    1    -
Eth 1/1/29                      up       40G                A    1    -
Eth 1/1/30                      up       40G                A    1    -
Eth 1/1/31                      up       40G                A    1    -
Eth 1/1/32                      up       40G                A    1    -
--------------------------------------------------------------------------------
```

In this example, when you enter `goint 1/1/1`, note that the text on the CLI changes to `interface ethernet 1/1/1`.

```
OS10(config)# alias goint "interface ethernet $1"
OS10(config)# goint 1/1/1
OS10(conf-if-eth1/1/1)#
```

Supported Releases 10.3.0E or later

alias (multi-line)

Creates a mulit-line command alias.

Syntax `alias alias-name`

Parameters *alias-name* — Enter the name of the multi-line alias. A maximum of up to 20 characters.

Default Not configured

Command Mode CONFIGURATION

Usage Information Use this command to save a series of multiple commands in an alias. The switch enters ALIAS mode when you create an alias. You can enter a series of commands to execute using the `line` command. The `no` version of this command deletes an alias.

Example

```
OS10(config)# alias mTest
OS10(config-alias-mTest)# line 1 "interface $1 $2"
OS10(config-alias-mTest)# line 2 "no shutdown"
OS10(config-alias-mTest)# line 3 "show configuration"
```

Supported Releases 10.4.0E(R1) or later

default (alias)

Configures default values for input parameters in a multi-line alias.

Syntax `default n value`

Parameters
- *n* — Enter the number of the argument, from 1 to 9.
- *value* — Enter the value for the input parameter.

Default Not configured

Command Mode ALIAS

Usage Information To use special characters in the input parameter value, enclose the string in double quotation marks ("). The `no` version of this command removes the default value.

Example

```
OS10(config)# alias mTest
OS10(config-alias-mTest)# default 1 "ethernet 1/1/1"
```

Supported Releases 10.4.0E(R1) or later

description (alias)

Configures a textual description for a multi-line alias.

Syntax `description string`

Parameters *string* — Enter a text string for a multi-line alias description.

Default Not configured

Command Mode ALIAS

Usage Information
- To use special characters as a part of the description string, enclose the string in double quotation marks (").
- To use comma as a part of the description string add double back slash before the comma.
- Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks, for example, "*text description*."
- To overwrite any previous text strings that you configured as the description, enter a text string after the `description` command.
- The `no` version of this command removes the description.

Example

```
OS10(config)# alias mTest
OS10(config-alias-mTest)# description "This alias configures interfaces"
```

Supported Releases 10.4.0E(R1) or later

line (alias)

Configures the commands to execute in a multi-line alias.

Syntax `line nn command`

Parameters
- *nn* — Enter the line number, from 1 to 99. The commands are executed in the order of the line numbers.
- *command* — Enter the command to execute enclosed in double quotation marks (").

Default Not configured

Command Mode ALIAS

Usage Information The `no` version of this command removes the line number and the corresponding command from the multi-line alias.

Example

```
OS10(config)# alias mTest
OS10(config-alias-mTest)# line 1 "interface $1 $2"
OS10(config-alias-mTest)# line 2 "no shutdown"
OS10(config-alias-mTest)# line 3 "show configuration"
```

Supported Releases 10.4.0E(R1) or later

show alias

Displays configured alias commands available in both Persistent and Non-Persistent modes.

Syntax `show alias [brief | detail]`

Parameters

- `brief` — Displays brief information of the aliases.
- `detail` — Displays detailed information of the aliases.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show alias
Name                 Type
----                 ----
govlt                Config
goint                Config
mTest                Config
shconfig             Local
showint              Local
shver                Local
Number of config aliases : 3
Number of local aliases : 3
```

Example (brief — displays the first 10 characters of the alias value))

```
OS10# show alias brief
Name                 Type        Value
----                 ----        -----
govlt                Config      "vlt-domain..."
goint                Config      "interface ..."
mTest                Config      line 1 "interface ..."
                                 line 2 "no shutdow..."
                                 line 3 "show confi..."
                                 default 1 "ethernet"
                                 default 2 "1/1/1"
shconfig             Local       "show runni..."
showint              Local       "show inter..."
shver                Local       "show versi..."

Number of config aliases : 3
Number of local aliases : 3
```

Example (detail — displays the entire alias value)

```
OS10# show alias detail
Name                 Type        Value
----                 ----        -----
govlt                Config      "vlt-domain $1"
goint                Config      "interface ethernet $1"
mTest                Config      line 1 "interface $1 $2"
                                 line 2 "no shutdown"
                                 line 3 "show configuration"
                                 default 1 "ethernet"
```

```
                                    default 2 "1/1/1"
shconfig              Local         "show running-configuration"
showint               Local         "show interface $*"
shver                 Local         "show version"

Number of config aliases : 3
Number of local aliases : 3
```

Supported Releases 10.3.0E or later

Batch mode

To execute a sequence of multiple commands, create and run a batch file. A batch file is an unformatted text file that contains two or more commands. Store the batch file in the home directory.

Use the vi editor or any other editor to create the batch file, then use the `batch` command to run the file. To run a series of commands in batch mode (non-interactive processing), use the `batch` command. OS10 automatically commits all commands in a batch file — you do not have to enter the `commit` command.

If a command in the batch file fails, batch operation stops at that command. The remaining commands are not executed.

- Create a batch file — for example, `b.cmd` — on a remote device by entering a series of commands.

```
interface ethernet 1/1/1
no shutdown
no switchport
ip address 172.17.4.1/24
```

- Copy the command file to the home directory on the switch.

```
OS10# copy scp://os10user:os10passwd@10.11.222.1/home/os10/b.cmd home://b.cmd

OS10# dir home

Directory contents for folder: home
Date (modified)         Size (bytes)   Name
----------------------  -------------  ------
2017-02-15T19:25:35Z    77             b.cmd

...
```

- Execute the batch file using the `batch /home/`*`username`*`/`*`filename`* command in EXEC mode.

```
OS10# batch /home/admin/b.cmd
Jun 26 18:29:12 OS10 dn_l3_core_services[723]: Node.1-Unit.1:PRI:notice [os10:trap],
%Dell EMC (OS10) %log-notice:IP_ADDRESS_ADD: IP Address add is successful.
IP 172.17.4.1/24 in VRF:default added successfully
```

- (Optional) Verify the new commands in the running configuration.

```
OS10# show running-configuration interface ethernet 1/1/1
!
interface ethernet1/1/1
no shutdown
no switchport
ip address 172.17.4.1/24
```

batch

Executes a series of commands in a batch file using non-interactive processing.

Syntax `batch {string | /home/`*`filepath`* `| config://`*`filepath`*`}`

Parameters

- `string` — Enter the batch file name.

- `/home/filepath` — Enter the username and the filepath as follows: `batch /home/username/filename`.
- `config://filepath` — Enter the filepath.

Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to create a batch command file on a remote machine. Copy the command file to the home directory on your switch. This command executes commands in batch mode. OS10 automatically commits all commands in a batch file; you do not have to enter the `commit` command. To display the files stored in the home directory, enter `dir home`. To view the files stored in the home directory, use the `dir home` command.

Example	`batch /home/admin/b.cmd`
	`Jun 26 18:29:12 OS10 dn_l3_core_services[723]: Node.1-Unit.1:PRI:notice [os10:trap], %Dell EMC (OS10) %log-notice:IP_ADDRESS_ADD: IP Address add is successful.`
	`IP 172.17.4.1/24 in VRF:default added successfully`

Supported Releases	10.2.0E or later

Linux shell commands

From the Linux shell, you can run a single command or a series of commands in a batch file.

NOTE: When you log in through SSH as a linuxadmin, you may not be able to run commands such as `show running-configuration` and `configure terminal`. You can use the sudo command to run these commands as the admin user, for example:

- `sudo -u admin clish -c 'show version'`
- `sudo -u admin 'clish -B /home/admin/script_1.txt'`

Linux command examples

- Use the `-c` option to run a single command.

```
admin@OS10:/opt/dell/os10/bin$ clish -c "show version"

New user admin logged in at session 10
Network Operating System
OS Version: 10.5.4.0
Build Version: 10.5.4.0.215
Build Time: 2022-04-12T21:35:41+0000
System Type: S5248F-ON
Architecture: x86_64
Up Time: 1 day 00:54:13

User admin logged out at session 10
admin@OS10:/opt/dell/os10/bin$
```

- Use the `-B` option to run a batch file with a series of commands.
  - Create a batch file — for example, `batch_cfg.txt` — with a series of executable commands.

```
configure terminal
router bgp 100
neighbor 100.1.1.1
remote-as 104
no shutdown
```

- Execute the batch file.

```
admin@OS10:/opt/dell/os10/bin$ clish -B ~/batch_cfg.txt

New user admin logged in at session 15
```

- Verify the `BGP` settings configured by the batch file.

```
admin@OS10:/opt/dell/os10/bin$ clish -c "show running-configuration bgp"

New user admin logged in at session 16
!
router bgp 100
 !
 neighbor 100.1.1.1
  remote-as 104
  no shutdown
admin@OS10:/opt/dell/os10/bin$

User admin logged out at session 16
```

- Use the `ifconfig -a` command to display the interface configuration. The Linux kernel port numbers that correspond to front-panel port, port-channel, and VLAN interfaces are displayed. Port-channel interfaces are in `bo`*`portchannel-number`* format. VLAN interfaces are in `br`*`vlan-id`* format. In this example, `e101-001-0` identifies port 1/1/1.

```
admin@OS10:~# ifconfig -a
e101-001-0: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet6 fe80::20c:29ff:feed:9ea9  prefixlen 64  scopeid 0x20<link>
     ether 00:0c:29:ed:9e:a9  txqueuelen 1000  (Ethernet)
        RX packets 266262  bytes 18763391 (17.8 MiB)
        RX errors 0  dropped 8293  overruns 0  frame 0
        TX packets 18754  bytes 3963136 (3.7 MiB)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0

bo1: flags=5123<UP,BROADCAST,MASTER,MULTICAST>  mtu 1500  >>>  port-channel
        inet6 fe80::20c:29ff:feed:9f11  prefixlen 64  scopeid 0x20<link>
        ether 00:0c:29:ed:9f:11  txqueuelen 1000  (Ethernet)
        RX packets 0  bytes 0 (0.0 B)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 0  bytes 0 (0.0 B)
        TX errors 0  dropped 1 overruns 0  carrier 0  collisions 0

br1: flags=4419<UP,BROADCAST,RUNNING,PROMISC,MULTICAST>  mtu 1500 >>> vlan1
        inet6 fe80::20c:29ff:feed:9f12  prefixlen 64  scopeid 0x20<link>
        ether 00:0c:29:ed:9f:12  txqueuelen 1000  (Ethernet)
        RX packets 257964  bytes 12155776 (11.5 MiB)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 10287  bytes 900262 (879.1 KiB)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0
```

- Use the `tcpdump -i` *`kernel-port-number`* command to capture all packets received on a specified port interface. Press **Ctrl+C** to stop the packet output display. For example, to capture the packets received on the Ethernet 1/1/1 interface, enter:

```
admin@OS10:~# tcpdump -i e101-001-0
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on e101-001-0, link-type EN10MB (Ethernet), capture size 262144 bytes

^C
4 packets captured
4 packets received by filter
0 packets dropped by kernel
1 packet dropped by interface
root@OS10:~#
```

- Run `show` commands remotely using an SSH session. Only `show` commands are supported.

  Enter the `$ ssh admin@`*`ip-address`* `"`*`show-command`*`"` command, where *`ip-address`* is the IP address of the switch.

```
$ ssh admin@10.11.98.39 "show version"
admin@10.11.98.39's password:
Network Operating System
OS Version: 10.5.4.0
Build Version: 10.5.4.0.215
Build Time: 2022-04-12T21:35:41+0000
System Type: S5248F-ON
Architecture: x86_64
Up Time: 1 day 00:54:13
```

Using OS9 commands

To enter configuration commands using an OS9 command syntax, use the `feature config-os9-style` command in CONFIGURATION mode and log out of the session. If you do not log out of the OS10 session, configuration changes made with OS9 command syntaxes do not take effect. After you log in again, you can enter OS9 commands, but only in the new session.

For example, to use OS9 commands to configure VLAN 11 on Ethernet port 1/1/15:

```
OS10(config)# feature config-os9-style
OS10(config)# interface vlan 11
OS10(conf-if-vl-11)# tagged ethernet 1/1/15

OS10(conf-if-vl-11)# show configuration
!
interface vlan11
 no shutdown
 tagged ethernet 1/1/15
```

To disable OS9 configuration-style mode, use the `no feature config-os9-style` command.

feature config-os9-style

Enables the command-line interface to accept OS9 command syntaxes.

Syntax	`feature config-os9-style`
Parameters	None
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	After you enter the `feature config-os9-style` command, log out of the session and log back in. In the next session, you can enter configuration commands in OS9 syntax. The `no` version of the command disables the feature.

Example	`OS10(config)# feature config-os9-style`
	`OS10(config)# interface vlan 11`
	`OS10(conf-if-vl-11)# tagged ethernet 1/1/15`

Supported Releases	10.3.0E or later

6

Dell SmartFabric OS10 zero-touch deployment

Zero-touch deployment (ZTD) allows OS10 users to automate switch deployment:

- Upgrade an existing OS10 image.
- Execute a CLI batch file to configure the switch.
- Execute a post-ZTD script to perform additional functions.

ZTD is enabled by default when you boot up a switch with a factory-installed OS10 for the first time or when you perform an `ONIE: OS Install` from the ONIE boot menu. When a switch boots up with OS10 in ZTD mode, it starts the DHCP client on all interfaces — management and front-panel ports. ZTD configures all interfaces for untagged VLAN traffic. The switch obtains an IP address and a ZTD provisioning script URL from a DHCP server running on the network, and downloads and executes the ZTD script.

NOTE: Zero-touch deployment refers to an OS10 feature, and not the ONIE automated provisioning.

- ZTD is supported only in an IPv4 network. ZTD is not supported by DHCPv6.
- If the switch accesses the DHCP server using a front-panel port, the port interface must be in non-breakout mode.
- At least one of the front-panel ports connected to the network on which the DHCP server is running must be in non-breakout mode.
- After booting up in ZTD mode, if a switch receives no DHCP server response with option 240 within five minutes, it automatically exits ZTD mode. During this time, you can abort ZTD by entering the `ztd cancel` command. The command unlocks the switch configuration so that you can enter OS10 CLI commands.
- When ZTD is enabled, the CLI is locked so you cannot enter OS10 configuration commands. Only the `show` commands are available.
- The ZTD process does not time out and runs continuously. To stop the ZTD process, you must enter one of the following commands: `ztd-stop`, `ztd-cancel`, or `configure terminal`.

If you accidentally stop the ZTD process; for example, by entering Configuration mode, but have not made any configuration changes, use the `ztd start` command to start the ZTD process. This command does not reload the switch, but starts only the ZTD process.

NOTE: On rare occasions, when you enter the `configure terminal` command, the system goes in to the CONFIGURATION Mode, but you will not be able to enter any configuration commands. An error similar to the following appears:

```
% Error: config locked.
```

To recover from this error, use the `ztd cancel` EXEC command to cancel the ZTD process.

According to the contents of the provisioning script, ZTD performs these tasks in thie following sequence. Although Steps 2, 3 and 4 are optional, you must enter a valid URL path for at least one of the `IMG_FILE`, `CLI_CONFIG_FILE`, and `POST_SCRIPT_FILE` variables. For example, if you only want to configure the switch, enter only a `CLI_CONFIG_FILE` URL value. In this case, ZTD does not upgrade the OS10 image and does not execute a post-ZTD script.

1. ZTD downloads the files specified in the ZTD provisioning script — OS10 image, CLI configuration batch file, and post-ZTD script.
   - In the provisioning script, enter the file names for the `IMG_FILE`, `CLI_CONFIG_FILE`, and `POST_SCRIPT_FILE` variables as shown in ZTD provisioning script.
   - If no file names are specified, OS10 immediately exits ZTD and returns to CLI Configuration mode.
   - If the download of any of the specified files fails, ZTD stops. OS10 exits ZTD and unlocks CLI Configuration mode.
2. If you specify an OS10 image for `IMG_FILE`, ZTD installs the standby image. If you do not specify a configuration file for `CLI_CONFIG_FILE`, ZTD reloads the switch with the new OS10 image.

3. If you specify an OS10 CLI batch file with configuration commands for `CLI_CONFIG_FILE`, ZTD executes the commands in the `PRE-CONFIG` and `POST-CONFIG` sections. After executing the `PRE-CONFIG` commands, the switch reloads with the new OS10 image and then executes the `POST-CONFIG` commands. For more information, see ZTD CLI batch file.
4. If you specify a post-ZTD script file for `POST_SCRIPT_FILE`, ZTD executes the script. For more information, see Post-ZTD script.

NOTE: The ZTD process performs a single switch reboot. The switch reboot occurs only if either a new OS10 image is installed or if the `PRE-CONFIG` section of the CLI batch file has configuration commands that are executed.

ZTD prerequisites

- Store the ZTD provisioning script on a server that supports HTTP connections.
- Store the OS10 image, CLI batch file, and post-ZTD script on a file server that supports either HTTP, FTP, SFTP, or TFTP connections.
- Configure the DHCP server to provide option 240 that returns the URL of the ZTD provisioning script.
- In the ZTD provisioning script, enter the URL locations of an OS10 image, CLI batch file, and/or post-ZTD script. Enter at least one URL, otherwise the ZTD fails and exits to CLI Configuration mode.

ZTD guidelines

- You can store the ZTD provisioning script, OS10 image, CLI batch file, and post-ZTD script on the same server, including the DHCP server.
- Write the ZTD provisioning script in bash.
- Write the post-ZTD script in bash or Python. Enter `#!/bin/bash` or `#!/usr/bin/python` as the first line in the script. The default python interpreter in OS10 is 2.7. Use only common Linux commands, such as curl, and common Python language constructs. OS10 only provides a limited set of Linux packages and Python libraries.

Cancel ZTD in progress

To exit ZTD mode and manually configure a switch by entering CLI commands, stop the ZTD process by entering the `ztd cancel` command. You can enter `ztd cancel` only when ZTD is in a waiting state; that is, before it receives an answer from the DHCP server. Otherwise, the command returns an error message; for example:

```
OS10# ztd cancel
% Error: ZTD cancel failed. ZTD process already started and cannot be cancelled at this
stage.
```

Disable ZTD

To disable ZTD, enter the `reload` command. The switch reboots in ZTD disabled mode.

Re-enable ZTD

To automatically upgrade OS10 and/or activate new configuration settings, re-enable ZTD by rebooting the switch using the `reload ztd` command. You are prompted to confirm the deletion of the startup configuration.

NOTE: To upgrade OS10 without losing the startup configuration, back up the startup configuration before ZTD runs the provisioning script. Then use the backup startup configuration to restore the previous system configuration.

```
OS10# reload ztd
This action will remove startup-config [confirm yes/no]:
```

View ZTD status

```
OS10# show ztd-status

-----------------------------------
ZTD Status     : disabled
ZTD State      : completed
Protocol State : idle
Reason         : ZTD process completed successfully at Mon Jul 16 19:31:57 2018
-----------------------------------
```

ZTD logs

ZTD generates log messages about its current status.

```
[os10:notify], %Dell EMC (OS10) %ZTD-IN-PROGRESS: Zero Touch Deployment
applying post configurations.
```

ZTD also generates failure messages.

```
[os10:notify], %Dell EMC (OS10) %ZTD-FAILED: Zero Touch Deployment failed to
download the image.
```

Troubleshoot configuration locked

When ZTD is enabled, the CLI configuration is locked. If you enter a CLI command, the error message `configuration is locked` displays. To configure the switch, disable ZTD by entering the `ztd cancel` command.

```
OS10# configure terminal
% Error: ZTD is in progress(configuration is locked).
OS10# ztd cancel
```

ZTD DHCP server configuration

For ZTD operation, configure a DHCP server in the network by adding the required ZTD options; for example:

```
option domain-name "example.org";
option domain-name-servers ns1.example.org, ns2.example.org;
option ztd-provision-url code 240 = text;

default-lease-time 600;
max-lease-time 7200;

subnet 50.0.0.0 netmask 255.255.0.0 {
range 50.0.0.10 50.0.0.254;
option routers rtr-239-0-1.example.org, rtr-239-0-2.example.org;
}

host ztd-leaf1 {
hardware ethernet 90:b1:1c:f4:a9:b1;
fixed-address 50.0.0.8;
option ztd-provision-url "http://50.0.0.1/ztd.sh";
}
```

ZTD provisioning script

Create a ZTD script file that you store on an HTTP server. Configure the URL of the script using DHCP option 240 (`ztd-provision-url`) on the DHCP server.

ZTD downloads and runs the script to upgrade the OS10 image, configure the switch, and run a post-ZTD script to perform other functions.

- Write the ZTD provisioning script in bash. Enter `#!/bin/bash` as the first line in the script. You can use the sample script in this section as a basis.
- For `IMG_FILE`, enter the URL path of the OS10 image to download and upgrade the switch. This image becomes the standby image.
- For `CLI_CONFIG_FILE`, enter the URL path of the CLI batch file to download and run.
- For `POST_SCRIPT_FILE`, enter the URL path of the script to run.
- ZTD requires all the ZTD scripts (provisioning, CLI batch file, and post-ZTD script) to be Unix-style line formatted.
- ZTD fails and exits to CLI Configuration mode if:
  - You do not specify at least one valid URL for the `IMG_FILE`, `CLI_CONFIG_FILE`, and `POST_SCRIPT_FILE` variables.
  - Any of the `IMG_FILE`, `CLI_CONFIG_FILE`, and `POST_SCRIPT_FILE` entries are invalid or if specified, the files cannot be downloaded.

For the `IMG_FILE`, `CLI_CONFIG_FILE`, and `POST_SCRIPT_FILE` files, you can specify HTTP, SCP, SFTP, or TFTP URLs. For example:

```
scp://userid:passwd@hostip/filepath
sftp://userid:passwd@hostip/filepath
```

Example

```
#!/bin/bash

######################################################################
#
#
#             Example OS10 ZTD Provisioning Script
#
#
######################################################################

########## UPDATE THE BELOW CONFIG VARIABLES ACCORDINGLY ###########
########## ATLEAST ONE OF THEM SHOULD BE FILLED ####################

IMG_FILE="http://50.0.0.1/OS10.bin"
CLI_CONFIG_FILE="http://50.0.0.1/cli_config"
POST_SCRIPT_FILE="http://50.0.0.1/no_post_script.py"

################## DO NOT MODIFY THE LINES BELOW ######################

sudo os10_ztd_start.sh "$IMG_FILE" "$CLI_CONFIG_FILE" "$POST_SCRIPT_FILE"

########################      **END**     ###############################
```

ZTD CLI batch file

Create a CLI batch file that ZTD downloads and executes to configure a switch. The ZTD CLI batch file consists of two sections: `PRE-CONFIG` and `POST-CONFIG`.

When you enter the `PRE-CONFIG` and `POST-CONFIG` lines, you must enter a hash tag (#), followed by a space before the text `PRE-CONFIG` or `POST-CONFIG`. If the `PRE-CONFIG` section has no commands, do not leave a blank line between `# PRE-CONFIG` and `# POST-CONFIG`; for example:

```
# PRE-CONFIG
# POST-CONFIG
Hostname VxRail-fabric-LEAF-1
!
lldp enable
!
spanning-tree mode rstp
spanning-tree rstp priority 0
...
```

ZTD executes the `PRE-CONFIG` commands first using the currently running OS10 image, not the OS10 image specified in the provisioning script. ZTD saves the `PRE-CONFIG` settings to the startup configuration.

If `PRE-CONFIG` commands are present, ZTD reloads the switch before executing the commands in the `POST-CONFIG` section. Enter OS10 configuration commands that require a switch reload, such as `switch-port-profile`, in the `PRE-CONFIG` section. If ZTD installs a new OS10 image (`IMG_FILE`), the new image is activated after the reload.

ZTD then executes the `POST-CONFIG` commands and saves the new settings in the startup configuration. No additional switch reload is performed. Enter `POST_CONFIG` commands with the exact syntax displayed in `show running-configuration` output.

Example

```
# PRE-CONFIG
switch-port-profile 1/1 profile-2

# POST-CONFIG
snmp-server community public ro
snmp-server contact NOC@dell.com
snmp-server location delltechworld
!
clock timezone GMT 0 0
!
```

```
hostname LEAF-1
!
ip domain-list networks.dell.com
ip name-server 8.8.8.8 1.1.1.1
!
ntp server 132.163.96.5 key 1 prefer
ntp server 129.6.15.32
!
!
logging server 10.22.0.99
```

Post-ZTD script

As a general guideline, use a post-ZTD script to perform any additional functions required to configure and operate the switch. In the ZTD provisioning script, specify the post-ZTD script path for the `POST_SCRIPT_FILE` variable. You can use a script to notify an orchestration server that the ZTD configuration is complete. The server can then configure additional settings on the switch.

For example, during the ZTD phase, you can configure only a management VLAN and IP address, then allow an Ansible orchestration server to perform complete switch configuration. Here is a sample curl script that is included in the post-ZTD script to contact an Ansible server:

```
/usr/bin/curl -H "Content-Type:application/json" -k -X POST
--data '{"host_config_key":"'7d07e79ebdc8f7c292e495daac0fe16b'"}'
-u admin:admin https://10.16.134.116/api/v2/job_templates/9/callback/
```

ZTD commands

reload ztd

Reboots the switch and enables ZTD after the reload.

Syntax	`reload ztd`
Parameters	None
Default	ZTD is enabled.
Command Mode	EXEC
Usage Information	Use the `reload ztd` command to automatically upgrade OS10 and/or activate new configuration settings. When you reload ZTD, you are prompted to confirm the deletion of the startup configuration.
Example	`OS10# reload ztd`
Supported Releases	10.4.1.0 or later

show ztd-status

Displays the current ZTD status: enabled, disabled, or canceled.

Syntax	`show ztd-status`
Parameters	None
Default	None
Command Mode	EXEC
Usage Information	None

Examples

```
OS10# show ztd-status

-----------------------------------
ZTD Status      : disabled
ZTD State       : completed
Protocol State : idle
Reason          : ZTD process completed successfully at Mon Jul 16
19:31:57 2018
-----------------------------------
```

```
OS10# show ztd-status

-----------------------------------
ZTD Status      : disabled
ZTD State       : failed
Protocol State : idle
Reason          : ZTD process failed to download post script file
-----------------------------------
```

- `ZTD Status` — Current operational status: enabled or disabled.
- `ZTD State` — Current ZTD state: initialized, in-progress, successfully completed, failed, or canceled while in progress.
- `Protocol State` — Current state of ZTD protocol: initialized, idle while waiting to enable or complete ZTD process, waiting for DHCP post-hook callback, downloading files, installing image, executing pre-config or post-config CLI commands, or executing post-ZTD script file.
- `Reason` — Description of a successful or failed ZTD process.

Supported Releases 10.4.1.0 or later

ztd cancel

Stops ZTD while in progress.

Syntax `ztd cancel`

Parameters None

Default ZTD is enabled.

Command Mode EXEC

Usage Information After you cancel ZTD, you can enter CLI commands to configure the switch.

The system cancels the ZTD process when you enter CLI Configuration mode. You can enter this command only when ZTD is in a waiting state; that is, before it receives an answer from the DHCP server. Otherwise, the command returns an error message. The `ztd stop` and `ztd cancel` commands perform the same function.

Example

```
OS10# ztd cancel
```

Supported Releases 10.4.1.0 or later

ztd start

Starts the ZTD process.

Syntax `ztd start`

Parameters None

Default Not configured

Command Mode	EXEC
Security and Access	Sysadmin and secadmin
Usage Information	When you enter this command, if there are any configuration changes, the system prompts you for a confirmation to delete the startup configuration. If you have made configuration changes after the ZTD process stops, the system reloads. This command is similar to the `reload ztd` command. However, if you have not made any configuration changes after the ZTD process stops, this command does not reload the switch. It starts only the ZTD process.
Example	`OS10# ztd start`
Supported Releases	10.5.2.0 or later

ztd stop

Stops ZTD while in progress.

Syntax	`ztd stop`
Parameters	None
Default	Not configured
Command Mode	EXEC
Security and Access	Sysadmin and secadmin
Usage Information	The system cancels the ZTD process when you enter CLI Configuration mode. The `ztd stop` and `ztd cancel` commands perform the same function. Use this command only when ZTD is in a waiting state; that is, before it receives an answer from the DHCP server. Otherwise, the command returns an error message.
Example	`OS10# ztd stop`
Supported Releases	10.5.2.0 or later

7

Dell SmartFabric OS10 provisioning

OS10 supports automated switch provisioning—configuration and monitoring—using:

- RESTCONF API—REST-like protocol that uses HTTPS connections. Use the OS10 RESTCONF API to set up the configuration parameters on OS10 switches with JavaScript Object Notation (JSON)-structured messages. You can use any programming language to create and send JSON messages; see RESTCONF API.
- Linux DevOps ecosystem—OS10 provides access to an unmodified Linux (Debian) operating system that allows you to benefit from the Linux DevOps ecosystem. Programmers can write applications in Python or C/C++ to execute on an OS10 switch.
- Ansible—Third-party DevOps tool. Ansible is a powerful, open-source IT automation engine that provides a simple way to automate application software and IT infrastructure. Ansible allows you to remove complexity from these environments and accelerate DevOps initiatives; see Using Ansible and Example: Configure OS10 switch using Ansible.

Using Ansible

Ansible works by connecting to your nodes using SSH and pushing out small programs, called *Ansible modules*, to them. Ansible includes hundreds of network modules to support a wide variety of network device vendors. Ansible uses a simple, powerful and agentless automation framework. For more information, go to Network Automation with Ansible.

Dell Networking Ansible solutions

Dell Networking Ansible solutions are based on an open ecosystem that allows organizations to choose from industry-standard network applications, network operating systems, and network hardware. Use Ansible to provision and manage Dell switches for rapid new device deployment and network configuration changes. Ansible also allows you to track running network device configurations against a known baseline for both Dell Technologies and third-party operating systems.

The Ansible modules for Dell Networking solutions allow organizations to reduce the time and effort required to design, provision, and manage networks by providing these benefits:

- Agentless — No new software is required to install on switches.
- Powerful — End-to-end automation of the configuration of bare metal switches using the Dell Open Automation framework.
- Easy-to-use — Dell Networking modules ship with the Ansible distribution. There is nothing extra to install.
- Best practice — Uses CLI user authentication to centralize and monitor session management.

Dell Networking Ansible modules

Ansible ships with a number of modules that can be executed directly on remote hosts or through playbooks. The collection of modules is called the *module library*. Modules are discrete units of code that are used from the command line or in a playbook task. You can also write your own modules.

Starting with Ansible 2.2, the Ansible core supports Dell Networking modules. Use these modules to manage and automate Dell switches running OS6, OS9, and OS10. Dell Networking modules are executed in local connection mode using CLI and SSH transport. The following OS10 modules are integrated into the Ansible core:

- `dellos10_command`: Runs show commands or EXEC mode commands through Ansible. For example, `show version` command output displays the current OS version running on a switch.
- `dellos10_config`: Runs OS10 configuration commands through Ansible.
- `dellos10_facts`: Retrieves the running configuration from an OS10 switch.

Dell Networking Ansible roles

Ansible roles allow you to automatically load variable files (`vars_files`) and tasks based on a known file structure. Grouping content by roles allows the roles to be easily shared with other users. These roles are abstracted for OS6, OS9 and OS10. Download Dell Ansible Networking roles from https://galaxy.ansible.com/.

For information and examples about how to use the Ansible roles, see Dell Networking Repositories.

Ansible inventory file

The inventory file contains the list of hosts on which you want to run commands. Ansible can run tasks on multiple hosts at the same time.

Ansible playbooks use `/etc/ansible/hosts` as the default inventory file. To specify a different inventory file, use the `-i filepath` command as an option when you run an Ansible playbook.

Ansible playbook file

Using playbooks, Ansible can configure multiple devices. Playbooks are human-readable scripts that are expressed in YAML format. An Ansible playbook takes inventory and playbook files as arguments and maps the group of hosts in the inventory files to the tasks listed in the playbook file.

Ansible variables

In Ansible, variables define switch configurations. Many Dell switches have common configurations. Common configuration variables are stored in the `vars/main.yaml` file; for example, `dns_server` and `ntp_server`. All host-specific configurations are stored in the `host_vars/host_name.yaml` configuration file; for example, the hostname of a switch. Variables are also used as part of playbook definitions, command-line arguments, and inventory definitions.

Example: Configure an OS10 switch using Ansible

OS10 supports Ansible integration to automate switch configuration. For detailed information about how to use Ansible scripts and create Ansible playbooks, go to:

- Dell Ansible Documentation
- Dell Networking Guides and search for `Ansible`

You can download auto-generated Ansible configuration files for the network design you provide from the Dell Fabric Design Center.

Before you start

Before you configure an OS10 switch using Ansible, configure basic network settings on your switch, such as assigning an IP address and default gateway to the management interface:

1. Connect a terminal emulator to the console serial port on the switch using a serial cable. The serial port settings are 115200, 8 data bits, and no parity.
2. Configure the management interface; for example:

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# no ip address dhcp
OS10(conf-if-ma-1/1/1)# ip address 10.1.1.10/24
OS10(conf-if-ma-1/1/1)# no shutdown
OS10(conf-if-ma-1/1/1)# exit
OS10(config)# management route 10.10.20.0/24 10.1.1.1
OS10(config)# end
```

Ansible configuration example

In this example, the configuration uses Ansible roles to configure an OS10 switch from an Ansible controller node with:

- User name and password
- NTP server
- Syslog server

1. Install Ansible on a controller node. You can find the latest version of Ansible on the Ansible Installation Guide page.

   You can run Ansible from any device with Python 2 (version 2.7) or Python 3 (version 3.5 or higher) installed, including Red Hat, Debian, Ubuntu, CentOS, OS X, any of the BSDs and so on.

   In this example, Ansible 2.7.12 is installed on an Ubuntu 16.04 virtual machine. To configure the Personal Package Archives (PPA) repository on the controller node and install Ansible, run these commands:

```
sudo apt-get update
sudo apt-get install software-properties-common
sudo apt-add-repository --yes --update ppa:ansible/ansible
sudo apt-get install ansible
```

   After you install Ansible, verify the version by entering:

```
$ ansible --version
```

2. Download and install Dell Networking Ansible roles from the Ansible Galaxy web page; for example:

```
$ ansible-galaxy install dell-networking.dellos-users
$ ansible-galaxy install dell-networking.dellos-logging
$ ansible-galaxy install dell-networking.dellos-ntp
```

3. Create a directory to store inventory and playbook files; for example:

```
$ mkdir AnsibleOS10
```

4. Navigate to the directory and create an inventory file.

```
$ cd AnsibleOS10/
$ vim inventory.yaml
```

5. Add the IP address and OS for each switch in the `inventory.yaml` file. Enter the command for each switch on one command line.

```
OS10switch-1 ansible_host=192.168.1.203 ansible_network_os=dellos10

OS10switch-2 ansible_host=192.168.1.204 ansible_network_os=dellos10
```

6. Create a `host_vars` directory to use for switch-specific variable files.

```
$ mkdir host_vars
```

7. Create a host variable file; for example, `host_vars/OS10switch-1.yaml`. Then define the host name and login credentials:

```
$ vim host_vars/OS10switch-1.yaml

hostname: OS10switch-1

dellos_cfg_generate: True
build_dir: /home/user/config
ansible_ssh_user: admin
ansible_ssh_pass: admin

dellos_logging:
  logging:
  - ip: 1.1.1.1
    state: present

dellos_users:
  - username: u1
    password: test@2468
    role: sysadmin
    privilege: 0
    state: present

dellos_ntp:
  server:
  - ip: 3.3.3.3
```

```
$ vim host_vars/OS10switch-2.yaml

hostname: OS10switch-2

dellos_cfg_generate: True
build_dir: /home/user/config
ansible_ssh_user: admin
ansible_ssh_pass: admin

dellos_logging:
  logging:
  - ip: 1.1.1.1
    state: present

dellos_users:
  - username: u1
    password: Test@1347
```

```
    role: sysadmin
    privilege: 0
    state: present

dellos_ntp:
  server:
  - ip: 3.3.3.3
```

The `dellos_cfg_generate` parameter creates a local copy of the configuration commands applied to the remote switch on the Ansible controller node, and saves the commands in the directory defined in the `build_dir` path.

8. Create a playbook file.

```
$ vim playbook.yaml

- hosts: OS10switch-1 OS10switch-2
  connection: network_cli
  roles:
    - dell-networking.dellos-logging
    - dell-networking.dellos-users
    - dell-networking.dellos-ntp
```

To check the syntax of a playbook, use the `ansible-playbook` command with the `--syntax-check` flag. This command runs the playbook file through the parser to ensure that its included files, roles, and other parameters have no syntax problems.

9. Run the playbook file. In the `ansible-playbook` command, the inventory and playbook files are mandatory entries. The play recap displays the results of the provisioning session; for example:

```
$ ansible-playbook -i inventory.yaml playbook.yaml
...
...
...
PLAY RECAP
*************************************************************
OS10switch-1: ok=7    changed=6    unreachable=0    failed=0
OS10switch-2: ok=7    changed=6    unreachable=0    failed=0
```

8

System management

System banners	Provides information to configure a system login and message of the day (MOTD) text banners, see System banners.
User session management	Provides information to manage the active user sessions, see User session management.
Telnet server	Provides information to set up Telnet TCP/IP connections on the switch, see Telnet server. To set up secure, encrypted the secure shell (SSH) connections to the switch, see SSH server.
Simple Network Management Protocol	Provides a message format for communication between Simple Network Management Protocol (SNMP) managers and agents. SNMP provides a standardized framework and common language for network monitoring and device management, see Simple Network Management Protocol.
System clock	Provides information to set the system time, see System clock.
Network Time Protocol	Provides information to synchronize timekeeping between time servers and clients, see NetworkTime Protocol.
Dynamic Host Configuration Protocol	Provides information to dynamically assign IP addresses and other configuration parameters to network hosts based on policies, see Dynamic Host Configuration Protocol.

For information about how to set up a management network that is separate from your production network, see Management Networks for Dell Networking.

Network load balancing

NLB enhances the reliability and scalability of server applications such as web servers, proxy servers, FTP servers, VPN, and so on.

Network load balancing (NLB) in Microsoft Windows servers allows you to manage two or more servers as a single virtual cluster.

NLB enables all hosts (servers) in the cluster to be addressed by the same set of IP addresses (Cluster IP). Interfaces through the SmartFabric OS10 switch where the cluster is connected become members of a single VLAN, called the NLB VLAN.

You can configure the NLB cluster to operate either in Unicast or Multicast modes. In Unicast mode, all the server NIC adapters have the same Unicast MAC address. In multicast mode, NLB converts the NLB virtual IP (VIP) address to an NLB Multicast MAC address. This MAC address has the following format: `03-BF-XX-XX-XX-XX`.

NLB also ensures that the primary IP address of the cluster resolves to the NLB MAC address as a static ARP entry. Although the individual network adapters retain their original MAC addresses, the NLB traffic is addressed to the NLB MAC address.

SmartFabric OS10 provides configuration commands to create an NLB cluster VLAN by associating the NLB cluster IP and MAC to a VLAN.

You must provide lists of interfaces to which the NLB cluster hosts (servers) connect. If you do not configure an interface list, the traffic that is destined for the NLB cluster IP forwards to all member interfaces of the VLAN.

Restrictions and limitations

Network load balancing restrictions and limitations:

- You can configure a maximum of 32 NLB cluster IPs. Therefore, the maximum number of ACL table entries that occupy the NLB cluster IP configurations are 2 x 32.
- Only IPv4 NLB cluster IP addresses are supported.
- Any PBR rule with an NLB cluster IP is set as Next Hop or Match parameter does not work if you configure the NLB cluster VLAN with the same IP.
- NLB cluster IP addresses must not overlap across VRFs.

- You cannot configure an NLB VLAN as a virtual-network, private VLAN, FCoE VLAN, or RSPAN VLAN.
- Use the `show acl-table-usage detail` command to display the hardware ACL entry occupancy per application and per hardware table. Because the PBR and NLB share the same table, the `show acl-table-usage` detail command output displays ACL entries against the PBR table with the NLB configurations alone.
- You cannot share the NLB cluster IP address with any other switch interface IP address and its subnet. Also, you cannot set an interface IP address that is already in use with the NLB cluster.

```
EXAMPLE:
OS10(conf-if-vl-1301)# nlb-cluster 100.2.1.3 44:44:44:44:44:11
% Error: Invalid IP Address: cannot configure i/f ip address
```

- When the NLB cluster is configured, irrespective of whether an IP address is set on the switch virtual interface (SVI) or not, traffic does not reach the next-hop router for that NLB cluster VIP.

Configure a VLAN as NLB cluster VLAN

To configure a VLAN as a NLB cluster VLAN:

1. Enter the configuration mode.

```
OS10# configure terminal
```

2. Create a VLAN (`300`).

```
OS10(config)# interface vlan 300
```

3. Ensure that `1/1/1-1/1/4` are VLAN 300 members.

```
OS10(conf-if-vl-300)# nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface ethernet
1/1/1-1/1/4
```

Configure NLB cluster where all VLAN members are cluster interfaces

To configure NLB cluster where all VLAN members are cluster interfaces:

1. Enter the configuration mode.

```
OS10# configure terminal
```

2. Enter the VLAN configuration mode (`200`).

```
OS10(config)# interface vlan 200
```

3. Create NLB cluster for `20.1.1.1` where all the VLAN 200 members are cluster interfaces.

```
OS10(conf-if-vl-200)# nlb-cluster 20.1.1.1 00:00:00:00:02:02
```

Update NLB cluster host ports of a NLB cluster VLAN

To update NLB cluster host ports of a NLB cluster VLAN:

1. Enter configuration mode.

```
OS10# configure terminal
```

2. Enter the VLAN configuration mode (`300`).

```
OS10(config)# interface vlan 300
```

3. Add ethernet 1/1/5 also to the cluster host ports list.

```
 OS10(conf-if-vl-300)# nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface ethernet 1/1/5
```

Remove NLB cluster host ports of a NLB cluster VLAN

To remove NLB cluster host ports of a NLB cluster VLAN:

1. Enter configuration mode.

```
OS10# configure terminal
```

2. Enter the VLAN configuration mode (`300`).

```
OS10(config)# interface vlan 300
```

3. Remove ethernet `1/1/5` from the cluster host port list.

```
 OS10(conf-if-vl-300)# no nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface ethernet
1/1/5
```

Unconfigure an NLB cluster VLAN

To remove a NLB cluster VLAN:

1. Enter the configuration mode.

```
OS10# configure terminal
```

2. Enter the VLAN configuration mode (`300`).

```
OS10(config)# interface vlan 300
```

3. Remove NLB cluster VLAN with cluster IP `10.1.1.1`.

```
OS10(conf-if-vl-300)# no nlb-cluster 10.1.1.1
```

Network load balancing - Use cases

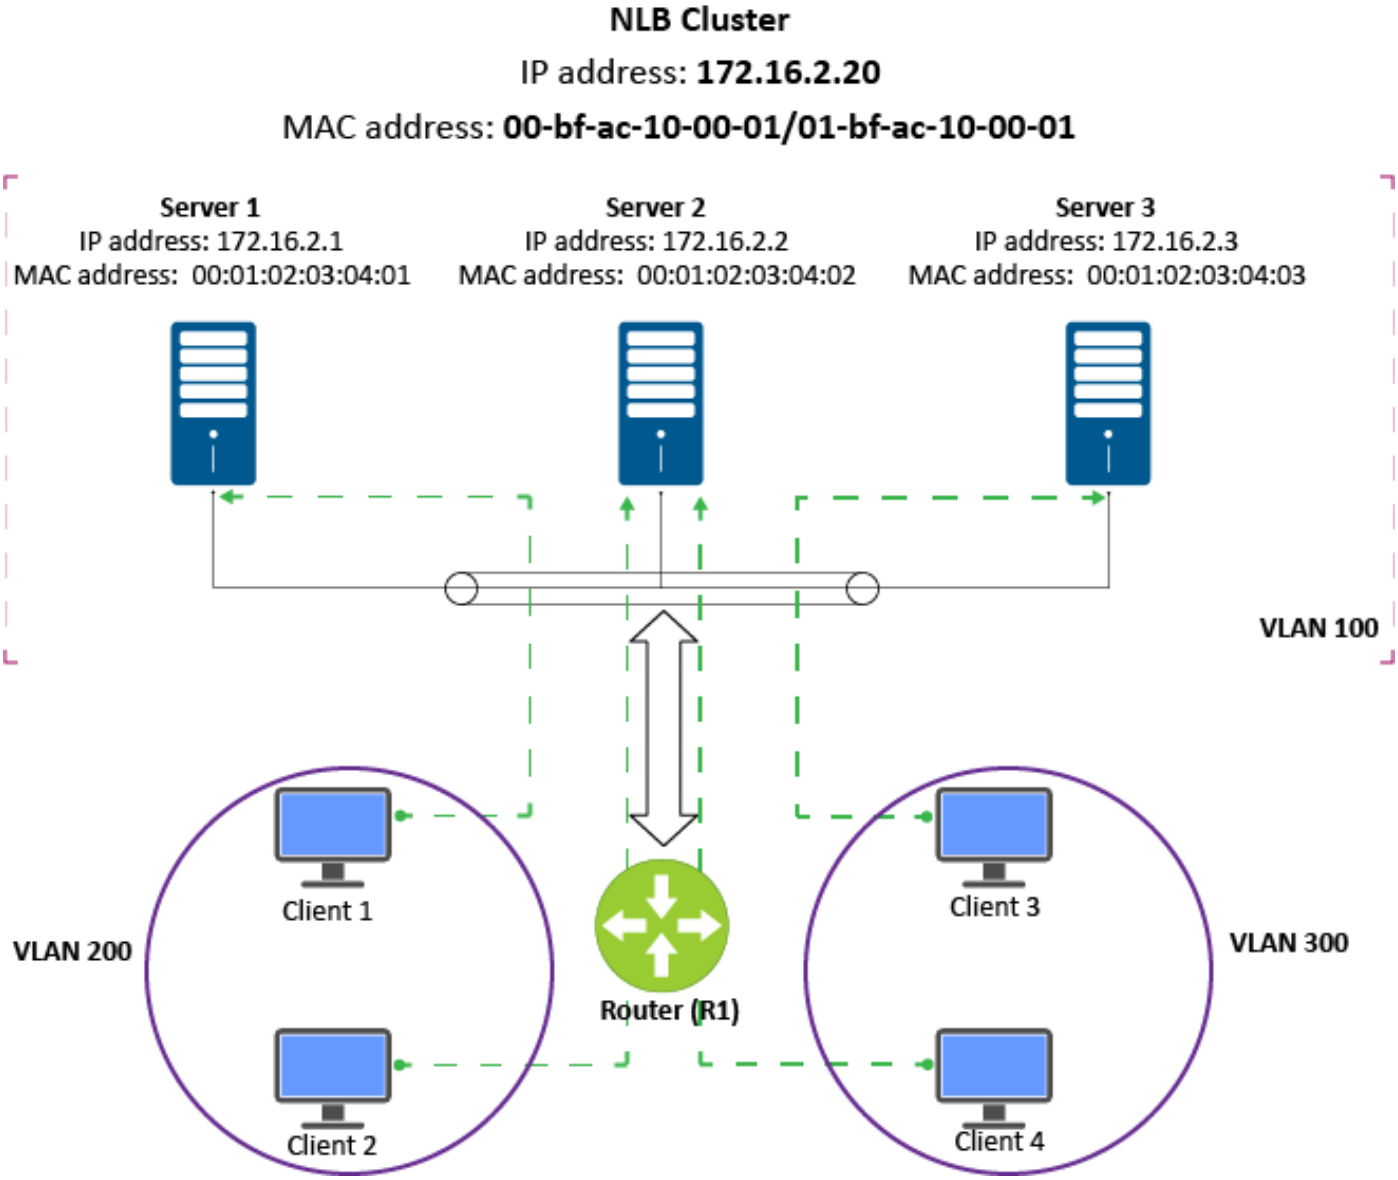
Network load balancing (NLB) is a clustering feature used by Microsoft on Windows 2000 Server and Windows Server 2003 operating systems. It allows you to manage two or more servers as a single virtual cluster, thereby enabling high availability and scalability for server applications.

The servers in an NLB cluster are called hosts and each host runs a separate copy of the server application. Servers interconnect through a dedicated network to work as a single cluster.

Each server is assigned a unique IP address and a MAC address. In addition, a common IP address (Cluster IP) and a MAC address (Cluster MAC) are assigned to the cluster.

The cluster MAC address can be a unicast MAC address or a multicast MAC address.

NLB distributes incoming client requests across the servers or hosts in the cluster. The following diagram captures how NLB balances load across servers:

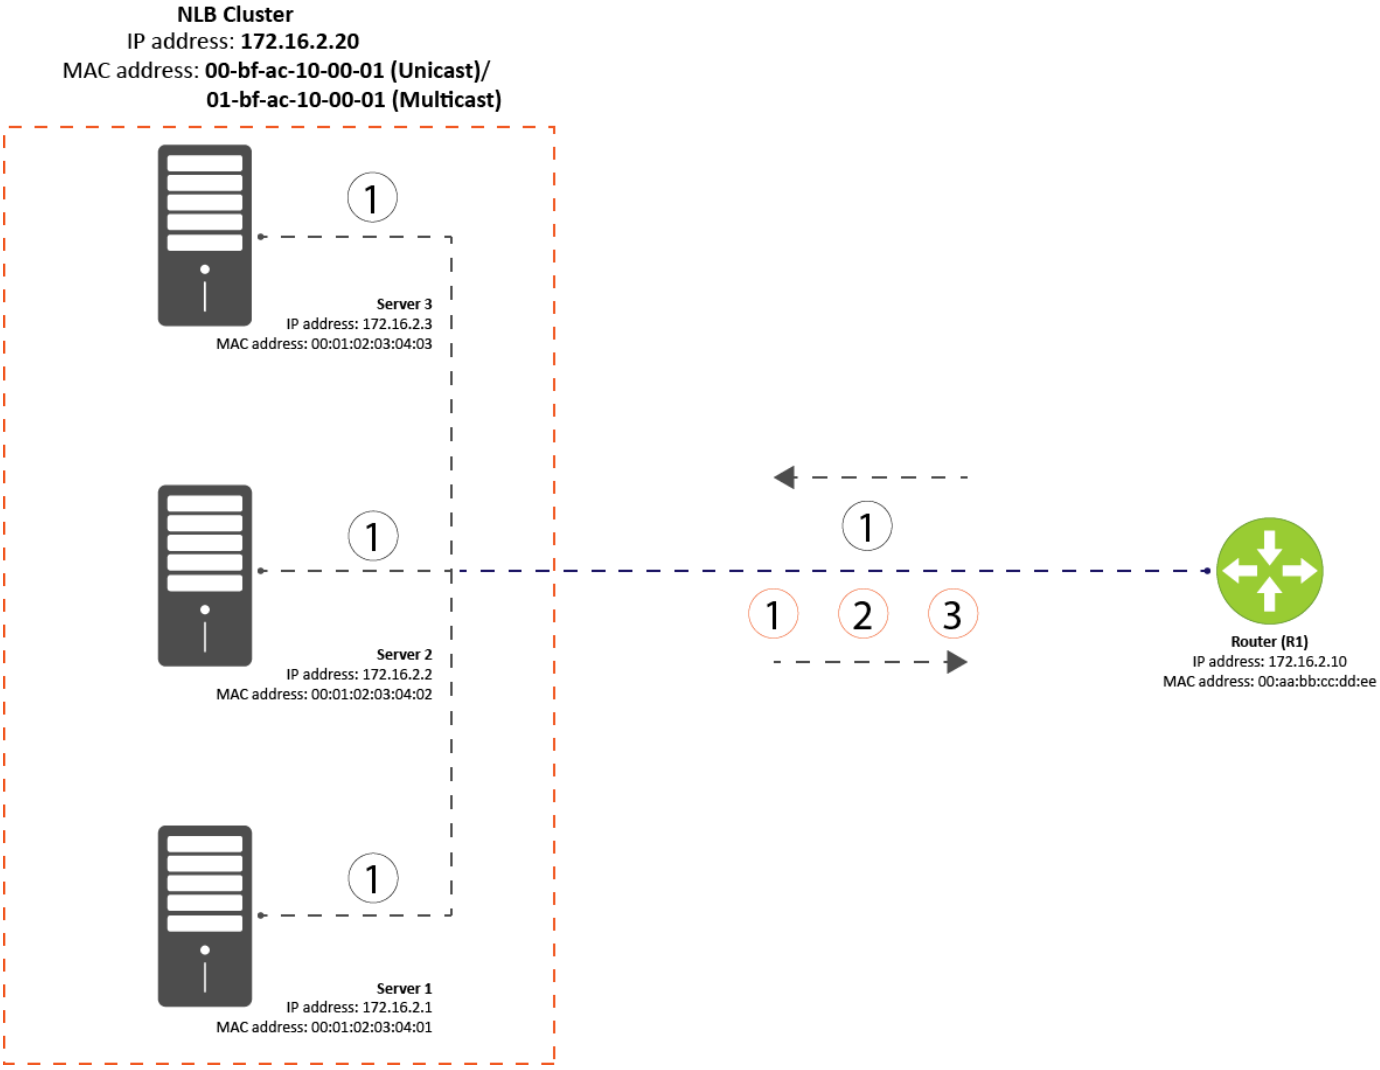


Following is the description corresponding to the topology diagram:

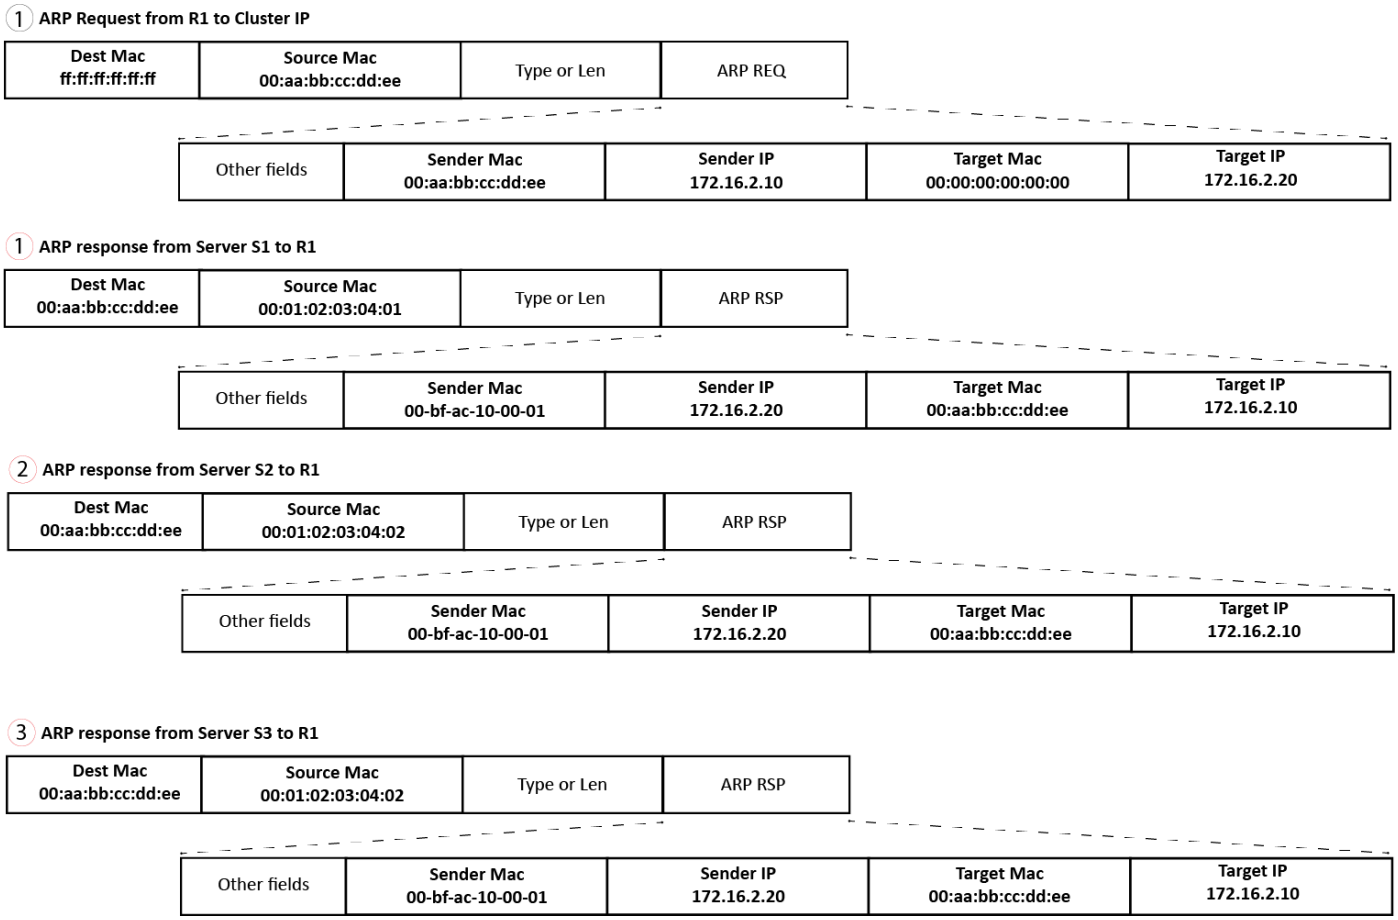
1. Clients 1, 2, 3, and, 4 use 172.16.2.20 (Cluster IP as destination IP address.
2. Router R1 routes packets from clients to the NLB VLAN 100.
3. While routing packets into VLAN 100 (NLB VLAN), router (R1) ensures that the packets are sent out on the appropriate member ports of VLAN 100.

ARP resolution for cluster IP address

The following diagram captures how ARP is resolved for cluster IP addresses:

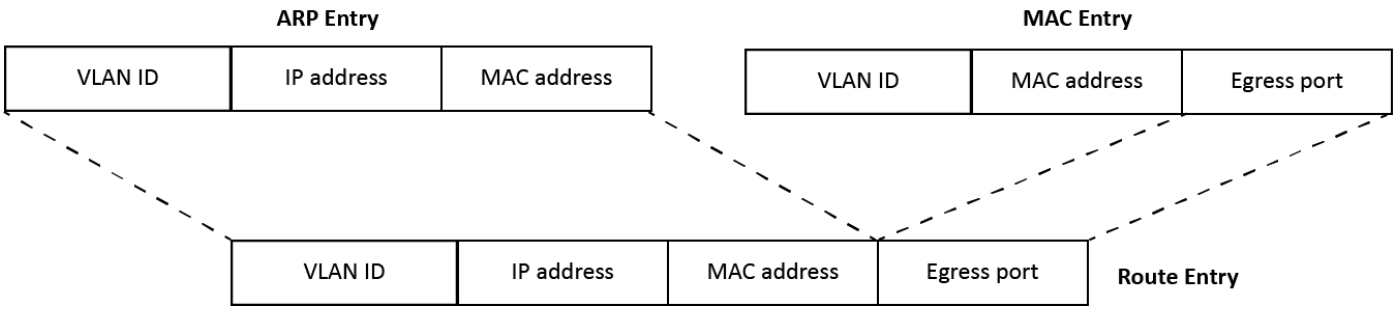


The following figure depicts how the ARP request and response packets are exchange between router R1 and the servers S1, S2, and S3:

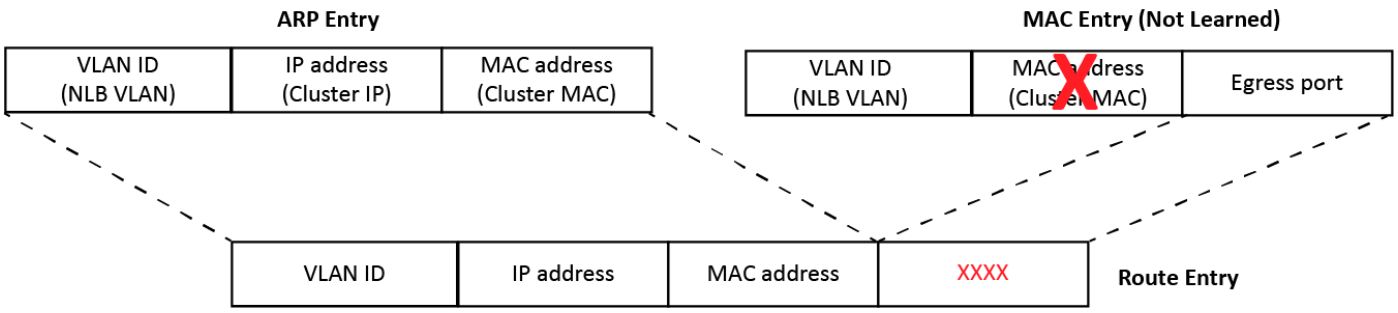


The following sequence describes the packet exchange between the router and servers in this use case:

1. ARP responses from servers may reach R1 in any order.
2. From the ARP responses 1, 2, and 3, router R1 learns the MAC addresses corresponding to the following servers: Server1, Server2, and Server3.
3. From the ARP responses 1, 2, and 3, router R1 does not learn the cluster MAC addresses as these addresses are embedded in the payload of the ARP responses. But, the ARP entry corresponding to the cluster IP is learned.
4. Typically, a route or host entry is constructed as depicted in the following:



5. As the router R1 cannot learn the cluster MAC address, the route entry corresponding to the cluster IP is incomplete without a MAC address. The following figure depicts this behavior:



NLB modes

NLB functions in the following modes: Unicast mode and Multicast mode.

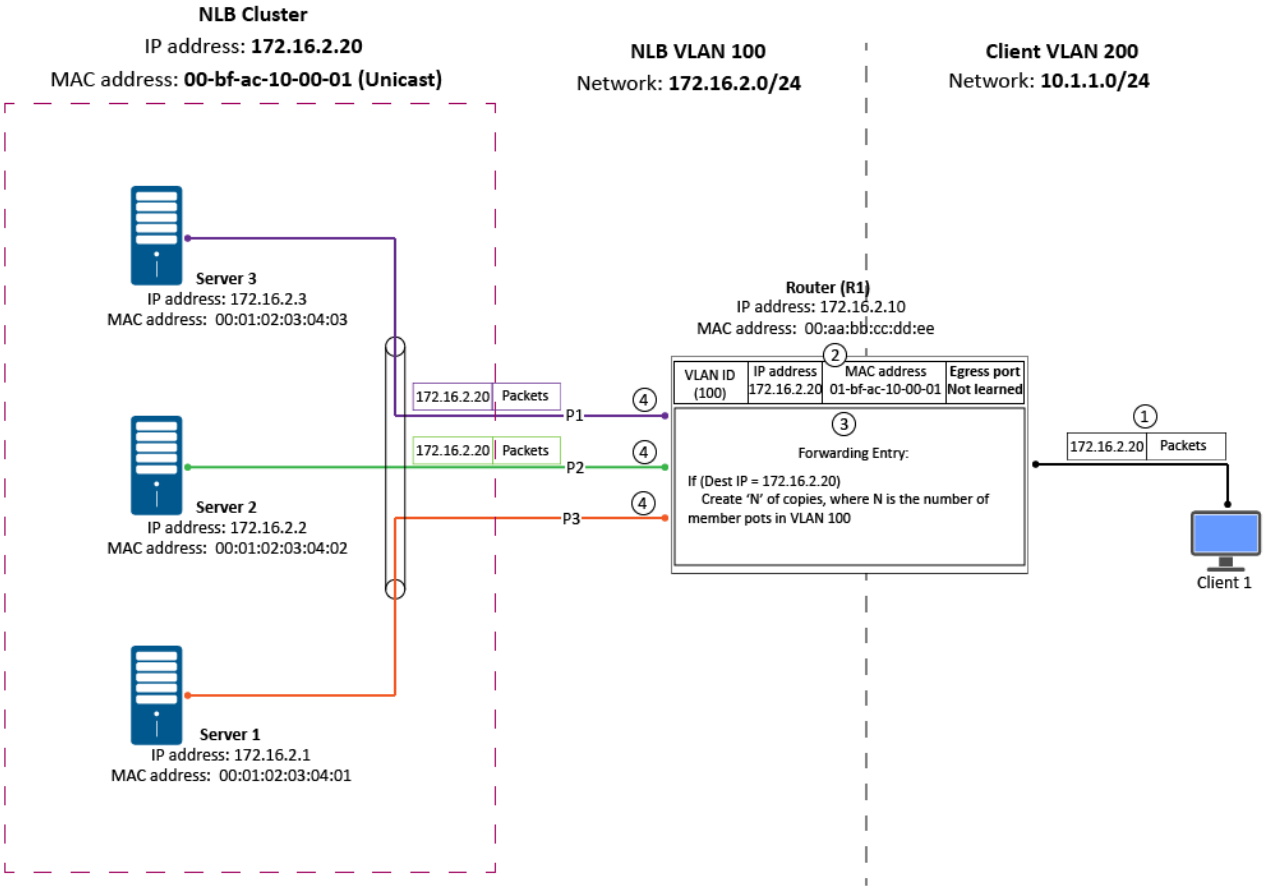
NLB unicast mode

In NLB Unicast mode, each NLB cluster is assigned with a unicast MAC address. The Layer 3 routers directly connected to the NLB clusters do not learn unicast cluster MAC addresses. As a result, incomplete route entry is created or learned for the cluster IP addresses.

The absence of a complete route entry for cluster IP addresses results in packet drops, especially the ones that are destined to cluster IP addresses.

After you enable NLB feature, Layer 3 routers that are directly connected to the NLB clusters must ensure that packets that are destined to NLB clusters are replicated and each member port of the NLB VLAN receives a separate copy of the packets. This behavior introduces unicast flooding.

The following diagram depicts a typical NLB unicast topology:



The following list describes the legends 1, 2, 3, and 4 depicted in the NLB unicast topology diagram:

- Legend 1 - Client 1 sends packets to the cluster with the following IP address: 172.16.2.20.
- Legend 2 - An incomplete route entry, 172.16.2.20, exists in router R1. Due to this, incomplete route entry packets are dropped.
- Legend 3 - An explicit forwarding rule is added to override the incomplete entries. As a result, packets are flooded to all the members of the NLB VLAN.
- Legend 4 - Duplicate packets are sent out on all the member ports of the NLB VLAN.

NLB multicast mode

In NLB Multicast mode, each NLB cluster is assigned with a multicast MAC address. The ARP reply from the NLB servers contains a multicast MAC address in the ARP header similar to NLB Unicast mode.

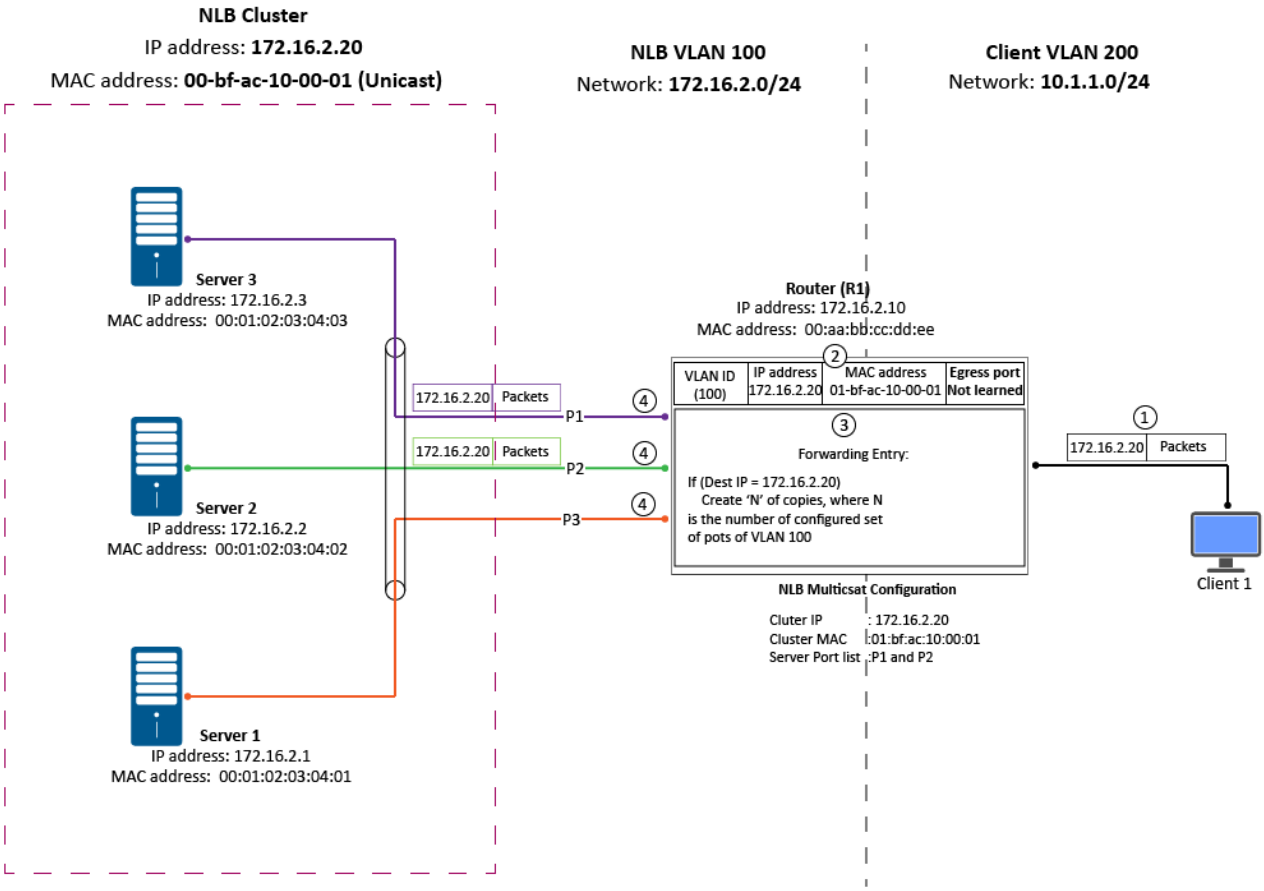
Layer 3 routers directly connected to NLB clusters do not learn Multicast cluster MAC addresses.

Failure to learn the MAC addresses of NLB clusters with Unicast MAC or Multicast MAC addresses, results in incomplete route entries that are created or learned for cluster IP addresses.

The absence of a complete route entry for cluster IP addresses results in packet drops, especially the ones that are destined to the cluster IP addresses.

After you enable the NLB feature in a Layer 3 router, the Layer 3 router must ensure that packets that are destined to an NLB cluster are replicated and a copy of the packet is sent on the configured set of ports that are a part of the NLB VLAN.

The following diagram depicts a typical NLB multicast topology:

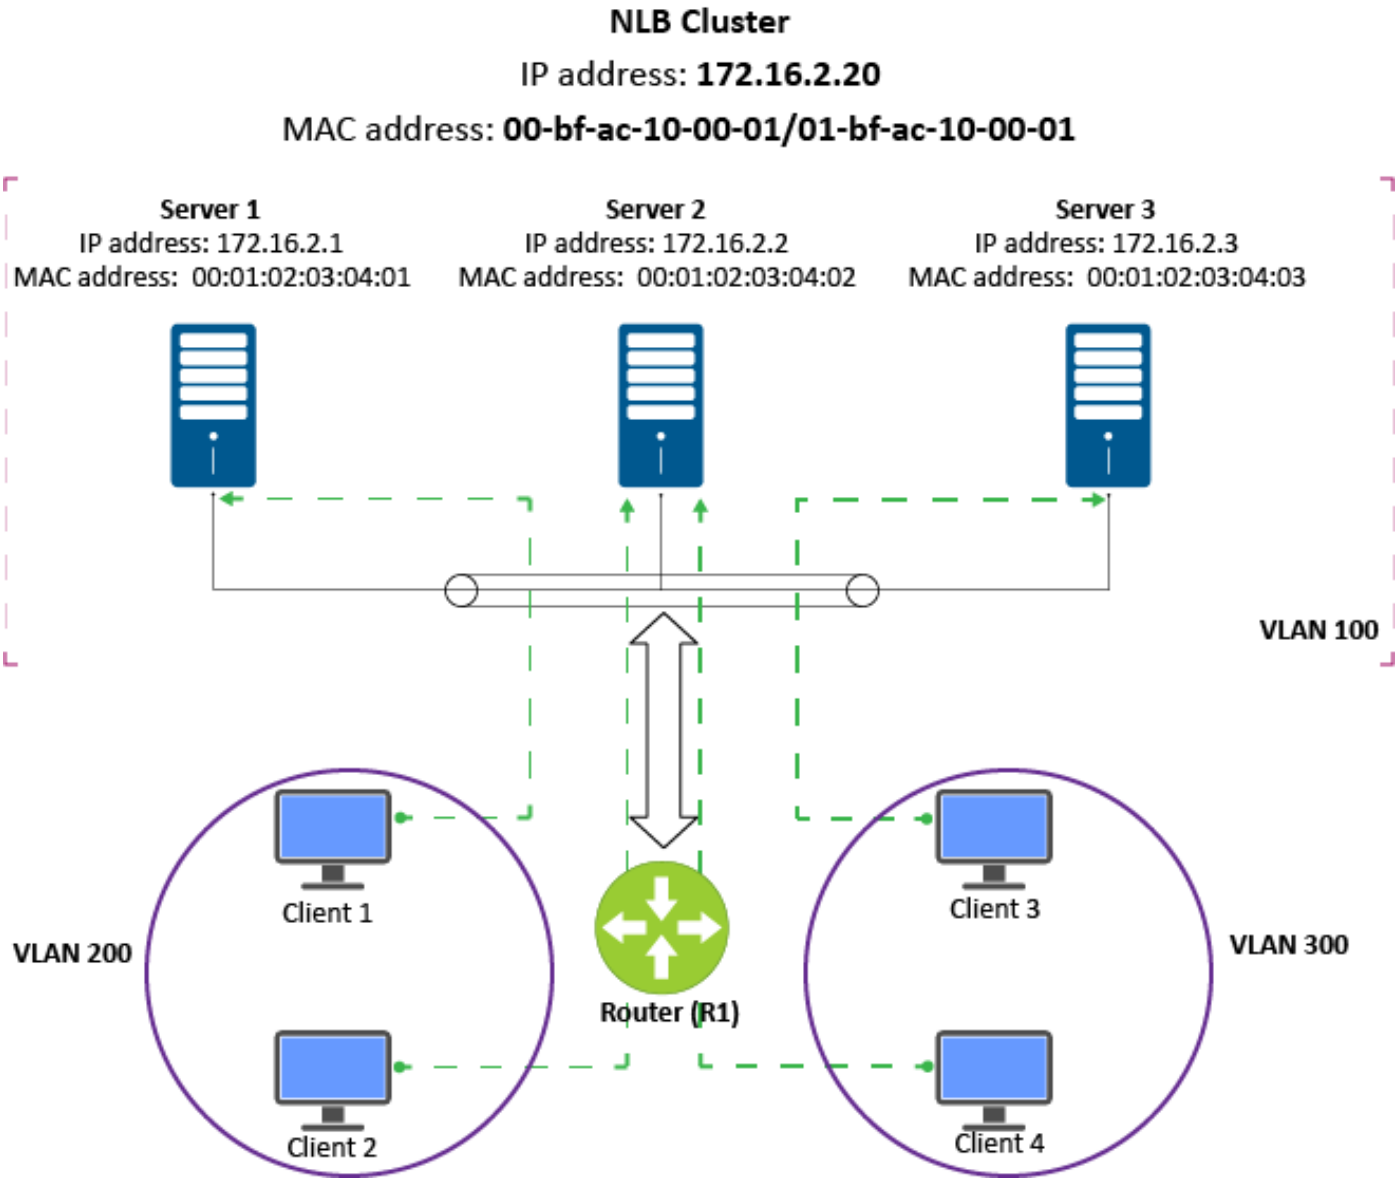


The following list describes the legends 1, 2, 3, and 4 depicted in the NLB multicast topology diagram:

- Legend 1 - Client 1 sends packets to the cluster with the following IP address: 172.16.2.20.
- Legend 2 - An incomplete route entry, 172.16.2.20, exists in router R1. Due to this, incomplete route entry packets are dropped.
- Legend 3 - An explicit forwarding rule is added to flood the packets to the configured set of ports (P1 and P2).
- Legend 4 - Duplicate packets are sent out on the configured set of ports (P1 and P2).

Non-VLT scenario

The following diagram depicts the non-VLT topology:



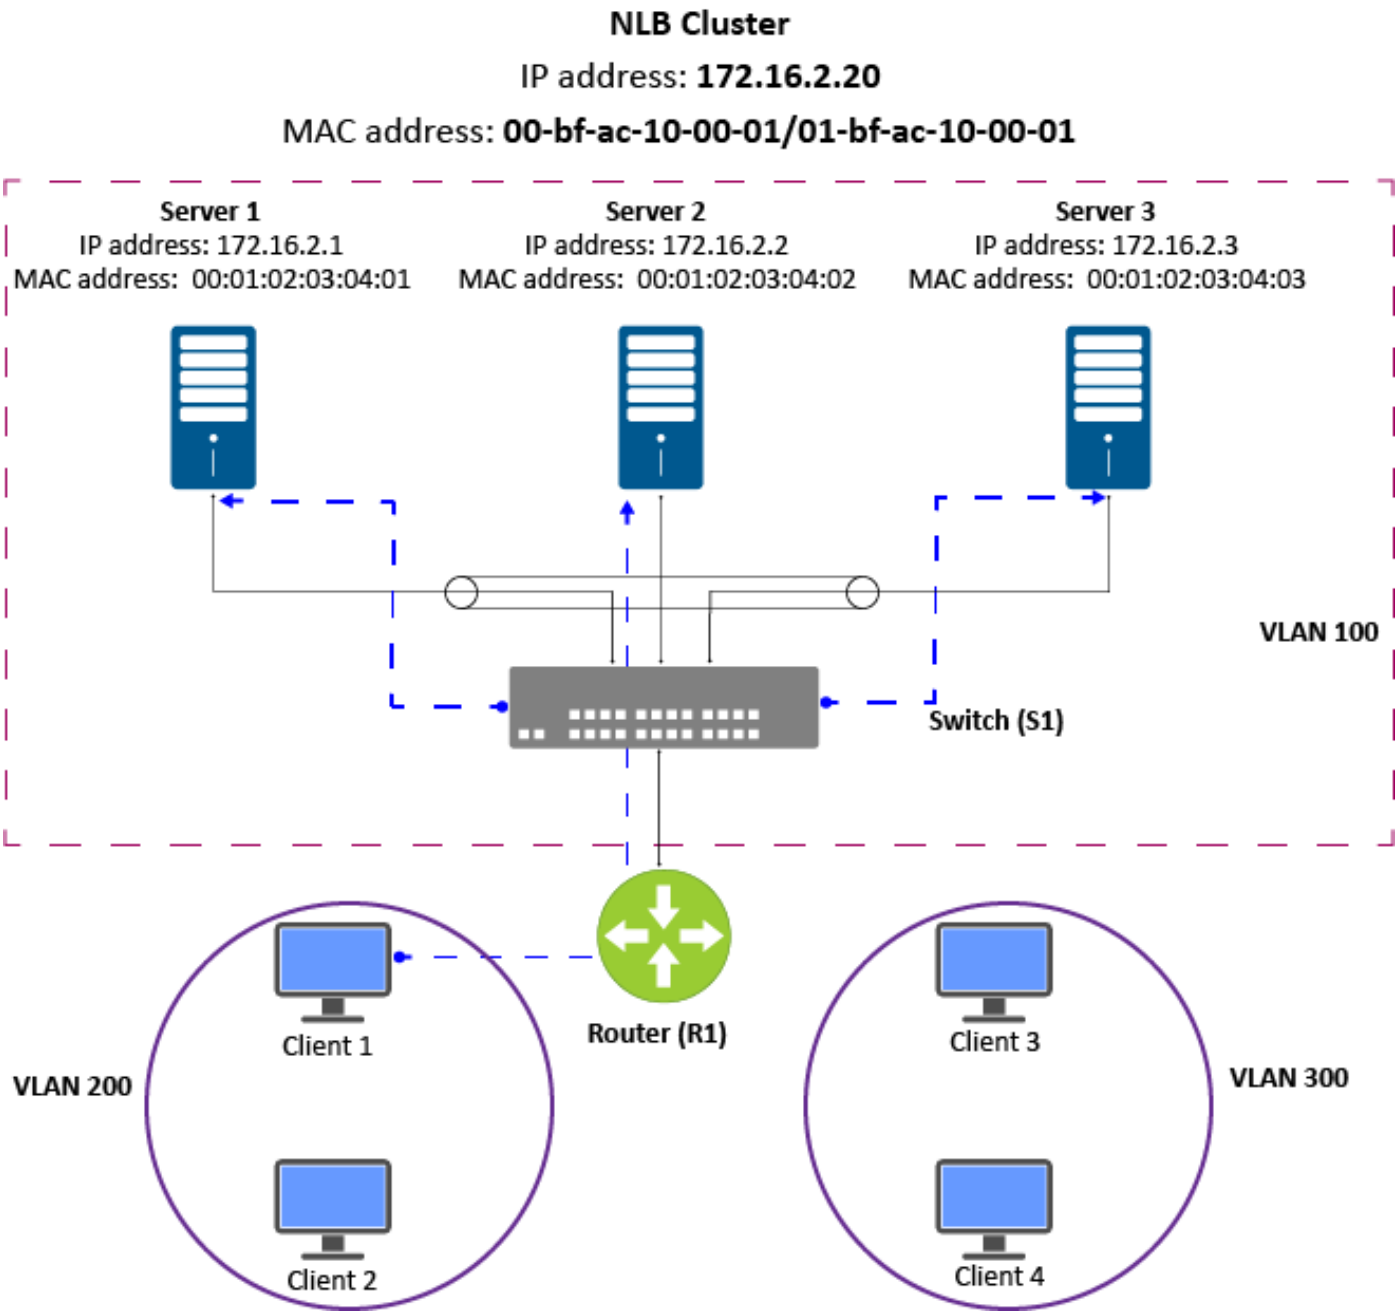
The following sequence describes the non-VLT topology:

1. Client 1, 2, 3, and 4 use 172.16.2.20 (cluster IP) as destination IP address.
2. Router R1, routes the packets from clients that are present in either VLAN 200 or VLAN 300 to the NLB VLAN 100.
3. While routing the packets into VLAN 100 (NLB VLAN), router (R1) ensures that the packets are sent out on the appropriate member ports of VLAN 100.
4. NLB takes care of distributing the requests among the servers in the cluster.

Client 3 is serviced by Server 1, Client 2 is served by Server 2 and Clients 3 and 4 are serviced by Server 3.

Non-VLT - L2 and L3 switch connect NLB cluster and clients

The following diagram depicts the non-VLT scenario where Layer 2 and Layer 3 switches connect NLB cluster and client:

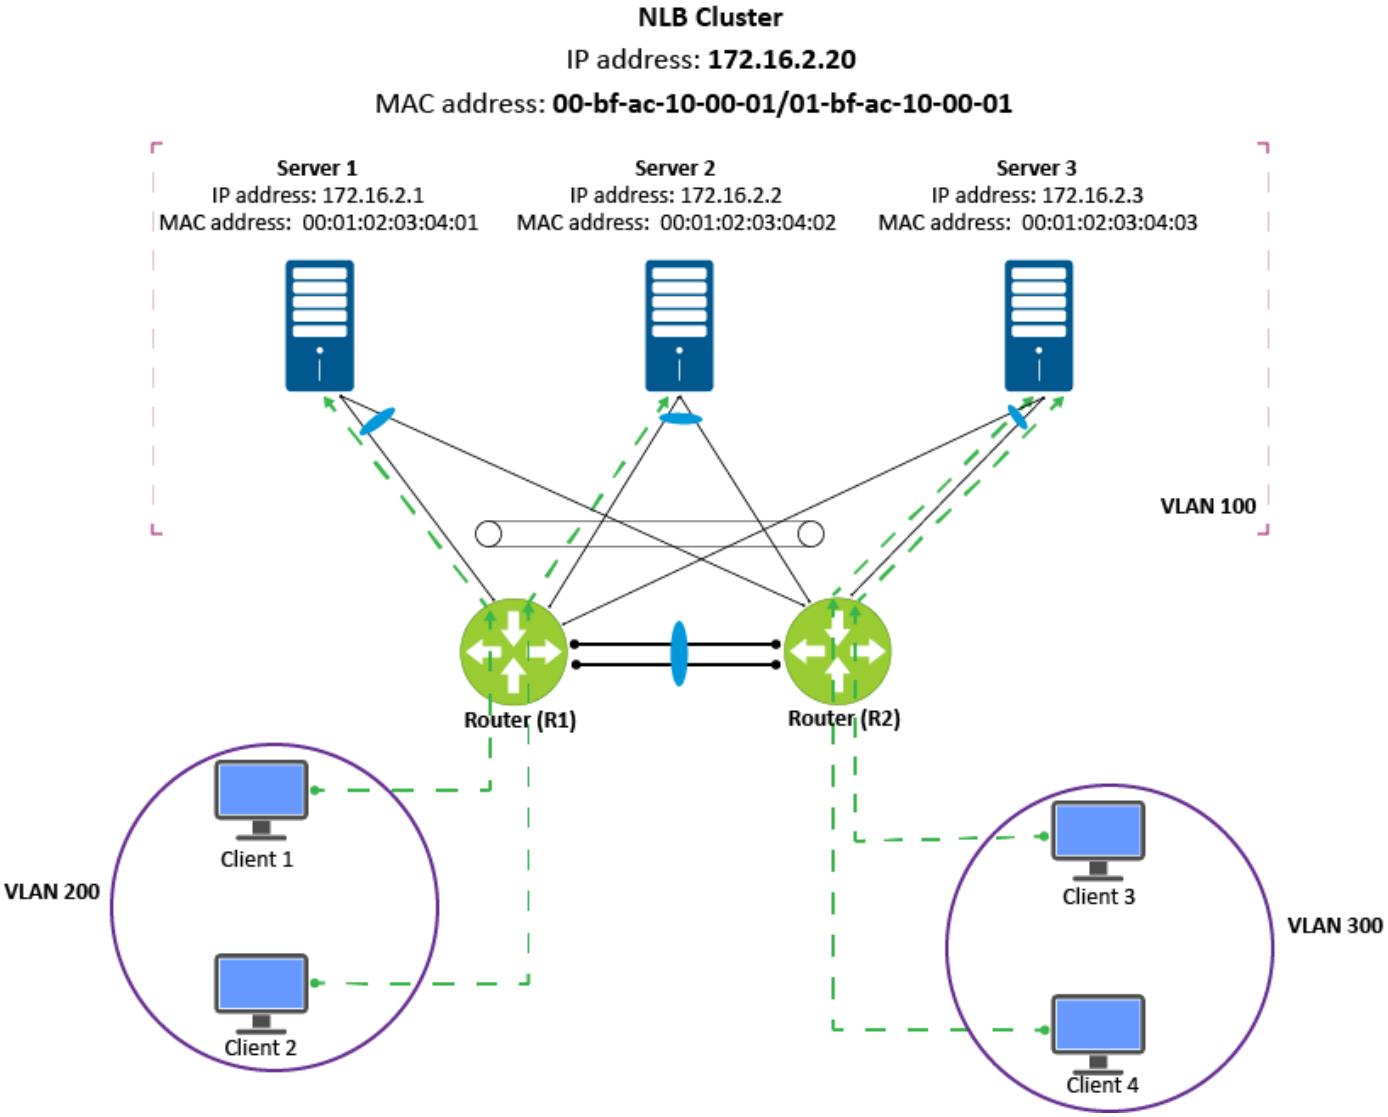


The following sequence describes the non-VLT scenario where Layer 2 and Layer 3 switches connect the NLB cluster and clients:

1. Clients 1, 2, 3, and 4 use 172.16.2.20 (cluster IP) as destination IP address.
2. Router R1 routes packets from clients to the NLB VLAN 100. Always a single copy of packets is sent to switch S1.
3. While switching packets into VLAN 100 (NLB VLAN), switch (S1) ensures that the packets are sent out on the appropriate member ports of VLAN 100.

VLT scenario

The following diagram depicts a typical VLT NLB topology:



The following sequence describes the VLT scenario:

1. Clients 1, 2, 3, and 4 use 172.16.2.20 (cluster IP) as destination IP address.
2. Router R1 routes packets from clients to the NLB VLAN 100.
3. While routing packets into VLAN 100 (NLB VLAN), router (R1) ensures that the packets are sent out on the appropriate member ports of VLAN 100.
4. NLB takes care of distributing the requests among the servers in the cluster.

Client 1 is serviced by Server 1. Client 2 is services by Server 2, and Clients 3 and 4 are serviced by Server 3.

NOTE: Clients can also be dual-homed to routers R1 and R2.

NLB commands

nlb cluster

Configures the NLB cluster IP and Cluster MAC address to make a VLAN a NLB cluster VLAN.

Syntax `[no] nlb cluster ip-address mac-address interface {ethernet node/slot/port[:subport] | port-channel {1-999 | 1001-2000}}`

Parameters

- *ip-address*—Set the IPv4 address of the NLB cluster.
- *mac-address*—Unicast or multicast MAC address of the NLB cluster member.

- `interface` - Multicast member interface of the NLB cluster.
- `ethernet` *node/slot/port[:subport]*—Ethernet physical interface of the multicast NLB cluster member.
- `port-channel` {*1-999* | *1001-2000*}—Port-channel interface of the multicast NLB cluster member.

Default None.

Command Mode INTERFACE-VLAN-CONFIGURATION

Security and access `sysadmin`, `netadmin`, and `netoperator` roles

Usage Information

You can configure the NLB cluster IP and MAC addresses to a VLAN to make a VLAN NLB VLAN.

If a VLAN is already a FCoE VLAN or, private VLAN or, RSPAN VLAN or, VN VLAN, you cannot make it an NLB cluster VLAN.

You cannot configure NLB cluster VLANs as FCOE VLAN or, private VLAN or, RSPAN VLAN, or VN VLAN.

If you do not provide an interface list, all member interfaces of the VLAN become the NLB server host-connected interfaces. Otherwise, the member interfaces become the interfaces corresponding to the interface list that you provide. Packets destined to NLB cluster IP address are forward the above interface list.

If you provide an interface which is not the member of the VLAN, the command is not rejected. After the interface becomes the member of the VLAN, forwarding functions.

Even though commands are accepted while this VLAN is a nondefault VLAN; if the VLAN is the default VLAN, NLB configurations are not accepted. After the VLAN becomes a nondefault VLAN, the configurations turn to Active state.

Dell Technologies does not recommend to configuring the NLB IPs as host IPs in any other VRFs configured in the switch.

Example

```
OS10(conf-if-vl-200)# nlb-cluster 1.1.1.1 00:00:00:00:00:01

OS10(conf-if-vl-200)# nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface
ethernet 1/1/1

OS10(conf-if-vl-200)# nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface
ethernet 1/1/1, 1/1/5

OS10(conf-if-vl-200)#no nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface
ethernet 1/1/3-1/1/4

OS10(conf-if-vl-200)# nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface
port-channel 5

% Error: No Space for NLB ACL entry in ACL Table

OS10(conf-if-vl-200)# show configuration

nlb-cluster 1.1.1.1 00:00:00:00:00:01

nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface ethernet
1/1/1-1/1/2,1/1/5

nlb-cluster 10.1.1.1 03:bf:00:00:00:01 interface port-channel 5
```

Supported Releases 10.5.3 or later

show nlb-cluster

Displays the NLB-cluster VLAN details.

Syntax

```
show nl-clusrer {vlan vlan-id | ip-address}
```

Parameters

- `vlan vlan-id` - Displays NLB cluster IP and MAC address association along with the VLANs through which the NLB server hosts connect.
- *ip-address* - Displays NLB cluster IP and MAC address association along with the interfaces through which the NLB server hosts connect.

Default None.

Command Mode EXEC

Security and access All user roles

Usage Information This command displays NLB cluster IP and MAC association along with the VLANs or interfaces through which the NLB server hosts connect.

Example

```
OS10# show nlb-cluster
nlb-cluster configuration:
VLAN: 10
nlb-cluster ip: 1.1.1.1 mac: 00:00:00:00:00:01
interface: ethernet 1/1/1-1/1/4,1/1/20
           po 1-3,5

VLAN : 1001
nlb-cluster ip : 1.1.1.99       mac : a1:a2:a3:a4:a5:a6
Interfaces : Eth1/1/9:1
             Po1,11,99,199,299

VLAN: 20
nlb-cluster ip: 20.1.1.1 mac: 00:00:00:00:00:20
interface: ethernet 1/1/1-1/1/4,1/1/20
           po 1-3,5

nlb-cluster ip: 22.1.1.1 mac: 00:00:00:00:00:22
interface: ethernet 1/1/11-1/1/14,1/1/21
           po 11-13,5

OS10# show nlb-cluster vlan 10
VLAN: 10
nlb-cluster ip: 1.1.1.1 mac: 00:00:00:00:00:01
interface: ethernet 1/1/1-1/1/4,1/1/20
           po 1-3,5

nlb-cluster ip: 2.1.1.1 mac: 00:00:00:00:00:02
interface: ethernet 1/1/11-1/1/14,1/1/21
           po 11-13,5

OS10# show nlb-cluster 1.1.1.1
VLAN: 10
nlb-cluster ip: 1.1.1.1 mac: 00:00:00:00:00:01
interface: ethernet 1/1/1-1/1/4,1/1/20
           po 1-3,5
```

Supported Releases 10.5.3 or later

System banners

You can configure a system login and message of the day (MOTD) text banners. The system login banner displays before you log in. The MOTD banner displays immediately after a successful login. You can also reset the banner text to the Dell Technologies default banner or disable the banner display.

Login banner

Configure a login banner that displays before you log in to the switch. Enter any single delimiter character to specify the start and end of the text banner.

Enable a login banner in CONFIGURATION mode using the following steps:

1. Enter the `banner login` command with a single delimiter character and press **Enter**.

```
banner login delimiter Enter
```

2. Enter each line of text and press **Enter**.

   You can enter a maximum of 4096 characters and there is no limit to the number of lines.

```
banner-text <Enter>
banner-text <Enter>
banner-text <Enter>
```

3. Complete the login banner configuration by entering a line that contains only the delimiter character.

```
delimiter
```

Configure the login banner

```
OS10# configure terminal
OS10(config)# banner login %
DellEMC S4148U-ON login
Enter your username and password
%
```

To delete a login banner and reset it to the Dell Technologies default banner, use the `no banner login` command. To disable the configured login banner, use the `banner login disable` command.

Message of the day banner

Configure a message of the day (MOTD) banner that displays after you log in. Enter any single delimiter character to start and end the MOTD banner.

Enable the MOTD banner using the following steps:

- Enter the `banner motd` command with a single delimiter character and press **Enter**.

```
banner motd delimiter <Enter>
```

- Enter each line of text and press **Enter**.

  You can enter a maximum of 4096 characters and there is no limit to the number of lines.

```
banner-text <Enter>
banner-text <Enter>
banner-text <Enter>
```

- Complete the banner configuration by entering a line that contains only the delimiter character.

```
delimiter
```

Configure a MOTD banner

```
OS10# configure terminal
OS10(config)# banner motd %
DellEMC S4148U-ON
Today's tip: Press tab or spacebar for command completion.
Have a nice day!
%
```

To delete a MOTD banner and reset it to the Dell Technologies default MOTD banner, use the `no banner motd` command. To disable the configured MOTD banner, use the `banner motd disable` command.

System banner commands

banner login

Configures a login banner that displays before you log in to the system.

Syntax

```
banner login delimiter <Enter>
banner-text <Enter>
banner-text <Enter>
... <Enter>
delimiter
```

Parameters

- *delimiter*—Enter any single delimiter character to specify the start and end of the text banner.
- *banner-text*—Enter the banner text, which is a maximum of 4096 characters. There is no limit to the number of lines.

Default Dell Technologies default banner is displayed before you log in.

Command Mode CONFIGURATION

Usage Information

- To enter a multiline banner text, use the interactive mode. Enter the command with the delimiter character and press **Enter**. Then enter each line and press **Enter**. Complete the banner configuration by entering a line that contains only the delimiter character.
- To delete a login banner and reset it to the Dell Technologies default banner, use the `no banner login` command. To disable the configured login banner, use the `banner login disable` command.

Example

```
OS10(config)# banner login %
Welcome to DellEMC Z9100-ON
Enter your username and password
%
```

Supported Releases 10.4.1.0 or later

banner motd

Configures a multiline MOTD banner that displays after you log in.

Syntax

```
banner motd delimiter <Enter>
banner-text <Enter>
banner-text <Enter>
... <Enter>
delimiter
```

Parameters

- *delimiter*—Enter any single delimiter character to specify the start and end of the text banner.
- *banner-text*—Enter the banner text, which is a maximum of 4096 characters. There is no limit on the number of lines.

Default Dell Technologies default MOTD banner is displayed after you log in.

Command Mode CONFIGURATION

Usage Information

- Enter the command with the delimiter character and press **Enter**. Then enter each line and press **Enter**. Complete the banner configuration by entering a line that contains only the delimiter character.
- To delete a login banner and reset it to the Dell Technologies default banner, use the `no banner motd` command. To disable the configured MOTD banner, use the `banner motd disable` command.

Example

```
OS10(config)# banner motd %
DellEMC S4148U-ON
```

```
Today's tip: Press tab or spacebar for command completion.
Have a nice day!
%
```

Supported releases	10.4.1.0 or later

User session management

You can manage the active user sessions using the following commands:

- Configure the timeout for all the active user sessions using the `exec-timeout` *`timeout-value`* command in the CONFIGURATION mode.
- Clear any user session using the `kill-session` *`session-ID`* command in the EXEC mode. You cannot clear your currently logged-in session.
- View the active user sessions using the `show sessions` command in the EXEC mode.

Configure timeout for user sessions

```
OS10(config)# exec-timeout 300
OS10(config)#
```

Clear user session

```
OS10# kill-session 3
```

View active user sessions

```
OS10# show sessions

Current session's operation mode: Non-transaction

Session-ID User      In-rpcs In-bad-rpcs Out-rpc-err Out-notify Login-time
Lock
-------------------------------------------------------------------------------------------
--
 3          snmp_user 114     0           0           0          2017-07-10T23:58:39Z
 4          snmp_user 57      0           0           0          2017-07-10T23:58:40Z
 6          admin     17      0           0           4          2017-07-12T03:55:18Z
*7          admin     10      0           0           0          2017-07-12T04:42:55Z
OS10#
```

The asterisk (*) in the `Session-ID` column indicates the current OS10 session.

User session management commands

exec-timeout

Configures a timeout value for all the user sessions.

Syntax	`exec-timeout` *`timeout-value`*
Parameters	*`timeout-value`* — Enter the timeout value in seconds, from 0 to 3600.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the timeout.

Example

```
OS10(config)# exec-timeout 300
OS10(config)#
```

Supported Releases 10.3.1E or later

kill-session

Terminates a user session.

Syntax `kill-session session-ID`

Parameters *session-ID* — Enter the user session ID.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# kill-session 3
```

Supported Releases 10.3.1E or later

show sessions

Displays the active management sessions.

Syntax `show sessions`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Use this command to view information about the active user management sessions.

Example

```
OS10# show sessions

Current session's operation mode: Non-transaction

Session-ID User      In-rpcs In-bad-rpcs Out-rpc-err Out-notify Login-time          Lock
-------------------------------------------------------------------------------------------
 3          snmp_user 114     0          0           0          2017-07-10T23:58:39Z
 4          snmp_user 57      0          0           0          2017-07-10T23:58:40Z
 6          admin     17      0          0           4          2017-07-12T03:55:18Z
*7          admin     10      0          0           0          2017-07-12T04:42:55Z
OS10#
```

Supported Releases 10.3.1E or later

Telnet server

To allow Telnet TCP/IP connections to an OS10 switch, enable the Telnet server. The OS10 Telnet server uses the Debian `telnetd` package. By default, the Telnet server is disabled.

When you enable the Telnet server, connect to the switch using the IP address configured on the management or any front-panel port. The Telnet server configuration is persistent and is maintained after you reload the switch. To verify the Telnet server configuration, enter the `show running-configuration` command.

NOTE: Dell Technologies recommends using SSH for secure, encrypted connections to the switch. SSH is enabled by default. To set up SSH connections, see SSH server.

Enable the Telnet server

```
OS10(config)# ip telnet server enable
```

Disable the Telnet server

```
OS10(config)# no ip telnet server enable
```

By default, the Telnet server is reachable on the default virtual routing and forwarding (VRF) instance if the Telnet server is enabled. To configure the Telnet server to be reachable on the management VRF, use the `ip telnet server vrf management` command. To configure the Tellnet server to be reachable on a non-default VRF instance, use the `ip telnet server vrf` *`vrf-name`* command.

Configure a Telnet server on the management VRF

```
OS10(config)# ip telnet server vrf management
```

Telnet commands

ip telnet server enable

Enables Telnet TCP/IP connections to an OS10 switch.

Syntax	`ip telnet server enable`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	By default, the Telnet server is disabled. When you enable the Telnet server, use the IP address configured on the management or any front-panel port to connect to an OS10 switch. After you reload the switch, the Telnet server configuration is maintained. To verify the Telnet server configuration, use the `show running-configuration` command.
Example	`OS10(config)# ip telnet server enable`
Example (disable)	`OS10(config)# no ip telnet server enable`
Supported Releases	10.4.0E(R1) or later

ip telnet server vrf

Configures the Telnet server for the management or non-default VRF instance.

Syntax	`ip telnet server vrf {management | vrf` *`vrf-name`*`}`
Parameters	• `management` — Configures the management VRF used to reach the Telnet server. • `vrf` *`vrf-name`* — Enter the keyword `vrf` followed by the name of the VRF to configure the non-default VRF instance used to reach the Telnet server.
Default	If the Telnet server is enabled, the Telnet server is reachable on the default VRF.
Command Mode	CONFIGURATION
Usage Information	By default, the Telnet server is disabled. To enable the Telnet server, use the `telnet enable` command.

Example

```
OS10(config)# ip telnet server vrf management
OS10(config)# ip telnet server vrf vrf-blue
```

Supported Releases 10.4.0E(R1) or later

Simple Network Management Protocol

Network management stations use simple network management protocol (SNMP) to retrieve and modify software configurations for managed objects on an agent in network devices. A *managed object* is a datum of management information.

The SNMP agent in a managed device maintains the data for managed objects in management information bases (MIBs). Managed objects are identified by their object identifiers (OIDs). A remote SNMP agent performs an SNMP walk on the OIDs stored in MIBs on the local switch to view and retrieve information.

OS10 supports standard and private SNMP MIBs, including all `get` requests. MIBs are hierarchically structured and use object identifiers to access managed objects. For a list of MIBs supported in the OS10 version running on a switch, see the *OS10 Release Notes* for the release.

OS10 supports different security models and levels in SNMP communication between SNMP managers and agents. Each security model refers to an SNMP version used in SNMP messages. SNMP versions provide different levels of security, such as user authentication and message encryption.

NOTE:

- OS10 does not support SNMP SET operations.
- SNMP traps over IPv6 are not supported with VRF management configuration.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

- SNMP server is supported in nondefault (data) VRFs.

Dell PowerSwitch S4200-ON Series:

- SNMP server is supported in nondefault (data) VRFs.

SNMP security models and levels

OS10 supports SNMP security models v1, v2c, and v3. The supported security levels are no authentication, authentication, and privacy.

You specify the SNMP security model and level when you configure SNMP groups and users. Each security model corresponds to an SNMP version that provides different security levels:

- SNMPv1 provides no user authentication or privacy protection (encryption). SNMP messages are sent in plain text.
- SNMPv2c provides no user authentication or encryption. SNMP messages are sent in plain text.
- SNMPv3 provides user-configured security levels for user authentication and encryption of SNMP messages:
  - No user password or message encryption
  - User authentication only
  - User authentication and message encryption

The supported characters for SNMP user password are:

- A-Z
- a-z
- 0-9
- +/
- _-
- =

NOTE: When setting password for an SNMP server, ensure that the password does not begin with the hyphen (-) character. For example, the following error message is displayed when you enter a password that begins with the hyphen character:

```
OS10(config)# snmp-server user test v3group 3 auth sha -abcd1234 priv aes -abcd1234
% Error: SNMP-V3 USM Local user AES: Failure op 2 priv aes parameters for Local user
```

MIBs

OS10 supports the following standard and Dell enterprise MIBs.

MIBs are stored in the `/opt/dell/os10/snmp/mibs/` directory.

Table 9. Standards MIBs

Module	Standard
BRIDGE-MIB	IEEE 802.1D
ENTITY-MIB	RFC 6933
EtherLike-MIB	RFC 3635
HOST-RESOURCES-MIB	RFC 2790
IEEE8021-PFC-MIB	IEEE 802.1Qbb
IEEE8023-LAG-MIB	IEEE 802.3ad
IF-MIB	RFC 2863
IP-FORWARD-MIB	RFC 4292
IP-MIB	RFC 4293
LLDP-EXT-DOT1-MIB	IEEE 802.1AB
LLDP-EXT-DOT3-MIB	IEEE 802.1AB
LLDP-MIB	IEEE 802.1AB
OSPF-MIB	RFC 4750
OSPFV3-MIB	RFC 5643
Q-BRIDGE-MIB	IEEE 802.1Q
RFC1213-MIB	RFC 1213
SFLOW-MIB	RFC 3176
SNMP-FRAMEWORK-MIB	RFC 3411
SNMP-MPD-MIB	RFC 3412
SNMP-NOTIFICATION-MIB	RFC 3413
SNMP-TARGET-MIB	RFC 3413
SNMP-USER-BASED-SM-MIB	RFC 3414
SNMP-VIEW-BASED-ACM-MIB	RFC 3415
SNMPv2-MIB	RFC 3418
TCP-MIB	RFC 4022
UDP-MIB	RFC 4113

Table 10. Dell Enterprise MIBs

Module	Description
DELLEMC-OS10-BGP4V2-MIB	OS10 BGPv2 implementations
DELLEMC-OS10-CHASSIS-MIB	OS10 chassis implementations
DELLEMC-OS10-PRODUCTS-MIB	OS10 platform product definitions
DELLEMC-OS10-SMI-MIB	OS10 SMI implementations
DELLEMC-OS10-TC-MIB	OS10 networking equipment textual convention
DELLEMC-OS10-PORT-SECURITY-MIB	OS10 port security feature MIB

NOTE:

- To monitor BGP, OS10 supports the Dell proprietary MIB, DELLEMC-OS10-BGP4V2-MIB.mib. OS10 returns a `No such object` message when you use the standard BGP4-MIB with OID 1.3.6.1.2.1.15. Use OID 1.3.6.1.4.1.674.11000.5000.200.1.1 for BGP-related MIB objects.
- Dell Enterprise MIBs are not supported in the SNMPv1 standard.

SNMPv3

SNMP version 3 (SNMPv3) provides an enhanced security model for user authentication and SNMP message encryption. User authentication requires that SNMP packets come from an authorized source. Message encryption ensures that packet contents cannot be viewed by an unauthorized source.

To configure SNMPv3-specific security settings — user authentication and message encryption — use the `snmp-server user` command. You can generate localized keys with enhanced security for authentication and privacy (encryption) passwords.

SNMP engine ID

An engine ID identifies the SNMP entity that serves as the local agent on the switch. The engine ID is an octet colon-separated number; for example, `00:00:17:8B:02:00:00:01`.

When you configure an SNMPv3 user, you can specify that a localized authentication and/or privacy key be generated. The localized password keys are generated using the engine ID of the switch. A localized key is more complex and provides greater privacy protection.

The engine ID used to generate the password keys is unique to the switch. For this reason, you cannot copy and use localized SNMP security passwords on another switch.

SNMP groups and users

A member of an SNMP group that accesses the local SNMP agent is known as an *SNMP user*. An SNMP user on a remote device is identified by an IP address and UDP port from which the user accesses the local agent.

In OS10, users are assigned SNMP access privileges according to the group they belong to. You configure each group for access to SNMP MIB tree views.

SNMP views

In OS10, you configure views for each security model and level in an SNMP user group. Each type of view specifies the object ID (OID) in the MIB tree hierarchy at which the view starts. You can also specify whether the rest of the MIB tree structure is included or excluded from the view.

- A *read* view provides read-only access to the specified OID tree.
- A *write* view provides read-write access to the specified OID tree.
- A *notify* view allows SNMP notifications (traps and informs) from the specified OID tree to be sent to other members of the group.

Configure SNMP

To set up communication with SNMP agents in your network:

- Configure the read-only, read-write, and notify access for SNMP groups.
- Configure groups with SNMP views for specified SNMP versions (security models).
- Assign users to groups and configure SNMPv3-specific authentication and encryption settings, and optionally, localized security keys and ACL-based access.

Configuring SNMP consists of these tasks in any order:

- Configure SNMP engine ID
- Configure SNMP views
- Configure SNMP groups
- Configure SNMP users

Configure SNMP engine ID

The engine ID identifies the SNMP local agent on a switch. The engine ID is an octet colon-separated number; for example, `80:00:02:b8:04:61:62:63` .

The local engine ID is used to create a localized authentication and/or privacy key for greater security in SNMPv3 messages. You generate a localized authentication and/or privacy key when you configure an SNMPv3 user.

Configure a remote device and its engine ID to allow a remote user to query the local SNMP agent. The remote engine ID is included in the query and used to generate the authentication and privacy password keys to access the local agent. If you do not configure the remote engine ID, remote users' attempts to access the local agent fail.

NOTE: Create a remote engine ID with the `snmp-server engineID` command before you configure a remote user with the `snmp-server user` command. If you change the configured engine ID for a remote device, you must reconfigure the authentication and privacy passwords for all remote users associated with the remote engine ID.

```
snmp-server engineID [local engineID] [remote ip-address {[udp-port port-number] remote-
engineID}]
```

To display the localized authentication and privacy keys in an SNMPv3 user configuration, use the `show snmp engineID local` command.

Configure SNMP engineID

```
OS10(config)# snmp-server engineID local 80:00:02:b8:04:61:62:63
```

Display SNMP engineID

```
OS10# show snmp engineID local
Local default SNMP engineID: 0x800002a2036c2b59fbd8a0
```

Configure SNMP views

Configure a read-only, read-write, or notify view of the MIB tree structure in the SNMP agent on the switch.

The `oid-tree` value specifies the OID in the MIB tree hierarchy at which a view starts. Enter `included` or `excluded` to include or exclude the rest of the sub-tree MIB contents in the view. If necessary, re-enter the command to exclude tree entries in the included content.

```
snmp-server view view-name oid-tree [included | excluded]
```

Configure read-only view

```
OS10(config)# snmp-server view readonly 1.3.6.1.2.1.31.1.1.1.6 included
```

Configure read-write view

```
OS10(config)# snmp-server view rwView 1.3.6.1.2.1.31.1.1.1.6 included
OS10(config)# snmp-server view rwView 1.3.6.1.2.1.31.0.0.0.0 excluded
```

Configure notify view

```
OS10(config)# snmp-server view notifyView 1.3.6.1.2.1.31.1.1.1.6 included
OS10(config)# snmp-server view notifyView 1.3.6.1.2.1.31.0.0.0.0 excluded
```

Display SNMP views

```
OS10# show snmp view
view name               : readview
OID                     : 1.3.6.5
excluded                : True
```

Configure SNMP groups

Configure an SNMP group with the views allowed for the members of the group. Specify the read-only, read-write, and/or notification access to the SNMP agent.

The security model corresponds to the SNMP version that users use to send and receive SNMP messages. The security level configures SNMPv3 user authentication and privacy settings:

- `auth` — Authenticate users in SNMP messages.
- `noauth` — Do not authenticate users or encrypt SNMP messages; send messages in plain text.
- `priv` — Authenticate users and encrypt/decrypt SNMP messages.

Enter an ACL to limit user access so that only messages from and to ACL-allowed users are received and sent from the SNMP agent on the switch.

```
snmp-server group group-name {v1 | v2c | v3 security-level} [access acl-name]
[read view-name] [write view-name] [notify view-name]
```

To configure a view of the MIB tree on the SNMP agent, use the `snmp-server view` command.

To configure an SNMPv3 user's authentication and privacy settings, use the `snmp-server user` command.

To display the configured SNMP groups, use the `show snmp group` command.

Configure SNMPv1 or v2c group

```
OS10(config)# snmp-server group v2group 2c read readview notify GetsSets
```

Configure SNMPv3 group

```
OS10(config)# snmp-server group v3group 3 priv read readview write writeview notify
alltraps
```

Display SNMP groups

```
OS10# show snmp group
groupname               : v2group
version                 : 2c
notifyview              : GetsSets
readview                : readview

groupname               : v3group
version                 : 3
security level          : priv
notifyview              : alltraps
readview                : readview
writeview               : writeview
```

Configure SNMP users

Configure user access to the SNMP agent on the switch using group membership. Assign each user to a group and configure SNMPv3-specific authentication and encryption settings, and optionally, localized security keys and ACL-based access. Re-enter the command multiple times to configure SNMP security settings for all users.

```
snmp-server user user-name group-name security-model [[noauth | auth {md5 | sha} auth-
password]
[priv {des | aes}]] [localized] [access acl-name]  [remote ip-address udp-port port-
number]]
```

The group to which a user is assigned determines the user's access privilege. To configure a group's access privilege — read, write, and notify — to the switch, use the `snmp-server group` command. The security model for SNMPv3 provides the strongest security with user authentication and packet encryption.

No default values exist for SNMPv3 authentication and privacy algorithms and passwords. If you forget a password, you cannot recover it — you must reconfigure the user. You can specify either a plain-text password or an encrypted cypher-text password. In either case, the password stores in the configuration in encrypted form and displays as encrypted in the `show running-config snmp` output.

A localized authentication or privacy key is more complex and provides greater privacy protection. Localized keys are generated using the engine ID of the switch. For this reason, you cannot use the localized SNMP security passwords in the configuration file on another switch. For more information, see Configure SNMP engine ID. To display the localized authentication and privacy keys in an SNMPv3 user configuration, use the `show running-configuration snmp` command.

To limit user access to the SNMP agent on the switch, enter an `access acl-name` value. In IPv6 ACLs, SNMP supports only IPv6 and UDP types. TCP, ICMP, and port rules are not supported.

To display the configured SNMP users, use the `show snmp user` command.

Configure SNMPv1 or v2c users

```
OS10(config)# snmp-server user admin1 netadmingroup 2c acl acl_AdminOnly
```

Configure SNMPv3 users

```
OS10(config)# snmp-server user privuser v3group 3 encrypted auth
md59fc53d9d908118b2804fe80e3ba8763d priv des56 d0452401a8c3ce42804fe80e3ba8763d

OS10(config)# snmp-server user n3user ngroup remote 172.31.1.3 udp-port 5009 3 auth md5
authpasswd
```

Display SNMP users

```
OS10# show snmp user
User name                   : privuser
Group                       : v3group
Version                     : 3
Authentication Protocol     : MD5
Privacy Protocol            : AES
```

Generate SNMPv3 localized keys

The user-based security model in SNMP v3 offers strong authentication and encryption using the following algorithms:

- Authentication algorithms—MD5 and SHA
- Encryption algorithms—DES and AES-128

While configuring SNMP users, instead of using plain text passwords, you can use localized keys that are encrypted using authentication and encryption algorithms. To generate the localized keys, use the Snmpkey utility in Linux. Ensure that you have the following packages installed in the Linux server to generate the localized keys:

- libnet-snmp-perl
- libcrypt-des-perl
- libdigest-hmac-perl
- libcrypt-rijndael-perl

Use the following command to generate the localized keys that you can use when configuring a user:

```
snmpkey {md5 | sha} authpassword engineID [des | 3des | aes] privpassword
```

where *authpassword* is the password that you specify for the authentication protocol, *engineID* is the local engineID, and *privpassword* is the password that you specify for the privacy protocol.

Use the `show snmp engineID local` command to view the local engineID.

```
OS10# show snmp engineID local

Local default SNMP engineID: 0x800002a2036c2b59fbd8a0
```

Enter the following command on the Linux server where you have the Snmpkey utility installed:

```
snmpkey md5 testauthpasswd 0x800002a2036c2b59fbd8a0 des testprivpasswd
authKey: 0xaa5bb0eb6e6a9f036dc548e4ad9405f8
privKey: 0xaa5bb0eb6e6a9f036dc548e4ad9405f8
```

The system generates the authentication and privacy keys.

Use the localized keys while configuring the SNMP user.

```
OS10(config)# snmp-server user user3 Group3 3 localized auth md5
0xaa5bb0eb6e6a9f036dc548e4ad9405f8 priv des 0xaa5bb0eb6e6a9f036dc548e4ad9405f8
```

Configure SNMP traps

The SNMP agent sends notification of events to the management station using unsolicited SNMP messages called SNMP traps. SNMP traps optimize the use of network resources.

SNMP version 1 and version 2C traps can coexist with version 3 traps. SNMP versions 1 and 2C use the trap category for access control. SNMP version 3 traps are associated to SNMP users with a given authentication level.

Configure SNMP traps on the OS10 switch for it to send notifications to the management station.

`snmp-server host {ipv4-address | ipv6-address} {informs version version-number | traps version version-number | version version-number} [snmpv3-security-level] [community-name] [udp-port port-number] [dom | entity | envmon | lldp | snmp | bfd | bgp]`

Configure SNMP v1 or v2C traps

```
OS10(config)# snmp-server host 10.10.10.10 traps version 2c comm2c lldp snmp
```

Configure SNMP v3 traps

```
OS10(config)# snmp-server group Group3 3 priv notify NOTIFY
OS10(config)# snmp-server user User3 Group3 3 auth md5 testpasswd priv aes testprivpasswd
OS10(config)# snmp-server host 10.10.10.10 version 3 priv User3 snmp
OS10(config)# snmp-server view NOTIFY .1 included
```

NOTE: To generate traps in snmpv3, it is mandatory to configure `view-name` in the group. The configured `view-name` in the group must be mapped with the `snmp-server view` configuration. A user can be assigned to this group and used further in the `snmp-server host` command.

Configure SNMP informs

The SNMP agent sends notification of events to and receives an acknowledgment from the network management station (NMS), also called as the remote SNMP server. Such notifications that receive an SNMP response from the NMS are called informs. Informs are more reliable than traps. If an SNMP agent does not receive an acknowledgment, it resends the inform, up to a maximum of three retries.

Configure the engine ID of the remote SNMP server to receive an acknowledgment.

```
snmp-server host {ipv4-address | ipv6-address} {informs version version-number | traps
version version-number | version version-number} [snmpv3-security-level] [community-name]
[udp-port port-number] [dom | entity | envmon | lldp | snmp | bfd | bgp]
```

Configure SNMP v3 informs

```
OS10(config)# snmp-server group Group3 3 priv notify NOTIFY
OS10(config)# snmp-server engineID remote 10.1.1.1 0x80000232334abc34d
OS10(config)# snmp-server user rem-user Group3 remote 10.1.1.1 udp-port 162 3 auth md5
testpasswd priv des testprivpasswd
OS10(config)# snmp-server host 10.11.5.1 informs version 3 priv rem-user
```

SNMP source interface

Using the SNMP source interface feature, you can define the IP address for SNMP packets that are sent to a remote system. You can associate the IP address of the configured source interface for SNMP transmitted packets. Dell Technologies recommends that you can use the loopback interface as the SNMP source interface because it is always available. You can associate all management traffic (if required) to one address. This address does not change regardless of the egress interface that is used for system egress SNMP traffic.

Use the following command to associate all management traffic to one address:

```
OS10(config)# snmp-server source-interface {loopback interface# | mgmt 1/1/1}
```

The `snmp-server source-interface` command identifies the source IP address that will be used to transmit the trap and inform packets between the SNMP source and the specified interface. If an IP address is configured or changed in the specified source interface, then the new IP address is used for the SNMP trap and inform packets. If no IP address is configured on the interface, then the SNMP trap and inform packets use the IP address of the egress interface where it transmits the packets until an IP address is setup on the associated interface.

SNMP commands

show snmp community

Displays the SNMP communities configured on the switch.

Syntax	`show snmp community`
Parameters	None
Defaults	None
Command Mode	EXEC
Usage Information	To configure an SNMP community, use the `snmp-server community` command.
Example	

```
OS10# show snmp community
Community      : public
Access         : read-only

Community      : dellOS10
Access         : read-write
ACL            : dellacl
```

Supported Releases	10.4.2.0 or later

show snmp engineID

Displays the SNMP engine ID on the switch or on remote devices that access the SNMP agent on the switch.

Syntax `show snmp engineID {local | remote}`

Parameters
- `local` — Display the local engine ID.
- `remote` — Display the SNMP engine ID of remote devices configured on the switch.

Defaults None

Command Mode EXEC

Usage Information To configure the local engine ID or the engine ID for a remote device, use the `snmp-server engineID` command.

Example

```
OS10# show snmp engineID remote
Remote Engine ID     IP-addr     Port
0x0712               1.1.1.1     23

OS10# show snmp engineID local
Local default SNMP engineID: 0x80001f880390b11cf4abe7
```

Supported Releases 10.4.2.0 or later

show snmp group

Displays the SNMP groups configured on the switch, including SNMP views and security models.

Syntax `show snmp group`

Parameters None

Defaults None

Command Mode EXEC

Usage Information To configure an SNMP group, use the `snmp-server group` command.

Example

```
OS10# show snmp group
groupname               : v2group
version                 : 2c
notifyview              : GetsSets
readview                : readview

groupname               : v3group
version                 : 3
security level          : priv
notifyview              : alltraps
readview                : readview
writeview               : writeview
```

Supported Releases 10.4.2.0 or later

show snmp user

Displays the users configured to access the SNMP agent on the switch, including the SNMP group and security model.

Syntax `show snmp user`

Parameters None

Defaults None

Command Mode EXEC

Usage Information To configure an SNMP user, use the `snmp-server user` command.

Example

```
OS10# show snmp user
User name                   : privuser
Group                       : v3group
Version                     : 3
Authentication Protocol     : MD5
Privacy Protocol            : AES
```

Supported Releases 10.4.2.0 or later

show snmp view

Displays the SNMP views configured on the switch, including the SNMP object ID at which the view starts.

Syntax `show snmp view`

Parameters None

Defaults None

Command Mode EXEC

Usage Information Use the `show snmp view` command to verify the OID starting point for SNMP views in MIB trees. To configure an SNMP view, use the `snmp-server view` command.

Example

```
OS10# show snmp view
view name                : readview
OID                      : 1.3.6.5
excluded                 : True
```

Supported Releases 10.4.2.0 or later

snmp-server community

Configures an SNMP user community.

Syntax `snmp-server community` *`name`* `{ro | rw} [acl` *`acl-name`*`]`

Parameters

- `community` *`name`* — Set the community name string to act as a password for SNMPv1 and SNMPv2c access. A maximum of 20 alphanumeric characters.
- `ro` — Set read-only access for the SNMP community.
- `rw` — Set read-write access for the SNMP community.
- `acl` *`acl-name`* — Enter an existing IPv4 ACL name to limit SNMP access in the SNMP community.

Defaults An SNMP community has read-only access.

Command Mode CONFIGURATION

Usage Information The SNMPv1 and SNMPv2c security models use a community-based form of security. Use this command to configure read-only or read-write access for an SNMP community name. The configured community text string is used for SNMPv1 and SNMPv2c user authentication.

To display the SNMP communities on the switch, use the `show snmp community` command.

These points are applicable when you assign an ACL to an SNMP community:

- By default, SNMP requests from all hosts are allowed.
- You can only apply `permit` ACL rues to an SNMP community. `deny` ACL rules do not take effect if you apply them.

- To permit SNMP requests for multiple hosts, apply individual `permit` ACL rules for hosts or prefixes.
- Applying ACL rules for an SNMP community in a nondefault VRF is not supported.

The `no` version of the command removes the configured community text string.

Example

```
OS10(config)# snmp-server community admin rw
OS10(config)# snmp-server community public ro acl snmp-read-only-acl
```

Supported Releases 10.2.0E or later

snmp-server contact

Configures contact information for troubleshooting the local SNMP switch.

Syntax `snmp-server contact text`

Parameters *text* — Enter an alphanumeric text string. A maximum of 55 characters.

Default The SNMP server contact is `support`.

Command Mode CONFIGURATION

Usage Information The `no` version of this command resets the SNMP server contact to the default value.

Example

```
OS10(config)# snmp-server contact administrator
```

Supported Releases 10.2.0E or later

snmp-server enable traps

Enables SNMP traps on a switch.

Syntax `snmp-server enable traps [notification-type] [notification-option]`

Parameters

- *notification-type notification-option* — Enter an SNMP notification type, and optionally, a notification option for the type.

Table 11. Notification types and options

Notification type	Notification option
`config`—Enable startup configuration change traps.	None
`entity`—Enable entity change traps.	None
`envmon`—Enable SNMP environmental monitor traps.	○ `fan` — Enable fan traps. ○ `power-supply` — Enable power-supply traps. ○ `temperature` — Enable temperature traps.
`lldp`—Enable LLDP state change.traps.	○ `rem-tables-change` — Enable the lldpRemTablesChange trap.
`snmp`—Enable SNMP traps.	○ `authentication` — Enable authentication traps. ○ `coldstart` — Enable coldstart traps when you power on the switch and the SNMP agent initializes. ○ `linkdown` — Enable link-down traps. ○ `linkup` — Enable link-up traps. ○ `warmstart` — Enable warmstart traps when the switch reloads and the SNMP agent reinitializes.

Table 11. Notification types and options (continued)

Notification type	Notification option
`bfd`—Triggers SNMP traps when the state of BFD session changes to UP or DOWN from any other state.	None
`bgp`—Triggers SNMP traps when the state of BGP session changes to UP or DOWN from any other state.	None

Defaults Not configured

Command Mode CONFIGURATION

Usage Information If you do not enter a `notification-type` or `notification-option` parameter with command, all traps are enabled. If you enter only a `notification-type`, all `notification-option` traps associated with the type are enabled.

To enable specific SNMP trap types, re-enter the command multiple times with different notification types and options.

To configure a host to receive SNMP notifications, use the `snmp-server host` command.

The `no` version of the command disables SNMP traps on the switch.

Example

```
OS10(config)# snmp-server enable traps envmon fan
OS10(config)# snmp-server enable traps envmon power-supply
OS10(config)# snmp-server enable traps snmp
OS10(config)# no snmp-server enable traps snmp
OS10(config)# snmp-server enable traps bgp
OS10(config)# snmp-server enable traps bfd
```

Supported Releases 10.4.1.0 or later

snmp-server engineID

Configures the local and remote SNMP engine IDs.

Syntax `snmp-server engineID [local` *`engineID`*`] [remote` *`ip-address`* `{[udp-port` *`port-number`*`]` *`remote-engineID`*`}]`

Parameters

- `local` *`engineID`* — Enter the engine ID that identifies the local SNMP agent on the switch as an octet colon-separated number. A maximum of 27 characters.
- `remote` *`ip-address`* — Enter the IPv4 or IPv6 address of a remote SNMP device that accesses the local SNMP agent.
- `udp-port` *`port-number`* — Enter the UDP port number on the remote device, from 0 to 65535.
- *`remote-engineID`* — Enter the engine ID that identifies the SNMP agent on a remote device, `0x` then by a hexadecimal string).

Defaults The local engine ID is generates using the MAC address of the management Ethernet interface.

Command Mode CONFIGURATION

Usage Information The local engine ID generates the localized keys for the authentication and privilege passwords. These passwords authenticate SNMP users and encrypt SNMP messages. If you reconfigure the local Engine ID, the localized keys also change. The existing values are no longer valid, and a warning message displays. As a result, you must reconfigure SNMP users with new localized password keys.

In addition, if you change the configured engine ID for a remote device, you must reconfigure the authentication and privacy passwords for the remote user.

To display the current local engine ID, use the `show snmp engineID local` command.

The `no` version of this command resets the default engine ID values.

Example

```
OS10(config)# snmp-server engineID local 80:00:02:b8:04:61:62:63

OS10(config)# snmp-server engineID local 80:00:02:b8:04:61:62:63
% Warning: Localized passwords need to be regenerated for local user.

OS10(config)# snmp-server engineID remote 1.1.1.1 0xaaffcc

OS10(config)# snmp-server engineID remote 1.1.1.2 udp-port 432 0xabeecc
```

Supported Releases 10.4.2.0 or later

snmp-server group

Configures the views allowed for the users in an SNMP group.

Syntax `snmp-server group group-name {v1 | v2c | v3 security-level} [access acl-name] [read view-name] [write view-name] [notify view-name]`

Parameters

- *group-name* — Enter the name of the group. A maximum of 32 alphanumeric characters.
- `v1` — SNMPv1 provides no user authentication or privacy protection. SNMP messages are sent in plain text.
- `v2c` — SNMPv2c provides no user authentication or privacy protection. SNMP messages are sent in plain text.
- `v3 security-level` — SNMPv3 provides optional user authentication and encryption for SNMP messages, configured with the `snmp-server user` command.
- `security-level` — (SNMPv3 only) Configure the security level for SNMPv3 users:
  - `auth` — Authenticate users in SNMP messages.
  - `noauth` — Do not authenticate users or encrypt SNMP messages; send messages in plain text.
  - `priv` — Authenticate users and encrypt/decrypt SNMP messages.
- `access acl-name` — (Optional) Enter the name of an IPv4 or IPv6 access list to filter SNMP requests received on the switch. A maximum of 16 characters.
- `read view-name` — (Optional) Enter the name of a read-only view. A maximum of 32 characters maximum.
- `write view-name` — (Optional) Enter the name of a read-write view. A maximum of 32 characters maximum.
- `notify view-name` — (Optional) Enter the name of a notification view. A maximum of 32 characters maximum.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information Use this command to set up the access privileges for a group of SNMP users. Configure the security level for receiving SNMP messages. Specify read-only, read-write, and/or notification access to the SNMP agent. To configure an SNMPv3 user's authentication and privacy settings, use the `snmp-server user` command.

Enter an `access acl-name` value to limit access to the SNMP agent to only ACL-allowed users.

A read-view provides read-only access to the SNMP agent. A read-write view allows read-write access. A notify-view allows SNMP notifications to be sent to group members.

The `no` version of the command deletes an SNMP group.

Example

```
OS10(config)# snmp-server group os10admin p3 priv read readonlyview
```

Supported Releases 10.4.2.0 or later

snmp-server host

Configures a host to receive SNMP notifications.

Syntax

```
snmp-server host {ipv4-address | ipv6-address} {informs version version-number | traps version version-number | version version-number} [snmpv3-security-level] [community-name] [udp-port port-number] [config | dom | entity | envmon | lldp | snmp | bfd | bgp]
```

Parameters

- *ipv4-address | ipv6-address*—Enter the IPv4 or IPv6 address of the SNMP host.
- `informs`—Send inform messages to the SNMP host.
- `traps`—Send trap messages to the SNMP host.
- `version` *version-number*—Enter the SNMP security model used to send traps or informs to the SNMP host — `1`, `2c`, or `3`. All security models support traps; only `2c` and `3` support informs. To send only SNMP notifications, enter only a *version-number*; do not enter `informs` or `traps`. For SNMPv3 traps and informs, enter the security level:
  - `noauth`—(SNMPv3 only) Send SNMPv3 traps without user authentication and privacy encryption.
  - `auth`—(SNMPv3 only) Include a user authentication key for SNMPv3 messages sent to the host:
    - `md5`—Generate an authentication key using the Message Digest Algorithm (MD5) algorithm.
    - `sha`—Generate an authentication key using the Secure Hash Algorithm (SHA) algorithm.
    - *auth-password*—Enter a text string used to generate the authentication key that identifies the user. A maximum of 32 alphanumeric characters. For an encrypted password, enter the encrypted string instead of plain text.
  - `priv`—(SNMPv3 only) Configure encryption for SNMPv3 messages sent to the host:
    - `aes`—Encrypt messages using an AES 128-bit algorithm.
    - `des`—Encrypt messages using a DES 56-bit algorithm.
    - *priv-password* — Enter a text string used to generate the privacy key used in encrypted messages. A maximum of 32 alphanumeric characters. For an encrypted password, you can enter the encrypted string instead of plain text.
- *community-name*—(Optional) Enter an SNMPv1 or SNMPv2c community string name or an SNMPv3 user name.
- `udp-port` *port-number*—(Optional) Enter the UDP port number on the SNMP host, from 0 to 65535.
- `config | dom | entity | envmon | lldp | snmp | bfd | bgp`—Enter one or more types of traps and notifications to send to the SNMP host — startup configuration change, digital optical monitor, entity change, environment monitor, LLDP state change traps, SNMP-type notifications, BFD session UP or DOWN traps, or BGP session UP or DOWN traps.

Defaults

Not configured

Command Mode

CONFIGURATION

Usage Information

The local SNMP agent sends SNMP notifications, traps, and informs to SNMP managers configured as host receivers. You can configure multiple host receivers.

An SNMP host does not acknowledge the trap messages and notifications received from the SNMP agent. SNMP hosts send an acknowledgement when receiving informs.

The `no` version of the command disables the local agent from sending SNMP traps, informs, or notifications to a host receiver.

Example — Send SNMP traps to host

```
OS10(config)# snmp-server host 1.1.1.1 traps version 3 priv user01 udp-port 32 entity lldp
```

Example — Send SNMP informs to host

```
OS10(config)# snmp-server host 1.1.1.1 informs version 2c public envmon snmp
```

Example — Send SNMP notifications to host

```
OS10(config)# snmp-server host 1.1.1.1 version 3 noauth u1 snmp lldp
```

Supported Releases	10.2.0E or later

snmp-server location

Configures the location of the SNMP server.

Syntax	`snmp-server location text`
Parameters	*text* — Enter an alphanumeric string. A maximum of 55 characters.
Default	None
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the SNMP location.
Example	`OS10(config)# snmp-server location datacenter10`
Supported Releases	10.2.0E or later

snmp-server user

Authorizes a user to access the SNMP agent and receive SNMP messages.

Syntax

```
snmp-server user user-name group-name security-model [[noauth | auth {md5 | sha} auth-password] [priv {des | aes} priv-password]] [localized] [access acl-name] [remote ip-address udp-port port-number]]
```

Parameters

- *user-name* — Enter the name of the user. A maximum of 32 alphanumeric characters.
- *group-name* — Enter the name of the group to which the user belongs. A maximum of 32 alphanumeric characters.
- *security-model* — Enter an SNMP version that sets the security level for SNMP messages:
  - `1` — SNMPv1 provides no user authentication or privacy protection. SNMP messages are sent in plain text.
  - `2c` — SNMPv2c provides no user authentication or privacy protection. SNMP messages are sent in plain text.
  - `3` — SNMPv3 provides optional user authentication and encryption for SNMP messages.
- `noauth` — (SNMPv3 only) Configure SNMPv3 messages to send without user authentication and privacy encryption.
- `auth` — (SNMPv3 only) Include a user authentication key for SNMPv3 messages sent to the user:
  - `md5` — Generate an authentication key using the MD5 algorithm.
  - `sha` — Generate an authentication key using the SHA algorithm.
  - *auth-password* — Enter a text string used to generate the authentication key that identifies the user; a maximum of 32 alphanumeric characters maximum. For an encrypted password, you can enter the encrypted string instead of plain text.
- `priv` — (SNMPv3 only) Configure encryption for SNMPv3 messages sent to the user:
  - `aes` — Encrypt messages using AES 128-bit algorithm.
  - `des` — Encrypt messages using DES 56-bit algorithm.
  - *priv-password* — Enter a text string used to generate the privacy key used in encrypted messages. A maximum of 32 alphanumeric characters. For an encrypted password, enter the encrypted string instead of plain text.
- `localized` — (SNMPv3 only) Generate an SNMPv3 authentication and/or privacy key in localized key format.
- `access` *acl-name* — (Optional) Enter the name of an IPv4 or IPv6 access list to filter SNMP requests on the switch. A maximum of 16 characters.

- `remote ip-address/prefix-length udp-port port-number` — (Optional) Enter the IPv4 or IPv6 address of the user's remote device and the UDP port number used to connect to the SNMP agent on the switch, from 0 to 65535. The default is 162.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information Use the `snmp-server user` command to set up the desired security level for SNMP access. For SNMPv3 users, configure user authorization and message encryption. Re-enter this command multiple times to configure SNMP security settings for all users.

The group to which a user is assigned determines the user's SNMP access. To configure a group's SNMP access to the switch — read, write, and notify, use the `snmp-server user` command.

No default values exist for SNMPv3 authentication and privacy algorithms and passwords. If you forget a password, you cannot recover it — you must reconfigure the user. You can specify either a plain-text password or an encrypted cypher-text password. In either case, the password stores in the configuration in an encrypted form and displays as encrypted in the `show running-config snmp` output.

A localized authentication or privacy key is more complex and provides greater privacy protection. To display the localized authentication and privacy keys in an SNMPv3 user configuration, use the `show running-configuration snmp` command.

To limit user access to the SNMP agent on the switch, enter an `access acl-name` value. In IPv6 ACLs, SNMP supports only IPv6 and UDP types. TCP, ICMP, and port rules are not supported.

The `no` version of this command removes a user from the SNMP group.

NOTE: When you create or modify a password, the password string that you input appears as a string of asterisks instead of plain text.

Example (Encrypted passwords)

```
OS10(config)# snmp-server user privuser v3group v3 auth md5
9fc53d9d908118b2804fe80e3ba8763d priv des
d0452401a8c3ce42804fe80e3ba8763d
```

Example (Plain-text passwords)

```
OS10(config)# snmp-server user authuser v3group v3 auth md5 authpasswd
```

Example (Remote user)

```
OS10(config)# snmp-server user n3user ngroup remote 172.31.1.3 udp-port
5009 3
auth md5 authpasswd
```

Supported Releases 10.4.2.0 or later

snmp-server view

Configures an SNMPv3 view.

Syntax `snmp-server view view-name oid-tree [included | excluded]`

Parameters

- `view-name` — Enter the name of a read-only, read-write, or notify view. A maximum of 32 characters.
- `oid-tree` — Enter the SNMP object ID at which the view starts in 12-octet dotted-decimal format.
  NOTE: The `oid-tree` parameter in the `snmp-server view` command does not support or recognize `.` as valid input.
- `included` — (Optional) Include the MIB family in the view.
- `excluded` — (Optional) Exclude the MIB family from the view.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information	The `oid-tree` value specifies the OID in the MIB tree hierarchy at which a view starts. Enter `included` or `excluded` to include or exclude the remaining part of the MIB sub-tree contents in the view. The `no` version of the command removes an SNMPv3 view.
Example	`OS10(config)# snmp-server view readview 1.3.6.5 excluded`
Supported Releases	10.4.2.0 or later

snmp-server vrf

Configures an SNMP agent to receive SNMP traps for the management VRF instance.

Syntax	`snmp-server vrf management`
Parameters	None
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the SNMP agent from receiving the SNMP traps.
Example	`OS10(config)# snmp-server vrf management`
Supported Releases	10.4.1.0 or later

snmp-server source interface

Specifies an interface and its IP address as the source address for SNMP packets that are sent to a remote server.

Syntax	`snmp-server source-interface {loopback` *`number`*`| mgmt 1/1/1}`
Parameters	• `loopback number` — Enter a loopback interface from 0 to 16383. • `mgmt 1/1/1` — Enter the management interface.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	• By default, no source interface is configured. If you do not specify a source interface, OS10 selects the source IP address as the IP address of the interface from which a packet is sent to the remote server. • The `no` version of this command removes the configured source interface.
Example	`OS10(config)# snmp-server source-interface loopback 1`
Supported Releases	10.5.2.0 or later

Example: Configure SNMP

This example shows how to configure SNMP on the switch, including SNMP engine ID, views, groups, and users.

```
OS10(config)# snmp-server contact "Contact Support"
OS10(config)# snmp-server engineID remote 192.168.1.2 udp-port 502 0xdefa
OS10(config)# snmp-server engineID local test
OS10(config)# snmp-server group sngroup 2c notify notofy_view
OS10(config)# snmp-server group snv3group 3 noauth  read read_view
```

```
OS10(config)# snmp-server user snuser sngroup 3 auth sha a2FubmFuX3Rlc3Q=
OS10(config)# snmp-server view readview 1.3.6.1.2.1.2.2 included
OS10(config)# snmp-server view snview .1 excluded
OS10(config)# do show snmp engineID local
Local default SNMP engineID: 0x800002a20474657374

OS10(config)# do show snmp engineID remote
Remote Engine ID      IP-addr       Port
0xdefa                192.168.1.2   502
OS10(config)# do show snmp group
groupname               : sngroup
version                 : 2c
notifyview              : notofy_view

groupname               : snv3group
version                 : 3
security level          : noauth
readview                : read_view

OS10(config)# do show snmp user
User name                  : snuser
Group                      : sngroup
Version                    : 3
Authentication Protocol    : SHA

OS10(config)# do show snmp view
view name               : readview
OID                     : 1.3.6.1.2.1.2.2
included                : True

view name               : snview
OID                     : .1
excluded                : True
```

System clock

OS10 uses the Network Time Protocol (NTP) to synchronize the system clock with a time-serving host. When you enable NTP, it overwrites the system time.

If you do not use NTP, set the system time and time zone after you disable NTP. Use the `clock set` command to set the current system time and date. The hardware-based real-clock time (RTC) resets to the new system time.

Some geographical locations in the world observe the daylight savings time (DST) during summer months. To configure DST, use the `clock timezone {standard-timezone` *`standard-timezone-name`* `| {`*`timezone-string Hours Minutes`*`}}` command. OS10 supports the DST feature only for standard time zones.

OS10 offers the user-defined time zone configuration only for backward compatibility. If you choose to configure a user-defined time zone, you must configure the hour and minute offset from UTC. User-defined time zones do not support DST.

NOTE: Dell Technologies recommends configuring a standard time zone supported in Linux. Use the `?` character for command completion to view a list of supported standard time zones.

Configuration notes

If you configure a time zone for which DST is applicable and you want to downgrade OS10 to an earlier release that does not support DST changes, do one of the following:

- Before you downgrade, disable the DST configuration or update the setting using the `clock timezone` command to specify only the local time zone.
- After the downgrade is complete, ignore the CLI error and reconfigure the setting using the `clock timezone` command to specify only the local time zone.

Configure system time and date

- Enter the time and date in EXEC mode.

```
clock set time year-month-day
```

  - *time* — Enter the time in the format *hour*:*minute*:*second*, where *hour* is 1 to 24; *minute* is 1 to 60; *second* is 1 to 60. For example, enter 5:15 PM as 17:15:00.
  - *year-month-day* — Enter the date in the format YYYY-MM-DD, where YYYY is a four-digit year, such as 2016; MM is a month from 1 to 12; DD is a day from 1 to 31.
- Enter the time zone in CONFIGURATION mode.

```
clock timezone {standard-timezone standard-timezone-name | {timezone-string Hours
Minutes}}
```

  - *standard-timezone-name* — Enter a standard time zone name that is supported in Linux. To view a list of supported standard time zone names, see the Time zones and UTC offset reference section.
  - *timezone-string* — Enter the name of the time zone.
  - *hours* — Enter the hour offset from UTC, ranging from -23 to 23.
  - *minutes* - Enter the minute offset from UTC, ranging from 0 to 59.

Set time and date

```
OS10# clock set 13:00:00 2018-08-30
```

View system time and date

```
OS10# show clock
2018-08-30T13:01:01.45+00:00
```

Set time zone

```
OS10(config)# clock timezone standard-timezone Brazil/West
```

View time zone configured

```
OS10# show clock timezone
Brazil/West (-04, -0400)
```

In this example, -04:00 is the negative offset from UTC for Brazil/West.

Time zones and UTC offset reference

This section lists the different time zones and corresponding UTC offset.

Table 12. Time zones and UTC offset

System Clock commands

clock set

Sets the system time.

Syntax `clock set time year-month-day`

Parameters

time Enter `time` in the format `hour:minute:second`, where `hour` is 1 to 24; `minute` is 1 to 60; `second` is 1 to 60. For example, enter 5:15 PM as `17:15:00`.

year-month-day Enter `year-month-day` in the format `YYYY-MM-DD`, where `YYYY` is a four-digit year, such as `2016`; `MM` is a month from 1 to 12; `DD` is a day from 1 to 31.

Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to reset the system time if the system clock is out of synch with the NTP time. The hardware-based real-clock time (RTC) resets to the new time. The new system clock setting applies immediately.
Example	`OS10# clock set 18:30:10 2017-01-25`
Supported Releases	10.2.1E or later

clock timezone

Configures the standard or user-defined time zone that OS10 applies on top of the system clock.

Syntax	`clock timezone {standard-timezone` *`standard-timezone-name`* `| {`*`timezone-string hours minutes`*`}}`
Parameters	• *`standard-timezone-name`* — Enter the standard time zone name that is supported in Linux. To view a list of supported standard time zone names, see the Time zones and UTC offset reference section. • *`timezone-string`* — Enter the name of the time zone. • *`hours`* — Enter the hour offset from UTC, ranging from -23 to 23. • *`minutes`* — Enter the minute offset from UTC, ranging from 0 to 59.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The standard time zone option applies the predefined offset for the selected standard time zone, including DST changes that apply to the local time. After you configure this command, OS10 uses the updated local time in all logs and timestamps. You can use the `?` character or press the `tab` key for command completion and view a list of supported standard time zones. To view a list of supported standard time zone names, see the Time zones and UTC offset reference section. Define region names with a "/" at the end of the string. The "/" character indicates that a time zone string follows the region name. For example, "Asia/Calcutta." The `no` form of the command resets the local time to UTC.
Example	`OS10(config)# clock timezone standard-timezone Brazil/West`
Supported Releases	10.3.0E or later

show clock

Displays the current system clock settings.

Syntax	`show clock`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	The universal time coordinated (UTC) value is the number of hours that your time zone is later or earlier than UTC/Greenwich mean time.
Example	`OS10# show clock` `2017-01-25T11:00:31.68-08:00`
Supported Releases	10.2.1E or later

show clock timezone

Displays the time zone that is configured in the system.

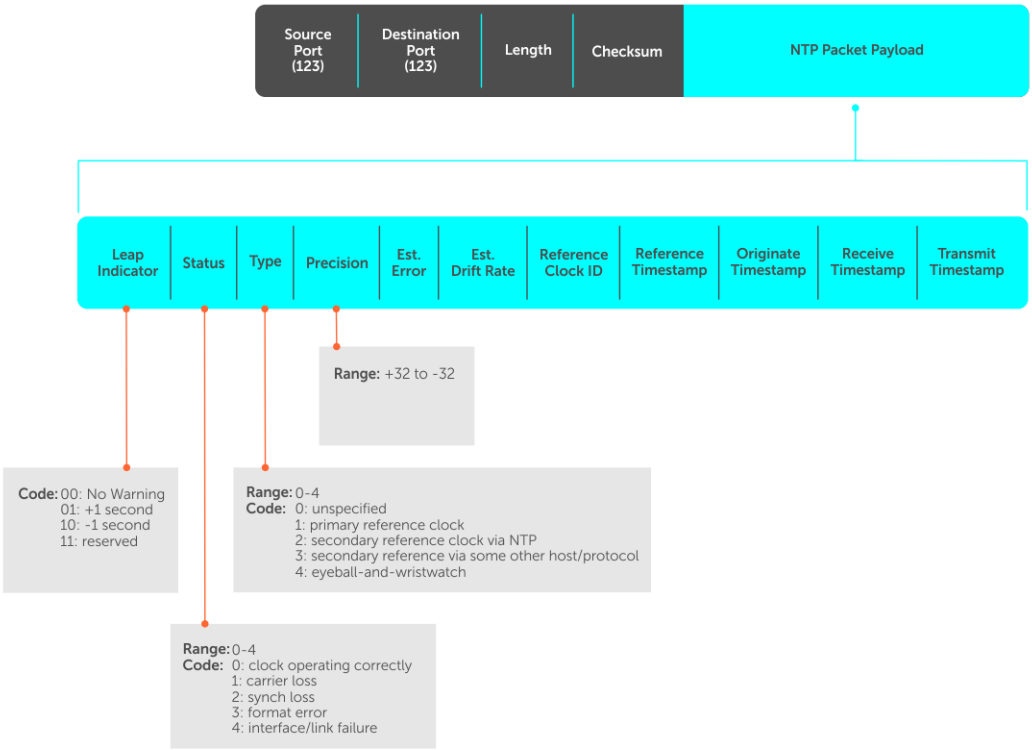
Syntax	`show clock timezone`
Parameters	None
Default	Etc/UTC
Command Mode	EXEC
Usage Information	None
Example	`OS10# show clock timezone` `Brazil/West (-04, -0400)`
Supported Releases	10.5.0 or later

Network Time Protocol

Network Time Protocol (NTP) synchronizes timekeeping among a set of distributed time servers and clients. The protocol coordinates time distribution in a large, diverse network. NTP clients synchronize with NTP servers that provide accurate time measurement. NTP clients choose from several NTP servers to determine which offers the best available source of time and the most reliable transmission of information.

To get the correct time, OS10 synchronizes with a time-serving host. For the current time, you can set the system to poll specific NTP time-serving hosts. From those time-serving hosts, the system chooses one NTP host to synchronize with and acts as a client to the NTP host. After the host-client relationship establishes, the networking device propagates the time information throughout its local network.

The NTP client sends messages to one or more servers and processes the replies as received. Information in the NTP message allows each client/server peer to determine the timekeeping characteristics of its other peers, including the expected accuracies of their clocks. Using this information, each peer selects the best time from several other clocks, updates the local clock, and estimates its accuracy.



NOTE: OS10 supports both NTP server and client roles.

Enable NTP

NTP is disabled by default. To enable NTP, configure an NTP server where the system synchronizes. To configure multiple servers, enter the command multiple times. Multiple servers may impact CPU resources.

- Enter the IP address of the NTP server where the system synchronizes in CONFIGURATION mode.

```
ntp server ip-address
```

View system clock state

```
OS10(config)# do show ntp status

authdelay:            0.000000 s
```

View calculated NTP synchronization variables

```
OS10(config)# do show ntp associations
     remote           local      st poll reach  delay   offset    disp
==============================================================================
```

```
 10.16.150.185   10.16.151.123 16 1024    0 0.00000  0.000000 3.99217
OS10# show ntp associations
     remote           local    st poll reach  delay   offset    disp
==============================================================================
 10.16.150.185   10.16.151.123 16 1024    0 0.00000  0.000000 3.99217
```

Broadcasts

Receive broadcasts of time information and set all the interfaces within the system to receive NTP information through broadcast. NTP is enabled on all active interfaces by default. NTP broadcast can be enabled only in global configuration mode. You can disable NTP broadcast globally or at the interface level. If you disable NTP on an interface, the system drops any NTP packets sent to that interface.

- Enable NTP broadcast in GLOBAL CONFIGURATION mode.

  ```
  ntp broadcast client
  ```

- Disable NTP globally.

  ```
  no ntp broadcast client
  ```

- Disable NTP on the interface in INTERFACE mode.

  ```
  ntp disable
  ```

Configure NTP broadcasts

```
OS10(config)# ntp broadcast client
```

Disable NTP broadcasts

```
OS10(config)# no ntp broadcast client
```

Disable NTP broadcast on an interface

```
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# ntp disable
```

Source IP address

Configure one interface IP address to include in all NTP packets. The source address of NTP packets is the interface IP address the system uses to reach the network by default.

- Configure a source IP address for NTP packets in CONFIGURATION mode.

  ```
  ntp source interface
  ```

  - `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information.
  - `port-channel channel-id`—Enter the port channel ID, from 1 to 999 or 1001 to 2000.
  - `vlan vlan-id`—Enter the VLAN ID number, from 1 to 4093.
  - `loopback id`—Enter the Loopback interface ID number, from 0 to 16383.
  - `mgmt node/slot/port`—Enter the physical port interface for the Management interface. The default is 1/1/1.

Configure the source IP address

```
OS10(config)# ntp source ethernet 1/1/10
```

View the source IP configuration

```
OS10(config)# do show running-configuration | grep source
ntp source ethernet1/1/1
```

Authentication

NTP authentication and the corresponding trusted key provide a reliable exchange of NTP packets with trusted time sources. NTP authentication begins with creating the first NTP packet after the key configuration. NTP authentication uses the message digest 5 (MD5), SHA-1, HMAC-SHA1, and SHA2-256 algorithms. The key is embedded in the synchronization packet that is sent to an NTP time source.

1. Enable NTP authentication in CONFIGURATION mode.

   ```
   ntp authenticate
   ```

2. Set an authentication key number and key in CONFIGURATION mode, from 1 to 65535.

   ```
   ntp authentication-key number hash-algorithm {0|9} key
   ```

   - The *number* must match in the `ntp trusted-key` command.
   - The supported *hash-algorithms* include md5, sha1, HMAC-sha1, and sha2-256.
   - The `0` specifies an unencrypted authentication key and `1` specifies an encrypted authentication key.
   - The *key* is an encrypted string.

3. Define a trusted key in CONFIGURATION mode, from 1 to 65535. This *number* must match the configured NTP authentication key.

   ```
   ntp trusted-key number
   ```

4. Configure an NTP server in CONFIGURATION mode.

   ```
   ntp server {hostname | ipv4-address | ipv6-address} [key keyid] [prefer]
   ```

   - *hostname*—Enter the keyword to see the IP address or hostname of the remote device.
   - *ipv4-address*—Enter an IPv4 address in *A.B.C.D* format.
   - *ipv6-address*—Enter an IPv6 address in *nnnn:nnnn:nnnn:nnnn:nnnn:nnnn:nnnn:nnnn* format. Elision of zeros is supported.
   - `key` *keyid*—Enter a text string as the key exchanged between the NTP server and the client.
   - `prefer`—Enter the keyword to set this NTP server as the preferred server.

5. Configure the NTP master and enter the stratum number that identifies the NTP server hierarchy in CONFIGURATION mode, from 2 to 10. The default is 8.

   The `ntp master` command enables the local switch to serve time to other client devices when the configured real-time sources are not reachable.

   ```
   ntp master {2-10}
   ```

Configure NTP

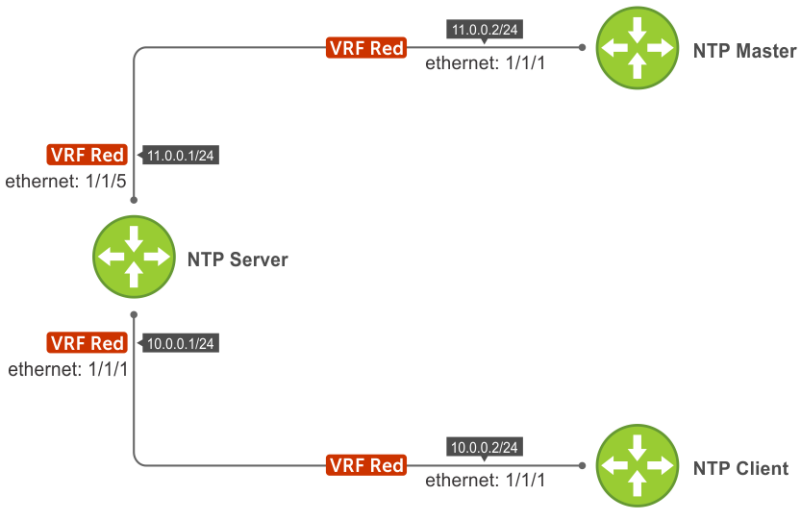
```
OS10(config)# ntp authenticate
OS10(config)# ntp trusted-key 345
OS10(config)# ntp authentication-key 345 md5 0 5A60910FED211F02
OS10(config)# ntp server 1.1.1.1 key 345
OS10(config)# ntp master 7
```

View NTP configuration

```
OS10(config)# do show running-configuration
!
ntp authenticate
ntp authentication-key 345 md5 0 5A60910FED211F02
ntp server 1.1.1.1 key 345
ntp trusted-key 345
ntp master 7
...
```

Sample NTP configuration

The following example shows an NTP master (11.0.0.2), server (10.0.0.1), and client (10.0.0.2) connected through a nondefault VRF instance (VRF Red). OS10 acts as an NTP server to synchronize its clock with the NTP master available in the nondefault VRF instance red and provides time to NTP clients in the VRF.



To create this sample NTP configuration:

1. Configure the NTP server:
   a. Create a nondefault VRF instance and assign an interface to the VRF.

```
OS10(conf-vrf)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip vrf forwarding red
OS10(conf-if-eth1/1/1)# ip address 10.0.0.1/24
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# ip vrf forwarding red
OS10(conf-if-eth1/1/5)# ip address 11.0.0.1/24
OS10(conf-if-eth1/1/5)# exit
OS10(config)#
```

   b. Configure the NTP master IP address on the NTP server. (In the example, NTP master 11.0.0.2, is reachable only through VRF Red.)

```
OS10(config)# ntp server 11.0.0.2
OS10(config)# do show running-configuration ntp
ntp server 11.0.0.2
OS10(config)#
```

   c. Configure NTP in the VRF Red instance.

```
OS10(config)# ntp enable vrf red

"% Warning: NTP server/client will be disabled in default VRF and enabled on a red
VRF"
Do you wish to continue? (y/n): y

OS10(config)#
OS10(config)# do show running-configuration ntp
ntp server 11.0.0.2
ntp enable vrf red
OS10(config)#
```

2. Configure an NTP client:

a. Create a nondefault VRF instance and assign an interface to the VRF.

```
OS10(config)# ip vrf red
OS10(conf-vrf)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip vrf forwarding red
OS10(conf-if-eth1/1/1)# ip address 10.0.0.2/24
OS10(conf-if-eth1/1/1)# exit
OS10(config)#
```

b. Configure the NTP server IP address on the NTP client.

```
OS10(config)# ntp server 10.0.0.1
OS10(config)# do show running-configuration ntp
ntp server 10.0.0.1
OS10(config)#
```

c. Configure NTP in the VRF Red instance.

```
OS10(config)# ntp enable vrf red

"% Warning: NTP server/client will be disabled in default VRF and enabled on a red
VRF"
Do you wish to continue? (y/n): y

OS10(config)# do show running-configuration ntp
ntp server 10.0.0.1
ntp enable vrf red
OS10(config)#
```

3. Configure an NTP master:

a. Create a nondefault VRF instance and assign an interface to the VRF.

```
OS10(config)# ip vrf red
OS10(conf-vrf)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip vrf forwarding red
OS10(conf-if-eth1/1/1)# ip address 11.0.0.2/24
OS10(conf-if-eth1/1/1)# exit
OS10(config)
```

b. Configure NTP as master.

```
OS10(config)# ntp master
OS10(config)# do show running-configuration ntp
ntp master 8
OS10(config)#
```

c. Configure NTP in the VRF Red instance.

```
OS10(config)# ntp enable vrf red

"% Warning: NTP server/client will be disabled in default VRF and enabled on a red
VRF"
Do you wish to continue? (y/n): y

OS10(config)# do show running-configuration ntp
ntp master 8
ntp enable vrf red
OS10(config)#
```

4. Verify that the NTP client (10.0.0.2) is connected to the NTP server (10.0.0.1) running in VRF Red.

```
OS10# show ntp associations vrf red

     remote           refid      st t when poll reach   delay   offset  jitter

==============================================================================

*10.0.0.1        11.0.0.2        10 u    2   64    1    0.578   -1.060   0.008
```

```
OS10# show ntp status vrf red

Configuring FIPS on NTP

You must configure NTP to perform authentication using FIPS-validated keyed-Hash Message Authentication Code (HAMC) technique.

This technique protects the integrity of non-local maintenance and diagnostics communications.

When you enable FIPS on NTP, NTP operates in FIPS mode. Meaning, with FIPS enabled, NTP supports authentication either using the HMAC-SHA1 algorithm or no authentication at all.

After enabling NTP, you must enable FIPS to make the NTP server authenticate using HMAC-SHA1.

To enable FIPS mode:

1. Enter configuration mode.

```
OS10# configure terminal
```

2. Enable FIPS mode.

```
OS10(config)# fips mode enable
```

NTP commands

ntp authenticate

Enables authentication of NTP traffic between the device and the NTP time serving hosts.

Syntax	`ntp authenticate`
Parameters	None
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Configure an authentication key for NTP traffic using the `ntp authentication-key` command. The `no` version of this command disables NTP authentication.
Example	`OS10(config)# ntp authenticate`
Supported Releases	10.2.0E or later

ntp authentication-key

Configures the authentication key for trusted time sources.

Syntax	`ntp authentication-key` *`number`* `{md5 | sha1 | sha2-256} {0 | 9}` *`key`*
Parameters	• *`number`*—Enter the authentication key number, from 1 to 65535. • `md5`—Set to MD5 encryption. • `sha1`—Set to SHA-1 encryption. • `sha2-256`—Set to SHA2-256 encryption. • `0`—Set to unencrypted format, the default. • `9`—Set to hidden encryption. • *`key`*—Enter the authentication key.
Default	0
Command Mode	CONFIGURATION
Usage Information	The authentication number must be the same as the `number` parameter configured in the `ntp trusted-key` command. Use the `ntp authenticate` command to enable NTP authentication. The supported values for md5, sha1, and sha2-256 are 0 and 9. **NOTE:** When you create or modify a password, the password string that you input appears as a string of asterisks instead of plain text.
Example	`OS10(config)# ntp authentication-key 1200 md5 0 dell`
Supported Releases	10.2.0E or later

ntp broadcast client

Configures all active interfaces to receive NTP broadcasts from an NTP server.

Syntax	`ntp broadcast client`
Parameters	None
Default	Not configured

Command Mode	GLOBAL CONFIGURATION
Usage Information	The `no` version of this command disables NTP broadcasts.
Example	`OS10(config)# ntp broadcast client`
Supported Releases	10.2.0E or later

ntp disable

By default, NTP is enabled on all interfaces. Disable NTP to prevent an interface from receiving NTP packets.

Syntax	`ntp disable`
Parameters	None
Default	Enabled
Command Mode	INTERFACE
Usage Information	Use this command to configure OS10 to not listen to a particular server and prevent the interface from receiving NTP packets. The `no` version of this command reenables NTP on an interface.
Example	`OS10(conf-if-eth1/1/7)# ntp disable`
Supported Releases	10.2.0E or later

ntp enable vrf

Enables NTP for the management or nondefault VRF instance.

Syntax	`ntp enable vrf {management | vrf-name}`
Parameters	• `management`—Enter the keyword to enable NTP for the management VRF instance. • *`vrf-name`*—Enter the keyword then the name of the VRF to enable NTP for that nondefault VRF instance.
Defaults	Disabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables NTP for the management VRF instance.
Example	`OS10(config)# ntp enable vrf management` `OS10(config)# ntp enable vrf vrf-blue`
Supported Releases	10.4.0E(R1) or later

ntp master

Configures an NTP Master Server.

Syntax	`ntp master` *`stratum`*
Parameters	*`stratum`*—Enter the stratum number to identify the NTP server hierarchy, from 2 to 10.
Default	8
Command Mode	CONFIGURATION

Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# ntp master 6`
Supported Releases	10.2.0E or later

ntp server

Configures an NTP time-serving host.

Syntax	`ntp server {hostname | ipv4-address | ipv6-address} [key keyid] [prefer]`
Parameters	• *hostname*—Enter the hostname of the server. • *ipv4-address | ipv6-address*—Enter the IPv4 address in A.B.C.D format or IPv6 address in A::B format of the NTP server. • `key` *keyid*—(Optional) Enter the NTP peer key ID, from 1 to 4294967295. • `prefer`—(Optional) Configures this peer to have priority over other servers.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	You can configure multiple time-serving hosts. From these time-serving hosts, the system chooses one NTP host to synchronize with. To determine which server to select, use the `show ntp associations` command. Dell Technologies recommends limiting the number of hosts you configure, as many polls to the NTP hosts can impact network performance.
Example	`OS10(config)# ntp server eureka.com`
Supported Releases	10.2.0E or later

ntp source

Configures an interface IP address to include in NTP packets.

Syntax	`ntp source` *interface*
Parameters	*interface*—Set the interface type: • `ethernet` *node/slot/port[:subport]*—Enter the Ethernet interface information. • `port-channel` *id-number*—Enter the port channel ID, from 1 to 999 or 1001 to 2000. • `vlan` *vlan-id*—Enter the VLAN number, from 1 to 4093. • `loopback` *loopback-id*—Enter the Loopback interface number, from 0 to 16383. • `mgmt` *node/slot/port*—Enter the Management port interface information.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the configuration.
Example	`OS10(config)# ntp source ethernet 1/1/24`
Supported Releases	10.2.0E or later

ntp trusted-key

Sets a key to authenticate the system to which NTP synchronizes with.

Syntax `ntp trusted-key number`

Parameters *number*—Enter the trusted key ID, from 1 to 4294967295.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `number` parameter must be the same number as the `number` parameter in the `ntp authentication-key` command. If you change the `ntp authentication-key` command, you must also change this command. The `no` version of this command removes the key.

Example

```
OS10(config)# ntp trusted-key 234567
```

Supported Releases 10.2.0E or later

show ntp associations

Displays the NTP master and peers.

Syntax `show ntp associations [vrf {management | vrf-name}]`

Parameters

- `management`—Enter the keyword to display NTP information corresponding to the management VRF instance.
- *vrf-name*—Enter the keyword then the name of the VRF to display NTP information corresponding to that nondefault VRF instance.

Default Not configured

Command Mode EXEC

Usage Information

- `(none)`—One or more of the following symbols displays:
  - *—Synchronized to this peer.
  - #—Almost synchronized to this peer.
  - +—Peer was selected for possible synchronization.
  - -—Peer is a candidate for selection.
  - ~—Peer is statically configured.
- `remote`—Remote IP address of the NTP peer.
- `ref clock`—IP address of the remote peer reference clock.
- `st`—Peer stratum, the number of hops away from the external time source. `16` means that the NTP peer cannot reach the time source.
- `when`—Last time the device received an NTP packet.
- `poll`—Polling interval in seconds.
- `reach`—Reachability to the peer in octal bitstream.
- `delay`—Time interval or delay for a packet to complete a round-trip to the NTP time source in milliseconds.
- `offset`—Relative time of the NTP peer clock to the network device clock in milliseconds.
- `disp`—Dispersion.

Example

```
OS10# show ntp associations
remote         ref clock  st when poll reach delay   offset disp
==============================================================
 10.10.120.5 0.0.0.0     16 - 256         0 0.00 0.000 16000.0
*172.16.1.33 127.127.1.0 11 6 16          377   -0.08 -1499.9 104.16
```

```
 172.31.1.33 0.0.0.0     16 - 256         0 0.00 0.000 16000.0
 192.200.0.2 0.0.0.0     16 - 256         0 0.00 0.000 16000.0
```

```
OS10# show ntp associations vrf management
remote     local      st    poll reach  delay       offset        disp
==============================================================================
*1.1.1.2   1.1.1.1     3    64    1     0.00027     0.000056    0.43309
```

Supported Releases 10.2.0E or later

show ntp status

Displays NTP configuration information.

Syntax `show ntp status [vrf {management | vrf-name]`

Parameters

- *status*—(Optional) View the NTP status.
- *management*—(Optional) Enter the keywords to display NTP information corresponding to the management VRF.
- *vrf-name*—(Optional) Enter the keyword then the name of the VRF to display NTP information corresponding to that nondefault VRF.

Default Not configured

Command Mode EXEC

Usage Information None

Example (Status)

```
OS10# show ntp status
system peer:        0.0.0.0
system peer mode:   unspec
leap indicator:     11

Supported Releases	10.2.0E or later

Precision Time Protocol

Precision Time Protocol (PTP), defined in the IEEE1588-2008 standard, is a protocol that uses a master-slave hierarchy to synchronize clocks on network devices. PTP uses hardware time stamping to achieve submicrosecond synchronization. PTP defines how real-time clocks in a network synchronize with each other. A network where PTP operates is called a PTP domain. This protocol operates by organizing clocks within a PTP domain into a master-slave hierarchy. The reference time for the entire system comes from the root clock, also known as the grandmaster clock.

PTP is more accurate than NTP because it uses hardware timestamping. PTP also accounts for device latency while synchronizing time. NTP synchronizes clocks with millisecond accuracy; PTP achieves submicrosecond accuracy.

OS10 supports PTP on all platforms that support hardware time stamping.

PTP-enabled devices consist of the following clock types:

Ordinary clock	A device with a single physical port is called an ordinary clock. This device could take on a master or slave clock role. **NOTE:** OS10 switch cannot function as the grandmaster clock and hence OS10 does not support the ordinary clock configuration.
Boundary clock	A device with multiple physical ports that synchronizes time from one network segment to another is called a boundary clock. One port is a slave that synchronizes time from upstream PTP device. The other ports are masters that distribute time to downstream devices. The best master clock algorithm (BMCA) decides the individual state of a port: master or slave.
End-to-end transparent clock	Calculates the residence time of the PTP event message and updates the correction field (CF) of the event message before forwarding the message. The ports are not in any specific state.

Best master clock algorithm

PTP uses the best master clock algorithm (BMCA) to compare clocks in a network. BMCA determines the status of ports in the network:

- Master—A clock that provides time to other clocks in the network.
- Slave—A clock that receives time from other clocks in the network.
- Passive—A port that is neither a master not a slave.

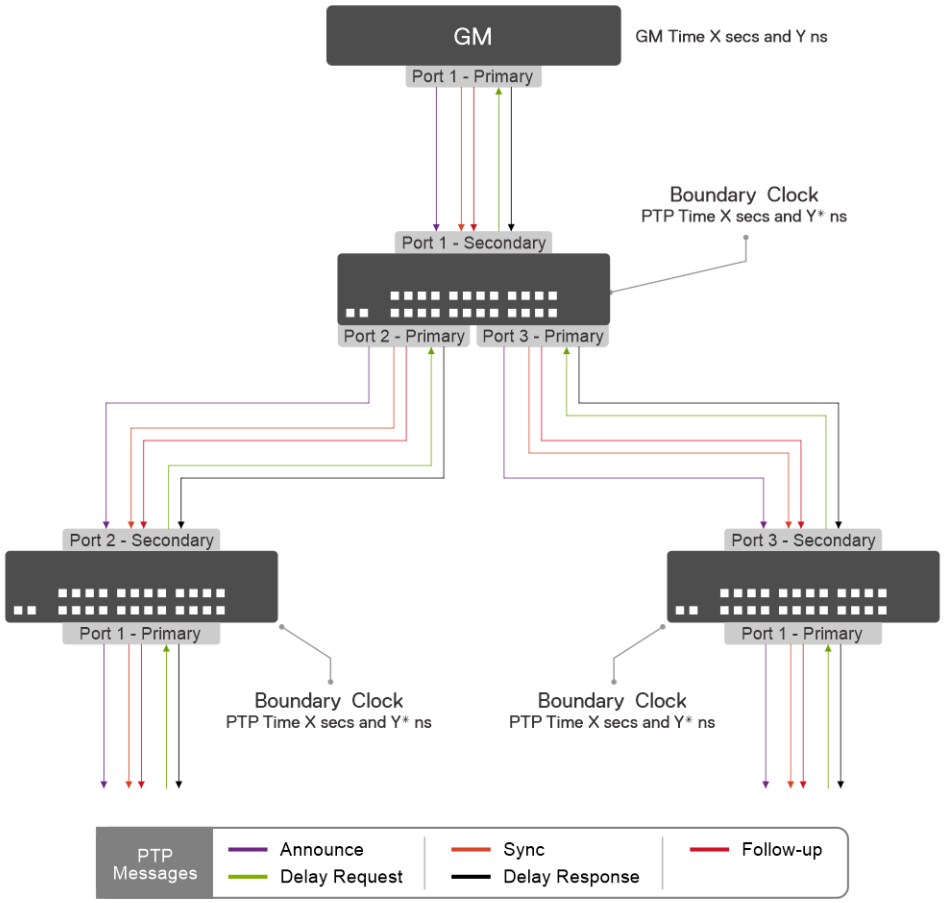
This algorithm determines if the newly discovered foreign clock is better than the local clock. The grandmaster field in the `Announce` message contains information about the foreign master clock. Information about the local clock is present in the default dataset of the clock. The foreign and local clocks are compared based on the following attributes:

1. Priority1—(Applicable only for the system-default profile) Configurable attribute that determines the master from an ordered set of clocks. Priority1 is the most significant of the six attributes that devices use to select a master clock. The lower the value of priority1, the higher its priority.
2. ClockClass—Defines the traceability of a clock.
3. ClockAccuracy—Defines the accuracy of a clock.
4. OffsetScaledLogVariance—Defines the stability of a clock.

5. Priority2—Configurable attribute that determines a master among equivalent clocks. Priority2 is the fifth-most significant attribute out of the six attributes that devices use to select a master clock. The lower the value of priority2, the higher its priority.
6. ClockIdentity—Unique identifier that determines a master when two clocks are the same. The clock with the lower clock identity has the highest preference.

When a PTP node receives two `Announce` messages from the same foreign master, PTP selects the best master based on the `StepsRemoved` field of the `Announce` message. This field indicates the number of boundary clocks between the local clock and the grandmaster clock.

Message types



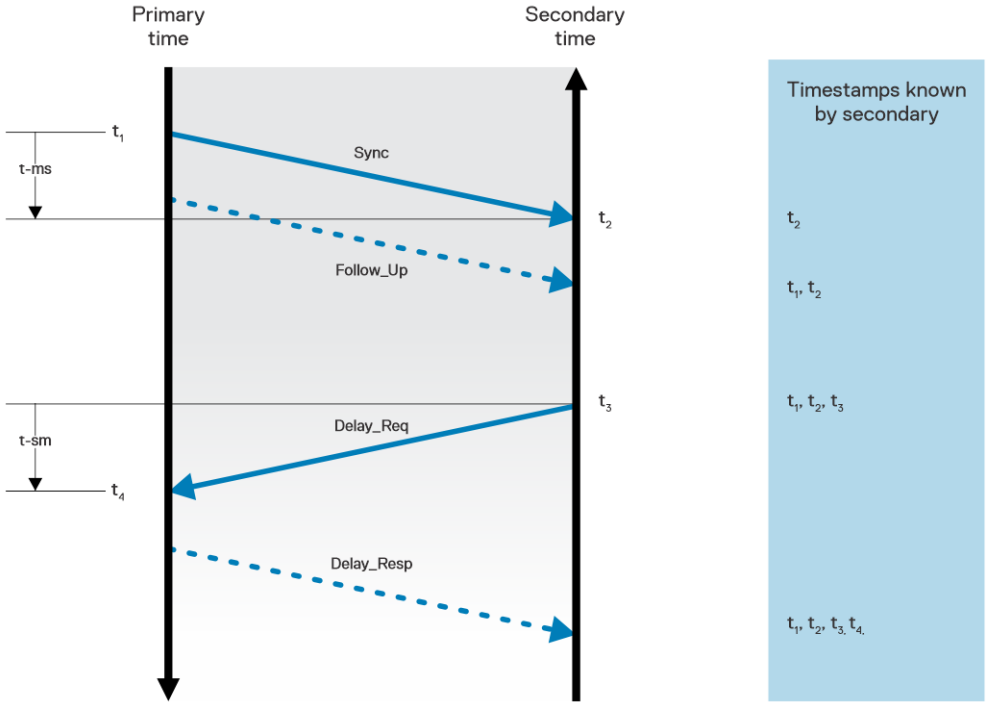
- Event messages: Timed messages with an accurate timestamp that is generated at both the transmit time and receive time.
  - `Sync`—Master sends a `Sync` message to distribute the time of the day.
  - `Delay_Req`—Slave sends a `Delay_Req` message to the master for end-to-end delay measurement, the request-response delay mechanism.
  - `Pdelay_Req`—Link node A sends a `Pdelay_Req` message to measure peer-to-peer delay.
  - `Pdelay_Resp`—Link node B sends a `Pdelay_Resp` message to measure peer-to-peer delay.
- General messages: Do not require accurate timestamps.
  - `Follow_Up`—In a two-step clock, the master sends a `Follow_Up` message after sending the Sync message.
  - `Delay_Resp`—Master sends a `Delay_Resp` message to measure the end-to-end delay.
  - `Pdelay_Resp_FollowUp`—Link node B sends a `Pdelay_Resp_FollowUp` message to measure peer-to-peer delay.
  - `Announce`—Master sends an `Announce` message to establish a synchronization hierarchy. The BMCA uses the `Announce` message to define a clock hierarchy and to select the grandmaster clock.
  - `Signaling`—Clock A sends a `Signaling` message to clock B for unicast negotiation and so on.

Time synchronization

Master and slave clock devices exchange PTP timing messages to achieve time synchronization. Slave clock devices adjust their time to synchronize with their master clock devices.

For time synchronization and to determine the slave offset with the master, PTP accounts for the following:

- Communication delay between two PTP nodes
- End-to-end delay that is measured using the delay request message from the slave and delay response message from the master



The following is the sequence of PTP messages during time synchronization:

1. Master sends a `Sync` message and makes note of the time t1 when the message was sent.
2. Slave receives the `Sync` message and makes note of the time t2 when the message was sent.
3. Master embeds the timestamp t1 in the `Follow-Up` message.
4. Slave sends a `Delay_request` message to the master and makes note of the time t3 when the message was sent.
5. Master receives the `Delay_request` message and makes note of the time t4 when the message was sent.
6. Master conveys the timestamp t4 in a `Delay_response` message.
7. Slave uses these timestamps to adjust its local clock to synchronize with the master:
   - Offset = [(t2 – t1) – (t4 – t3)] / 2
   - Delay = [(t2 – t1) + (t4 – t3)] / 2

Supported profiles

OS10 supports the following PTP profiles:

- System default profile
- G.8275.1 profile
- G.8275.2 profile

Supported transport methods

OS10 supports the following PTP transport methods:

- Layer2 (Ethernet)
- IPv4 (Unicast and multicast)

- IPv6 (Unicast and multicast)

For the multicast transport method, as defined in the IEEE 1588 standard, PTP uses 224.0.1.129 as the multicast destination IPv4 address. PTP uses FF0X:0:0:0:0:0:0:181 as the multicast destination IPv6 address.

NOTE:
- OS10 supports IPv6 multicast only between two directly connected IPv6 PTP nodes.
- Profile G8275.1 supports only Layer 2 transport.
- Profile G8275.2 supports only Unicast transport.

Configurable PTP attributes

The following are configurable PTP attributes that BMCA uses to determine the master and slave clock devices:

- Priority1—Has the highest preference in the list of attributes that are used for master clock device selection.
- Priority2—Has the fifth preference in the list of attributes that are used for master clock device selection.
- LocalPriority—(Applicable only for the G.8275.1 profile) Determines the master clock device when two clocks are similar to each other.

Supported platforms

OS10 supports PTP only on the following platforms:

- S4100-ON series: S4148F-ON, S4148T-ON, S4148FE-ON, S4148U-ON
- S5200-ON series: S5232F-ON, S5248F-ON, S5296F-ON, S5224F–ON
- Z9264F-ON

Standards compliance

OS10 complies with the following standards:

Table 13. Supported standards

Supported standards	Description
G. 8273.2	Timing characteristics of telecom boundary clocks.
G. 8275.1	PTP telecom profile for phase and time synchronization with full timing support from the network.
G. 8275.2	PTP telecom profile for time and phase synchronization with partial timing support from the network.
IEEE 1588-2008	IEEE standard for a precision clock synchronization protocol.

PTP installation scale and limits

The following table lists the verified scalability limits for PTP nodes with message rate (sync and delay request) of `16 pps`.

Table 14. PTP scale and limits

Platform	PTP peer slave sessions	PTP peer master sessions	Total number of sessions
S4100-ON series	36	4	40
• S5200F-ON series • Z9264F-ON	120	8	128

Configuration notes

- The maximum number of supported PTP ports is 40.
- Maximum number of supported PTP unicast masters is eight.
- In a topology where a PTP device is connected to VLT primary and secondary nodes, configure PTP as an independent boundary clock on both the VLT nodes.

  NOTE:
  - Dell Technologies recommends enabling PTP on the VLT port channel member interfaces and not on the VLT port channel interface.
  - Tagged PTP messages using the `ptp vlan` command are not supported on VLT port channel member interfaces.
  - The unicast transport method is not supported on the VLT port channel member interfaces.
- Reed-Solomon Forward Error Correction (RS-FEC) is enabled by default on optical modules in compliance with IEEE 802.3 standards. If the FEC latency is different on the switch and the peer PTP node, it can introduce a delay asymmetry and thereby cause time error. In this case, FEC can be disabled for the allowed link distance based on the optical module. With 25G-LR, FEC can be disabled up to the link distance of 500m SMF. With 25G-SR-NOF, FEC can be disabled up to the link distance of 30m (OM3) or 40m (OM4).
- System time settings:

  When you enable PTP as the system time source, PTP sets the system time. When you enable PTP on a system, the system cannot act as an NTP client, but can act as an NTP server.

  NOTE: PTP system time configuration using the `ptp system-time enable` command is not required for boundary clock functionality. This command is used to set the following:
  - The switch local clock based on PTP timescale (International Atomic Time (TAI)).
  - The switch local clock in the timescale as received from master. If the received timescale is in PTP timescale, then the time on the switch local clock is set in PTP timescale (TAI) without converting to Universal Time Coordinated (UTC).

  The following table describes the system clock behavior depending on whether you choose PTP or NTP as the system time source:

  Table 15. System clock behavior

System time settings/time source	System clock behavior
When PTP is the system time source:	○ You cannot configure the system as an NTP client. ○ If you configure the PTP clock and it is phase locked, PTP sets the time. If this time is set from a PTP master in PTP timescale, switch local time is bound to have TAI-UTC difference with UTC. ○ If you do not configure the PTP clock and it is not phase locked, the free-running system clock sets the time.
When NTP is the system time source:	NTP client sets the system time. Even if the PTP clock runs on the system, PTP does not set the system time.
When you configure NTP as a server:	NTP provides the system clock. PTP or NTP can set the system clock.

- You can configure PTP on the port channel interface and the port channel member interfaces.
  - Port-channel interface: If the link aggregation is between two peer nodes, configure PTP on the port channel interface. The forward and reverse paths must be symmetrical for PTP. In this case, the links of the port channel need not be the same for both forward and reverse paths.

    NOTE: Dell Technologies recommends that you configure PTP on port channel member interfaces.
  - Port-channel member interfaces: If the link aggregation spans across multiple nodes, configure PTP on the port channel member interfaces. PTP requires symmetrical forward and reverse paths. Therefore, configure PTP on the respective port channel member interfaces.
- If you have configured PTP on an interface and use the `interface breakout` command, it removes the PTP configuration.

  On boundary clocks, the `interface breakout` command removes the PTP port and changes the clock hierarchy.

- When peer-to-peer delay requests are corrupted (SeqID is zero), check whether Spanning Tree Protocol (STP) is enabled and capture packets through the Linux `tcpdump` command. Then, verify if the packets seen on the test tool are the misinterpreted STP PDUs or genuine SeqID corruption. You can disable STP and check in the test tool whether the peer-to-peer delay requests are still seen with corrupted SeqID.

Precision Time Protocol Limitations

- OS10 does not support the following features:
  - Multiple PTP timing domains
  - Nondefault VRF
  - OS10 does not send PTP messages in the two-step mode. However, OS10 does support PTP port nodes that use the two-step mode.
- PTP (v2) defined in IEEE 1588-2008 standard does not support confidentiality, integrity, and authentication. Experimental security extension that is defined in Annexure K is obsolete. Mitigation is to deploy PTP in a trusted network.
- On Z9432F-ON platform, the residence time update in end-to-end transparent clock is supported only with Layer 2 and IP unicast traffic, and it is not supported with multicast traffic.

Hybrid clocking

OS10 supports hybrid clocking, where Synchronous Ethernet (SyncE) is used to synchronize frequency and PTP is used to synchronize phase and Time of Day (ToD).

Use the `ptp clock boundary hybrid` command to enable hybrid clocking on the system-default profile. Hybrid clocking is applicable only for PTP boundary clock.

When PTP clock is configured in the hybrid mode, any change in the SyncE frequency lock status affects the PTP clock synchronization. Also, the PTP clock is synchronized only when the frequency is locked to a clock source.

OS10 supports hybrid clocking only on the following platforms:

- S5200-ON series: S5224F–ON, S5232F-ON, S5248F-ON, S5296F-ON
- Z9264F-ON
- Z9432F-ON

For more information about SyncE, see Synchronous Ethernet.

PTP time stamping mode

IEEE 1588-2008 Precision Time Protocol (PTP) version 2 (PTPv2) is a nanosecond time and frequency synchronization protocol for packet-based networks. The protocol defines synchronization messages that are used between a master and a slave clock to calculate path delay and time offset.

PTP master passes egress hardware time stamping information of event messages to the slave clock for accurate calculation. OS10 supports two types of time stamping modes:

- One-step—A timestamp is captured in real time as the message starts transmitting out of the physical port and the timestamp is a part of the synchronization message.
- Two-step—For two-step operation, the synchronization message is forwarded without modification and a follow-up message is used to transfer the captured timestamp.

By default, one-step clock mode is used. OS10 supports configuration of PTP two-step boundary clock using the `ptp clock-mode two-step` command.

NOTE:

- In PTP two-step clock mode, the maximum supported downstream nodes and peers is 60, respectively.
- Dell Technologies recommends using one-step clock mode instead of two-step clock in high-scale environments.
- Use only the default synchronization message rates for all profiles in the two-step clock mode.

Configure Precision Time Protocol

You can configure global and interface-level settings to set up the OS10 switch to function as a PTP device. Some of these configurations have default values assigned. For a minimum configuration to set up different use cases, see:

- Configure boundary clock with L2 transport method
- Configure boundary clock with IPv4 multicast transport method
- Configure boundary clock with IPv4 unicast transport method
- Configure end-to-end transparent clock
- Configure boundary clock with IPv4 unicast transport method and L3 VLAN

Global configurations

You can configure the following settings globally.

Configure the PTP clock

Configure the PTP clock type on the switch and optionally specify a profile for the clock. OS10 supports the following clock types: boundary and end-to-end transparent. OS10 supports the system default profile and ITU G.8275.1 profile. The profile defines the set of parameters, allowed values of parameters, and default value of parameters. To configure PTP clock:

```
OS10(config)# ptp clock boundary
```

Configure the PTP domain

A PTP domain is a logical group of clock devices where all the clocks have the same time synchronized from the grandmaster clock. To configure a domain for PTP clock:

```
OS10(config)# ptp domain 1
```

Configure the source IP address for multicast transport

To configure source IP address for PTP multicast packets:

```
OS10(config)# ptp source ipv4 10.10.10.1
```

NOTE: The IPv4 or IPv6 address that you configure must correspond to a configured L3 interface (physical, Loopback, VLAN, or port channel) and the interface must be operationally up.

Configure the priority1 attribute

Priority1 has the highest priority in master clock device selection. Lower values have higher priority.

```
OS10(config)# ptp priority1 125
```

Configure the priority2 attribute

Priority2 has the fifth precedence in master clock device selection. Lower values have higher priority.

```
OS10(config)# ptp priority2 120
```

Configure the local priority attribute for the PTP clock

(Applicable only for the G.8275.1 profile) PTP uses the local priority attribute to compare a potential GM data set.

```
OS10(config)# ptp local-priority 120
```

Configure the PTP clock to set the system time

To configure the PTP clock to set the system time:

```
OS10(config)# ptp system-time enable
```

Interface-level configurations

Enable PTP on an interface

To enable PTP on an interface:

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp enable
```

Configure the PTP role

A PTP interface can operate in master or slave role. To configure PTP role:

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp role master
```

NOTE: The PTP role is set to dynamic by default. If the role is set to dynamic, PTP uses the BMCA to select the master or slave role.

Configure the PTP delay mechanism

While measuring the time delay between the master and slave nodes, PTP takes into account the communication delay. This delay is measured using a delay request message from the slave and a delay response message from the master. To configure PTP delay mechanism:

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp delay-mechanism end-to-end
```

Configure the PTP transport

Supported PTP transport methods include Layer2 (ethernet), IPv4 (unicast and multicast), and IPv6 (unicast and multicast). Unicast transport method avoids flooding multicast messages in the network.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast master
```

Configure slave devices for a master clock device

You can configure the IP addresses of multiple slave devices. To configure slave devices for the master clock device:

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast master
OS10(conf-ethernet1/1/1-ptp-ipv4-master)# slave 10.10.10.1
OS10(conf-ethernet1/1/1-ptp-ipv4-master)# slave 10.10.10.2
```

Configure a source for unicast transport from a master clock device to a slave clock device

You must configure a source IP address for unicast transport from a master clock device to a slave clock device.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast master
OS10(conf-ethernet1/1/1-ptp-ipv4-master)# source 10.10.10.2
```

NOTE: If you are configuring PTP on an OS10 switch that functions as a virtual router, configure the local IP address as the source IP address for UNICAST TRANSPORT mode. Do not configure the virtual IP address as the source IP address.

Configure master clock devices for a slave clock device

You can configure the IP addresses of multiple master clock devices. OS10 supports configuring a maximum of eight master clock devices.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 10.10.10.1
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 10.10.10.2
```

Configure a source for unicast transport from a slave clock device to a master clock device

You must configure a source IP address for unicast transport from a slave clock device to a master clock device.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# source 10.10.10.2
```

NOTE: If you are configuring PTP on an OS10 switch that functions as a virtual router, configure the local IP address as the source IP address for UNICAST TRANSPORT mode. Do not configure the virtual IP address as the source IP address.

Configure a PTP VLAN

You can configure a VLAN on a PTP-enabled interface. If you configure a VLAN on the grandmaster clock, the grandmaster clock can drop untagged packets. If the VLAN tagged in a packet is the same as the PTP VLAN, the VLAN tagged packets are received on the PTP interface. Untagged packets are accepted on the PTP interface.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp vlan 10
```

Configure the PTP announce message interval

You can configure the time interval in units of $\log_2$ seconds between two successive announce messages.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp announce interval 1
```

Configure the PTP synchronization message interval

You can configure the time interval in units of $\log_2$ seconds between two successive synchronization messages.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp sync-interval -1
```

Configure the delay request message interval

You can configure the time interval in units of $\log_2$ seconds between two successive delay request messages.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp delay-req-min-interval 1
```

View PTP information

Use the `show` commands to view the PTP information, status, and settings.

View the PTP clock and port information

```
OS10# show ptp
PTP Clock                     : Boundary
Clock Identity                : 68:4f:64:ff:ff:01:db:ec

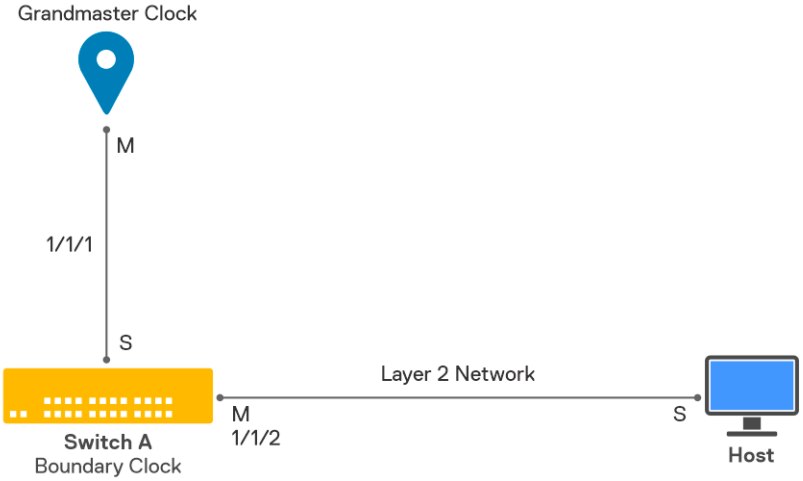
View the PTP state and lock status

```
OS10# show ptp servo
Servo State                    : Locked
Lock Status                    : Phase-locked
```

Example: Configure boundary clock with L2 transport method

You must connect the grandmaster clock to one of the interfaces. In this example, interface 1 is connected to the grandmaster clock.

Configure a boundary clock with two PTP interfaces using L2 transport method. The interface that is connected to the grandmaster clock or the best master clock becomes the slave device. The other interface becomes the master clock.



1. Configure the PTP boundary clock.

   The delay mechanism of the boundary clock is end-to-end by default.

```
OS10(config)# ptp clock boundary
```

2. Enable PTP on interface 1 with L2 multicast transport mode.

   PTP role is dynamic by default.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport layer2
OS10(conf-if-eth1/1/1)# ptp enable
```

3. Enable PTP on interface 2 with L2 multicast transport mode.

   PTP role is dynamic by default.

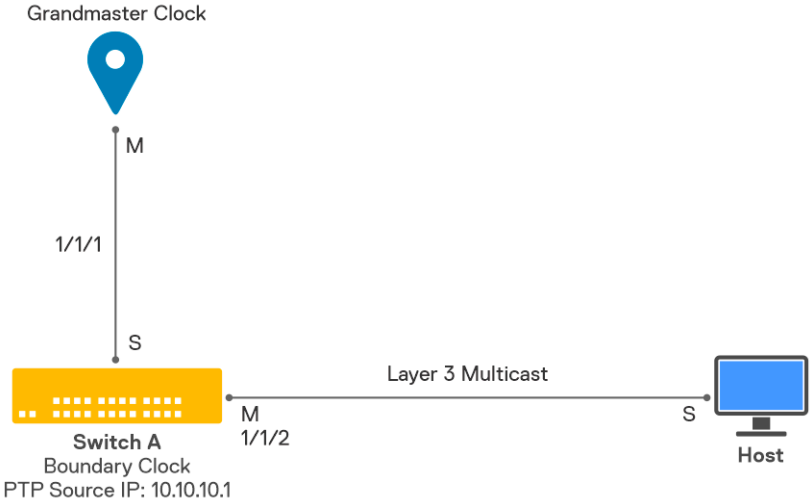
```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# ptp transport layer2
OS10(conf-if-eth1/1/2)# ptp enable
```

Interface 1 becomes the slave device and interface 2 becomes the master clock device for other devices.

Example: Configure boundary clock with IPv4 multicast transport method

You must connect the grandmaster clock to one of the interfaces. In this example, interface 1 is connected to the grandmaster clock.

Configure a boundary clock with two PTP interfaces using IPv4 multicast transport. The interface that is connected to the grandmaster clock or the best master clock becomes the slave device. The other interface becomes the master device.



NOTE: For L3 interface, the interface IP address is used as the PTP multicast source IP address. If there is no interface IP address, then the multicast source IP address (GLOBAL CONFIGURATION mode) is used as the PTP source IP address.

1. Configure the PTP boundary clock.

   The delay mechanism of the boundary clock is end-to-end by default.

```
OS10(config)# ptp clock boundary
```

2. Configure the multicast source IP address.

```
OS10(config)# ptp source ipv4 10.10.10.1
```

3. Enable PTP on interface 1 with IPv4 multicast transport mode.

   PTP role is dynamic by default. For multicast transport mode, when you enable PTP, the system sends a join message.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 multicast
OS10(conf-if-eth1/1/1)# ptp enable
```

4. Enable PTP on interface 2 with IPv4 multicast transport mode.

   PTP role is dynamic by default. For IPv4, multicast is the default transport mode.

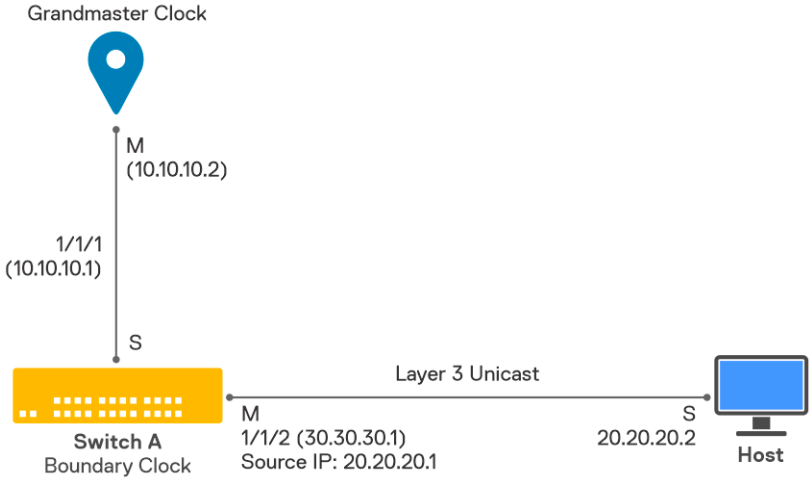
```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# ptp transport ipv4 multicast
OS10(conf-if-eth1/1/2)# ptp enable
```

Interface 1 becomes the slave device and interface 2 becomes the master clock for other devices.

Example: Configure boundary clock with IPv4 unicast transport method

Ensure that you configure the interface connected to the grandmaster clock as a slave device with a list of master device IP addresses. Configure the other interface as the master device with a list of slave device IP addresses. In this example, the grandmaster clock is connected to interface 1.

Configure a boundary clock with two PTP interfaces using IPv4 unicast transport. Use unicast transport mode when you have clearly defined the role of each node in your deployment.



1. Configure the PTP boundary clock.

   The delay mechanism of the boundary clock is end-to-end by default.

```
OS10(config)# ptp clock boundary
```

2. Enable PTP on interface 1 with IPv4 unicast transport mode.

   For L3 interface, if you have not configured the source IP address, the interface IP address is used as the source IP address for unicast transport from the slave device to the master device.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip address 10.10.10.1/24
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 10.10.10.2
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# exit
OS10(conf-if-eth1/1/1)# ptp enable
```

3. Enable PTP on interface 2 with IPv4 unicast transport mode.

   For both L2 and L3 interfaces, the configured source IP address is used as the source IP address for unicast transport from the master device to the slave device.

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/1)# ip address 30.30.30.1/24
OS10(conf-if-eth1/1/2)# ptp transport ipv4 unicast master
OS10(conf-ethernet1/1/2-ptp-ipv4-master)# source 20.20.20.1
OS10(conf-ethernet1/1/2-ptp-ipv4-master)# slave 20.20.20.2
OS10(conf-ethernet1/1/2-ptp-ipv4-master)# exit
OS10(conf-if-eth1/1/2)# ptp enable
```

   In this example, a source address different from the interface IP address is configured because the slave device is reachable in a different subnet of the source IP address.

Interface 1 becomes the slave device and interface 2 becomes the master clock for the other devices.

Example: Configure end-to-end transparent clock

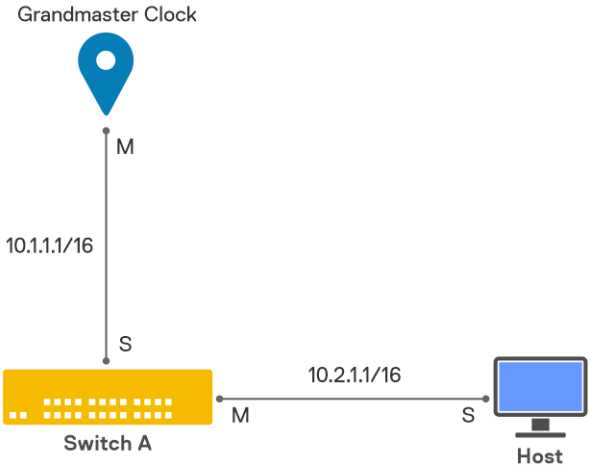
Ensure that you configure the following on the OS10 switch:

- Enable IP multicast routing.
- Configure the IP address on the PTP-enabled interfaces.
- Enable PIM sparse mode on the PTP-enabled interfaces.
- Configure a rendezvous point (RP) or a bootstrap router (BSR).

- The OS10 switch sends all PTP packets to the multicast group address, 224.0.1.129. Ensure that the PTP-enabled interfaces are part of this multicast group. Use IGMP and PIM for multicast routing.

You can enable the end-to-end transparent clock globally on the OS10 switch. The system applies this configuration on all the PTP-enabled interfaces. In the following example, port 1 is connected to the grandmaster clock and port 2 is connected to a slave device. Ports 1 and 2 are members of the multicast group, 224.0.1.129.

NOTE: OS10 does not support PTP multicast IPv6 negotiation in transparent clock mode.



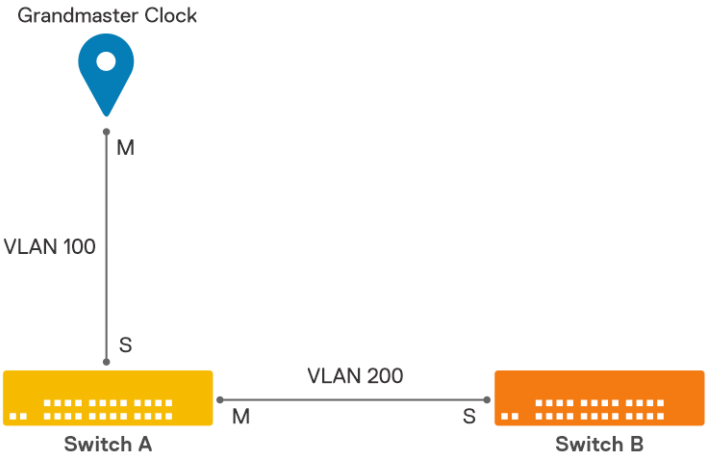
To configure an end-to-end transparent clock, use the following command:

```
OS10(config)# ptp clock end-to-end-transparent
```

The system updates the residence time in the correction field of the message and forwards the PTP messages.

Example: Configure boundary clock with IPv4 unicast transport method and L3 VLAN

Ensure that the interface connected to the grandmaster clock is configured as a slave device with a list of master clock IP addresses. Configure the other interface as a master clock with a list of slave device IP addresses. Both the interfaces are only reachable through the L3 VLAN.



In this example:

- Interface 1 that is part of VLAN 100 is connected to the grandmaster clock.
- The grandmaster clock is reachable only through VLAN 100.
- Interface 2 that is part of VLAN 200 is connected to the slave device.
- The slave device is reachable only through VLAN 200.

Use unicast transport mode when you have clearly defined the role of each node in your deployment. To configure a boundary clock with two PTP interfaces using IPv4 unicast transport method:

1. Configure the PTP boundary clock.

   The delay mechanism of the boundary clock is end-to-end by default.

```
OS10(config)# ptp clock boundary
```

2. Enable PTP on interface 1 with IPv4 unicast transport mode.
   - The interface is a trunk port.
   - A source address is configured for unicast transport from the slave device to the master clock device.
   - The unicast IP traffic flows through the PTP-enabled interface and reaches the destination. The system applies hardware time stamps on PTP packets.

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip address 10.10.10.1/24

OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# switchport mode trunk
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 100
OS10(conf-if-eth1/1/1)# ptp vlan 100
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# source 10.10.10.1
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 10.10.10.2

OS10(conf-if-eth1/1/1)# ptp enable
```

3. Enable PTP on interface 2 with IPv4 unicast transport mode.
   - The interface is an access port.
   - Configure a source IP address for unicast transport from the master device to the slave device.
   - The unicast IP traffic flows through PTP-enabled interface, interface 2. The system applies hardware time stamps on PTP packets.

```
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# ip address 20.20.20.1/24

OS10(config)# interface ethernet 1/1/2

OS10(conf-if-eth1/1/2)# switchport access vlan 200
OS10(conf-if-eth1/1/2)# ptp transport ipv4 unicast master
OS10(conf-ethernet1/1/2-ptp-ipv4-master)# source 20.20.20.1
OS10(conf-ethernet1/1/2-ptp-ipv4-master)# slave 20.20.20.2

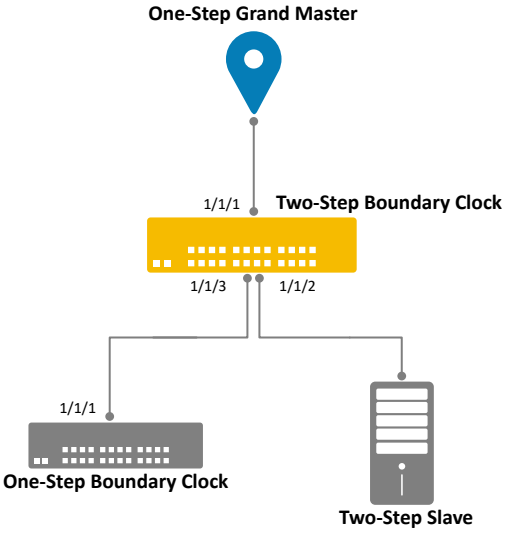
OS10(conf-if-eth1/1/2)# ptp enable
```

Interface 1 becomes the slave device and interface 2 becomes the master clock for other devices.

Example: Configure PTP time stamping mode

The OS10 switch can be configured with one-step or two-step mode for the system clock synchronization. By default, the one-step clock mode is used. To enable two-step clock mode, use the `ptp clock-mode two-step` command. In both clock modes, the switch accepts both one-step or two-step master clock synchronization.

The following example shows PTP two-step and one-step configuration. This configuration is applicable only on the master clock and not on the slave clock.



Two-step boundary clock

1. Configure PTP boundary clock.

```
OS10(config)# ptp clock boundary
```

2. Configure PTP clock mode.

```
OS10(config)# ptp clock-mode two-step
```

3. Enable PTP slave on the port connecting to the master clock.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp enable
OS10(conf-if-eth1/1/1)# ptp role slave
OS10(conf-if-eth1/1/1)# ptp transport layer2
OS10(conf-if-eth1/1/1)# exit
```

4. Enable PTP master on the port connecting the one-step boundary clock.

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# ptp enable
OS10(conf-if-eth1/1/2)# ip address 10.0.0.1/24
OS10(conf-if-eth1/1/2)# ptp role master
OS10(conf-if-eth1/1/2)# ptp transport ipv4 multicast
OS10(conf-if-eth1/1/2)# exit
```

5. Enable PTP master on the port connecting to the two-step slave clock.

```
OS10(config)# interface ethernet 1/1/3
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 21.0.0.1/24
OS10(conf-if-eth1/1/3)# ptp transport ipv4 unicast master
OS10(conf-ethernet1/1/3-ptp-ipv4-master)# slave 21.0.0.2/24
OS10(conf-ethernet1/1/3-ptp-ipv4-master)# exit
OS10(conf-if-eth1/1/3)# exit
OS10(config)#
```

One-step boundary clock

1. Configure PTP boundary clock.

```
OS10(config)# ptp clock boundary
```

2. Configure PTP clock mode.

```
OS10(config)# ptp clock-mode one-step
```

3. Enable PTP slave on port connecting to master.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 21.0.0.2/24
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 21.0.0.1/24
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# exit
OS10(conf-if-eth1/1/1)# exit
OS10(config)#
```

Example: Configure PTP in a multinode setup

The following example describes how to configure PTP in a multinode setup.

Ensure that you configure VLT multicast routing. In this topology:

- CR1, CR2, AG1, AG2, AG3, and AG4 are multicast routers.
- CR1 and CR2 are the BSR and RP nodes.
- TR1 and TR2 are IGMP-enabled L2 nodes.
- OSPFv2 is the unicast routing protocol.

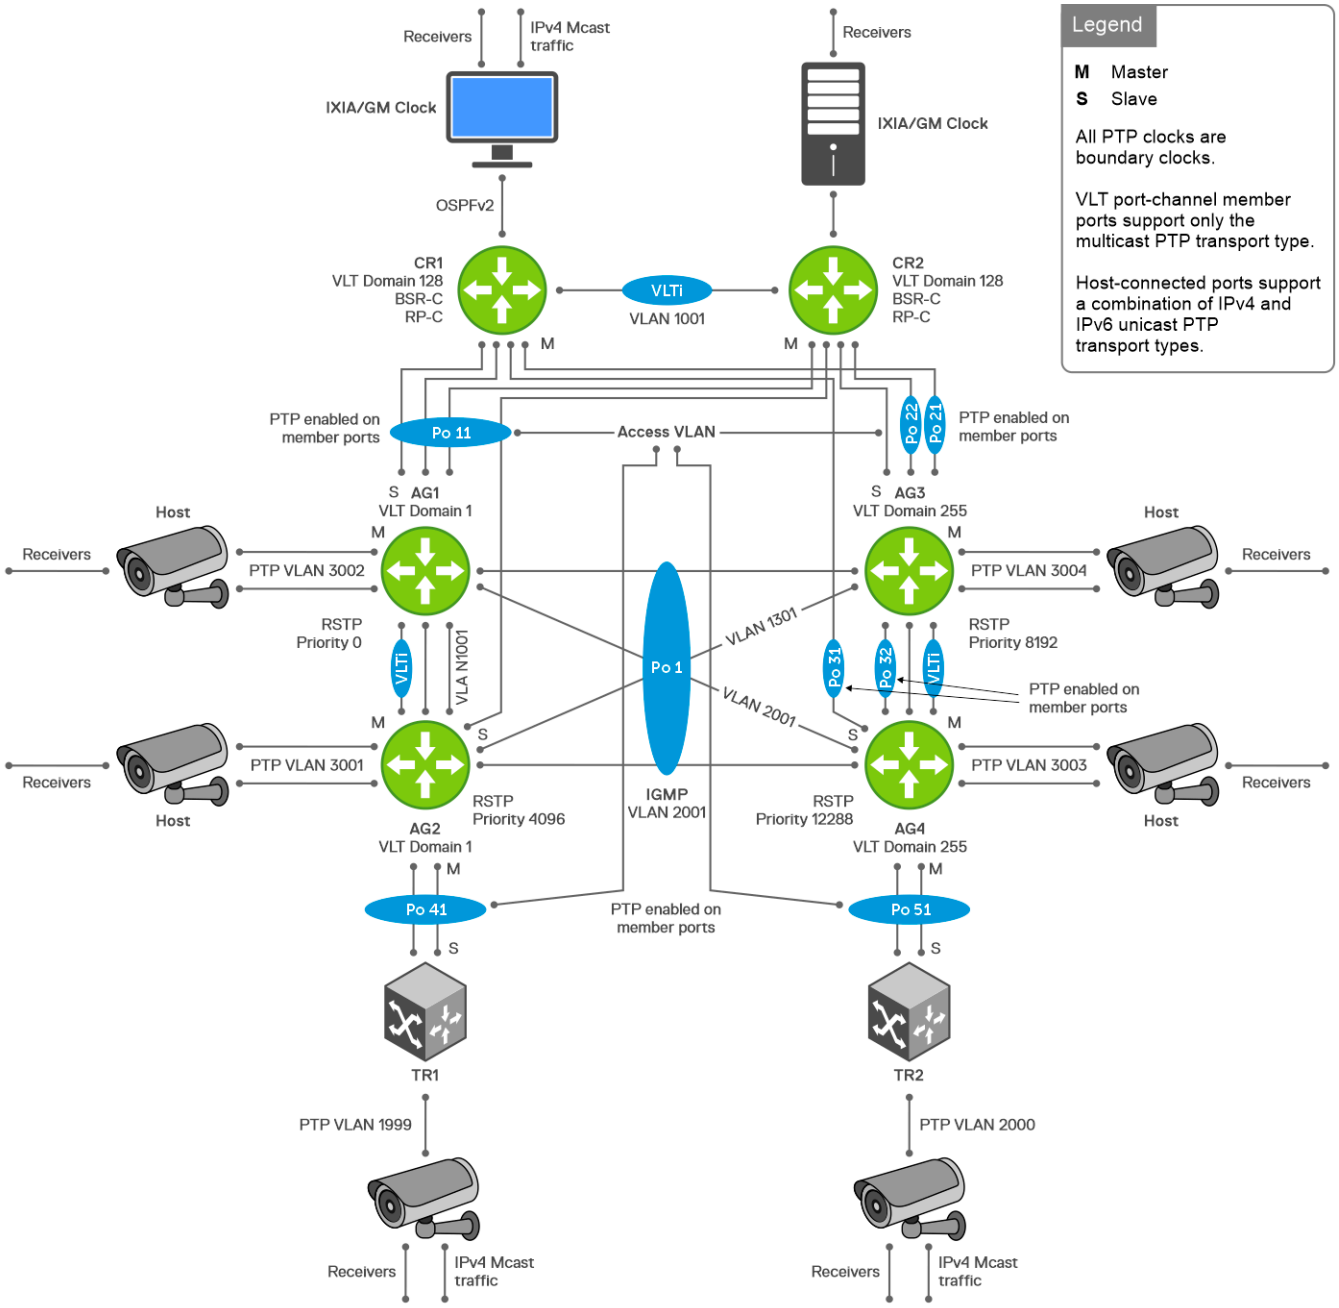


Table 16. Example PTP topology—Switch connections, port numbers, and IP addresses

From	To	Port number	IP address
CR1	GM	Eth1/1/28:1	Nondefault VLAN 1 IP as source
	AG1	Eth1/1/1:1 (VLT PO11)	Global IPv4/IPv6 addresses: • 10.0.0.5 • 10:0:0::5
	AG1	Eth1/1/3:1 (VLT PO11)	
	AG2	Eth1/1/9:1 (VLT PO11)	
	AG2	Eth1/1/16:1 (VLT PO11)	
	AG3	Eth1/1/25:1 (VLT PO21)	
	AG4	Eth1/1/17:1 (VLT PO31)	
CR2	GM	Eth1/1/28:2	Nondefault VLAN 1 IP as source

Table 16. Example PTP topology—Switch connections, port numbers, and IP addresses (continued)

From	To	Port number	IP address
	AG1	Eth1/1/3:1 (VLT PO11)	Global IPv4/IPv6 addresses: • 10.0.0.6 • 10:0:0::6
	AG1	Eth1/1/8:1 (VLT PO11)	
	AG2	Eth1/1/12:1 (VLT PO11)	
	AG2	Eth1/1/13:1 (VLT PO11)

CR1 switch

1. Configure IP address for the VLAN and loopback interfaces.

```
CR1(config)# interface vlan1
CR1(conf-if-vl-1)# ip address 200.1.1.5/24
CR1(conf-if-vl-1)# exit
CR1(config)# interface loopback1
CR1(conf-if-lo-1)# ip address 10.0.0.5/32
CR1(conf-if-lo-1)# ipv6 address 10:0:0::5/128
```

2. Configure PTP globally.

```
CR1(config)# ptp clock boundary
CR1(config)# ptp local-priority 127
CR1(config)# ptp source ipv4 10.0.0.5
CR1(config)# ptp source ipv6 10:0:0::6
CR1(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
CR1(config)# interface ethernet 1/1/1:1
CR1(conf-if-eth1/1/1:1)# ptp enable
CR1(conf-if-eth1/1/1:1)# ptp transport ipv4 multicast

CR1(config)# interface ethernet 1/1/3:1
CR1(conf-if-eth1/1/3:1)# ptp enable
CR1(conf-if-eth1/1/3:1)# ptp transport ipv4 multicast

CR1(config)# interface ethernet 1/1/9:1
CR1(conf-if-eth1/1/9:1)# ptp enable
CR1(conf-if-eth1/1/9:1)# ptp transport ipv4 multicast

CR1(config)# interface ethernet 1/1/16:1
CR1(conf-if-eth1/1/16:1)# ptp enable
CR1(conf-if-eth1/1/16:1)# ptp transport ipv4 multicast

CR1(config)# interface ethernet 1/1/17:1
CR1(conf-if-eth1/1/17:1)# ptp enable
CR1(conf-if-eth1/1/17:1)# ptp transport ipv4 multicast

CR1(config)# interface ethernet 1/1/25:1
CR1(conf-if-eth1/1/25:1)# ptp enable
CR1(conf-if-eth1/1/25:1)# ptp transport ipv4 multicast

CR1(config)# interface ethernet 1/1/28:1
CR1(conf-if-eth1/1/28:1)# ptp enable
CR1(conf-if-eth1/1/28:1)# ptp vlan 1
CR1(conf-if-eth1/1/28:1)# ptp transport ipv4 unicast slave
CR1(conf-ethernet1/1/28:1-ptp-ipv4-slave)# master 172.16.10.11
CR1(conf-ethernet1/1/28:1-ptp-ipv4-slave)# source 172.16.10.5
```

CR2 switch

1. Configure IP address for the VLAN and loopback interfaces.

```
CR2(config)# interface vlan1
CR2(conf-if-vl-1)# ipv6 address 2001:200:1:1::5/64
CR2(conf-if-vl-1)# exit
CR2(config)# interface loopback1
CR2(conf-if-lo-1)# ip address 10.0.0.6/32
CR2(conf-if-lo-1)# ipv6 address 10:0:0::6/128
```

2. Configure PTP globally.

```
CR2(config)# ptp clock boundary
CR2(config)# ptp local-priority 2
CR2(config)# ptp source ipv4 10.0.0.6
```

```
CR2(config)# ptp source ipv6 10:0:0::6
CR2(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
CR2(config)# interface ethernet 1/1/3:1
CR2(conf-if-eth1/1/3:1)# ptp enable
CR2(conf-if-eth1/1/3:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/3:1
CR2(conf-if-eth1/1/3:1)# ptp enable
CR2(conf-if-eth1/1/3:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/8:1
CR2(conf-if-eth1/1/8:1)# ptp enable
CR2(conf-if-eth1/1/8:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/12:1
CR2(conf-if-eth1/1/12:1)# ptp enable
CR2(conf-if-eth1/1/12:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/13:1
CR2(conf-if-eth1/1/13:1)# ptp enable
CR2(conf-if-eth1/1/13:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/17:1
CR2(conf-if-eth1/1/17:1)# ptp enable
CR2(conf-if-eth1/1/17:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/25:1
CR2(conf-if-eth1/1/25:1)# ptp enable
CR2(conf-if-eth1/1/25:1)# ptp transport ipv4 multicast

CR2(config)# interface ethernet 1/1/28:2
CR2(conf-if-eth1/1/28:2)# ptp enable
CR2(conf-if-eth1/1/28:2)# ptp vlan 1
CR2(conf-if-eth1/1/28:2)# ptp transport ipv6 unicast slave
CR2(conf-ethernet1/1/28:2-ptp-ipv4-slave)# master 2001:200:1:1::99
CR2(conf-ethernet1/1/28:2-ptp-ipv4-slave)# source 2001:200:1:1::5
```

AG1 switch

1. Configure IP address for the VLAN and loopback interfaces.

```
AG1(config)# interface vlan3002
AG1(conf-if-vl-3002)# ipv6 address 2001:101:2::1/64
AG1(conf-if-vl-3002)# exit
AG1(config)# interface loopback1
AG1(conf-if-lo-1)# ip address 10.0.0.1/32
AG1(conf-if-lo-1)# ipv6 address 10:0:0::1/128
```

2. Configure PTP globally.

```
AG1(config)# ptp clock boundary
AG1(config)# ptp source ipv4 10.0.0.1
AG1(config)# ptp source ipv6 10:0:0::1
AG1(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
AG1(config)# interface ethernet 1/1/1:1
AG1(conf-if-eth1/1/1:1)# ptp enable
AG1(conf-if-eth1/1/1:1)# ptp transport ipv4 multicast

AG1(config)# interface ethernet 1/1/1:3
AG1(conf-if-eth1/1/1:3)# ptp enable
AG1(conf-if-eth1/1/1:3)# ptp transport ipv4 multicast

AG1(config)# interface ethernet 1/1/5:3
AG1(conf-if-eth1/1/5:3)# ptp enable
```

```
AG1(conf-if-eth1/1/5:3)# ptp transport ipv4 multicast

AG1(config)# interface ethernet 1/1/7:4
AG1(conf-if-eth1/1/7:4)# ptp enable
AG1(conf-if-eth1/1/7:4)# ptp transport ipv4 multicast

AG1(config)# interface ethernet 1/1/9:1
AG1(conf-if-eth1/1/9:1)# ptp enable
AG1(conf-if-eth1/1/9:1)# ptp vlan 3002
AG1(conf-if-eth1/1/9:1)# ptp transport ipv6 unicast master
AG1(conf-ethernet1/1/9:1-ptp-ipv6-master)# slave 2001:101:2::200a
AG1(conf-ethernet1/1/9:1-ptp-ipv6-master)# slave 2001:101:2::200b
AG1(conf-ethernet1/1/9:1-ptp-ipv6-master)# slave 2001:101:2::200c
.
.
.
AG1(conf-ethernet1/1/9:1-ptp-ipv6-master)# slave 2001:101:2::2027
AG1(conf-ethernet1/1/9:1-ptp-ipv6-master)# source 2001:101:2::1

AG1(config)# interface ethernet 1/1/17:1
AG1(conf-if-eth1/1/17:1)# ptp enable
AG1(conf-if-eth1/1/17:1)# ptp transport ipv4 multicast

AG1(config)# interface ethernet 1/1/19:4
AG1(conf-if-eth1/1/19:4)# ptp enable
AG1(conf-if-eth1/1/19:4)# ptp transport ipv4 multicast
```

AG2 switch

1. Configure IP address for the VLAN and loopback interfaces.

```
AG2(config)# interface vlan3001
AG2(conf-if-vl-3001)# ip address 101.1.0.2/16
AG2(conf-if-vl-3001)# exit
AG2(config)# interface loopback1
AG2(conf-if-lo-1)# ip address 10.0.0.2/32
AG2(conf-if-lo-1)# ipv6 address 10:0:0::2/128
```

2. Configure PTP globally.

```
AG2(config)# ptp clock boundary
AG2(config)# ptp source ipv4 10.0.0.2
AG2(config)# ptp source ipv6 10:0:0::2
AG2(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
AG2(config)# interface ethernet 1/1/1:1
AG2(conf-if-eth1/1/1:1)# ptp enable
AG2(conf-if-eth1/1/1:1)# ptp transport ipv4 multicast

AG2(config)# interface ethernet 1/1/3:4
AG2(conf-if-eth1/1/3:4)# ptp enable
AG2(conf-if-eth1/1/3:4)# ptp transport ipv4 multicast

AG2(config)# interface ethernet 1/1/5:4
AG2(conf-if-eth1/1/5:4)# ptp enable
AG2(conf-if-eth1/1/5:4)# ptp transport ipv6 multicast

AG2(config)# interface ethernet 1/1/7:3
AG2(conf-if-eth1/1/7:3)# ptp enable
AG2(conf-if-eth1/1/7:3)# ptp transport ipv6 multicast

AG2(config)# interface ethernet 1/1/9:1
AG2(conf-if-eth1/1/9:1)# ptp enable
AG2(conf-if-eth1/1/9:1)# ptp vlan 3001
AG2(conf-if-eth1/1/9:1)# ptp transport ipv4 unicast master
AG2(conf-ethernet1/1/9:1-ptp-ipv4-master)# slave 172.16.0.0
AG2(conf-ethernet1/1/9:1-ptp-ipv4-master)# slave 172.16.0.1
```

```
AG2(conf-ethernet1/1/9:1-ptp-ipv4-master)# slave 172.16.0.2
.
.
.
AG2(conf-ethernet1/1/9:1-ptp-ipv4-master)# slave 172.16.0.39
AG2(conf-ethernet1/1/9:1-ptp-ipv4-master)# source 172.16.0.2

AG2(config)# interface ethernet 1/1/17:4
AG2(conf-if-eth1/1/17:4)# ptp enable
AG2(conf-if-eth1/1/17:4)# ptp transport ipv6 multicast

AG2(config)# interface ethernet 1/1/19:3
AG2(conf-if-eth1/1/19:3)# ptp enable
AG2(conf-if-eth1/1/19:3)# ptp transport ipv4 multicast
```

TR1 switch

1. Configure IP address for the VLAN and loopback interfaces.

```
TR1(config)# interface vlan1999
TR1(conf-if-vl-1999)# ipv6 address 2091:101:1::1/64
TR1(conf-if-vl-1999)# exit
TR1(config)# interface loopback1
TR1(conf-if-lo-1)# ip address 10.0.0.10/32
TR1(conf-if-lo-1)# ipv6 address 10:0:0::a/128
```

2. Configure PTP globally.

```
TR1(config)# ptp clock boundary
TR1(config)# ptp source ipv4 10.0.0.10
TR1(config)# ptp source ipv6 10:0:0::a
TR1(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
TR1(config)# interface ethernet 1/1/27:4
TR1(conf-if-eth1/1/27:4)# ptp enable
TR1(conf-if-eth1/1/27:4)# ptp transport ipv6 multicast

TR1(config)# interface ethernet 1/1/28:3
TR1(conf-if-eth1/1/28:3)# ptp enable
TR1(conf-if-eth1/1/28:3)# ptp transport ipv4 multicast

TR1(config)# interface ethernet 1/1/33
TR1(conf-if-eth1/1/33)# ptp enable
TR1(conf-if-eth1/1/33)# ptp vlan 1999
TR1(conf-if-eth1/1/33)# ptp transport ipv6 unicast master
TR1(conf-ethernet1/1/33-ptp-ipv6-master)# slave 2091:101:1::111a
TR1(conf-ethernet1/1/33-ptp-ipv6-master)# slave 2091:101:1::111b
TR1(conf-ethernet1/1/33-ptp-ipv6-master)# slave 2091:101:1::111c
.
.
.
TR1(conf-ethernet1/1/33-ptp-ipv6-master)# slave 2091:101:1::1119
TR1(conf-ethernet1/1/33-ptp-ipv6-master)# source 2091:101:1::1

TR1(config)# interface ethernet 1/1/39
TR1(conf-if-eth1/1/39)# ptp enable
TR1(conf-if-eth1/1/39)# ptp transport ipv4 multicast

TR1(config)# interface ethernet 1/1/46
TR1(conf-if-eth1/1/46)# ptp enable
TR1(conf-if-eth1/1/46)# ptp transport ipv4 multicast
```

AG3 switch

1. Configure IP address for the loopback interface.

```
AG3(config)# interface loopback1
AG3(conf-if-lo-1)# ip address 10.0.0.3/32
AG3(conf-if-lo-1)# ipv6 address 10:0:0::3/128
```

2. Configure PTP globally.

```
AG3(config)# ptp clock boundary
AG3(config)# ptp source ipv4 10.0.0.3
AG3(config)# ptp source ipv6 10:0:0::3
AG3(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
AG3(config)# interface ethernet 1/1/1:1
AG3(conf-if-eth1/1/1:1)# ptp enable
AG3(conf-if-eth1/1/1:1)# ptp transport ipv4 multicast

AG3(config)# interface ethernet 1/1/25:1
AG3(conf-if-eth1/1/25:1)# ptp enable
AG3(conf-if-eth1/1/25:1)# ptp transport ipv4 multicast

AG3(config)# interface ethernet 1/1/17:1
AG3(conf-if-eth1/1/17:1)# ptp enable
AG3(conf-if-eth1/1/17:1)# ptp transport ipv4 multicast
```

AG4 switch

1. Configure IP address for the loopback interface.

```
AG4(config)# interface loopback1
AG4(conf-if-lo-1)# ip address 10.0.0.4/32
AG4(conf-if-lo-1)# ipv6 address 10:0:0::4/128
```

2. Configure PTP globally.

```
AG4(config)# ptp clock boundary
AG4(config)# ptp source ipv4 10.0.0.4
AG4(config)# ptp source ipv6 10:0:0::4
AG4(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
AG4(config)# interface ethernet 1/1/1:1
AG4(conf-if-eth1/1/1:1)# ptp enable
AG4(conf-if-eth1/1/1:1)# ptp transport ipv4 multicast

AG4(config)# interface ethernet 1/1/17:1
AG4(conf-if-eth1/1/17:1)# ptp enable
AG4(conf-if-eth1/1/17:1)# ptp transport ipv4 multicast

AG4(config)# interface ethernet 1/1/19:1
AG4(conf-if-eth1/1/19:1)# ptp enable
AG4(conf-if-eth1/1/19:1)# ptp transport ipv4 multicast
```

TR2 switch

1. Configure IP address for the loopback interface.

```
TR2(config)# interface loopback1
TR2(conf-if-lo-1)# ip address 10.0.0.11/32
TR2(conf-if-lo-1)# ipv6 address 10:0:0::b/128
```

2. Configure PTP globally.

```
TR2(config)# ptp clock boundary
TR2(config)# ptp source ipv4 10.0.0.11
TR2(config)# ptp source ipv6 10:0:0::b
TR2(config)# ptp system-time enable
```

3. Configure PTP on the interfaces.

```
TR2(config)# interface ethernet 1/1/1:1
TR2(conf-if-eth1/1/1:1)# ptp enable
TR2(conf-if-eth1/1/1:1)# ptp transport ipv4 multicast

TR2(config)# interface ethernet 1/1/25:1
TR2(conf-if-eth1/1/25:1)# ptp enable
TR2(conf-if-eth1/1/25:1)# ptp transport ipv4 multicast
```

PTP commands

clear ptp counters

Resets the statistics of the PTP packets that are received at or transmitted from an interface.

Syntax `clear ptp counters [{ethernet node/slot/port[:subport]} | {port-channel port-channel-id}]`

Parameters
- `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information.
- `port-channel port-channel-id`—Enter the port channel ID, from 1 to 999 or 1001 to 2000.

Defaults None

Command Mode EXEC

Security and Access `netadmin` and `sysadmin`

Usage Information None

Example

```
OS10# clear ptp counters ethernet 1/1/14
```

Supported Releases 10.5.1.0 or later

debug ptp

Enables debug logs for the PTP stack.

Syntax `debug ptp {all | bmca | protocol | servo | system | timestamps} {level level}`

Parameters
- `all`—All debug logs of system, stack, and servo
- `bmca`—Best Master Clock Algorithm (BMCA) logs
- `protocol`—PTP protocol engine and transport layer logs
- `servo`—Servo and PLL logs
- `system`—System and task logs
- `timestamps`—Logs related to timestamps
- `level`—Specify the debug log level. Enter a value from 1 to 5. Level 1 is critical and level 5 is informational.

Defaults
- Debug: Not enabled
- Debug level: 1

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information Debug log messages are stored in the following file: */var/log/ptp.log*. The `debug ptp system` command logs all information about internal data structures and is useful for debugging issues.

Example

```
OS10# debug ptp servo level 2
```

Supported Releases 10.5.1.0 or later

master

Configures master clocks for the PTP slave devices.

Syntax `master` *`ip-address`* `[ingress-delay-asymmetry` *`ingress-delay-value`*`] [egress-delay-asymmetry` *`egress-delay-value`*`]`

Parameters

- *`ip-address`*—Specifies the IP addresses of the master clock devices.
- `ingress-delay-asymmetry` *`ingress-delay-value`*—Specifies the ingress delay asymmetry value in nanoseconds. The supported values are from -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
- `egress-delay-asymmetry` *`egress-delay-value`*—Specifies the egress delay asymmetry value in nanoseconds. The supported values are from -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.

.

Defaults

- None for IP address; unicast negotiation disabled
- Ingress-delay-value : 0
- Egress-delay-value : 0

Command Mode INTERFACE CONFIGURATION - SLAVE submode

Security and Access `Netadmin` and `sysadmin`

Usage Information The delay asymmetry value is applicable only in slave mode. This configuration is applicable only to unicast peers. The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 10.10.10.1
OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# master 10.10.10.2
```

Example (delay asymmetry)

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave negotiation-
enable
OS10(conf-if-ptp-ipv4-slave)# master 10.10.10.1
OS10(conf-if-ptp-ipv4-slave)# master 10.10.10.1 ingress-delay-asymmetry
23 egress-delay-asymmetry 67
OS10(conf-if-ptp-ipv4-slave)# master 10.10.10.1 ingress-delay-asymmetry
23
OS10(conf-if-ptp-ipv4-slave)# master 10.10.10.1 egress-delay-asymmetry 67
OS10(conf-if-ptp-ipv4-slave)# master 10.10.10.1 egress-delay-asymmetry
67 ingress-delay-asymmetry 23
```

Supported Releases 10.5.1.0 or later

ptp announce

Configures the interval between successive announce messages and the timeout for the message.

Syntax

```
ptp announce {[interval log2-seconds] | [timeout multiplier]}
```

Parameters

- *log2-seconds*—Configures the logarithmic time interval in seconds between successive announce messages. For the system default profile, enter a value from -2 to 4 (1/4 s to 16 s). For the ITU G.8275.1 profile, only -3 (1/8 s) is the supported value.
- *multiplier*—Configures the count of announce message intervals that have to pass without receipt of an announce message to declare a timeout. For the system default profile, enter a value from 2 to 10 (default value is 3). For the ITU G.8275.1 profile, enter a value from 3 to 10 (default value is 3).

Defaults

- Interval:
  - System default profile: 1
  - ITU G.8275.1 profile: -3
- Timeout: 3

Command Mode

INTERFACE CONFIGURATION

Security and Access

`Netadmin` and `sysadmin`

Usage Information

When a timeout event occurs, the system selects a port with dynamic role to be the master. The `no` form of this command removes the configuration.

Example (system default profile)

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp announce interval 1
OS10(conf-if-eth1/1/1)# ptp announce timeout 5
```

Supported Releases

10.5.1.0 or later

ptp clock

Configures the PTP clock type on the switch and specifies the profile for the clock.

Syntax

```
ptp clock {boundary [hybrid] | end-to-end-transparent} [profile {g8275.1 |
g8275.2 | system-default}]
```

Parameters

- `boundary`—Enables boundary clock.
- `hybrid`—Enables hybrid mode to use synchronous Ethernet for frequency synchronization.
- `end-to-end-transparent`—Enables end-to-end transparent clock.
- `g8275.1`—Configures the clock to adhere to the ITU G.8275.1 profile.
- `g8275.2`—Configures the clock to adhere to the ITU G.8275.2 profile.
- `system-default`—Configures the clock to adhere to the system default profile.

Defaults

System default profile, when PTP clock is configured.

Command Mode

CONFIGURATION

Security and Access

`Netadmin` and `sysadmin`

Usage Information

Enables the PTP clock and configures the clock type and profile on the switch. The clock identity is an array of 8 bytes. The system determines the clock identity from the system MAC address. The most significant 3 bytes (OUI portion) of the MAC address is assigned to the most significant 3 bytes of clock identity. The least significant 3 bytes of the MAC address is assigned to the least significant 3 bytes of the clock identity. Fourth and fifth bytes of clock identity can take on either of the following values: 0xFF or 0xFE. The G8275.1 profile is applicable only for boundary clock. When you configure an attribute, the new configuration overrides the attribute configuration that is defined in the profile.

Use the `hybrid` option to enable frequency synchronization using SyncE and synchronization of the time of the day (ToD) and phase using PTP.

Enable negotiation option using the `ptp transport` command for unicast transport with G.8275.2 profile.

The `no` form of this command removes the configuration.

Example

```
OS10(config)# ptp clock boundary
OS10(config)# ptp clock boundary profile g8275.1
```

```
OS10(config)# ptp clock boundary
OS10(config)# ptp clock boundary profile g8275.2
```

Example - PTP hybrid mode

```
OS10(config)# ptp clock boundary hybrid profile system-default
```

Supported Releases 10.5.1.0 or later

ptp clock-mode

Configures the time stamping mode on PTP clock to either one-step or two-step.

Syntax `[no] ptp clock-mode [one-step | two-step]`

Parameters

- `one-step`—Enables one-step mode to send the timestamp with the synchronous message.
- `two-step`—Enables two-step mode to send a synchronous message followed by a follow-up with the timestamp.

Defaults One-step mode

Command Mode CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information The time stamping mode configuration is not applicable on the slave port of a boundary clock. However, slave port can process the messages from both one-step and two-step clocks. The time stamping mode configuration is not applicable on the transparent clock. The `no` form of this command removes the configuration.

Example

```
OS10(config)# ptp clock-mode two-step

OS10(config)# no ptp clock-mode
```

Supported Releases 10.5.4.2 or later

ptp delay-mechanism

Configures the delay mechanism of the PTP boundary clock.

Syntax `ptp delay-mechanism {end-to-end}`

Parameters `end-to-end`—Enables delay request-response mechanism for the boundary clock.

Defaults End-to-end

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information This configuration is only applicable for the boundary clock. The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp delay-mechanism end-to-end
```

Supported Releases 10.5.1.0 or later

ptp delay-req-min-interval

Configures the minimum interval between delay request messages.

Syntax `ptp delay-req-min-interval` *log2-seconds*

Parameters *log2-seconds*—Configures the logarithmic time interval in seconds between successive delay request messages. For the system default profile, enter a value from -7 to 5 (1/128 s to 32 s). For the ITU G.8275.1 profile, only -4 is the supported value.

Defaults -4

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information This configuration is applicable only with end-to-end delay mechanism. The `no` form of this command removes the configuration.

Example (system default profile)

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp delay-req-min-interval 1
```

Supported Releases 10.5.1.0 or later

ptp domain

Configures the domain for the PTP clock.

Syntax `ptp domain` *domain-number*

Parameters *domain-number*—Enter a value from the following ranges:

- System default profile: 0 to 127
- ITU G.8275.1 profile: 24 to 43

NOTE: Domain numbers 128 to 255 are reserved and cannot be configured for the system default profile.

Defaults

- System default profile: 0
- ITU G.8275.1 profile: 24

Command Mode CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information The `no` form of this command removes the configuration.

Example

```
OS10(config)# ptp domain 1
```

Supported Releases 10.5.1.0 or later

ptp egress-delay-asymmetry

Configures delay asymmetry to offset the static delay on a PTP egress path.

Syntax	`[no] ptp egress-delay-asymmetry` *egress-delay-value*
Parameters	*egress-delay-value*—Enter the egress delay asymmetry value in nanoseconds. The supported values are from -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
Defaults	0
Command Mode	INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	The egress delay asymmetry value is applicable only in slave mode. This configuration is applicable only to Layer 2, IPv4, and IPv6 multicast peers. The `no` form of this command removes the configuration.
Example (system default profile)	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ptp egress-delay-asymmetry 67`
Supported Releases	10.5.3.0 or later

ptp enable

Enables PTP on a physical or port channel interface.

Syntax	`ptp enable`
Parameters	None
Defaults	Disabled
Command Mode	INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	The PTP protocol operates only on interfaces with a network address. Ensure that you have configured the PTP transport method for the interface using the `ptp transport` command. You can enable PTP on either the port channel interface or the port channel member interfaces, but not both. The `no` form of this command removes the configuration.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ptp enable`
Supported Releases	10.5.1.0 or later

ptp ingress-delay-asymmetry

Configures delay asymmetry to offset the static delay on a PTP ingress path.

Syntax	`[no] ptp ingress-delay-asymmetry` *ingress-delay-value*
Parameters	*ingress-delay-value*—Enter the ingress delay asymmetry value in nanoseconds. The supported values are from -9,223,372,036,854,775,808 to 9,223,372,036,854,775,807.
Defaults	0
Command Mode	INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`

Usage Information	The ingress delay asymmetry value is applicable only in slave mode. This configuration is applicable only to Layer 2, IPv4, and IPv6 multicast peers. The `no` form of this command removes the configuration.
Example (system default profile)	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ptp ingress-delay-asymmetry 23`
Supported Releases	10.5.3.0 or later

ptp local-priority

Configures the local priority for the PTP clock.

Syntax	`ptp local-priority` *priority-number*
Parameters	*priority-number*—Enter a value from 1 to 255.
Defaults	128
Command Mode	• CONFIGURATION • INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command is applicable only for boundary clocks and for the ITU G.8275.1 profile. Use the local-priority attribute to compare the local clock with the data on another potential grandmaster clock. The `no` form of this command removes the configuration.
Example	`OS10(config)# ptp local-priority 120`
Supported Releases	10.5.1.0 or later

ptp priority1

Configures the priority1 attribute for advertising the PTP clock.

Syntax	`ptp priority1` *priority-number*
Parameters	*priority-number*—Priority1 has the highest precedence among the six attributes that are used in the selection of the master clock. Enter a value from 0 to 255 for the system default profile. The G.8275.1 profile assigns a static value of 128 for this attribute.
Defaults	128
Command Mode	CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	The clock with the lowest priority1 value becomes the master clock. The lower the value of this attribute, the higher is the priority. The `no` form of this command removes the configuration.
Example	`OS10(config)# ptp priority1 125`
Supported Releases	10.5.1.0 or later

ptp priority2

Configures the priority2 attribute for advertising PTP clock.

Syntax `ptp priority2 priority-number`

Parameters *priority-number*—Priority2 has the fifth precedence among the six attributes that are used in the selection of the master clock. Enter a value from 0 to 255.

Defaults 128

Command Mode CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information The lower the value of this attribute, the higher is the priority. The `no` form of this command removes the configuration.

Example

```
OS10(config)# ptp priority2 120
```

Supported Releases 10.5.1.0 or later

ptp role

Configures the interface to operate in master, slave, or dynamic role.

Syntax `ptp role {dynamic | master | slave}`

Parameters

- `master`—Enables master role only on the interface
- `slave`—Enables slave role only on the interface
- `dynamic`—Enables dynamic role on the interface. The interface can be a master or slave based on the best master clock algorithm (BMCA).

Defaults Dynamic

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information If the configuration conflicts with unicast transport mode, this command returns an error. The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp role master
```

Supported Releases 10.5.1.0 or later

ptp source

Configures the source IP address for the PTP multicast packets.

Syntax `ptp source {ipv4 ipv4-address | ipv6 ipv6-address}`

Parameters

- *ipv4-address*—Source IPv4 address for the PTP multicast packets
- *ipv6-address*—Source IPv6 address for the PTP multicast packets

Defaults None

Command Mode CONFIGURATION

Security and Access	`Netadmin` and `sysadmin`
Usage Information	Supports both IPv4 and IPv6 addresses. The version of the source IP address (IPv4 or IPv6) depends on the transport mode that you configured using the `ptp transport` command. The IPv4 or IPv6 address that you specify must correspond to a configured L3 interface (physical, Loopback, VLAN, or port channel) and the interface must be operationally up. The `no` form of this command removes the configuration.
Example	`OS10(config)# ptp source ipv4 10.10.10.1` `OS10(config)# ptp source ipv6 2018:1105::1`
Supported Releases	10.5.1.0 or later

ptp sync-interval

Configures the interval between synchronization messages.

Syntax	`ptp sync-interval` *`log2-seconds`*
Parameters	*`log2-seconds`*—Configures the logarithmic time interval in seconds between successive synchronization messages. For the system default profile, enter a value from -7 to 1 (1/128 s to 2 s). For the ITU G.8275.1 profile, only -4 is the supported value.
Defaults	-4
Command Mode	INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	The `no` form of this command removes the configuration.
Example (system default profile)	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ptp sync-interval -1`
Supported Releases	10.5.1.0 or later

ptp system-time enable

Configures the PTP clock to set the system time on the switch.

Syntax	`ptp system-time enable`
Parameters	`enable`—Enables the PTP clock and sets the system time from the PTP clock.
Defaults	Disabled
Command Mode	CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	When you enable this configuration, PTP sets the system time on the switch only if the servo clock is phase locked. You cannot enable the PTP system time if the system is configured as an NTP client. However, you can enable the PTP system time if the system is configured as an NTP server. The `no` form of this command removes the configuration.
Example	`OS10(config)# ptp system-time enable`

Supported Releases	10.5.1.0 or later

ptp transport

Configures the PTP transport method for an interface.

Syntax

```
ptp transport {ipv4 {multicast | unicast {master [negotiation-enable]
| slave [negotiation-enable]}} | ipv6 {multicast | unicast {master
[negotiation-enable] | slave [negotiation-enable]}} | layer2 [address
{forwardable | non-forwardable}]
```

Parameters

- `ipv4 multicast`—Enables IPv4 multicast as the transport method.
- `ipv4 unicast master`—Enables IPv4 unicast master mode.
- `ipv4 unicast master negotiation-enable`—Enables unicast negotiation (signaling support) on master to grant unicast transmission requests from slave.
- `ipv4 unicast slave`—Enables IPv4 unicast slave mode.
- `ipv4 unicast slave negotiation-enable`—Enables unicast negotiation (signaling support) on slave to request for unicast transmission to master.
- `ipv6 multicast`—Enables IPv6 multicast as the transport method.
- `ipv6 unicast master`—Enables IPv6 unicast master mode.
- `ipv6 unicast master negotiation-enable`—Enables unicast negotiation (signaling support) on master to grant unicast transmission requests from slave.
- `ipv6 unicast slave`—Enables IPv6 unicast slave mode.
- `ipv6 unicast slave negotiation-enable`—Enables unicast negotiation (signaling support) on slave to request for unicast transmission to master.
- `layer2`—Enables Layer2 protocol (untagged or 802.1Q tagged Ethernet packet) as the transport method.
- `layer2 address forwardable`—Enables the forwardable destination address (01:1B:19:00:00:00) for the layer2 transport method.
- `layer2 address non-forwardable`—Enables the non-forwardable destination address (01:80:C2:00:00:0E) for the layer2 transport method.

Defaults

- None for the transport method.
- Unicast negotiation is disabled for the unicast transport method.
- Forwardable destination address is enabled for the Layer 2 transport method.

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information

- For unicast transport, you must configure an IP address in INTERFACE mode or a source IP address (in UNICAST IP CONFIGURATION mode) to represent the interface.

  NOTE: If you are configuring PTP on an OS10 switch that functions as a virtual router, configure the local IP address as the source IP address for unicast transport mode. Do not configure the virtual IP address as the source IP address.

  - If you enable the unicast master mode, it leads to a sub mode where you can configure the slave IP addresses.
  - If you enable the unicast slave mode, it leads to a sub mode where you can configure the master IP addresses.
  - If the unicast transport mode configuration conflicts with role configuration, the system returns an error.
- For multicast transport, you must configure an IP address in INTERFACE mode or a source IP address (in GLOBAL CONFIGURATION mode) to represent the interface.
- You can configure Layer2 transport method when the interface is in L2 or L3 mode. The layer 2 address options are applicable only for the ITU G.8275.1 profile.

The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast master
```

Supported Releases 10.5.1.0 or later

ptp vlan

Configures a VLAN for the PTP-enabled interface.

Syntax `ptp vlan vlan-id`

Parameters *vlan-id*—Specifies VLAN for the PTP interface.

Defaults None

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information You can configure only one PTP VLAN per interface. If the PTP interface is in trunk mode, the VLAN tag is added to PTP packets transmitted out of the PTP interface. The system accepts tagged ingress packets, only if the configured PTP VLAN is present in the VLAN tag. The system accepts all untagged packets. The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ptp vlan 10
```

Supported Releases 10.5.1.0 or later

show ptp

Displays the PTP clock and port information.

Syntax `show ptp`

Parameters None

Defaults None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information None

Example - Boundary clock

```
OS10# show ptp
PTP Clock                       : Boundary
Clock Identity                  : 68:4f:64:ff:ff:01:db:ec

Ethernet1/1/23    Master          68:4f:64:ff:ff:01:db:ec:2
--------------------------------------------------------------------------------
Number of slave ports :1
Number of master ports :1
```

Example - Boundary clock configured in hybrid mode

```
OS10# show ptp
PTP Clock                     : Boundary (Hybrid)
Clock Identity                : 22:22:22:ff:ff:22:22:01
Grandmaster Clock Identity    : 00:11:00:ff:fe:00:00:01
Clock Mode                    : One-step
Clock Quality
   Class                      :  248
   Accuracy                   : <=25ns
   Offset Log Scaled Variance : 0
Domain                        : 0
Priorityl                     : 128
Priority2                     : 128
Profile                       : System-default
Steps Removed                 : 1
Mean Path Delay(ns)           : 176
Offset From Master(ns)        : -8
Number of Ports               : 1
------------------------------------------------------------
Interface      State         Port Identity
------------------------------------------------------------
Ethernetl/1/1  Slave         20:04:0f:ff:ff:0d:5b:56:2
------------------------------------------------------------
Number of slave ports  :1
Number of master ports :1
```

Example - End-to-end transparent clock

```
OS10# show ptp
PTP Clock       :  End-to-end-transparent
Delay Mechanism :  End-to-end
```

Supported Releases 10.5.1.0 or later

show ptp clock

Displays information about the local PTP clock and synchronization.

Syntax `show ptp clock`

Parameters None

Defaults None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information None

Example - Boundary clock

```
OS10# show ptp clock
PTP Clock                     : Boundary
Clock Identity                : 68:4f:64:ff:ff:01:db:ec
Grandmaster Clock Identity    : 00:16:00:ff:fe:00:02:00
Clock Mode                    : One-step
Clock Quality
```

```
    Class                        : 248
    Accuracy                     : <=100ns
    Offset Log Scaled Variance   : 0
Domain                           : 0
Priority1                        : 128
Priority2                        : 128
Profile                          : System-default
Steps Removed                    : 1
Mean Path Delay(ns)              : 68
Offset From Master(ns)           : 6
Number of Ports                  : 2
```

Example - End-to-end transparent clock

```
OS10# show ptp clock
PTP Clock       :  End-to-end-transparent
Delay Mechanism :  End-to-end
```

Supported Releases 10.5.1.0 or later

show ptp counters

Displays the count of the PTP packets received at or transmitted from an interface.

Syntax `show ptp counters [{ethernet` *node/slot/port[:subport]*`} | {port-channel` *port-channel-id*`}]`

Parameters

- `ethernet` *node/slot/port*—Enter the Ethernet interface information.
- `port-channel` *port-channel-id*—Enter the port channel ID, from 1 to 999 or 1001 to 2000.

Defaults None

Command Mode EXEC

Security and Access `netadmin` and `sysadmin`

Usage Information This command displays the count of packets that are received or transmitted from the logical PTP port corresponding to the interface network address. This count does not correlate with the interface packet count. This command is not applicable for transparent clocks.

Example

```
OS10# show ptp counters
Interface   :  ethernet1/1/22
Port No     :  1
Total Announce messages Sent             : 4061
Total Announce messages Received         : 2375569
Total Sync messages Sent                 : 259876
Total Sync messages Received             : 2375568
Total Follow Up messages Sent            : 0
Total Follow Up messages Received        : 0
Total Delay Request messages Sent        : 74377
Total Delay Request messages Received    : 0
Total Delay Response messages Sent       : 0
Total Delay Response messages Received   : 74371

Total Follow Up messages Received       : 0
Total Delay Request messages Sent       : 0
Total Delay Request messages Received   : 2392374
Total Delay Response messages Sent      : 2392374
Total Delay Response messages Received  : 0
Total Management messages Sent          : 0
Total Management messages Received      : 0
Total Signaling messages Sent           : 0
Total Signaling messages Received       : 0
Summary:
Tx messages                             : 5073542
Rx messages                             : 2392374
Lost messages                           : 0
```

Supported Releases 10.5.1.0 or later

show ptp foreign-masters

Displays PTP information about foreign masters.

Syntax `show ptp foreign-masters [{ethernet node/slot/port[:subport]} | {port-channel port-channel-id}]`

Parameters

- `ethernet node/slot/port`—Enter the Ethernet interface information.
- `port-channel port-channel-id`—Enter the port channel ID, from 1 to 999 or 1001 to 2000.

Defaults None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information The maximum number of foreign master data set entries is 10. This command is not applicable for transparent clocks.

Example

```
OS10# show ptp foreign-masters
Interface : Ethernet1/1/22
-------------------------------------------------------------------------
Index  Port-Identity Clock Clock    Offset   GM   GM   Announce Receiver
                     Class Accuracy Variance Pri1 Pri2 Msgs #  Interface
-------------------------------------------------------------------------
0(Best)00:16::1      6     <=100ns  0        100  128  437      eth1/1/22
-------------------------------------------------------------------------
```

Supported Releases 10.5.1.0 or later

show ptp interface

Displays PTP information about the interface.

Syntax `show ptp interface [{ethernet node/slot/port[:subport]} | {port-channel port-channel-id}]`

Parameters

- `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information.
- `port-channel port-channel-id`—Enter the port channel ID, from 1 to 999 or 1001 to 2000.

Defaults None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information

For boundary clocks, this command indicates if the port is enabled or disabled. This command is not applicable for transparent clocks.

Example

```
OS10# show ptp interface
Interface : Ethernet1/1/22
    PTP                                 : Enabled
    Port Identity                       : 68:4f:64:ff:ff:01:db:ec:1
    Port State                          : Slave
    Vlan                                :
    Transport                           : Ipv4-multicast
    Log Delay Request Minimum interval  : -4
    Log Announce Interval               : 1
    Announce Receipt Timeout Multiplier : 3
    Log Sync Interval                   : -4
    Delay Mechanism                     : End-to-end
Interface : Ethernet1/1/23
    PTP                                 : Enabled
    Port Identity                       : 68:4f:64:ff:ff:01:db:ec:2
    Port State                          : Master
    Vlan                                :
    Transport                           : Ipv4-multicast
    Log Delay Request Minimum interval  : -4
    Log Announce Interval               : 1
    Announce Receipt Timeout Multiplier : 3
    Log Sync Interval                   : -4
    Delay Mechanism                     : End-to-end
```

Supported Releases

10.5.1.0 or later

show ptp parent

Displays information about the local PTP parent and grandmaster clock.

Syntax

```
show ptp parent
```

Parameters

None

Defaults

None

Command Mode

EXEC

Security and Access

`Netadmin` and `sysadmin`

Usage Information

This command is not applicable for transparent clocks.

Example

```
OS10# show ptp parent
Parent Clock Idenitity                    : 00:16:00:ff:fe:00:02:00
Parent Port Number                        : 1
Grandmaster Clock Identity                : 00:16:00:ff:fe:00:02:00
Grandmaster Clock Quality
    Class                                 : 6
    Accuracy                              : <=100ns
    OffsetLogScaledVariance               : 0
Grandmaster Clock Priority1               : 100
Grandmaster Clock Priority2               : 128
```

Supported Releases

10.5.1.0 or later

show ptp peer

Displays the count of PTP messages received from a peer at an interface or transmitted to a peer from an interface.

Syntax

`show ptp peer [{ethernet node/slot/port[:subport]} | {port-channel port-channel-id}]`

Parameters

- `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information.
- `port-channel port-channel-id`—Enter the port channel ID, from 1 to 999 or 1001 to 2000.

Defaults

None

Command Mode

EXEC

Security and Access

`Netadmin` and `sysadmin`

Usage Information

This command is not applicable for transparent clocks.

Example

```
OS10# show ptp peer
Interface              : Ethernet1/1/22
Total number of peers  : 1
    Peer index : 0
        Peer Clock Identity                  : 00:16:00:ff:fe:00:02:00
        Peer Port number                     : 1
        Peer Port Address                    : 22.0.0.2
        Receiving Interface                  : ethernet1/1/22
        Announce messages transmitted        : 4061
        Announce messages received           : 2372855
        Sync messages transmitted            : 259876
        Sync messages received               : 2372854
        Follow up  messages transmitted      : 0
        Follow up  messages received         : 0
        Delay request messages transmitted   : 74292
        Delay request messages received      : 0
        Delay response messages transmitted  : 0
        Delay response messages received     : 74286
        Management messages transmitted      : 0
        Management messages received         : 0
        Signaling messages transmitted       : 0
        Signaling messages received          : 0
Interface              : Ethernet1/1/23
Total number of peers  : 1
    Peer index : 0
        Peer Clock Identity                  : 00:17:00:ff:fe:00:02:00
        Peer Port number                     : 1
        Peer Port Address                    : 23.0.0.2
        Receiving Interface                  : ethernet1/1/23
        Announce messages transmitted        : 41207
        Announce messages received           : 0
        Sync messages transmitted            : 2637200
        Sync messages received               : 0
        Follow up  messages transmitted      : 0
        Follow up  messages received         : 0
        Delay request messages transmitted   : 0
        Delay request messages received      : 2389638
        Delay response messages transmitted  : 2389638
        Delay response messages received     : 0
        Management messages transmitted      : 0
        Management messages received         : 0
        Signaling messages transmitted       : 0
        Signaling messages received          : 0
```

Supported Releases

10.5.1.0 or later

show ptp servo

Displays PTP servo information such as servo state and lock status.

Syntax `show ptp servo`

Parameters None

Defaults None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information None

Example

```
OS10# show ptp servo
Servo State                    : Locked
Lock Status                    : Phase-locked
```

Supported Releases 10.5.1.0 or later

show ptp time-properties

Displays information about the time scale.

Syntax `show ptp time-properties`

Parameters None

Defaults None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information This command is not applicable for transparent clocks.

Example

```
OS10# show ptp time-properties
Current UTC Offset Valid : False
Current UTC Offset       : 0
Leap 59                  : False
Leap 61                  : False
Time Traceable           : False
Frequency Traceable      : False
PTP Timescale            : False
Time source              : Gps
```

Supported Releases 10.5.1.0 or later

slave

Configures the IP address of PTP slave devices for the master clock.

Syntax `slave` *ip-address*

Parameters *ip-address*—IP address of the slave clock device

Defaults No default IP address; unicast negotiation disabled

Command Mode INTERFACE CONFIGURATION - MASTER submode

Security and Access	`Netadmin` and `sysadmin`
Usage Information	You can configure the IP addresses of multiple slaves. The format of the slave IP address depends on the configured unicast mode. The system reports an error when you configure more than the maximum number of slaves. The `no` form of this command removes the configuration.

Example	`OS10(config)# interface ethernet 1/1/1`
	`OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast master`
	`OS10(conf-ethernet1/1/1-ptp-ipv4-master)# slave 10.10.10.1`
	`OS10(conf-ethernet1/1/1-ptp-ipv4-master)# slave 10.10.10.2`

Supported Releases	10.5.1.0 or later

source

Configures the source IP address for unicast transport from master to slave and slave to master.

Syntax	`source` *ip-address*
Parameters	*ip-address*—Specifies the source IP address for the PTP packets.
Defaults	None
Command Mode	• INTERFACE CONFIGURATION - MASTER submode • INTERFACE CONFIGURATION - SLAVE submode
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command is applicable for unicast transport mode. This configuration is required for an L2 interface. For an L3 interface, if you do not configure the source IP address, the system uses the interface IP address as the source IP address for the PTP packets. The `no` form of this command removes the configuration. **NOTE:** If you are configuring PTP on an OS10 switch that functions as a virtual router, configure the local IP address as the source IP address for unicast transport mode. Do not configure the virtual IP address as the source IP address.

Example - MASTER submode	`OS10(config)# interface ethernet 1/1/1`
	`OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast master`
	`OS10(conf-ethernet1/1/1-ptp-ipv4-master)# source 10.10.10.2`

Example - SLAVE submode	`OS10(config)# interface ethernet 1/1/1`
	`OS10(conf-if-eth1/1/1)# ptp transport ipv4 unicast slave`
	`OS10(conf-ethernet1/1/1-ptp-ipv4-slave)# source 10.10.10.2`

Supported Releases	10.5.1.0 or later

Synchronous Ethernet (SyncE)

Frequency and time synchronization over a network is a key requirement for network service providers. Frequency synchronization over Ethernet interfaces can be achieved in two ways:

- Synchronous Ethernet (SyncE)—SyncE achieves frequency synchronization by recovering clock frequency from the physical layer of Ethernet. SyncE supports the frequency transfer from hop-to-hop.
- Precision Time Protocol (PTP)—PTP achieves frequency synchronization based on the timing event messages.

The advantage of using SyncE for network synchronization as compared to PTP is that it provides high-quality frequency synchronization irrespective of the network load. When SyncE is enabled on the physical Ethernet interface and switch,

frequency recovery from the received signal on the physical line and frequency synchronization is done in the hardware. It uses Synchronization Status Message (SSM) and Ethernet Synchronization Message Channel (ESMC) for clock selection, traceability, and failover. For the SyncE functionality to work correctly, ensure that each network element along the network supports SyncE.

Use hybrid clocking (PTP and SyncE) to frequency synchronize the clock using SyncE, and Time of Day (ToD) and phase synchronization using PTP. For more information, see Hybrid clocking.

NOTE: See Appendix III of ITU G.8262 standard for the list of SyncE compatible interfaces.

Synchronization Status Message (SSM)

Synchronization status message indicates the quality level (QL) of the transmitting clock to the neighboring nodes. Clock quality helps a synchronous Ethernet node derive timing from the most reliable source and prevent timing loops by selecting the clock source with best QL. Benefits of SSM are as follows:

- Provides fast recovery when a part of the network fails by switching to the next best available clock source.
- Ensures that a node derives timing from the most reliable clock source.

Ethernet Synchronization Message Channel (ESMC)

ESMC is the logical channel that uses Ethernet PDU to exchange SSM information over the SyncE link. ESMC packets are received and processed on the SyncE-enabled ports that are configured as clock sources. The clock selection algorithm uses the QL values to select the best clock source.

Supported platforms

OS10 supports SyncE only on the following platforms:

- S5200-ON series: S5224F–ON, S5232F-ON, S5248F-ON, S5296F-ON
- Z9264F-ON
- Z9432F-ON

Standards compliance

OS10 complies with the following standards:

Table 17. Supported standards

Supported standards	Description
G.8261	Timing and synchronization aspects in packet networks. **NOTE:** For G.8261, test cases 12-17 defined in Appendix VI of G.8261 standard can be performed only in a future OS10 release with ITU.G.8275.2 profile support.
G.8262	Timing characteristics of the Synchronous Ethernet Equipment Clock (EEC).
G.8262.1	Timing characteristics of the enhanced Synchronous Ethernet Equipment Clock (eEEC).
G.8264	Distribution of timing information through packet networks.

Clock source selection

The clock selection algorithm selects the best available synchronization source from the Candidate sources. OS10 supports the following clock selection modes:

- QL-enabled
- QL-disabled

Each mode uses different criteria to select the best available clock source. Use the `sync-e mode` command to configure the QL mode to select the clock source for synchronization.

Use the `sync-e esmc` command to enable ESMC capability in the QL-enabled mode.

QL-enabled mode

In the QL-enabled mode, the switch considers the following factors when selecting a clock source on the SyncE-enabled interfaces:

- Clock quality level (QL)
- Clock availability or signal fail through QL-FAILED
- Priority
- External commands (SyncE force switch or manual switch)

In this mode, the switch always selects the clock source with the best QL value. SSM codes indicate the QL values, which are defined for the different regions such as Europe and America (see `sync-e ssm-network-option`). When multiple clock sources are available on the network, a clock source is selected according to the following rules:

- If no external switch commands are active, the switch selects the clock source with the highest QL that does not experience a signal fail condition.
- If multiple clock sources have the same highest QL, the clock source with the highest priority is selected.
- If multiple clock sources have the same highest priority and QL, the switch remains synchronized to the current clock source or an arbitrary clock source from the group is selected.

QL-disabled mode

In the QL-disabled mode, the switch considers the following factors when selecting a clock source on the SyncE-enabled interfaces:

- Clock availability or signal fail through QL-FAILED
- Priority
- External commands (SyncE force switch or manual switch)

When multiple clock sources are available on the network, a clock source is selected according to the following rules:

- If no external switch commands are active, the switch selects the clock source with the highest priority that does not experience a signal fail condition.
- If multiple clock sources have the same highest priority, the switch remains synchronized to the current clock source or an arbitrary clock source from the group is selected.

Manage clock selection

Clock synchronization depends to a large extent on QL or priority of the clock sources. However, you can influence clock selection by modifying the following clock properties:

- Force switch—The switch forcibly selects a clock source regardless of its availability or quality. Use the `sync-e switch force` command to override the currently selected synchronization source. Ensure that the new source clock is enabled and is not locked out. Use the `clear sync-e switch` command to clear the force switch command.
- Manual switch—The switch selects a synchronization source that is in enabled state, not locked out, not in signal fail condition, and has a QL better than Do Not Use (DNU) in QL-enabled mode. In QL-enabled mode, a manual switch is performed only to a source that has the highest available QL. Use the `sync-e switch manual` command to initiate a manual switch. Use the `clear sync-e switch` command to clear the manual switch command.
- Lockout—The clock source is locked and it is not available for the selection process. Use the `sync-e lockout` command to lock a clock source on an interface. Use the `clear sync-e lockout` command to clear the lockout state of an interface so that the clock source on that interface can be considered for selection process.
- Hold-Off Time—When a clock source goes down, the switch waits for the configured hold-off time period before removing the clock source from the clock selection process. The default time period is 300 milliseconds. Use the `sync-e hold-off-time` command to configure the hold-off time.
- Wait-to-Restore Time—The amount of time that the switch waits before considering a previously failed synchronization source as available for the selection process, if it is fault free for the configured time period. The default time period is 300 seconds. Use the `sync-e wait-to-restore-time` command to configure the wait-to-restore time. Use the `clear sync-e wait-restore-time` command to stop the remaining timer and allow the ports to participate in clock selection.

Standby clock source states

Under normal circumstances, all network elements are synced to the active clock source. If the active clock source becomes faulty, a reference source from the available standby clock sources is selected based on the selection algorithm. The standby clock sources work in any of the following states:

- Available—The clock source is operationally up.
- Failed—The clock source is in signal fail state or the SyncE-enabled interfaces do not receive any clock signal. This state can be caused due to link failure, ESMC timeout, or frequency recovery failure.
- Locked—The clock source is not available for the selection process.
- Wait-to-Restore—The clock source has recovered from the signal fail state and is waiting for the wait-to-restore interval to expire so that it can participate in the clock selection process.
- Holdover—The lock status of a system clock when it is not synchronized to any of the reference clock sources.
- Free Run—The temporary state until a valid source is available.
- Acquiring—The state of acquiring lock before moving to either frequency locked or holdover state.

Restrictions and limitations

- SNMP MIBs for ESMC statistics and SyncE events are not supported.
- In a port-channel, the SyncE configuration is supported only on the member ports of the port-channel. SyncE configuration is not supported on the port-channel.
- SyncE is supported only on some specific optics. See Appendix III of ITU G.8262 standard for the list of SyncE compatible interfaces.
- SyncE is not supported on the following 10G SFP+ ports on S5232F-ON platform: 33 and 34. Hence, these ports cannot be used for recovering clock frequency.
- 1G ports are not supported for recovering clock frequency even though an in-accurate clock frequency recovery is possible. Hence, Dell Technologies recommend not to use 1G ports for SyncE.

Sample configurations

The following figure shows a simple topology with SyncE enabled switches, Switch A and Switch B connected to each other through a back-to-back interface. The external clock source SRC-1 is configured with quality level `SSU-A`, and SRC-2 is configured with quality level `PRC`.

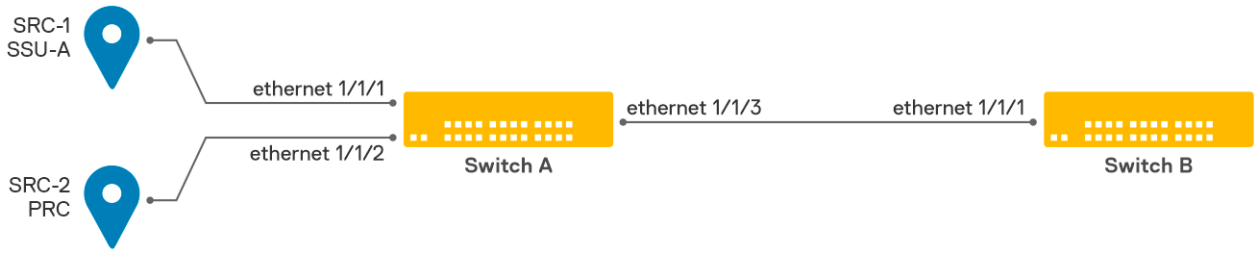

Figure 1. SyncE sample configuration

The following sections explain the minimum configurations that are required to set up different modes of SyncE and hybrid clocking:

- SyncE QL-enabled mode with ESMC and SSM
- SyncE QL-disabled mode
- PTP and SyncE enabled on different Ethernet ports
- PTP and SyncE enabled on same Ethernet ports

Example - SyncE QL-enabled mode with ESMC and SSM

SyncE is configured in the QL-enabled mode and ESMC is enabled on Switch A and Switch B. In this example, Switch A is synchronized to the best input clock source, SRC2 because it has higher QL. This QL value is transmitted from Ethernet interface 1/1/3 to Switch B, which also gets synchronized to the trail of clock source, SRC2.

Switch A configuration

1. Enable SyncE on the switch.

```
SwitchA: configure terminal
SwitchA(config)# sync-e enable
```

2. Set the SyncE mode to QL-enabled.

```
SwitchA(config)# sync-e mode ql-enabled
```

3. Configure the synchronization network. The default value is 1, and it is a synchronization network that is designed for Europe.

```
SwitchA(config)# sync-e ssm-network-option 1
```

4. Enable SyncE on the interfaces that are connected to the clock sources and interfaces transmitting to the neighboring SyncE node.

```
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# sync-e enable
SwitchA(conf-if-eth1/1/1)# exit
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e enable
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e enable
```

5. Enable the ESMC mode on the interfaces that are connected to the clock sources and interfaces transmitting ESMC to the neighboring SyncE nodes.

```
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# sync-e esmc rx-tx
SwitchA(conf-if-eth1/1/1)# exit
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e esmc rx-only
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e esmc tx-only
```

6. Verify the SyncE configuration.

```
SwitchA# show sync-e
QL Mode                           : QL-Enabled

```

Switch B configuration

1. Enable SyncE on the switch.

```
SwitchB: configure terminal
SwitchB(config)# sync-e enable
```

2. Set the SyncE mode to QL-enabled.

```
SwitchB(config)# sync-e mode ql-enabled
```

3. Configure the synchronization network. The default value is 1, and it is a synchronization network that is designed for Europe.

```
SwitchB(config)# sync-e ssm-network-option 1
```

4. Enable SyncE on the interfaces that are connected to the clock sources and interfaces transmitting to the neighboring SyncE node.

```
SwitchB(config)# interface ethernet 1/1/1
SwitchB(conf-if-eth1/1/1)# sync-e enable
```

5. Enable the ESMC mode on the interfaces that are connected to the clock sources and interfaces transmitting ESMC to the neighboring SyncE nodes.

```
SwitchB(config)# interface ethernet 1/1/1
SwitchB(conf-if-eth1/1/1)# sync-e esmc rx-tx
```

6. Verify the SyncE configuration.

```
SwitchB# show sync-e

```

Example - SyncE QL-disabled mode

In this example, SyncE is configured in the QL-disabled mode. In SyncE QL-disabled mode, QL value is not used for clock selection. To select any specific synchronization clock source, you can configure interface-level priority. If the interface-level priority is not configured, an arbitrary reference source from the available valid clock sources is selected.

Switch A is synchronized to the input clock source, SRC2 based on priority configured on Ethernet interface 1/1/2. This synchronized clock frequency is used for further transmission from Ethernet interface 1/1/3 to Switch B, which also gets synchronized to the trail of clock source, SRC2.

Switch A configuration

1. Enable SyncE on the switch.

```
SwitchA: configure terminal
SwitchA(config)# sync-e enable
```

2. Set the SyncE mode to QL-disabled.

```
SwitchA(config)# sync-e mode ql-disabled
```

3. Enable SyncE on the interfaces that are connected to the clock sources and interfaces transmitting to the neighboring SyncE node.

```
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# sync-e enable
SwitchA(conf-if-eth1/1/1)# exit
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e enable
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e enable
```

4. Configure priority on the ports to ensure that the best synchronization clock source is selected.

```
SwitchA(conf-if-eth1/1/2)# sync-e priority 1
```

5. Verify the SyncE configuration.

```
SwitchA# show sync-e
QL Mode                            : QL-Disabled

Example - PTP and SyncE enabled on different Ethernet ports

In this example, SyncE and PTP are enabled on Switch A and Switch B. These switches are connected to input clock sources, SRC1 (QL=SSU-A) and SRC2 (QL=PRC). On Switch A, Ethernet interface 1/1/1 is a PTP-enabled port that is connected to the clock source, SRC 1 (PTP grandmaster). Ethernet interface 1/1/3 is a PTP master port to the neighboring boundary clock, Switch B . SyncE and ESMC are enabled on Ethernet interfaces 1/1/2 and 1/1/3.

As ESMC is enabled, Switch A gets frequency-synchronized to the input clock source, SRC2, and this QL value is transmitted from the Ethernet interface 1/1/3 to Switch B. Switch B also gets synchronized to the trail of clock source SRC2. The PTP boundary clock is phase-locked with its grandmaster clock (SRC1) and gets the Time of the Day (ToD).

Switch A configuration

1. Enable SyncE on the switch.

```
SwitchA: configure terminal
SwitchA(config)# sync-e enable
```

2. Set the SyncE mode to QL-enabled.

```
SwitchA(config)# sync-e mode ql-enabled
```

3. Configure the synchronization network. The default value is 1, and it is a synchronization network that is designed for Europe.

```
SwitchA(config)# sync-e ssm-network-option 1
```

4. Enable SyncE on the interfaces that are connected to the clock sources and interfaces transmitting to the neighboring SyncE node.

```
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e enable
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e enable
```

5. Enable ESMC mode on the interfaces that are connected to the clock sources and interfaces transmitting ESMC to the neighboring SyncE nodes.

```
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e esmc rx-only
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e esmc tx-only
```

6. Configure PTP boundary clock on the switch.

```
SwitchA(config)# ptp clock boundary hybrid profile system-default
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# ptp enable
SwitchA(conf-if-eth1/1/1)# ptp transport layer2
SwitchA(conf-if-eth1/1/1)# ptp role slave
SwitchA(conf-if-eth1/1/1)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# ptp enable
SwitchA(conf-if-eth1/1/3)# ptp transport layer2
SwitchA(conf-if-eth1/1/3)# ptp role master
```

7. Verify the SyncE configuration.

```
SwitchA# show sync-e

9. Verify the PTP state and lock status.

```
switchA# show ptp servo
Servo State : Locked
Lock Status : Phase-locked
```

Switch B configuration

1. Enable SyncE on the switch.

```
SwitchB: configure terminal
SwitchB(config)# sync-e enable
```

2. Enable SyncE mode of QL operation.

```
SwitchB(config)# sync-e mode ql-enabled
```

3. Configure the SSM network option (default is option-1 for Europe).

```
SwitchB(config)# sync-e ssm-network-option 1
```

4. Enable SyncE on the interfaces that are connected to the clock sources and interfaces transmitting to the neighboring SyncE node.

```
SwitchB(config)# interface ethernet 1/1/1
SwitchB(conf-if-eth1/1/2)# sync-e enable
```

5. Enable ESMC mode on the interfaces that are connected to the clock sources and interfaces transmitting ESMC to the neighboring SyncE nodes.

```
SwitchB(config)# interface ethernet 1/1/1
SwitchB(conf-if-eth1/1/1)# sync-e esmc rx-only
```

6. Configure PTP boundary clock on the switch.

```
SwitchB(config)# ptp clock boundary hybrid profile system-default
SwitchB(config)# interface ethernet 1/1/1
SwitchB(conf-if-eth1/1/1)# ptp enable
SwitchB(conf-if-eth1/1/1)# ptp transport layer2
SwitchB(conf-if-eth1/1/1)# ptp role slave
```

Example - PTP and SyncE enabled on same Ethernet ports

In this example, SyncE and PTP are enabled on Switch A and Switch B. PTP boundary clock is enabled on the switches. On Switch A, Ethernet interface 1/1/1 is a PTP-enabled port that is connected to the clock source, SRC-2 (PTP grandmaster). Ethernet interface 1/1/3 is a PTP master port to the neighboring boundary clock, Switch B . SyncE and ESMC are enabled on Ethernet ports, 1/1/1, 1/1/2, and 1/1/3.

Switch A gets synchronized to the best available input clock source, SRC-2, and this QL value is transmitted from the Ethernet interface 1/1/3 to Switch B. Switch B also gets synchronized to the trail of clock source SRC2. The PTP boundary clock is phase-locked with its grandmaster clock (SRC-2) and gets the Time of the Day (ToD).

Switch A configuration

1. Enable SyncE on the switch.

```
SwitchA: configure terminal
SwitchA(config)# sync-e enable
```

2. Set the SyncE mode to QL-enabled.

```
SwitchA(config)# sync-e mode ql-enabled
```

3. Configure the synchronization network. The default value is 1, and it is a synchronization network that is designed for Europe.

```
SwitchA(config)# sync-e ssm-network-option 1
```

4. Enable SyncE on the interfaces that are connected to the clock sources and interfaces transmitting to the neighboring SyncE node.

```
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# sync-e enable
SwitchA(conf-if-eth1/1/1)# exit
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e enable
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e enable
```

5. Enable ESMC mode on the interfaces that are connected to the clock sources and interfaces transmitting ESMC to the neighboring SyncE nodes.

```
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# sync-e esmc rx-tx
SwitchA(conf-if-eth1/1/1)# exit
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# sync-e esmc rx-only
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/3
SwitchA(conf-if-eth1/1/3)# sync-e esmc tx-only
```

6. Configure PTP boundary clock on the switch.

```
SwitchA(config)# ptp clock boundary hybrid profile system-default
SwitchA(config)# interface ethernet 1/1/1
SwitchA(conf-if-eth1/1/1)# ptp enable
SwitchA(conf-if-eth1/1/1)# ptp transport layer2
SwitchA(conf-if-eth1/1/1)# ptp role slave
SwitchA(conf-if-eth1/1/2)# exit
SwitchA(config)# interface ethernet 1/1/2
SwitchA(conf-if-eth1/1/2)# ptp enable
```

```
SwitchA(conf-if-eth1/1/2)# ptp transport layer2
SwitchA(conf-if-eth1/1/2)# ptp role slave
```

7. Verify the SyncE configuration.

```
SwitchA# show sync-e

```

SyncE commands

clear sync-e counters

Resets the statistics of the ESMC packets received at or transmitted from an interface.

Syntax	`clear sync-e counters [ethernet node/slot/port]`
Parameters	`ethernet node/slot/port`—(Optional) Enter a physical Ethernet interface.
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	The `ethernet` parameter is optional. If it is not specified, the counters are cleared on all the SyncE interfaces.
Example	`OS10# clear sync-e counters ethernet 1/1/1`
Supported Releases	10.5.2.1 or later

clear sync-e lockout

Clears the lockout state of a specific interface or all interfaces.

Syntax	`clear sync-e lockout [ethernet node/slot/port]`
Parameters	`ethernet node/slot/port`—(Optional) Enter a physical Ethernet interface.
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command clears the lockout state on a specific interface or all the interfaces. After clearing the lockout status, the SyncE clock source on the interface is considered available for the selection process.
Example	`OS10# clear sync-e lockout ethernet 1/1/1`
Supported Releases	10.5.2.1 or later

clear sync-e switch

Clears the manual or forced selection of a clock source.

Syntax	`clear sync-e switch`

Parameters	None
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command clears the active manual or force switched clock reference. Clearing the force-switch reinitiates the clock selection process.
Example	`OS10# clear sync-e switch`
Supported Releases	10.5.2.1 or later

clear sync-e wait-restore-time

Clears the wait-to-restore state of a specific interface or all interfaces.

Syntax	`clear sync-e wait-restore-time [ethernet` *node/slot/port*`]`
Parameters	`ethernet` *node/slot/port*—(Optional) Enter a physical Ethernet interface.
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	Use this command to reset the timer for a specific interface or all the interfaces that are in the wait-to-restore state. Clearing this timer makes the clock sources to be available for the selection process immediately.
Example	`OS10# clear sync-e wait-restore-time ethernet 1/1/1`
Supported Releases	10.5.2.1 or later

debug sync-e

Enables debug logs for G.781 and ESMC (G.8264).

Syntax	`[no] debug sync-e {all | esmc | g781}`
Parameters	• `all`—Enables all debug logs of the system. • `esmc`—Enables ESMC-related debug logs. • `g781`—Enables G.781-related debug logs.
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	The debug log messages are logged in the `/var/log/synce.log` file.
Example	`OS10# debug sync-e esmc`
Supported Releases	10.5.2.1 or later

show debug sync-e

Shows the debug options enabled for Sync-E.

Syntax	`show debug sync-e`
Parameters	None
Default	None
Command Mode	EXEC
Usage Information	None

Example	`OS10# show debug sync-e`
	`sync-e debug settings:`
	`debug sync-e all`

Supported Releases	10.5.2.1 or later

show sync-e

Displays the SyncE information and synchronization status.

Syntax	`show sync-e`
Parameters	None
Default	None
Command Mode	EXEC
Usage Information	Use this command to view the SyncE information such as lock status, selection process state, selected references (primary and secondary), selected QL, and information about each clock sources. The following selection process states are displayed in the output: ● Selection Process State ○ State 1A: QL-enabled mode, no active switch request. ○ State 1B: QL-enabled mode, active manual switch request. ○ State 1C: QL-enabled mode, active forced switch. ○ State 2A: QL-disabled mode, no active switch request. ○ State 2B: QL-disabled mode, active manual switch request. ○ State 2C: QL-disabled mode, active forced switch request. To know more about the working states of the clock sources, see Clock source states.

Example - QL-enabled mode	`OS10# show sync-e`
	`QL Mode : QL-Enabled`
	`Lock Status : Locked`
	`QL Out : QL-SSU-A`
	`Selection Process State : State 1A (QL-enabled and no active switch request)`
	`Primary Reference Interface : Ethernet1/1/1`
	`Secondary Reference Interface : Ethernet1/1/2`
	`Selected Reference Clock Identity : 3c:2c:30:ff:fe:04:05:80`
	`Local Clock Identity : d8:9e:f3:ff:fe:ab:47:20`
	`SSM Network Option : Option-1`
	`Hold-off Time : 300 ms`
	`Wait-To-Restore Time : 300 secs`
	`SyncE Interfaces`
	`---`
	`Interface Priority QL Signal State State Status`
	`---`
	`Eth1/1/1 128 QL -SSU -A Up Available Primary`
	`Eth1/1/2 128 QL -SSU -A Up Available Secondary`

```
  Eth1/1/3   128       QL -EEC1     Up       Available   -
  Eth1/1/4   128       QL -EEC1     Up       Available   -
-------------------------------------------------------------------------
```

Example - QL-disabled mode

```
OS10# show sync-e
QL Mode                           : QL-Disabled
Lock Status                       : Locked
QL Out                            : -
Selection Process State           : State 2A (QL-disabled and no active
switch request)
Primary Reference Interface       : Ethernetl/1/2
Secondary Reference Interface     : Ethernet1/1/1
Selected Reference Clock Identity : -
Local Clock Identity              : d8:9e:f3:ff:fe:ab:47:20
55M Network Option                : Option-1
Hold-off Time                     : 300 ms
Wait-To-Restore Time              : 300 secs
SyncE Interfaces
-------------------------------------------------------------------------
 Interface Priority   QL   Signal        State              Status
                           State
-------------------------------------------------------------------------
 Eth1/1/1     128     -      Up        Available           Secondary
 Eth1/1/2     128     -      Up        Available           Primary
-------------------------------------------------------------------------
```

Supported Releases 10.5.2.1 or later

show sync-e counters

Displays the count of SyncE packets that are received at, discarded, or transmitted from a specific interface or all interfaces.

Syntax `show sync-e counters [ethernet node/slot/port]`

Parameters `ethernet node/slot/port`—(Optional) Enter a physical Ethernet interface.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show sync-e counters ethernet 1/1/10:1
Interface  :  ethernet1/1/10:1
Number of event packets transmitted         : 1
Number of event packets received            : 0
Number of Tx event packets discarded        : 0
Number of Rx event packets discarded        : 0
Number of information packets transmitted   : 8770
Number of information packets received      : 11271
Number of Tx information packets discarded  : 0
Number of Rx information packets discarded  : 0
Number of invalid packets discarded         : 0
Summary:
Transmitted packets                         : 8771
Received packets                            : 11271
Discarded packets                           : 0
```

Supported Releases 10.5.2.1 or later

show sync-e esmc

Displays the ESMC information of all interfaces.

Syntax `show sync-e esmc`

Parameters None

Default None

Command Mode EXEC

Usage Information This command prints the output of the interfaces only if ESMC and SyncE are enabled on the interfaces and SyncE globally.

Example

```
OS10# show sync-e esmc
Codes: EEC # - Number of cascaded  EECs, eEEC # - Number of cascaded eEECs
-------------------------------------------------------------------------------
Interface     Mode      QL Rx      QL Tx    Clock Source Identity    Lag   EEC # e
                                                                     Name
-------------------------------------------------------------------------------
Eth1/1/5    Disabled       -          -                -             -     0
Eth1/1/1    Rx and Tx   QL-SSU-A   QL-PRC   3c:2c:30:ff:fe:04:07:00  po1    0
Eth1/1/2    Rx and Tx   QL-SSU-A   QL-PRC   3c:2c:30:ff:fe:04:07:00  po1    0
Eth1/1/3    Rx and Tx   QL-PRC     QL-DNU   3c:2c:30:ff:fe:04:07:00  po1    0
Eth1/1/4    Rx and Tx   QL-SSU-B   QL-DNU   3c:2c:30:ff:fe:04:07:00  po1    0
-------------------------------------------------------------------------------
```

Supported Releases 10.5.2.1 or later

show sync-e interface

Displays the SyncE configuration and status of a specific interface or all interfaces.

Syntax `show sync-e interface [ethernet node/slot/port]`

Parameters `ethernet node/slot/port`—(Optional) Enter a physical Ethernet interface.

Default None

Command Mode EXEC

Usage Information This command prints output only when SyncE is enabled globally and on the interfaces.

Example - QL-enabled mode

```
OS10# show sync-e interface ethernet 1/1/1
Interface : Ethernetl/1/1
  SyncE                : Enabled
  State                : Available
  Status               : Primary
  Signal State         : Up
  Priority             : 128
  ESMC Capability      : Rx and Tx
  QL                   : QL-SSU-A
  QL Received          : QL-SSU-A
  QL Transmitted       : QL-DNU
  Hold-off Time        : 300 ms
  Wait-To-Restore Time : 5 secs
```

Example - QL-disabled mode

```
OS10# show sync-e interface
Interface : Ethernetl/1/1
  SyncE                : Enabled
  State                : Available
  Status               : Secondary
  Signal State         : Up
  Priority             : 128
```

```
  ESMC Capability      : -
  QL                   : -
  QL Received          : -
  QL Transmitted       : -
  Hold-off Time        : 300 ms
  Wait-To-Restore Time : 300 secs
Interface : Ethernetl/1/2
  SyncE                : Enabled
  State                : Available
  Status               : Primary
  Signal State         : Up
  Priority             : 128
  ESMC Capability      : -
  QL                   : -
  QL Received          : -
  QL Transmitted       : -
  Hold-off Time        : 300 ms
  Wait-To-Restore Time : 300 secs
```

Supported Releases 10.5.2.1 or later

sync-e enable

Enables Synchronous Ethernet (SyncE) globally on a switch or on a physical interface.

Syntax `[no] sync-e enable`

Parameters None

Default Disabled

Command Mode
- CONFIGURATION
- INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information When you enable SyncE globally on a switch, it is enabled by default in the QL-Disabled mode. Enabling SyncE on interfaces permits the clock sources that are connected to those interfaces to participate in the clock selection process. You can enable SyncE only on the physical interfaces. The `no` form of this command removes the configuration.

Example - Enable SyncE globally

```
OS10(config)# sync-e enable
```

Example - Enable SyncE on a physical interface

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# sync-e enable
```

Supported Releases 10.5.2.1 or later

sync-e esmc

Enables Ethernet Synchronization Messaging Channel (ESMC) capability on an interface.

Syntax `[no] sync-e esmc {disable | rx-only | rx-tx | tx-only}`

Parameters
- `disable`—Disables ESMC capability on an interface.
- `rx-only`—Configures an interface to receive ESMC quality level (QL) values for participating in clock selection process.
- `rx-tx`—Configures an interface to receive and transmit ESMC QL values.
- `tx-only`—Configures an interface to transmit ESMC QL values to the next node.

Default	Disabled
Command Mode	INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	Ensure to enable SyncE on the interfaces for ESMC to work on the interfaces. When ESMC capability is disabled, it indicates that the interface is not going to receive or transmit QL. In that case, QL of the interface can be configured using the `sync-e quality-level` command. The `no` form of this command removes the configuration.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# sync-e esmc rx`
Supported Releases	10.5.2.1 or later

sync-e esmc-ext-ql-tlv disable

Disables extended QL TLV for the ESMC transmit messages.

Syntax	`[no] sync-e esmc-ext-ql-tlv disable`
Parameters	None
Default	Extended QL TLV is enabled in ESMC transmit messages
Command Mode	INTERFACE CONFIGURATION
Security and Access	`netadmin` and `sysadmin`
Usage Information	Incoming ESMC messages with extended QL TLV are processed regardless of whether extended QL TLV configuration is disabled or not. The `no` version of this command reenables QL TLV support for the ESMC transmit messages.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# sync-e esmc-ext-ql-tlv disable`
Supported Releases	10.5.2.6 or later

sync-e hold-off-time

Configures hold-off time interval.

Syntax	`[no] sync-e hold-off-time` *`milliseconds`*
Parameters	*`milliseconds`*—Enter the hold-off time interval in milliseconds, from 300 to 1800.
Default	300
Command Mode	• CONFIGURATION • INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command enables hold-off time for the SyncE interfaces. The hold-off-time is the time period for which the switch waits before removing the clock source from the clock selection process when it goes down. The clock selection process is triggered after the hold-off time to select the new synchronization clock source. The switch might be in holdover state during the reference switch from one clock source to another. In QL-disabled mode, signal fail is sent to the selection process after the hold-off time. In QL-enabled mode, QL value of QL-FAILED signal is sent to the selection process after the hold-off time. In the meantime, previous QL value is passed to selection process. QL values other than QL-FAILED is

passed to selection process immediately. The interface level hold-off-time value takes precedence over the global hold-off-time value. The `no` form of this command removes the configuration.

Example - Global level

```
OS10(config)# sync-e hold-off-time 400
```

Example - Interface level

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# sync-e hold-off-time 500
```

Supported Releases 10.5.2.1 or later

sync-e lockout

Locks out clock source on an interface for the selection process.

Syntax `sync-e lockout [ethernet node/slot/port]`

Parameters `ethernet node/slot/port`—(Optional) Enter a physical Ethernet interface.

Default None

Command Mode EXEC

Security and Access `Netadmin` and `sysadmin`

Usage Information Ensure that SyncE is enabled on the interface before running this command. If you disable SyncE on a locked out interface, the lock out status of the interface is reset. If you disable SyncE globally on the switch, the lock out status of the locked out interfaces is reset.

Example

```
OS10# sync-e lockout ethernet 1/1/1
```

Supported Releases 10.5.2.1 or later

sync-e mode

Configures the quality level (QL) mode to select the clock source for synchronization.

Syntax `[no] sync-e mode {ql-disabled | ql-enabled}`

Parameters

- `ql-disabled`—Configures clock selection based on priority.
- `ql-enabled`—Configures clock selection based on QL and priority.

Default ql-disabled

Command Mode CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information By default, the QL mode is set to `ql-disabled` and the priority value is used to select the clock source. When you configure the `ql-enabled` mode, the received QL value is used to select the clock source. The `no` form of this command removes the configuration.

Example

```
OS10(config)# sync-e mode ql-enabled
```

Supported Releases 10.5.2.1 or later

sync-e priority

Configures the priority for the clock source of an interface.

Syntax `[no] sync-e priority priority-number`

Parameters *priority-number*—Enter the priority for the clock source, from 1 to 254. The lower number denotes a higher priority.

Default 128

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information This command configures the preference of one timing source over the other during the selection process. The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# sync-e priority 1
```

Supported Releases 10.5.2.1 or later

sync-e quality-level

Configures quality level on an interface.

Syntax `[no] sync-e quality-level value`

Parameters *value*—Enter quality level value. The supported values vary depending on the synchronization network that is selected using the `sync-e ssm-network-option` command.

- Supported quality-levels in option 1 SSM network: QL-ePRTC, QL-PRTC, QL-ePRC, QL-PRC, QL-SSU-A, QL-SSU-B, QL-eEEC, QL-EEC1 and QL-DNU.
- Supported quality-levels in option 2 SSM network: QL-ePRTC, QL-PRTC, QL-ePRC, QL-PRS, QLSTU, QL-ST2, QL-TNC, QL-ST3E, QL-EEC2, QL-ST3, QL-PROV and QL-DUS.

Default

- Option 1 SSM network—QL-eEEC
- Option 2 SSM network—QL-STU.

Command Mode INTERFACE CONFIGURATION

Security and Access `Netadmin` and `sysadmin`

Usage Information The configured QL value is used for the source selection when ESMC is disabled in QL-Enabled mode. If ESMC is enabled on the interface or QL mode is set to QL-Disabled, configured QL value is ignored. The `no` form of this command removes the configuration.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# sync-e quality-level ql-ssu-a
```

Supported Releases 10.5.2.1 or later

sync-e ssm-network-option

Configures the synchronization network.

Syntax `[no] sync-e ssm-network-option {1 | 2}`

Parameters

- `1`—Enable synchronization network designed for Europe. The following clock source QL values are supported for this SSM network: QL-ePRTC, QL-PRTC, QL-ePRC, QL-PRC, QL-SSU-A, QL-SSU-B, QL-eEEC, QL-EEC1 and QL-DNU.

- 2—Enable synchronization network designed for US. The following clock source QL values are supported for this SSM network: QL-ePRTC, QL-PRTC, QL-ePRC, QL-PRS, QLSTU, QL-ST2, QL-TNC, QL-ST3E, QL-EEC2, QL-ST3, QL-PROV and QL-DUS.

Default	1
Command Mode	CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	You cannot change the network option when a mismatching QL configuration exists on an interface. See `sync-e quality-level`. The `no` form of this command removes the configuration.
Example	`OS10(config)# sync-e ssm-network-option 2`
Supported Releases	10.5.2.1 or later

sync-e switch force

Configures the switch to use a SyncE clock source on a specific interface, regardless of the clock quality or availability.

Syntax	`sync-e switch force [ethernet` *`node/slot/port`*`]`
Parameters	`ethernet` *`node/slot/port`*—Enter a physical Ethernet interface.
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command configures a switch to use the clock source that is enabled and not locked out.
Example	`OS10# sync-e switch force ethernet 1/1/1`
Supported Releases	10.5.2.1 or later

sync-e switch manual

Configure the switch to select the clock source on the interface manually.

Syntax	`sync-e switch manual [ethernet` *`node/slot/port`*`]`
Parameters	`ethernet` *`node/slot/port`*—Enter a physical Ethernet interface.
Default	None
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	Use this command to manually select the clock source on the interface, provided the quality level of clock source is not lesser than the selected source. In QL-enabled mode, a manual switch can be performed only to a source that has the highest QL.
Example	`OS10# sync-e switch manual ethernet 1/1/1`
Supported Releases	10.5.2.1 or later

sync-e vlan

Configures a VLAN for SyncE-enabled interface.

Syntax	`[no] sync-e vlan vlan-id`
Parameters	*vlan-id*—Enter a VLAN number from 1 to 4093.
Default	None
Command Mode	INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	You can configure a VLAN per SyncE-enabled interface. When you configure a VLAN for SyncE, VLAN tag is added in the ESMC packets if the configured VLAN is present in the allowed VLAN list of interfaces in the trunk mode. Untagged ESMC packets are transmitted if VLAN for SyncE is not configured or if the configured VLAN for SyncE is not present in the allowed VLAN list of interfaces in the trunk mode. The `no` form of this command removes the configuration.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# sync-e vlan 20`
Supported Releases	10.5.2.3 or later

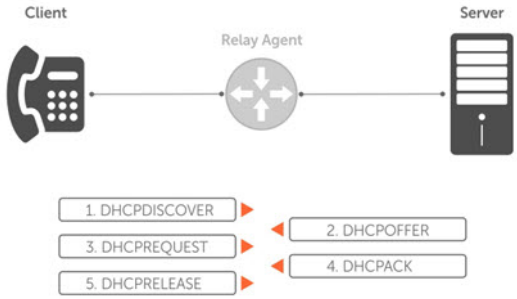
sync-e wait-to-restore-time

Configures the wait-to-restore time period for the failed clock sources.

Syntax	`[no] sync-e wait-to-restore-time seconds`
Parameters	*seconds*—Enter the wait-to-restore time interval in seconds, from 0 to 720.
Default	300
Command Mode	• CONFIGURATION • INTERFACE CONFIGURATION
Security and Access	`Netadmin` and `sysadmin`
Usage Information	This command configures the time period for a previously failed synchronization source to be up before it is again considered selection process. For an input clock to transition out of the signal fail state, it must be fault-free for the wait-to-restore time. Use the `clear sync-e wait-restore-time` command to clear the wait-to-restore timer. The interface-level wait-to-restore value takes precedence over the global wait-to-restore value. The `no` form of this command removes the configuration.
Example	`OS10(config)# sync-e wait-to-restore-time 3`
Supported Releases	10.5.2.1 or later

Dynamic Host Configuration Protocol

Dynamic Host Configuration Protocol (DHCP) is an application layer protocol that dynamically assigns IP addresses and other configuration parameters to network end-stations, also known as hosts, based on configuration policies network administrators determine.



DHCP server	Network device offering configuration parameters to the client.
DHCP client	Network device requesting configuration parameters from the server.
Relay agent	Intermediary network device that passes DHCP messages between the client and the server when the server is not on the same subnet as the host.

If you attempt to enable (start) the DHCP server with an incorrect configuration, you must re-enable the DHCP server after you enter the correct configuration.

Consider the following example, and assume that no interface matches either one of the network pools, netdhcp1 and netdhcp2:

```
OS10# show running-configuration ip dhcp
!
ip dhcp server
no disable
!
pool netdhcp1
lease infinite
network 35.1.1.0/24
!
pool netdhcp2
network 40.1.1.0/24
OS10# show ip interface brief
Interface Name IP-Address OK Method Status
Protocol
================================================================================
===
Ethernet 1/1/1 unassigned YES unset up
up
Ethernet 1/1/2 unassigned YES unset up
up
…
Ethernet 1/1/32 unassigned NO unset up down
…
```

To resolve this issue, you must:

1. Configure a matching interface for pool netdhcp2-40.1.1.1/24 matches 40.1.1.0/24.

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 40.1.1.1/24
```

2. Run the show ip interface brief command to verify if an IP address is assigned to ethernet 1/1/2 port.

```
OS10# show ip interface brief
Interface Name IP-Address OK Method Status
Protocol
================================================================================
=====
Ethernet 1/1/1 unassigned YES unset up
up
Ethernet 1/1/2 40.1.1.1/24 YES manual up
up
…
```

3. Re-enable the DHCP server because it failed to start initially.

```
OS10# configure terminal
OS10(config)# ip dhcp server
OS10(config-dhcp)# disable
OS10(config-dhcp)# no disable
OS10(config-dhcp)#
```

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

- Before you configure a DHCP address pool, you must configure a DHCP server interface with an IP address in the range that is used in the DHCP address pool. If you configure the DHCP address pool first, and then configure a DHCP server interface, to enable automatic DHCP address allocation, you must restart the DHCP service using the disable and no disable commands. Select one of the choices for successfully configuring a DHCP address pool:
  - Configure manual binding for a host/hardware MAC address in the IP address range that is used for the DHCP pool.
  - Configure a network statement with a valid IP address range.
- DHCP client is enabled by default on the management interface. The management interface automatically tries to obtain an IP address from a DHCP server. To manually configure an IP address on the management port, disable the DHCP client using the no ip address dhcp command in Interface mode
- The DHCP server does not start unless at least one interface matches one of the configured network pools. An interface matches a network pool when you include the IP address in the subnet that is defined for that network pool. For example, an interface with IP address 10.1.1.1/24 matches a pool that is configured with network 10.1.1.0/24.

Packet format and options

The DHCP server listens on port 67 and transmits to port 68. The DHCP client listens on port 68 and transmits to port 67.

In the DHCP packet format, configuration parameters are options in the DHCP packet in type, length, value (TLV) format. To limit the number of parameters that servers provide, hosts enter the parameters that they require and the server sends only those parameters. DHCP uses the User Datagram Protocol (UDP) as its transport protocol.

The following options are commonly used in DHCP packets.

DHCP Option	Description
Subnet mask	1 — Subnet mask of the client
Router	3 — Router IP addresses that serve as the default gateway for the client
Domain name server	6 — Domain name servers (DNS) that are available to the client
Domain name	15 — Domain name that clients use to resolve hostnames via DNS
IP address lease time	51 — Amount of time that the client uses an assigned IP address
DHCP message type	53: • 1 — DHCPDISCOVER • 2 — DHCPOFFER • 3 — DHCPREQUEST

DHCP Option	Description
	• 4 — DHCPDECLINE • 5 — DHCPACK • 6 — DHCPNACK • 7 — DHCPRELEASE • 8 — DHCPINFORM
Parameter request list	55 — A list of parameters that a DHCP client requires from the DHCP server. This is a series of octets where each octet is a DHCP option code
Renewal time	58 — Amount of time, after the IP address is granted, that the client attempts to renew its lease with the *original* server
Rebinding time	59 — Amount of time, after the IP address is granted, that the client attempts to renew its lease with *any* server, if the original server does not respond
Vendor class identifier	60 — User-defined string the Relay Agent uses to forward DHCP client packets to a specific DHCP server
DHCP relay agent information option	82 — Helps secure DHCP traffic that goes through a DHCP relay agent, and ensures that communication between the DHCP relay agent and the DHCP server is not compromised.
User port stacking	230 — Stacking option variable that provides the DHCP server stack-port details when the DHCP offer is set
End	255 — Signal of the last option in the DHCP packet

DHCP server

The Dynamic Host Configuration Protocol (DHCP) server provides network configuration parameters to DHCP clients on request. A DHCP server dynamically allocates four required IP parameters to each system on the virtual local area network (VLAN)—the IP address, network mask, default gateway, and name server address. DHCP IP address allocation works on a client/server model where the server assigns the client reusable IP information from an address pool.

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP makes it easier to add new devices to the network. The DHCP access service provides a centralized, server-based setup to add clients to the network. This setup means you do not have to create and maintain IP address assignments to clients manually.

When you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses you need. DHCP manages the IP address pool by leasing an IP address to a host for a limited period, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that connects to the network and eliminates duplicate resource assignments.

NOTE: The implementation of DHCP server supports IPv4 and IPv6 addresses.

DHCPv6 server

A Dynamic Host Configuration Protocol version 6 (DHCPv6) server is the IPv6 equivalent of the DHCP server for IPv4. It is used to automatically allocate IPv6 addresses and distribute network configuration information to IPv6 hosts in a network. You can configure IPv6 pools with various configurations such as lease time, DNS server, and other user-defined options using DHCPv6.

Automatic address allocation

Automatic address allocation is an address assignment method that the DHCP server uses to lease an IP address to a client from a pool of available addresses. You cannot configure an empty DHCP pool under a DHCP pool configuration. For a successful commit, you must have either a network statement or host/hardware-address (manual binding) configuration. An IP address pool is a range of addresses that the DHCP server assigns. Both IPv4 and IPv6 DHCP pool configuration is supported. The subnet number indexes the address pools.

1. Enable the DHCP server in CONFIGURATION mode.

```
ip dhcp server
```

2. Create an IP address pool and provide a name in DHCP mode.

```
pool name
```

3. Enter the subnet from which the DHCP server may assign addresses in DHCP *POOL* mode. The `network` option specifies the subnet address. The `prefix-length` option specifies the number of bits used for the network portion of the address; for IPv4 addresses, the valid values are from 17 to 30.

```
network network/prefix-length
```

4. Enter a range of IP addresses from the subnet specified above, which the DHCP server uses to assign addresses in DHCP <*POOL*> mode.

```
range {ip-address1 [ip-address2]}
```

NOTE: Configure at least one interface to match one of the configured network pools. An interface matches a network pool when its IP address is included in the subnet defined for that network pool. For example, an interface with IP address 10.1.1.1/24 matches a pool configured with network 10.1.1.0/24. For the DHCP server to process DHCP discovery packets, you must configure the IP address pool that matches the interfaces where packets are received. This configuration applies even though the leased IP addresses are meant for a totally different subnet.

DHCP server automatic address allocation

```
OS10(config)# ip dhcp server
OS10(config-dhcp)# pool Dell
OS10(config-dhcp-Dell)# default-router 20.1.1.1
OS10(config-dhcp-Dell)# network 20.1.1.0/24
OS10(config-dhcp-Dell)# range 20.1.1.2 20.1.1.8
```

Show running configuration

```
OS10(conf-dhcp-Dell)# do show running-configuration
...
!
ip dhcp server
 !
 pool Dell
  network 20.1.1.0/24
  default-router 20.1.1.1
  range 20.1.1.2 20.1.1.8
```

Address lease time

Use the `lease {days [hours] [minutes] | infinite}` command to configure an address lease time. The default is 24 hours.

```
OS10(config)# ip dhcp server
OS10(conf-dhcp)# pool Dell
OS10(conf-dhcp-Dell)# lease 36
```

Default gateway

Ensure the IP address of the default router is on the same subnet as the client.

1. Enable DHCP server-assigned dynamic addresses on an interface in CONFIGURATION mode.

```
ip dhcp server
```

2. Create an IP address pool and provide a name in DHCP mode.

```
pool name
```

3. Enter the default gateway(s) for the clients on the subnet in order of preference in DHCP<*POOL*> mode.

```
default-router address
```

Change default gateway name

```
OS10(config)# ip dhcp server
OS10(conf-dhcp)# pool Dell
OS10(conf-dhcp-Dell)# default-router 20.1.1.1
```

Enable the DHCP server

Use the `ip dhcp server` command to enable DHCP server-assigned dynamic addresses on an interface in CONFIGURATION mode. The DHCP server is disabled by default.

```
OS10(config)# ip dhcp server
OS10(conf-dhcp)# no disable
```

Hostname resolution

You have two choices for hostname resolution — domain name server (DNS) or NetBIOS Windows internet naming service (WINS). Both DHCP and WINS clients query IP servers to compare hostnames to IP addresses.

1. Enable DHCP server-assigned dynamic addresses on an interface in CONFIGURATION mode.

```
ip dhcp server
```

2. Create an IP address pool and enter the name in DHCP mode.

```
pool name
```

3. Create a domain and enter the domain name in DHCP <*POOL*> mode.

```
domain-name name
```

4. Enter the DNS servers in order of preference that is available to a DHCP client in DHCP <*POOL*> mode.

```
dns-server address
```

DNS address resolution

```
OS10(config)# ip dhcp server
OS10(conf-dhcp)# pool Dell
OS10(conf-dhcp-Dell)# domain-name dell.com
OS10(conf-dhcp-Dell)# dns-server 192.168.1.1
```

NetBIOS WINS address resolution

DHCP clients can be one of four types of NetBIOS nodes — broadcast, peer-to-peer, mixed, or hybrid. Dell Technologies recommends using hybrid as the NetBIOS node type.

1. Enable DHCP server-assigned dynamic addresses on an interface in CONFIGURATION mode.

```
ip dhcp server
```

2. Create an IP address pool and enter the pool name in DHCP mode.

```
pool name
```

3. Enter the NetBIOS WINS name servers in the order of preference that they are available to DHCP clients in DHCP <*POOL*> mode.

```
netbios-name-server ip-address
```

4. Enter the keyword `Hybrid` as the NetBIOS node type in DHCP <*POOL*> mode.

```
netbios-node-type type
```

Configure NetBIOS WINS address resolution

```
OS10(config)# ip dhcp server
OS10(conf-dhcp)# pool Dell
OS10(conf-dhcp-Dell)# netbios-name-server 192.168.10.5
OS10(conf-dhcp-Dell)# netbios-node-type Hybrid
```

Manual binding entries

Address binding is a mapping between the IP address and the media access control (MAC) address of a client. The DHCP server assigns the client an available IP address automatically and then creates an entry in the binding table. You can also manually create an entry for a client. Manual bindings help to guarantee that a particular network device receives a particular IP address.

Consider manual bindings as single-host address pools. There is no limit to the number of manual bindings, but you can only configure one manual binding per host. Manual binding entries do not display in the `show ip dhcp binding` output.

1. Create an address pool in DHCP mode.

```
pool name
```

2. Enter the client IP address in DHCP <*POOL*> mode.

```
host address
```

3. Enter the client hardware address in DHCP <*POOL*> mode.

```
hardware-address hardware-address
```

Configure manual binding

```
OS10(config)# ip dhcp server
OS10(conf-dhcp)# pool static
OS10(conf-dhcp-static)# host 20.1.1.2
OS10(conf-dhcp-static)# hardware-address 00:01:e8:8c:4d:0a
```

View the DHCP binding table

```
OS10# show ip dhcp binding
  IP Address        Hardware address     Lease expiration        Hostname
+-------------------------------------------------------------------------
11.1.1.254        00:00:12:12:12:12 Jan 27 2016 06:23:45

Total Number of Entries in the Table = 1
```

With a fixed host configuration, also known as manual binding, you must configure a network pool with a matching subnet. The static host-to-MAC address mapping pool inherits the network mask from the network pool with subnet configuration, which includes the host's address range.

In the following example, the pool `host1`, which is the fixed host mapping pool, inherits the subnet and other attributes from the pool `hostnetwork`, which is the DHCP client IP address pool. There is no matching network pool for `host2`. Therefore, the DHCP client with the MAC address `00:0c:29:aa:22:f4` does not obtain the correct parameters.

```
OS10# show running-configuration interface ethernet 1/1/2
!
interface ethernet1/1/2
no shutdown
no switchport
```

```
ip address 100.1.1.1/24
flowcontrol receive off

OS10# show running-configuration ip dhcp
!
ip dhcp server
no disable
!
pool host1
host 100.1.1.34
hardware-address 00:0c:29:ee:4c:f4
!
pool hostnetwork
lease infinite
network 100.1.1.0/24
!
pool host2
host 20.1.1.34
hardware-address 00:0c:29:aa:22:f4
```

View DHCP Information

Use the `show ip dhcp binding` command to view the DHCP binding table entries.

```
OS10# show ip dhcp binding
  IP Address        Hardware address     Lease expiration        Hostname
+-------------------------------------------------------------------------
11.1.1.254        00:00:12:12:12:12 Jan 27 2016 06:23:45

Total Number of Entries in the Table = 1
```

DHCP relay agent

A DHCP relay agent relays DHCP messages to and from a remote DHCP server, even if the client and server are on different IP networks. You can configure the IP address of the remote DHCP server.

You can configure a device either as a DHCP server or a DHCP relay agent — but not both.

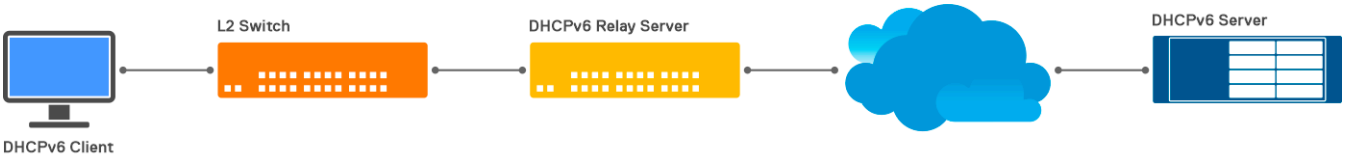
If routes are not leaked between VRFs, the DHCP relay agent supports multi-virtual routing and forwarding (VRF) instances. The client-facing and server-facing interfaces must be in the same VRF.

NOTE: DHCP relay implementation supports IPv4 and IPv6 addresses.

Intermediate switch deployed between DHCPv6 client and the DHCPv6 relay agent

If your deployment includes an intermediate switch between the DHCP client and the DHCP relay agent, messages from the client might not reach the server.

In this example, the client sends a request for an IPv6 address to the DHCP server. The request is sent through the L2 switch, the Relay Agent, and then to the DHCP server. The server processes the request.



In OS10, the MLD snooping and the Unknown Multicast Flood Control feature are enabled by default. Hence, all the unknown multicast packets are dropped. In this case, the DHCPv6 solicit message is considered an unknown multicast packet and is dropped.

For the DHCPv6 solicit messages to reach the DHCP server:

1. On the intermediate switch (L2 switch), you must do one of the following:
   - Disable multicast snooping flood-restrict globally.

     ```
     L2switch(config)# no multicast snooping flood-restrict
     ```

   - Configure the specific VLAN interface as a multicast router interface using the `ipv6 mld snooping mrouter` command.

     ```
     L2switch(config)# interface vlan 10
     L2switch(conf-if-vl-10)# ipv6 mld snooping mrouter interface ethernet 1/1/51
     L2switch(conf-if-vl-10)# ipv6 mld version 2
     L2switch(conf-if-vl-10)# ipv6 mld snooping query-interval 60
     L2switch(conf-if-vl-10)# ipv6 mld snooping query-interval 130
     L2switch(conf-if-vl-10)# ipv6 mld snooping query-max-resp-time 10
     L2switch(conf-if-vl-10)# ipv6 mld snooping last-member-query-interval 1000
     L2switch(conf-if-vl-10)# exit
     ```

   - Disable MLD snooping on the specific VLAN interface.

     ```
     L2switch(config)# interface vlan 10
     L2switch(conf-if-vl-10)# no shutdown
     L2switch(conf-if-vl-10)# no ipv6 mld snooping enable
     ```

   - Disable MLD snooping globally.

     ```
     L2switch(config)# no ipv6 mld snooping enable
     ```

2. On the relay agent, enable MLD querier on the specific VLAN interface.

   ```
   L2switch(config)# interface vlan 10
   L2switch(conf-if-vl-10)# ipv6 mld version 2
   L2switch(conf-if-vl-10)# ipv6 mld snooping query-interval 60
   L2switch(conf-if-vl-10)# ipv6 mld snooping query-interval 130
   L2switch(conf-if-vl-10)# ipv6 mld snooping query-max-resp-time 10
   L2switch(conf-if-vl-10)# ipv6 mld snooping last-member-query-interval 1000
   L2switch(conf-if-vl-10)# exit
   ```

   ```
   RA(config)# interface vlan 10
   RA(conf-if-vl-10)# ipv6 address 3::1/64
   RA(conf-if-vl-10)# ipv6 mld snooping querier
   RA(conf-if-vl-10)# ipv6 helper-address 3::3
   RA(conf-if-vl-10)# ipv6 mld version 2
   RA(conf-if-vl-10)# ipv6 mld snooping query-interval 60
   RA(conf-if-vl-10)# ipv6 mld snooping query-interval 130
   RA(conf-if-vl-10)# ipv6 mld snooping query-max-resp-time 10
   RA(conf-if-vl-10)# ipv6 mld snooping last-member-query-interval 1000
   ```

Option 82 for security

DHCP, as defined by RFC 2131, provides no authentication or security mechanisms. To ensure security, the DHCP relay agent supports Option-82 with the Circuit ID sub-option, which is the printable name of the interface where the client request was received.

This option secures all DHCP traffic that goes through a DHCP relay agent, and ensures that communication between the DHCP relay agent and the DHCP server is not compromised.

The DHCP relay agent inserts Option 82 before forwarding DHCP packets to the DHCP server. The DHCP server includes Option 82 back in its response to the relay agent. The relay agent uses this information to forward a reply out the interface on which the request was received rather than flooding it on the entire VLAN. However, the relay agent removes Option 82 from its DHCP responses before forwarding the responses to the client.

Enable or disable DHCP Option-82

Use DHCP Option-82 in a distributed DHCP server or relay environment. When a network device, such as a DHCP, client sends a DHCP request, the relay agent inserts information about the client network location into the packet header of that request. The relay agent then sends the request to the DHCP server.

After the DHCP server sends a response, the relay agent strips out the DHCP Option-82 and forwards it to the client. DHCP Option-82 serves as enhancement to the DHCP request allowing the DHCP server to select a sub-range in the pool.

Use Option-82 to uniquely identify the client point of attachment. Option-82 carries two sub-options, circuit-id and remote-id:

- Circuit-id : This sub option contains the VLAN and port information of the DHCP client. The VLAN id and Port name are used for this option. The circuit-id is added in the `<VLANID>-<INTERFACE_NAME>` format. For example: `vlan100-eth1/1/1`.
- Remote-id : This sub option contains the system identification. System MAC address is used for this sub-option. For example: `00:04:89:76:62:78`.

By default, Option-82 is enabled at both the Global level and interface level. When you disable Option-82, the relay agent forwards the packet without adding client information (Option-82 and its sub-options) to the packet header. The DHCP server allocates the IP address based on the `giaddr` value.

Restrictions and Limitations

- Enabling or disabling Option-82 is not supported on PVLAN. By default, Option-82 is always enabled on PVLAN.
- This feature is not supported on VXLAN.
- In case of a VLT configuration mismatch, `discover` and `offer` take one route where Option-82 is enabled but takes another route where Option-82 is disabled and the client never gets an IP address.

Option-82 with the Client and the Server in same VLAN

In this topology, Host1, Host2, and Host3 are the DHCP clients connected to the DHCP-relay-enabled switch. The DHCP clients and the DHCP server are part of same VLAN 100.

In this scenario, the DHCP-relay-enabled switch floods the DHCP packets from the DHCP client and also forwards the DHCP packets with Option-82 set in the DHCP packet header to the DHCP server.

If you configured Option-82, the DHCP server allocates the IP address based on the options present in Option-82. Otherwise, the DHCP server allocates the IP address with the on-link subnet.

If you disable Option-82 in the DHCP relay switch, the DHCP packet from the client forward without Option-82 and the DHCP server allocates the IP address from the on-link subnet value.

Option-82 with the Client and the Server in different VLANs

In this topology, Host1, Host2,and Host3 are the DHCP clients connected to the DHCP-relay-enabled switch. The DHCP clients and the DHCP server are part of different VLANs, VLAN 100 and VLAN 200, respectively.

In this scenario, the DHCP-relay-enabled switch floods the DHCP packets from the DHCP client in VLAN 100 and also forwards the DHCP packet with Option-82 set in the DHCP packet header to the DHCP Server in VLAN 200. If you configured Option-82, the DHCP server allocates the IP address based on Option-82. Otherwise, the DHCP server allocates the IP address from the subnet based on the `giaddr` value in the DHCP relay packet.

If you disabled Option-82 in the DHCP relay switch, the DHCP packets from the client forward without Option-82 and the DHCP server allocates the IP address based on the `giaddr` value, which is the VLAN IP address.

You can configure Option-82 at the Global level and interface level. When both the global and interface level Option-82 configuration is present, the configuration to disable Option-82 takes precedence. By default, Option-82 is enable both at Global and Interface levels.

Option-82 is enabled by default.

If you disable Option-82 Globally or at a specific Interface, Option-82 sub-options such as option 1,2,5,11,151,152 are also disabled.

If Global DHCP snooping is enabled after disabling Option-82 globally, an error message displays. Similarly, if you disable Option-82 Globally after enabling Global DHCP snooping, an error message displays.

If you enable DHCP snooping at the Interface level, you cannot disable the VLAN interface level Option-82. Similarly, if you disable Option-82 in the VLAN, you cannot enable DHCP snooping at the VLAN interface level.

DHCP relay agent options

When enabled on VLANs, DHCP Option-82 is inserted by the DHCP relay agent. When a network device, such as a DHCP client, is connected to the VLAN on an untrusted interface sends a DHCP request, the relay agent inserts information about the client network location into the packet header (the `options` field of the DHCP packet is Option-82 `circuitid`) of that request.

The relay agent then sends the request to the DHCP server. The DHCP server reads the Option-82 information in the packet and uses it to determine the IP address or another parameter assignments for the client. After receiving the response from the DHCP server, the relay agent strips the DHCP Option-82 and forwards it to the client.

Use Option-82 to uniquely identify the domain in which the DHCP client is connected. Option-82 carries two sub-options: circuit-id and remote-id (for snooping-enabled VLANs).

- circuit-id: This sub option contains the VLAN and port information of the DHCP client. VLAN id and Port name are used for this option. The circuit- id is added in the `<VLANID>-<INTERFACE_NAME>` format. For example: `vlan100-eth1/1/1`. The DHCP relay packet is appended to the circuit id and the circuit id becomes the interface port number.
- remote-id: This sub option contains the system identification. System MAC address is used for this sub-option. For example: `00:04:89:76:62:78`, for dhcp snooping.

Additionally, DHCPv4 Option-82 sub-options include:

- Server ID override suboption Sub-option `11 (0xb)`
- Link selection suboption- Sub-option `5 (0x5)`
- DHCPv4 virtual subnet selection option - Sub-option `151 (0x97)`
- DHCPv4 virtual subnet selection control - Sub-option `152 (0x98)`
- source-interface CLI for relay agents. The gateway address (`giaddr`) field carries the source interface address.

Server ID override suboption sub-option 11(0xb)

The server ID override suboption allows the DHCP relay agent to specify a new value for the server ID option, which is inserted by the DHCP server in the reply packet. This suboption allows the DHCP relay agent to act as the proxy for the DHCP server so that the renew requests comes to the relay agent rather than to the DHCP server directly.

The server ID override suboption carries the virtual anycast gateway IP (which is the IP address on the relay agent) that is accessible from the client. The DHCP client uses this information to send all renew and release request packets to the relay agent. The relay agent adds all of the appropriate suboptions and then forwards the renew and release request packets to the original DHCP server.

If configured, the server identifier (ID) override suboption carries virtual anycast gateway IP. Otherwise, the option is not sent in the DHCP request.

Link selection suboption- Sub-option 5(0x5)

The link selection suboption provides a mechanism to separate the subnet or link on which the DHCP client resides from the gateway address (`giaddr`). Use this gateway address to communicate with the relay agent by the DHCP server. The relay agent sets the suboption to the correct subscriber IP and the DHCP server uses that value to assign an IP address from that subnet rather than the `giaddr` value.

NOTE: The DHCP server allocates the IP address based on the link-selection suboption. If the link-selection is not present, the `giaddr` option is used to allocate IP address.

The DHCPv4 relay agent must support link selection sub-option 5 based on the following order of precedence:

- If the IP address configured on interface, use the interface IP as the subnet IP for sub-option 5.
- If you configure the virtual anycast gateway IP address on interface, use the virtual anycast gateway IP as the subnet IP for sub-option 5.

DHCP source-Interface

If the client-connected interface is unnumbered, the server may not be able to reach the relay agent. This feature manually configures the interface for the relay agent to use as the source IP address for messages relayed to the DHCP server, which is used by the server to send the reply. This configuration allows the network administrator to specify a stable IP address (such as a Loopback interface). The specified interface IP address is used to fill the `giaddr` by the DHCP relay agent.

NOTE: Dell Technologies recommends configuring different DHCP relay source IP addresses for the VLT peers.

DHCPv4 Virtual subnet selection option - Sub-option 151(0x97) and DHCPv4 virtual subnet selection control - Sub-option 152(0x98)

This sub-option conveys DHCP client VRF-related information to the DHCP server in an L3-VRF-Lite and VXLAN-EVPN-multi-tenant environment. Suboption 152 determines whether the DHCP server understood the VSS sub-option 151 or not. The VRF identifier suboption is used by the relay agent to tell the DHCP server the VRF for every DHCP request it passes on to the DHCP server.

The VRF identifier suboption contains the VRF ID or VRF name configured on the incoming interface to which the client is connected. The VXLAN VTEP acts as a relay agent, providing DHCP relay services in a multi-tenant VXLAN environment. The network element that contains the relay agent captures the VRF association of the DHCP client connected interface and includes this information in the relay agent information option of the DHCP packet.

Restrictions and Limitations

- This feature is not supported on PVLAN.
- DHCP relay options do not work if Option-82 is disabled globally or at the interface level.
- The server-override option is supported only on VXLAN VXLAN-VLT scenarios.
- The DHCP relay source-interface configuration at the VRF level may have problem in batch-apply. This IP VRF context comes in the beginning of the running configuration even before the Loopback interface configuration. When the IP VRF configuration plays, Loopback is not present and it will cause an error. This is similar to the existing behavior with `update-source interface` command.
- With server override enabled, the DHCP relay drops further packets from the DHCP client if there is change in the anycast gateway IP address. This forces the client to restart the discovery process.

System operation and behavior

A combination of the Option-82 sub-options (suboption-5, suboption-11, suboption-151) are used in the multi-tenant EVPN environment, where the relay agent supports multiple clients on different VPNs. Many of these clients from different VPNs can have identical IP addresses (as they are in different L2 domains or different L3 domains; for example, VRFs).

A DHCP server that provides service to DHCP clients on different VPNs must be informed of the VPN identity in which each client resides. You can configure the OS10 DHCP relay agent to provide information about the DHCP client-to-VPN association in options added to the DHCP packets that it relays to the DHCP server.

When the DHCP client, server, and source-interface belongs to different VRFs, you must configure route leaking between the VRFs to establish communication across VRFs.

DHCP relay options work only with default Option-82 settings.

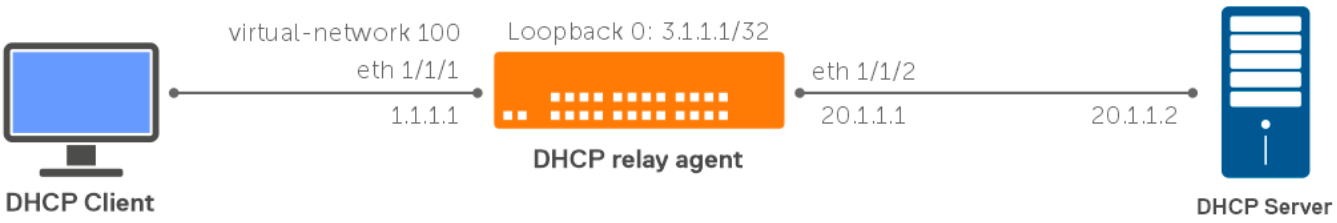
In VxLAN symmetric and asymmetric IRB scenarios, Dell Technologies recommends having the same relay configurations at the Global and Interface level on the VTEP OS10 devices.

Dell Technologies recommends enabling the DHCPv4 virtual subnet selection and link selection options along with the server ID override option. Enabling DHCPv4 options without the server ID override option might not work when the DHCPv4 server renews or releases the client IP address that is based on these options. The server ID override option is supported only on VLAN or VXLAN interfaces as the virtual-router (virtual router anycast gateway IP) configuration is available only on VLAN or VXLAN interfaces and the same is used to fill the server ID override option.

Use Case 1: Source-interface CLI link selection and server-override suboptions

NOTE: Configure at least one interface to match one of the configured network pools. An interface matches a network pool when its IP address is included in the subnet defined for that network pool. For example, an interface with IP address 1.1.1.1/24 matches a pool configured with network 1.1.1.0/24. For the DHCP server to process DHCP discovery packets, you must configure the IP address pool for all the interfaces on which DHCP packets are received. Also, these interfaces must be connected to the DHCP server. This configuration is required even if the IP addresses are not leased to any DHCP client in the subnet directly connected to the DHCP server.

In the following example, the DHCP client is connected on `eth 1/1/1`:



Loopback 0 is used as the relay source-interface for the default VRF clients. The server-override option is enabled on the default VRF.

Configure the DHCP relay agent globally to insert the server ID override suboption (suboption-11) and link selection suboption (suboption-5) into the relay agent information option of the DHCP packet.

The DHCP client sends a broadcast DHCP request on the network.

The DHCP relay agent inserts a server ID override suboption and link selection suboption to its relay agent information option in the DHCP packet. The link selection suboption contains the incoming interface IP address, `1.1.1.1`. In this case, as the interface IP address is present, link selection uses the `1.1.1.x` subnet. If the interface IP address is not present, the virtual gateway address is used in VxLAN scenarios. The server-override option carries the virtual anycast gateway IP address. In case the virtual gateway IP address is not configured, the server-override option does not carry any value.

Table 18. Source-interface values

Field/suboption	Value
giaddr (source-interface)	3.1.1.1
link selection (suboption-5)	1.1.1.1
server-override (suboption-11)	1.1.1.254

As the source interface is explicitly configured on the Loopback 0 interface, the relay agent uses that address as the gateway IP address (`giaddr`) for messages relayed to the DHCP server, `3.1.1.1`.

DHCP Relay Agent

You must configure the following settings at the DHCP relay agent level:

Global configuration

```
ip dhcp-relay server-override
ip dhcp-relay link-selection
```

VRF configuration for source-interface

```
ip vrf default
ip dhcp-relay source-interface loopback 0
```

Interface configuration

```
!
interface loopback0
 no shutdown
 ip address 3.1.1.1/32
!

interface virtual-network 100
 no shutdown
 ip address 1.1.1.1/24
 ip helper-address 20.1.1.2
 ip virtual-router address 1.1.1.254
!
```

```
interface Ethernet 1/1/2
 no shutdown
 ip address 20.1.1.1/24
```

DHCP Server

```
OS10# show running-configuration ip dhcp
!
ip dhcp server
!

pool Client_1.1.1.0
 network 1.1.1.0/24
 default-router 1.1.1.254
 range 1.1.1.2 1.1.1.10
!

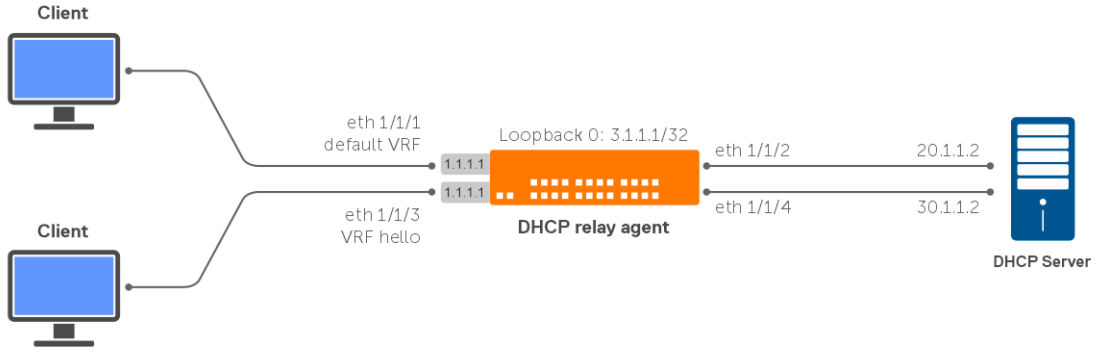
pool Server_20.1.1.0
 network 20.1.1.0/24
 default-router 20.1.1.2
 range 20.1.1.3 20.1.1.10

OS10# show running-configuration route
ip route 1.1.1.0/24 20.1.1.1
ip route 3.1.1.0/24 20.1.1.1
```

Use Case 2: Configuration of source-interface CLI, link selection, and server-override and VSS suboptions

NOTE: You cannot use Dell SmartFabric OS10 switch as a DHCP Server for the Use Case 2 scenario since it is not VRF aware and the DHCP server that you use must be compliant with the RFC standards mentioned under the DHCP Server configuration example section. Configure at least one interface to match one of the configured network pools. An interface matches a network pool when its IP address is included in the subnet defined for that network pool. For example, an interface with IP address 1.1.1.1/24 matches a pool configured with network 1.1.1.0/24. For the DHCP server to process DHCP discovery packets, you must configure the IP address pool for all the interfaces on which DHCP packets are received. Also, these interfaces must be connected to the DHCP server. This configuration is required even if the IP addresses are not leased to any DHCP client in the subnet directly connected to the DHCP server.

In this example, the DHCP client is connected to `eth 1/1/1` on the default VRF and `eth 1/1/3` on the VRF hello.



Loopback 0 is used as the relay source-interface for the default VRF clients. The server-override option is enabled globally.

Configure the DHCP relay agent globally to insert the server ID override suboption and link selection suboption into the relay agent information option of the DHCP packet. The VSS option is enabled globally and the `vss-info` value is configured on the interfaces to send VRF information on the client-connected interfaces to the DHCP server.

DHCP server is also configured with VRF pool `default` and `hello` for the same `1.1.1.x` network range to assign the IP addresses to the clients requesting from the respective VRFs.

Consider the following scenarios:

- The DHCP client sends a broadcast DHCP request on the network.
- The DHCP relay agent inserts the VRF `vss-info` value, server ID override suboption, and link selection suboption to its relay agent information option in the DHCP packet. The link selection suboptions contains the incoming interface IP address, which is the IP address on the relay agent that is accessible from the client `1.1.1.1`. In this case, as the interface IP is present, link selection uses the `1.1.1.x` subnet. If the interface IP is not present, the virtual gateway address is used in VXLAN scenarios. The server-override option carries the virtual anycast gateway IP.
- Based on the `vss-info` value in the DHCP packet, the DHCP server offers an address from the respective VRF pool; for example, pool `hello_clients` as it matches with the `type0` value `serverVRF` is sent in the `vss-info`.
- As the source interface is explicitly configured on a Loopback 0, the relay agent uses that address as the source IP address (`giaddr`) for messages relayed to the DHCP server `3.1.1.1`.
- If the DHCP server is reachable on a different VRF, configure route leaking on VRF hello to reach the DHCP server.
- In the above case, as there is no virtual anycast IP, the server-override option value is not added. As a result, further DHCP packets from the client directly go to the server.

NOTE: SmartFabric OS10 switch configured as a DHCP Server is not VRF aware. For this use case scenario, you must use a DHCP server that is VRF aware.

DHCP Relay Agent

You must configure the following settings at the DHCP relay agent level:

Global configuration

```
ip dhcp-relay server-override
ip dhcp-relay vss
ip dhcp-relay link-selection
```

VRF configuration for source-interface:

```
OS10# show running-configuration vrf
!
ip vrf default
 update-source-ip loopback0
 ip dhcp-relay source-interface loopback0
!
ip vrf serverVRF
!
ip vrf hello
 update-source-ip loopback1
!
```

Interface configuration

```
!
interface loopback0
 no shutdown
 ip address 3.1.1.1/32

!
interface loopback1
 no shutdown
 ip vrf forwarding hello
 ip address 5.1.1.1/32

!
interface ethernet1/1/1
 no shutdown
 ip address 1.1.1.1/24
 ip helper-address 20.1.1.2
```

```
!
interface ethernet1/1/2
 no shutdown
 ip address 20.1.1.1/24

!
interface ethernet1/1/3
 no shutdown
 ip vrf forwarding hello
 ip address 1.1.1.1/24
 ip helper-address 30.1.1.2 vrf hello
 ip dhcp-relay vss-info type 0 serverVRF

!
interface ethernet1/1/4
 no shutdown
 ip vrf forwarding hello
 ip address 30.1.1.1/24
```

DHCP Server

You must use a VRF aware DHCP server that is compliant with the following RFC standards:

- RFC 6607 - Virtual Subnet Selection Options (VSS).
- RFC 3527 - Link Selection sub-option.
- RFC 5107 - DHCP Server Identifier Override Sub-option.

Refer to the configuration guidelines of the DHCP Server you are planning to use for DHCP server-specific configuration.

Following are some of the key points to note to support use case 2:

- IP pools for the DHCP client subnet on different VRFs connected to DHCP relay agent have to be defined in the DHCP server.
- The VRF name provided in the vss type 0 value must match the VRF name in the DHCP server.
- The value provided for vss type 1 must match the VPN identifier configured in the DHCP server.

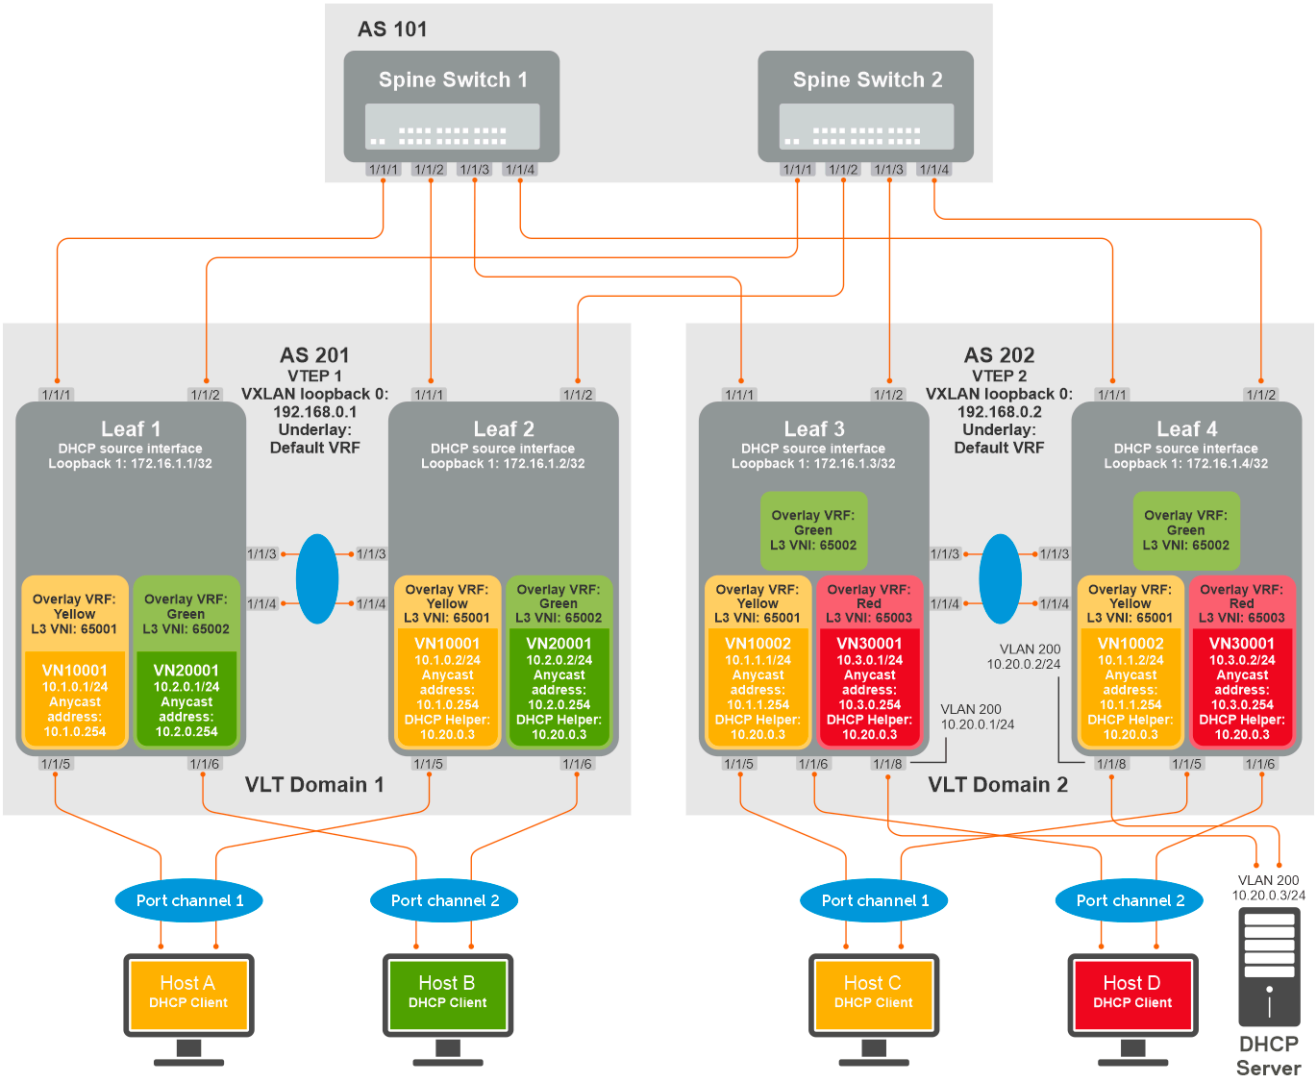
Use Case 3: DHCP Relay on VTEPs with DHCP Option-82 sub-options 5,11,151

The following example uses a Clos leaf-spine VXLAN with BGP EVPN topology to show how to set up DHCP relay on tenant VRFs with Option-82 sub-options 5,11,151 on the VTEPs.

- .

  Option 5 = Link selection sub-option

- Option 11 = Server ID Override Sub-option
- Option 151 = Virtual Subnet Selection



Leaf1 configuration:

1. Enable DHCP Option-82 suboptions - link-selection, server-override, vss:

```
OS10(config)# ip dhcp-relay link-selection
OS10(config)# ip dhcp-relay server-override
OS10(config)# ip dhcp-relay vss
```

2.

Configure source interface (giaddr) to be used for DHCP relayed packets in each VRF. IP belonging to the loopback interface in underlay is given here as the server is reachable in the underlay network in default VRF. The response from the DHCP server comes to this IP in underlay default VRF.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# ip address 172.16.1.1/32
OS10(conf-if-lo-1)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)#
```

3. Configure L3 virtual-network interface with VRF and IP address

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.1/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip vrf forwarding Green
OS10(conf-if-vn-20001)# ip address 10.2.0.1/24
OS10(conf-if-vn-20001)# ip virtual-router address 10.2.0.254
OS10(conf-if-vn-20001)#
```

4. Configure DHCP server address and VSS info. Virtual-network 10001 uses type 0 VSS format (ASCII VPN identifier) and Virtual-network 20001 uses type 1 VSS format (VPN ID). The DHCP server should be configured with these identifiers in the network pools.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip dhcp-relay vss-info type 0 Yellow
OS10(conf-if-vn-10001)# ip helper-address 10.20.0.3 vrf Yellow
OS10(conf-if-vn-10001)# exit
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip dhcp-relay vss-info type 1 222:2222
OS10(conf-if-vn-20001)# ip helper-address 10.20.0.3 vrf Green
OS10(conf-if-vn-10001)# exit
```

Leaf2 configuration:

1. Enable DHCP Option-82 suboptions - link-selection, server-override, vss

```
OS10(config)# ip dhcp-relay link-selection
OS10(config)# ip dhcp-relay server-override
OS10(config)# ip dhcp-relay vss
```

2. Configure source interface (giaddr) to be used for DHCP relayed packets in each VRF. IP belonging to the loopback interface in underlay is given here as the server is reachable in the underlay network in default VRF.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# ip address 172.16.1.2/32
OS10(conf-if-lo-1)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)#
```

3. Configure L3 virtual-network interface with VRF and IP address

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.2/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip vrf forwarding Green
OS10(conf-if-vn-20001)# ip address 10.2.0.2/24
OS10(conf-if-vn-20001)# ip virtual-router address 10.2.0.254
OS10(conf-if-vn-20001)#
```

4. Configure DHCP server address and VSS info. Virtual-network 10001 uses type 0 VSS format (ASCII VPN identifier) and Virtual-network 20001 uses type 1 VSS format (VPN ID). The DHCP server should be configured with these identifiers in the network pools.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip dhcp-relay vss-info type 0 Yellow
OS10(conf-if-vn-10001)# ip helper-address 10.20.0.3 vrf Yellow
OS10(conf-if-vn-10001)# exit
OS10(config)# interface virtual-network 20001
```

```
OS10(conf-if-vn-20001)# ip dhcp-relay vss-info type 1 222:2222
OS10(conf-if-vn-20001)# ip helper-address 10.20.0.3 vrf Green
OS10(conf-if-vn-10001)# exit
```

Leaf3 configuration:

1. Enable DHCP Option-82 suboptions - link-selection, server-override, vss:

```
OS10(config)# ip dhcp-relay link-selection
OS10(config)# ip dhcp-relay server-override
OS10(config)# ip dhcp-relay vss
```

2. Configure source interface (giaddr) to be used for DHCP relayed packets in each VRF. IP belonging to the loopback interface in underlay is given here as the server is reachable in the underlay network in default VRF.

The response from the DHCP server comes to this IP in underlay default VRF.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# ip address 172.16.1.3/32
OS10(conf-if-lo-1)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)#
```

3. Configure L3 virtual-network interface with VRF and IP address

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.3/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip vrf forwarding Red
OS10(conf-if-vn-30001)# ip address 10.3.0.1/24
OS10(conf-if-vn-30001)# ip virtual-router address 10.3.0.254
OS10(conf-if-vn-30001)#
```

4. Configure DHCP server address and VSS info. Virtual-network 10001 and 30001 uses type 0 VSS format (ASCII VPN identifier). The DHCP server should be configured with these identifiers in the network pools.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip dhcp-relay vss-info type 0 Yellow
OS10(conf-if-vn-10001)# exit
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip dhcp-relay vss-info type 0 Red
OS10(conf-if-vn-30001)# exit
OS10(config)#
```

5. Configure route leaking and leak the DHCP Server route to the VRFs Yellow, Green and Red.

```
OS10(config)# ip prefix-list PrefixList_DHCPServer permit 10.20.0.0/24
OS10(config)#
OS10(config)# route-map RouteMap_DHCPServer
OS10(config-route-map)# match ip address prefix-list PrefixList_DHCPServer
OS10(config-route-map)# exit
OS10(config)#

OS10(config)# ip vrf default
OS10(conf-vrf)# ip route-export 0:0 route-map RouteMap_DHCPServer
OS10(conf-vrf)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# exit
```

```
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# exit
OS10(config)#
```

NOTE: If Border Leaf switch is already advertising a default route in each VRF to other VTEPs, there is no need to advertise this DHCP server route to other VTEPs. Otherwise, this leaked route could be advertised to other VTEPs using "advertise ipv4 connected" command under EVPN for each VRF.

Leaf4 configuration:

1. Enable DHCP Option-82 suboptions - link-selection, server-override, vss:

```
OS10(config)# ip dhcp-relay link-selection
OS10(config)# ip dhcp-relay server-override
OS10(config)# ip dhcp-relay vss
```

2. Configure source interface (giaddr) to be used for DHCP relayed packets in each VRF. IP belonging to the loopback interface in underlay is given here as the server is reachable in the underlay network in default VRF.

The response from the DHCP server comes to this IP in underlay default VRF.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# ip address 172.16.1.4/32
OS10(conf-if-lo-1)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
OS10(conf-vrf)# exit
OS10(config)#
```

3. Configure L3 virtual-network interface with VRF and IP address

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.4/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip vrf forwarding Red
OS10(conf-if-vn-30001)# ip address 10.3.0.2/24
OS10(conf-if-vn-30001)# ip virtual-router address 10.3.0.254
OS10(conf-if-vn-30001)#
```

4. Configure DHCP server address and VSS info. Virtual-network 10001 and 30001 uses type 0 VSS format (ASCII VPN identifier). The DHCP server should be configured with these identifiers in the network pools.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip dhcp-relay vss-info type 0 Yellow
OS10(conf-if-vn-10001)# exit
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip dhcp-relay vss-info type 0 Red
OS10(conf-if-vn-30001)# exit
OS10(config)#
```

5. Configure route leaking and leak the DHCP Server route to the VRFs Yellow, Green and Red.

```
OS10(config)# ip prefix-list PrefixList_DHCPServer permit 10.20.0.0/24
OS10(config)#
OS10(config)# route-map RouteMap_DHCPServer
OS10(config-route-map)# match ip address prefix-list PrefixList_DHCPServer
OS10(config-route-map)# exit
```

```
OS10(config)#

OS10(config)# ip vrf default
OS10(conf-vrf)# ip route-export 0:0 route-map RouteMap_DHCPServer
OS10(conf-vrf)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# exit
OS10(config)#
```

NOTE: If Border Leaf switch is already advertising a default route in each VRF to other VTEPs, there is no need to advertise this DHCP server route to other VTEPs. Otherwise, this leaked route could be advertised to other VTEPs using "advertise ipv4 connected" command under EVPN for each VRF.

DHCPv6 Relay agent options

When a DHCP client sends a DHCPv6 request, the relay agent adds the DHCPv6 relay agent options to the request. The relay agent then sends the request to the DHCP server. The DHCP server reads the relay agent options information in the packet and uses these options to uniquely determine the defined policy based on which IPv6 addresses are assigned to the clients. The DHCPv6 server uses these options to determine the policy associated with the configuration parameters such as DNS Server, SIP Server, and so on. The DHCPv6 server replies to the relay agent with these options. Upon receipt of the response from the DHCP server, the relay agent strips the DHCPv6 agent options from the packet before sending it to the client.

Following DHCPv6 relay agent options are supported:

- DHCPv6 interface-ID option (option 18).
- remote-id: This sub option contains the system identification. DUID based on system MAC address is used by default for this option. For example: `00:04:89:76:62:78`.

DHCPv6 interface-ID option (option 18).

The DHCPv6 interface-ID option (option 18) is used to specify the interface on which the DHCPv6 client message is received. This option is similar to the DHCPv4 relay option 82 sub-option 1 circuit-id. The DHCPv6 server uses the interface-ID option value for the parameter assignment corresponding to the clients. You can configure interface description and the prefix to be used for the interface-ID option. The prefix and the interface description are separated by a colon (:).

The interface description is a combination of VLAN and port information. By default, the interface name is used for the interface description. The VLAN name and the port name are separated by a hyphen (-). You can optionally configure the customized string for each interface using textual descriptions.

The prefix is an optional parameter to be configured globally. You can configure the hostname and VRF name or customized string as prefix. Optionally, you can also configure DHCPv6 hostname. For example, Prefix:<VLAN name>-<Port name>

Interface-ID (option 18) option is disabled by default in the DHCPv6 relay agent.

DHCPv6 Remote-ID Option (option 37)

The DHCPv6 remote-ID option (option 37) is used to specify the remote host identification in the RELAY-FORWARD packet to the DHCPv6 server. This option is similar to the DHCPv4 relay option 82 sub option 2 remote-id. The remote-ID field contains vendor specific enterprise-number and DHCPv6 relay agent DUID by default. The system uses 674 as the enterprise-number. The DHCPv6 server uses this option to select parameters based on the DHCPv6 relay agent.

The remote identification is configured globally. By default, DHCPv6 relay agent type 3 DUID (system mac) is used as remote-ID value. You can optionally configure a customized string to be used. In VLT cases, VLT MAC address is used to generate DUID.

The prefix is an optional parameter to be configured globally. You can configure hostname and VRF name or customized string as prefix. Optionally, you can also configure DHCPv6 hostname.

The prefix and the remote identification are separated by the colon (:). For example, prefix : Remote Identification

Remote-ID (option 37) option is disabled by default in the DHCPv6 relay agent.

Restrictions and Limitations

If there is a mismatch in the interface-ID option between the VLT peers, the DHCPv6 client originated packet is dropped and a log is created to indicate the interface-ID option mismatch.

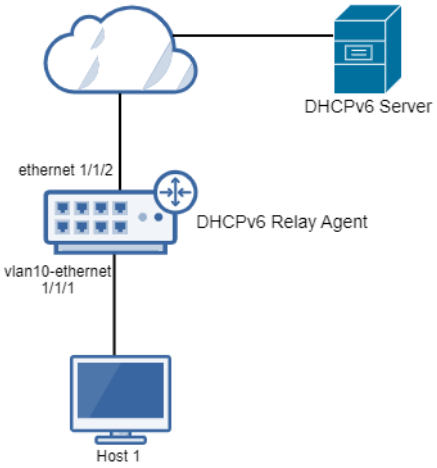
If there is a mismatch in the remote-ID option between the VLT peers, the DHCPv6 client originated packet is dropped and a log is created to indicate the remote-ID option mismatch.

If DHCPv6 hostname is configured for prefix, then Dell Networking recommendeds to configure the same hostname for both the VLT peers.

Parameter assignment based on Interface-ID option

The DHCPv6 server uses link addresses in the DHCPv6 RELAY-FORWARD packet to select the subnet from which the IPv6 address is assigned to the clients. If interface-ID option is enabled, then the interface-ID option in the RELAY-FORWARD packet is used to select the subnet and other configuration parameters. The DHCPv6 server is configured with the policy to assign IPv6 address or configuration parameters based on the interface-ID.

In the following diagram, the Host1, Host2, and Host3 could get different set of DHCPv6 subnet and configuration parameters based on the interface-ID option.



The interface description is a combination of VLAN and port information. By default, the interface name is used for the interface description. The VLAN name and the port name are separated by a hyphen (-). You can optionally configure the customized string for each interface using textual description configuration.

The prefix is an optional parameter to be configured globally. You can configure hostname, VRF Name, hostname, and VRF name or customized string as prefix. Optionally, you can also configure DHCPv6 hostname. For example, Prefix:<VLAN name>-<Port name>.

Following are the different formats of the interface-ID value with different configurations of the prefix.

```
 Host name as prefix :
        <Host name> : <VLANname>-<Portname>
        e.g.: DELL OS10:vlan200-ethernet1/1/2

        VRF Name as prefix :
        <VRF Name of the interface> : <VLANname>-<Portname>
        e.g.: RED:vlan200-ethernet1/1/2

        Both Host name and VRF Name as prefix :
        <Host name>-<VRF Name of the interface> : <VLANID>-<Portname>
        e.g.: DELL OS10-RED:vlan200-ethernet1/1/2

CLI Configuration:
```

DHCP Relay Agent:

```
Global config:
ipv6 dhcp-relay interface-id
ipv6 dhcp-relay prefix interface-id hostname
ipv6 dhcp-relay hostname DELL

OS10#show running-configuration
```

```
interface Ethernet 1/1/1
no shutdown
switchport mode trunk
switch port trunk allowed vlan 10
ipv6 dhcp-relay interface-id description PORT
!
interface vlan 10
no shutdown
ip address 1.1.1.1/24
ip helper-address 20.1.1.2
ipv6 dhcp-relay interface-id description VLAN
!
interface Ethernet 1/1/2
no shutdown
ip address 20.1.1.1
!
```

DHCP Server

```
OS10(config)# ip dhcp server
OS10(config-dhcp)# pool dell_1
OS10(config-dhcp-dell_1)# network 10.1.1.0/24
OS10(config-dhcp-dell_1)# range 10.1.1.2 10.1.1.10
OS10(config-dhcp-dell_1)# default-router 10.1.1.1
OS10(config-dhcp-dell_1)# end

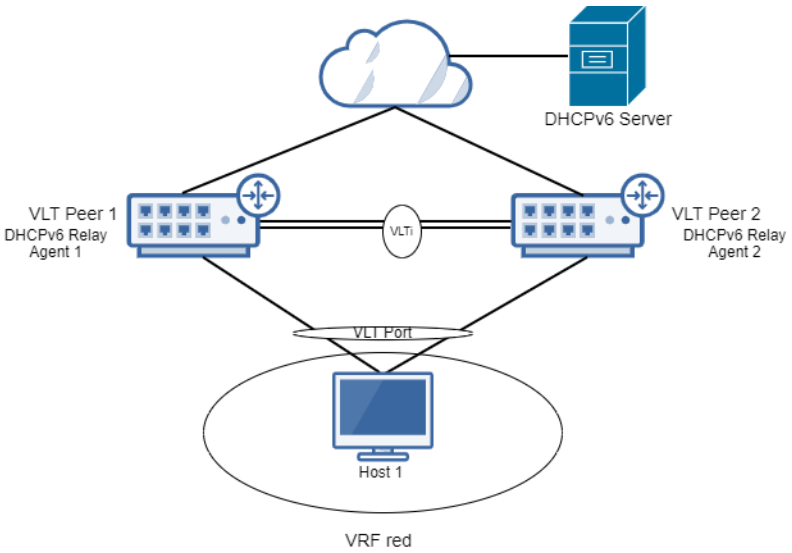
OS10(config-dhcp)# pool dell_2
OS10(config-dhcp-dell_2)# network 20.1.1.0/24
OS10(config-dhcp-dell_2)# range 20.1.1.2 20.1.1.10
OS10(config-dhcp-dell_2)# default-router 20.1.1.1
OS10(config-dhcp-dell_2)# end
OS10#show running-config ip dhcp
!
ip dhcp server
!
ip dhcp pool dell_1
network 10.1.1.0/24
default-router 10.1.1.1
address range 10.1.1.2 10.1.1.10

ip dhcp pool dell_2
network 20.1.1.0/24
default-router 20.1.1.1
address range 20.1.1.2 20.1.1.10
```

In this scenario, the interface-id value: `DELL:VLAN-PORT` is added in the packet and sent out of DHCPv6 relay agent. You can configure the DHCP server to allocate an IP address from a range of IP addresses based on the interface-id value that is received from the DHCPv6 packet. The prefix value is configured to take hostname: DELL(DHCPv6 hostname) and interface description is configured in both the VLAN and physical interface (VLAN and PORT).

Parameter assignment based on Remote-ID option

In this scenario, there are two DHCPv6 relay agents that are connected to the VLT peers. The hosts that are connected to the two DHCPv6 relay agents belong to different VLANs that are part of different VRFs. The link address subnet in the DHCPv6 RELAY-FORWARD message from either of the DHCPv6 relay agents can be the same. The IPv6 address range and the configuration parameters for the hosts connected to different DHCPv6 relay agents are managed by the administrator based on the remote-ID option value in the DHCPv6 relay agent.



The remote identification is configured globally. By default, the DHCPv6 relay agent type 3 DUID (system mac) is used as the remote-ID value. You can optionally configure a customized string. In VLT cases, VLT MAC address is used to generate the DUID.

The prefix is an optional parameter to be configured globally. You can configure hostname, VRF Name, hostname, and VRF name or customized string as prefix. Optionally, you can configure DHCPv6 hostname.

The prefix and the remote identification are separated by the colon (:). For example, prefix : Remote Identification.

Following are the different formats of the remote-ID value with different configuration of the prefix.

```
Host name as prefix :
        <Host name> : <Remote identification>
        e.g.: DELL OS10:90b11cf4a65d

        VRF Name as prefix :
        <VRF Name of the interface> : <Remote identification>
        e.g.: RED:90b11cf4a65d

        Both Host name and VRF Name as prefix :
        <Host name>-<VRF Name of the interface> : <Remote identification>
        e.g.: DELL OS10-RED:90b11cf4a65d

CLI Configuration:
```

DHCPv6 Relay Agent 1:

```
Global config:
ipv6 dhcp-relay remote-id
ipv6 dhcp-relay prefix remote-id hostname vrfname
ipv6 dhcp-relay hostname DELL

Interface configuration:
OS10#show running-configuration
interface Ethernet 1/1/1

```

In this scenario, the remote-id value: `DELL-red:90b11cf4a65d` is added in the packet and sent out of the DHCPv6 relay agent. You can configure the DHCP server to allocate an IP address from a range of IP addresses based on the remote-id value received from the DHCPv6 packet. The prefix value is configured to take hostname and vrfname: DELL(DHCPv6 hostname), red(client interface's vrfname). By default, the DHCPv6 relay agent type 3 DUID (system mac - 90b11cf4a65d) is used as the remote-ID description.

DHCPv4 relay counters

The purpose of this feature is to enhance the DHCP relay component in OS10 to include interface DHCP relay packet counters. These counters are used to provide telemetry and debugging support.

Overview

The DHCPv4 relay agent maintains DHCPv4 relay counters per interface. These relay counters are configured for all the DHCP packets that are processed by the DHCP client-connected interfaces. You must configure DHCPv4 relay or helper address for the client-connected interfaces.

The DHCP relay counters provide visibility into the OS10 nodes DHCPv4 relay behavior in DHCPv4 relay use cases. These DHCP relay counters also enable telemetry support for monitoring and debugging the DHCPv4 relay functionality.

DHCPv4 relay maintains the counters per interface only in client-connected interfaces where helper address is configured. When the first helper address is configured on the interface, the DHCPv4 relay counters are initialized to 0 and the last clear timestamp is updated.

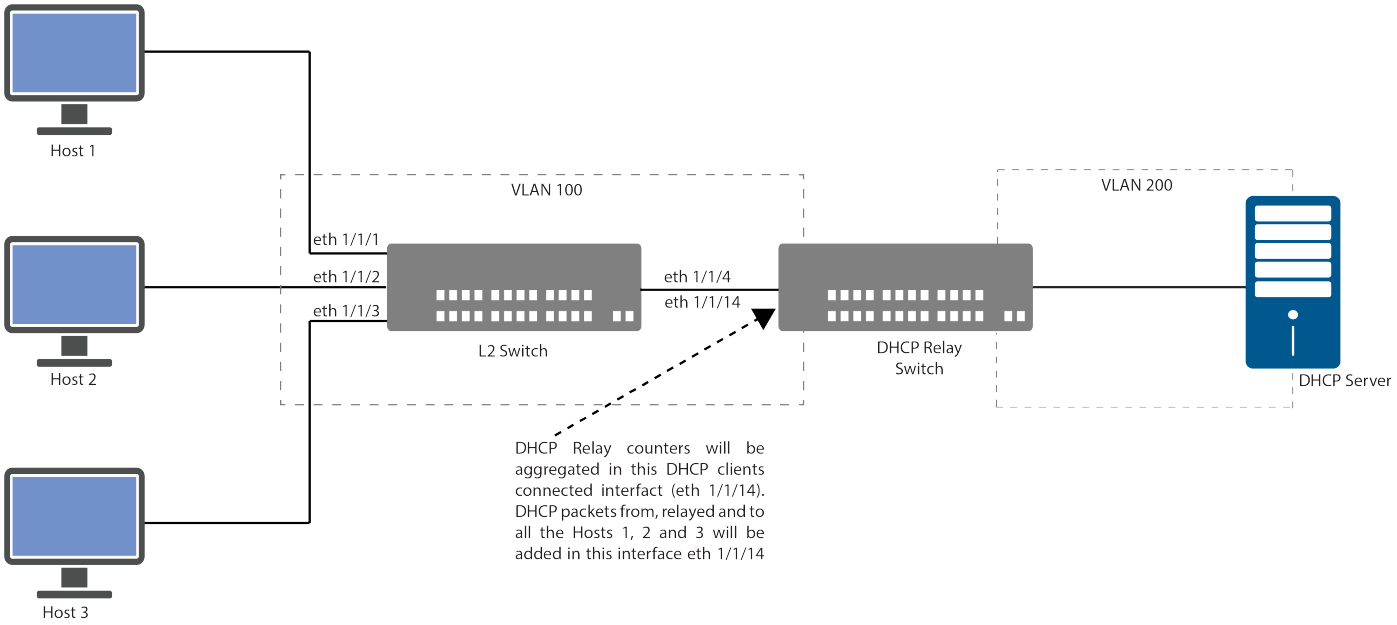
Restrictions and limitations

The following restrictions and limitations apply to this feature:

- The DHCPv4 relay counters do not persist when system reloads occur. You must configure the counters after the system reloads.
- In a VLT topology, each VLT node maintains its own DHCPv4 relay counter independently. Execution of any clear command affects only the individual node.
- The DHCPv4 relay agent maintains a counter per interface only in client-connected interfaces where helper address is configured.
- The show commands display only the DHCP counter statistics of the interface that are configured with the helper address.
- Each counter is 64 bits long; so, when the DHCPv4 relay counter reaches its maximum value of 2^64, it resets to zero. A system log message is also delivered by the system.
- Interface level counters are reset to 0 when the first helper address is configured in the interface.
- For DHCP unicast messages, the DHCPv4 relay agent counters are valid only if server-identifier-override is enabled.
- The DHCPv4 relay counters for the PVLAN secondary VLANs are maintained in PVLAN primary VLAN. This limitation applies because the secondary VLANs are L2 VLANs where DHCPv4 helper address configuration is not allowed.
- To deliver the DHVPv4 relay counter statistics, the system takes up to a maximum of 1 minute.

Use case - DHCPv4 relay counters

Consider the following use case diagram in which three hosts (Host 1, Host 2 and Host 3) connected to the L2 switch in VLAN 100.



The DHCPv4 relay switch is connected to the L2 switch. The DHCPv4 relay is configured in interface Ethernet 1/1/14.

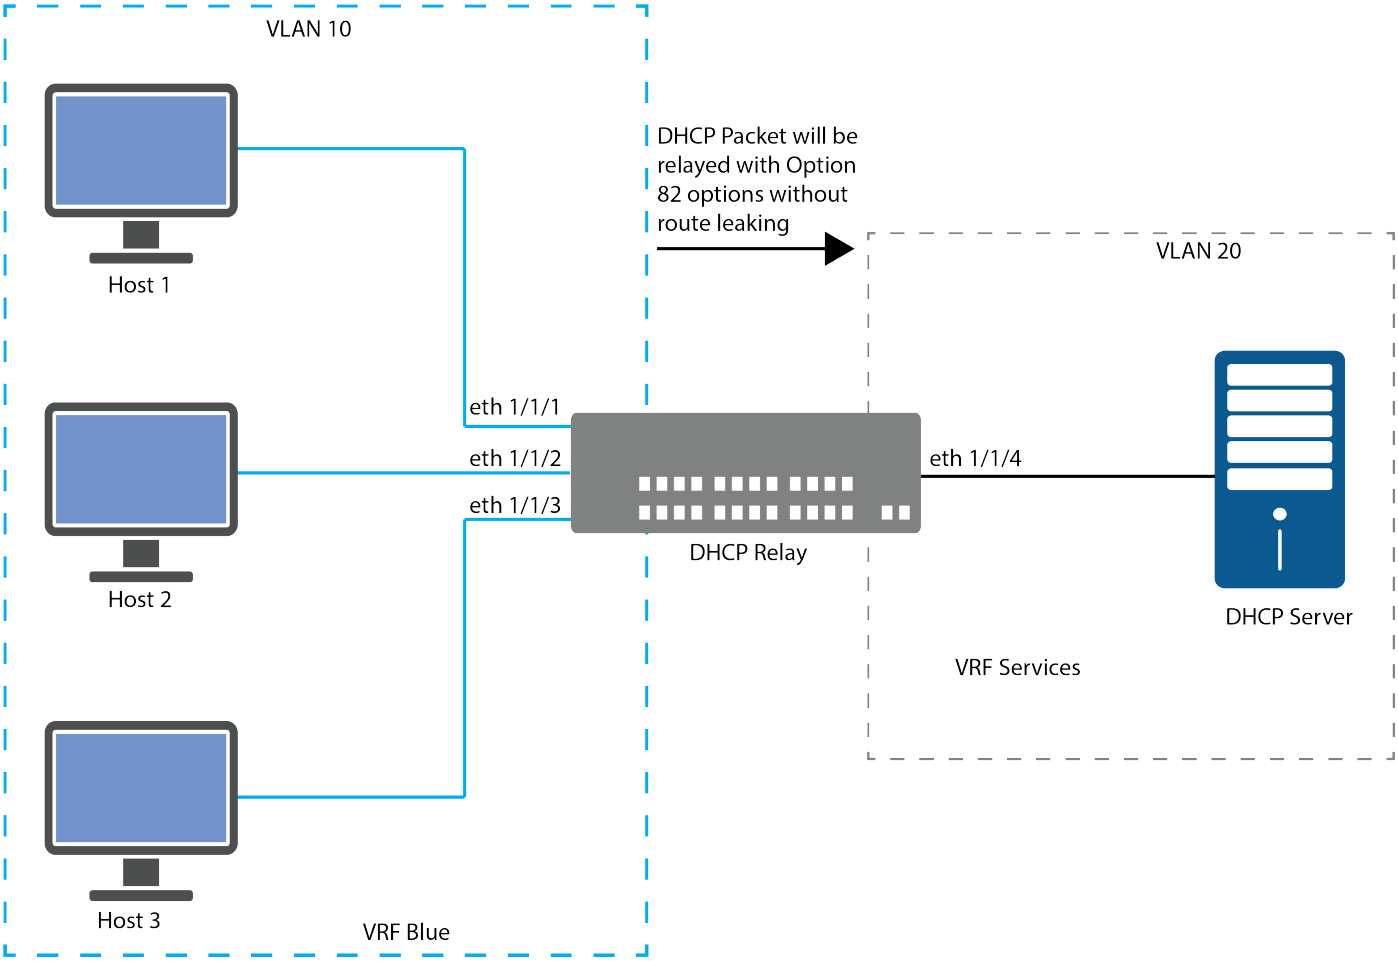
The DHCP server is connected to the DHCPv4 relay switch in VLAN 200. The DHCP packets to and from the DHCP clients (Host 1, Host 2, and Host 3) are counted at the interface Ethernet 1/1/14 (client-connected interface). The DHCPv4 relay switch maintains the aggregate counters of all the DHCP packets to and from all the hosts.

DHCP relay without route leaking

This feature enables you to support DHCP relay across VRFs without route leaking. DHCP relay with DHCP client and DHCP server in different VRFs requires route reachability for the DHCP server. You can achieve route reachability using the route leaking method.

To enable DHCP relay across VRFs without route leaking for SFD with open config model, the existing helper-address configuration is modified to allow any VRF name. For this configuration to work, you must first configure a helper-address reachable VRF.

Consider the scenario depicted in the following figure:



In this scenario the DHCP clients (Host 1, 2, 3) are part of the VRF Blue. The DHCP packet sent by these DHCP clients reach the DHCP relay in VLAN 10 in the VRF Blue. In the VLAN 10, you must configure the helper-address with the DHCP server reachable VRF services. DHCP relay forwards the DHCP client packets to the DHCP server without route leaking by forwarding it in the services VRF. The DHCP relay appends the option 82 and its following sub options:

- Link selection option (sub option 5) set to the IP address of the VLAN 10.
- Server-override option (sub option 11) set to the IP address of the VRRP virtual IP or anycast gateway IP.
- VSS option (sub option 151 and sub option 152) set to the VRF Blue.
- You must configure VLAN 20 on interface Ethernet 1/1/4 as source interface, which sets the `giaddr` field in the BOOTP relay request packet towards the DHCP server.

The BOOTP relay reply packet from the DHCP server contains the destination IP address set to the IP address of the source interface (VLAN 20). This interface is forwarded to the DHCP client by the DHCP relay in VRF Blue after removing the DHCP option 82 and its relay sub options.

The DHCP server allocates the IP address to the DHCP client based on the link selection and VSS options. The DHCP unicast packet from the DHCP client is sent to the server-override IP. After appending the option 82 and its sub options, DHCP relay forwards this packet to the DHCP server.

DHCP relay custom source IP

A DHCP relay agent is any host that forwards DHCP packets between clients and servers. In SmartFabric OS10, DHCP relay agents forward a DHCP client packet with the source IP address set to the IP address of the outgoing interface of the DHCP server. This feature provides the capability to configure the source IP address for the DHCP requests.

The DHCPv6 relay agent source-interface configuration supports the following interface types:

- ethernet
- loopback
- port-channel

- VLAN
- virtual-network

Restrictions and limitations

The following restrictions and limitations apply to this feature:

- The DHCPv6 relay agent source-interface configuration is supported at the interface level. SmartFabric OS10 recommends that the specified source interface should belong to the server connected interface VRF.
- Dell Technologies recommends to configure different source interface IP addresses in VLT peers. Synchronization for DHCPv6 functionality across VLT peers is not supported.
- The DHCPv6 relay agent source-interface configuration is not supported at the VRF level when applied in batch mode. The IP VRF context appears at the beginning of running configuration file even before the loopback interface is configured. As a result, the IP VRF configurations fail to execute as the loopback interfaces do not exist. This behavior is similar to the update-source interface configuration command.

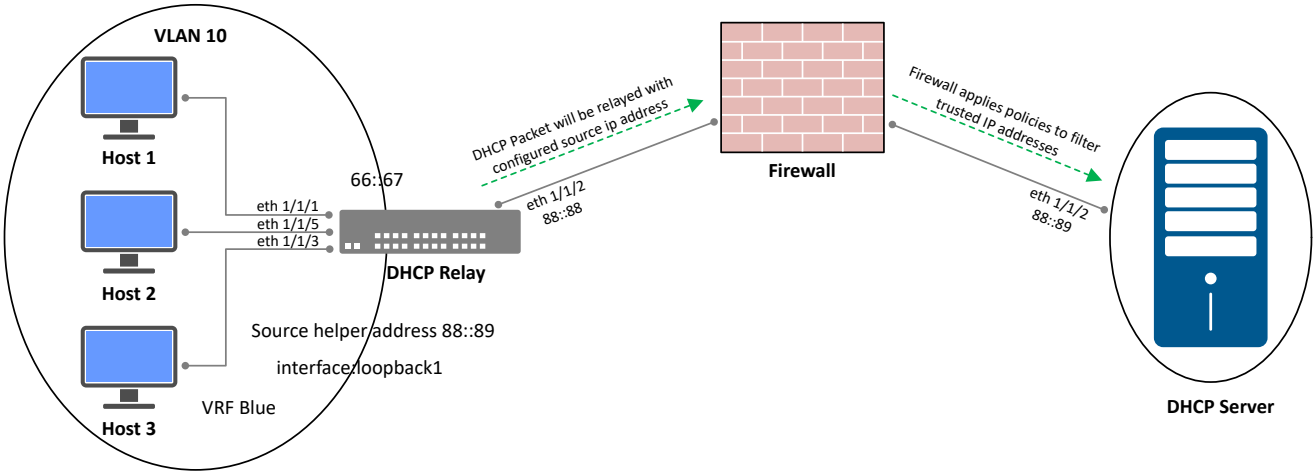
Impact on software upgrade and downgrade

NOTE: The existing IPv4 source interface is used to fill relay agent gateway IP address. After upgrade, the same IPv4 source interface is used to fill the relay agent gateway IP address along with the source IP header.

System operation and behavior

In network configurations where a firewall gateway exists between the DHCP relay agent and the DHCP server, only the trusted IP addresses passes through this firewall. In such a scenario, the DHCP unicast packets do not pass through the firewall and are discarded.

The DHCP relay agent source-interface IP configuration places the loopback address in the IP headers and DHCP messages. This action enables the DHCP unicast packets to pass through the firewall to the DHCP server.



Following is the format of the source-interface value with interface loopback and Ethernet:

```
loopback  as interface :
       <loopback>  <loopback_interface_no>
       e.g: loopback_interface_no ranges from  <0-16383>
       e.g.: ipv6 dhcp-relay source-interface loopback 1

       Ethernet as interface :
       <ethernet >  <node/slot/port[:subport]>
       e.g.: ipv6 dhcp-relay source-interface ethernet 1/1/1
```

DHCP relay agent - Client interfacing interface configuration

```
OS10-Relay(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
no switchport
ipv6 address 66::67/64
flowcontrol receive off
ipv6 helper-address 88::89
ipv6 dhcp-relay source-interface loopback1
OS10-Relay(conf-if-eth1/1/1)#
```

DHCP relay agent - Server interfacing interface configuration

```
OS10-Relay(conf-if-eth1/1/2)# show configuration
!
interface ethernet1/1/2
no shutdown
no switchport
ipv6 address 88::88/64
flowcontrol receive off
OS10-Relay(conf-if-eth1/1/2)#
```

DHCP server configuration

```
OS10-Server(conf-if-eth1/1/2)# show configuration
!
interface ethernet1/1/2
no shutdown
no switchport
ipv6 address 88::89/64
flowcontrol receive off
OS10-Server(conf-if-eth1/1/2)#

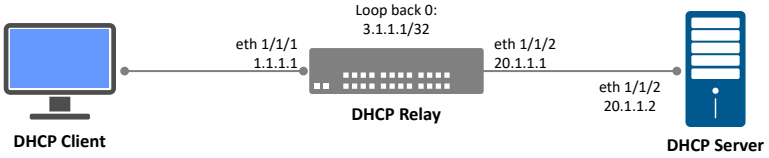
OS10-Server(config-dhcp-pool1)# show configuration
!
pool pool1
network 66::60/64
OS10-Server(config-dhcp-pool1)#
```

DHCP client configuration

```
OS10-Client(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
no switchport
ipv6 address dhcp
flowcontrol receive off
```

Usecase - Example for source-interface command for IPv4

In the following example, the DHCP client is connected on Eth 1/1/1.



Loopback 0 is used as the relay source-interface for the default VRF clients.

```
Gi addr ( source-interface) - 3.1.1.1
```

DHCP client

```
Client(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
no switchport
ip address dhcp
flowcontrol receive off
Client(conf-if-eth1/1/1)#
```

DHCP server

```
OS10(config)# ip dhcp server
OS10(config-dhcp)# pool dell_1
OS10(config-dhcp-dell_1)# network 1.1.1.0/24
OS10(config-dhcp-dell_1)# range 1.1.1.2 1.1.1.10
Server(config-dhcp-dell_1)# show configuration
!
pool dell_1
network 1.1.1.0/24
range 1.1.1.2 1.1.1.10
Server(config-dhcp-dell_1)#

Server(conf-if-eth1/1/2)# show configuration
!
interface ethernet1/1/2
no shutdown
no switchport
ip address 20.1.1.2/24
flowcontrol receive off
Server(conf-if-eth1/1/2)#
```

DHCP relay

```
Relay(config)# interface loopback 0
Relay(conf-if-lo-0)# show configuration
!
interface loopback0
no shutdown
Relay(conf-if-lo-0)# ip address 3.1.1.1/32
Relay(conf-if-lo-0)# show configuration
!
interface loopback0
no shutdown
ip address 3.1.1.1/32
Relay(conf-if-lo-0)#

Relay(conf-if-eth1/1/1)# show configuration
```

```
!
interface ethernet1/1/1
no shutdown
no switchport
ip address 1.1.1.1/24
flowcontrol receive off
ip helper-address 20.1.1.2
ip dhcp-relay source-interface loopback1

Relay(conf-if-eth1/1/2)# show configuration
!
interface ethernet1/1/2
no shutdown
no switchport
ip address 20.1.1.1/24
flowcontrol receive off
Relay(conf-if-eth1/1/2)#
```

VRRP Virtual IP as Server Override (sub option 11)

The server identifier (server ID) override sub-option allows the DHCP relay agent to specify a new value for the server ID option. This option inserted by the DHCP server in the BOOTPReply packet.

This sub-option allows the DHCP relay agent to act as a proxy to the actual DHCP server, such that the renew requests come to the relay agent rather than to the DHCP server directly.

The server ID override sub-option contains the IP address on the relay agent that is accessible from the client. Using this information, the DHCP client sends all the DHCP unicast packet (RENEW, RELEASE, DECLINE) to the relay agent. The relay agent adds all the appropriate option 82 sub-options and then forwards it to the configured helper-address for further processing.

In a VRRP scenario, the VRRP virtual IP is reachable from the DHCP clients; hence, it is used as the server-override option.

NOTE: In the current implementation, SmartFabric Services OS10 supports enabling or disabling of the server-override option. If the server-override option is enabled, the anycast gateway is used as the server-override option. VRRP and anycast gateway are mutually exclusive. Hence, for VRRP to support the server-override option, VRRP virtual IP is used as the server-override option.

There is no option to configure any other interface IP as the server-override option.

VRRP is used for gateway redundancy in the LAN. All the hosts in the LAN use VRRP virtual IP as default route to forward packets towards the network.

In a DHCP relay use case, the DHCP client or host performs DISCOVER, OFFER, REQUEST, ACK (DORA) to acquire the IP address from the DHCP server. In normal scenarios, when the DHCP server sends the DHCP OFFER, it sets the server identifier option (option 54) to its IP address. This option is set, so that the DHCP clients use this IP address as destination address for any DHCP messages unicast to the DHCP server. The DHCP client sends unicast packets to RENEW, REQUEST, RELEASE, or DECLINE the IP address to the DHCP server.

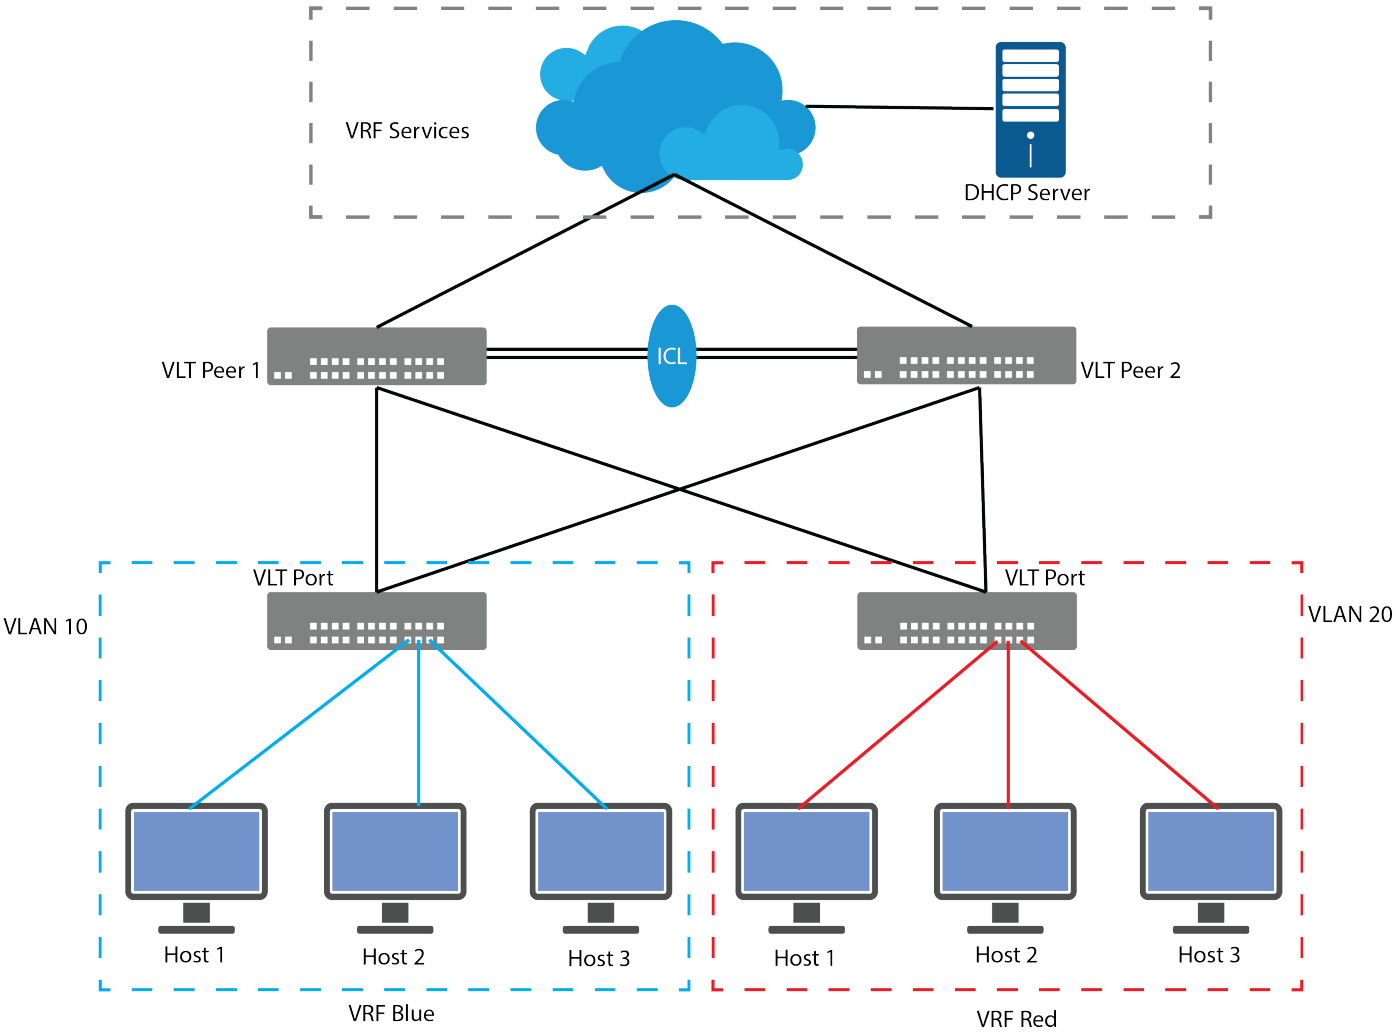
In SmartFabric Services OS10 power switch, for DHCP relay across VRFs, in which DHCP client is in one VRF and DHCP server is residing in another VRF; the following option 82 sub options are used to achieve the functionality:

- Link Selection option (sub option 5)
- VSS option (sub option 151, sub option 152)
- Server Override option (sub option 11)
- Source interface configuration

In a Layer3 VLAN VLT scenario, for the DHCP unicast packet, one of the options is to use the any cast gateway IP address as the server-override option. This configuration enables the host to send the DHCP unicast packet with any cast gateway IP as the destination IP address. For use cases in which any cast gateway is not supported, VRRP protocol is used to achieve the functionality of the any cast gateway. VRRP and anycast gateway are mutually exclusive configurations. For example, in a SFD use case any cast gateway is not supported and hence VRRP is supported.

In a VRRP use case with DHCP client and DHCP server in different VRFs, you must use the VRRP virtual IP as the server-override option. This option enables the host or DHCP client connected in the LAN to send the DHCP unicast packets with virtual IP as the destination IP address. The DHCP relay agent uses the DHCP unicast packet with virtual IP as destination IP. It also appends the configured option 82 options before forwarding to the configured helper-address in the VRF for further processing.

Consider the scenario in the following figure:



In this scenario, in the VLT pairs (VLT Peer 1 and VLT Peer 2) VRRP is enabled and the virtual IP is configured to achieve gateway redundancy.

Alternatively, you can configure VLAN anycast gateway to achieve the gateway redundancy. VRRP and anycast gateway are mutually exclusive. The DHCP clients (Host 1, 2, 3) in VLAN 10 or VRF BLUE and DHCP clients (Host 1, 2, 3) in VLAN 20 or VRF RED use VRRP virtual IP as the default gateway.

The DHCP relay helper-address is configured in VLAN 10 and VLAN 20 with the VRF name Services (DHCP Server reachable VRF). For this use case, when server-override is enabled the VRRP virtual IP is used as server-override option when BOOTP Relay request is sent to the DHCP server. The DHCP server sets the server-override option in the server identifier option in the DHCP OFFER packet. The DHCP client uses the VRRP virtual IP or server-override option as destination IP in the DHCP unicast packet. The DHCP relay forwards the packet to the DHCP server for further processing.

DHCP snooping

DHCP snooping is a layer 2 security feature that helps networking devices to monitor DHCP messages and block untrusted or rogue DHCP servers.

When you enable DHCP snooping on a switch, it begins monitoring transactions between trusted DHCP servers and DHCP clients and uses the information to build the DHCP snooping binding table. You configure interfaces that connect to DHCP servers as trusted interfaces. All other interfaces are untrusted by default.

The DHCP snooping binding table contains the following information:

- Client IP addresses
- Client MAC addresses
- Interface facing the clients

- Client VLAN
- Lease time
- DHCP binding type – static or dynamic

The switch considers DHCP servers connected to trusted interfaces on the switch as legitimate servers. When a switch receives DHCP server-initiated packets (UDP destination port 67) on an untrusted interface, it drops the packet.

When a switch receives DHCP renew, release, or decline messages from a client, it checks the DHCP snooping binding table for a match. If the information in the DHCP message matches the table, the switch forwards the message to the DHCP server. If the information does not match, the switch interprets the client as an unauthorized client and drops the packet.

The DHCP snooping switch removes a dynamically-learned DHCP snooping binding entry when one of the following occurs:

- Lease expiry
- DHCP RELEASE packet received from the client
- DHCP DECLINE packet received from the client
- User actions, such as DHCP clear or disabling DHCP snooping

You can add a static DHCP snooping binding entry using the CLI. If you add a static entry for a client, any dynamic entry that is present for the same client is overwritten. The switch does not remove static entries if it receives DHCP RELEASE or DHCP DECLINE packets.

By default, DHCP snooping is disabled globally and enabled on VLANs. For the DHCP snooping feature to work, enable it globally.

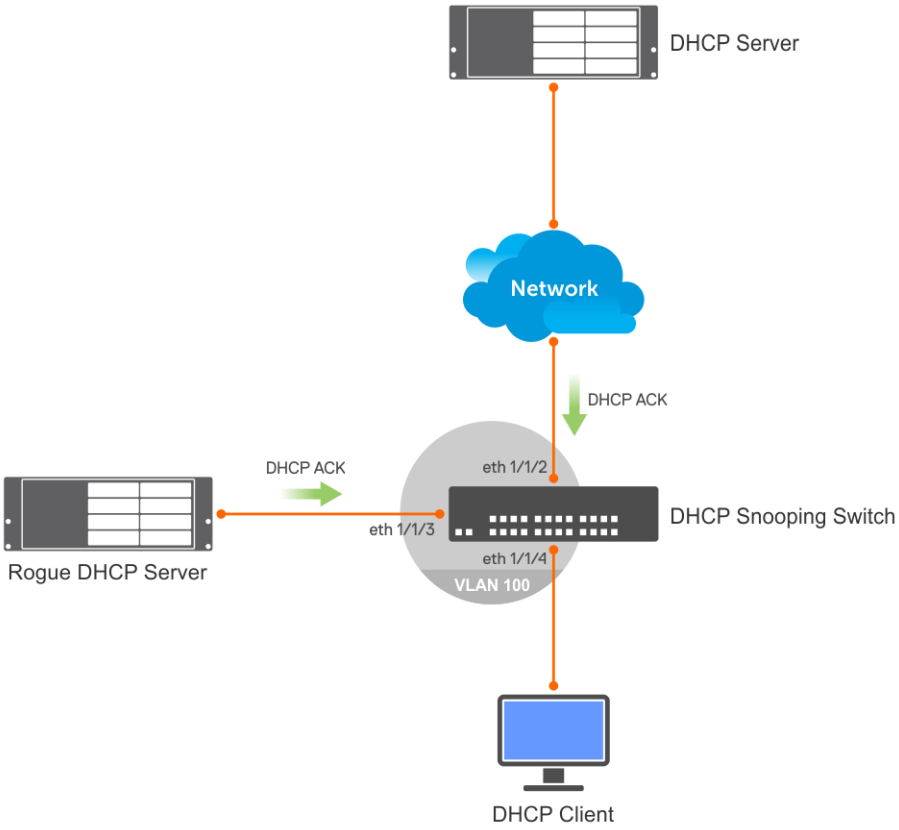
NOTE: If you move a DHCP client from an untrusted interface to another untrusted interface within the VLAN, the DHCP snooping binding database is not updated. The switch drops subsequent packets from the client. However, if you move a DHCP client from an untrusted interface to a trusted interface, there is no impact to the traffic from the client.

Restrictions for DHCP snooping

- The management VLAN does not support DHCP snooping.
- VxLAN bridges do not support DHCP snooping.
- The maximum number of supported DHCP snooping binding entries is 4000.
- OS10 does not support multi-hop DHCP snooping.
- For the DHCP snooping functionality to work correctly, ensure that the DHCP server supports option 82 (RFC 3046).
- Enable option 82 (RFC 3046) on the DHCP server for the DHCP Snooping functionality to work correctly.

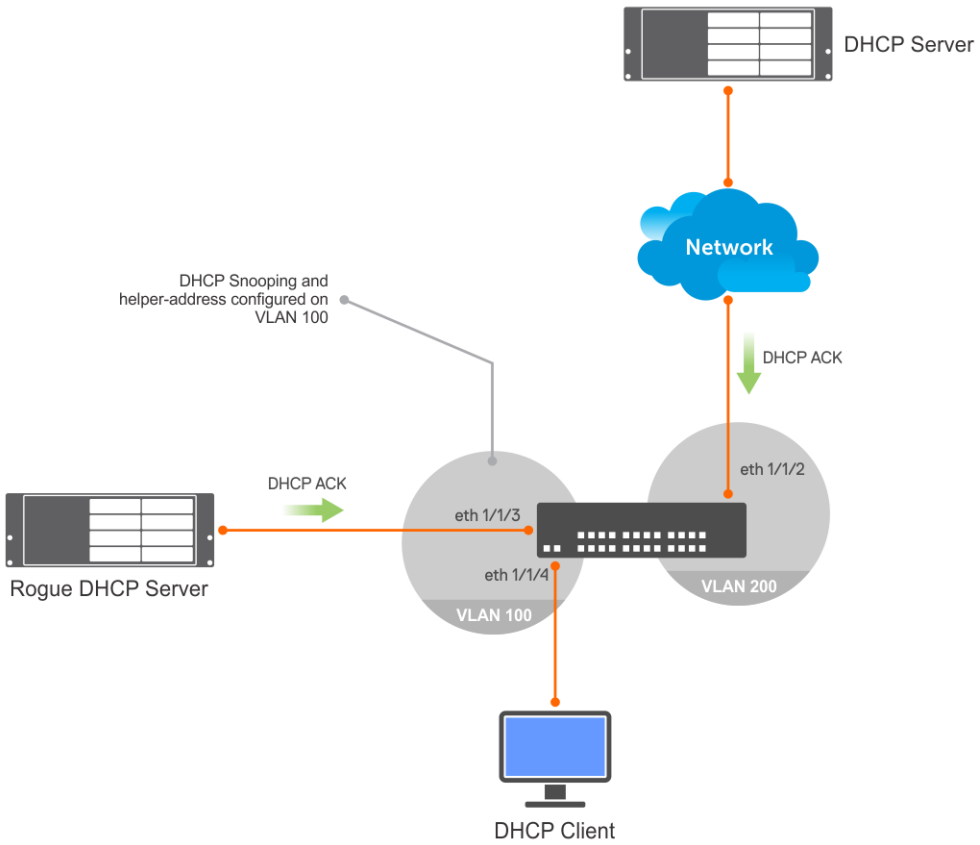
Rogue DHCP server detection

In the following topology, a trusted DHCP server, a DHCP client, and a rogue DHCP server are connected to the DHCP snooping switch. The DHCP client and DHCP server are on the same VLAN. The physical interface eth 1/1/2 is a trusted interface. When the rogue DHCP server sends a DHCP packet to the client, the switch analyzes the packet. As the rogue server is connected to the switch to an untrusted eth 1/1/3 interface the switch deems the server as a rogue DHCP server and drops the packet.



DHCP snooping with DHCP relay

In the following topology, the DHCP snooping switch is the DHCP relay agent for DHCP clients on VLAN 100. The DHCP server is reachable on VLAN 200 through eth 1/1/2. The switch forwards the client DHCP messages to the trusted DHCP server. The switch processes DHCP packets from the DHCP server before forwarding them to DHCP clients. As the rogue server is connected to the switch to the eth 1/1/3 interface which is untrusted, the switch drops DHCP packets from that interface.



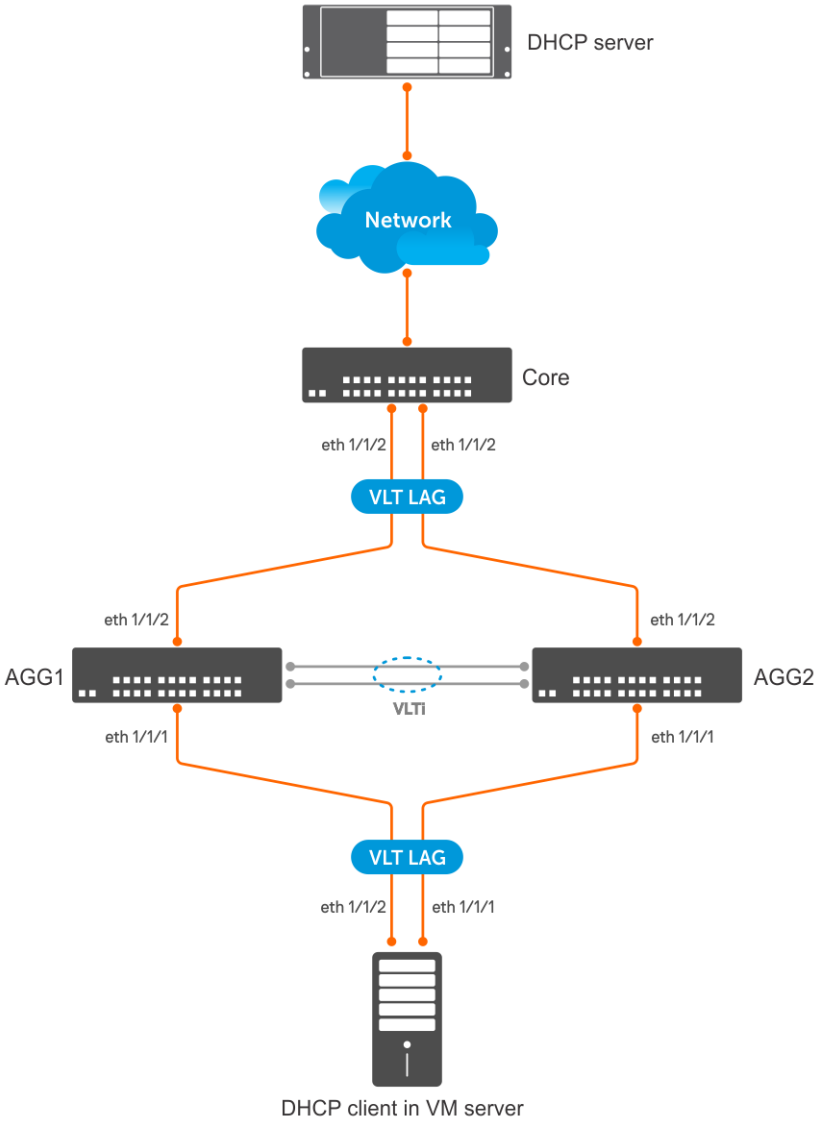
DHCP snooping in a VLT environment

OS10 supports DHCP snooping in a VLT environment. DHCP snooping switches in a VLT topology synchronize DHCP snooping binding information between them. The system interprets the VLTi link between VLT peers as trusted interfaces. To configure DHCP snooping in a VLT environment:

- Enable DHCP snooping on both VLT peers.
- Configure the VLT port-channel interfaces facing the DHCP server as trusted interfaces.

In the following VLT topology, AGG1 and AGG2 are VLT peers and have VLT port-channel interfaces connected to the VM server and Core switch. The DHCP server is reachable through the CORE switch. The following describes the functioning of DHCP snooping in a VLT environment:

- One of the VLT peers receives a DHCP client packet from a DHCP client on the VM server through the VLT port-channel interface. The switch processes this packet.
- The VLT peer forwards the DHCP client packet to the Core switch through the VLT port-channel interface.
- The Core switch forwards the DHCP reply packet from the DHCP server to one of the VLT peers, which processes the packet.
- If the DHCP reply packet is from a trusted DHCP server, the VLT peer forwards the reply packet to the DHCP client on the VM server.
- The VLT peers synchronize the DHCP snooping binding table.



Enable and configure DHCP snooping globally

1. Enable DHCP snooping globally in CONFIGURATION mode.

```
ip dhcp snooping
```

2. Specify physical or port-channel interfaces that have connections towards DHCP servers as trusted in INTERFACE mode.

```
ip dhcp snooping trust
```

Add static DHCP snooping entry in the binding table

- Add a static DHCP snooping entry in the binding table in CONFIGURATION mode.

```
ip dhcp snooping binding mac mac-address vlan vlan-id ip ip-address interface
[ethernet slot/port/sub-port | port-channel port-channel-id | VLTi]
```

Example of adding static DHCP snooping entry

```
OS10(config)# ip dhcp snooping binding mac 00:04:96:70:8a:12 vlan 100 ip 100.1.1.2
interface ethernet 1/1/4
```

Remove static DHCP snooping entry from the binding table

- Remove a static DHCP snooping entry from the binding table in CONFIGURATION mode.

```
no ip dhcp snooping binding mac mac-address vlan vlan-id interface [ethernet slot/
port/sub-port | port-channel port-channel-id]
```

Example for removing static DHCP snooping entry in the binding table

```
OS10(config)# no ip dhcp snooping binding mac 00:04:96:70:8a:12 vlan 100 ip 100.1.1.2
interface ethernet 1/1/4
```

Clear dynamically-learned entries from DHCP snooping binding table

- Use the following command in EXEC mode:

```
clear ip dhcp snooping binding [mac mac-address] [vlan vlan-id] [interface {ethernet
slot/port/sub-port | port-channel port-channel-id}]
```

CAUTION: Clearing the DHCP snooping binding table using the `clear ip dhcp snooping binding` command also clears the Source Address Validation (SAV) and Dynamic ARP Inspection (DAI) entries on the system. This affects the traffic from clients that are connected to the DHCP snooping-enabled VLANs.

Example for clearing dynamically-learned entries from DHCP snooping binding table

The following example clears all dynamic DHCP snooping binding entries that are associated with the MAC address 04:56:79:86:73:fe

```
OS10# clear ip dhcp snooping binding mac 04:56:79:86:73:fe
```

The following example clears all dynamic DHCP snooping binding entries that are associated with VLAN 100:

```
OS10# clear ip dhcp snooping binding vlan 100
```

The following example clears all the dynamic DHCP snooping binding entries that are associated with VLAN 100 with MAC address 04:56:79:86:73:fe on port-channel 10:

```
OS10# clear ip dhcp snooping binding mac 04:56:79:86:73:fe  vlan 100 port-channel 10
```

View contents of DHCP binding table

- Use the following command in EXEC mode:

```
show ip dhcp snooping binding [vlan vlan-name]
```

Example for viewing contents of DHCP binding table

```
OS10# show ip dhcp snooping binding
Codes :  S - Static D - Dynamic

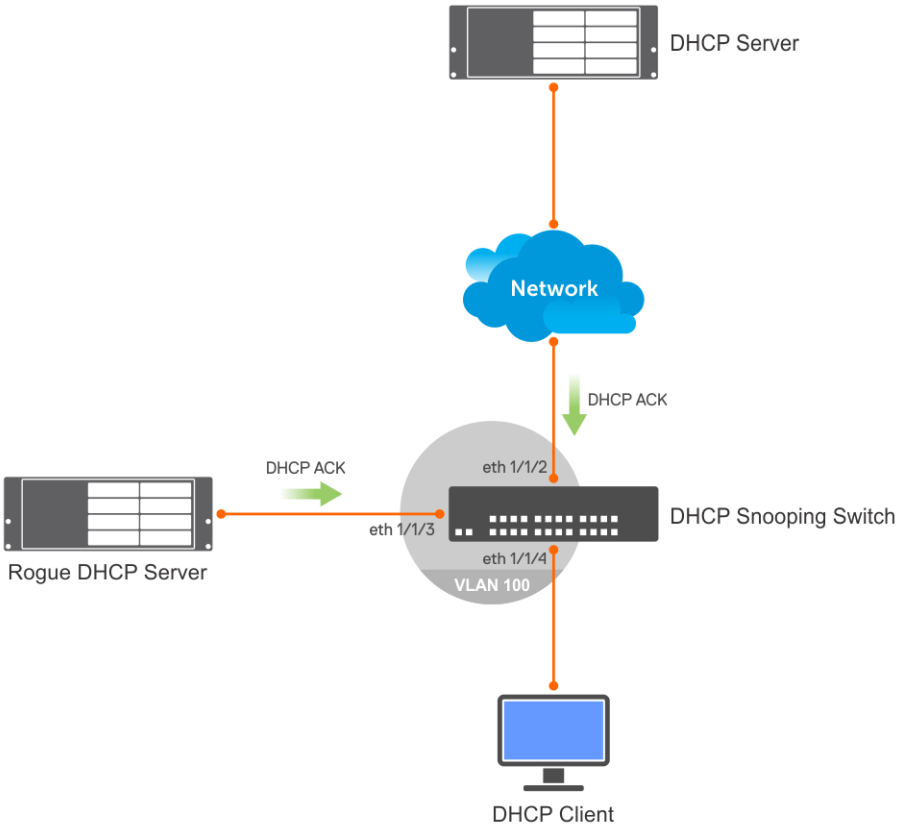
DHCP snooping examples

DHCP snooping in a simple layer 2 network

This example uses a simple topology with a DHCP snooping switch and a DHCP server. A DHCP client is connected to the snooping switch and a rogue DHCP server attempts to pose as a legitimate DHCP server. With a configuration similar to the following, the DHCP snooping switch drops packets from the rogue DHCP server which is connected to an untrusted interface.



DHCP server

```
OS10(config)# interface ethernet 1/1/1
S10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 10.1.1.1/24
OS10(conf-if-eth1/1/1)# exit
OS10(config)# ip dhcp server
OS10(config-dhcp)# no disable
OS10(config-dhcp)# pool dell_server1
OS10(config-dhcp-dell_server1)# lease 0 1 0
OS10(config-dhcp-dell_server1)# network 10.1.1.0/24
OS10(config-dhcp-dell_server1)# range 10.1.1.2 10.1.1.100
```

DHCP snooping switch

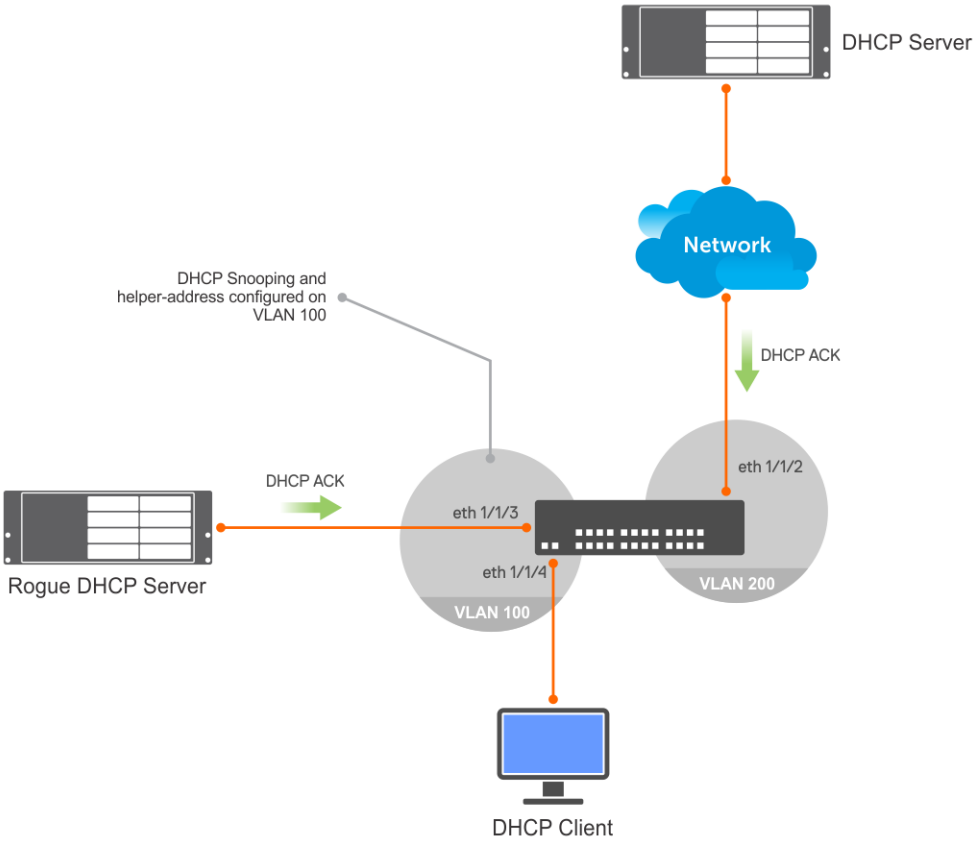
```
OS10# configure terminal
OS10(config)# ip dhcp snooping
OS10(config)# interface vlan 100
OS10(config-if-vl-100)# exit
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# switchport access vlan 100
OS10(conf-if-eth1/1/2)# ip dhcp snooping trust
OS10(conf-if-eth1/1/2)# interface ethernet 1/1/3
OS10(conf-if-eth1/1/3)# switchport access vlan 100
OS10(conf-if-eth1/1/3)# interface ethernet 1/1/4
OS10(conf-if-eth1/1/4)# switchport access vlan 100
```

DHCP client

```
OS10(config)# interface ethernet 1/1/4
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# no ip address
OS10(conf-if-eth1/1/4)# ip address dhcp
OS10(conf-if-eth1/1/4)# end
```

DHCP snooping switch as a relay agent

This example uses a simple topology with a DHCP snooping switch configured as a DHCP relay agent. A DHCP server and a DHCP client are connected to the snooping switch through different VLANs. A rogue DHCP server attempts to pose as a legitimate DHCP server. With a configuration similar to the following, the DHCP snooping switch drops packets from the rogue DHCP server which is connected to an untrusted interface.



DHCP snooping switch

```
OS10# configure terminal
OS10(config)# ip dhcp snooping
OS10(config)# end
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
OS10(conf-if-vl-100)# ip address 10.1.1.1/24

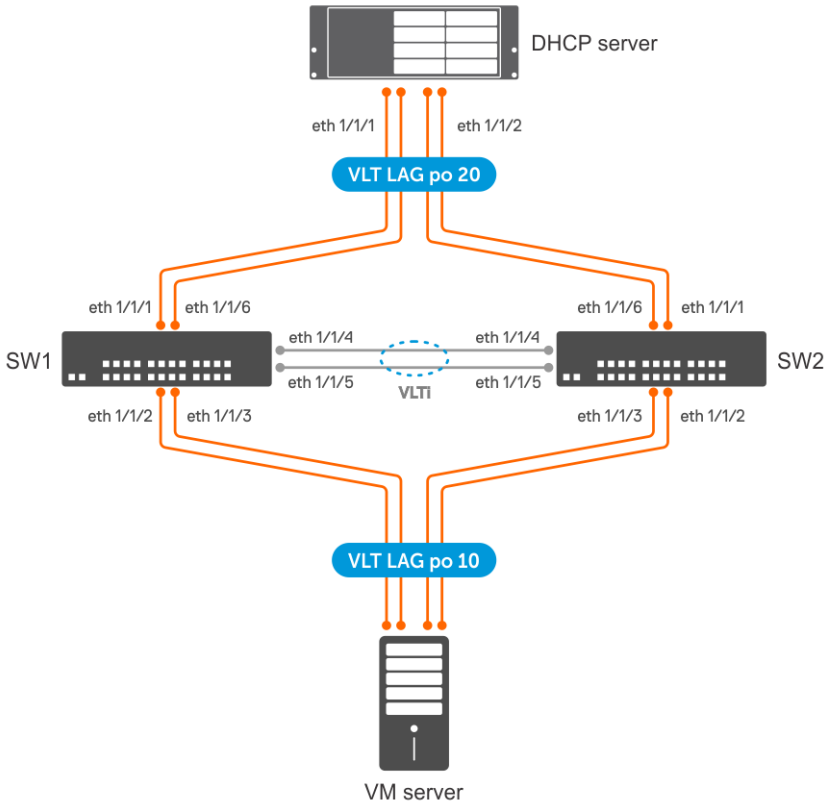
OS10(conf-if-eth1/1/4)# no ip address
OS10(conf-if-eth1/1/4)# ip address dhcp
OS10(conf-if-eth1/1/4)# end
```

DHCP snooping in a Layer 2 VLT setup

In this layer 2 VLT setup, DHCP clients on the virtual machine are connected to SW1 and SW2 and acquire IP addresses from the DHCP server.



SW 1

DHCP snooping configuration

- Enable DHCP snooping globally.

```
OS10(config)# ip dhcp snooping
```

VLAN configuration

- Create a VLAN.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
```

VLT configuration

1. Create a VLT domain and configure VLTi.

```
OS10(config)# interface range ethernet 1/1/4-1/1/5
OS10(conf-range-eth1/1/4-1/1/5)# no switchport
OS10(conf-range-eth1/1/4-1/1/5)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/4-1/1/5
```

2. Configure a VLT MAC address.

```
OS10(conf-vlt-1)# vlt-mac 12:5e:23:2d:76:3e
```

3. Specify the management IP address of the VLT peer as a backup link.

```
OS10(conf-vlt-1)# backup destination 10.10.10.2
```

4. Configure VLT port channels.

   VLT port channel to VM

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description SW1ToVM
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# switchport mode access
OS10(conf-if-po-10)# switchport access vlan 100
OS10(conf-if-po-10)# exit
OS10(config)# interface ethernet 1/1/2-1/1/3
OS10(conf-if-eth1/1/2-1/1/3)# no shutdown
OS10(conf-if-eth1/1/2-1/1/3)# channel-group 10
```

   VLT port channel to DHCP server

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# description SW1ToDHCP-Server
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# switchport mode access
OS10(conf-if-po-20)# switchport access vlan 100
OS10(conf-if-po-20)#  ip dhcp snooping trust
OS10(conf-if-po-20)# exit
OS10(config)# interface ethernet 1/1/1,1/1/6
OS10(conf-if-eth1/1/1,1/1/6)# no shutdown
OS10(conf-if-eth1/1/1,1/1/6)# channel-group 20
```

SW 2

DHCP snooping configuration

- Enable DHCP snooping globally.

```
OS10(config)# ip dhcp snooping
```

VLAN configuration

- Create a VLAN.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
```

VLT configuration

1. Create a VLT domain and configure VLTi.

```
OS10(config)# interface range ethernet 1/1/4-1/1/5
OS10(conf-range-eth1/1/4-1/1/5)# no switchport
OS10(conf-range-eth1/1/4-1/1/5)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/4-1/1/5
```

2. Configure a VLT MAC address.

```
OS10(conf-vlt-1)# vlt-mac 12:5e:23:f4:23:54
```

3. Specify the management IP address of the VLT peer as a backup link.

```
OS10(conf-vlt-1)# backup destination 10.10.10.1
```

4. Configure VLT port channels.

   VLT port channel to VM

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description SW2ToVM
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# switchport mode access
OS10(conf-if-po-10)# switchport access vlan 100
OS10(conf-if-po-10)#  exit
OS10(config)# interface ethernet 1/1/2-1/1/3
OS10(conf-if-eth1/1/2-1/1/3)# no shutdown
OS10(conf-if-eth1/1/2-1/1/3)# channel-group 10
```

   VLT port channel to DHCP server

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# description SW2ToDHCP-Server
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# switchport mode access
OS10(conf-if-po-20)# switchport access vlan 100
OS10(conf-if-po-20)#  ip dhcp snooping trust
OS10(conf-if-po-20)# exit
OS10(config)# interface ethernet 1/1/1,1/1/6
OS10(conf-if-eth1/1/1,1/1/6)# no shutdown
OS10(conf-if-et1/1/1,1/1/6)# channel-group 20
```

DHCP server

DHCP server configuration

```
OS10(config)# interface vlan 100
OS10((conf-if-vl-100)# ip address 10.1.1.1/24
OS10((conf-if-vl-100)# exit
OS10(config)# ip dhcp server
OS10(config-dhcp)# no disable
OS10(config-dhcp)# pool dell_server1
OS10(config-dhcp-dell_server1)# lease 0 1 0
OS10(config-dhcp-dell_server1)# network 10.1.1.0/24
OS10(config-dhcp-dell_server1)# range 10.1.1.2 10.1.1.100
```

Verify DHCP snooping on both VLT peers

The following output shows that the DHCP snooping switches (VLT peers) snooped DHCP messages. The interface column displays the local VLT port channel number.

```
OS10# show ip dhcp snooping binding

Number of entries : 1

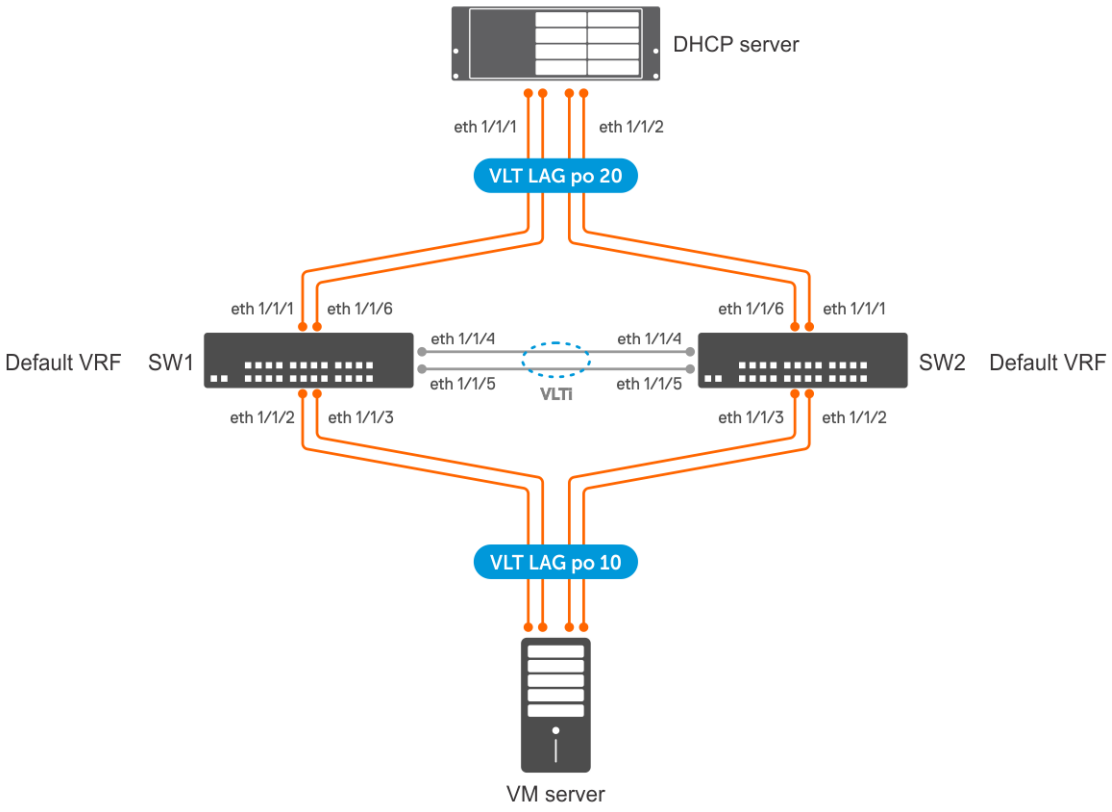
```

DHCP snooping with DHCP relay agent in a VLT setup

In this VLT setup, DHCP clients on the virtual machine are connected to SW1 and SW2 and acquire IP addresses from the DHCP server. The VLAN of both the client and the DHCP server is in the default VRF on SW 1 and SW 2.



SW 1

DHCP snooping configuration

- Enable DHCP snooping globally.

```
OS10(config)# ip dhcp snooping
```

VLAN configuration

- Create a VLAN and assign an IP address to it which acts as the gateway for the VMs.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
OS10(conf-if-vl-100)# ip address 10.1.1.1/24
OS10(conf-if-vl-100)# exit
```

- Create another VLAN and assign an IP address to it which can communicate with the DHCP server.

```
OS10# configure terminal
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# no shutdown
OS10(conf-if-vl-200)# ip address 10.2.1.1/24
OS10(conf-if-vl-200)# exit
```

- Configure SW 1 as the DHCP relay agent for the clients in the VM. The IP address that you specify here is the IP address of the DHCP server

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip helper-address 10.2.1.2
```

VLT configuration

1. Create a VLT domain and configure VLTi.

```
OS10(config)# interface range ethernet 1/1/4-1/1/5
OS10(conf-range-eth1/1/4-1/1/5)# no switchport
OS10(conf-range-eth1/1/4-1/1/5)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/4-1/1/5
```

2. Configure a VLT MAC address.

```
OS10(conf-vlt-1)# vlt-mac 12:5e:23:2d:76:3e
```

3. Specify the management IP address of the VLT peer as a backup link.

```
OS10(conf-vlt-1)# backup destination 10.10.10.2
```

4. Configure VLT port channels.

   SW1 to VM VLT port channel configuration

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description SW1ToVM
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# switchport mode access
OS10(conf-if-po-10)# switchport access vlan 100
OS10(conf-if-po-10)# exit
OS10(config)# interface ethernet 1/1/2-1/1/3
OS10(conf-if-eth1/1/2-1/1/3)# no shutdown
OS10(conf-if-eth1/1/2-1/1/3)# channel-group 10
```

SW 1 to DHCP server configuration

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# description SW1ToDHCP-Server
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport trunk allowed vlan 100,200
OS10(conf-if-po-20)#  ip dhcp snooping trust
OS10(conf-if-po-20)# exit
OS10(config)# interface ethernet 1/1/1,1/1/6
OS10(conf-if-eth1/1/1,1/1/6)# no shutdown
OS10(conf-if-eth1/1/1,1/1/6)# channel-group 20
```

(Optional) Peer routing configuration

- Configure peer routing.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# peer-routing
```

SW 2

DHCP snooping configuration

- Enable DHCP snooping globally.

```
OS10(config)# ip dhcp snooping
```

VLAN configuration

- Create a VLAN and assign an IP address to it which acts as the gateway for the VMs.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
OS10(conf-if-vl-100)# ip address
OS10(conf-if-vl-100)# ip address 10.1.1.2/24
OS10(conf-if-vl-100)# exit
```

- Create another VLAN and assign an IP address to it which can communicate with the DHCP server.

```
OS10# configure terminal
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# no shutdown
OS10(conf-if-vl-200)# ip address
OS10(conf-if-vl-200)# ip address 10.2.1.3/24
OS10(conf-if-vl-200)# exit
```

- Configure SW 1 as the DHCP relay agent for the clients in the VM. The IP address that you specify here is the IP address of the DHCP server

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip helper-address 10.2.1.2
```

VLT configuration

1. Create a VLT domain and configure VLTi.

```
OS10(config)# interface range ethernet 1/1/4-1/1/5
OS10(conf-range-eth1/1/4-1/1/5)# no switchport
OS10(conf-range-eth1/1/4-1/1/5)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/4-1/1/5
```

2. Configure a VLT MAC address.

```
OS10(conf-vlt-1)# vlt-mac 12:5e:23:f4:23:54
```

3. Specify the management IP address of the VLT peer as a backup link.

```
OS10(conf-vlt-1)# backup destination 10.10.10.1
```

4. Configure VLT port channels.

   SW2 to VM VLT port channel configuration

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description SW2ToVM
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# switchport mode access
OS10(conf-if-po-10)# switchport access vlan 100
OS10(conf-if-po-10)# exit
OS10(config)# interface ethernet 1/1/2-1/1/3
OS10(conf-if-eth1/1/2-1/1/3)# no shutdown
OS10(conf-if-eth1/1/2-1/1/3)# channel-group 10
```

SW 2 to DHCP server configuration

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# description SW2ToDHCP-Server
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport trunk allowed vlan 100,200
OS10(conf-if-po-20)#  ip dhcp snooping trust
```

```
OS10(conf-if-po-20)# exit
OS10(config)# interface ethernet 1/1/1,1/1/6
OS10(conf-if-eth1/1/1,1/1/6)# no shutdown
OS10(conf-if-eth1/1/1,1/1/6)# channel-group 20
```

(Optional) Peer routing configuration

- Configure peer routing.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# peer-routing
```

DHCP server

VLAN configuration

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# exit
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# ip address 10.2.1.2/24
OS10(conf-if-vl-200)# exit
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport trunk allowed vlan 100,200
```

DHCP server configuration

```
OS10(config)# ip dhcp server
OS10(config-dhcp)# no disable
OS10(config-dhcp)# pool dell_server1
OS10(config-dhcp-dell_server1)# network 10.1.1.0/24
OS10(config-dhcp-dell_server1)# range 10.1.1.3 10.1.1.250
OS10(config-dhcp-dell_server1)# lease 0 1 0
OS10(config-dhcp-dell_server1)# default-router 10.1.1.1
OS10(config-dhcp)# pool dell_2
OS10(config-dhcp-dell_2)# network 10.2.1.0/24
OS10(config-dhcp-dell_2)# range 10.2.1.4 10.2.1.100
OS10(config-dhcp-dell_2)# lease 0 1 0
```

Route to reach VLAN 100

```
OS10(config)#ip route 10.1.1.0/24 10.2.1.1
```

Verify DHCP snooping on both VLT peers

The following output shows that the DHCP snooping switches (VLT peers) snooped DHCP messages.

```
OS10# show ip dhcp snooping binding

Number of entries : 1

Codes :  S - Static               D - Dynamic

IPv4 Address      MAC Address          Expires(Sec)     Type  Interface           VLAN
=============================================================================================
10.1.1.3          14:18:77:0d:05:e9    3600             D     port-channel10      100
```

Dynamic ARP inspection

Dynamic Address Resolution Protocol (ARP) Inspection (DAI) is a security feature that protects local area networks from man-in-the-middle ARP spoofing attacks.

When you enable DAI, the switch intercepts ARP packets on DAI-enabled VLANs. The switch then compares the source IP and source MAC addresses, VLAN, and the interface (physical or port channel) of the received packet with the DHCP snooping binding table. If the information in the packet does not match any entry in the DHCP snooping binding table, the switch drops the packet.

NOTE: Dell Networking recommends enabling DAI before enabling DHCP snooping on the system.

DAI violation logging

You can configure the system to log DAI validation failures corresponding to ARP packets. DAI violations are logged at the console if it is enabled. DAI violation logging is disabled by default.

If you configure an interface as trusted, the switch interprets ARP packets that ingress the interface from hosts as legitimate packets. By default, all interfaces are in DAI untrusted state.

For DAI to work, enable the DHCP snooping feature on the switch. DAI is disabled by default.

DAI statistics

The system maintains DAI statistics that contain the following details:

- Valid ARP requests
- Invalid ARP requests
- Valid ARP replies
- Invalid ARP replies

You can clear the DAI statistics using the `clear ip arp inspection statistics` command.

DAI trusted interfaces

By default, all ports are untrusted and all packets go through the DAI validation process on all DAI-enabled VLANs. You can configure an interface to bypass ARP inspection by configuring the interface as trusted.

NOTE: Dell Networking recommends configuring the `arp inspection-trust` command on the DHCP snooping trusted interfaces when DAI is enabled for a VLAN.

Restrictions for Dynamic ARP Inspection

- Dynamic ARP Inspection with VxLAN bridges is not supported.
- Maximum number of recommended Dynamic ARP Inspection entries is 2000.

Enable Dynamic ARP Inspection

- Enable DHCP snooping. For more information about configuring DHCP snooping, see DHCP snooping.
- Enable Dynamic ARP Inspection on a VLAN in INTERFACE VLAN mode.

```
arp inspection
```

Enable Dynamic ARP Inspection violation logging

- Use the following command in CONFIGURATION mode:

```
arp inspection violation logging
```

Bypass Dynamic ARP Inspection on an interface

- Use the following command in INTERFACE mode:

```
arp inspection-trust
```

Clear DAI statistics

- Clear DAI statistics in EXEC mode.

```
clear ip arp inspection statistics [vlan vlan-name]
```

View DAI database

- View DAI database in EXEC mode

```
show ip arp inspection database [vlan vlan-name]
```

Use the `vlan` option to view DAI database for a specific VLAN.

Example for viewing DAI database

```
OS10# show ip arp inspection database
Number of entries : 828
```

```
Address          Hardware Address        Interface           VLAN
-------------------------------------------------------------------
10.2.1.1         00:40:50:00:00:00       port-channel100     vlan3001
10.1.1.13        00:2a:10:01:00:00       port-channel100     vlan3001
10.1.1.62        00:2a:10:01:00:01       port-channel100     vlan3001
```

View DAI statistics

You can view valid and invalid ARP requests that the switch has received and replies that the switch has sent.

- Use the following command in EXEC mode:

```
show ip arp inspection statistics vlan vlan-name
```

Example for viewing DAI statistics

```
OS10# show ip arp inspection statistics
Dynamic ARP Inspection (DAI) Statistics
---------------------------------------

Valid ARP Requests           : 0
Valid ARP Replies            : 1000
Invalid ARP Requests         : 1000
Invalid ARP Replies          : 0
```

- **View DAI violation information**

```
show ip arp inspection logging
```

Example for viewing DAI violation information

```
OS10# show ip arp inspection logging
Total Number of Clients                         : 1
New Clients learnt in current Interval          : 0
Invalid ARP packets in current interval         : 0

Address       Hw-Address          Port           VLAN   First-detected-time
Packet-count
-------------------------------------------------------------------------------
10.1.1.1      12:d3:43:a1:2e:23   ethernet1/1/1  10     00:23:14              2
```

Source Address Validation

Source Address Validation (SAV) is a security feature that instructs switches to permit IP traffic only from clients present in the DHCP snooping binding table.

When you enable SAV, the switch compares the source IP and MAC addresses in the packet with the DHCP snooping binding table. If there is a match, the device forwards the packet. If there is no match, it drops the packet.

SAV is disabled by default.

NOTE: Dell Networking recommends enabling SAV before enabling DHCP snooping on the system.

OS10 supports three types of Source Address Validation:

1. Source IP address validation
2. Source IP and MAC address validation
3. DHCP source MAC address validation

Source IP address validation

This feature filters IP traffic, based on the source IP address and permits traffic only from clients present in the DHCP snooping binding table. The switch compares the following in the packet to the DHCP snooping binding table:

- Source IP address
- The VLAN to which the client is connected
- The interface (physical or port channel) to which the client is connected

If there is a match, the switch forwards the packet.

Source IP and MAC address validation

This feature filters IP traffic, based on both source IP and source MAC addresses and permits traffic only from clients found in the DHCP snooping binding table. The switch compares the following in the packet to the DHCP snooping binding table:

- Source MAC address
- Source IP address
- The VLAN to which the client is connected
- The interface (physical or port channel) to which the client is connected

If there is a match, the switch forwards the packet.

DHCP source MAC address validation

The switch compares the source MAC address of the DHCP packet to the Client Hardware Address (CHADDR) field in the DHCP packet and drops the DHCP packet if there is a mismatch.

Restrictions for Source Address Validation

- As the SAV feature shares TCAM memory with user ACLs, the maximum number of SAV rules that the system can support depends on how much TCAM memory is allocated to user ACLs.

Enable source IP address validation

- Enable source IP address validation in INTERFACE mode.

  ```
  ip dhcp snooping source-address-validation ip [vlan vlan-name]
  ```

  Use the `vlan` option to optionally specify SAV for one or more VLANs. The range is from 1 to 4093. If you do not specify the `vlan` option, SAV is enabled on all VLANs of an interface.

Enable source IP and MAC address validation

- Enable source IP and MAC address validation in INTERFACE mode.

  ```
  ip dhcp snooping source-address-validation ipmac [vlan vlan-name]
  ```

  Use the VLAN option to optionally specify SAV for one or more VLANs. The range is from 1 to 4093. If you do not specify the `vlan` option, SAV is enabled on all VLANs of an interface.

Enable DHCP source MAC address validation

- Enable DHCP source MAC address validation in CONFIGURATION mode.

  ```
  ip dhcp snooping verify mac-address
  ```

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

Learning of source MAC address from received LLDP and LACP packets is disabled.

System domain name and list

If you enter a partial domain, the system searches different domains to finish or fully qualify that partial domain. A fully qualified domain name (FQDN) is any name that terminates with a period or dot.

OS10 searches the host table first to resolve the partial domain. The host table contains both statically configured and dynamically learned host and IP addresses. If OS10 cannot resolve the domain, it tries the domain name assigned to the local system. If that does not resolve the partial domain, the system searches the list of domains configured.

You can configure the `ip domain-list` command up to five times to enter a list of possible domain names. The system searches the domain names in the order they were configured until a match is found or the list is exhausted.

1. Enter a domain name in CONFIGURATION mode with a maximum of 64 alphanumeric characters.

   ```
   ip domain-name name
   ```

2. Add names to complete unqualified hostnames in CONFIGURATION mode.

```
ip domain-list name
```

You can configure a domain name and list corresponding to a non-default VRF instance.

1. Enter a domain name corresponding to a non-default VRF instance in the CONFIGURATION mode.

```
ip domain-name vrf vrf-name server-name
```

2. Add names to complete unqualified hostnames corresponding to a non-default VRF instance.

```
ip domain-list vrf vrf-name name
```

Configure the local system domain name and list

```
OS10(config)# ip domain-name ntengg.com
OS10(config)# ip domain-list dns1
OS10(config)# ip domain-list dns2
OS10(config)# ip domain-list dns3
OS10(config)# ip domain-list dns4
OS10(config)# ip domain-list dns5
```

```
OS10(config)# ip domain-name vrf vrf-blue ntengg.com
OS10(config)# ip domain-list vrf vrf-blue dns1
OS10(config)# ip domain-list vrf vrf-blue dns2
OS10(config)# ip domain-list vrf-vrfblue dns3
OS10(config)# ip domain-list vrf vrf-blue dns4
OS10(config)# ip domain-list vrf vrf-blue dns5
```

View local system domain name information

```
OS10# show running-configuration

DHCP commands

DHCP relay commands

clear ip dhcp-relay-counters

Resets the statistics of the DHCP packets received or transmitted by the relay agent.

Syntax `clear ip dhcp-relay-counters {interface [ethernet node/slot/port | port-channel id-number | vlan vlan-id | virtual-network vn-id | <cr>}}`

Parameters

- `interface` — Specify the interface on which you want to reset the DHCP packet statistics.
- *`ethernet node/slot/port`* — (Optional) Specify the ethernet node, slot and port on which you want to reset the DHCP packet statistics.

- *port-channel id-number* — (Optional) Specify the port-channel *id-number* on which you want to reset the DHCP packet statistics. Valid values are from 1 to 999 or 1001 to 2000.
- *vlan vlan-id* — (Optional) Specify the VLAN *vlan-id* on which you want to reset the DHCP packet statistics.
- *vitual-network vn-id* — (Optional) Specify the virtual-network *vn-id* on which you want to reset the DHCP packet statistics.

Defaults None

Command Mode EXEC

Usage Information The `clear ip dhcp relay counters interface <interface>` command clears the DHCP counter statistics for the requested interface.

The `clear ip dhcp relay counters` command clears the DHCP counter statistics of all interfaces.

Security and Access This command is restricted to the `netadmin` and `sysadmin` roles.

Example

```
OS10# clear ip dhcp-relay counters?
interface     Clears the interface DHCP counter statistics
<cr>

OS10#clear ip dhcp-relay counters interface?
ethernet          Ethernet interface type
port-channel      Port-channel interface type
vlan              Vlan interface type
virtual-network   Virtual network type
```

Supported Release 10.5.2.3 or later

ip helper-address

Configures the DHCP server address.

Syntax `ip helper-address address [vrf vrf-name]`

Parameters

- *address* — Enter the IPv4 address to forward UDP broadcasts to the DHCP server in A.B.C.D format.
- `vrf vrf-name` — (Optional) Enter `vrf` and then the name of the VRF through which the host address is reached.

Default Disabled

Command Mode INTERFACE

Usage Information The DHCP server is supported only on L3 interfaces. After you configure an IP helper address, the address forwards UDP broadcasts to the DHCP server. You can configure multiple helper addresses on an interface by repeating the same command for each DHCP server address. The `no` version of this command returns the value to the default. The client-facing and server-facing interfaces must be in the same VRF.

Example (IPv4)

```
OS10(config)# interface eth 1/1/22
OS10(conf-if-eth1/1/22)# ip helper-address 20.1.1.1 vrf blue
```

Supported Releases 10.2.0E or later

ipv6 helper-address

Configures a DHCPv6 server address.

Syntax `ipv6 helper-address ipv6-address [vrf vrf-name]`

Parameters

- `vrf vrf-name` — (Optional) Enter the keyword `vrf` and then the name of the VRF through which the host address can be reached.
- *`ipv6-address`* — Specify the DHCPv6 server address in the A::B format.

Defaults Disabled

Command Mode INTERFACE

Usage Information Use this command on interfaces to which DHCPv6 clients connect, to forward the packets between IPv6 clients and a DHCPv6 server. After you configure an IPv6 helper address, the address forwards UDP broadcasts from IPv6 clients to the DHCPv6 server. You can configure multiple helper addresses on an interface by repeating the same command for each DHCPv6 server address. The `no` version of this command deletes the IPv6 helper address.

Example

```
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# ipv6 helper-address 2001:db8:0:1:1:1:1:1 vrf
blue
```

Supported Releases 10.4.1.0 or later

ip dhcp-relay information-option

Configures the system to enable the remote-id string in Option-82.

Syntax `ip dhcp-relay information-option`

Parameters None.

Default Not configured

Command Mode CONFIGURATION, INTERFACE CONFIGURATION

Usage Information By default, Option-82 is enabled Globally. When Option-82 is enabled Globally, the relay agent adds the client information to the packet and sends it to the server. When Option-82 is disabled Globally, the client packets are sent to the server without Option-82 information. When both Global and the Interface level Option-82 configurations are present, the configuration to disable Option-82 takes precedence.

The following table shows the Option-82 status depending on the global and interface level configurations:

Table 19. Option-82 status

Global Level	Interface Level	Option-82 status
Enable	Enable	Adds Option-82 information to the packet.
Enable	Disable	Does not add Option-82 information to the packet.
Disable	Enable	Does not add Option-82 information to the packet.
Disable	Disable	Does not add Option-82 information to the packet.

Example

```
OS10(config)# ip dhcp-relay information-option
```

Supported Releases 10.5.2.0 or later

ip dhcp-relay vss

Enables the support for the DHCPv4 Virtual Subnet Selection (VSS) option.

Syntax `ip dhcp-relay vss`

Parameters None.

Defaults Disabled by default.

Command Mode CONFIGURATION

Usage Information After enabling the VSS option, the DHCPv4 virtual subnet selection support gets enabled globally. Additionally, to send VRF information to the DHCP server, you must configure the VSS type information on the respective DHCP client facing interfaces.

NOTE: Option-82 must be enabled Globally and at the interface level to activate VSS feature support.

This command is restricted to `netadmin` and `sysadmin` roles users.

Example

```
OS10(config)# ip dhcp-relay vss
OS10-8986(config)# ip dhcp-relay ?
max-hops Maximum    allowable hop count
server-override     Enable relay server override sub-option
vss                 Enable VSS sub-option in relay agent
```

Supported Releases 10.5.2 or later

ip dhcp-relay vss-info

Configures the VRF information to be carried in the option 151 field of relay packets to the server which allows the DHCP server to decide the address pool for IP allocation.

Syntax `ip dhcp-relay vss-info type {0 [ value string]/1 [value 7-octet value]/255}`

Parameters

- `0 string` - Enter the type as 0 then the VRF name.
- `1 value` - Enter the type as 1 then `OUI:VRF-Index ,3 bytes OUI:4 bytes VRF_Index`
- `255` - Enter the type as 255 for global or default address space.

Defaults No `vss-info` value is configured on the interface.

Command Mode INTERFACE CONFIGURATION

Usage Information The VRF values for subnet selection are sent to the DHCP server in the `option 151` field only if `ip dhcp-relay vss-enable` is enabled at the Global level. The value of the VRF name must match a VRF configured on the DHCP server for a DHCP pool. It is not the name of a VRF configured on the local switch, as a result, no validation is performed.

- To send the VRF information to the DHCP server, set the `vss-info` type as `type-0` or `type-1` and configure the corresponding VRF name string or VRF Octet value, respectively, on the interface.
- If a `no` value or `type-255` is passed as the `vss` value, the IP address is allocated from the default address pool of the server corresponding to the link selection subnet.
- The `type 0` and `type 1` values configured on the client interfaces must contain the server-side VRF DHCP pool information. It is used by the server to allocate IP address to the clients from the requested VRF pool. The configured `type 0` or `type 1` value must be the VRF or VPN ID associated with the DHCP pool in the server.

You can configure the `vss-info` on all types of the DHCP client interfaces (Ethernet interface, port-channel, VLAN, and virtual-network).

NOTE: With VSS enabled, change in the `vss-info` configuration value at the interface after the client IP assignment takes effect in the subsequent renew process. If the client receives a NACK, the client starts the discovery process with the new values.

This command is restricted to `netadmin` and `sysadmin` role users.

Example

```
OS10(conf-if-eth1/1/1)# ip dhcp-relay
server-override       Enable dhcp-relay server overrride sub-option
source-interface      Source interface for dhcp relay
vss-info              Configure VSS information

OS10-8986(conf-if-eth1/1/1)# ip dhcp-relay vss-info
type               Configure VSS type

OS10-8986(conf-if-eth1/1/1)# ip dhcp-relay vss-info type
0                Type-0
1                Type-1
255              Type-255 for global/default address space
OS10(config)# interface ethernet 1/1/1

OS10(conf-if-eth1/1/1)# ip dhcp-relay vss-info type 0 value vrf_red

OS10(conf-if-eth1/1/1)# ip dhcp-relay vss-info type 1 value F10:1234

OS10(conf-if-eth1/1/1)# ip dhcp-relay vss-info type 255
```

Supported Releases 10.5.2 or later

ip dhcp-relay link-selection

Enables link-selection (suboption-5) globally on the relay agent.

Syntax `ip dhcp-relay link-selection`

Parameters None.

Defaults Disabled on the relay agent.

Command Mode CONFIGURATION

Usage Information

After enabling the link-selection option, the DHCPv4 link-selection support is enabled Globally.

Anycast gateway IP address or client interface IP address is filled in the link-selection option to communicate the client subnet to the DHCP server.

NOTE: Link-selection gets functionally enabled only if Option-82 is enabled Globally and at the interface level.

This command is restricted to the `netadmin` and `sysadmin` role users.

Example

```
OS10(conf)# ip dhcp-relay link-selection
```

Supported Releases 10.5.2 or later

ip dhcp-relay source-interface

Configures the source interface to be used by the DHCP relay agent to decide the Gateway IP address used for forwarding a DHCP packet received on the VRF.

Syntax `ip dhcp-relay {source-interface [ethernet node/slot/port | loopback loopback-id | port-channel id-number | vlan vlan-id | virtual-network vn-id]`

Parameters

- `ethernet node/ slot/port` - Enter the ethernet interface type.
- `loopback loopback-id` - Enter the Loopback interface type.

- `port-channel id-number` - Enter the port channel interface type.
- `vlan vlan-id` - Enter the VLAN interface type.
- `virtual-network vn-id` - Enter the virtual network type.

Defaults No source-interface configuration on the VRF and the client connected interface IP address is used by the relay for forwarding.

Command Mode IP VRF

Usage Information When you configure the DHCP-relay source interface for a given VRF, all the DHCP client-facing interfaces associated with the VRF use this interface IP in the `giaddr` field to forward the packets to and from the DHCP server.

The DHCP server uses the IP address of that source interface as destination for RELAY-REPLY packets. We can configure a unique source-interface for the DHCP client facing interfaces (apart from the one configured at the VRF level), by using the `interface level source-interface` command.

The source-interface IP address takes precedence for the `giaddr` field even if an interface IP address or virtual anycast gateway IP address is present on the interface.

NOTE: You must enable the link-selection option globally to allocate the IP address on the client subnet if the client-connected interface IP address and source interface IP address are in different network domain.

This command is restricted to `netadmin` and `sysadmin` role users.

Example

```
OS10(conf-vrf)# ip dhcp-relay source-interface
ethernet        Ethernet interface type
loopback        Loopback interface type
port-channel    Port-channel interface type
vlan            Vlan interface type
virtual-network virtual network type

OS10(conf-vrf)# ip dhcp-relay source-interface loopback 1
```

Supported Releases 10.5.2 or later

ip dhcp-relay server-override

Enables server identifier override (suboption-11) globally on the relay agent.

Syntax `ip dhcp-relay server-override`

Parameters None.

Defaults Disabled on the relay agent.

Command Mode CONFIGURATION

Usage Information Enabling the server identifier option on the relay agent allows the DHCP relay agent to act as the proxy DHCP server such that the renew requests from the clients come to the relay agent rather than the DHCP server directly.

Enabling the CLI at global level enables the server-override option on all the DHCP client-facing interfaces by default. In order to disable the server-override option for specific client facing interfaces, configure `no ip dhcp-relay server-override` command on them.

NOTE: Option-82 must be enabled Globally and at the interface level to activate the server-override feature support.

This command is restricted to `netadmin` and `sysadmin` role users.

Example

```
OS10(conf)# ip dhcp-relay server-override
```

Supported Releases	10.5.2 or later

ip dhcp-relay source-interface

Configures the DHCP relay source interface to be used by the DHCP relay agents to forward the packets to and from the DHCP server.

Syntax

```
ip dhcp-relay {source-interface [ethernet node/slot/port | loopback loopback-id | port-channel id-number | vlan vlan-id | virtual-network vn-id]
```

Parameters

- `ethernet` *`node/slot/port`*—Enter the Ethernet interface type.
- `loopback` *`loopback-id`*—Enter the Loopback interface type.
- `port-channel` *`id-number`*—Enter the port channel ID, from 1 to 999 or 1001 to 2000.
- `vlan` *`vlan-id`*—Enter the VLAN interface type.
- `virtual-network` *`vn-id`*—Enter the virtual network type.

Defaults No source-interface configuration on the interface and the client connected interface IP address is used by the relay for forwarding.

Command Mode INTERFACE CONFIGURATION

Usage Information

When you configure the DHCP-relay source interface on a given DHCP client facing interface, the DHCP server uses the IP address of that source interface as the destination for the RELAY-REPLY packets.

This interface level source-interface configuration takes precedence over the VRF source-interface configuration, if configured. The source-interface IP address takes precedence for the `giaddr` field even if an interface IP address or virtual anycast gateway IP address is present on the interface.

You can configure the source-interface on all types of DHCP client interfaces (Ethernet interface, port channel, VLAN, and virtual-network).

NOTE: You must enable the link-selection option globally to allocate the IP address on the client subnet if the client-connected interface IP address and source interface IP address are in different network domains.

This command is restricted to `netadmin` and `sysadmin` role users.

Example

```
OS10(conf-if-eth1/1/1)# ip dhcp-relay source-interface

ethernet            Ethernet interface type
loopback            Loopback interface type
port-channel        Port-channel interface type
vlan                VLAN interface type
virtual-network     Virtual network type

OS10(conf-if-eth1/1/1)# ip dhcp-relay source-interface loopback 1
```

Supported Releases	10.5.2.0 or later

ip dhcp-relay server-override

Enables server identifier override (`suboption-11`) globally on the relay agent.

Syntax

```
ip dhcp-relay server-override
```

Parameters None.

Defaults If server-override is enabled globally, DHCPv4 relay server identifier override option (`suboption-11`) is enabled on an interface by default.

Command Mode INTERFACE CONFIGURATION

Usage Information

Disable the server identifier override (`suboption-11`) on the interface using the `no ip dhcp-relay server-override` command.

If you enable `server-override-enable` Globally, DHCPv4 relay server identifier override option (`suboption-11`) is enabled on an interface by default. To avoid sending this option on selected client, you must explicitly disable the option on the interface using the `no ip dhcp-relay server-override` command.

NOTE: The `ip dhcp-relay server-override` configuration is disabled globally by default.

With server override enabled, the DHCP relay drops further packets from the DHCP client if there is a change in the anycast gateway IP address. This behavior forces the client to restart the discovery process.

Table 20. Values

Global Level	Interface Level	Server-override value
Enabled	Enabled (By default)	Enabled. value: *anycast gatewayIP*
Disabled	Enabled	Disabled
Enabled	Disabled	Disabled on interface

This command is restricted to `netadmin` and `sysadmin` role users.

Example

```
Globally enable Server-override:

OS10(conf)# ip dhcp-relay server-override

Disable server-override on interface

OS10(config)# interface ethernet 1/1/1

OS10(conf-if-eth1/1/1)#no  ip dhcp-relay server-override
```

Supported Releases

10.5.2 or later

ipv6 dhcp-relay interface-id

Enables or disables DHCPv6 interface-id option..

Syntax

`ipv6 dhcp-relay interface-id`

Parameters

None

Defaults

Disabled

Command Mode

CONFIGURATION

Usage Information

After enabling the interface-id option, the interface name is used for interface description.

NOTE: This command is restricted to the `sysadmin` and `netadmin` user roles.

Example

```
OS10(config)# ipv6 dhcp-relay interface-id
OS10(config)# ipv6 dhcp-relay ?
interface-id        Enable interface-id option
remote-id           Enable remote-id option
prefix              Configure prefix value
hostname            Configure DHCPv6 hostname
```

```
OS10(config)# ipv6 dhcp-relay interface-id ?
<cr>
```

Supported Releases 10.5.2.1 or later

ipv6 dhcp-relay prefix

Configures the prefix value for the interace-id.

Syntax `ipv6 dhcp-relay prefix [interface-id {hostname [vrfname] | vrfname [hostname] user-defined-string}`

Parameters

- `hostname` - System hostname or configured DHCPv6 hostname.
- `vrfname` - Interface VRF name.
- `user-defined-string` - User-defined string. The maximum length is 96 characters.

Defaults None.

Command Mode CONFIGURATION

Usage Information You must globally configure prefix as an optional parameter. You can configure hostname, VRF Name, or a customized string as prefix. Colon (:) is not allowed in the customized string prefix configuration. If you try to configure the prefix value with colon (:), the following error appears: `OS10(config)# % Error: Colon ( : ) is not supported`

If the hostname is configured as a prefix, then the system hostname is used by default.

If the `vrfname` is configured as a prefix and the client connected interface is not configured in any non-default VRF, then default is used as prefix vrfname.

NOTE: This command is restricted to the `sysadmin` and `netadmin` user roles.

Example

```
OS10(config)# ipv6 dhcp-relay prefix?
interface-id        Enable interface-id option
remote-id           Enable remote-id option

OS10(config)# ipv6 dhcp-relay prefix interface-id ?
hostname            Uses system hostname or DHCPv6 hostname
vrfname             Uses interface vrfname
string              Uses user-defined string for prefix(Max: 96 chars,
Except ':')

OS10(config)# ipv6 dhcp-relay prefix interface-id hostname?
vrfname            Use interface vrfname
<cr>

OS10(config)# ipv6 dhcp-relay prefix interface-id vrfname?
hostname           User-defined string for hostname
<cr>
```

Supported Releases 10.5.2.1 or later

ipv6 dhcp-relay remote-id

Enables or disables DHCPv6 remote-id option and customized description configurations.

Syntax `ipv6 dhcp-relay {remote-id [description user-defined-string]}`

Parameters None

Defaults Disabled

Command Mode CONFIGURATION

Usage Information

After enabling the remote-id option, the enterprise number and DHCPv6 relay agent type 3 DUID based on the system mac is used as as the remote-ID value. For VLT cases, VLT MAC is used as the remote-id value by default.

SmartFabric Services OS10 uses the type 3 DUID link-layer address (DUID-LL) for stability and persistence.

You can optionally configure any customized value for the remote-id option.

Colon (:) is not supported for the customized string prefix configuration.

NOTE: This command is restricted to the `sysadmin` and `netadmin` user roles.

Example

```
OS10(config)# ipv6 dhcp-relay remote-id
OS10(config)# ipv6 dhcp-relay ?
interface-id         Enable interface-id option
remote-id            Enable remote-id option
prefix               Configure prefix value
hostname             Configure DHCPv6 hostname

OS10(config)# ipv6 dhcp-relay remote-id ?
description          Add customized string to remote-id
<cr>

OS10(config)# ipv6 dhcp-relay remote-id description <string>?
string              Use user-defined string for description(Max:
```

Supported Releases

10.5.2.1 or later

ipv6 dhcp-relay prefix remote-id

Configures the prefix value for the remote-id option.

Syntax

```
ipv6 dhcp-relay prefix {remote-id [hostname [vrfname] | vrfname [hostname]]
user-defined-string]
```

Parameters

- `hostname` - System hostname or configured DHCPv6 hostname.
- `vrfname` - Interface VRF name.
- `user-defined-string` - User-defined string. The maximum length is 96 characters.

Defaults

None.

Command Mode

CONFIGURATION

Usage Information

You must globally configure prefix as an optional parameter. You can configure hostname, VRF Name, or a customized string as prefix. Colon (:) is not allowed in the customized string prefix configuration. If you try to configure the prefix value with colon (:), the following error appears: `OS10(config)# % Error: Colon ( : ) is not supported`

If the hostname is configured as a prefix, then the system hostname is used by default.

If the `vrfname` is configured as a prefix and the client connected interface is not configured in any non-default VRF, then default is used as prefix vrfname.

NOTE: This command is restricted to the `sysadmin` and `netadmin` user roles.

Example

```
OS10(config)# ipv6 dhcp-relay prefix?
interface-id         Enable interface-id option
remote-id            Enable remote-id option

OS10(config)# ipv6 dhcp-relay prefix remote-id ?
hostname             Uses system hostname or DHCPv6 hostname
vrfname              Uses interface vrfname
string               Uses user-defined string for prefix(Max: 96 chars,
Except ':')
```

```
OS10(config)# ipv6 dhcp-relay prefix remote-id hostname?
vrfname             Use interface vrfname
<cr>

OS10(config)# ipv6 dhcp-relay prefix remote-id vrfname?
hostname            User-defined string for hostname
<cr>
```

Supported Releases 10.5.2.1 or later

ipv6 dhcp-relay hostname

Configures the DHCPv6 hostname..

Syntax `ipv6 dhcp-relay hostname user-defined-string`

Parameters None

Defaults None.

Command Mode CONFIGURATION

Usage Information You can optionally configure any customized value for the DHCPv6 relay hostname. This hostname is used in interface-id and remote-id prefix hostname configurations.

By default, system the hostname is used as the hostname prefix.

The DHCPv6 hostname configuration has the same restrictions as the system hostname configuration.

NOTE: This command is restricted to the `sysadmin` and `netadmin` user roles.

Example

```
OS10-8986(config)# ipv6 dhcp-relay hostname ?

String            User-defined value (Max: 32 chars)
```

Supported Releases 10.5.2.1 or later

ipv6 dhcp-relay interface-id

Configures customized string value for the interface-id option.

Syntax `ipv6 dhcp-relay interface-id description user-defined-string`

Parameters None

Defaults None.

Command Mode INTERFACE CONFIGURATION

Usage Information You can optionally configure any customized value for the interface-id option. By default, interface name is sent as the interface-id value.

It can be configured on all types of interfaces. For example, ethernet interface, port-channel, VLAN, and virtual-network. No two interfaces can have the same interface-id description value.

Hyphen (-) is not supported for the customized interface-id configuration.

When Interface-ID is enabled and custom interface description is not configured, the default Interface-ID description is updated as below

- For physical interface - Interface name `ethernet1/1/1`.
- For Port-channel - `port-channel100`.
- For virtual network interface - `virtual-network10`.
- For vlt port channel - `vlt20`.

If the interface is part of VLAN, both VLAN and interface-name are used to update the default interface-id description.

- If VLAN has port channel, then default description is `vlan-port_channel`. (physical-port will not be present).
- If VLAN has physical port, then default description is `vlan-physicalport`.
- If vn has member port, then default description is `vn-name` only..

IIf custom description is configured, then custom value is used as interface-id description.

NOTE: This command is restricted to the `sysadmin` and `netadmin` user roles.

Example

```
OS10(conf-if-eth1/1/1)#  ipv6 dhcp-relay interface-id ?
description      Add customized string to interface-id

OS10(conf-if-eth1/1/1)# ipv6 dhcp-relay interface-id description?
String           User-defined value (Max: 32 chars, Except '-')
```

Supported Releases 10.5.2.1 or later

ipv6 dhcp-relay source-interface

Configures IPv6 DHCP relay source-interface option.

Syntax `[no] ipv6 dhcp-relay source-interface [ethernet node/slot/port | loopback loopback-id | port-channel id-number | vlan vlan-id | virtual-network vn-id]`

Parameters

- `ethernet node/slot/port` - Ethernet interface type.
- `loopback loopback-id` - Loopback interface type.
- `port-channel id-number` - Port-channel interface type.
- `vlan vlan-id` - VLAN interface type.
- `virtual-network vn-id` - Virtual network interface type.

Defaults ipv6 dhcp-relay source- interface option is disabled by default.

Command Mode INTERFACE CONFIGURATION

Usage Information The DHCP IPv6 relay agents forward a DHCP IPv6 client packet with the source IPv6 address set to the IPv6 address corresponding to the outgoing interface of the DHCP IPv6 server. This command provides the capability to configure source IPv6 address for the DHCP request, when DHCP IPv6 relay source interface is configured on a given DHCP client facing interface. DHCP server uses the IPv6 address of that source interface as destination for RELAY-REPLY packets.

You can configure source interface on all types of DHCP client interfaces such as, ethernet interface, loopback interfaces, port-channels, VLANs, and virtual-networks.

Security and access This command is restricted to the `netadmin` and `sysadmin` user roles.

Example

```
OS10-Relay(conf-if-eth1/1/1)# ipv6 dhcp-relay  ?
interface-id Enable interface-id option
source-interface Ipv6 Source interface for dhcp relay

OS10-Relay(conf-if-eth1/1/1)# ipv6 dhcp-relay source-interface loopback1
OS10-Relay(conf-if-eth1/1/1)# ipv6 dhcp-relay source-interface ?
ethernet Ethernet interface type
loopback Loopback interface type
port-channel Port-channel interface type
vlan Vlan interface type
virtual-network Virtual network type
```

Supported Releases 10.5.3.2 or later

show ip dhcp-relay

Displays the DHCP relay information corresponding to the client interfaces.

Syntax

```
show ip dhcp-relay interface [vrf vrf-name] {ethernet slot/port | port-channel port-channel-id | vlan vlan-id | virtual-network vn-id}
```

Parameters

- `vrf vrf-name`—Enter `vrf` then the name of the VRF.
- `ethernet slot/port`—Displays information corresponding to the Ethernet interface that you specify.
- `port-channel port-channel-id`—Displays information corresponding to the port channel that you specify. Valid values are from 1 to 999 or 1001 to 2000.
- `vlan vlan-id`—Displays information corresponding to the VLAN interface that you specify.
- `virtual-network vn-id`—Displays information corresponding to the virtual network that you specify.

Defaults

None

Command Mode

EXEC

Usage Information

This command displays the global-level status of Option-82 and the interface-level Option-82 status.

The `show ip dhcp-relay interface` command displays the relay information corresponding to the requested interface enabled with the helper address. If you enable the Option-82 configuration, the Option-82 status appears as `Enabled(Default)`. If you disable the Option-82 configuration, the Option-82 status appears as `Disabled`.

The command displays the following information:

- Per-interface `giaddr` field value.
- Per-interface suboption 5 field value.
- Per-interface suboption 151 field value.
- Per-interface suboption 11 field value.
- Configured list of the DHCP server IP addresses with the reachable VRF name.
- Per-interface source-interface field value.

`show ip dhcp relay interface interface` – This command displays the relay information for the requested interface that is enabled with the helper address.

`show ip dhcp relay vrf vrf-name` – This command displays the relay information for all the interfaces that are enabled with the helper address and associated with the `vrf_name`.

- If the `Giaddr = 0`, it displays an additional message in the `GiAddr` field None - `Relay cannot work without gateway IP address`.
- If the link selection field does not have an interface or anycast gateway IP, the link-selection field shows the value `None`.
- If the `server_override` option is enabled, the server-override field displays `Enabled(<anycast gateway IP >)`.
- If the `server_override` option is enabled, and anycast gateway IP is not present , the server-override field displays `Enabled(None)`.
- If the `server_override` option is disabled at the Globally or Interface level, the server-override field displays `Disabled`.
- If the VSS option is disabled, the VSS field displays `Disabled`.
- If the VSS option is enabled Globally without any interface `vss-info`, the VSS field displays `Enabled(None)`.
- If the VSS option is enabled Globally with interface `vss-info`, the VSS field displays `Enabled(type <0/1/> value <value>)`.
- If source interface is configured with IP address, then the show command displays the `source-interface IP address`.
- If source interface is configured without any IP address, then the show command displays that the `source-interface IP address` is not configured.
- If source interface is not configured, then the show command displays that the source interface is not configured.

Example (Interface)

```
OS10# show ip dhcp-relay interface vlan 3033

 Interface                          : Vlan3033
 Gateway Address                    : 3.0.17.1
 Option 82 Status                   : Enabled (Default)
 Link Selection [option-5]          : Enabled (192.168.33.1)
 VSS Info [option-151]              : Enabled (type 0 Red)
 Server ID override [option-11]     : Enabled (192.168.33.254)
 DHCP Helper Address List           :

 Helper-Address       VRF
 -------------------------
 192.172.2.3          Red
```

Example (source-interface)

```
OS10(conf)#ip dhcp-relay server-override

OS10(conf)#ip dhcp-relay vss

interface loopback1
no shutdown
ip address 11.1.1.1/32

interface ethernet1/1/1
no shutdown
no switchport
ip address 6.1.1.1/24
flowcontrol receive on
ip dhcp-relay source interface loopback 1
ip helper-address 3.1.1.2
ip helper-address 4.1.1.2
ip dhcp-relay vss-info type 255

interface ethernet1/1/2
no shutdown
no switchport
ip address 2.1.1.1/24
flowcontrol receive on
ip dhcp-relay source interface loopback 1
ip helper-address 3.1.1.2
ip helper-address 4.1.1.2
ip dhcp-relay vss-info type 255

interface vlan 100
no shutdown
no switchport
ip vrf forwarding vrf_red
ip address 100.1.1.1/24

```

Supported Releases 10.5.2.0 or later

show ipv6 dhcp-relay

Displays the DHCPv6 relay information about the client interfaces.

Syntax

```
show ipv6 dhcp-relay interface {{ethernet node/slot/port | port-channel id-number} | vlan vlan-id [{ethernet node/slot/port | port-channel id-number}] | virtual-network vnid}
```

Parameters

- `ethernet` *`node/slot/port`*—Enter the interface information.
- `port-channel` *`id-number`*—Enter the port channel ID, from 1 to 999 or 1001 to 2000.
- `vlan` *`vlan-id`*—Enter the VLAN ID number.
- `virtual-network` *`vnid`*—Enter a virtual-network ID.

Defaults

None

Command Mode

EXEC

Usage Information

The `show ipv6 dhcp-relay` command displays the following information:

```
Interface name
Per-interface interface-id field value
Per-interface remote-id field value
Per-interface source-interface field value
```

`show ipv6 dhcp relay interface <interface>` - This command displays the relay information for the requested interface.

If the interface-id option is enabled, the show command displays the option-18 value which is sent in packet Format:- `interface-id (or) prefix:interface-id (if prefix is configured)`

If the remote-id option is enabled, the show command displays the option-37 value which is sent in packet format:- `remote-id (or) prefix:remote-id (if prefix is configured)`

If interface-id option is disabled, the corresponding show command field displays `Disabled`.

If remote-id option is disabled, the corresponding show command field displays `Disabled`.

If source interface is configured with IP address, the corresponding show command field displays `source-interface IP address`.

If the source interface is configured without any IP address, the corresponding show command field displays that the `source-interface IP address` is not configured.

If source interface is not configured, the corresponding show command field displays that the source-interface is not configured.

If an interface is associated to a VLAN, then it is mandatory to give both VLAN and port information in the show command. For example, `show ipv6 dhcp-relay vlan 10 ethernet 1/1/1`. Otherwise, the show command displays an empty output.

NOTE: If an interface is associated with a VLAN, then you must specify both the VLAN and port information in the show command. For example, `show ipv6 dhcp-relay vlan 10 ethernet 1/1/1`. Otherwise, the show command displays empty output.

NOTE: This command is accessible to all user roles.

Example

```
OS10(conf)#ipv6 dhcp-relay remote-id
OS10(conf)#ipv6 dhcp-relay interface-id
OS10-Relay(config)# interface loopback 1
OS10-Relay(config)# interface loopback 1
OS10-Relay(conf-if-lo-1)# show configuration
!
interface loopback1
no shutdown
ipv6 address 55::1/64
OS10-Relay(conf-if-lo-1)#

OS10-Relay(conf-if-eth1/1/1)# ipv6 dhcp-relay source-interface loopback 1
Relay(config)# show ipv6 dhcp-relay interface ethernet 1/1/1
```

```
Interface : ethernet1/1/1
Interface-id[option-18] : Enabled
Interface-id value : ethernet1/1/1
Remote-id[option-37] : Enabled
Enterprise-number : 674
Remote-id value : 0003000126b6775dfb76
Source-ip : 55::1 (loopback1)
Relay(config)#

Relay(conf-if-eth1/1/1)# no ipv6 dhcp-relay source-interface
Relay(config)# show ipv6 dhcp-relay interface ethernet 1/1/1
Interface : ethernet1/1/1
Interface-id[option-18] : Enabled
Interface-id value : ethernet1/1/1
Remote-id[option-37] : Enabled
Enterprise-number : 674
Remote-id value : 0003000126b6775dfb76
Source-ip : Not Configured
Relay(config)#
```

Supported Releases 10.5.2.1 or later

show ip dhcp-relay-counters

Displays the statistics of the DHCP packets that the relay agent received or transmitted.

Syntax `show ip dhcp-relay-counters {interface [ethernet` *node/slot/port* `| port-channel` *id-number* `| vlan` *vlan-id* `| virtual-network` *vn-id* `| <cr>}}`

Parameters

- `interface`—Displays the interface statistics corresponding to the DHCP packet.
- *`ethernet node/slot/port`*—(Optional) Displays the statistics corresponding to the Ethernet node, slot, and port of the DHCP packet.
- *`port-channel id-number`*—(Optional) Displays the statistics corresponding to the port channel *id-number* of the DHCP packet. Valid values are from 1 to 999 or 1001 to 2000.
- *`vlan vlan-id`*—(Optional) Displays the statistics corresponding to the VLAN *vlan-id* of the DHCP packet.
- *`vitual-network vn-id`*—(Optional) Displays the statics corresponding to the virtual-network *vn-id* of the DHCP packet.

Defaults None

Command Mode EXEC

Usage Information

The `show ip dhcp relay counters interface <interface>` command displays the count of DHCP packets received, transmitted, dropped on the specified interface that is enabled with the helper address.

The `show ip dhcp relay counters` command displays the count of DHCP packets that are received, transmitted, or dropped on all interfaces that are enabled with helper address.

The show commands with interface option in which DHCPv4 helper address is not configured display an error message.

The `show relay counters` command displays the following information:

- Recently cleared Timestamp.
- BOOTREQUEST messages received by the relay agent.
- DHCP DISCOVER messages received by the relay agent.
- DHCP REQUEST messages received by the relay agent.
- DHCP RELEASE messages received by the relay agent.
- DHCP INFORM messages received by the relay agent.
- DHCP DECLINE messages received by the relay agent.
- BOOTREQUEST messages forwarded by the relay agent.
- BOOTREPLY messages forwarded by the relay agent.
- DHCP OFFER messages sent by the relay agent.

- DHCP ACK messages sent by the relay agent.
- DHCP NACK messages sent by the relay agent.
- DHCP packets dropped due to an invalid opcode.
- DHCP packets dropped due to an invalid option.
- Total number of DHCP packets dropped at the requested interface by the relay agent.

Example

```
OS10#show ip dhcp-relay counters interface ethernet1/1/1
Interface : ethernet 1/1/1
Last cleared : 1 weeks 6 days 18:31:16
PACKETS RECEIVED
----------------------
Bootrequest      :5
Discover         :3
Request          :2
Release          :0
Inform           :0
Decline          :0

PACKETS SENT
----------------------
Bootrequest      :5
Booteply         :4
Offer            :2
Ack              :2
Nack             :0

PACKETS DROPPED
----------------------
Invalid opcode   :0
Invalid option   :0
Total Dropped    :1
```

Supported Release 10.5.2.3 or later

show vlt mismatch dhcp-relay

Displays the mismatch (if any), between the VLT peer for the DHCP relay options configuration on the Global level, VRF levels, and VLANs spanned across the VLT peers.

Syntax `show vlt vlt-domain mismatch dhcp-relay`

Parameters None.

Defaults None

Command Mode EXEC

Usage Information This command shows the mismatch in the `global ip dhcp-relay vss` and `ip dhcp-relay server-override` commands.

This command shows the codes for the mismatch between the VLT peers for the server-override configuration and `vss-info` values for the spanned VLANs or virtual-networks. This command also displays the presence or absence of VRF or interface level source-interface configurations whenever the interface IP address on the client-facing interface is not present.

This command is restricted to `netadmin` and `sysadmin` role users.

Example (Interface)

```
OS10(conf-if-po-20)# do show vlt 100 mismatch dhcp-relay

Global relay Configuration Mismatch
-------------------------------------------------------------------
VLT Unit ID    Link-Selection        Server-Override    VSS
-------------------------------------------------------------------
* 1            enabled                -                  disabled
  2            disabled               -                  enabled
```

```
VRF relay Configuration Mismatch
-----------------------------------------------------------------
VRF : VRF_RED
VLT Unit ID   Source-Interface
----------------------------------
* 1            Present
  2            Not Present

Interface Relay Configuration Mismatch
-------------------------------------------------------------------------
VLAN: 10
VLT Unit ID   Server-Override    VSS              Source-Interface
-------------------------------------------------------------------------
* 1            enabled         type-0(Red)          -
  2            disabled        type-0(Blue)         -
VNI: 20
VLT Unit ID   Server-Override    VSS              Source-Interface
-------------------------------------------------------------------------
* 1            -               type-0(Red)         Present
  2            -               type-1(ABC:1234)    Not Present
```

Supported Releases 10.5.2 or later

show vlt mismatch dhcpv6-relay

Displays the mismatch (if any), between the VLT peer for the DHCPv6 relay options configuration on the Global level, VLT port-channel, and VLANs and VxLANs spanned across the VLT peers.

Syntax `show vlt vlt-domain mismatch dhcpv6-relay`

Parameters None.

Defaults None

Command Mode EXEC

Security and access This command is restricted to the `netadmin`, `secadmin`, and `sysadmin` roles.

Usage Information This command shows the mismatch in the following parameters:

- dhcpv6 hostname.
- global interface-id and remote-id enable/disable status.
- prefix configuration of both interface-id and remote-id.
- remote-id customized description configuration.
- interface-id customized description configuration for vlt port-channel, spanned vlan and vxlans.
- Status of the source-interface configuration; whether present or not present.

This command is restricted to `netadmin`, `secadmin`, and `sysadmin` role users.

Example (Interface)

```
OS10(conf-if-po-20)# do show vlt 100 mismatch dhcpv6-relay

Global relay Configuration Mismatch
-----------------------------------------------------------

DHCPv6 Hostname Mismatch:
VLT Unit ID               Hostname
-------------------------------------------------------------
* 1                       Present (DELL)
  2                       Not Present

Remote-id Mismatch:
VLT Unit ID    Status          prefix                              description
-------------------------------------------------------------------------------
* 1            -              hostname                            default
  2            -              hostname-vrfname                    custom(force10)
```

```
Interface-id Mismatch:
VLT Unit ID    Status         prefix
-------------------------------------------------------
* 1           -              hostname
  2           -              custom(DELL)

Interface Relay Configuration Mismatch
-------------------------------------------------------
VLAN: 10

VLT Unit ID     description              Source-Interface
-------------------------------------------------------
* 1             default                   -
  2             custom(santaclara)        -

VNI: 20

VLT Unit ID      description            Source-Interface
-------------------------------------------------------
* 1              custom(force10)         Present
  2              default                 Not Present

VLT-PORTCHANNEL: 100

VLT Unit ID     description               Source-Interface
-------------------------------------------------------
* 1             custom(force10)            Present
  2             custom(santaclara)         Not Present
Note : - Represent no mismatch.
```

Supported Releases 10.5.2.0 or later

show vlt mismatch

Displays mismatches in a VLT domain configuration.

Syntax

```
show vlt domain-id mismatch [port-security |dhcp-snooping | peer-routing | pim | vlan | vlt-vlan vlt-port-id| virtual-network | private-vlan {mapping | port-mode | vlan-mode} | multicast-snooping | ra-guard | vlan-anycast| dhcp-relay | lacp-individual | evpn | nlb | vlan-stack | vlan-mac-learning]
```

Parameters

- `port-security`—Displays mismatches in global port-security configurations and all the VLT port-channel port-security configurations.
- *`domain-id`*—Enter the VLT domain ID, from 1 to 255.
- `dhcp-snooping`—Display mismatches in a DHCP snooping configuration in a VLT domain.
- `peer-routing`—Display mismatches in the peer-routing configuration.
- `pim`—Displays PIM mismatch in VLT peers.
- `vlan`—Display mismatches in a VLAN configuration in the VLT domain.
- `vlt-vlan` *`vlt-port-id`*—Display mismatches in the VLT port configuration, from 1 to 4095.
- `virtual-network`—Display mismatches in virtual network configurations between VLT peers.
- `private-vlan`—Displays mismatches in private VLAN mapping, port mode, or VLAN mode.
- `multicast-snooping`—Displays mismatches in IGMP and MLD snooping configuration.
- `ra-guard`—Displays mismatches in IPv6 RA guard configuration.
- `vlan-anycast`—Display mismatches in VLAN anycast IP configuration between VLT peers.
- `dhcp-relay` — Displays the mismatch (if any) between the VLT peers for DHCP relay options configuration on global level and VLANs spanned across the VLT peers.
- `lacp-individual`—Displays mismatches in the LACP individual ports between VLT peers.
- `evpn`—Displays the ARP-suppression global enabled or disabled mismatch configuration between VLT nodes.
- `nlb`—Displays the spanned NLB-cluster VLAN configuration mismatch.

- `vlan-stack`—Display the mismatch in stack VLAN configuration.
- `vlan-mac-learning`—Display the MAC learning configuration mismatch on VLT nodes for VLAN interfaces.

Default Not configured

Command Mode EXEC

Usage Information

The * in the mismatch output indicates a local node entry.

The `show vlt mismatch dhcp-relay` command displays the mismatch in the Global `ip dhcp-relay information-option` command.

The `show vlt mismatch dhcp-relay` command displays the presence or absence of Interface level `ip dhcp-relay information-option` configurations.

Example (no mismatch)

```
OS10# show vlt 1 mismatch
Peer-routing mismatch:
No mismatch

VLAN mismatch:
No mismatch

VLT VLAN mismatch:
No mismatch
```

Example (mismatch)

```
OS10# show vlt 1 mismatch
Peer-routing mismatch:
VLT Unit ID    Peer-routing
---------------------------------
* 1            Enabled
  2            Disabled

VLAN mismatch:
No mismatch

VLT VLAN mismatch:
VLT ID : 1
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              1
  2              2
VLT ID : 2
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              1
  2              2
```

Example (mismatch peer routing)

```
OS10# show vlt 1 mismatch peer-routing
Peer-routing mismatch:
VLT Unit ID    Peer-routing
----------------------------
* 1            Enabled
  2            Disabled
```

Example (mismatch VLAN)

```
OS10# show vlt 1 mismatch vlan
VLAN mismatch:
VLAN L2 mismatch:
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              103
  2              -

VLAN L3-IPv4 mismatch:
No mismatch

VLAN L3-IPv6 mismatch:
```

```
No mismatch

VLAN Local-Proxy-ARP enabled mismatch:
No mismatch

Private VLAN mode mismatch:
No mismatch
```

Example (mismatch VLT VLAN)

```
OS10# show vlt 1 mismatch vlt-vlan
VLT VLAN mismatch:
vlt-port-channel ID : 100
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              1001
  2              -
```

Example (mismatch — Virtual Network (VN) name not available in the peer)

```
OS10# show vlt all mismatch virtual-network
Virtual Network Name Mismatch:
VLT Unit ID  Mismatch Virtual Network List
-----------------------------------------
  1            10,104
* 2            -
```

Example (mismatch of VLTi and VLAN)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 100
VLT Unit ID  Configured VLTi-Vlans
----------------------------------
  1             101
* 2             100
```

Example (mismatch of VN mode)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 102
VLT Unit ID  Configured Virtual Network Mode
-------------------------------------------
  1          PV
* 2          Attached
```

Example (mismatch of port and VLAN list)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 102
VLT Unit ID  Mismatch (VLT Port,Vlan) List
-----------------------------------------
  1          -
* 2          (vlt-port-channel10,vlan99)

Virtual Network: 103
VLT Unit ID  Mismatch (VLT Port,Vlan) List
-----------------------------------------
  1          (vlt-port-channel10,vlan103)
* 2          (vlt-port-channel10,vlan104)
```

Example (mismatch of untagged interfaces)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 104
VLT Unit ID  Mismatch Untagged VLT Port-channel List
-----------------------------------------------------
  1          10
* 2           -
```

Example (Anycast MAC address)

```
show vlt 1 mismatch virtual-network

Interface virtual-network Anycast-mac mismatch:
VLT Unit ID  Anycast-MAC
--------------------------------
```

```
  1           00:01:02:03:04:051
* 2           00:01:02:03:04:055
```

Example (Anycast MAC address not available on one of the peers)

```
show vlt 1 mismatch virtual-network

Interface virtual-network Anycast-mac mismatch:
VLT Unit ID  Anycast-MAC
-------------------------------
  1          00:01:02:03:04:051
* 2          -
```

Example (Virtual network interface anycast IP address)

```
show vlt 1 mismatch virtual-network

Interface virtual-network Anycast-IP mismatch:

Virtual-network: 10

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.25
* 2          10.16.128.20

Virtual-network: 20

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.26
* 2          10.16.128.30
```

Example (Anycast IP addresses not configured on one of the virtual networks on both peers)

```
show vlt 1 mismatch virtual-network
Interface virtual-network Anycast-IP mismatch:

Virtual-network: 10

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.25
* 2          ABSENT

Virtual-network: 20

VLT Unit ID  Anycast-IP
--------------------------
  1          ABSENT
* 2          10.16.128.30
```

Example (Virtual network mismatch and Anycast IP addresses mismatch)

```
Interface virtual-network Anycast-IP mismatch:

Virtual-network: 10

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.25
* 2          10.16.128.20

Virtual-network: 20

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.26
* 2          ABSENT

Virtual-network: 30

VLT Unit ID  Anycast-IP
--------------------------
```

```
  1          ABSENT
* 2          10.16.128.30
```

Example (Displays multicast routing mismatches)

```
OS10# show vlt mismatch

Multicast routing mismatches:

PIM spanned status

Vlan status V4 V6
VlanId Local Peer Local Peer
Vlan 5 Inactive Active Inactive Inactive
Vlan 25 Active Inactive Inactive Active
```

Example (mismatch VLAN anycast IP)

```
OS10# show vlt 1 mismatch vlan-anycast
VLAN anycast ip Mismatch:

VLAN: 2000

VLT Unit ID  Anycast-IPs
--------------------------------------
* 1          64::100, 64.6.7.88

  2          100::100, 100.101.102.100

VLAN: 3000

VLT Unit ID    Anycast-IPs
---------------------------------
* 1              100.101.102.100

  2              Not configured

VLAN: 4000

VLT Unit ID    Anycast-IPs
--------------------------------
* 1              Not configured

  2              8.7.6.5
```

Example (mismatch dhcp-relay)

```
OS10# show vlt 100 mismatch dhcp-relay

Global relay Configuration Mismatch
-------------------------------------------------------------
VLT Unit ID   Link-Selection   Server-Override    VSS
-------------------------------------------------------------
* 1           enabled               -             disabled
  2           disabled              -             enabled

VRF relay Configuration Mismatch
-------------------------------------------------------------
VRF : VRF_RED
VLT Unit ID   Source-Interface
-------------------------------------------------------------
* 1            Present
  2            Not Present

Interface Relay Configuration Mismatch
-------------------------------------------------------------
VLAN: 10
VLT Unit ID Server-Override          VSS        Source-Interface
-------------------------------------------------------------------
* 1         enabled $(100.1.1.254)$  type-0(Red)       -
  2         enabled $(100.1.1.253)$  type-0(Blue)      -
VNI: 20
VLT Unit ID   Server-Override    VSS           Source-Interface
-------------------------------------------------------------
```

```
* 1             -               type-0(Red)       Present
  2             -               type-1(ABC:1234)  Not Present

Note : The content between $ $ is the new addition to the existing show
command.
```

Example (mismatch private-vlan mapping)

```
OS10# show vlt 1 mismatch private-vlan mapping
Private VLAN mapping mismatch:
No mismatch
```

Example (mismatch private-vlan port-mode)

```
OS10# show vlt 1 mismatch private-vlan port-mode
Private VLAN port mode mismatch:
No mismatch
```

Example (mismatch private-vlan vlan-mode)

```
OS10# show vlt 1 mismatch private-vlan vlan-mode
Private VLAN mode mismatch:
No mismatch
```

Example (LACP individual ports)

```
OS10# show vlt 1 mismatch lacp-individual
port-channel id: 1

VLT Unit ID  lacp-individual
-------------------------------------
1               enable
* 2             disable

port-channel id: 2

VLT Unit ID  lacp-individual
-------------------------------------
1               enable
* 2             disable
```

Example (port-security)

Table 21. Port-security output

VLT-PEER1 *	VLT-PEER2	Command output
Global switchport port-security disable **VLT Port-channel 10 port-sec config** • mac-learn limit 1 • mac-learn limit violation drop • aging off • disable • no sticky • mac-move allow • mac-move violation shut-orig **VLT Port-channel 20 port-sec config**	**Global** **VLT Port-channel 10 port-sec config** • mac-learn limit 5 • mac-learn limit violation drop • aging off • enable • sticky • no mac-move allow • mac-move violation shut-offending **VLT Port-channel 20 port-sec config** • mac-learn limit 1 • mac-learn limit violation drop • aging off • disable • no sticky • mac-move allow • mac-move violation shut-orig	DUT1# show vlt 128 mismatch port-security Mismatch check for Port Security configs in VLT --- GLOBAL PORT-SECURITY CONFIGURATION UNIT-ID: 1 * 2 --- Port Security Status Enabled Disabled --- VLT-LAG PORT-SECURITY CONFIGURATION ---

VLT-PEER1 *	VLT-PEER2	Command output
• mac-learn limit 1 • mac-learn limit violation drop • aging off • disable • no sticky • mac-move allow • mac-move violation shut-orig		```--------------------------- ---------------------- VLT-LAG-ID: 10 --------------------------- --------------------------- ---------------------- UNIT- ID: 1 * 2 --------------------------- --------------------------- ---------------------- Mac-learn- limit 1 5 Port Security Status Disabled Enabled Mac-move- allow Allowed Not Allowed Mac-move-violation action Shutdown- Original Shutdown- Offending Mac-learn-limit-Violation action Drop Shutdown Sticky Disabled Enabled Aging Off On --------------------------- --------------------------- ----------------------```
VLT Port-channel 10 port-sec config • mac-learn limit 1 • mac-learn limit violation drop • aging off • disable • no sticky • mac-move allow • mac-move violation shut-orig	**VLT Port-channel 10 is not created**	-

Example (ARP-suppression)

```
OS10# show vlt 1 mismatch evpn
EVPN Mismatch:
EVPN Mode Mismatch:
```

```
No mismatch

EVPN EVI Mismatch:
No mismatch

EVPN VRF Mismatch:
No mismatch

EVPN ARP-ND SUPPRESSION Mismatch:
VLT Unit ID    Status
-----------------------------
* 1            disabled
  2            enabled
```

Example (NLB)

```
OS10# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 1.1.1.1
VLT Unit ID     nlb-cluster mac     vlt-port-channel
-------------------------------------------------
* 1             00:00:00:00:00:01        10
  2                   -                  -

IP: 2.2.2.2
VLT Unit ID     nlb-cluster mac     vlt-port-channel
-------------------------------------------------
* 1             00:00:00:00:00:05        20,30
  2                 -                    -

VLAN: 300
IP: 2.1.1.1
VLT Unit ID    nlb-cluster mac      vlt-port-channel
-------------------------------------------------
* 1            00:00:00:00:00:06         10
  2            00:00:00:00:00:07         20

IP: 3.1.1.1
VLT Unit ID    nlb-cluster mac      vlt-port-channel
-------------------------------------------------
* 1            00:00:00:00:00:08         -
  2            00:00:00:00:00:09         -

OS10-VLT-2# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 2.1.1.1
VLT Unit ID   nlb-cluster mac       vlt-port-channel
-------------------------------------------------
  1                 -                    -
* 2           00:00:00:00:00:01          -

IP: 3.1.1.1
VLT Unit ID   nlb-cluster mac      vlt-port-channel
-------------------------------------------------
  1                 -                   -
* 2           00:00:00:00:00:01         10

OS10-VLT-1# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 10.1.1.1
VLT Unit ID   nlb-cluster mac       vlt-port-channel
-------------------------------------------------
* 1           00:00:00:00:00:01          -
  2                 -                    -
```

```
Note:- If cluster IP is not configured in node-1, mismatch will not show in
node-1

OS10# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 1.1.1.1
VLT Unit ID  nlb-cluster mac      vlt-port-channel
-------------------------------------------------
  1          03:bf:00:00:00:01          10
* 2          03:bf:00:00:00:02          10

OS10# show vlt 38 mismatch nlb-cluster-vlan
No mismatch
```

Example (mismatch vlan-stack)

```
OS10#show vlt 1 mismatch vlan-stack

VLAN Stack mismatch:
VLT Unit ID       Mismatch VLAN-Stack List
-------------------------------------------------------------------------------
  1               100-103,106
* 2               104

VLAN Stack VLT port TPID mismatch:
vlt-port-channel ID : 100
VLT Unit ID      Configured TPID
-------------------------------------
  1               0x9100
* 2               0x88A8

vlt-port-channel ID : 200
VLT Unit ID      Configured TPID
-------------------------------------
  1               0x8100
* 2               0x9100
```

Supported Releases 10.2.0E or later

DHCP server commands

default-router address

Assigns a default gateway to clients based on the IP address pool.

Syntax `default-router address [address2...address8]`

Parameters

- *address* — Enter an IPv4 or IPv6 address to use as the default gateway for clients on the subnet in A.B.C.D or A:B format.
- *address2...address8* — (Optional) Enter up to eight IP addresses, in order of preference.

Default Not configured

Command Mode DHCP-POOL

Usage Information Configure up to eight IP addresses, in order of preference. Use the `no` version of this command to remove the configuration.

Example

```
OS10(conf-dhcp-pool2)# default-router 20.1.1.100
```

Supported Releases 10.2.0E or later

disable

Disables the DHCP server.

Syntax	`disable`
Parameters	None
Default	Disabled
Command Mode	DHCP
Usage Information	The `no` version of this command enables the DHCP server.
Example	`OS10(conf-dhcp)# no disable`
Supported Releases	10.2.0E or later

domain-name

Configures the name of the domain where the device is located.

Syntax	`domain-name` *`domain-name`*
Parameters	*`domain-name`* — Enter the name of the domain with a maximum of 32 characters.
Default	Not configured
Command Mode	DHCP-POOL
Usage Information	This is the default domain name that appends to hostnames that are not fully qualified. The `no` version of this command removes the configuration.
Example	`OS10(conf-dhcp-Dell)# domain-name dell.com`
Supported Releases	10.2.0E or later

dns-server address

Assigns a DNS server to clients based on the address pool.

Syntax	`dns-server` *`address`* `[`*`address2...address8`*`]`
Parameters	• *`address`* — Enter the DNS server IP address that services clients on the subnet in A.B.C.D or A::B format. • *`address2...address8`* — (Optional) Enter up to eight DNS server addresses, in order of preference.
Default	Not configured
Command Mode	DHCP-POOL
Usage Information	None
Example	`OS10(conf-dhcp-Dell)# dns-server 192.168.1.1`
Supported Releases	10.2.0E or later

hardware-address

Configures the client's hardware address for manual configurations.

Syntax	`hardware-address` *`nn:nn:nn:nn:nn:nn`*
Parameters	*`nn:nn:nn:nn:nn:nn`* — Enter the 48-bit hardware address.
Default	Not configured
Command Mode	DHCP-POOL
Usage Information	The client hardware address is the MAC address of the client machine used for manual address binding.
Example	`OS10(conf-dhcp-static)# hardware-address 00:01:e8:8c:4d:0a`
Supported Releases	10.2.0E or later

host

Assigns a host to a single IPv4 or IPv6 address pool for manual configurations.

Syntax	`host` *`A.B.C.D/A::B`*
Parameters	*`A.B.C.D/A::B`* — Enter the host IP address in A.B.C.D or A::B format.
Default	Not configured
Command Mode	DHCP-POOL
Usage Information	The host address is the IP address that a client machine uses for DHCP.
Example	`OS10(conf-dhcp-Dell)# host 20.1.1.100`
Supported Releases	10.2.0E or later

ip dhcp server

Enters DHCP configuration mode.

Syntax	`ip dhcp server`
Parameters	None
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Use the `ip dhcp server` command to enter the DHCP mode required to enable DHCP server-assigned dynamic addresses on an interface.
Example	`OS10(config)# ip dhcp server` `OS10(conf-dhcp)#`
Supported Releases	10.2.0E or later

lease

Configures a lease time for the IP addresses in a pool.

Syntax `lease {infinite | days [hours] [minutes]}`

Parameters
- `infinite` — Enter the keyword to configure a lease that never expires.
- *days* — Enter the number of lease days, from 0 to 31.
- *hours* — Enter the number of lease hours, from 0 to 23.
- *minutes* — Enter the number of lease minutes, from 0 to 59.

Default 24 hours

Command Mode DHCP-POOL

Usage Information The `no` version of this command removes the lease configuration.

Example
```
OS10(conf-dhcp-Dell)# lease 2 5 10
```

Example (Infinite)
```
OS10(conf-dhcp-Dell)# lease infinite
```

Supported Releases 10.2.0E or later

netbios-name-server address

Configures a NetBIOS WINS server that is available to DHCP clients.

Syntax `netbios-name-server ip-address [address2...address8]`

Parameters

ip-address — Enter the address of the NetBIOS WINS server.

address2...address8 — (Optional) Enter additional server addresses.

Default Not configured

Command Mode DHCP-POOL

Usage Information Configure up to eight NetBIOS WINS servers available to a Microsoft DHCP client, in order of preference. The `no` version of this command returns the value to the default.

Example
```
OS10(conf-dhcp-Dell)# netbios-name-server 192.168.10.5
```

Supported Releases 10.2.0E or later

netbios-node-type

Configures the NetBIOS node type for the DHCP client.

Syntax `netbios-node-type type`

Parameters *type* — Enter the NetBIOS node type:
- `Broadcast` — Enter `b-node`.
- `Hybrid` — Enter `h-node`.
- `Mixed` — Enter `m-node`.
- `Peer-to-peer` — Enter `p-node`.

Default Hybrid

Command Mode DHCP-POOL

Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-dhcp-Dell)# netbios-node-type h-node`
Supported Releases	10.2.0E or later

network

Configures a range of IPv4 or IPv6 addresses in the address pool.

Syntax	`network address/mask`
Parameters	*address/mask* — Enter a range of IP addresses and subnet mask in *A.B.C.D/x* or *A::B/x* format.
Default	Not configured
Command Mode	DHCP-POOL
Usage Information	Use the `network` command to configure the IPv4 or IPv6 subnet address from which the DHCP server may assign addresses. For IPv4 address, the prefix length (*mask*) is 17 to 30 bits.
Example	`OS10(config-dhcp-Dell)# network 20.1.1.1/24`
Supported Releases	10.2.0E or later

pool

Configures an IP address pool name.

Syntax	`pool pool-name`
Parameters	*pool-name* — Enter the DHCP server pool name.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Use the `pool` command to name the pool of available IP addresses used by a DHCP server to assign an IP address to a client and enter DHCP POOL mode. In this mode, use the `network` command to configure the IPv4 or IPv6 subnet from which the DHCP server assigns addresses.
Example	`OS10(conf-dhcp)# pool Dell` `OS10(conf-dhcp-Dell)#`
Supported Releases	10.2.0E or later

range

Configures a range of IP addresses.

Syntax	`range {ip-address1 [ip-address2]}`
Parameters	• *ip-address1* — First IP address of the IP address range. • *ip-address2* — Last IP address of the IP address range.
Default	Not configured
Command Mode	DHCP-POOL

Usage Information	Use the `range` command to configure a range of IP addresses that the OS10 switch, acting as the DHCP server, can assign to DHCP clients. The `no` version of this command requires only the first IP address to remove the range configuration.

Example	`OS10(config)# OS10(config)# ip dhcp server`
	`OS10(config-dhcp)# pool pool1`
	`OS10(config-dhcp-pool1)# network 192.168.10.0/24`
	`OS10(config-dhcp-pool1)# range 192.168.10.2 192.168.10.8`

Supported Releases	10.4.1 or later

show ip dhcp binding

Displays the DHCP binding table with IPv4 addresses.

Syntax	`show ip dhcp binding`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	After configuring a static IP-to-MAC address mapping with the `host` and `hardware-address` commands in DHCP POOL mode, use this command to verify the single manual binding for a host in the DHCP binding table.

Example	`OS10# show ip dhcp binding`
	` IP Address  Hardware address  Lease expiration Hostname`
	`+-----------------------------------------------`
	`11.1.1.254  00:00:12:12:12:12 Jan 27 2016 06:23:45`
	
	`Total Number of Entries in the Table = 1`

Supported Releases	10.2.0E or later

DHCP snooping commands

arp inspection

Enables Dynamic ARP Inspection (DAI) on a VLAN.

Syntax	`arp inspection`
Parameters	None
Defaults	Disabled
Command Mode	INTERFACE VLAN
Usage Information	Dell Technologies recommends enabling DAI before enabling DHCP snooping.
Example	`OS10(conf-if-vl-230)# arp inspection`
Supported Releases	10.5.0 or later

arp inspection-trust

Configures a port as trusted so that ARP frames are not validated against the DAI database.

Syntax	`arp inspection-trust`
Parameters	None
Defaults	All interfaces are untrusted
Command Mode	INTERFACE
Usage Information	**NOTE:** Dell Technologies recommends configuring the `arp inspection-trust` command on the DHCP snooping trusted interfaces when DAI is enabled for a VLAN. This command is accessible to users with `sysadmin` and `secadmin` roles.
Example	`OS10(conf-if-eth1/1/33)# arp inspection-trust`
Supported Release	10.5.0 or later

arp inspection violation logging

Enables Dynamic ARP Inspection (DAI) on a VLAN.

Syntax	`arp inspection violation logging`
Parameters	• `violation logging`—Enter `violation logging` to enable DAI violation logging.
Defaults	Disabled
Command Mode	CONFIGURATION
Usage Information	When you enable the `violation logging` option, each violated ARP request is logged with the source IP address, source MAC address, and interface details.
Example	`OS10(config)# arp inspection violation logging`
Supported Releases	10.5.0 or later

clear ip arp inspection statistics

Clear the Dynamic ARP Inspection statistics.

Syntax	`clear ip arp inspection statistics [vlan` **`vlan-id`**`]`
Parameters	• `vlan` **`vlan-id`**—Enter the VLAN ID. The range is from 1 to 4093.
Defaults	None
Command Mode	EXEC
Usage Information	This command is accessible to users with `sysadmin` and `secadmin` roles.
Example (Global)	`OS10# clear ip dhcp snooping binding`
Supported Release	10.5.0 or later or later

clear ip dhcp snooping binding

Clears the dynamic entries in the DHCP snooping binding table.

Syntax

```
clear ip dhcp snooping binding [mac mac-address] [vlan vlan-id] [interface
{ethernetslot/port/sub-port> | port-channel port-channel-id}]
```

Parameters

- `mac` **`mac-address`**—Enter the MAC address of the host to which the server is leasing the IP address.
- `vlan` **`vlan-id`**—Enter the VLAN ID. The range is from 1 to 4093.
- `interface` *`type`*—Enter the interface type information. You can enter a physical, a VLAN, or a port-channel interface.

Defaults

None

Command Mode

EXEC

Usage Information

This command clears the dynamic entries in the DHCP snooping binding table.

CAUTION: Clearing the DHCP snooping binding table using the clear ip dhcp snooping binding command also clears the SAV and DAI entries on the system. This affects the traffic from clients that are connected to the DHCP snooping-enabled VLANs.

Example (Global)

```
OS10# clear ip dhcp snooping binding
```

Example (MAC)

```
OS10# clear ip dhcp snooping binding mac 04:56:79:86:73:fe
```

Example (Port Channel)

```
OS10# clear ip dhcp snooping binding mac 04:56:79:86:73:fe  vlan 100
port-channel 10
```

Supported Release

10.5.0 or later or later

ip dhcp snooping (global)

Enables DHCP snooping globally.

Syntax

```
ip dhcp snooping
```

Parameters

None

Defaults

Disabled

Command Mode

CONFIGURATION

Usage Information

When you enable this feature, the switch begins to monitor all transactions between DHCP servers and DHCP clients and use the information to build the DHCP snooping binding table.

If you disable DHCP snooping, the system removes the DHCP snooping binding table. Source Address Validation and Dynamic ARP Inspection entries are also removed.

This command is accessible to users with `sysadmin` and `secadmin` roles.

The `no` version of this command disables DHCP snooping globally.

Example

```
OS10(config)# ip dhcp snooping
```

Supported Releases

10.5.0 or later or later

ip dhcp snooping (interface)

Enables DHCP snooping on a VLAN.

Syntax

```
ip dhcp snooping
```

Parameters

None

Defaults

Enabled if enabled globally

Command Mode

INTERFACE VLAN

Usage Information

When you enable this feature, the switch begins to monitor all transactions between DHCP servers and DHCP clients and use the information to build the DHCP snooping binding table.

The system snoops packets from DHCP clients on the DHCP snooping-enabled VLAN and forwards the packets to all physical and port-channel interfaces of the VLAN.

The system processes DHCP server packets that are received through trusted physical interfaces and port-channel interfaces and forwards the packets to all VLAN member interfaces.

You can enable DHCP snooping globally and disable it on an interface.

This command is accessible to users with `sysadmin` and `secadmin` roles.

The `no` version of this command disables DHCP snooping on the interface.

Example

```
OS10(conf-if-vl-4)# ip dhcp snooping
```

Supported Releases

10.5.0 or later or later

ip dhcp snooping binding

Create a static DHCP snooping binding entry in the DHCP binding table.

Syntax

```
ip dhcp snooping binding mac address vlan vlan-id ip ip-address interface
[ethernet slot/port/sub-port | port-channel port-channel-id | VLTi]
```

Parameters

- `mac address`—Enter the MAC address of the host to which the server is leasing the IP address.
- `vlan vlan-id`—Enter the VLAN ID of the VLAN the host belongs to. The range is from 1 to 4093.
- `ip ip-address`—Enter the IP address of the host.
- `interface interface-type`—Enter the interface type information.

Defaults

None

Command Mode

CONFIGURATION

Usage Information

When you create a static DHCP snooping entry, it does not time out.

Before creating a static entry for a VLAN, create the VLAN. If you do not create a VLAN before creating a static entry, the system displays an error message.

Before deleting a port-channel or VLAN, remove any associated DHCP snooping entries.

This command is accessible to users with `sysadmin` and `secadmin` roles.

The `no` version of this command deletes the static entry from the DHCP snooping binding table.

Example

```
OS10(config)# ip dhcp snooping binding mac 00:04:96:70:8a:12 vlan 100 ip
100.1.1.2 interface ethernet 1/1/4
```

Supported Releases

10.5.0 or later

ip dhcp snooping trust

Configures an interface as trusted in a DHCP snooping enabled VLAN.

Syntax	`ip dhcp snooping trust`
Parameters	None
Defaults	Untrusted
Command Mode	INTERFACE
Usage Information	This command configures a physical or port channel interface as trusted. By default all physical and port channel interfaces in the DHCP snooping enabled VLAN are untrusted. You can configure a DHCP server-facing physical or port channel interface as trusted. The system permits DHCP server packets only if they ingress through a trusted interface. If the system receives DHCP packets on an untrusted interface, it interprets the device that is connected to the untrusted interface as rogue DHCP server and drops the packet. The `no` version of this command resets the interface to untrusted.
Example	`OS10(conf-if-eth1/1/33)# ip dhcp snooping trust`
Supported Releases	10.5.0 or later

ip dhcp snooping verify mac-address

Enables DHCPv4 source MAC address validation

Syntax	`ip dhcp snooping verify mac-address`
Parameters	None
Defaults	Disabled
Command Mode	CONFIGURATION
Usage Information	This command enables DHCPv4 source MAC address validation to validate the source hardware address of a DHCP packet against the client hardware address field (CHADDR) in the DHCP payload.
Example	`OS10(config)# ip dhcp snooping verify mac-address`
Supported Releases	10.5.0 or later

show ip arp inspection database

Displays the contents of the DAI database.

Syntax	`show ip arp inspection database`
Parameters	None
Defaults	None
Command Mode	EXEC
Usage Information	This command displays the list of snooped hosts from which ARP packets were processed.

Example	`OS10# show ip arp inspection database`
	`Number of entries : 3`
	
	`Address  Hardware Address  Interface  VLAN`

```
-------------------------------------------------------------------------
55.2.1.1          00:40:50:00:00:00         port-channel100     vlan3001
200.1.1.134       00:2a:10:01:00:00         port-channel100     vlan3001
200.1.1.62        00:2a:10:01:00:01         port-channel100     vlan3001
```

Supported Releases 10.5.0 or later

show ip arp inspection statistics

Displays valid and invalid ARP requests and reply statistics.

Syntax `show ip arp inspection statistics [vlan vlan-id]`

Parameters

- `vlan` **`vlan-id`**—Enter the VLAN ID. The range is from 1 to 4093.

Defaults None

Command Mode EXEC

Usage Information This command displays how many valid and invalid ARP requests and replies are processed.

Example

```
OS10# show ip arp inspection statistics
Dynamic ARP Inspection (DAI) Statistics
-----------------------------------------------
Valid ARP Requests            : 1118
Valid ARP Replies             : 18649
Invalid ARP Requests          : 577
Invalid ARP Replies           : 470
```

Supported Releases 10.5.0 or later

show ip arp inspection logging

Displays violated ARP packet information about DAI-enabled VLANs.

Syntax `show ip arp inspection logging`

Defaults None

Command Mode EXEC

Example

```
OS10# show ip arp inspection logging
Total Number of Clients                        : 1
New Clients learnt in current Interval         : 0
Invalid ARP packets in current interval        : 0

Address    Hw-Address          Port          VLAN  First-detected-time
Packet-count
-------------------------------------------------------------------------------
10.1.1.1   12:d3:43:a1:2e:23   ethernet1/1/1 10    00:23:14             2
```

Supported Releases 10.5.0 or later

show ip dhcp snooping binding

Displays the contents of the DHCP snooping binding table.

Syntax `show ip dhcp snooping binding [vlan vlan-id]`

Parameters

- `vlan` **`vlan-id`**—Enter the VLAN ID. The range is from 1 to 4093.

Defaults None

Command Mode EXEC

Usage Information The dynamically learned entries are displayed as `D` and statically configured entries are displayed as `S`.

Example

```
OS10# show ip dhcp snooping binding

Codes :  S - Static D - Dynamic

IPv4 Address  MAC Address       Expires(Sec)  Type Interface         VLAN

=============================================================================
10.1.1.22     11:22:11:22:11:22    120331     S    ethernet1/1/4     100
10.1.1.44     11:22:11:22:11:23    120331     S    port-channel100   200

10.1.1.5      11:22:11:22:11:24    120331     D    ethernet1/1/5:4   300
```

Supported Releases 10.5.0 or later

DNS commands

OS10 supports the configuration of a DNS host and domain parameters.

ip domain-list

Adds a domain name to the DNS list.

Syntax `ip domain-list [vrf vrf-name] [server-name] name`

Parameters

- `vrf vrf-name` — (Optional) Enter `vrf` and then the name of the VRF to add a domain name to the DNS list corresponding to that VRF.
- *`server-name`* — (Optional) Enter the server name to add a domain name to the DNS list.
- *`name`* — Enter the name of the domain to append to the DNS list.

Default Not configured

Command Mode CONFIGURATION

Usage Information There is a maximum of six domain names in the DNS list. Use the `ip domain-list` command to configure a domain name to complete unqualified hostnames. The domain name appends to incomplete host names in DNS requests. The `no` version of this command removes a domain name from the DNS list.

Example

```
OS10(config)# ip domain-list jay dell.com
```

Supported Releases 10.2.0E or later

ip domain-name

Configures the default domain and appends to incomplete DNS requests.

Syntax `ip domain-name [vrf vrf-name] server-name`

Parameters

- `vrf vrf-name` — (Optional) Enter `vrf` and then the name of the VRF to configure the domain corresponding to that VRF.
- *`server-name`* — (Optional) Enter the server name the default domain uses.

Default Not configured

Command Mode CONFIGURATION

Usage Information	This domain appends to incomplete DNS requests. The `no` version of this command returns the value to the default.
Example	`OS10(config)# ip domain-name vrf jay dell.com`
Supported Releases	10.2.0E or later

ip host

Configures mapping between the hostname server and the IP address.

Syntax	`ip host [vrf vrf-name] [host-name] address`
Parameters	• `vrf vrf-name` — (Optional) Enter `vrf` and then the name of the VRF to configure the name server to IP address mapping for that VRF. • *`host-name`* — (Optional) Enter the name of the host. • *`address`* — Enter an IPv4 or IPv6 address of the name server in A.B.C.D or A::B format.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The name-to-IP address table uses this mapping information to resolve host names. The `no` version of this command disables the mapping.
Example	`OS10(config)# ip host dell 1.1.1.1`
Supported Releases	10.2.0E or later

ip name-server

Configures up to three IPv4 or IPv6 addresses used for network name servers.

Syntax	`ip name-server ip-address [ip-address2 ip-address3]`
Parameters	• *`ip-address`* — Enter the IPv4 or IPv6 address of a domain name server to use for completing unqualified names, such as incomplete domain names that cannot be resolved. • *`ip-address2 ip-address3`* — (Optional) Enter up to two additional IPv4 or IPv6 name servers, separated with a space.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	OS10 does not support sending DNS queries over a VLAN. DNS queries are sent out on all other interfaces, including the Management port. You can separately configure both IPv4 and IPv6 domain name servers. In a dual stack setup, the system sends both A (request for IPv4) and AAAA (request for IPv6) record requests to a DNS server even if you only configure this command. The `no` version of this command removes the IP name-server configuration.
Example	`OS10(config)# ip name-server 10.1.1.5`
Supported Releases	10.2.0E or later

show hosts

Displays the host table and DNS configuration.

Syntax	`show hosts [vrf vrf-name]`
Parameters	`vrf vrf-name` — Enter `vrf` then the name of the VRF to display DNS host information corresponding to that VRF.
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	

```
OS10# show hosts
Default Domain Name : dell.com
Domain List : abc.com
Name Servers : 1.1.1.1 20::2
=============================================
       Static Host to IP mapping Table
=============================================
Host                                IP-Address
---------------------------------------------
dell-pc1                              20.1.1.1
```

Supported Releases	10.2.0E or later

Containers

Docker-CE allows you to download and install external packages and run them within OS10.

When you start a container, use the `--net=` option to connect it to a network. This network can access the Management and front-end interfaces. If you do not want networking for your Docker containers, use `none`.

If you are in the `sysadmin` group, you can run Docker commands from the OS10 Linux Shell.

Docker-CE restrictions

- Docker-CE is supported on platforms with at least 16 GB of flash memory.
- Docker-CE is disabled by default on the system.
- By default, the dockers that you create have no visibility to the Layer 2 traffic arriving on the data ports.
- Dell Networking recommends creating containers only with the network type as **host** or **none**.
- Do not create bridge networks using the `docker network create` command as this configuration can conflict with the OS10 networking capability.
- Interfaces that are part of nondefault VRFs are not available for Docker-CE containers.
- Do not use multiple containers simultaneously as this may affect system performance.
- Do not run CPU intensive Docker containers.
- Container support is not available in the SFS mode.

Enable Docker-CE

- Use the following commands in the OS10 Linux Shell:

```
sudo systemctl enable docker
sudo systemctl start docker
```

NOTE: When you run the `docker run` command to create a container, you must use the `--net=host` parameter.

Install a Docker image

- To pull the latest Docker image from a Docker hub:

```
docker pull nginx
```

Or

```
docker pull nginx:latest
```

NOTE: Docker downloads the latest image if you do not specify the image file name.

- To pull a Docker image from a private repository:

```
docker pull private-repository-URL
```

View installed local images

- Use one of the following commands:

```
docker images
```

Or

```
docker image ls
```

Or

```
docker image inspect node:latest
```

Remove installed local images

- Remove the Puppet Agent image:

```
docker image rm puppet-agent
```

- Remove the nginx image with the latest tag:

```
docker image rm nginx:latest
```

Install and start images

- Create a container with the latest image in the host network namespace:

```
docker run -d --net=host --name mynode node
```

- Create a container with the stretch image in the host network namespace:

```
docker run -d --net=host --name strnode node:stretch
```

- Create a container with the Puppet Agent image in the host network namespace:

```
docker run -d --net=host --name mypuppet puppet-agent
```

- Start an existing container:

```
docker start --name container-name
```

- Stop a running existing container:

```
docker stop --name container-name
```

- Open an interactive terminal inside a container:

```
docker exec -it --name container-name
```

Manage volumes

- Create a Docker volume:

```
docker volume create volume-name
```

- Run a Docker in a particular volume mapped to "/work" inside the container:

```
docker run -d -it -v workvol1:/work puppet-agent /bin/bash
```

- Display details of a volume:

```
docker volume inspectvolume-name
```

- List all the volumes in the system:

```
docker volume ls
```

- Remove a volume:

```
docker volume rm volume-name
```

Docker Management

- List all running Docker containers:

```
docker ps
```

- List all running and stopped Docker containers:

```
docker ps -a
```

- Remove a Docker container:

```
docker rm container-name
```

- Remove a Docker image:

```
docker rmi image-name
```

- Remove unused Docker images:

```
docker image prune
```

- Remove unused Docker volumes:

```
docker volume prune
```

- Remove all unused containers, images, and networks:

```
docker system prune
```

- Run a Docker container with a certain amount of memory:

```
docker run -d --memory="size" container-name
```

- Run a Docker container, and restrict its CPU usage:

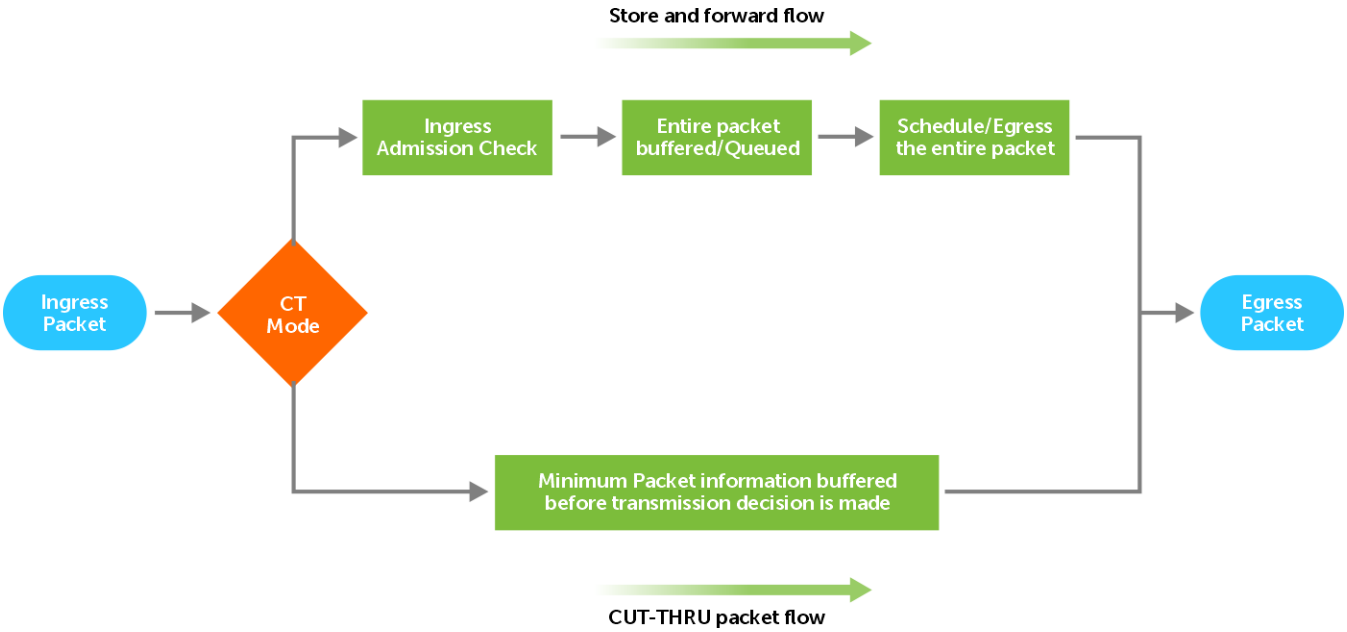
```
docker run -d --cpus="processor-allocation-precentage" container-name
```

For more information about Docker-CE commands, see the Docker-CE documentation.

Low Latency Modes

Low latency describes a system network that processes a high volume of data messages with minimal delay (latency). These networks support operations that require near real-time access to rapidly changing data. Use Low Latency mode to reduce the switching latency for timing-critical applications such as storage networks. By default, Low Latency mode is not enabled in OS10 switches. To achieve low latency, only the Memory Management Unit (MMU) Cut-Through (CT) mode is enabled.

- Low Latency modes include bypass paths in different blocks within the ingress and egress switching pipeline.
- MMU CT mode switches send the packets to the destination port without buffering the entire packet in the MMU buffer.



Cut-through switching mode

CT switching offers low-latency performance for SCSI traffic. Use CT switching in packet-switching systems. The switch forwards packets or frames to its destination immediately after the destination address is processed without waiting to receive the entire data.

The egress scheduler block in the NPU pipeline schedules the packet to transmit out after the first cells of packet arrive. However, egress scheduler falls back to Store and Forward (SF) mode if the conditions are not met for CT transmission, even though you configure the switch in CT mode.

The following conditions must be met for the switch to operate in CT mode. If these conditions are not met, the switch stays in SF mode, irrespective of the configured value. For Multicast packets, all the destination ports must satisfy the following conditions:

1. The source and destination port speed must be within the configured range. The range can be same speed ports or fast-to-slow speed ports. For example 10G to 10G, 40G to 40G, 40G to 10G, 400G to 100G. For more information, see Restrictions and Limitations.
2. The destination port must not experience a back-pressure due to Priority Flow Control (PFC) or pause frames.
3. Do not overlap the destination port. Multiple ingress ports must not send packets to the same destination port. Similarly, one ingress port must not send multiple copies of a packet to the same port; for example, unicast or mirror copy.
4. The queue of the destination port must not have packets waiting for transmission in SF mode.
5. If the *port-max shaper* is configured on the egress port, outgoing packets rate on the egress port must be in the configured range. The transmitted packet rate is less than the configured maximum peak rate.
6. If the policer configuration is enabled on the ingress port in CT Switching mode and if the incoming packet rate is higher than the peak information rate, the excess traffic drops at ingress. The outgoing traffic which abides in the policer configuration transmits in CT mode.
7. If the source-to-destination port path of the packet is in CT mode, no other source ports can queue their packets to the same destination port.
8. CT mode switching is not allowed to the CPU port.
9. CT mode is not allowed to the Loopback port.
10. CT mode is not allowed to the management port.
11. Destination ports must have enough Egress Pipeline (EP) credits. Depending on the port speed, a different number of EP credits are required.
12. Any CPU-generated packets like STP, LLDP, IGMP, and so on that goes out of the destination port may affect the CT switching of data packets momentarily on that port.

Restrictions and limitations

When the port is operating in CT mode, you can observe the following restrictions, depending on the configuration or timing of the incoming packet, PFC message, or port speed configurations.

- Layer 2/Layer 1/Layer 0, and queue level maximum shaper configurations are not considered. For example, if a queue within a port has a shaper that is configured to a rate that is less than the rate of the port, the queue can violate the shaper limit and can grow to the port rate, if the traffic rate is out of the profile.
- The following table lists the CT mode support on existing OS10 platforms:

Table 22. Cut-Through mode support

Platform	CT Mode Support
Z9100-ON	No
S4048-ON	Yes
S6000-ON	Yes (only 40G ports)
S4000-ON	Yes (only 40G ports)
S6010-ON	Yes (only 40G ports)
S4100-ON Series	Yes (only 40G ports)
Z9264-ON	Yes
S4200-ON	No
S5148-ON	No
S5200-ON Series	Yes
S3048-ON	No
Z9300-ON Series	Yes
N-Series	No

- The destination port cannot use Link Level Flow Control (LLFC) Pause as flow control (PFC). However, PFC can co-exist with CT mode, but the response time can be delayed depending on the size of the on-the-fly packet.
- CT mode is not allowed for multicast packets. This limitation is specific to Z9300-ON Series switches.
- CT mode is not supported for egress encapsulations such as VXLAN, ERSPAN, and any other tunneling the knowledge of the full packet length.
- Fast-to-slow CT mode support is available only when the maximum port speed ratio is 4:1; for example, 40G to 10G or 400G to 100G. Fast-to-slow CT mode support is available on S5200-ON Series, Z9200-ON Series, and Z9300-ON Series switches.

Table 23. Fast-to-slow CT mode support

Ingress Port speed range (Min-Max)	Egress Port speed	Combinations (SRC-DEST)
10G-50G	10G	(25G-10G), (40G-10G), (50G-10G)
25G-50G	25G	(40G-25G), (50G-25G)
40G-100G	40G	(50G-40G), (100G-40G)
50G-100G	50G	(100G-50G)

Low Latency Modes CLI commands

show switching-mode

Displays the current configured switching-mode.

Syntax `show switching-mode`

Parameters	None
Defaults	Not applicable
Command Mode	EXEC
Usage Information	None

Example

```
OS10(config)# switching-mode cut-through
OS10(config)# exit
OS10# show switching-mode
Current switching mode: cut-through
OS10# configure terminal
OS10(config)# no switching-mode
OS10(config)# exit
OS10# show switching-mode
Current switching mode: store-and-forward
OS10#
```

Supported Releases	10.5.2.0 or later

switching-mode cut-through

Enables the Cut-Through (CT) Switching mode.

Syntax	`switching-mode cut-through`
Parameters	None
Defaults	Store and Forward (SF) switching mode
Command Mode	CONFIGURATION
Usage Information	• Use this command to change the default switching-mode to CT Switching mode. • As part of the `show configuration` command, nondefault configurations display. • The `No` form of this command resets the configuration to the default SF mode.

Example

```
OS10(config)# switching-mode cut-through
OS10(config)# exit
OS10# show switching-mode
Current switching mode: cut-through
```

```
OS10# configure terminal
OS10(config)# no switching-mode
OS10(config)# exit
OS10# show switching-mode
Current switching mode: store-and-forward
OS10#
```

Supported Releases	10.5.2.0 or later

9

Interfaces

You can configure and monitor physical interfaces (Ethernet), port-channels, and virtual local area networks (VLANs) in Layer 2 (L2) or Layer 3 (L3) modes.

Table 24. Interface types

Interface type	Supported	Default mode	Requires creation	Default status
Ethernet (PHY)	L2, L3	unset	No	no shutdown enabled
Management	N/A	N/A	No	no shutdown enabled
Loopback	L3	L3	Yes	no shutdown enabled
Port-channel	L2, L3	unset	Yes	no shutdown enabled
VLAN	L2, L3	L3	Yes, except default	no shutdown enabled

Configuration notes

- All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:
  - To avoid loops in an L2 network with statically configured port channels, keep the no switchport configuration on an interface after you remove its port-channel configuration using the no interface port-channel command.
  - On a S4148-ON switch, 10GBASE-T transceiver cannot operate at 100M or 1G speed.
- S3048-ON platform: During reload of S3048-ON, copper GbE ports transiently become operationally up for around 80 seconds, and then they go down. This is a known hardware behavior.
- When the 1GBASE-T optic is plugged on a 100G port using a QSA adapter on a device and the RJ45 end is plugged into the copper port of the peer, there is a slight delay during the link up or down events.

Ethernet interfaces

Ethernet port interfaces are enabled by default. To disable an Ethernet interface, use the `shutdown` command. Use the `show interface status` command to view the status of the interfaces.

NOTE: Linux operation or commands such as shutdown or no-shutdown and ip-address that are run against the interface is not reflected in the CLI.

To reenable a disabled interface, use the `no shutdown` command.

1. Configure an Ethernet port interface from Global CONFIGURATION mode.

```
interface ethernet node/slot/port[:subport]
```

2. Disable and reenable the Ethernet port interface in INTERFACE mode.

```
shutdown
```

```
no shutdown
```

Disable Ethernet port interface

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# shutdown
```

Enable Ethernet port interface

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
```

Unified port groups

In an OS10 unified port group, all ports operate in either Ethernet or Fibre Channel (FC) mode. You cannot mix modes for ports in the same unified port group. To activate Ethernet interfaces, configure a port group to operate in Ethernet mode and specify the port speed. To activate Fibre Channel interfaces, see Fibre Channel interfaces.

S4148U-ON

On the S4148U-ON switch, the available Ethernet and Fibre Channel interfaces in a port group depend on the currently configured port profile. For more information, see S4148U-ON port profiles.

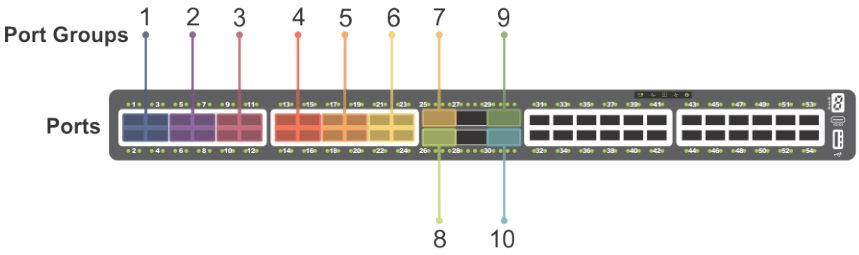


Figure 2. S4148U-ON unified port groups

To enable Ethernet interfaces in a unified port group:

1. Configure a unified port group in CONFIGURATION mode. Enter `1/1` for *node/slot*. The port-group range depends on the switch.

   ```
   port-group node/slot/port-group
   ```

2. Activate the unified port group for Ethernet operation in PORT-GROUP mode. To activate a unified port group in Fibre Channel mode, see Fibre Channel interfaces. The available options depend on the switch.

   ```
   mode Eth {100g-1x | 50g-2x | 40g-1x | 25g-4x | 10g-4x}
   ```

   - `100g-1x` — Reset a port group to 100GE mode.
   - `50g-2x` — Split a port group into two 50GE interfaces.
   - `40g-1x` — Set a port group to 40GE mode for use with a QSFP+ 40GE transceiver.
   - `25g-4x` — Split a port group into four 25GE interfaces.
   - `10g-4x` — Split a port group into four 10GE interfaces.

3. Return to CONFIGURATION mode.

   ```
   exit
   ```

4. Enter Ethernet Interface mode to configure other settings. Enter a single interface, a hyphen-separated range, or multiple interfaces separated by commas.

   ```
   interface ethernet node/slot/port[:subport]
   ```

Configure Ethernet unified port interface

```
OS10(config)# port-group 1/1/13
OS10(conf-pg-1/1/13)# mode Eth 25g-4x
OS10(conf-pg-1/1/13)# exit
OS10(config)# interface ethernet 1/1/41:1
OS10(conf-if-eth1/1/41:1)#
```

View Ethernet unified port interface

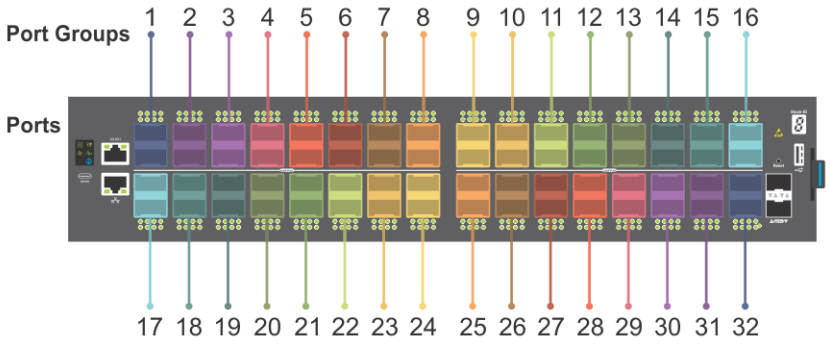
```
OS10(config)# interface ethernet 1/1/41
OS10(conf-if-eth1/1/41:1)# show configuration
!
```

```
interface ethernet1/1/41:1
 no shutdown
```

Z9264F-ON port-group profiles

On the Z9264F-ON switch, the port-group profiles determine the available front-panel Ethernet ports and supported breakout interfaces. QSFP28 ports operate only in Ethernet mode. Use the port-group profile to configure breakout interfaces and specify the port speed.

NOTE: The configuration steps to enable Ethernet interfaces on a Z9264F-ON port group are different than that of the S4100-ON series. Follow the procedure described in this section to configure breakout interfaces on a Z9264F-ON switch.



Each pair of odd and even numbered ports is configured as a port group. For example:

```
hybrid-group          profile        Ports              Mode
port-group1/1/1       restricted     1/1/1              Eth 10g-4x
                                     1/1/2              Eth Disabled
port-group1/1/2       restricted     1/1/3              Eth 10g-4x
                                     1/1/4              Eth Disabled
port-group1/1/3       restricted     1/1/5              Eth 10g-4x
                                     1/1/6              Eth Disabled
.
.
.
port-group1/1/31      unrestricted   1/1/61             Eth 100g-1x
                                     1/1/62             Eth 100g-1x
port-group1/1/32      unrestricted   1/1/63             Eth 100g-1x
                                     1/1/64             Eth 100g-1x
```

On the Z9264F-ON switch, the available Ethernet interfaces in a port group depends on the currently configured port-group profile. For details about the supported breakout modes in port-group profiles, see the `profile` CLI command.

To enable Ethernet interfaces:

1. Configure a Z9264F-ON port group in CONFIGURATION mode. Enter `1/1` for *node/slot*. The port-group range is from 1 to 32.

   ```
   port-group node/slot/port-group
   ```

2. Configure the restricted profile in PORT-GROUP mode. This command applies only to the odd-numbered port within the port group, and disables the even-numbered port in the port group.

   ```
   profile restricted
   ```

3. Configure the port mode for the odd numbered port within the port group.

   ```
   port node/slot/port mode Eth port-mode
   ```

   - `100g-1x` — Reset a port to 100GE mode.
   - `40g-1x` — Set a port to 40GE mode for use with a QSFP+ 40GE transceiver.
   - `25g-4x` — Split a port into four 25GE interfaces.

- `10g-4x` — Split a port into four 10GE interfaces.

4. Return to CONFIGURATION mode.

```
exit
```

5. Enter Ethernet Interface mode to configure other settings. Enter a single interface, a hyphen-separated range, or multiple interfaces separated by commas.

```
interface ethernet node/slot/port[:subport]
```

Configure restricted port-group profile

```
OS10(config)# port-group 1/1/2
OS10(conf-pg-1/1/2)# profile restricted
OS10(conf-pg-1/1/2)# port 1/1/3 mode Eth 25g-4x
OS10(conf-pg-1/1/2)# exit
OS10(config)# interface ethernet 1/1/3:2
OS10(conf-if-eth1/1/3:2)#
```

View the interface

```
OS10(config)# interface ethernet 1/1/3:2
OS10(conf-if-eth1/1/3:2)# show configuration
!
interface ethernet1/1/3:2
 no shutdown
```

Port-groups on S5200F-ON switches

On the S5200F-ON series switches, port-groups determine the available front-panel Ethernet ports and supported breakout interfaces.

When you convert a port to a particular mode, all ports that belong to the port group also operate at the same mode. For example, if you convert the Ethernet 1/1/1 interface to 10g-4x, all other interfaces that belong to port-group 1/1/1 namely, 1/1/2, 1/1/3, and 1/1/4 also operate at 10g-4x mode.

NOTE: The S5232F-ON platform does not use port groups. On this platform, use the `interface breakout` command instead.

The following shows the supported port groups and breakout modes on the S5212F-ON switch:

```
OS10# show port-group

Port-group            Mode           Ports                FEM
port-group1/1/1       Eth 10g-4x     1  2  3  4      -
port-group1/1/2       Eth 10g-4x     5  6  7  8      -
port-group1/1/3       Eth 10g-4x     9  10  11  12   -
port-group1/1/4       Eth 100g-1x    13              -
port-group1/1/5       Eth 100g-1x    14              -
port-group1/1/6       Eth 100g-1x    15              -
```

Table 25. Port groups and breakout modes on the S5212F-ON switch

Port Group	Ports	Supported breakout modes
Port-group1/1/1	1, 2, 3, 4	• 25g-4x • 10g-4x
Port-group1/1/2	5, 6, 7, 8	• 25g-4x • 10g-4x
Port-group1/1/3	9, 10, 11, 12	• 25g-4x • 10g-4x
Port-group1/1/4	13	• 100g-1x

Table 25. Port groups and breakout modes on the S5212F-ON switch (continued)

Port Group	Ports	Supported breakout modes
		• 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/14	14	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/6	15	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x

The following shows the supported port groups and breakout modes on the S5224F-ON switch:

```
OS10# show port-group
Port-group              Mode            Ports           FEM
port-group1/1/1         Eth 10g-4x      1   2   3   4       -
port-group1/1/2         Eth 10g-4x      5   6   7   8       -
port-group1/1/3         Eth 10g-4x      9   10   11   12    -
port-group1/1/4         Eth 10g-4x      13   14   15   16   -
port-group1/1/5         Eth 10g-4x      17   18   19   20   -
port-group1/1/6         Eth 10g-4x      21   22   23   24   -
port-group1/1/7         Eth 100g-1x     25                -
port-group1/1/8         Eth 100g-1x     26                -
port-group1/1/9         Eth 100g-1x     27                -
port-group1/1/10        Eth 100g-1x     28                -
```

Table 26. Port groups and breakout modes on the S5224F-ON switch

Port Group	Ports	Supported breakout modes
Port-group1/1/1	1, 2, 3, 4	• 25g-4x • 10g-4x
Port-group1/1/2	5, 6, 7, 8	• 25g-4x • 10g-4x
Port-group1/1/3	9, 10, 11, 12	• 25g-4x • 10g-4x
Port-group1/1/4	13, 14, 15, 16	• 25g-4x • 10g-4x
Port-group1/1/5	17, 18, 19, 20	• 25g-4x • 10g-4x
Port-group1/1/6	21, 22, 23, 24	• 25g-4x • 10g-4x
Port-group1/1/7	25	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/8	26	• 100g-1x

Table 26. Port groups and breakout modes on the S5224F-ON switch (continued)

Port Group	Ports	Supported breakout modes
		• 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/9	27	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/10	28	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x

The following shows the supported port groups and breakout modes on the S5248F-ON switch:

```
OS10# show port-group
Port-group      Mode        Ports         FEM
port-group1/1/1 Eth 25g-4x 1 2 3 4      -
port-group1/1/2 Eth 25g-4x 5 6 7 8      -
port-group1/1/3 Eth 25g-4x 9 10 11 12   -
port-group1/1/4 Eth 25g-4x 13 14 15 16     -
port-group1/1/5 Eth 25g-4x 17 18 19 20     -
port-group1/1/6 Eth 25g-4x 21 22 23 24     -
port-group1/1/7 Eth 25g-4x 25 26 27 28     -
port-group1/1/8 Eth 25g-4x 29 30 31 32     -
port-group1/1/9 Eth 25g-4x 33 34 35 36     -
port-group1/1/10 Eth 25g-4x 37 38 39 40 -
port-group1/1/11 Eth 25g-4x 41 42 43 44 -
port-group1/1/12 Eth 25g-4x 45 46 47 48 -
port-group1/1/13 Eth 100g-2x 49 50      -
port-group1/1/14 Eth 100g-2x 51 52      -
port-group1/1/15 Eth 100g-1x 53         -
port-group1/1/16 Eth 100g-1x 54                    -
port-group1/1/17 Eth 100g-1x 55                    -
port-group1/1/18 Eth 100g-1x 56                    -
```

Table 27. Port groups and breakout modes on the S5248F-ON switch

Port Group	Ports	Supported breakout modes
Port-group1/1/1	1, 2, 3, 4	• 25g-4x • 10g-4x
Port-group1/1/2	5, 6, 7, 8	• 25g-4x • 10g-4x
Port-group1/1/3	9, 10, 11, 12	• 25g-4x • 10g-4x
Port-group1/1/4	13, 14, 15, 16	• 25g-4x • 10g-4x
Port-group1/1/5	17, 18, 19, 20	• 25g-4x • 10g-4x
Port-group1/1/6	21, 22, 23, 24	• 25g-4x • 10g-4x
Port-group1/1/7	25, 26, 27, 28	• 25g-4x • 10g-4x

Table 27. Port groups and breakout modes on the S5248F-ON switch (continued)

Port Group	Ports	Supported breakout modes
Port-group1/1/8	29, 30, 31, 32	• 25g-4x • 10g-4x
Port-group1/1/9	33, 34, 35, 36	• 25g-4x • 10g-4x
Port-group1/1/10	37, 38, 39, 40	• 25g-4x • 10g-4x
Port-group1/1/11	41, 42, 43, 44	• 25g-4x • 10g-4x
Port-group1/1/12	45, 46, 47, 48	• 25g-4x • 10g-4x
Port-group1/1/13	49, 50	• 100g-2x • 50g-4x • 40g-2x • 25g-8x • 10g-8x
Port-group1/1/14	51, 52	• 100g-2x • 50g-4x • 40g-2x • 25g-8x • 10g-8x
Port-group1/1/15	53	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/16	54	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/17	55	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/18	56	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x

The following shows the supported port groups and breakout modes on the S5296F-ON switch:

```
OS10# show port-group

Port-group            Mode           Ports              FEM
port-group1/1/1       Eth 25g-4x     1   2   3   4              -
port-group1/1/2       Eth 25g-4x     5   6   7   8              -
port-group1/1/3       Eth 25g-4x     9   10   11   12       -
port-group1/1/4       Eth 25g-4x     13   14   15   16      -

Port-group1/1/29	101	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x

Table 28. Port groups and breakout modes on the S5296F-ON switch (continued)

Port Group	Ports	Supported breakout modes
Port-group1/1/30	102	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/31	103	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x
Port-group1/1/32	104	• 100g-1x • 50g-2x • 40g-1x • 25g-4x • 10g-4x

To configure breakout modes:

1. Configure a port group in CONFIGURATION mode. Enter `1/1` for *node/slot* and the port group number.

```
port-group node/slot/port-group
```

2. Configure the breakout mode in PORT-GROUP mode.

```
mode Eth breakout-mode
```

- `100g-2x` — Split a port group into two 100GE interface.
- `100g-1x` — Set a port group to 100GE mode.
- `50g-4x` — Split a port group into four 50GE interfaces.
- `50g-2x` — Split a port group into two 50GE interfaces.
- `40g-2x` — Split a port group into two 40GE interfaces for use with a QSFP+ 40GE transceiver.
- `40g-1x` — Set a port group to 40GE mode for use with a QSFP+ 40GE transceiver.
- `25g-8x` — Split a port group into eight 25GE interfaces.
- `25g-4x` — Split a port group into four 25GE interfaces.
- `10g-8x` — Split a port group into eight 10GE interfaces.
- `10g-4x` — Split a port group into four 10GE interfaces.

3. Return to CONFIGURATION mode.

```
exit
```

4. Enter Interface breakout mode to configure other settings, such as, speed.

```
interface ethernet node/slot/port[:subport]
```

The following shows converting a port group from `25g-4x` mode to `10g-4x` mode:

```
OS10# configure terminal
OS10(config)# port-group 1/1/1
OS10(conf-pg-1/1/1)# mode Eth 10g-4x
OS10(conf-pg-1/1/1)# exit
OS10(config)# interface ethernet 1/1/1:1
OS10(conf-if-eth1/1/1:1)# speed
1000 Set speed to 1000 Mbps
10000 Set speed to 10000 Mbps
auto Automatic Settings (default)
OS10(conf-if-eth1/1/1:1)# speed 1000
```

L2 mode configuration

Each physical Ethernet interface uses a unique MAC address. Port-channels and VLANs use a single MAC address. By default, all the interfaces operate in L2 mode. From L2 mode you can configure switching and L2 protocols, such as VLANs and Spanning-Tree Protocol (STP) on an interface.

Enable L2 switching on a port interface in Access or Trunk mode. By default, an interface is configured in Access mode. Access mode allows L2 switching of untagged traffic on a single VLAN (VLAN 1 is the default). Trunk mode enables L2 switching of untagged traffic on the Access VLAN, and tagged traffic on one or more VLANs.

By default, native VLAN of a port is the default VLAN ID of the switch. You can change the native VLAN using the `switchport access vlan` *`vlan-id`* command.

A Trunk interface carries VLAN traffic that is tagged using 802.1q encapsulation. If an Access interface receives a packet with an 802.1q tag in the header that is different from the Access VLAN ID, it drops the packet.

By default, a trunk interface carries only untagged traffic on the Access VLAN. You must manually configure other VLANs for tagged traffic.

1. Select one of the two available options:
   - Configure L2 trunking in INTERFACE mode and the tagged VLAN traffic that the port can transmit. By default, a trunk port is not added to any tagged VLAN. You must create a VLAN before you can assign the interface to it.

     ```
     switchport mode trunk
     switchport trunk allowed vlan vlan-id-list
     ```

   - Reconfigure the access VLAN assigned to a L2 access or trunk port in INTERFACE mode.

     ```
     switchport access vlan vlan-id
     ```

2. Enable the interface for L2 traffic transmission in INTERFACE mode.

   ```
   no shutdown
   ```

L2 interface configuration

```
OS10(config)# interface ethernet 1/1/7
OS10(conf-if-eth1/1/7)# switchport mode trunk
OS10(conf-if-eth1/1/7)# switchport trunk allowed vlan 5,10
OS10(conf-if-eth1/1/7)# no shutdown
```

L3 mode configuration

Ethernet and port-channel interfaces are in L2 access mode by default. When you disable the L2 mode and then assign an IP address to an Ethernet port interface, you place the port in L3 mode.

Configure one primary IP address in L3 mode. You can configure up to 255 secondary IP addresses on an interface. At least one interface in the system must be in L3 mode before you configure or enter a L3–protocol mode, such as OSPF.

1. Remove a port from L2 switching in INTERFACE mode.

   ```
   no switchport
   ```

2. Configure L3 routing in INTERFACE mode. Add `secondary` to configure backup IP addresses.

   ```
   ip address address [secondary]
   ```

3. Enable the interface for L3 traffic transmission in INTERFACE mode.

   ```
   no shutdown
   ```

L3 interface configuration

```
OS10(config)# interface ethernet 1/1/9
OS10(conf-if-eth1/1/9)# no switchport
```

```
OS10(conf-if-eth1/1/9)# ip address 10.10.1.92/24
OS10(conf-if-eth1/1/9)# no shutdown
```

View L3 configuration error

```
OS10(config)# interface ethernet 1/1/14
OS10(conf-if-eth1/1/14)# ip address 10.1.1.2/24
% Error: Interface ethernet1/1/14, IP address cannot exist with L2 modes.
```

Fibre Channel interfaces

OS10 unified port groups support FC interfaces. A unified port group operates in Fibre Channel or Ethernet mode. To activate FC interfaces, configure a port group to operate in Fibre Channel mode and specify the port speed. By default, FC interfaces are disabled.

S4148U-ON

On a S4148U-ON switch, FC interfaces are available in all port groups. The activated FC interfaces depend on the currently configured port profile. For more information, see S4148U-ON port profiles.

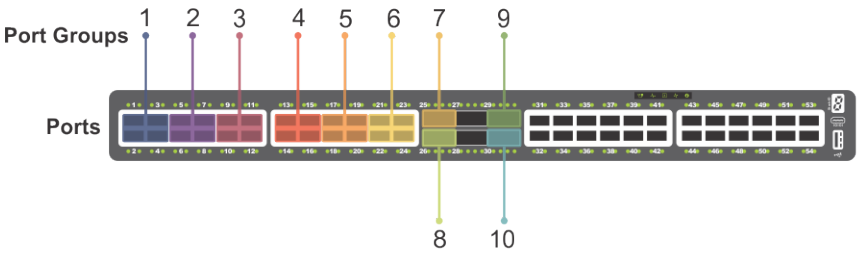

Figure 3. S4148U-ON unified port groups

1. Configure a unified port group in CONFIGURATION mode. Enter `1/1` for *node/slot*. The port-group range depends on the switch.

   ```
   port-group node/slot/port-group
   ```

2. Activate the unified port group for FC operation in PORT-GROUP mode. The available FC modes depend on the switch.

   ```
   mode fc {32g-4x | 32g-2x | 32g-1x | 16g-4x | 16g-2x | 8g-4x}
   ```

   - `8g-4x` — Split a unified port group into four 8 GFC interfaces.
   - `16g-2x` — Split a unified port group into two 16 GFC interfaces.
   - `16g-4x` — Split a unified port group into four 16 GFC interfaces.
   - `32g-1x` — Split a unified port group into one 32 GFC interface. A 1x-32G interface has a rate limit of 28G.
   - `32g-2x` — Split a unified port group into two 32 GFC interfaces.
   - `32g-4x` — Split a unified port group into four 32 GFC interfaces. Each 4x-32GE breakout interface has a rate limit of 25G.

3. Return to CONFIGURATION mode.

   ```
   exit
   ```

4. Enter FC Interface mode to enable data transmission. Enter a single interface, a hyphen-separated range, or multiple interfaces separated by commas.

   ```
   interface fibrechannel node/slot/port[:subport]
   ```

5. (Optional) Reconfigure the interface speed in INTERFACE mode.

   ```
   speed {8 | 16 | 32 | auto}
   ```

6. Apply vfabric configuration on the interface. For more information about vfabric configuration, see Virtual fabric.

```
vfabric fabric-ID
```

7. Enable the FC interface in INTERFACE mode.

```
no shutdown
```

Configure FC interface

```
OS10(config)# port-group 1/1/15
OS10(conf-pg-1/1/15)# mode FC 16g-4x
OS10(conf-pg-1/1/15)# exit
OS10(config)# interface fibrechannel 1/1/43:1
OS10(conf-if-fc-1/1/43:1)# speed 32
OS10(conf-if-fc-1/1/43:1)# no shutdown
```

View FC interface

```
OS10(config)# interface fibrechannel 1/1/43:1
OS10(conf-if-fc-1/1/43:1)# show configuration
!
interface fibrechannel1/1/43:1
 no shutdown
 speed 32
 vfabric 100
```

```
OS10# show interface fibrechannel 1/1/43:1
Fibrechannel 1/1/43:1 is up, FC link is up
Address is 14:18:77:20:8d:fc, Current address is 14:18:77:20:8d:fc
Pluggable media present, QSFP+ type is QSFP+ 4x(16GBASE FC SW)

     Output 78 bytes/sec, 1 frames/sec, 0% of line rate
Time since last interface status change: 00:00:24
```

Configuring wavelength

You can configure optical transmission wavelength values for SPF+ optics. This configuration enables you to fine tune the laser wavelengths and frequencies up to two decimal places in the nanometer scale.

To configure and view optical transmission wavelength when SPF+ optics are plugged into an interface:

1. In interface configuration mode, enter the following command:

```
wavelength wavelength-value
```

NOTE: The supported wavelength range is from 1528.38 nm to 1568.77 nm.

```
OS10(conf-if-eth1/1/14)# wavelength 1530.00
```

2. View the optical transmission values that you configured using the following command:
   `show interface phy-eth [interface] [transceiver]`

```
 OS10# show interface phy-eth 1/1/14 transceiver | grep "Tunable wavelength"
SFP1/1/14 Tunable wavelength= 1530.000nm
```

NOTE: To specify the wavelength value, you must enter exactly six digits - four before and two after the decimal point. The value must conform to the following format: ABCD.EF; for example, 1545.23. Any number that does not conform to this format is rejected including whole numbers such as 1568. However, the following type of values are accepted: 1568.00.

Management interface

The Management interface provides OOB management access to the network device. You can configure the Management interface, but the configuration options on this interface are limited. You cannot configure gateway addresses and IP addresses if it appears in the main routing table. Proxy ARP is not supported on this interface.

1. Configure the Management interface in CONFIGURATION mode.

```
interface mgmt 1/1/1
```

2. By default, DHCP client is enabled on the Management interface. Disable the DHCP client operations in INTERFACE mode.

```
no ip address dhcp
```

3. Configure an IP address and mask on the Management interface in INTERFACE mode.

```
ip address A.B.C.D/prefix-length
```

4. Enable the Management interface in INTERFACE mode.

```
no shutdown
```

Configure management interface

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# no ip address dhcp
OS10(conf-if-ma-1/1/1)# ip address 10.1.1.10/24
OS10(conf-if-ma-1/1/1)# no shutdown
```

Management interface

For management connectivity, use the management VLAN. VLAN 4020 is the default management VLAN and is enabled by default. The mgmt1/1/1 port is part of VLAN 4020.

You cannot configure gateway addresses, IP addresses, and proxy ARPs on the management interface.

VLAN interfaces

VLANs are logical interfaces and are, by default, in L2 mode. Physical interfaces and port-channels can be members of VLANs.

OS10 supports inter-VLAN routing. You can add IP addresses to VLANs and use them in routing protocols in the same manner that physical interfaces are used.

When using VLANs in a routing protocol, you must configure the `no shutdown` command to enable the VLAN for routing traffic. In VLANs, the `shutdown` command prevents L3 traffic from passing through the interface. L2 traffic is unaffected by this command.

- Configure an IP address in A.B.C.D/x format on the interface in INTERFACE mode. The secondary IP address is the interface's backup IP address.

```
ip address ip-address/mask [secondary]
```

Configure VLAN

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# ip address 1.1.1.2/24
```

You cannot simultaneously use egress rate shaping and ingress rate policing on the same VLAN.

User-configured default VLAN

By default, VLAN1 serves as the default VLAN for switching untagged L2 traffic on OS10 ports in Trunk or Access mode. The default VLAN is used for untagged protocol traffic sent and received between switches, such as STPs. If you use VLAN1 for data traffic for network-specific needs, reconfigure the VLAN ID of the default VLAN.

- Assign a new VLAN ID to the default VLAN in CONFIGURATION mode, from 1 to 4093.

```
default vlan-id vlan-id
```

In the `show vlan` output, an asterisk (*) indicates the default VLAN.

Reconfigure default VLAN

```
OS10# show vlan
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
*   1      up                                       A
Eth1/1/1-1/1/25,1/1/29,1/1/31-1/1/54

OS10(config)# interface vlan 10
Sep 19 17:28:10 OS10 dn_ifm[932]: Node.1-Unit.1:PRI:notice [os10:notify],
%Dell EMC (OS10) %IFM_ASTATE_UP: Interface admin state up :vlan10
OS10(conf-if-vl-10)# exit

OS10(config)# default vlan-id 10
Sep 19 17:28:15 OS10 dn_ifm[932]: Node.1-Unit.1:PRI:notice [os10:trap], %Dell EMC (OS10)
%IFM_OSTATE_DN: Interface operational state is down :vlan1
Sep 19 17:28:16 OS10 dn_ifm[932]: Node.1-Unit.1:PRI:notice [os10:trap], %Dell EMC (OS10)
%IFM_OSTATE_UP: Interface operational state is up :vlan10

OS10(config)# do show vlan
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
    1      down
*   10     up                                       A
Eth1/1/1-1/1/25,1/1/29,1/1/31-1/1/54
```

VLAN scale profile

When you scale the number of VLANs on a switch, use the VLAN scale profile. VLAN scale profile consumes less memory. Enable the scale profile before you configure VLANs on the switch. The scale profile globally applies L2 mode on all VLANs you create and disables L3 transmission. To enable L3 routing traffic on a VLAN, use the `mode L3` command.

NOTE: With VLAN scale profile configuration, Layer 3 VLANs, and FCoE VLANs require `mode L3` configuration.

1. Configure the L2 VLAN scale profile in CONFIGURATION mode.

```
scale-profile vlan
```

2. (Optional) Enable L3 routing on a VLAN in INTERFACE VLAN mode.

```
mode L3
```

After you configure the VLAN scale profile and enable L3 routing on the respective VLANs, save the configuration and reload the switch for the scale profile settings to take effect. To reload the switch, use `reload` command.

Apply VLAN scale profile

```
OS10(config)# scale-profile vlan
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# mode L3
OS10(conf-if-vl-10)# end
OS10# write memory
OS10(config)# reload
```

Dell Technologies recommends the following sequence when configuring scale profile VLANs:

1. Enable the scale profile VLANs using `scale-profile vlan` command.
2. Disable IGMP and MLDP.

   For more information about disabling IGMP and MLD, see Internet Group Management Protocol and Multicast Listener Discovery Protocol.

3. Configure the Spanning-Tree mode to RSTP.
4. Configure the VLANs.
5. Enter Ethernet Interface mode and add the VLANs to the interface.

   NOTE: Do not use `interface range` command to enter Ethernet Interface mode.

From OS10.5.2.3 onwards, the total number of Port VLAN (PV) combinations that are supported on PowerSwitches in Full Switch mode are listed as follows:

Table 29. Support VLAN values

Platform	With VLAN scale profile configured	Without VLAN scale configuration
S4100-ON Series	40000 PV	10000 PV
S5200-ON Series	60000 PV	30000 PV
S5448F-ON	60000 PV	30000 PV

This number is calculated based on the total number of VLANs provisioned on the switch and the number of active ports, including VLTi and port channels.

Loopback interfaces

A Loopback interface is a virtual interface where the software emulates an interface. Because a Loopback interface is not associated to physical hardware entities, the Loopback interface status is not affected by hardware status changes.

Packets routed to a Loopback interface process locally to the OS10 device. Because this interface is not a physical interface, to provide protocol stability you can configure routing protocols on this interface. You can place Loopback interfaces in default L3 mode.

- Enter the Loopback interface number in CONFIGURATION mode, from 0 to 16383.

```
interface loopback number
```

- Enter the Loopback interface number to view the configuration in EXEC mode.

```
show interface loopback number
```

- Enter the Loopback interface number to delete a Loopback interface in CONFIGURATION mode.

```
no interface loopback number
```

View Loopback interface

```
OS10# show interface loopback 4
Loopback 4 is up, line protocol is up
Hardware is unknown.
Interface index is 102863300
Internet address is 120.120.120.120/24
Mode of IPv4 Address Assignment : MANUAL
MTU 1532 bytes
Flowcontrol rx false tx false
ARP type: ARPA, ARP Timeout: 240
Last clearing of "show interface" counters : 00:00:11
Queuing strategy : fifo
    Input 0 packets, 0 bytes, 0 multicast
    Received 0 errors, 0 discarded
    Output 0 packets, 0 bytes, 0 multicast
    Output 0 errors, Output 0 invalid protocol
Time since last interface status change : 00:00:11
```

Port-channel interfaces

Port-channels are not configured by default. Link aggregation (LA) is a method of grouping multiple physical interfaces into a single logical interface — a port-channel. A port-channel aggregates the bandwidth of member links, provides redundancy, and load balances traffic. If a member port fails, the OS10 device redirects traffic to the remaining ports.

A physical interface can belong to only one port-channel at a time. A port-channel must contain interfaces of the same interface type and speed. OS10 supports a maximum of 128 port-channels, with up to thirty-two ports per channel.

To configure a port-channel, use the same configuration commands as the Ethernet port interfaces. Port-channels are transparent to network configurations and manage as a single interface. For example, configure one IP address for the group, and use the IP address for all routed traffic on the port-channel.

By configuring port channels, you can create larger capacity interfaces by aggregating a group of lower-speed links. For example, you can build a 40G interface by aggregating four 10G Ethernet interfaces together. If one of the four interfaces fails, traffic redistributes across the three remaining interfaces.

Static	Port-channels are statically configured.
Dynamic	Port-channels are dynamically configured using Link Aggregation Control Protocol (LACP).

Member ports of a port-channel are added and programmed into the hardware based on the port ID, instead of the order the ports come up. Load balancing yields predictable results across resets and reloads.

Create port-channel

You can create a maximum of 128 port-channels, with up to 32 port members per group. Configure a port-channel similarly to a physical interface, enable or configure protocols, or ACLs to a port channel. After you enable the port-channel, place it in L2 or L3 mode.

To place the port-channel in L2 mode or configure an IP address to place the port-channel in L3 mode, use the `switchport` command.

- Create a port-channel in CONFIGURATION mode.

```
interface port-channel id-number
```

Create port-channel

```
OS10(config)# interface port-channel 10
```

Add port member

When you add an interface to a port-channel:

- The administrative status applies to the port-channel.
- The port-channel configuration is applied to the member interfaces.
- A port-channel operates in either L2 (default) or L3 mode. To place a port-channel in L2 mode, use the `switchport mode` command. To place a port-channel in L3 mode and remove L2 configuration before you configure an IP address, use the `no switchport` command.
- All interfaces must have the same speed.
- An interface must not contain non-default L2/L3 configuration settings. Only the `description` and `shutdown` or `no shutdown`commands are supported. You cannot add an IP address or static MAC address to a member interface.
- You cannot enable flow control on a port-channel interface. Flow control is supported on physical interfaces that are port-channel members.
- Port-channels support 802.3ad LACP. LACP identifies similarly configured links and dynamically groups ports into a logical channel. LACP activates the maximum number of compatible ports that the switch supports in a port-channel.
- If you globally disable a spanning-tree operation, L2 interfaces that are LACP-enabled port-channel members may flap due to packet loops.

Add port member — static port-channel

A static port-channel contains member interfaces that you manually assign using the `channel-group mode on` command.

```
OS10(config)# interface port-channel 10
Aug 24 4:5:38: %Node.1-Unit.1:PRI:OS10 %dn_ifm
%log-notice:IFM_ASTATE_UP: Interface admin state up.:port-channel10
Aug 24 4:5:38: %Node.1-Unit.1:PRI:OS10 %dn_ifm
%log-notice:IFM_OSTATE_DN: Interface operational state is down.:port-channel10
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# channel-group 10 mode on
Aug 24 4:5:56: %Node.1-Unit.1:PRI:OS10 %dn_ifm
%log-notice:IFM_OSTATE_UP: Interface operational state is up.:port-channel10
```

Add port member — dynamic LACP

LACP enables ports to dynamically bundle as members of a port-channel. To configure a port for LACP operation, use the `channel-group mode {active|passive}` command. Active and Passive modes allow LACP to negotiate between ports to determine if they can form a port channel based on their configuration settings.

```
OS10(config)# interface port-channel 100
OS10(conf-if-po-100)# exit

OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# channel-group 100 mode active
```

Minimum links

Configure minimum links in a port-channel that must be in *oper up* status to consider the port-channel to be in *oper up* status.

NOTE:

If the minimum links criteria that you have configured is not met, the port channel operationally goes down only in the device in which you have configured the minimum links and not on the device at the other side of the port channel.

For the port channel to go down operationally on both sides when the minimum links criteria is not met, you must configure minimum links on both sides of the port-channel.

Enter the number of links in a port-channel that must be in *oper up* status in PORT-CHANNEL mode, from 1 to 32, default 1.

```
minimum-links number
```

Configure minimum operationally up links

```
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# minimum-links 5
```

Assign Port Channel IP Address

You can assign an IP address to a port channel and use port channels in L3 routing protocols.

- Configure an IP address and mask on the interface in INTERFACE PORT-CHANNEL mode.

  `ip address` *`ip-address/mask`* `[`*`secondary-ip-address`*`]`

  - *`ip-address/mask`* — Specify an IP address in dotted-decimal A.B.C.D format and the mask.
  - *`secondary-ip-address`* — Specify a secondary IP address in dotted-decimal A.B.C.D format, which acts as the interface's backup IP address.

Assign Port Channel IP Address

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# ip address 1.1.1.1/24
OS10(conf-if-po-1)#
```

Remove or disable port-channel

You can delete or disable a port-channel.

1. Delete a port-channel in CONFIGURATION mode.

   ```
   no interface port-channel channel-number
   ```

2. Disable a port-channel to place all interfaces within the port-channel operationally down in CONFIGURATION mode.

   ```
   shutdown
   ```

Delete port-channel

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# no interface port-channel 10
```

Load balance traffic

Use hashing to load balance traffic across member interfaces of a port-channel. Load balancing uses source and destination packet information to distribute traffic over multiple interfaces when transferring data to a destination.

For packets without an L3 header, OS10 automatically uses the `load-balancing mac—selection destination-mac` command for hash algorithms by default.

When you configure an IP and MAC hashing scheme at the same time, the MAC hashing scheme takes precedence over the IP hashing scheme.

- Select one or more methods of load balancing and replace the default IP 4-tuple method of balancing traffic over a port-channel in CONFIGURATION mode.

  ```
  OS10(config)# load-balancing
    ingress-port        Ingress port configurations
    tcp-udp-selection   TCP-UDP port for load-balancing configurations
    ip-selection        IPV4 load-balancing configurations
    ipv6-selection      IPV6 load-balancing configurations
    mac-selection       MAC load-balancing configurations
  ```

  - `ingress-port [enable]` — Enables the ingress port configuration.

- `tcp-upd-selection [l4-destination-port | l4-source-port]` — Uses the Layer 4 destination port or Layer 4 source port in the hash calculation.
- `ip-selection [destination-ip | source-ip | protocol | vlan-id | l4-destination-port | l4-source-port]` — Uses the destination IP address, source IP address, protocol, VLAN ID, Layer 4 destination port or Layer 4 source port in the hash calculation.
- `ipv6-selection [destination-ip | source-ip | protocol | vlan-id | l4-destination-port | l4-source-port]` — Uses the destination IPv6 address, source IPv6 address, protocol, VLAN ID, Layer 4 port or Layer 4 source port in the hash calculation.
- `mac—selection [destination-mac | source-mac] [ethertype | vlan-id]` — Uses the destination MAC address or source MAC address, and ethertype, or VLAN ID in the hash calculation.

Configure load balancing

```
OS10(config)# load-balancing ip-selection destination-ip source-ip
```

Change hash algorithm

The `load-balancing` command selects the hash criteria applied to traffic load balancing on port-channels. If you do not obtain even traffic distribution, use the `hash-algorithm` command to select the hash scheme for port channel. Rotate or shift the L2-bit port channel hash until you achieve the desired traffic distribution.

- Change the default (`0`) to another algorithm and apply it to port channel hashing in CONFIGURATION mode.

```
hash-algorithm lag  {crc | xor | random}
```

Change hash algorithm

```
OS10(config)# hash-algorithm lag crc
```

Configure interface ranges

Bulk interface configuration allows you to apply the same configuration to multiple physical or logical interfaces, or to display their current configuration. An interface range is a set of interfaces that you apply the same command to.

You can use interface ranges for:

- Ethernet physical interfaces
- Port channels
- VLAN interfaces

A bulk configuration includes any non-existing interfaces in an interface range from the configuration.

You can configure a default VLAN only if the interface range being configured consists of only VLAN ports. When a configuration in one of the VLAN ports fails, all the VLAN ports in the interface range are affected.

Create an interface range allowing other commands to be applied to that interface range using the `interface range` command.

Configure range of Ethernet addresses and enable them

```
OS10(config)# interface range ethernet 1/1/1-1/1/5
OS10(conf-range-eth1/1/1-1/1/5)# no shutdown
```

View the configuration

```
OS10(conf-range-eth1/1/1-1/1/5)# show configuration
!
interface ethernet1/1/1
 no shutdown
 switchport access vlan 1
!
interface ethernet1/1/2
 no shutdown
 switchport access vlan 1
```

```
!
interface ethernet1/1/3
 no shutdown
 switchport access vlan 1
!
interface ethernet1/1/4
 no shutdown
 switchport access vlan 1
!
interface ethernet1/1/5
 no shutdown
 switchport access vlan 1
```

Configure range of VLANs

```
OS10(config)# interface range vlan 1-100
OS10(conf-range-vl-1-100)#
```

Configure range of port channels

```
OS10(config)# interface range port-channel 1-25
OS10(conf-range-po-1-25)#
```

Support for north-bound external interfaces

Use this feature to enable or disable Layer 2-host Wide mode or Narrow mode on a S5448F-ON or Z9432F-ON switch.

Configurations apply only to the layer on which they are first configured each time the switch re-boots.

Enable or disable configurations are persistently saved across numerous reloads.

You can configure the MAC address table or the Layer 2 host table using the following two modes:

- Wide mode (extended mode)
- Narrow mode (default mode)

The maximum Layer 2 hosts that you can configure varies between the two modes. In Narrow mode the maximum number of configurable Layer 2 hosts is twice that of the Wide mode.

Layer 2 forwarding based on traditional VLANs (with the VLAN-ID range from 1 to 4093) or virtual networks operating in EVPN mode, can function in both Wide and Narrow modes.

However, for Layer 2 forwarding on virtual networks operating in non-EVPN mode (for example, static VXLAN), you must explicitly configure Wide mode on the Layer 2 host table.

You must save the Layer 2 Wide and Narrow mode configuration. The saved configuration is reflected after the system reloads.

Restrictions and Limitations

North-bound external interface restrictions and limitations:

- You must reboot the system to apply Wide mode configuration changes.
- You cannot configure non-EVPN mode (Static VXLAN) in Narrow mode.
- You cannot disable Wide mode when Static VXLAN is configured.

SFP56-DD port-groups

On the SFP56-DD port-groups, you can configure breakout modes such that the overall number of ports that can be assigned is limited to 32.

The following table lists the SFP56-DD port-group breakout modes:

Table 30. SFP56-DD port-group breakout

Port-groups	Port	Default profile	Restricted profile	Description
1/1/3-1/1/8	Odd port member	100g-1x 50g-1x 25g-1x 10g-1x	100g-1x 50g-2x 50g-1x 25g-2x 25g-1x 10g-2x 10g-1x	2x-? breakout mode is available on the odd-numbered port members in a special breakout profile; where, the even-numbered port member is disabled.
	Even port member	100g-1x 50g-1x 25g-1x 10g-1x	Disabled	

QSFP56-DD port-groups

On the QSFP56-DD port-groups, you can configure breakout modes such that the overall number of ports that can be assigned is 40.

Three different types of Restricted profiles exist for configuring breakout modes on the QSFP56-DD ports and SFP56-DD port members.

The following table lists the QFP56-DD port-group breakout modes:

Table 31. QSFP56-DD port-group breakout

Port-groups	Port	Default profile	Restricted-QSFP-2x	Restricted-QSFP-8x	Restricted-SFP-2x	Description
1/1/1, 1/1/2, 1/1/19, and 1/1/20	QSFP DD Odd port member	400g-1x 200g-2x 200g-1x 100g-4x 100g-2x 100g-1x 50g-2x 40g-2x 40g-1x 25g-4x 25g-2x 10g-4x 10g-2x	400g-1x 200g-2x 200g-1x 100g-2x 100g-1x 50g-2x 50g-1x 40g-2x 40g-1x 25g-2x 10g-2x	400g-1x 200g-1x 100g-1x 50g-8x 50g-1x 40g-1x 25g-8x 10g-8x	400g-1x 200g-1x 100g-1x 50g-1x 40g-1x	• The default profile allows you to configure the 4x-? and 2x-? breakout modes on the QSFP56-DD port members. • The Restricted-QSFP-2x profile allows you to configure the QSFP56-DD port members in the 2x-? breakout mode. Simultaneously, this profile allows you to configure the SFP56-DD odd port members in the 50g-2x breakout mode. • The Restricted-QSPF-8x profile allows you to configure the 8x-? breakout mode on the odd- numbered QSFP56-DD port members. • The Restricted-SFP-2x profile allows you to configure the 2x-? breakout mode on all the SFP56-DD port members while utilizing the QSFP56-DD uplinks in 1x-? breakout mode. • Switching the breakout profile initializes the port members in the default mode for the
	QSFP DD Even port members	400g-1x 200g-2x 200g-1x 100g-2x 100g-1x	400g-1x 200g-2x 200g-1x 100g-2x 100g-1x	400g-1x 200g-2x 200g-1x 100g-2x 100g-1x	400g-1x 200g-1x 100g-1x 50g-1x	

Table 31. QSFP56-DD port-group breakout (continued)

Port-groups	Port	Default profile	Restricted-QSFP-2x	Restricted-QSFP-8x	Restricted-SFP-2x	Description
		50g-2x 50g-1x 40g-2x 40g-1x 25g-2x 10g-2x	50g-2x 50g-1x 40g-2x 40g-1x 25g-2x 10g-2x	50g-2x 50g-1x 40g-2x 40g-1x 25g-2x 10g-2x	40g-1x	profiles such as 400g-1x for the QSFP56-DD ports and 100g-1x (or Disabled) for the SFP56-DD ports.
	SFD DD Odd port members	100g-1x 50g-1x 25g-1x 10g-1x	100g-1x 50g-2x 50g-1x 25g-2x 25g-1x 10g-2x 10g-1x	Disabled	100g-1x 50g-2x 50g-1x 25g-2x 25g-1x 10g-2x 10g-1x	
	SFD DD Even port members	100g-1x 50g-1x 25g-1x 10g-1x	100g-1x 50g-1x 25g-1x 10g-1x	Disabled	100g-1x 50g-2x 50g-1x 25g-2x 25g-1x 10g-2x 10g-1x	

Breakout configuration matrix

The following table captures the support matric corresponding to the breakout configurations:

Table 32. Breakout configuration matrix

Speed	Configuration	Yes or No	Description
100G	48x100G (PAM4) + 8x400G (PAM4)	Yes	
	48x100G (PAM4) + 8x400G (PAM4)	Yes	
	48x100G (PAM4) + 16x100G (NRZ)	Yes	
50G	48x50G (PAM4) + 8x400G (PAM4)	Yes	
	64x50G (PAM4) + 8x400G (PAM4)	Yes	You must configure the QSFP56-DD port-groups in Restricted-SFP-2x profile.
	72x50G (PAM4)	Yes	
	56x50G (PAM4) + 16x100G(NRZ)	Yes	You must configure the QSFP56-DD port-groups in Restricted-QSFP-2x profile.

Table 32. Breakout configuration matrix (continued)

Speed	Configuration	Yes or No	Description
	64x50G (PAM4) + 8x100G(NRZ)	Yes	
	48x50G (PAM4) + 16x100G (NRZ)	Yes	
	48x50G (PAM4) + 8x100G(NRZ)	Yes	
25G	48x25G (NRZ) + 8x400G (PAM4)	Yes	
	64x25G (NRZ) + 8x400G (PAM4)	Yes	
	72x25G (NRZ)	Yes	
	48x25G (NRZ) + 16x100G(NRZ)	Yes	
	48x25G (NRZ) + 8x100G (NRZ)	Yes	
	56x25G (NRZ) + 16x100G(NRZ)	Yes	
	64x25G (NRZ) + 8x100G(NRZ)	Yes	
10G	48x10G (NRZ) + 8x400G (PAM4)	Yes	
	64x10G (NRZ) + 8x400G (PAM4)	Yes	
	48x10G(NRZ) + 8x100G (NRZ)	Yes	
	72x10G (NRZ)	Yes	
	48x10G (NRZ) + 8x40G (NRZ)	Yes	
	48x10G (NRZ) + 16x40G (NRZ)	Yes	

Switch-port profiles

A port profile determines the enabled front-panel ports and supported breakout modes on Ethernet and unified ports. Change the port profile on a switch to customize uplink and unified port operation, and the availability of front-panel data ports.

To change the port profile at the next reboot, use the `switch-port-profile` command with the desired profile, save it to the startup configuration, and use the `reload` command to apply the changes.

1. Configure a platform-specific port profile in CONFIGURATION mode. For a standalone switch, enter `1/1` for `node/unit`.

```
switch-port-profile node/unit profile
```

2. Save the port profile change to the startup configuration in EXEC mode.

```
write memory
```

3. Reload the switch in EXEC mode.

```
reload
```

The switch reboots with the new port configuration and resets the system defaults, except for the switch-port profile and these configured settings:

- Management interface 1/1/1 configuration
- Management IPv4/IPv6 static routes
- System hostname
- Unified Forwarding Table (UFT) mode
- ECMP maximum paths

You must manually reconfigure other settings on a switch after you apply a new port profile and reload the switch.

NOTE: After you change the switch-port profile, do not immediately back up and restore the startup file without using the `write memory` command and reloading the switch using the `reload` command. Otherwise, the new profile does not take effect.

NOTE: When you upgrade or reinstall SmartFabric OS10 through the ONIE Rescue mode or using the backup and restore method, and if switch port profiles are used and switch port profile configuration is present in the `startup.xml` file, perform the following steps:

1. Once the switch comes up in the ONIE mode, apply the switch port profiles, run the `write memory` command, and then reload the switch.
2. If the backup of `startup.xml` file is available, restore the backup configuration and then reload the switch.

Configure port profile

```
OS10(config)# switch-port-profile 1/1 profile-6
OS10(config)# exit
OS10# write memory
OS10# reload
```

Verify port profile

```
OS10(config)# show switch-port-profile 1/1

|  Node/Unit   |  Current     |  Next-boot   | Default    |
|--------------+--------------------+--------------------|
|     1/1      |  profile-2   |  profile-2   | profile-1  |

Supported Profiles:
profile-1
profile-2
profile-3
profile-4
profile-5
profile-6
```

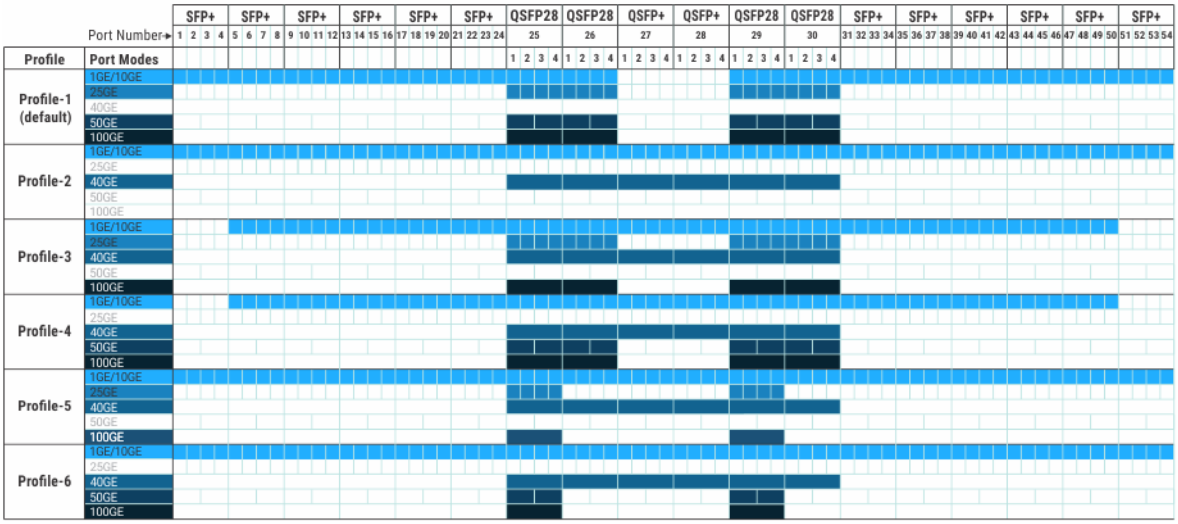
S4148-ON Series port profiles

On the S4148-ON Series of switches, port profiles determine the available front-panel Ethernet ports and supported breakout interfaces on uplink ports. In the port profile illustration, blue boxes indicate the supported ports and breakout interfaces. Blank spaces indicate ports and speeds that are not available.

- 10GE mode is an SFP+ 10GE port or a 4x10G breakout of a QSFP+ or QSFP28 port.
- 25GE is a 4x25G breakout of a QSFP28 port.
- 40GE mode is a QSFP+ port or a QSFP28 port that supports QSFP+ 40GE transceivers.
- 50GE is a 2x50G breakout of a QSFP28 port.
- 100GE mode is a QSFP28 port.

NOTE: For S4148U-ON port profiles with both unified and Ethernet ports, see S4148U-ON port profiles. An S4148U-ON unified port supports Fibre Channel and Ethernet modes.

For example, `profile-1` enables 10G speed on forty-eight ports (1-24 and 31-54), and 4x10G breakouts on QSFP28 ports 25-26 and 29-30; QSFP+ ports 27 and 28 are deactivated. `profile-3` enables 10G speed on forty ports, and 4x10G breakouts on all QSFP28 and QSFP+ ports. Similarly, `profile-1` disables 40G speed on ports 25-30; `profile-3` enables 40G on these ports. For more information, see switch-port-profile.



1GE mode: 1GE is supported only on SFP+ ports; 1GE is not supported on QSFP+ and QSFP28 ports 25-26.

Breakout interfaces: Use the `interface breakout` command in Configuration mode to configure 4x10G, 4x25G, and 2x50G breakout interfaces.

To view the ports that belong to each port group, use the `show port-group` command.

S4148U-ON port profiles

S4148U-ON port profiles determine the available front-panel unified and Ethernet ports and supported breakout interfaces. In the port profile illustration, blue boxes indicate the supported Ethernet port modes and breakout interfaces. Brown boxes indicate the supported Fibre Channel port modes and breakout interfaces. Blank spaces indicate ports and speeds that are not available. Unified port groups are numbered 1 to 10.

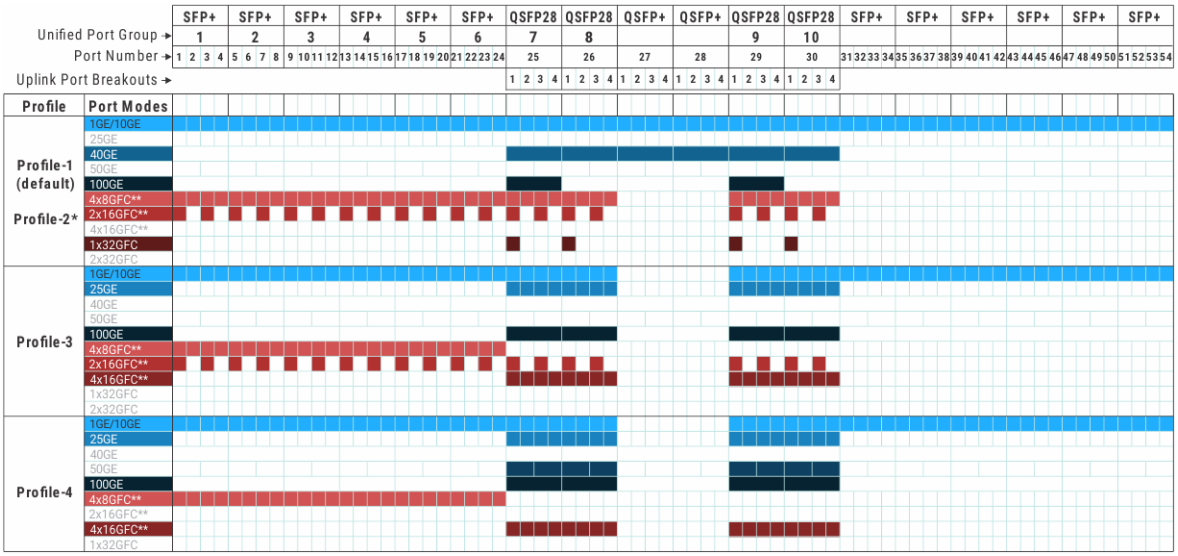
S4148U-ON unified port modes—SFP+ ports 1-24 and QSFP28 ports 25-26 and 29-30:

- 10GE is an SFP+ port in Ethernet mode or a 4x10G breakout of a QSFP+ or QSFP28 port in Ethernet mode.
- 25GE is a 4x25G breakout of a QSFP28 Ethernet port.
- 40GE is a QSFP+ or QSFP28 Ethernet port that uses QSFP+ 40GE transceivers.
- 50GE is a 2x50G breakout of a QSFP28 Ethernet port.
- 100GE is a QSFP28 Ethernet port.
- 4x8GFC are breakout interfaces in an SFP+ or QSFP28 FC port group.
- 2x16GFC are breakout interfaces (subports 1 and 3) in an SFP+ or QSFP28 FC port group.
- 4x16GFC are breakout interfaces in a QSFP28 FC port group.
- 1x32GFC (subport 1) are breakout interfaces in a QSFP28 FC port group.

S4148U-ON Ethernet modes—QSFP+ ports 27-28 and SFP+ ports 31-54:

- 10GE mode is an SFP+ 10GE port or a 4x10G breakout of a QSFP+ port.
- 40GE mode is a QSFP+ port.

For example, all S4148U-ON activate support 10G speed on unified ports 1-24 and Ethernet ports 31-54, but only `profile-1` and `profile-2` activate QSFP+ ports 27-28 in 40GE mode with 4x10G breakouts. Similarly, all S4148U-ON profiles activate 8GFC speed on unified ports 1-24, but only `profile-1`, `profile-2`, and `profile-3` activate 2x16GFC in port groups 1-6. In QSFP28 port groups, `profile-1` and `profile-2` support 1x32GFC; `profile-3` and `profile-4` support 4x16GFC.



*`profile-1` and `profile-2` activate the same port mode capability on unified and Ethernet ports. The difference is that in `profile-1`, by default SFP+ unified ports 1-24 come up in Fibre Channel mode with 2x16GFC breakouts per port group. In `profile-2`, by default SFP+ unified ports 1-24 come up in Ethernet 10GE mode. `profile-1` allows you to connect FC devices for plug-and-play; `profile-2` is designed for a standard Ethernet-based data network.

****Oversubscription**: Configure oversubscription to support bursty storage traffic on a Fibre Channel interface. Oversubscription allows a port to operate faster, but may result in traffic loss. To support oversubscription, use the `speed` command in Interface Configuration mode. This command is not supported on an Ethernet interface. In S4148U-ON port profiles:

- SFP+ and QSFP28 port groups in 4x8GFC mode support 16GFC oversubscription on member interfaces.
- QSFP28 ports in 2x16GFC mode support 32GFC oversubscription. SFP+ port groups in 2x16GFC mode do not support 32GFC oversubscription. 2x16GFC mode activates subports 1 and 3.
- QSFP28 ports in 4x16GFC mode support 32GFC oversubscription.

Breakout interfaces:

- To configure breakout interfaces on a unified port, use the `mode {FC | Eth}` command in Port-Group Configuration mode. The `mode {FC | Eth}` command configures a unified port to operate at line rate and guarantees no traffic loss.
- To configure breakout interfaces on a QSFP+ Ethernet port, use the `interface breakout` command in global Configuration mode.

1GE mode: Only SFP+ ports support 1GE; QSFP+ and QSFP28 ports 25 to 30 do not support 1GE.

To view the ports that belong to each port group, use the `show port-group` command.

Configure negotiation modes on interfaces

On OS10, the `auto` negotiation mode is enabled by default.

Configuration notes

- All Dell PowerSwitches:
  - Platforms (Z9100, Z9264F, Z9332F-ON, Z9432F-ON, S5200 Series, S5448F-ON, S4100 Series, and S4200 Series with 25G (SFP28), 100G (SFP56DD, QSFP28), 200G (QSFP28DD), and 400G (QSFP56DD) ports do not support 1G auto negotiation.
  - For 10G and 1G BASE-T ports, you cannot disable auto negotiation for copper Gigabit Ethernet interfaces.
  - If you modify flow control settings on an auto negotiation-enabled port, the port flaps for the changes to take effect.
  - If a DAC (25G, 40G, 50G, 100G, 200G, or 400G) is connected to a switch, auto negotiation is enabled by default.
- Z9332F-ON platform: OS10 supports 25G auto negotiation with third-party 25G NIC devices that comply with the IEEE 802.3by and 25G Ethernet Consortium standards. When you use a third-party NIC device that does not support the 25G Ethernet Consortium standard, to bring up the port:
  - If you have enabled SmartAN technology on the server, disable auto negotiation on the OS10 switch port.
  - Otherwise, disable auto negotiation on both the OS10 switch port and the third-party link partner.

To force negotiation, use the following command:

```
negotiation on
```

To disable negotiation, use the following command:

```
negotiation off
```

To reset the negotiation mode to the default setting of the media you use, use one of the following commands:

```
negotiation auto
```

```
no negotiation
```

The following examples show that the nondefault configuration is added to the running configuration:

```
OS10(conf-if-eth1/1/50)# negotiation off
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 negotiation off
 flowcontrol receive on
OS10(conf-if-eth1/1/50)# negotiation on
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 negotiation on
 flowcontrol receive on
```

The following examples show that the default configuration is not added to the running configuration:

```
OS10(conf-if-eth1/1/50)# negotiation auto
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 flowcontrol receive on
```

The following example shows that the `no negotiation` command resets the interface to the default setting of the media used.

```
OS10(conf-if-eth1/1/50)# no negotiation
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 flowcontrol receive on
OS10(conf-if-eth1/1/50)# do show interface ethernet 1/1/50
Ethernet 1/1/50 is up, line protocol is up
Hardware is Eth, address is e4:f0:04:3e:2d:86
    Current address is e4:f0:04:3e:2d:86
Pluggable media present, QSFP28 type is QSFP28 100GBASE-CR4-2.0M
    Wavelength is 64
    Receive power reading is not available

Interface index is 112
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Disabled
MTU 1532 bytes, IP MTU 1500 bytes
LineSpeed 100G, Auto-Negotiation on
```

Configure breakout mode

Using a supported breakout cable, you can split a 40GE QSFP+ or 100GE QSFP28 Ethernet port into separate breakout interfaces. All breakout interfaces have the same speed. You can set a QSFP28 port to operate in 40GE mode with a QSFP+ transceiver.

```
interface breakout node/slot/port map {10g-4x | 25g-4x | 40g-1x | 50g-2x |
100g-1x}
```

- *node/slot/port* — Enter the physical port information.
- `10g-4x` — Split a QSFP28 or QSFP+ port into four 10G interfaces.
- `25g-4x` — Split a QSFP28 port into four 25G interfaces.
- `40g-1x` — Set a QSFP28 port to use with a QSFP+ 40G transceiver.
- `50g-2x` — Split a QSFP28 port into two 50G interfaces.
- `100g-1x` — Reset a QSFP28 port to 100G speed.

To configure an Ethernet breakout interface, use the `interface ethernet` *node/slot/port:subport* command in CONFIGURATION mode.

Each breakout interface operates at the configured speed. Use the `no` version of the `interface breakout` command to reset a port to its default speed: 40G or 100G.

To configure breakout interfaces on a unified port, use the `mode {Eth | FC}` command in Port-Group Configuration mode.

NOTE:

- You cannot configure the 40G ports 13, 14, 15, 16, 29, 30, 31, and 32 to split into four 10G interfaces on the S6010 platform.
- Depopulated QSFP56 ends of the QSFP56-DD to 4x100G depop-QSFP56 copper DAC breakout cables are not supported on the following:
  - Legacy 100G platforms such as the S5200-ON and S4100-ON series switches
  - 100G QSFP28 ports

Cables and Optics - Supported speeds

The following table lists the cables and optics, and the supported speeds:

Table 33. Supported speeds

Cables and Optics	Supported speeds
100G DAC	100G, 40G, 2x50G, 4x25G, 4x10G
100G Fiber optics	100G, 4x25G (SR4, ESR4, PSM4 can support physical breakout)
40G DAC	40G, 4x10G
40G Fiber optics	40G, 4x10G (SR4, ESR4, PSM4 can support physical breakout)
10G DAC	10G
10G Fiber optics	10G
1G Fiber optics	1G
1G Cu SFP	1G (100M, 10M, or both speeds can be supported in certain switches)
10G Cu SFP+	10G (1G, 100M, or both speeds can be supported in certain switches)
2x100G QSFP28-DD DAC	2x100G, 2x40G, 2x50G, 8x25G, 8x10G, 4x25G, 4x10G
2x100G QSFP28-DD Fiber optics	2x100G, 8x25G, 4x25G
2x40G QSFP-DD Fiber optics	2x40G, 8x10G, 4x10G

Table 33. Supported speeds (continued)

Cables and Optics	Supported speeds
200G/80G QSFP28-DD Fiber optics	2x100G, 2x40G, 8x25G, 8x10G, 4x25G, 4x10G
25G DAC	25G, 10G
25G Fiber optics	25G
4x25G breakout DAC	25G
8x25G breakout DAC	25G
2x50G breakout DAC	50G
400G DAC	400G, 2x200G PAM4, 2x100G NRZ, 2x40G, 4x100G PAM4, 4x50G PAM4, 4x25G, 4x10G, 8x50G PAM4, 8x25G, 8x10G
400G eDR4 to 100G FR	100G PAM4 to 100G NRZ

NOTE: Ensure that you configure the breakout mode based on the supported speeds listed in this table. If you configure an unsupported speed, you might see port flapping issues.

Configure interface breakout

```
OS10(config)# interface breakout 1/1/7 map 10g-4x
```

Display interface breakout

```
OS10# show interface status

--------------------------------------------------------------------
Port       Description  Status Speed Duplex Mode Vlan Tagged-Vlans
--------------------------------------------------------------------
Eth 1/1/1               down   0     auto    -
Eth 1/1/2               down   0     auto    A    1    -
Eth 1/1/7:1             down   0     auto    A    1    -
Eth 1/1/7:2             down   0     auto    A    1    -
Eth 1/1/7:3             down   0     auto    A    1    -
Eth 1/1/7:4             down   0     auto    A    1    -
Eth 1/1/25              down   0     auto    A    1    -
```

NOTE: In order to ascertain that interfaces are operational without any glitches in the network, Dell Technologies recommends you to ensure that media speed matches with the configured port mode or breakout speed.

Breakout Mode Restrictions

On the S5232F-ON switch, port 32 alone cannot be split into 10x4 or 25x4. Supported breakout modes for port 32 are:

- 100G-1x Breakout to 1 100G interface
- 50G-2x Breakout to 2 50G interfaces
- 40G-1x Breakout to 1 40G interface

NOTE: In the S5448F, the 100G depop-QSFP56 DAC breakout cables support 100G (2x50G PAM4) instead of 100G (4x25G NRZ) breakout configuration; also, this configuration is supported only in the QSFP56-DD port with 100g-4x port configuration.

Breakout auto-configuration

You can globally enable front-panel Ethernet ports to automatically detect SFP pluggable media in a QSFP+ or QSFP28 port. The port autoconfigures breakout interfaces for media type and speed. For example, if you plug a 40G direct attach cable (DAC) with 4x10G far-side transceivers into a QSFP28 port, the port autoconfigures in `10g-4x` Interface-breakout mode.

RJ-45 ports and ports that are members of a port group do not support breakout auto-configuration. Breakout auto-configuration is disabled by default.

Enable breakout auto-configuration

```
OS10(config)# feature auto-breakout
```

Display breakout auto-configuration

Before you plug a cable in Ethernet port 1/1/25:

```
OS10# show interface status

--------------------------------------------------------------------
Port       Description  Status Speed Duplex Mode Vlan Tagged-Vlans
--------------------------------------------------------------------
Eth 1/1/1               down   0     auto    -
Eth 1/1/2               down   0     auto    A    1    -
Eth 1/1/25              down   0     auto    A    1    -
Eth 1/1/29              down   0     auto    A    1    -
```

After you enter `feature auto-breakout` and plug a breakout cable in Ethernet port 1/1/25:

```
OS10# show interface status

--------------------------------------------------------------------
Port       Description  Status Speed Duplex Mode Vlan Tagged-Vlans
--------------------------------------------------------------------
Eth 1/1/1               down   0     auto    -
Eth 1/1/2               down   0     auto    A    1    -
Eth 1/1/25:1            down   0     auto    A    1    -
Eth 1/1/25:2            down   0     auto    A    1    -
Eth 1/1/25:3            down   0     auto    A    1    -
Eth 1/1/25:4            down   0     auto    A    1    -
Eth 1/1/29              down   0     auto    A    1    -
```

Reset default configuration

You can clear all configured settings on an Ethernet or Fibre Channel interface and reset the interface to its default settings. By default:

- An Ethernet interface is enabled, using the `no shutdown` command, and assigned to the default VLAN.
- A Fibre Channel interface is disabled, using the`shutdown` command.

Restrictions

The `default interface` command removes all software settings and all L3, VLAN, and port-channel configurations on a port interface. However, the command does not remove configurations to the interface from other software features, such as VLT. If you do not remove these configured settings, the command does not execute. For example, if you configure an Ethernet interface as a discovery interface in a VLT domain and you do not delete this setting, resetting the interface to its default configuration fails:

```
OS10(config)# vlt-domain 10
OS10(conf-vlt-10)# discovery-interface ethernet 1/1/1
OS10(conf-vlt-10)# exit
OS10(config)# default interface ethernet 1/1/1
Proceed to cleanup the interface config? [confirm yes/no]:y
% Error: Discovery Interface mode must not be in switchport mode
```

Configuration

1. From CONFIGURATION mode, enter INTERFACE mode and view the currently configured settings.

   ```
   interface {ethernet | fibrechannel} node/slot/port[:subport]
   show config
   ```

2. Return to CONFIGURATION mode.

   ```
   exit
   ```

3. Reset an interface to its default configuration in CONFIGURATION mode. Enter multiple interfaces in a comma-separated string or a port range using the `default interface range` command.

```
default interface {ethernet | fibrechannel} node/slot/port[:subport]
```

4. Enter INTERFACE mode and verify the factory-default configuration.

```
interface {ethernet | fibrechannel} node/slot/port[:subport]
show config
```

Reset default Ethernet configuration

```
OS10(conf-if-eth1/1/2)# show configuration
!
interface ethernet 1/1/2
no shutdown
no switchport
negotiation on
ip address 1.2.3.4/24

switchport access vlan 1
```

Reset default Fibre Channel configuration

```
OS10# show running-configuration interface fibrechannel 1/1/1
!
interface fibrechannel1/1/1
no shutdown
description fc-port

OS10(conf-if-fc1/1/1)# exit
OS10(config)# default interface fc1/1/1
Proceed to cleanup the interface config? [confirm yes/no]:y
!
OS10(config)# do show running-configuration interface fibrechannel 1/1/1
interface fibrechannel1/1/1
shutdown
```

Forward error correction

Forward error correction (FEC) enhances data reliability.

FEC modes supported in OS10:

- CL74-FC—Supports 25G and 50G
- CL91-RS—Supports 100G
- CL108-RS—Supports 25G and 50G
- CL119-RS — Supports 400G
- off—Disables FEC

FEC modes supported for PAM4 breakout speeds in OS10:

- CL134-RS—Supports 50G PAM4
- CL91-RS544—Supports 100G PAM4
- CL119-RS, CL91-RS544—Supports 100G and 200G PAM4
- CL119-RS—Supports 200G and 400G PAM4

For 25G AOC and SR transceivers, the default FEC mode is CL108-RS. If a peer device does not support CL108-RS, but supports only CL74-FC, the ports do not come up. For the ports to come up, you must manually configure the FEC mode on the OS10 switch to CL74-FC using the `fec` command.

NOTE: OS10 does not support FEC on 10G and 40G.

By default, FEC is enabled in SmartFabric Services mode.

Configure FEC

```
OS10(config)# interface ethernet 1/1/41
OS10(conf-if-eth1/1/41)# fec CL91-RS
```

View FEC configuration

```
OS10# show interface ethernet 1/1/41
Ethernet 1/1/41 is up, line protocol is up
Hardware is Dell EMC Eth, address is e4:f0:04:3e:1a:06
    Current address is e4:f0:04:3e:1a:06
Pluggable media present, QSFP28 type is QSFP28_100GBASE_CR4_2M
    Wavelength is 64
    Receive power reading is
Interface index is 17306108
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Disabled
MTU 1532 bytes, IP MTU 1500 bytes
LineSpeed 100G, Auto-Negotiation on

Energy-efficient Ethernet

Energy-efficient Ethernet (EEE) reduces power consumption of physical layer devices (PHYs) during idle periods. EEE allows Dell Networking devices to conform to green computing standards.

An Ethernet link consumes power when a link is idle. EEE allows Ethernet links to use Regular Power mode only during data transmission. EEE is enabled on devices that support LOW POWER IDLE (LPI) mode. Such devices save power by entering LPI mode during periods when no data is transmitting.

In LPI mode, systems on both ends of the link saves power by shutting down certain services. EEE transitions into and out of LPI mode transparently to upper-layer protocols and applications.

EEE advertises during the auto-negotiation stage. Auto-negotiation detects abilities supported by the device at the other end of the link, determines common abilities, and configures joint operation.

Auto-negotiation performs at power-up, on command from the LAN controller, on detection of a PHY error, or following Ethernet cable re-connection. During the link establishment process, both link partners indicate their EEE capabilities. If EEE is supported by both link partners for the negotiated PHY type, EEE functions independently in either direction.

Changing the EEE configuration resets the interface because the device restarts Layer 1 auto-negotiation. You may want to enable Link Layer Discovery Protocol (LLDP) for devices that require longer wake-up times before they are able to accept data on their receive paths. Doing so enables the device to negotiate extended system wake-up times from the transmitting link partner.

NOTE: The EEE feature is applicable only for Base-T switches.

Enable energy-efficient Ethernet

EEE is disabled by default. To reduce power consumption, enable EEE.

1. Enter the physical Ethernet interface information in CONFIGURATION mode.

```
interface ethernet node/slot/port[:subport]
```

2. Enable EEE in INTERFACE mode.

```
eee
```

Enable EEE

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# eee
```

Disable EEE

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no eee
```

Clear EEE counters

You can clear EEE counters on physical Ethernet interfaces globally or per interface.

Clear all EEE counters

```
OS10# clear counters interface eee
Clear all eee counters [confirm yes/no]:yes
```

Clear counters for specific interface

```
OS10# clear counters interface 1/1/48 eee
Clear eee counters on ethernet1/1/48 [confirm yes/no]:yes
```

View EEE status/statistics

You can view the EEE status or statistics for a specified interface, or all interfaces, using the `show` commands.

View EEE status for a specified interface

```
OS10# show interface ethernet 1/1/48 eee

Port            EEE  Status   Speed    Duplex
-----------------------------------------------
Eth 1/1/48      on   up       1000M
```

View EEE status on all interfaces

```
OS10# show interface eee

Port            EEE  Status   Speed    Duplex
-----------------------------------------------
Eth 1/1/1       off  up       1000M
...
Eth 1/1/47      on   up       1000M
Eth 1/1/48      on   up       1000M
Eth 1/1/49      n/a
Eth 1/1/50      n/a
Eth 1/1/51      n/a
Eth 1/1/52      n/a
```

View EEE statistics for a specified interface

```
OS10# show interface ethernet 1/1/48 eee statistics
Eth 1/1/48
  EEE             : on
  TxIdleTime(us)  : 2560
  TxWakeTime(us)  : 5
  Last Clearing   : 18:45:53
  TxEventCount    : 0
  TxDuration(us)  : 0
  RxEventCount    : 0
  RxDuration(us)  : 0
```

View EEE statistics on all interfaces

```
OS10# show interface eee statistics

Port        EEE  TxEventCount   TxDuration(us)  RxEventCount   RxDuration(us)
-------------------------------------------------------------------------------
Eth 1/1/1   off  0              0               0              0

Eth 1/1/49  n/a
...
Eth 1/1/52  n/a
```

EEE commands

clear counters interface eee

Clears all EEE counters.

Syntax	`clear counters interface eee`
Parameters	None
Default	Not configured

Command Mode	EXEC
Usage Information	None
Example	`OS10# clear counters interface eee` `Clear all eee counters [confirm yes/no]:yes`
Supported Releases	10.3.0E or later

clear counters interface ethernet eee

Clears EEE counters on a specified Ethernet interface.

Syntax	`clear counters interface ethernet` *node/slot/port[:subport]* `eee`
Parameters	`node/slot/port[:subport]`—Enter the interface information.
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	`OS10# clear counters interface 1/1/48 eee` `Clear eee counters on ethernet1/1/48 [confirm yes/no]:yes`
Supported Releases	10.3.0E or later

eee

Enables or disables energy-efficient Ethernet (EEE) on physical ports.

Syntax	`eee`
Parameters	None
Default	Enabled on Base-T devices and disabled on S3048-ON and S4048T-ON switches.
Command Mode	Interface
Usage Information	To disable EEE, use the `no` version of this command.
Example (Enable EEE)	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# eee`
Example (Disable EEE)	`OS10(config)# interface ethernet 1/1/2` `OS10(conf-if-eth1/1/2)# no eee`
Supported Releases	10.3.0E or later

show interface eee

Displays the EEE status for all interfaces.

Syntax	`show interface eee`
Parameters	None

Default Not configured

Command Mode EXEC

Example

```
OS10# show interface eee

Port            EEE  Status   Speed    Duplex
-----------------------------------------------
Eth 1/1/1       off  up       1000M
...
Eth 1/1/47      on   up       1000M
Eth 1/1/48      on   up       1000M
Eth 1/1/49      n/a
Eth 1/1/50      n/a
Eth 1/1/51      n/a
Eth 1/1/52      n/a
```

Supported Releases 10.3.0E or later

show interface eee statistics

Displays EEE statistics for all interfaces.

Syntax `show interface eee statistics`

Parameters None

Default Not configured

Command Mode EXEC

Example

```
OS10# show interface eee statistics

Port        EEE  TxEventCount   TxDuration(us)  RxEventCount   RxDuration(us)
-------------------------------------------------------------------------------
Eth 1/1/1   off  0              0               0              0
...
Eth 1/1/47  on   0              0               0              0
Eth 1/1/48  on   0              0               0              0
Eth 1/1/49  n/a
...
Eth 1/1/52  n/a
```

Supported Releases 10.3.0E or later

show interface ethernet eee

Displays the EEE status for a specified interface.

Syntax `show interface ethernet` *node/slot/port[:subport]* `eee`

Parameters *node/slot/port[:subport]*—Enter the interface information.

Default Not configured

Command Mode EXEC

Example

```
OS10# show interface ethernet 1/1/48 eee

Port            EEE  Status   Speed    Duplex
-----------------------------------------------
Eth 1/1/48      on   up       1000M
```

Supported Releases	10.3.0E or later

show interface ethernet eee statistics

Displays EEE statistics for a specified interface.

Syntax	`show interface ethernet node/slot/port[:subport] eee statistics`
Parameters	*node/slot/port[:subport]*—Enter the interface information.
Default	Not configured
Command Mode	EXEC

Example

```
OS10# show interface ethernet 1/1/48 eee statistics
Eth 1/1/48
  EEE             : on
  TxIdleTime(us)  : 2560
  TxWakeTime(us)  : 5
  Last Clearing   : 18:45:53
  TxEventCount    : 0
  TxDuration(us)  : 0
  RxEventCount    : 0
  RxDuration(us)  : 0
```

Supported Releases	10.3.0E or later

View interface configuration

To view basic interface information, use the `show interface`, `show running-configuration`, and `show interface status` commands. Stop scrolling output from a `show` command by entering CTRL+C. Display information about a physical or virtual interface in EXEC mode, including up/down status, MAC and IP addresses, and input/output traffic counters.

```
show interface [type]
```

- `phy-eth` *node/slot/port[:subport]*—Display information about physical media connected to the interface.
- `status` — Display interface status.
- `ethernet` *node/slot/port[:subport]*—Display Ethernet interface information.
- `loopback` *id*—Display Loopback interface information, from 0 to 16383.
- `mgmt` *node/slot/port*—Display Management interface information.
- `port-channel` *id-number*—Display port-channel interface information, from 1 to 999 or 1001 to 2000.
- `vlan` *vlan-id*—Display the VLAN interface information, from 1 to 4093.

NOTE: On virtual machines (VMs), the `show interface` command may not show the correct interface counter information. Therefore, use the `ifconfig` command to view the interface counter information.

View interface information

```
OS10# show interface
Ethernet 1/1/1 is up, line protocol is down
Hardware is Eth, address is 00:0c:29:66:6b:90
    Current address is 00:0c:29:66:6b:90
Pluggable media present, QSFP+ type is QSFP+ 40GBASE CR4
    Wavelength is 64
    Receive power reading is 0.000000 dBm
Interface index is 15
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Enabled

```

Configuration notes

OS10 allows you to configure interface names with upper case characters, but the interface is not programmed correctly. To ensure proper configuration, always use lower case to configure interface names.

```
OS10(Config)# interface vlan20
OS10(Config)# interface port-channel20
```

Viewing journal logs

This section describes how to view the journal logs.

To view the journal logs on the Linux prompt, enter the following commands:

1. Enter the following command:

   ```
   OS10#system bash
   ```

2. On the Linux prompt, enter the following command:

   ```
   root@OS10:~# journalctl
   ```

To view the whole logs, enter the following command from the Linux prompt:

```
root@OS10:~# journalctl
```

```
-- Logs begin at Tue 2021-05-11 21:06:46 UTC, end at Tue 2021-05-11 21:33:46 UTC

```

High-power optical modules

OS10 supports high-power optical modules on switches with QSFP56-DD ports. This feature helps to prevent the risk of auto power shutdown and service disruptions because of high-power optic usage. Using this feature, you can:

- Monitor the maximum power rating on pluggable optics.
- Disable the optical module, if the maximum power exceeds the threshold permitted on the port.

Table 34. High-power optical modules—Platform profiles

Platform	Optics power rating
Z9332F-ON	Above 12 W
Z9332F-ON with I/O Panel to PSU Airflow mode	Above 5 W

CAUTION: Ensure that you use the high-power optics only on platforms that support them. Deploying high-power optics without following the platform guidelines might lead to service disruption.

Use the OS10 CLI to prevent such service disruptions. OS10 enables or disables high-power optics based on the following:

- Warning threshold—The platform specification defines this value. If you have configured to allow high-power optics, an optic with power rating below this threshold is enabled.
- Alarm threshold—The platform specification defines this value. A high-power optic with power rating above this threshold is disabled.

OS10 checks for the following:

- If you have enabled high-power optics on a port, OS10 checks the alarm threshold value. If the power rating of the optic is less than the alarm threshold value, the system powers up the optic.
- If you have disabled high-power optics on a port, OS10 checks the warning threshold value. If the power rating of the optic is less than the warning threshold, the system powers up the optic.
- If the optic's power rating is higher than both the warning and alarm thresholds, the system disables the optic.

Configuration notes

- Enable or disable high-power optics before or after you insert the pluggable optic.
- Use the `allow high-wattage-optics` command to power on an optic that was disabled earlier using the `no allow high-wattage-optics` command.
- If the interface is in breakout mode, apply this CLI command on the first subinterface.
- Configure this feature on each of the front-panel ports or for a range of ports using the `interface range ethernet` command.
- This feature is enabled by default. You do not have to explicitly configure it. If the switch supports QSFP56-DD ports and the power rating of the high-power optic is less than the alarm threshold, OS10 enables the high-power optic.

To disable high-power optics, enter the following command in INTERFACE CONFIGURATION mode:

```
OS10(conf-if-eth1/1/25:1)# no allow high-wattage-optics
```

To enable an optic that was disabled earlier using the `no allow high-wattage-optics` command, enter the following command in INTERFACE CONFIGURATION mode to enable it:

```
OS10(conf-if-eth1/1/26:1)# allow high-wattage-optics
```

The system triggers an alert in the form of an informational syslog message when a high-power optic is installed on the switch.

When a high-power optic is plugged in and is enabled, a message similar to the following appears:

```
<165>1 2017-04-07T17:05:47.733673+00:00 OS10 dn_alm 839 - - Node.1-Unit.1:PRI [event],
Dell EMC (OS10) %EQM_MEDIA_PRESENT: Media inserted. Media QSFP56-DD 400GBASE-SR4.2 in
slot:1 port:6 serial number:CN04HQ0005VG009 is high-power optics. Check system power
allocation and actively monitor ambient temperatures to avoid service disruption.
```

When a high-power optic is plugged in, but is disabled, a message similar to the following appears in any of the following cases:

- You have previously configured the `no allow high-wattage-optics` command on the interface.
- The power rating of the optical module exceeds the Alarm threshold.

```
<165>1 2017-04-07T17:05:47.733673+00:00 OS10 dn_alm 839 - - Node.1-Unit.1:PRI [event],
Dell EMC (OS10) %EQM_MEDIA_PRESENT: Media inserted. Media QSFP56-DD 400GBASE-SR4.2 in
slot:1 port:6 serial number:CN04HQ0005VG009 is high-power optics and is disabled.
```

The `show inventory media wattage` command displays information about the plugged-in optic.

High-power optical module commands

allow high-wattage-optics

Allows high-power optical modules to be enabled in the physical interfaces.

Syntax	`allow high-wattage-optics`
Parameters	None
Default	Enabled and allowed on all the physical interfaces.

Command Mode	• INTERFACE CONFIGURATION • INTERFACE RANGE ETHERNET CONFIGURATION submode
Usage Information	By default, this command is enabled on all the physical interfaces. Use the `no` version of this command to disable high-power optics on the interface or interfaces. If you disable high-power optics, this configuration is displayed in the `show running-configuration` command output. This command is applicable only for Z9332F-ON and Z9432F-ON platforms. **NOTE:** When the Ethernet interface is in breakout configuration mode, this command is applicable only for the first subinterface.
Security and Access	Not applicable
Example	`OS10(config)# interface ethernet 1/1/2:1` `OS10(conf-if-eth1/1/2:1)# no allow high-wattage-optics`
Supported Releases	10.5.2.1 or later

show inventory media wattage

Displays wattage information of the optics present in the switch.

Syntax	`show inventory media wattage`
Parameters	None
Default	Not applicable
Command Mode	EXEC
Usage Information	Displays the following information for each port that has a pluggable media inserted on the Z9332F-ON and Z9432F-ON platforms: • Wattage of the pluggable optics read from the media EEPROM. • Maximum power threshold on the port above which an optic is disabled on the interface. • An field to indicate if the pluggable optic present in the port is a high-power optic or not. • An field to indicate if the pluggable optic is enabled or disabled.
Security and Access	Not applicable

Example	`OS10# show inventory media wattage`
	`----------------------------------------`
	`System Inventory Media wattage`
	`------------------------------`
	`Node/Slot Media Media-wattage Max-threshold High-power-media /Port`
	`----------------------------------------------------------------------------`
	`1/1/1 Not Present`
	`1/1/2 Not Present`
	`1/1/3 Not Present`
	`1/1/4 QSFP56-DD400GBASE -SR8-AOC-10.0M 12.5W 15W Yes`
	`1/1/5 QSFP56-DD400GBASE -SR8 9W 15W No`
	`--more--`

Supported Releases	10.5.2.1 or later

Digital optical monitoring

The digital optical monitoring (DOM) feature monitors the digital optical media for temperature, voltage, bias, transmission power (Tx), and reception power (Rx). This feature also generates event logs, alarms, and traps for any fluctuations, when configured thresholds are reached.

There are four threshold levels for each of the DOM categories—temperature, voltage, bias, transmission power, and reception power as summarized in the following table:

- High
- High warning
- Low
- Low warning

The OS10 DOM subsystem periodically monitors the optical transceivers for temperature, voltage, bias, transmission power and reception power changes and generate event logs, alarms, and traps when their respective values cross the predefined thresholds.

Table 35. DOM Alarms

Alarm Category	Alarm Name	Traps Generated?	Severity Level
Temperature	Temperature high	Y	Major
	Temperature high warning	N	Minor
	Temperature low	Y	Major
	Temperature low warning	N	Minor
Voltage	Voltage high	Y	Major
	Voltage high warning	N	Minor
	Voltage low	Y	Major
	Voltage low warning	N	Minor
Bias	Bias high	Y	Major
	Bias high warning	N	Minor
	Bias low	Y	Major
	Bias low warning	N	Minor
Power transmission (Tx)	Tx high	Y	Major
	Tx high warning	N	Minor
	Tx low	Y	Major
	Tx low warning	N	Minor
Power reception (Rx)	Rx high	Y	Major
	Rx high warning	N	Minor
	Rx low	N	Minor
	Rx low warning	N	Minor

You can enable or disable the DOM feature, configure traps, and view the DOM status.

Enable DOM and DOM traps

To generate DOM alarms, do the following.

1. Enable DOM.

```
OS10(config)# dom enable
```

2. Enable DOM traps.

```
OS10(config)# snmp-server enable traps dom
```

You can run the `show alarms` command in EXEC mode to view any alarms that are generated.

View DOM alarms

```
OS10# show alarms

Index   Severity  Name                  Raise-time              Source
-----   --------  --------------------  ----------------------- ------
0       major     EQM_MEDIA_TEMP_HIGH   Tue 06-04-2019 12:32:07  Node.1-Unit.1
```

View DOM event log message

The following are examples of event logs:

- High temperature warning:

```
Aug 03 06:35:47 OS10 dn_eqm[9135]: [os10:alarm], %Dell EMC (OS10)
%EQM_MEDIA_TEMP_HIGH: Media high temperature threshold crossed major warning
SET media 1/1/21 high threshold crossed, 82.00:78.00 Aug 03 06:35:47 OS10
dn_eqm[9135]: [os10:alarm], %Dell EMC (OS10) %EQM_MEDIA_VOLTAGE_HIGH: Media high
voltage threshold crossed major warning SET media 1/1/21 high threshold crossed,
6.00:3.63
```

  In this example, the threshold for high temperature is 78.00, but the current temperature is 82.00.

- High reception power warning:

```
Aug 03 06:35:47 OS10 dn_eqm[9135]: [os10:alarm], %Dell EMC (OS10)
%EQM_MEDIA_RX_POWER_HIGH: Media high rx_power threshold crossed major warning
SET media 1/1/21 high threshold crossed, 7.00:3.30 Aug 03 06:35:47 OS10
dn_eqm[9135]: [os10:alarm], %Dell EMC (OS10) %EQM_MEDIA_BIAS_HIGH: Media high
bias threshold crossed major warning SET media 1/1/21 high threshold crossed,
120.00:105.00
```

  In this example, the threshold for high reception power is 3.30, but the current reception power is 7.00.

View DOM traps

The following are examples of DOM traps.

```
2018-08-21 17:38:18 <UNKNOWN> [UDP: [10.11.56.49]:51635->[10.11.86.108]:162]:

```

Default MTU Configuration

Maximum transmission unit (MTU) defines the largest packet size that an interface can transmit without fragmentation. The MTU of an interface determines whether to accept the packet ingress and egress in the switch. The interface drops any packet with size exceeding the MTU.

If you have not configured the MTU value for an interface, the default value is set automatically. Any packet exceeding this value is dropped. Starting from Release 10.5.4.4, the default MTU value is 9216 bytes. Previously, the default value was 1532 bytes. To build an MTU with higher value, configure the default MTU of the system to the required value.

You can use the following commands for MTU configuration:

- `default mtu <val>`—configure a custom MTU value to all the interfaces that do not have a user configured MTU.
- `no default mtu`—assign the system default value to interfaces with no custom MTU value.
- `show default mtu`—verify the default MTU value at the system level.
- `show interface`—view the current MTU set on the interface at the interface level. Configurations that are made at the interface level override the system default for that specific interface.

NOTE: If default MTU is configured globally and if VLAN is configured with non-default MTU, configure non-default MTU on the VLAN members as well.

NOTE: Set the MTU value on all interfaces, including logical and physical interfaces between BGP peers (iBGP and eBGP), to be uniform to avoid L2 and L3 VPN flaps.

The following examples show how to display and modify the default MTU using CLIs:

Display the default MTU

```
OS10# show default mtu
Default MTU 9216 bytes
```

System default with no user configuration

```
OS10# show interface ethernet 1/1/1
Ethernet 1/1/1 is up, line protocol is down
Hardware is Eth, address is 90:b1:00:00:00:a0
    Current address is 90:b1:00:00:00:a0
Pluggable media present, QSFP+ type is QSFP+ 40GBASE-LR4
    Wavelength is 1311
    Receive power reading is no power
Interface index is 11
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Disabled
MTU 9216 bytes, IP MTU 1500 bytes
LineSpeed 0, Auto-Negotiation off
Flowcontrol rx off tx off
ARP type: ARPA, ARP Timeout: 60
Last clearing of "show interface" counters: 20:45:24
Queuing strategy: fifo
Input statistics:
     0 packets, 0 octets
     0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
     0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
     0 Multicasts, 0 Broadcasts, 0 Unicasts
     0 runts, 0 giants, 0 throttles
     0 CRC, 0 overrun, 0 discarded
Output statistics:
     0 packets, 0 octets
     0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
     0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
     0 Multicasts, 0 Broadcasts, 0 Unicasts
     0 throttles, 0 discarded, 0 Collisions,  wred drops
Rate Info(interval 30 seconds):
     Input 0 Mbits/sec, 0 packets/sec, 0% of line rate
     Output 0 Mbits/sec, 0 packets/sec, 0% of line rate
Time since last interface status change: 20:45:25

OS10# configure terminal
```

```
OS10(config)# default mtu 9000
OS10(config)#
```

Configure polling interval for Ethernet interface counters

OS10 caches the interface counters every 15 s. The interface statistics include the number of packets that are sent or received through an interface. You can change this polling interval for Ethernet interface counters from 1 s to 15 s.

To configure the polling interval for Ethernet interface counters, from the CONFIGURATION mode, enter:

```
OS10(config)# stats-monitor stat-type ethernet polling-interval interval-value
```

The *interval-value* can range from 1 s to 15 s.

Interface commands

channel-group

Assigns an interface to a port channel group.

Syntax `channel-group channel-number mode {active | on | passive}`

Parameters

- *channel-number*—Enter a port channel number, from 1 to 999 or 1001 to 2000.
- `mode`—Sets LACP Actor mode.
- `active`—Sets Channeling mode to Active.
- `on`—Sets Channeling mode to static.
- `passive`—Sets Channeling mode to passive.

Default Not configured

Command Mode INTERFACE

Usage Information The `no` version of this command resets the value to the default, and unassigns the interface from the port channel group.

Example

```
OS10(config)# interface ethernet 1/1/2:1
OS10(conf-if-eth1/1/2:1)# channel-group 20 mode active
```

Supported Releases 10.3.0E or later

default interface

Resets an Ethernet or Fibre Channel interface to its default settings.

Syntax `default interface interface-type`

Parameters *interface-type* — Enter the interface type:

- `ethernet` *node/slot/port[:subport]* — Resets an Ethernet interface to its default settings.
- `fibrechannel` *node/slot/port[:subport]* — Resets a Fibre Channel interface to its default settings.
- `range ethernet` *node/slot/port:[subport]-node/slot/port[:subport]* — Resets a range of Ethernet interfaces to their default settings.

Default Not configured

Command mode CONFIGURATION

Usage information

To remove the configuration from an Ethernet or Fibre Channel interface and reset the interface to its default settings, use the `default interface` command. By default:

- An Ethernet interface is enabled using the `no shutdown` command; a Fibre Channel interface is disabled using the `shutdown` command.
- An Ethernet interface is assigned to the default VLAN.

The `default interface` command removes all software settings and all L3, VLAN, and port-channel configurations on a physical interface. You must manually remove configured links to the interface from other software features; for example, if you configure an Ethernet interface as a discovery interface in a VLT domain. Enter multiple interfaces in a comma-separated string or a port range using the `default interface range` command.

There is no undo for this command. The `no` version of the command has no effect.

Example (Ethernet)

```
OS10# show running-configuration interface ethernet 1/1/15
 !
 interface ethernet1/1/15
 no shutdown
 no switchport
 ip address 101.1.2.2/30
 ipv6 address 2101:100:2:1::2/64
 ipv6 ospf 65535 area 0.0.0.0
 ipv6 ospf cost 10
 ip ospf 65535 area 0.0.0.0
 ip ospf cost 10

OS10# configure terminal

OS10(config)# default interface ethernet 1/1/15
 Proceed to cleanup the interface config? [confirm yes/no]:yes

OS10(conf-range-eth1/1/1-1/1/4)#
```

Supported releases 10.4.0E(R1) or later

default mtu

Configures the default MTU at system level.

Syntax	`default mtu <mtu-value>`
Parameters	None
Defaults	9216 bytes
Command Mode	CONFIGURATION
Usage Information	The interface-level MTU may be different from the system-level MTU. The `no` version of this command resets the MTU value to the default value.
Example	`OS10# default mtu 9216` `OS10# no default mtu`
Supported Releases	10.5.1.0 or later

default vlan-id

Reconfigures the VLAN ID of the default VLAN.

Syntax	`default vlan-id vlan-id`
Parameters	*vlan-id* — Enter the default VLAN ID number, from 1 to 4093.
Default	VLAN1
Command Mode	CONFIGURATION
Usage Information	By default, VLAN1 serves as the default VLAN for switching untagged L2 traffic on OS10 ports in Trunk or Access mode. If you use VLAN1 for network-specific data traffic, reconfigure the VLAN ID of the default VLAN. The command reconfigures the access VLAN ID, the default VLAN, of all ports in Switchport Acess mode. Ensure that the VLAN ID exists before configuring it as the default VLAN.

Example	`OS10(config)# default vlan-id 10`
	
	`OS10(config)# do show running-configuration`
	`...`
	`!`
	`interface vlan1`
	`no shutdown`
	`!`
	`interface vlan10`
	`no shutdown`
	`!`
	`interface ethernet1/1/1`
	`no shutdown`
	`switchport access vlan 10`
	`!`
	`interface ethernet1/1/2`
	`no shutdown`
	`switchport access vlan 10`
	`!`
	`interface ethernet1/1/3`
	`no shutdown`
	`switchport access vlan 10`
	`!`
	`interface ethernet1/1/4`
	`no shutdown`
	`switchport access vlan 10`

Supported Releases	10.4.0E(R1) or later

description (Interface)

Configures a textual description of an interface.

Syntax	`description string`
Parameters	*string* — Enter a text string for the interface description. A maximum of 240 characters.
Default	Not configured
Command Mode	INTERFACE
Usage Information	• To use special characters as a part of the description string, enclose the string in double quotes. • To use comma as a part of the description string add double back slash before the comma. • Spaces between characters are not preserved after entering this command unless you enclose the entire description in quotation marks; for example, "*text description*". • Enter a text string after the `description` command to overwrite any previously configured text string. • Use the `show running-configuration interface` command to view descriptions configured for each interface. • The `no` version of this command deletes the description.
Example	`OS10(conf-if-eth1/1/7)# description eth1/1/7`
Supported Releases	10.2.0E or later

duplex

Configures Duplex mode on the Management port.

Syntax	`duplex {full | half | auto}`
Parameters	• `full` — Set the physical interface to transmit in both directions. • `half` — Set the physical interface to transmit in only one direction. • `auto` — Set the port to auto-negotiate speed with a connected device.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	You can only use this command on the Management port. The `no` version of this command removes the duplex mode configuration from the management port.
Example	`OS10(conf-if-ma-1/1/1)# duplex auto`
Supported Releases	10.3.0E or later

enable dom

Enables or disables the DOM feature.

Syntax	`dom enable`
Parameters	None
Default	Disabled

Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables digital optical monitoring.

Example	`OS10# configure terminal`
	`OS10(config)# dom enable`
	
	`OS10# configure terminal`
	`OS10(config)# no dom enable`

Supported Releases	10.4.3.0 or later

enable dom traps

Enables DOM traps if the specified parameter crosses the defined threshold three times.

Syntax	`snmp-server enable traps dom {temperature | voltage | rx-power | tx-power | bias}`
Parameters	`temperature | voltage | rx-power | tx-power | bias` — Enter the keyword to enable DOM traps for the specified category.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the DOM traps.

Example	`OS10# configure terminal`
	`OS10(config)# snmp-server enable traps dom temperature`
	
	`OS10# configure terminal`
	`OS10(config)# no snmp-server enable traps dom temperature`

Supported Releases	10.4.3.0 or later

feature auto-breakout

Enables front-panel Ethernet ports to automatically detect SFP media and autoconfigure breakout interfaces.

Syntax	`feature auto-breakout`
Parameters	None
Default	Not configured
Command mode	CONFIGURATION
Usage information	After you enter the `feature auto-breakout` command and plug a supported breakout cable in a QSFP+ or QSFP28 port, the port autoconfigures breakout interfaces for media type and speed. Use the `interface breakout` command to manually configure breakout interfaces. The media type plugged into a port is no longer automatically learned. The `no` version of this command disables the auto-breakout feature.
Example	`OS10(config)# feature auto-breakout`
Supported releases	10.4.0E(R1) or later

fec

Configures Forward Error Correction (FEC) on 25G, 50G, 100G, and 400G interfaces.

Syntax

```
fec {CL74-FC | CL91-RS | CL108-RS | CL119-RS | CL134-RS | CL91-RS544 | off}
```

Parameters

- `CL74-FC`—Supports 25G and 50G
- `CL91-R`—Supports 100G
- `CL108-RS`—Supports 25G and 50G
- `CL119-RS`—Supports 200G and 400G PAM4
- `CL134-RS`—Supports 50G Pulse Amplitude Modulation 4-level (PAM4)
- `CL91-RS544`—Supports 100G and 200G PAM4
- `off`—Disables FEC

Defaults

NOTE: Default FEC settings are determined by the inserted media type.

- For 25G and 50G interfaces: `off, CL108-RS, or auto-negotiate`
- For 100G interfaces: `off, CL91-RS, or auto-negotiate`
- For 400G interfaces: `off, CL119-RS, or auto-negotiate`

Command Mode

CONFIGURATION

Usage Information

The `no` version of this command resets the value to the default.

Example

```
OS10(config)# interface ethernet 1/1/41
OS10(conf-if-eth1/1/41)# fec CL91-RS
```

Supported Releases

10.3.0E or later

interface breakout

Splits a front-panel Ethernet port into multiple breakout interfaces.

Syntax

```
interface breakout node/slot/port map { 400g-1x | 100g-4x | 100g-2x |
100g-1x | 50g-2x |40g-1x | 25g-4x | 10g-4x}
```

Parameters

- *`node/slot/port`*—Enter the physical port information.
- `100g-1x`—Reset a QSFP28 port to 100G speed.
- `50g-2x`—Split a QSFP28 port into two 50GE interfaces.
- `40g-1x`—Set a QSFP28 port to use with a QSFP+ 40GE transceiver.
- `25g-4x`—Split a QSFP28 port into four 25GE interfaces.
- `10g-4x`—Split a QSFP28 or QSFP+ port into four 10GE interfaces.
- `1g-4x`—Split a QSFP28 or QSFP+ port into four 1GE interfaces.

Default

Not configured

Command Mode

CONFIGURATION

Usage Information

- Each breakout interface operates at the configured speed; for example, 10G, 25G, 50G, or 100G.
- The `no interface breakout` *`node/slot/port`* command resets a port to its default speed: 40G or 100G.
- To configure breakout interfaces on a unified port, use the `mode {Eth | FC}` command in Port-Group Configuration mode.
- On the S4148U-ON platform, ensure that you use the same breakout mode as you have configured on the peer interface. For example, if you have explicitly configured the interface on the peer device as 10g-4x, use the same configuration on your switch.

Example

```
OS10(config)# interface breakout 1/1/41 map 10g-4x
```

Supported Releases	10.2.2E or later

interface ethernet

Configures a physical Ethernet interface.

Syntax	`interface ethernet node/slot/port:subport`
Parameters	*node/slot/port:subport* — Enter the Ethernet interface information.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command deletes the interface.
Example	`OS10(config)# interface ethernet 1/1/10:1` `OS10(conf-if-eth1/1/10:1)#`
Supported Releases	10.2.0E or later

interface loopback

Configures a Loopback interface.

Syntax	`interface loopback id`
Parameters	*id* — Enter the Loopback interface ID number, from 0 to 16383.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command deletes the Loopback interface.
Example	`OS10(config)# interface loopback 100` `OS10(conf-if-lo-100)#`
Supported Releases	10.2.0E or later

interface mgmt

Configures the Management port.

Syntax	`interface mgmt node/slot/port`
Parameters	*node/slot/port* — Enter the physical port interface information for the Management interface.
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	You cannot delete a Management port. To assign an IP address to the Management port, use the `ip address` command.
Example	`OS10(config)# interface mgmt 1/1/1` `OS10(conf-if-ma-1/1/1)#`

Supported Releases	10.2.0E or later

interface null

Configures a null interface on the switch.

Syntax	`interface null number`
Parameters	*number* — Enter the interface number to set as null (0).
Default	0
Command Mode	CONFIGURATION
Usage Information	You cannot delete the Null interface. The only configuration command possible in a Null interface is `ip unreachables`.
Example	`OS10(config)# interface null 0` `OS10(conf-if-nu-0)#`
Supported Releases	10.3.0E or later

interface port-channel

Creates a port channel interface.

Syntax	`interface port-channel channel-id`
Parameters	*channel-id*—Enter the port channel ID number, from 1 to 999 or 1001 to 2000.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command deletes the interface.
Example	`OS10(config)# interface port-channel 10` `OS10(conf-if-po-10)#`
Supported Releases	10.2.0E or later

interface range

Configures a range of Ethernet, port channel, or VLAN interfaces for bulk configuration.

Syntax	`interface range {ethernet node/slot/port[:subport]-node/slot/port[:subport],[...]} | {port-channel IDnumber-IDnumber,[ ...]} | vlan vlanID-vlanID,[...]}`
Parameters	• *node/slot/port[:subport]-node/slot/port[:subport]*—Enter a range of Ethernet interfaces. • *IDnumber-IDnumber*—Enter a range of port channel numbers, from 1 to 999 or 1001 to 2000. • *vlanID-vlanID*—Enter a range of VLAN ID numbers, from 1 to 4093.
Default	Not configured
Command Mode	CONFIGURATION

Usage Information	Enter up to six comma-separated interface ranges without spaces between commas. When creating an interface range, interfaces are not sorted and appear in the order entered. You cannot mix interface configuration such as Ethernet ports with VLANs. • A bulk configuration is created if at least one interface is valid. • Nonexisting interfaces are excluded from the bulk configuration with a warning message. • This command has multiple port ranges, the prompt excludes the smaller port range. • If you enter overlapping port ranges, the port range extends to the smallest port and the largest end port. • You can only use VLAN, and port channel interfaces created using the `interface vlan` and `interface port-channel` commands. • You cannot create virtual VLAN or port channel interfaces using the `interface range` command. The `no` version of this command deletes the interface range.
Example	`OS10(config)# interface range ethernet 1/1/7-1/1/24` `OS10(conf-range-eth1/1/7-1/1/24)#`
Supported Releases	10.2.0E or later

interface vlan

Creates a VLAN interface.

Syntax	`interface vlan` *`vlan-id`*
Parameters	*`vlan-id`* — Enter the VLAN ID number, from 1 to 4093.
Default	VLAN 1
Command Mode	CONFIGURATION
Usage Information	FTP, TFTP, MAC ACLs, and SNMP operations are not supported. IP ACLs are supported on VLANs only. The `no` version of this command deletes the interface. **NOTE:** In SmartFabric Services mode, you can create VLAN using the `interface vlan` command through OS10 CLI but you cannot delete the VLAN from the CLI. Therefore, Dell Technologies recommends you to use the SFS GUI to create, edit, or delete a VLAN.
Example	`OS10(config)# interface vlan 10` `OS10(conf-if-vl-10)#`
Supported Releases	10.2.0E or later

hardware l2 host-mode wide

Enables or disables Layer 2 wide host mode.

Syntax	`[no] hardware l2 host-mode wide`
Parameters	None.
Default	Narrow mode.
Command Mode	CONFIGURATION
Usage Information	This configuration is applicable only to the S5448F-ON and Z9432F-ON platforms. The `no hardware l2 host-mode wide` command disables the Layer 2 wide host mode configuration.

Example

```
OS10(Conf)#hardware l2 host-mode wide
```

Supported Releases 10.5.2.1 or Later

link-bundle-utilization

Configures link-bundle utilization.

Syntax `link-bundle-utilization trigger-threshold value`

Parameters *value* — Enter the percentage of port-channel bandwidth that triggers traffic monitoring on port-channel members, from 0 to 100.

Default Disabled

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(config)# link-bundle-utilization trigger-threshold 10
```

Supported Releases 10.2.0E or later

link-bundle-monitor

Enables link-bundle monitor on an port-channel.

Syntax `link-bundle-monitor`

Parameters None

Default Disabled

Command Mode INTERFACE CONFIGURATION

Usage Information If you enable link-bundle monitor in interface configuration mode, the `show link-bundle-utilization` command displays the member link utilization information in percentage.

Example

```
OS10(config)#interface port-channel 1
OS10(config-if-po-1)#link-bundle-monitor
```

```
OS10#show link-bundle-utilization

Link-bundle trigger threshold - 60
LAG bundle - port-channel 1   Utilization[In Percent]- 0 Alarm State-
false
Interface            Line Protocol  Utilization[In Percent]
ethernet1/1/1         up             0
ethernet1/1/2         up             0
```

Supported Releases 10.2.0E or later

mode

Configures a front-panel unified port group to operate in Fibre Channel or Ethernet mode, or a QSFP28-DD or QSFP28 port group to operate in Ethernet mode, with the specified speed on activated interfaces.

Syntax

```
mode {Eth {100g-2x | 100g-1x | 50g-2x | 40g-2x | 40g-1x | 25g-8x [fabric-expander-mode] | 25g-4x | 10g-8x | 10g-4x} | FC {32g-4x | 32g-2x | 32g-1x | 16g-4x | 16g-2x | 8g-4x}}
```

Parameters

- `mode Eth` — Configure a port group in Ethernet mode and set the speed to:
  - `100g-2x` — Split a QSFP28-DD port into two 100GE interfaces.
  - `100g-1x` — Reset a QSFP28 port group to 100GE mode.
  - `50g-2x` — Split a QSFP28 port into two 50GE interfaces.
  - `40g-2x` — Split a port group into two 40GE interfaces.
  - `40g-1x` — Set a port group to 40G mode for use with a QSFP+ 40GE transceiver.
  - `25g-8x fabric-expander-mode` — Split a QSFP28-DD port into eight 25GE interfaces for connection to a Fabric Expander.
  - `25g-8x` — Split a port group into eight 25GE interfaces.
  - `25g-4x` — Split a port group into four 25GE interfaces.
  - `10g-8x` — Split a port group into eight 10GE interfaces.
  - `10g-4x` — Split a port group into four 10GE interfaces.
- `mode FC` — Configure a port group in Fibre Channel mode and set the speed to:
  - `32g-4x` — Split a port group into four 32GFC interfaces.
  - `32g-2x` — Split a port group into two 32GFC interfaces, subports 1 and 3.
  - `32g-1x` — Split a port group into one 32GFC interface, subport 1.
  - `16g-4x` — Split a port group into four 16GFC interfaces; supports 4x32GFC oversubscription.
  - `16g-2x` — Split a port group into two 16GFC interfaces using ports 1 and 3.
  - `8g-4x` — Split a port group into four 8GFC interfaces.

Default S4148U-ON: Depends on the port profile activated.

Command Mode PORT-GROUP

Usage Information

- The `mode {FC | Eth}` command configures a port group to operate at line rate and guarantees no traffic loss.
- To configure oversubscription on a FC interface, use the `speed` command.
- To configure breakout interfaces on an Ethernet port, use the `interface breakout` command.
- To view the currently active ports and subports, use the `show interfaces status` command.
- The `no` version of the command resets port-group interfaces to the default Ethernet port mode/speed. Use the `no mode` command before you reset the mode on an interface.

Example

```
OS10(conf-pg-1/1/2)# mode FC 16g-4x

OS10(conf-pg-1/1/8)# mode Eth 10g-4x
```

Example: Reset mode

```
OS10(conf-pg-1/1/2)# mode FC 16g-4x
OS10(conf-pg-1/1/2)# no mode
OS10(conf-pg-1/1/2)# mode Eth 10g-4x
```

Supported Releases 10.3.1E or later

mode l3

Enables L3 routing on a VLAN after you configure the VLAN scale profile.

Syntax

```
mode l3
```

Parameters None

Defaults Not configured

Command Mode INTERFACE VLAN

Usage Information To configure the VLAN scale profile, use the `scale-profile vlan` command. The scale profile globally applies L2 mode on all VLANs you create and disables L3 transmission. To enable L3 routing traffic on a VLAN, use the `mode L3` command.

Example

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# mode L3
```

Supported Releases 10.4.0E(X2) or later

mtu

Sets the link maximum transmission unit (MTU) frame size for an Ethernet L2 or L3 interface.

Syntax `mtu value`

Parameters *value*—Enter the maximum frame size in bytes, from 1280 to 65535. Maximum frame size for an S3000-ON is 12000, and S4000-ON is 9216.

Default 9216 bytes (or the value that is configured using the `default mtu` command)

Command Mode INTERFACE

Usage Information To return to the default MTU value, use the `no mtu` command. If an IP packet includes a L2 header, the IP MTU must be at least 32 bytes smaller than the L2 MTU.

Set the MTU value on all interfaces, including logical and physical interfaces between BGP peers (iBGP and eBGP), to be uniform to avoid L2 and L3 VPN flaps.

The following table shows the different use cases of VLAN MTU configuration. Use case 1 and 2 describe configuration of VLAN without attaching to virtual network. Use case 3 and 4 describe configuration of VLAN and attaching the VLAN to a virtual network.

Configuration	Ethernet interface configuration	**show interface** output
interface vlan300 no shutdown !	interface ethernet1/1/6 no shutdown switchport mode trunk switchport trunk allowed vlan 300 ! interface ethernet1/1/9 no shutdown switchport mode trunk switchport trunk allowed vlan 300	OS10# show interface vlan 300 Vlan 300 is up, line protocol is up Address is 14:10:10:0d:00:e9, Current address is 14:10:10:0d:00:e9 Interface index is 84 Internet address is not set Mode of IPv4 Address Assignment: not set Interface IPv6 oper status: Enabled Link local IPv6 address: fe80::1010:10ff:fe0d:e9/10 **MTU 1532 bytes, IP MTU 1500 bytes**
interface vlan300 no shutdown !	interface ethernet1/1/6 no shutdown switchport mode trunk switchport trunk allowed vlan 300 ! interface ethernet1/1/9	OS10# show interface vlan 300 Vlan 300 is up, line protocol is up Address is 14:10:10:0d:00:e9, Current address is 14:10:10:0d:00:e9 Interface index is 84 Internet address is not set Mode of IPv4 Address

Configuration	Ethernet interface configuration	show interface output
	no shutdown switchport mode trunk switchport trunk allowed vlan 300 mtu 1312	Assignment: not set Interface IPv6 oper status: Enabled Link local IPv6 address: fe80::1010:10ff:fe0d:e9/10 **MTU 1312 bytes, IP MTU 1280 bytes**
virtual- network 3333 ! interface vlan300 no shutdown virtual- network 3333 !	interface ethernet1/1/6 no shutdown switchport mode trunk switchport trunk allowed vlan 300 ! interface ethernet1/1/9 no shutdown switchport mode trunk switchport trunk allowed vlan 300 mtu 1312	OS10# # show interface vlan 300 Vlan 300 is up, line protocol is up Address is 14:18:77:0d:00:e9, Current address is 14:18:77:0d:00:e9 Interface index is 84 Internet address is not set Mode of IPv4 Address Assignment: not set Interface IPv6 oper status: Enabled Link local IPv6 address: fe80::1618:77ff:fe0d:e9/64 **MTU 1532 bytes, IP MTU 1500 bytes**
virtual- network 3333 ! interface vlan300 no shutdown virtual- network 3333 ! interface virtual- network 3333	interface ethernet1/1/6 no shutdown switchport mode trunk switchport trunk allowed vlan 300 ! interface ethernet1/1/9 no shutdown switchport mode trunk switchport trunk allowed vlan 300 mtu 1312	show interface vlan 300 Vlan 300 is up, line protocol is up Address is 14:18:77:0d:00:e9, Current address is 14:18:77:0d:00:e9 Interface index is 84 Internet address is not set Mode of IPv4 Address Assignment: not set Interface IPv6 oper status: Enabled Link local IPv6 address: fe80::1618:77ff:fe0d:e9/64 **MTU 1532 bytes, IP MTU 1500 bytes** OS10# show interface virtual- network 3333 Virtual-network 3333 is up, line protocol is up Address is 14:18:77:0d:00:ea, Current address is 14:18:77:0d:00:ea Interface index is 87 Internet address is not set Mode of IPv4 Address Assignment: not set Interface IPv6 oper status: Enabled **MTU 1312 bytes, IP MTU 1280 bytes**

For use case 1 and 2:

- Member interfaces inherit the MTU value that is configured on the port channel interface.
- Tagged members must have a link MTU 4 bytes higher than untagged members to account for the packet tag.
- OS10 selects the lowest MTU value that is configured on the VLAN or VLAN members to be the VLAN MTU.

For example, the VLAN contains tagged members with Link MTU of 1522 and IP MTU of 1500 and untagged members with Link MTU of 1518 and IP MTU of 1500. The Link MTU of VLAN cannot be higher than 1518 bytes and its IP MTU cannot be higher than 1500 bytes.

The `show running-configuration` command displays the VLAN MTU configuration. The `show interface vlan` command displays the VLAN MTU operational values.

For use case 3 and 4:

In the kernel and NPU, VLAN bridge is removed, and virtual network bridge is created. Data forwarding happens in the virtual-network context. The `show interface vlan` command displays the VLAN MTU configuration and not the VLAN MTU operational values.

In use case 3, when a VLAN is attached to a virtual network, the VLAN broadcast domain is removed, and only the associated virtual network broadcast domain becomes active. Hence, the `show interface vlan` command does not display the correct value of the active broadcast domain. Rather it displays the MTU for the removed broadcast domain. If a virtual network is not configured as L3 (the `interface virtual network` command is not run for that virtual network), the virtual network remains as L2 VXLAN. Hence, IP MTU for that L2 VXLAN is not valid. Once the virtual network is configured as L3 (the `interface virtual network` command is run for that virtual network), use the `show interface virtual-network` command to display the operational MTU values for the VXLAN network.

In use case 4, once the virtual network is configured as L3 (the `interface virtual network` command is run for that virtual network), use the `show interface virtual-network` command to display the operational MTU values for the VXLAN network.

Example

```
OS10(conf-if-eth1/1/7)# mtu 3000
```

Supported Releases 10.2.0E or later

negotiation

Configures a negotiation mode on an interface.

Syntax `negotiation {auto | on | off}`

Parameters

`auto` — Sets the negotiation mode to the default setting. The default setting depends on the media that you use.

`on` — Forces interface negotiation.

`off` — Disables interface negotiation.

Defaults Auto

Command Mode INTERFACE CONFIGURATION

Usage Information

Use the `show interfaces` command to view the interface negotiation status.

Both sides of the link must have auto-negotiation enabled or disabled for the link to come up.

Use either the `negotiation auto` command or the `no negotiation` command to reset the negotiation mode to its default setting.

Example

```
OS10(conf-if-eth1/1/50)# negotiation off
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 negotiation off
 flowcontrol receive on
OS10(conf-if-eth1/1/50)# negotiation on
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
```

```
 no shutdown
 switchport access vlan 1
 negotiation on
 flowcontrol receive on
OS10(conf-if-eth1/1/50)# negotiation auto
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 flowcontrol receive on
OS10(conf-if-eth1/1/50)#
OS10(conf-if-eth1/1/50)# negotiation on
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 negotiation on
 flowcontrol receive on
OS10(conf-if-eth1/1/50)# no negotiation
OS10(conf-if-eth1/1/50)# show configuration
!
interface ethernet1/1/50
 no shutdown
 switchport access vlan 1
 flowcontrol receive on
OS10(conf-if-eth1/1/50)# do show interface ethernet 1/1/50
Ethernet 1/1/50 is up, line protocol is up
Hardware is Eth, address is e4:f0:04:3e:2d:86
    Current address is e4:f0:04:3e:2d:86
Pluggable media present, QSFP28 type is QSFP28 100GBASE-CR4-2.0M
    Wavelength is 64
    Receive power reading is not available

Interface index is 112
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Disabled
MTU 1532 bytes, IP MTU 1500 bytes
LineSpeed 100G, Auto-Negotiation on
```

Supported Releases	10.2.0E or later

no switchport access vlan

Resets access VLAN membership on a range of interfaces or an individual interface.

Syntax	`no switchport access vlan`
Parameters	None
Default	VLAN 1
Command Mode	INTERFACE-RANGE
Security and Access	`sysadmin`, `secadmin`, and `netadmin`
Usage Information	None.
Example	`OS10(config)# interface range ethernet 1/1/1-1/1/5` `OS10(conf-if-eth1/1/1-1/1/5)# no switchport access vlan`
Supported Releases	10.5.3.0 or later

port mode Eth

Configures a Z9264F-ON QSFP28 port group to operate in Ethernet mode, with the specified speed on activated interfaces.

Syntax

```
port node/slot/port mode Eth port-mode
```

Parameters

- *node/slot/port*—Enter the interface type details.
- `mode Eth`—Configure a port group in Ethernet mode and set the speed to:
  - `400g-1x`—Reset a port to 400G speed.
  - `200g-2x`—Split a port into two 200G interfaces.
  - `200g-1x`—Reset a port to 200G speed.
  - `100g-4x`—Split a port into four 100G interfaces.
  - `100g-2x`—Split a port into two 100G interfaces.
  - `100g-1x`—Reset a port to 100GE mode.
  - `50g-8x`—Split a port into eight 50GE interfaces.
  - `50g-4x`—Split a port into four 50GE interfaces.
  - `50g-2x`—Split a port into two 50GE interfaces.
  - `50g-1x`—Reset a port to 50GE mode.
  - `40g-2x`—Split a port into two 40G interfaces.
  - `40g-1x`—Set a port to 40GE mode for use with a QSFP+ 40GE transceiver.
  - `25g-8x`—Split a port into eight 25GE interfaces.
  - `25g-4x`—Split a port into four 25GE interfaces.
  - `25g-2x`—Split a port into two 25GE interfaces.
  - `25g-1x`—Reset a port to 25GE mode.
  - `10g-8x`—Split a port into eight 10GE interfaces.
  - `10g-4x`—Split a port into four 10GE interfaces.
  - `10g-2x`—Split a port into two 10GE interfaces.
  - `10g-1x`—Reset a port to 10GE mode.

Default 100g-1x

Command mode PORT-GROUP

Usage information

- To view the active ports and subports, use the `show port-group` command. The `no` version of the command resets port-group interfaces to the default Ethernet port mode and speed.
- On the S4148U-ON platform, ensure that you use the same breakout mode as you have configured on the peer interface. For example, if you have explicitly configured the interface on the peer device as 10g-4x, use the same configuration on your switch.

Example

```
OS10(config)# port-group 1/1/2
OS10(conf-pg-1/1/2)# profile restricted
OS10(conf-pg-1/1/2)# port 1/1/3 mode Eth 25g-4x
OS10(conf-pg-1/1/2)# exit
OS10(config)# interface ethernet 1/1/3:2
OS10(conf-if-eth1/1/3:2)#
```

Supported releases 10.4.3.0 or later

port-group

Configures a group of front-panel unified ports, or a double-density QSFP28 (QSFP28-DD) or single-density QSFP28 port group.

Syntax `port-group node/slot/port-group`

Parameters

- *node/slot* — Enter `1/1` for *node/slot* when you configure a port group.

- *port-group* — Enter the port-group number, from 1 to 16. The available port-group range depends on the switch.

Default Not configured

Command mode CONFIGURATION

Usage information
Enter PORT-GROUP mode to:
- Configure unified ports in Fibre Channel or Ethernet mode and break out interfaces with a specified speed.
- Break out a Z9264F-ON QSFP28 port group into multiple interfaces with a specified speed.

To view the ports that belong to a port group, use the `show port-group` command.

Example
```
OS10(config)# port-group 1/1/8
OS10(conf-pg-1/1/8)#
```

Supported releases 10.3.1E or later

profile

Configures breakout interfaces on a Z9264F-ON switch.

Syntax `profile {restricted | unrestricted}`

Parameters
- `restricted` — Applies only to the odd-numbered port within the port group. The even-numbered port in the port group is disabled. Supported speeds are:
  - 100g-1x
  - 40g-1x
  - 25g-4x
  - 10g-4x
- `unrestricted` — Applies to both the odd-numbered and even-numbered ports within the port group. Supported speeds are:
  - 100g-1x
  - 50g-2x
  - 40g-1x

Default Unrestricted

Command mode PORT-GROUP

Usage information Enter the `profile` command to configure breakout interfaces. Use the `port` command to specify the speed. The Z9264F-ON switch has a total of 64 physical ports and can support a maximum of 128 logical ports. To view the ports that belong to a port group, use the `show port-group` command.

Example
```
OS10(config)# port-group 1/1/2
OS10(conf-pg-1/1/2)# profile restricted
```

Supported releases 10.4.3.0 or later

scale-profile vlan

Configures the L2 VLAN scale profile on a switch.

Syntax `scale-profile vlan`

Parameters None

Defaults Not configured

Command Mode CONFIGURATION

Usage Information	Use the VLAN scale profile when you scale the number of VLANs so that the switch consumes less memory. Enable the scale profile before you configure VLANs on the switch. The scale profile globally applies L2 mode on all VLANs you create and disables L3 transmission. The `no` version of the command disables L2 VLAN scaling. To enable L3 routing traffic on a VLAN, use the `mode L3` command.
Example	`OS10(config)# scale-profile vlan`
Supported Releases	10.4.0E(X2) or later

show default mtu

Display the default MTU at system level.

Syntax	`show default mtu`
Parameters	None
Defaults	None
Command Mode	EXEC
Usage Information	The interface-level MTU may be different from the system-level MTU.
Example	`OS10# show default mtu` `Default MTU 9216 bytes`
Supported Releases	10.5.1.0 or later

show hardware l2 host-mode

Displays the current boot and next boot settings of the L2 host mode.

Syntax	`show hardware l2 host-mode`
Parameters	None.
Default	None.
Command Mode	EXEC Privilege
Usage Information	This command is applicable only to the S5448F-ON and Z9432F-ON platforms.

Example	`OS10# show hardware l2 host-mode`
	`Current boot l2 host mode : narrow-mode`
	`Next boot l2 host mode     :  wide-mode`

Supported Releases	10.5.2.1 or Later

show interface

Displays interface information.

Syntax	`show interface [`*type*`]`
Parameters	`interface` *type*—Enter the interface type:

- `phy-eth node/slot/port[:subport]`—Displays information about physical ports that are connected to the interface.
- `status`—Displays interface status.
- `ethernet node/slot/port[:subport]`—Displays Ethernet interface information.
- `loopback id`—Displays Loopback IDs, from 0 to 16383.
- `mgmt node/slot/port`—Displays Management interface information.
- `null`—Displays null interface information.
- `port-channel id-number`—Displays port channel interface IDs, from 1 to 999 or 1001 to 2000.
- `vlan vlan-id`—Displays the VLAN interface number, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information To view interface information from other command modes, use the `do show interface` command.

Example

```
OS10# show interface ethernet 1/1/25
Ethernet 1/1/25 is up, line protocol is down
Hardware is Eth, address is 14:18:77:13:3b:41
Current address is 14:18:77:13:3b:41
Pluggable media present, QSFP+ type is QSFP+ 40GBASE-CR4-3.0M
Wavelength is 90
Interface index is 29
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Enabled
MTU 1532 bytes, IP MTU 1500 bytes
LineSpeed 0, Auto-Negotiation on
Configured FEC is off, Negotiated FEC is off
Flowcontrol rx on tx off
ARP type: ARPA, ARP Timeout: 60
Tag Protocol IDentifier (TPID) value: 0x9100

Last clearing of "show interface" counters: 00:43:49
Queuing strategy: fifo
Input statistics:
0 packets, 0 octets
0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
0 Multicasts, 0 Broadcasts, 0 Unicasts
0 runts, 0 giants, 0 throttles
0 CRC, 0 overrun, 0 discarded
Output statistics:
0 packets, 0 octets
0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
0 Multicasts, 0 Broadcasts, 0 Unicasts
0 throttles, 0 discarded, 0 Collisions, wred drops
Rate Info(interval 30 seconds):
Input 0 Mbits/sec, 0 packets/sec, 0% of line rate
Output 0 Mbits/sec, 0 packets/sec, 0% of line rate
Time since last interface status change: 00:44:06
```

Example (port channel)

```
OS10# show interface port-channel 1
Port-channel 1 is up, line protocol is down
Address is 90:b1:1c:f4:a5:8c, Current address is 90:b1:1c:f4:a5:8c
Interface index is 85886081
Internet address is not set
Mode of IPv4 Address Assignment: not set
MTU 1532 bytes
LineSpeed 0
Minimum number of links to bring Port-channel up is 1
Maximum active members that are allowed in the portchannel is 5
```

```
Members in this channel:
ARP type: ARPA, ARP Timeout: 60
```

```
OS10# show interface port-channel summary
LAG Mode Status Uptime Ports
22 L2 up 20:38:08 Eth 1/1/10 (Up)
                  Eth 1/1/11 (Down)
                  Eth 1/1/12 (Inact)
23 L2 up 20:34:32 Eth 1/1/20 (Up)
                  Eth 1/1/21 (Up)
                  Eth 1/1/22 (Up)
```

Example (VLAN)

```
OS10# show interface vlan 20
Vlan 20 is up, line protocol is down
vlan name: vlanname20
Address is 0c:9b:1d:68:89:6a, Current address is 0c:9b:1d:68:89:6a
Mac Learning is disabled
Interface index is 60
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Enabled
MTU 1532 bytes, IP MTU 1500 bytes
LineSpeed 0
ARP type: ARPA, ARP Timeout: 60
Last clearing of "show interface" counters: 00:05:14
Queuing strategy: fifo
Input statistics:
    0 packets, 0 octets
Output statistics:
    0 packets, 0 octets
Time since last interface status change: 00:05:15
```

Example (VLAN-Stack)

```
OS10# show interface vlan 10

VLAN-Stack Vlan 10 is up, line protocol is down

Address is 14:18:77:13:3b:b9, Current address is 14:18:77:13:3b:b9
Mac Learning is disabled
Interface index is 71
Internet address is not set
Mode of IPv4 Address Assignment: not set
Interface IPv6 oper status: Enabled
MTU 1532 bytes, IP MTU 1500 bytes
LineSpeed 0
ARP type: ARPA, ARP Timeout: 60
Last clearing of "show interface" counters: 00:11:52
Queuing strategy: fifo
Input statistics:
0 packets, 0 octets
Output statistics:
0 packets, 0 octets
Time since last interface status change: 00:11:53
```

Supported Releases 10.2.0E or later

show interface description

Displays the description that is configured on an interface.

Syntax `show interface [type] description`

Parameters *type*—Enter the interface type:

- `ethernet` *node/slot/port[:subport]*—Displays the description of an Ethernet interface.
- `loopback` *id*—Displays the description of Loopback IDs, from 0 to 16383.

- `mgmt node/slot/port`—Displays the description of Management interface.
- `port-channel id-number`—Displays the description of port channel interface IDs. Valid values are from 1 to 999 or 1001 to 2000.
- `vlan vlan-id`—Displays the description of VLAN interface, from 1 to 4093.
- `virtual-network id`—Displays the description of virtual network, from 1 to 65535.
- `fibrechannel node/slot/port[:subport]`—Displays the description of fibre channel interface.

Default None

Command Mode EXEC

Usage Information Use the `do show interface description` command to view interface description from other command modes.

Example

```
OS10# show interface description
--------------------------------------------------------------------------
Port          OK    Status      Protocol   Description
--------------------------------------------------------------------------
Eth 1/1/1     NO    admin down  down       connected-to-host
Eth 1/1/2     YES   up          up         connected-to-server
Eth 1/1/3     NO    up          down       connected-to-radius-server
Eth 1/1/4     NO    up          down
Eth 1/1/5     NO    up          down
Eth 1/1/6     NO    up          down
```

Supported Releases 10.5.2.3 or later

show interface phy-eth

Displays the optical details for an interface.

Syntax `show interface phy-eth [interface] [transceiver]`

Parameters

- `interface`—(Optional) Specify the interface corresponding to which you want to view the optical details.
- `transceiver`—(Optional) Displays the transceiver details.

Defaults None

Command Mode EXEC

Usage Information Starting from Release 10.5.2.1, the `interface` and `transceiver` parameters are optional. If you do not specify these parameters, this command displays the optical information for all the interfaces.

Example

```
OS10# show interface phy-eth 1/1/14 transceiver | grep "Tunable
wavelength"

SFP1/1/14 Tunable wavelength= 1530.000nm
```

Supported Releases 10.4.2E or later

show interface switchport

Displays the physical and port channel interfaces that are VLAN bridge ports or switch ports.

Syntax `show interface switchport [interface]`

Parameters `interface`—(Optional) Enter the interface type:

- `ethernet node/slot/port[:subport]`—Enter Ethernet interface information.
- `port-channel id-number`—Enter port channel interface IDs, from 1 to 999 or 1001 to 2000.

Default None

Command Mode EXEC

Usage Information Use this command to display the Layer 2 interfaces and their VLAN membership details.

Example

```
OS10# show interface switchport
Codes: A - Access (Untagged), T - Tagged
       v - VLTi untagged, V - VLTi tagged

Name: ethernet1/1/2
802.1QTagged: False
Stack Vlan: None
Vlan membership:
Q       Vlans
U       1

Name: ethernet1/1/3
802.1QTagged: Hybrid
Stack Vlan: Access
Vlan membership:
Q       Vlans
U       12

Name: ethernet1/1/4
802.1QTagged: Hybrid
Stack Vlan: Trunk
Vlan membership:
Q       Vlans
U       1
T       13

Name: Po1000
802.1QTagged: Hybrid
Stack Vlan: Trunk
Vlan membership:
Q     Vlans
v     1
V     2-4
```

Supported Releases 10.5.2.3 or later

show inventory media

Displays installed media in switch ports.

Syntax `show inventory media`

Parameters None

Command Mode EXEC

Usage Information Use the `show inventory media` command to verify the media type inserted in a port.

Example

```
OS10# show inventory media
-----------------------------------------------------------------------
               System Inventory Media
-----------------------------------------------------------------------
Node/Slot/Port  Category     Media               Serial    Dell EMC
                                                 Number    Qualified
-----------------------------------------------------------------------
1/1/1           Not Present
1/1/2           SFP+         SFP+ 10GBASE SR     AM70843   true
1/1/3           Not Present
1/1/4           SFP+         SFP+ 10GBASE SR     AKN0LC7   false
1/1/5           SFP+         SFP+ 10GBASE SR     AM718GQ   true
```

```
1/1/6           SFP+         SFP+ 10GBASE SR     AM708XM  true
1/1/7           SFP+         SFP+ 10GBASE SR     AQ2237K  true
1/1/8           SFP+         SFP+ 10GBASE SR     AGT047N  true
1/1/9           Not Present
1/1/10          Not Present
1/1/11          Not Present
1/1/12          Not Present
1/1/13          Not Present
1/1/14          Not Present
1/1/15          SFP+         SFP+ 10GBASE SR     AK60QJN  false
1/1/16          SFP+         SFP+ 10GBASE SR     AL30KWM  true
1/1/17          SFP+         SFP+ 10GBASE SR     AQ22DMB  true
1/1/18          SFP+         SFP+ 10GBASE SR     AQM146U  true
...
```

Supported Releases 10.2.0E or later

show inventory media details

Displays information corresponding to the non-Dell optics that are inserted in switch ports.

Syntax `show inventory media details`

Parameters None

Command Mode EXEC

Usage Information Use the `show inventory media details` command to verify the media type inserted in a port.

Example

```
OS10# show inventory media details
-------------------------------------------------------------------
               System Inventory Media
-------------------------------------------------------------------
Node/Slot/Port  Form-factor     Media            Serial   Dell Media
                                                 Number
-------------------------------------------------------------------
1/1/1           Not Present
1/1/2           SFP+         SFP+ 10GBASE SR     AM70843  true
1/1/3           Not Present
1/1/4           SFP+         SFP+ 10GBASE SR     AKN0LC7  third party
1/1/5           SFP+         SFP+ 10GBASE SR     AM718GQ  true
1/1/6           SFP+         SFP+ 10GBASE SR     AM708XM  true
1/1/7           SFP+         SFP+ 10GBASE SR     AQ2237K  true
1/1/8           SFP+         SFP+ 10GBASE SR     AGT047N  true
1/1/9           Not Present
1/1/10          Not Present
1/1/11          Not Present
1/1/12          Not Present
1/1/13          Not Present
1/1/14          Not Present
1/1/15          SFP+         SFP+ 10GBASE SR     AK60QJN  third party
1/1/16          SFP+         SFP+ 10GBASE SR     AL30KWM  true
1/1/17          SFP+         SFP+ 10GBASE SR     AQ22DMB  true
1/1/18          SFP+         SFP+ 10GBASE SR     AQM146U  true
...
```

Supported Releases 10.5.2.6 or later

show link-bundle-utilization

Displays information about the link-bundle utilization.

Syntax `show link-bundle-utilization`

Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	None

Example	`OS10# show link-bundle-utilization`
	
	`Link-bundle trigger threshold - 60`

Supported Releases	10.2.0E or later

show port-channel summary

Displays port-channel summary information.

Syntax	`show port-channel summary`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	This command is useful to determine the status of the port-channel and its member ports. The output of this command shows whether the member ports have transitioned to individual ports or if they still exist as normal port-channel members. **NOTE:** The `show tech-support` command also displays the port-channel summary information that is similar to the output displayed by the `show port-channel summary` command.

Example

```
OS10(conf-if-eth1/1/4)# do show port-channel summary
Flags: D - Down I - member up but inactive P - member up and active
U - Up (port-channel)

Group Port-Channel Type Protocol Member Ports

22 port-channel22 (U) Eth STATIC 1/1/2(D) 1/1/3(P)
23 port-channel23 (D) Eth DYNAMIC 1/1/4(I)
```

Example (Interface)

```
OS10(conf-range-eth1/1/10-1/1/11,1/1/13,1/1/14)# do show port-channel summary
Flags: D - Down U - member up but inactive P - member up and active
U - Up (port-channel)

Group Port-Channel Type Protocol Member Ports

22 port-channel22 (U) Eth STATIC 1/1/10(P) 1/1/11(P) 1/1/12(P) 1/1/13(P)
1/1/14(P) 1/1/15(P) 1/1/16(P) 1/1/17(P) 1/1/18(P) 1/1/19(P)
23 port-channel23 (D) Eth STATIC
OS10(config)# interface range e1/1/12-1/1/13,1/1/15,1/1/17-1/1/18
OS10(conf-range-eth1/1/12-1/1/13,1/1/15,1/1/17-1/1/18)# no channel-group
OS10(conf-range-eth1/1/12-1/1/13,1/1/15,1/1/17-1/1/18)# do show port-channel
summary
Flags: D - Down U - member up but inactive P - member up and active
U - Up (port-channel)

Group Port-Channel Type Protocol Member Ports

22 port-channel22 (U) Eth STATIC 1/1/10(P) 1/1/11(P) 1/1/14(P) 1/1/16(P)
1/1/19(P)
23 port-channel23 (D) Eth STATIC
```

Example (LACP individual ports)

In this example, port-channel 100 is enabled using the LACP individual port feature. However, only port `1/1/51` has transitioned to LCAP individual port status and port `1/1/1` did not transition to LACP individual port.

```
OS10# show port-channel summary
Flags:  D - Down     I - member up but inactive     P - member up and active
        U - Up (port-channel)     F - Fallback Activated     IND - LACP Individual
--------------------------------------------------------------------------------
Group    Port-Channel            Type     Protocol              Member Ports
--------------------------------------------------------------------------------
1        port-channel1    (D)    Eth      DYNAMIC
100      port-channel100  (D)    Eth      DYNAMIC   1/1/1(D)    1/1/51(IND)
```

Supported Releases

10.2.0E or later

show port-group

Displays the current port-group configuration on a switch.

Syntax

```
show port-group
```

Parameters

None

Default

None

Command Mode

EXEC

Usage Information

To view the ports that belong to each port-group, use the `show port-group` command. To configure a port-group, use the `port-group` command.

Example: S4148U-ON

```
OS10(config)# show port-group
port-group mode           ports
1/1/1      Eth 10g-4x     1 2 3 4
1/1/2      FC  16g-2x     5 6 7 8
1/1/3      FC  16g-2x     9 10 11 12
1/1/4      FC  16g-2x     13 14 15 16
1/1/5      FC  16g-2x     17 18 19 20
1/1/6      FC  16g-2x     21 22 23 24
1/1/7      Eth 100g-1x    25
1/1/8      Eth 40g-1x     26
1/1/9      Eth 100g-1x    29
1/1/10     Eth 40g-1x     30
```

Example: Z9264F-ON

```
OS10(config)# show port-group
hybrid-group         profile       Ports              Mode
port-group1/1/1      restricted    1/1/1              Eth 10g-4x
                                   1/1/2              Eth Disabled
port-group1/1/2      restricted    1/1/3              Eth 10g-4x
                                   1/1/4              Eth Disabled
port-group1/1/3      restricted    1/1/5              Eth 10g-4x
                                   1/1/6              Eth Disabled
port-group1/1/4      restricted    1/1/7              Eth 10g-4x
                                   1/1/8              Eth Disabled
port-group1/1/5      restricted    1/1/9              Eth 10g-4x
                                   1/1/10             Eth Disabled
port-group1/1/6      restricted    1/1/11             Eth 10g-4x
                                   1/1/12             Eth Disabled
port-group1/1/7      restricted    1/1/13             Eth 10g-4x
                                   1/1/14             Eth Disabled
port-group1/1/8      restricted    1/1/15             Eth 10g-4x
```

Supported Releases

- 10.3.1E or later
- 10.4.3.0 or later—Z9264F-ON platform support added

show switch-port-profile

Displays the current and default port profile on a switch.

Syntax `show switch-port-profile node/slot`

Parameters
- *node/slot* — Enter the switch information. For a standalone switch, enter `1/1`.

Default `profile-1`

Command Mode EXEC

Usage Information A switch-port profile determines the available front-panel ports and breakout modes on Ethernet and unified ports. To display the current port profile, use the `show switch-port-profile` command. To reset the switch to the default port profile, use the `no switch-port-profile node/slot` command.

Example

```
OS10(config)# show switch-port-profile 1/1

|  Node/Unit   |  Current     |  Next-boot   | Default    |
|--------------+--------------------+--------------------|
|     1/1      |  profile-2   |  profile-2   | profile-1  |

Supported Profiles:
profile-1
profile-2
profile-3
profile-4
profile-5
profile-6
```

Supported Releases 10.3.1E or later

show system

Displays the status of the DOM feature, whether it is enabled or disabled.

Syntax `show system`

Parameters None

Defaults DOM disabled

Command Mode EXEC

Usage Information None

Example

```
OS10# show system
Node Id                : 1
MAC                    : 14:18:77:15:c3:e8
Number of MACs         : 256
Up Time                : 1 day 00:48:58

-- Unit 1 --
Status                       : up
System Identifier            : 1
Down Reason                  : unknown
Digital Optical Monitoring   : disable
System Location LED          : off
Required Type                : S4148F
Current Type                 : S4148F
Hardware Revision            : X01
Software Version             : 10.5.1.0
Physical Ports               : 48x10GbE, 2x40GbE, 4x100GbE
BIOS                            : 3.33.0.0-3
System CPLD                     : 0.4
```

```
Master CPLD                    : 0.10
Slave CPLD                     : 0.7
```

Supported Releases 10.4.3.0 or later

show vlan

Displays the current VLAN configuration.

Syntax `show vlan [vlan-id]`

Parameters *vlan-id* — (Optional) Enter a VLAN ID, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show vlan
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring
VLANs
Q: A - Access (Untagged), T - Tagged
NUM Status Description Q Ports
1 down
```

Supported Releases 10.2.0E or later

shutdown

Disables an interface.

Syntax `shutdown`

Parameters None

Default Disabled

Command Mode INTERFACE

Usage Information This command marks a physical interface as unavailable for traffic. Disabling a VLAN or a port-channel causes different behavior. When you disable a VLAN, the L3 functions within that VLAN are disabled, and L2 traffic continues to flow. Use the `shutdown` command on a port-channel to disable all traffic on the port-channel, and the individual interfaces. Use the `no shutdown` command to enable a port-channel on the interface. The `shutdown` and `description` commands are the only commands that you can configure on an interface that is a port-channel member.

Example

```
OS10(config)# interface ethernet 1/1/7
OS10(conf-if-eth1/1/7)# no shutdown
```

Supported Releases 10.2.0E or later

speed (Fibre Channel)

Configures the transmission speed of a Fibre Channel interface.

Syntax `speed {8 | 16 | 32 | auto}`

Parameters Set the speed of a Fibre Channel interface to:
- `8` — 8GFC
- `16` — 16GFC
- `32` — 32GFC
- `auto` — Set the port speed to the speed of the installed media.

Defaults Auto

Command Mode INTERFACE

Usage Information
- To configure oversubscription for bursty storage traffic on a FC interface, use the `speed` command. Oversubscription allows a port to operate faster, but may result in traffic loss. For example, QSFP28 port groups in 4x8GFC mode support 16GFC oversubscription on member interfaces. QSFP28 breakout interfaces in 4x16GFC mode support 32GFC oversubscription.
- The `no` version of this command resets the port speed to the default value `auto`.

Example
```
OS10(conf-if-fc-1/1/2)# speed 16
```

Supported Releases 10.3.1E or later

speed (Management)

Configures the transmission speed of the Management interface.

Syntax `speed {10 | 100 | 1000 | auto}`

Parameters Set the Management port speed to:
- `10` — 10M
- `100` — 100M
- `1000` — 1000M
- `auto` — Set the port to auto-negotiate speed with a connected device.

Defaults Auto

Command Mode INTERFACE

Usage Information
- When you manually configure the Management port speed, match the speed of the remote device. Dell Technologies highly recommends using auto-negotiation for the Management port.
- The `no` version of this command resets the port speed to the default value `auto`.

Example
```
OS10(conf-if-ma-1/1/1)# speed auto
```

Supported Releases 10.3.0E or later

stats-monitor

Configures the polling interval for Ethernet interface counters.

Syntax `stats-monitor stat-type ethernet polling-interval` *`interval-value`*

Parameters *`interval-value`*—Enter the polling interval value, from 1 s to 15 s.

Defaults 15 s

Command Mode CONFIGURATION

Usage Information The `no` version of this command resets the configuration to the default value.

Example
```
stats-monitor stat-type ethernet polling-interval 1
```

Supported Releases	10.5.2.1 or later

switch-port-profile

Configures a port profile on the switch. The port profile determines the available front-panel ports and breakout modes.

Syntax `switch-port-profile node/unit profile`

Parameters

- *node/unit*—Enter switch information. For a standalone switch, enter `1/1`.
- *profile*—Enter the name of a platform-specific profile.

Default `profile-1`

Command Mode CONFIGURATION

Usage Information

- S4148-ON Series port profiles:
  - `profile-1` — SFP+ 10G ports (1-24 and 31-54) and QSFP28 100G ports (25-26 and 29-30) are enabled.

    QSFP28 ports support 100GE and 4x10G, 4x25G, and 2x50G breakouts. QSFP+ transceivers support 40x10G breakouts.
  - `profile-2` — SFP+ 10G ports (1-24 and 31-50), QSFP+ 40G ports (27-28), and QSFP28 ports in 40G mode (25-26 and 29-30) are enabled.

    QSFP+ and QSFP28 ports support 40GE and 4x10G breakouts. QSFP+ transceivers support 40x10G breakouts.
  - `profile-3` — SFP+ 10G ports (5-24 and 31-50), QSFP+ 40G ports (27-28), and QSFP28 ports with 40G and 100G capability (25-26 and 29-30) are enabled.

    QSFP+ ports support 40GE and 4x10G breakouts. QSFP28 ports support 100GE and 4x25G breakouts with QSFP28 transceivers, and 40GE and 4x10G breakouts with QSFP+ transceivers.
  - `profile-4` — SFP+ 10G ports (5-24 and 31-50), QSFP+ 40G ports (27-28), and QSFP28 ports with 40G and 100G capability (25-26 and 29-30) are enabled.

    QSFP+ ports support 40GE and 4x10G breakouts. QSFP28 ports support 100GE and 2x50G breakouts with QSFP28 transceivers, and 40GE and 4x10G breakouts with QSFP+ transceivers.
  - `profile-5` — SFP+ 10G ports (1-24 and 31-54), QSFP+ 40G ports (27-28), QSFP28 ports with 40G capability (26 and 30), and QSFP28 ports with 40G and 100G capability (25 and 29) are enabled.

    QSFP+ ports support 40GE and 4x10G breakouts. QSFP28 ports 26 and 30 support 40GE and 4x10G breakouts with QSFP+ transceivers. QSFP28 ports 25 and 29 support 100GE and 4x25G breakouts with QSFP28 transceivers, and 40GE and 4x10G breakouts with QSFP+ transceivers.
  - `profile-6` — SFP+ 10G ports (1-24 and 31-54), QSFP+ 40G ports (27-28), QSFP28 ports with 40G capability (26 and 30), and QSFP28 ports with 40G and 100G capability (25 and 29) are enabled.

    QSFP+ ports support 40GE and 4x10G breakouts. QSFP28 ports 26 and 30 support 40GE and 4x10G breakouts with QSFP+ transceivers. QSFP28 ports 25 and 29 support 100GE and 2x50G breakouts with QSFP28 transceivers, and 40GE and 4x10G breakouts with QSFP+ transceivers.
- S4148U-ON Port profiles:
  - `profile-1` — SFP+ unified ports (1-24), QSFP28 unified ports (25-26 and 29-30), QSFP+ Ethernet ports (27-28), and SFP+ Ethernet ports (31-54) are enabled.
    - SFP+ unified port groups operate in FC mode with 2x16GFC breakouts (ports 1 and 3) by default and support 4x8GFC. SFP+ unified ports support Ethernet 10GE mode.
    - QSFP28 unified ports 25 and 29 operate in Ethernet 100GE mode by default, and support 40GE with QSFP+ transceivers and 4x10G breakouts. QSFP28 ports 25 and 29 support 1x32GFC, 2x16GFC, and 4x8GFC in FC mode.

        - QSFP28 unified ports 26 and 30 operate in Ethernet 40GE mode by default and support 4x10G breakouts. QSFP28 ports 26 and 30 support 1x32GFC, 2x16GFC, and 4x8GFC in FC mode. QSFP+ transceivers support 4x10G breakouts.
        - QSFP+ Ethernet ports operate at 40GE by default and support 4x10G breakouts.
        - SFP+ Ethernet ports operate at 10GE.
    - `profile-2` — SFP+ unified ports (1-24), QSFP28 unified ports (25-26 and 29-30), QSFP+ Ethernet ports (27-28), and SFP+ Ethernet ports (31-54) are enabled.
        - SFP+ unified ports operate in Ethernet 10GE mode by default. SFP+ unified port groups support 4x8GFC and 2x16GFC breakouts (ports 1 and 3) in FC mode.
        - QSFP28 unified ports 25 and 29 operate in Ethernet 100GE mode by default, and support 40GE with QSFP+ transceivers and 4x10G breakouts. QSFP28 ports 25 and 29 support 1x32GFC, 2x16GFC, and 4x8GFC in FC mode.
        - QSFP28 unified ports 26 and 30 operate in Ethernet 40GE mode by default and support 4x10G breakouts. QSFP28 ports 26 and 30 support 1x32GFC, 2x16GFC, and 4x8GFC in FC mode. QSFP+ transceivers support 40x10G breakouts.
        - QSFP+ Ethernet ports operate at 40GE by default and support 4x10G breakouts.
        - SFP+ Ethernet ports operate at 10GE.
    - `profile-3` — SFP+ unified ports (1-24), QSFP28 unified ports (25-26 and 29-30), and SFP+ Ethernet ports (31-54) are enabled. QSFP+ Ethernet ports (27-28) are not available.
        - SFP+ unified ports operate in Ethernet 10GE mode by default. SFP+ unified port groups support 4x8GFC and 2x16GFC breakouts (ports 1 and 3) in FC mode.
        - QSFP28 unified ports operate in Ethernet 100GE mode by default and support 4x25G and 4x10G breakouts. QSFP28 ports support 2x16GFC and 4x16GFC breakouts in FC mode. QSFP+ transceivers support 40x10G breakouts.
        - SFP+ Ethernet ports operate at 10GE.
    - `profile-4` — SFP+ unified ports (1-24), QSFP28 unified ports (25-26 and 29-30), and SFP+ Ethernet ports (31-54) are enabled. QSFP+ Ethernet ports (27-28) are not available.
        - SFP+ unified ports operate in Ethernet 10GE mode by default. SFP+ unified ports support 4x8FC in FC mode.
        - QSFP28 unified ports operate in Ethernet 100GE mode by default, and support 2x50G, 4x25G, and 4x10G breakouts. QSFP28 ports support 4x16GFC breakouts in FC mode. QSFP+ transceivers support 40x10G breakouts.
        - SFP+ Ethernet ports operate at 10GE.
- S5232F-ON Port profiles:
    - `profile -1` — QSFP28 ports (1-32) and SFP+ ports (33-34).
        - QSFP28 ports 1 to 31 operate in 100GbE mode by default, and support 1x40G, 2x50G, 4x25G, and 4x10G breakouts.
        - QSFP28 port 32 operates in 100GbE mode by default and supports 2x50G and 1x40GE breakouts.
        - 2xSFP+ ports 33 and 34 operate in 10GbE mode by default.
    - `profile -2` — QSFP28 ports (1-32) and SFP+ port 33.
        - QSFP28 ports 1 to 32 operate in Ethernet 100GbE mode by default, and support 1x40G, 2x50G, 4x25G, and 4x10G breakouts.
        - SFP+ port 33 operates in 10GbE mode by default.
        - SFP+ port 34 is not available in this profile.

Usage Information

- Setting a port group in 2x16GFC mode activates odd-numbered interfaces 1 and 3. A port group in 1x32GFC mode activates only interface 1.
- To display the current port profile on a switch, use the `show switch-port-profile` command.
- To change the port profile on a switch, use the `switch-port-profile` command with the desired profile, save it to the startup configuration and use the `reload` command to apply the change. The switch reboots with new port configuration. The `no` version of the command resets to the default profile. When a switch reloads with a new port profile, the startup configuration resets to system defaults, except for the switch-port profile and these configured settings:
    - Management interface 1/1/1 configuration
    - Management IPv4/IPv6 static routes
    - System hostname
    - Unified Forwarding Table (UFT) mode
    - ECMP maximum paths

You must manually reconfigure other settings on a switch after you apply a new port profile and use the `reload` command to apply the change.

Example

```
OS10(config)# switch-port-profile 1/1 profile-1
Warning: Switch port profile will be applied only after a save and
reload. All management port
configurations will be retained but all other configurations will be
wiped out after the reload.
OS10(config)# do write memory
OS10(config)# do reload
```

Supported Releases 10.3.0E or later

switchport access vlan

Assigns access VLAN membership to a port in L2 Access or Trunk mode.

Syntax `switchport access vlan vlan-id`

Parameters `vlan vlan-id` — Enter the VLAN ID number, from 1 to 4093.

Default VLAN 1

Command Mode INTERFACE

Usage Information This command enables L2 switching for untagged traffic and assigns a port interface to default VLAN1. Use this command to change the assignment of the access VLAN that carries untagged traffic. You must create the VLAN before you can assign an access interface to it. The `no` version of this command resets access VLAN membership on a L2 access or trunk port to VLAN 1.

Example

```
OS10(conf-if-eth1/1/3)# switchport mode access
OS10(conf-if-eth1/1/3)# switchport access vlan 100
```

Supported Releases 10.2.0E or later

switchport mode

Places an interface in L2 Access or Trunk mode.

Syntax `switchport mode {access | trunk}`

Parameters

- `access` — Enables L2 switching of untagged frames on a single VLAN.
- `trunk` — Enables L2 switching of untagged frames on the access VLAN, and of tagged frames on the VLANs specified with the `switchport trunk allowed vlan` command.

Default `access`

Command Mode INTERFACE

Usage Information

- If you assign an IP address to an interface, you cannot use this command to enable L2 switching — you must first remove the IP address.
- The `access` parameter automatically adds an interface to default VLAN1 to transmit untagged traffic. Use the `switchport access vlan` command to change the access VLAN assignment.
- The `trunk` parameter configures an interface to transmit tagged VLAN traffic. You must manually configure VLAN membership for a trunk port with the `switchport trunk allowed vlan` command.
- Use the `no switchport` command to remove all L2 configurations when you configure an L3 mode interface.
- Use the `no switchport mode` command to restore a trunk port on an interface to L2 Access mode on VLAN1.

Example

```
OS10(conf-if-eth1/1/7)# switchport mode access
```

Supported Releases 10.2.0E or later

switchport trunk allowed vlan

Configures the tagged VLAN traffic that a L2 trunk interface can carry. An L2 trunk port has no tagged VLAN membership and does not transmit tagged traffic.

Syntax `switchport trunk allowed vlan vlan-id-list`

Parameters *vlan-id-list* — Enter the VLAN numbers of the tagged traffic that the L2 trunk port can carry. Comma-separated and hyphenated VLAN number ranges are supported.

Default None

Command Mode INTERFACE

Usage Information Use the `no` version of this command to remove the configuration.

Example

```
OS10(conf-if-eth1/1/2)# switchport trunk allowed vlan 1000
```

```
OS10(conf-if-eth1/1/2)# no switchport trunk allowed vlan 1000
```

Supported Releases 10.2.0E or later

wavelength

Configures wavelength for tunable 10-GB SFP+ optical transceiver.

Syntax `wavelength wavelength-value`

Parameters *wavelength-value* — Enter a value to set a wavelength for the SPF+ optics. The range is from 1528.38 to 1568.77.

Defaults None.

Command Mode INTERFACE CONFIGURATION

Usage Information To specify the wavelength value, you must enter exactly six digits - four before and two after the decimal point. The value must conform to the following format: ABCD.EF; for example, 1545.23. Any number that does not conform to this format is rejected including whole numbers such as 1568. However, the following type of values are accepted: 1568.00.

Example

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/14
OS10(conf-if-eth1/1/14)# wavelength 1530.00
```

Supported Releases 10.4.2E or later

10

Fibre Channel

OS10 switches with Fibre Channel (FC) ports operate in one of the following modes: Direct attach (F_Port), NPIV Proxy Gateway (NPG). In the FSB mode, you cannot use the FC ports.

E_Port

Expansion port (E_Port) in a switch is used to connect two fiber channel switches to form a multiswitch SAN fabric.

The default port mode in a multiswitch setup is F. You can create a multiswitch fabric by configuring the port mode as E on the interface that connects two switches, which creates an interswitch link (ISL) consecutively. Enable the multiswitch fabric mode using the `feature fc [domain-id` *`domain-id-val`* `| npg | fip-snooping [with-cvl] | multi-switch]` command in CONFIGURATION mode.

```
OS10(config)# feature fc multi-switch
```

F_Port

Fibre Channel fabric port (F_Port) is the switch port that connects the FC fabric to a host. S4148U-ON switches support F_Port.

Enable Fibre Channel F_Port mode globally using the `feature fc domain-ID` *`domain-ID`* command in CONFIGURATION mode.

```
OS10(config)# feature fc domain-id 100
```

NPIV Proxy Gateway

A node port (N_Port) is a port on a network node that acts as a host or storage device, and is used in FC point-to-point or FC switched fabric topologies.

N_Port ID Virtualization (NPIV) allows multiple N_Port IDs to share a single physical N_Port.

The NPIV Proxy Gateway (NPG) provides Fibre Channel over Ethernet (FCoE) to Fibre Channel (FC) bridging and conversely. Starting from OS 10.4.1, NPG supports FC to FC switching as well.

The S4148U-ON supports both, CNA and HBA, in NPG mode.

Enable NPG mode globally using the `feature fc npg` command in CONFIGURATION mode.

To change the port mode from default N_Port, use the `fc port-mode F` command on FC interfaces.

NOTE: In a switch that is configured in NPG or F-Port mode, OS10 does not support scale profile VLAN configuration. To use scale profile configuration in NPG or F-Port mode, enable CPU-based VLAN flooding on the vfabric VLAN using the `mode L3` command.

FIP snooping bridge

FCoE encapsulates FC frames over Ethernet networks. FCoE Initialization protocol (FIP) establishes FC connectivity with Ethernet ports. FSB implements security characteristics to admit valid FCoE traffic in the Ethernet networks. FIP and FCoE provide FC emulation-over-Ethernet links. OS10 switches with Ethernet ports operate in FSB.

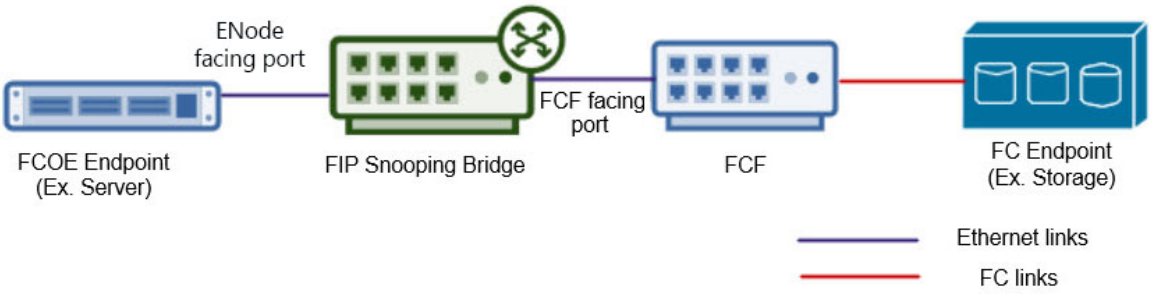
```
OS10(config)# feature fip-snooping
```

An Ethernet switch operating in FSB mode snoops FIP packets on FCoE-enabled VLANs and discovers the following information:

- End nodes (E-Nodes)
- Fibre Channel Forwarder (FCF)
- Connections between E-Nodes and FCFs
- Sessions between E-Nodes and FCFs

NOTE: OS10 supports multiple E-Nodes in F_Port mode.

Using the discovered information, the switch installs ACL entries that provide security and point-to-point link emulation.



Configuration notes

Dell PowerSwitch S4148U-ON:

The total errors count in the show interface fibrechannel command output displays incorrect values during FC port flaps, IOM reboot, or port conversion from ETH to FC, followed by bringing up of the FC port.

Fibre Channel over Ethernet

Fibre Channel over Ethernet (FCoE) encapsulates Fibre channel frames over Ethernet networks.

FCoE Initialization protocol (FIP) establishes Fibre channel connectivity with Ethernet ports.

FIP snooping bridge (FSB) implements security characteristics to admit valid FCoE traffic in the Ethernet networks.

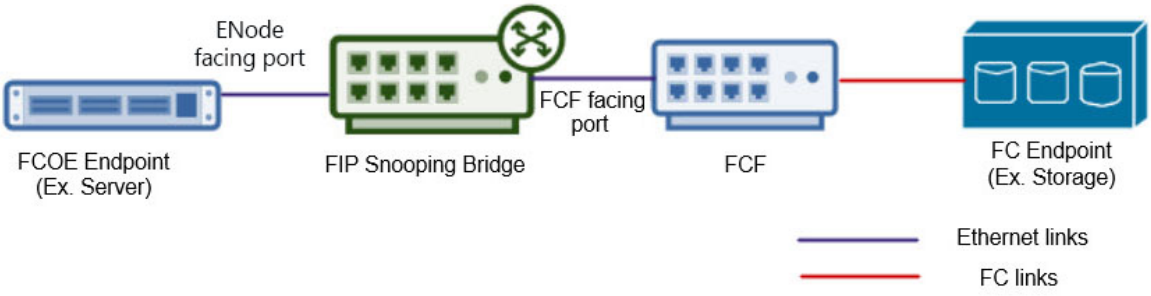
FIP and FCoE provide FC emulation over Ethernet links.

An Ethernet switch configured to operate in FSB mode snoops FIP packets on FCoE enabled VLANs and discovers the following information:

- End nodes (ENodes)
- Fibre channel forwarder (FCF)
- Connections between ENodes and FCFs
- Sessions between ENodes and FCFs

NOTE: OS10 supports multiple ENodes in F_Port mode.

Using the discovered information, the switch installs ACL entries that provide security and point-to-point link emulation.



Configure FIP snooping

1. Enable FIP snooping globally using the `feature fip-snooping with-cvl` command in CONFIGURATION mode.
2. Before applying FIP snooping to a VLAN, ensure that the VLAN already contains Ethernet or port-channel members that are enabled with FCF Port mode. Enable FCF mode on an Ethernet or port-channel using the `fip-snooping port-mode fcf` command in INTERFACE mode.
3. Enable FIP snooping on the VLAN using the `fip-snooping enable` command in VLAN INTERFACE mode. You can apply FIP snooping on a maximum of 12 VLANs.
4. Add an FC map to the VLAN with the `fip-snooping fc-map` *`fc-map`* command.

5. Configure the maximum number of ENode sessions to be allowed using the `fcoe max-sessions-per-enodemac` *`max-session-number`* command in CONFIGURATION mode, from 1 to 64.

NOTE: OS10 switches do not support multi-hop FIP snooping bridge (multi-hop FSB) capability; links to other FIP snooping bridges on a FIP snooping-enabled device (bridge-to-bridge links) are not supported.

Configure FIP snooping bridge

```
OS10(config)# feature fip-snooping with-cvl
OS10(config)# interface ethernet 1/1/32
OS10(conf-if-eth1/1/32)# fip-snooping port-mode fcf
OS10(conf-if-eth1/1/32)# exit
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# fip-snooping enable
OS10(conf-if-vl-100)# fip-snooping fc-map 0xEFC64
OS10(conf-if-vl-100)# exit
OS10(config)# fcoe max-sessions-per-enodemac 64
```

Terminology

ENode	End Node or FCoE node
FC	Fibre Channel
FC ID	A 3-byte address used by FC to identify the end points
FC Map	A 3-byte prefix configured per VLAN, used to frame FCoE MAC address
FCF	Fibre Channel Forwarder
FCoE	Fibre Channel over Ethernet
FCoE MAC	Unique MAC address used to identify an FCoE session. This is a combination of FC ID and FC Map.
FIP	FCoE Initialization Protocol
NPG	NPIV Proxy Gateway
NPIV	N_Port ID Virtualization

Virtual fabric

Virtual fabrics (vfabric) divide a physical fabric into logical fabrics. Manage each vfabric independently. The fabric ID identifies each vfabric. You can configure only one vfabric in F_Port mode and multiple vfabrics in NPG mode. F_Port and NPG modes are mutually exclusive.

If you have already configured a vfabric in F_Port mode, while configuring vfabrics in NPG mode, disable F_Port mode. When you disable F_Port mode, the existing vfabric is removed and you must configure new vfabrics in NPG mode. If you are moving from NPG mode to F_Port mode, disable NPG mode and create the new vfabric in F_Port mode.

Zoning allows you to increase network security by partitioning the devices connected to the vfabric into subsets. Partitioning restricts unnecessary interactions between the members of vfabric. For more information, see Fibre Channel zoning.

After configuring a vfabric ID, you can create a name, associate a VLAN to carry traffic to the vfabric, configure FCoE parameters, configure the default zone, and activate the zoneset.

NOTE: Do not associate a VLAN that is already in use as a vfabric VLAN.

To configure a vfabric in F_Port mode:

1. Configure a vfabric using the `vfabric` *`fabric-ID`* command in CONFIGURATION mode. The switch enters vfabric CONFIGURATION mode
2. Associate a VLAN ID to the vfabric with the `vlan` *`vlan-ID`* command.
3. Add an FC map with the `fcoe fcmap` *`fc-map`* command.
4. Activate a zoneset using the `zoneset activate` *`zoneset-name`* command.
5. Allow access to all logged-in members in the absence of an active zoneset configuration using the `zone default-zone permit` command. The logged-in members are the FC nodes that are successfully logged into the FC fabric, identified by the vfabric.
6. (Optional) Add a name to the vfabric using the `name` *`vfabric-name`* command.
7. Apply the vfabric to FC interfaces using the `vfabric` *`fabric-ID`* command in FC INTERFACE mode.

Example configuration of vfabric in F_Port mode

```
OS10(config)# vfabric 100
OS10(conf-vfabric-100)# name 100
OS10(conf-vfabric-100)# vlan 1023
```

```
OS10(conf-vfabric-100)# fcoe fcmap 0xEFC64
OS10(conf-vfabric-100)# zoneset activate set
OS10(conf-vfabric-100)# zone default-zone permit
OS10(conf-vfabric-100)# exit
OS10(config)# interface fibrechannel 1/1/1
OS10(conf-if-fc1/1/1)# vfabric 100
```

View vfabric configuration

```
OS10(conf-vfabric-100)# show configuration
!
vfabric 100
 name 100
 vlan 1023
 fcoe fcmap 0xEFC64
 zoneset activate set
 zone default-zone permit
```

```
OS10# show vfabric

```

To configure a vfabric in NPG mode:

1. Configure a vfabric using the `vfabric` *`fabric-ID`* command in CONFIGURATION mode. The switch enters vfabric CONFIGURATION mode.
2. Associate a VLAN ID to the vfabric with the `vlan` *`vlan-ID`* command.
3. Add FCoE parameters with the `fcoe {fcmap` *`fc-map`* `| fcf-priority` *`fcf-priority-value`* `| fka-adv-period` *`adv-period`* `| vlan-priority` *`vlan-priority-value`* `| keep-alive}` command.

4. (Optional) Add a name to the vfabric using the `name vfabric-name` command.
5. Apply the vfabric to interfaces using the `vfabric fabric-ID` command in INTERFACE mode.

Configure vfabric in NPG mode

```
OS10(config)# vfabric 10
OS10(conf-vfabric-10)# name 10
OS10(conf-vfabric-10)# vlan 100
OS10(conf-vfabric-10)# fcoe fcmap 0x0efc01
OS10(conf-vfabric-10)# fcoe fcf-priority 128
OS10(conf-vfabric-10)# fcoe fka-adv-period 8
OS10(conf-vfabric-10)# fcoe vlan-priority 3
OS10(conf-vfabric-10)# exit
OS10(config)# interface ethernet 1/1/31
OS10(conf-if-eth1/1/31)# vfabric 10
```

View vfabric configuration

```
OS10(conf-vfabric-10)# show configuration
!
vfabric 10
 name 10
 vlan 100
 fcoe fcmap 0xEFC01
 fcoe fcf-priority 128
 fcoe fka-adv-period 8
 fcoe vlan-priority 3
```

```
OS10# show vfabric
Fabric Name 10
Fabric Type NPG
Fabric Id 10

 fcoe vlan-priority 3
```

Fibre Channel zoning

Fibre Channel (FC) zoning partitions a FC fabric into subsets to restrict unnecessary interactions, improve security, and manage the fabric more effectively. Create zones and add members to the zone. Identify a member by an FC alias, world wide name (WWN), or FC ID. A zone can have a maximum of 255 unique members. Create zonesets and add the zones to a zoneset. A switch can have multiple zonesets, but you can activate only one zoneset at a time in a fabric.

1. (Optional) Create an FC alias using the `fc alias alias-name` command in CONFIGURATION mode. The switch enters Alias CONFIGURATION mode.
2. Add members to the alias using the `member {wwn wwn-ID | fc-id fc-id}` command in Alias CONFIGURATION mode. You can add a maximum of 255 unique members.
3. Create a zone using the `fc zone zone-name` command in CONFIGURATION mode. The switch enters Zone CONFIGURATION mode.

4. Add members to the zone with the `member {alias-name alias-name | wwn wwn-ID | fc-id fc-id}` command in Zone CONFIGURATION mode.
5. Create a zoneset using the `fc zoneset zoneset-name` command in CONFIGURATION mode. The switch enters Zoneset CONFIGURATION mode.
6. Add the existing zones to the zoneset with the `member zone-name` command in Zoneset CONFIGURATION mode.
7. Activate the zoneset using the `zoneset activate zoneset-name` command in vfabric CONFIGURATION mode. The members in the zoneset become active.
8. Allow access between all the logged-in FC nodes in the absence of an active zoneset configuration using the `zone default-zone permit` command in vfabric CONFIGURATION mode. A default zone advertises a maximum of 255 members in the registered state change notification (RSCN) message.

   NOTE: The default-zone allows or denies access to the FC nodes when an active zoneset is not available. When the default-zone action is set to `permit`, the switch allows communication between all the possible pairs of FC nodes. When you do not configure the default-zone action, the switch denies any communication between FC nodes.

To configure the vfabric on FC interfaces, associate a VLAN ID to the vfabric and add an FC map. For more information, see Virtual fabric.

Configure FC zoning

```
OS10(config)# fc zone hba1
OS10(config-fc-zone-hba1)# member wwn 10:00:00:90:fa:b8:22:19
OS10(config-fc-zone-hba1)# member wwn 21:00:00:24:ff:7b:f5:c8
OS10(config-fc-zone-hba1)# exit

OS10(config)# fc zoneset set
OS10(conf-fc-zoneset-set)# member hba1
OS10(conf-fc-zoneset-set)# exit

OS10(config)# vfabric 100
OS10(conf-vfabric-100)# zoneset activate set
OS10(conf-vfabric-100)# zone default-zone permit
```

View FC zone configuration

```
OS10(config-fc-zone-hba1)# show configuration

```

F_Port on Ethernet

OS10 supports configuring F_Port mode on an Ethernet port that connects to converged network adapters (CNA). After enabling F_Port mode, configure a vfabric and apply the vfabric to Ethernet ports connected to CNA. You can configure only one vfabric in F_Port mode.

You can apply the configured vfabric to multiple Ethernet interfaces. You can also add Ethernet interfaces to a port-channel and apply the vfabric to the port-channel.

Example configuration

```
OS10(config)# feature fc domain-id 100
OS10(config)# vfabric 100
OS10(conf-vfabric-100)# name 100
OS10(conf-vfabric-100)# vlan 1023
OS10(conf-vfabric-100)# fcoe fcmap 0xEFC64
OS10(conf-vfabric-100)# zoneset activate set
OS10(conf-vfabric-100)# zone default-zone permit
OS10(conf-vfabric-100)# exit
OS10(config)# interface ethernet 1/1/30
OS10(conf-if-eth1/1/30)# vfabric 100
```

Pinning FCoE traffic to a specific port of a port-channel

You can isolate FIP and FCoE traffic by configuring a pinned port at the FCoE port-channel.

FCoE port-channel is the port-channel used for FIP and FCoE traffic in the intermediate switches between server and storage devices.

VLT provides Active/Active LAN connectivity on converged links by forwarding traffic in multiple paths to multiple upstream devices without STP blocking any of the uplinks. This works for Ethernet traffic, but FCoE requires dedicated links for each SAN Fabric. FCoE traffic sent on VLT breaks SAN fabric isolation.

The FC sessions form between FC nodes and FCoE sessions happen between Ethernet nodes.

To form FC or FCoE sessions, the fabric login request and reply must traverse the switch through the same port. The fabric login request initiated from the server through the switch reaches the SAN Fabric. The login accept response is hashed out to any of the ports in the port-channel. If the server receives the response on a different port than where the request was sent, the server keeps retrying the request. Because of this action, the FC or FCoE sessions learnt based on the login accept response change to the unstable state. The sessions keep flapping until the request and response converge in the same port. To avoid this, pin one of the ports in the port-channel.

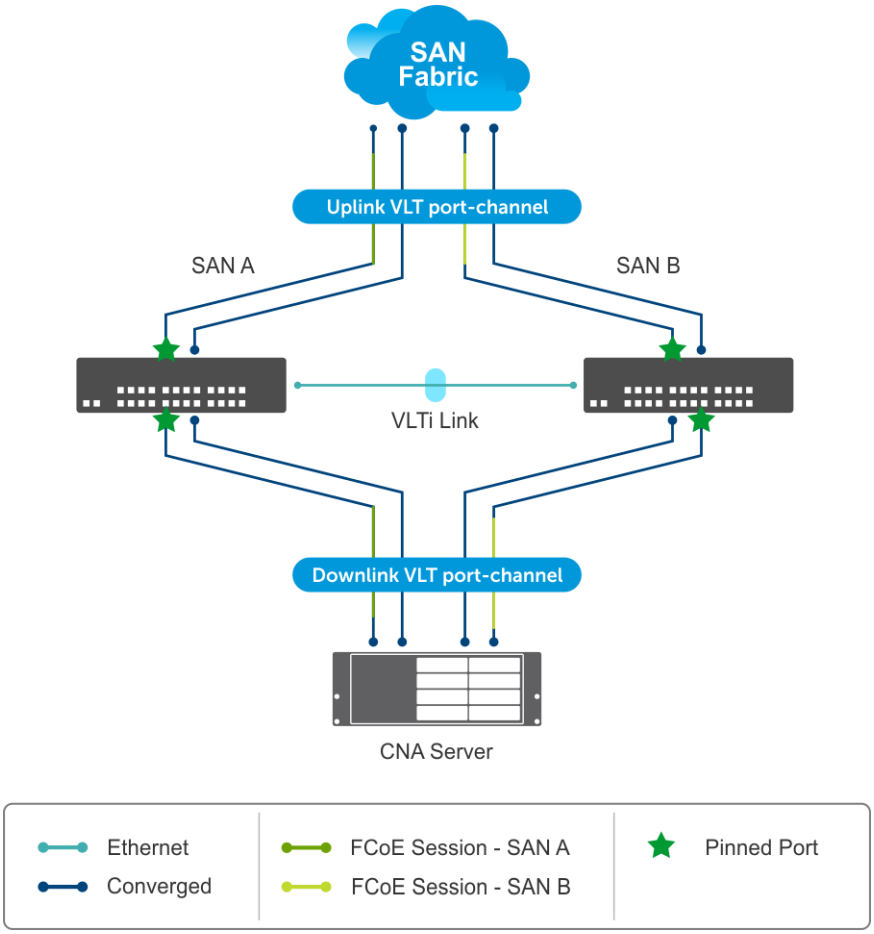
To support FCoE on multi-level VLT networks, use port pinning in FCoE port-channels. Port pinning is a static configuration that restricts the FIP and FCoE traffic to one port of the port-channel overriding hardware port channel hashing. The system classifies and redirects the packets exchanged during FCoE sessions to the port based on the ACL configuration. The remaining Ethernet traffic flows through both the pinned port and other ports in the port-channel, based on port channel hashing. Dell Technologies recommends to use pinned port if there are more than one port in FCoE port-channel. In a VLT network, the server has two unique FCoE sessions to SAN fabric and the traffic flows based on pinned port configuration. If there is only one port in the port-channel, there is no need for a pinned port.

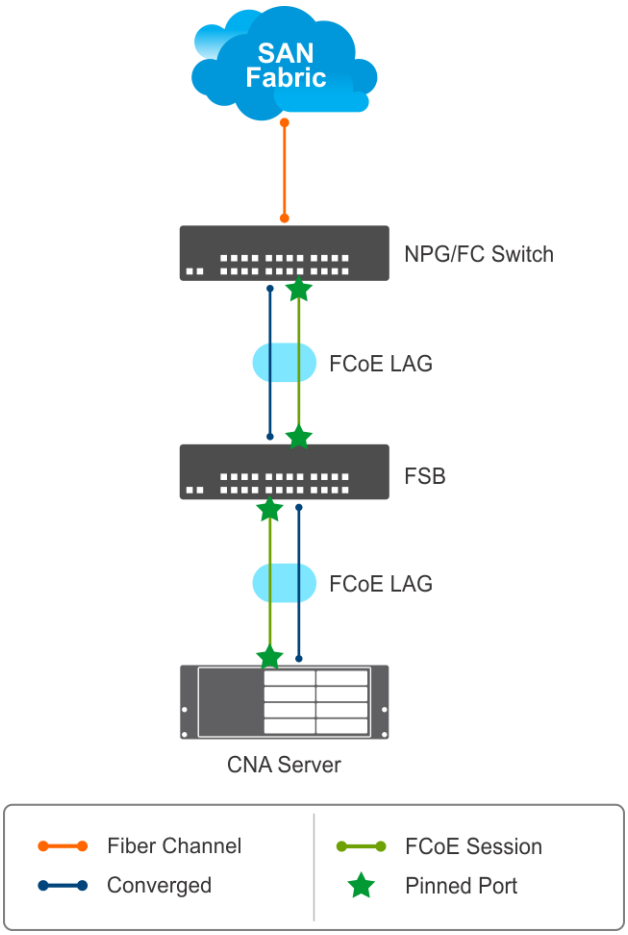
NOTE: The pinned port configuration is supported on FSB, Ethernet downlink port-channel of NPG, and F_Port mode.

Limitations:

- The system uses an ACL table for ENode MAC with a redirect port option similar to FCF. This limits the number of FC or FCoE sessions.
- When the pinned port goes down, you must manually re-configure another active port in the port-channel as pinned port. You can perform this re-configuration only in the intermediate switches, but not in the server.
- If there is a mismatch in the configuration or if the pinned port goes down, the system does not use other ports in port-channel even if there is a valid path to server and storage device.
- When you add or remove a pinned port when FCoE sessions are active, the system clears and re-initiates the FCoE sessions based on the configuration. The system displays warning messages during the configuration.

The following illustrations show VLT and non-VLT networks with FCoE traffic flowing through pinned port.





Sample FSB configuration on VLT network

1. Enable the FIP snooping feature globally.

```
OS10(config)# feature fip-snooping with-cvl
```

2. Create the FCoE VLAN.

```
OS10(config)#interface vlan 1001
OS10(conf-if-vl-1001)# fip-snooping enable
```

3. Configure the VLTi interface.

```
OS10(config)# interface ethernet 1/1/27
OS10(conf-if-eth1/1/27)# no shutdown
OS10(conf-if-eth1/1/27)# no switchport
```

4. Configure the VLT.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.151.110  <<Enter the management IP address
of the VLT peer>>
OS10(conf-vlt-1)# discovery-interface ethernet1/1/27
```

5. Enable DCBX.

```
OS10(config)# dcbx enable
```

6. Enable the PFC parameters on the interfaces.

```
OS10(config)# class-map type network-qos fcoematch
OS10(config-cmap-nqos)# match qos-group 3
OS10(config-cmap-nqos)# exit
```

```
OS10(config)# policy-map type network-qos PFC
OS10(config-pmap-network-qos)# class fcoematch
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 3
```

7. Create uplink and downlink port-channels, and configure the FCF facing port.

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description uplink_VLT_PORT_CHANNEL
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport access vlan 1
OS10(conf-if-po-10)# switchport trunk allowed vlan 1001,10
OS10(conf-if-po-10)# vlt-port-channel 1
OS10(conf-if-po-10)# fip-snooping port-mode fcf
```

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# description downlink_VLT_PORT_CHANNEL
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport access vlan 1
OS10(conf-if-po-20)# switchport trunk allowed vlan 1001,10
OS10(conf-if-po-20)# vlt-port-channel 2
```

8. Apply the PFC configuration on downlink and uplink interfaces. In addition, include the interfaces to the port-channel and configure one of the interfaces as pinned-port.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# description uplink_port_channel_member1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# channel-group 10 mode active
OS10(conf-if-eth1/1/1)# fcoe-pinned-port
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/1)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# description uplink_port_channel_member2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# channel-group 10 mode active
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/2)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/3
OS10(conf-if-eth1/1/3)# description downlink_port_channel_member1
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# channel-group 20 mode active
OS10(conf-if-eth1/1/3)# fcoe-pinned-port
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/3)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/4
OS10(conf-if-eth1/1/4)# description downlink_port_channel_member2
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# channel-group 20 mode active
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/4)# priority-flow-control mode on
```

```

Sample FC Switch configuration on VLT network

1. Enable the F_PORT mode.

```
OS10(config)# feature fc domain-id 1
```

2. Create the FC zones.

```
OS10(config)# fc zone zoneA
OS10(config-fc-zone-zoneA)# member wwn 10:00:00:90:fa:b8:22:19 <<Enter the WWN of
Initiator CNA>>
OS10(config-fc-zone-zoneA)# member wwn 21:00:00:24:ff:7b:f5:c8 <<Enter the WWN of
Target>>
```

3. Create the FC zoneset.

```
OS10(config)# fc zoneset zonesetA
OS10(conf-fc-zoneset-zonesetA)# member zoneA
```

4. Create the vfabric VLAN.

```
OS10(config)# interface vlan 1001
```

5. Create vfabric and activate the FC zoneset.

```
OS10(config)# vfabric 1
OS10(conf-vfabric-1)# vlan 1001
OS10(conf-vfabric-1)# fcoe fcmap 0xEFC00
OS10(conf-vfabric-1)# zoneset activate zonesetA
```

6. Configure the VLTi interface.

```
OS10(config)# interface ethernet 1/1/27
OS10(conf-if-eth1/1/27)# no shutdown
OS10(conf-if-eth1/1/27)# no switchport
```

7. Configure the VLT.

```
OS10(config)# vlt-domain 10
OS10(conf-vlt-10)# backup destination 10.16.151.110
OS10(conf-vlt-10)# discovery-interface ethernet1/1/27
```

8. Enable DCBX.

```
OS10(config)# dcbx enable
```

9. Apply the vfabric on the interfaces.

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description downlink_VLT_PORT_CHANNEL_to FSB
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport access vlan 1
OS10(conf-if-po-10)# switchport trunk allowed vlan 10
OS10(conf-if-po-10)# vlt-port-channel 1
OS10(conf-if-po-10)# vfabric 1
```

```
OS10(config)# interface fibrechannel 1/1/26
OS10(conf-if-fc1/1/26)# description target_connected_port
OS10(conf-if-fc1/1/26)# no shutdown
OS10(conf-if-fc1/1/26)# vfabric 1
```

10. Apply the PFC configuration on the downlink interfaces. Include the interfaces to the port-channel and configure one of the interfaces as pinned-port.

```
OS10(config)# interface ethernet 1/1/9
OS10(conf-if-eth1/1/9)# description downlink_port_channel_member1

Sample FSB configuration on non-VLT network

The following examples illustrate configurations in intermediate switches in non-vlt network, to communicate with server.

1. Enable the FIP snooping feature globally.

```
OS10(config)# feature fip-snooping with-cvl
```

2. Create the FCoE VLAN.

```
OS10(config)#interface vlan 1001
OS10(conf-if-vl-1001)# fip-snooping enable
```

3. Enable DCBX.

```
OS10(config)# dcbx enable
```

4. Enable the PFC parameters on the interfaces.

```
OS10(config)# class-map type network-qos fcoematch
OS10(config-cmap-nqos)# match qos-group 3
OS10(config-cmap-nqos)# exit
OS10(config)# policy-map type network-qos PFC
OS10(config-pmap-network-qos)# class fcoematch
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 3
```

5. Create uplink and downlink port-channels, and configure the FCF facing port.

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport access vlan 1
```

```
OS10(conf-if-po-10)# switchport trunk allowed vlan 1001,10
OS10(conf-if-po-10)# fip-snooping port-mode fcf
```

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport access vlan 1
OS10(conf-if-po-20)# switchport trunk allowed vlan 1001,10
```

6. Apply the PFC configuration on downlink and uplink interfaces. In addition, include the interfaces to the port-channel and configure one of the interfaces as pinned-port.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# channel-group 10 mode active
OS10(conf-if-eth1/1/1)# fcoe-pinned-port
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/1)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# channel-group 10 mode active
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/2)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# channel-group 20 mode active
OS10(conf-if-eth1/1/3)# fcoe-pinned-port
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/3)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# channel-group 20 mode active
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/4)# priority-flow-control mode on
```

```

Sample FC Switch configuration on non-VLT network

1. Enable the F_PORT mode.

```
OS10(config)# feature fc domain-id 1
```

2. Create the FC zones.

```
OS10(config)# fc zone zoneA
OS10(config-fc-zone-zoneA)# member wwn 10:00:00:90:fa:b8:22:19 <<Enter the WWN of
Initiator CNA>>
OS10(config-fc-zone-zoneA)# member wwn 21:00:00:24:ff:7b:f5:c8 <<Enter the WWN of
Target>>
```

3. Create the FC zoneset.

```
OS10(config)# fc zoneset zonesetA
OS10(conf-fc-zoneset-zonesetA)# member zoneA
```

4. Create the vfabric VLAN.

```
OS10(config)# interface vlan 1001
```

5. Create vfabric and activate the FC zoneset.

```
OS10(config)# vfabric 1
OS10(conf-vfabric-1)# vlan 1001
OS10(conf-vfabric-1)# fcoe fcmap 0xEFC00
OS10(conf-vfabric-1)# zoneset activate zonesetA
```

6. Enable DCBX.

```
OS10(config)# dcbx enable
```

7. Apply the vfabric on the interfaces.

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport access vlan 1
OS10(conf-if-po-10)# switchport trunk allowed vlan 10
OS10(conf-if-po-10)# vfabric 1
```

```
OS10(config)# interface fibrechannel 1/1/26
OS10(conf-if-fc1/1/26)# description target_connected_port
OS10(conf-if-fc1/1/26)# no shutdown
OS10(conf-if-fc1/1/26)# vfabric 1
```

8. Apply the PFC configuration on the downlink interfaces. Include the interfaces to the port-channel and configure one of the interfaces as pinned-port.

```
OS10(config)# interface ethernet 1/1/9
OS10(conf-if-eth1/1/9)# no shutdown
OS10(conf-if-eth1/1/9)# channel-group 10 mode active
OS10(conf-if-eth1/1/9)# fcoe-pinned-por
OS10(conf-if-eth1/1/9)# no switchport
```

```
OS10(conf-if-eth1/1/9)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/9)# priority-flow-control mode on
```

```
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# no shutdown
OS10(conf-if-eth1/1/10)# channel-group 10 mode active
OS10(conf-if-eth1/1/10)# no switchport
OS10(conf-if-eth1/1/10)# service-policy input type network-qos PFC
OS10(conf-if-eth1/1/10)# priority-flow-control mode on
```

Multiswitch fabric (E Port)

E Ports are interfaces that connect the FC switches to form a multiswitch SAN fabric. These ports carry control frames between the switches to configure and maintain the fabric. An Inter-Switch Link (ISL) is created when you connect two E Ports to one another. FC ISL maintains the information in FC frames as the traffic flows between multiple switches.

The multiswitch configuration sets the port mode as E. The switch port initialization for an E Port includes the exchange of Exchange link parameters (ELP) message sequences, on the ISL between two E Ports.

Use the multiswitch option to enable the multiswitch fabric mode. In the multiswitch fabric mode, the default port mode is F. You can enable the E Port mode by configuring the port mode as E. When the E port becomes operationally up, the link initialization starts, which include the exchange of link parameters (ELP) with the peer switch through the ISL. On successful exchange of ELP, the switches are allowed to participate in principal switch election. Delete multiswitch configurations when disabling a feature. You can disable the multiswitch mode only if you delete the related configurations.

Principal switch selection

A principal switch is a switch that assigns and maintains a unique domain ID across the fabric. During the principal switch selection, the switch with the highest priority becomes the principal switch. If two switches have the same priority, the switch with lower WWN becomes the principal switch. The valid range to set the priority is 1, and from 3 to 255. Priority 1 has the highest priority. A switch with priority 255 cannot become the principal switch. You can modify the switch priority only when the vfabric is in inactive state. You can activate the vfabric only by adding VLAN and fcmap configuration under the vfabric configuration view. Ensure to configure the switch priority before activating the vfabric.

An ISL that points towards the principal switch is called an upstream principal ISL, which is discovered during principal switch election. After completing the fabric reconfiguration, the local switch requests for domain ID allocation through an upstream principal ISL. An ISL that points away from the principal switch is called a downstream principal ISL. Link failure results in

rebuilding the fabric. When the principal ISL fails and if no other path exists between the two affected switches, then the build fabric (BF) operation is triggered. If the backup link (nonprincipal ISL) is available, then the link failure recovery is triggered. Whenever the principal switch election is retriggered nondisruptively, the switches check if the previously assigned domain IDs match the newly elected principal switch. The switches remember the previously assigned domain IDs. If you have already configured the preferred domain IDs, during a switch reboot, the switches check for the preferred domain IDs. If you do not configure a preferred domain ID, the previously assigned domain ID is considered throughout the switch reload. When two different fabrics join and when both fabrics have the same domain ID configured, the reconfigure fabric (RCF) operation occurs as the domain ID overlaps. Any duplicate domain IDs assigned during a fabric merge are detected during the EFP exchange.

Fabric reconfigurations occur in two ways. They are nondisruptive reconfiguration (build fabric) and disruptive reconfiguration (reconfigure fabric). BF occurs when two configured fabrics merge and both the fabrics have nonoverlapping domain ID list. Reconfigure fabric occurs when both the fabrics have overlapping domain ID list, which can be detected through EFP exchange. Login request packets from F or VF ports are not served until the domain ID allocation is successfully completed.

The principal switch assigns a requested domain ID based on the availability of the ID. The FLOGI requests, received until the domain ID is assigned are silently dropped.

All the switches in the fabric must have identical E_D_TOV ranging between 1000 ms to 10,000 ms and R_A_TOV timer values ranging between 5000 ms and 10000 ms respectively. If there is a mismatch in the configuration value, that switch is isolated from the fabric.

Fabric shortest path first (FSPF)

FSPF is a link state path selection protocol. All the ISL links between FC switches are treated as point to point. FSPF tracks the state of the links on all switches in the fabric, and associates a cost with each link. FSPF computes paths from one switch to all other switches present in the fabric. FSPF computes the best path by adding the cost of the link that is traversed by the paths and by choosing the least path with the least cost to reach a particular domain ID from a switch. It also computes the best path between the switches that is based on the link cost. FSPF computes the shortest path from the local domain to all other domains available in the fabric and updates route details with the next hop to reach the shortest path. Hold-time interval must be elapsed between the two runs of shortest path first (SPF) run. This release of OS10 does not support incremental SPF run. E ports exchange FSPF hello packets periodically on the ISL to form and maintain neighbor adjacency. The FSPF link state updates (LSU) use this link adjacency to exchange the link state information of a switch, across the fabric. Each switch maintains a link state database that is based on this link state information. This link state database is used in the SPF (Dijkstra algorithm) to compute the shortest path to reach a switch in the fabric. The name server service uses these routes to synchronize the name server database across the fabric. Hence, FSPF helps in building the fabric connectivity. Configure the same hold-time value on all the switches to ensure a consistent route convergence, and to avoid intermittent forwarding loop. When you configure a shorter hold-time, the route update is faster. FSPF detects the link failures in the fabric and recomputes the next available shortest path to reach the destination domain. FSPF also updates the change in route such as addition of new link or removal of existing link and when the link goes up or down.

Distributed domain name server (DNS)

DNS is responsible for name server registration and management of Nx_Ports that are attached to the switch. The registered name entries are stored in the local database. Each switch exchanges its name server information with other switches in the fabric to maintain a synchronized and distributed name service.

Each switch in the fabric must distribute switch registered state change notification (SW_RSCNs) throughout the fabric whenever there is a change in its local database.

Topology changes trigger SW_RSCN, and NS queries. Each switch forwards the SW_RSCN packets on the FSPF computed path towards the other switches in the fabric.

System logs

The system log file contains the system logs for the following events:

- FC port operationally up
- Principal switch selection
- Domain ID assignment
- Port isolation
- Fabric or nondisruptive reconfiguration data
- Disruptive fabric reconstruction
- Error conditions when ELP or EFP exchange fails, and when the port goes into isolated state

Restrictions and limitations

This section lists the restrictions, and limitations of the multiswitch fabric feature.

- The multiswitch feature does not support Virtual E-ports (VE), BB_credit configuration, autoport mode, static FC route, zone merging, ESC exchange between switches, and switch port initialization.
- Only one vfabric is supported per switch in the multiswitch mode.
- Interoperability with other vendors, such as non-OS10 switches are not supported.
- Due to hardware limitations, multiswitch fabric feature does not support ECMP at the NPU level.
- Incremental update for shortest path route computation is not supported. The shortest path computation always runs for the entire fabric.
- ACL entries that are installed for control and data traffic use statically reserved CAM entries. Dynamic ACL space allocation is not supported.
- The switch supports zoning configurations like the F port mode. Configure the same zoning configurations on all switches in the fabric to avoid the Logical Unit Numbers (LUNs) being lost, during topology changes.

NOTE: When you enable the multiswitch feature, the N port mode is disabled. The default port mode is the F port. During the multiswitch fabric configuration, if you delete the E Port mode, the port mode resets to the default, F port mode.

Multiswitch Fabric (E Port) Limitations

The following limitations are applicable in 10.5.1:

- The multiswitch feature does not support Virtual E ports (VE), BB_credit configuration, autoport mode, static FC route, zone merging, ESC exchange between switches, and switch port initialization.
- Only one vfabric is supported per switch in multiswitch mode.
- Interoperability with other vendors, such as non-OS10 switches are not supported.
- Due to hardware limitations, the multiswitch fabric feature does not support ECMP at the NPU level.
- Incremental update for shortest path route computation is not supported. The shortest path computation always runs for the entire fabric.
- ACL entries that are installed for control and data traffic use statically reserved CAM entries. Dynamic ACL space allocation is not supported.
- The switch supports zoning configurations like the F port mode. Configure the same zoning configurations on all switches in the fabric to avoid the Logical Unit Numbers (LUNs) being lost, during topology changes.

Configure multiswitch fabric (E Port)

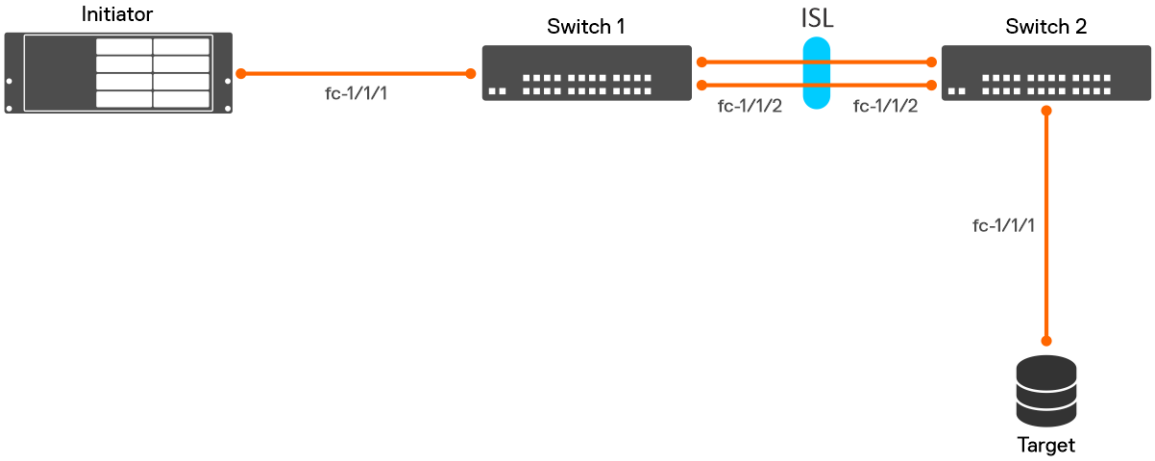
This section describes the procedure to configure multiswitch fabric (E Port).

Configuration notes

- When two different fabrics join and when both fabrics have the same domain ID configured, the reconfigure fabric (RCF) operation occurs as the domain ID overlaps.
- The RCF operation results in traffic disruptions and after the RCF operation, each switch in the fabric gets a unique domain ID from the principal switch.
- During the merge of conflicting domain IDs, the switch may perform an additional RCF to stabilize when the switch name server entries exceed 700.
- It is recommended to not merge fabrics with conflicting preferred domain IDs.
- During a switch reboot, with conflicting preferred domain IDs, the switches first assign itself a configured domain ID.
- When the E Port links of the switch comes up, the RCF operation occurs again as the domain ID overlaps.

The following example shows a simple multiswitch setup that includes switch-1 and switch-2 with default configurations:

To enable the multiswitch mode, you must first disable the current mode. Configure switch-1 and switch-2 to configure the multiswitch fabric.



Switch-1 configuration

1. Enable the multiswitch feature globally.

```
OS10(config)# feature fc multi-switch
```

2. Create a vFabric VLAN.

```
OS10(config)# interface vlan 1001
```

3. Create vFabric.

```
OS10(config)# vfabric 1
OS10(conf-vfabric-1)#
```

NOTE: The recommended configuration is to configure the same VLAN and fcmap values on all the switches. vFabric ID is of local significance, and hence the vFabric can have different values on different switches.

4. Create a port group.

```
OS10(config)# port-group 1/1/1
OS10(conf-pg-1/1/1)# no mode
OS10(conf-pg-1/1/1)# mode FC 8g-4x
```

5. Configure FC interface.

```
OS10(config)# interface fibrechannel 1/1/1
OS10(conf-if-fc1/1/1)# no shutdown
OS10(conf-if-fc1/1/1)# vfabric 1
OS10(conf-if-fc1/1/1)# exit
OS10(config)# interface fibrechannel 1/1/2
OS10(conf-if-fc1/1/2)# no shutdown
OS10(conf-if-fc1/1/2)# vfabric 1
```

6. Configure the FC switch port mode.

```
OS10(conf-if-fc1/1/2)# fc port-mode E
```

7. Add VLAN 1001 and fcmap to switch-1 to activate vFabric.

```
OS10(config)# vfabric 1
OS10(conf-vfabric-1)# vlan 1001
OS10(conf-vfabric-1)# fcoe fcmap 0xefc00
OS10(conf-vfabric-1)# exit
```

8. Create zones.

```
OS10(config)# fc zone zoneA
OS10(config-fc-zone-zoneA)# member wwn 20:01:f4:e9:d4:f9:fc:44
OS10(config-fc-zone-zoneA)# member wwn 20:02:00:11:0d:a5:56:01
```

9. Create and activate a zone set.

```
OS10(config)# fc zoneset zoneset1
OS10(conf-fc-zoneset-zoneset1)# member zoneA
OS10(config)# vfabric 1
OS10(conf-vfabric-1)# zoneset activate zoneset1
```

10. You can deactivate vFabric by removing either the VLAN or fcmap configuration.

```
OS10(conf-vfabric-1)# no vlan 100
Warning: All traffic on this fabric will be lost. Continue? [yes/no]:yes
```

Switch-2 configuration

1. Enable the multiswitch feature globally.

```
OS10(config)# feature fc multi-switch
```

2. Create a vFabric VLAN.

```
OS10(config)# interface vlan 1001
```

3. Create a vFabric.

```
OS10(config)# vfabric 1
OS10(conf-vfabric-1)#
```

4. Create a port group.

```
OS10(config)# port-group 1/1/1
OS10(conf-pg-1/1/1)# no mode
OS10(conf-pg-1/1/1)# mode FC 8g-4x
```

5. Configure FC interface.

```
OS10(config)# interface fibrechannel 1/1/1
OS10(conf-if-fc1/1/1)# no shutdown
OS10(conf-if-fc1/1/1)# vfabric 1
OS10(conf-if-fc1/1/1)# exit
OS10(config)# interface fibrechannel 1/1/2
OS10(conf-if-fc1/1/2)# no shutdown
OS10(conf-if-fc1/1/2)# vfabric 1
```

6. Configure the FC switch port mode.

```
OS10(conf-if-fc1/1/2)# fc port-mode E
```

7. Add VLAN 1001 and fcmap to switch-2 to activate vFabric.

```
OS10(config)# vfabric 1
OS10(conf-vfabric-1)# vlan 1001
OS10(conf-vfabric-1)# fcoe fcmap 0xefc00
OS10(conf-vfabric-1)# exit
```

8. Create zones.

```
OS10(config)# fc zone zoneA
OS10(config-fc-zone-zoneA)# member wwn 20:01:f4:e9:d4:f9:fc:44
OS10(config-fc-zone-zoneA)# member wwn 20:02:00:11:0d:a5:56:01
```

9. Create and activate a zone set.

```
OS10(config)# fc zoneset zoneset1
OS10(conf-fc-zoneset-zoneset1)# member zoneA
OS10(config)# vfabric 1
OS10(conf-vfabric-1)# zoneset activate zoneset1
```

10. You can deactivate the vFabric by removing either the VLAN or fcmap configuration.

```
OS10(conf-vfabric-1)# no vlan 100
Warning: All traffic on this fabric will be lost. Continue? [yes/no]:yes
```

Verify multiswitch fabric (E Port) configuration

Verify the multiswitch configuration using the following `show` commands:

- To verify the current configured switch mode, run the `show fc switch` command.

```
OS10# show fc switch
Switch Mode : Disabled
Switch WWN :
```

- To display the multiswitch mode after configuring the multiswitch feature, run the `show fc switch` command.

```
OS10# show fc switch
Switch Mode : Multi-Switch
Switch WWN : 10:00:14:18:77:20:73:cf
```

- To verify the port groups, run the `do show port-group` command.

```
OS10(config)# do show port-group
Port-group   Mode    Ports      FEM
port-group  1/1/1   FC 16g-2x  1 2 3 4 -
port-group  1/1/2   FC 16g-2x  5 6 7 8 -
port-group  1/1/3   FC 16g-2x  9 10 11 12 -
port-group  1/1/4   FC 16g-2x  13 14 15 16 -
port-group  1/1/5   FC 16g-2x  17 18 19 20 -
port-group  1/1/6   FC 16g-2x  21 22 23 24 -
port-group  1/1/7  Eth 100g-1x 25 -
port-group  1/1/8   Eth 40g-1x 26 -
port-group  1/1/9  Eth 100g-1x 29 -
port-group  1/1/10  Eth 40g-1x 30 -
```

```
OS10(config)# do show port-group
Port-group  Mode  Ports       FEM
port-group 1/1/1  FC 8g-4x   1 2 3 4 -
port-group 1/1/2  FC 16g-2x  5 6 7 8 -
port-group 1/1/3  FC 16g-2x  9 10 11 12 -
port-group 1/1/4  FC 16g-2x  13 14 15 16 -
port-group 1/1/5  FC 16g-2x  17 18 19 20 -
port-group 1/1/6  FC 16g-2x  21 22 23 24 -
port-group 1/1/7 Eth 100g-1x 25 -
port-group 1/1/8 Eth 40g-1x  26 -
port-group 1/1/9 Eth 100g-1x 29 -
port-group 1/1/10 Eth 40g-1x 30 -
```

- To verify the fabric details in switch-1, run the `show fc fabric` command.

```
OS10#show fc fabric
Number of FC Switches = 2
Vfabric-Id      Domain ID        Switch WWNN
------------------------------------------------------------
1               0x65(101)      >10:00:14:18:77:20:73:cf
1               0x77(119)      *20:00:44:18:37:10:73:0a
> Principal
*Local Switch
```

- To verify the fabric details in switch-2, principal switch, run the `show fc fabric` command.

```
OS10#show fc fabric
Number of FC Switches = 2
Vfabric-Id      Domain ID             Switch WWNN
------------------------------------------------------------
1                0x65(101)     >10:00:14:18:77:20:73:cf

```

- To view the established shortest routes between the server and the target ports in switch-1, run the `show fc fspf route` command.

```
OS10#show fc fspf route
vfabric-Id   Dest-Domain    Route-Cost    Next-hop
---------------------------------------------------------------
1             0x77(119)        125        fc1/1/2
```

- To view the established shortest routes between the server and the target ports in switch-2, run the `show fc fspf route` command.

```
OS10#show fc fspf route
vfabric-Id    Dest-Domain    Route-Cost      Next-hop
-----------------------------------------------------------
1             0x65(101)         125          fc1/1/2
```

- To view the FSPF neighbor information in switch-1, use the `show fc fspf neighbor` command.

```
OS10#show fc fspf neighbor
Vfabric-Id  Interface Neighbor-DomainID  State   Dead-Time
-----------------------------------------------------------
1             fc1/1/2      0x77(119)       Full    00:00:39
```

Multiswitch fabric (E Port) CLI commands

show fc fspf interface

Displays the FSPF interface information.

Syntax `show fc fspf interface [fibrechannel node/slot/port[:subport]]`

Parameters `node/slot/port[:subport]`—Enter the interface information.

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the FSPF information of an interface.

Example

```
OS10#show fc fspf interface fc 1/1/1
FSPF interface fc1/1/1 in vfabric-id 100
Interface cost is 125
Timer intervals, Hello 20s, Dead 80s, Retransmit 5s
FSPF State is FULL
Neighbor Domain Id is 0x0c(12), Neighbor Interface Index is 0x8080E06
Statistics counters:
Number of packets received: LSU 8 LSA 8 Hello 118 Error packets 0
Number of packets transmitted : LSU 8 LSA 8 Hello 119 Retransmitted LSU 0
```

Supported Releases 10.5.1.0 or later

clear fc fabric statistics

Clears the fabric statistics for all the interfaces.

Syntax `clear fc fabric statistics [interface type node/slot/port[:subport] | vfabric vfabric-id]`

Parameters

- `node/slot/port[:subport]`—Enter interface information.
- `vfabric-id`—Enter the vfabric ID.

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to clear the fabric statistics of either a specific or all the fibre channel interfaces, and a vfabric .

Example

```
OS10# clear fc fabric statistics interface fc 1/11
```

Supported Releases	10.5.1.0 or later

clear fc flow-control-statistics

Clears all flow-control counters for all domains.

Syntax	`clear fc flow-control-statistics`
Parameters	None
Default	None
Command Mode	EXEC
Usage Information	If multiswitch mode is disabled, this command returns silently.

Example

```
OS10# clear fc flow-control-statistics

#show fc flow-control-statistics
SW6(config)# do show fc flow-control-statistics | no-more
S_E2E    : Start e2e credit  C_E2E : Current e2e credit
REC      : Number of times credit was recovered
Z_credit : Number of times credit became zero
W_ACK1   : Frames waiting to get ACK1
W_credit : Transmit Frames waiting on credit

vfabric : 10    Source Domain : 36
-----------------------------------------------------------
D_ID | S_E2E | C_E2E | REC | Z_credit | W_ACK1 | W_credit
-----------------------------------------------------------
34      10      10      0       0         0         0
32      10      10      0       0         0         0
31      10      10      0       0         0         0
33      10      10      0       0         0         0
35      10      10      0       0         0         0
-----------------------------------------------
D_ID | NS_SENT | NS_ACK1_RECV | NS_ACK1_SENT
-----------------------------------------------
34      0               0            0
32      0               0            0
31      0               0            0
33      0               0            0
35      0               0            0
```

Supported Releases	10.5.1.0 or later

clear fc fspf statistics

Clears FSPF statistics for all the interfaces.

Syntax	`clear fc fspf statistics [interface type` *`node/slot/port[:subport]`* `| vfabric` *`vfabric-id`*
Parameters	• `node/slot/port[:subport]`—Enter interface information. • `vfabric-id`—Enter the vfabric ID.
Defaults	Not applicable
Command Mode	GLOBAL CONFIGURATION
Usage Information	Use this command to clear the FSPF statistics for all the fibre channel and vfabric interfaces.

Example

```
OS10#clear fc fspf statistics interface fc 1/1/1
```

Supported Releases 10.5.1.0 or later

clear fc ns switch statistics

Clears the Name Server statistics on all interfaces.

Syntax `clear fc ns switch statistics [interface type node/slot/port[:subport]| vfabric vfabric-id|vfabric vfabric-id domain [domain-id]]`

Parameters

- `node/slot/port[:subport]`—Enter the Interface type details.
- `vfabric-ID`—Enter the vfabric ID.
- `domain-id`—Enter the vfabric domain ID.

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to clear the Name Server statistics on either a specific or all the fibre channel interfaces, vfabric interfaces, and domain on a vfabric.

Example

```
OS10# clear fc ns switch statistics interface fc 1/1/1
```

Supported Releases 10.5.1.0 or later

domain-id

Configures the domain-id for every vfabric.

Syntax `domain-id [preferred domain-id-val]`

Parameters

- `domain-id`—Enter the domain ID of the E_Port.
- `domain-id-val`—Valid values are from 1 to 239.

Defaults Dynamic Configuration

Command Mode Vfabric CONFIGURATION

Usage Information

- The configurations are supported only in the multiswitch mode. The configured domain ID can be preferred or dynamic.
- If the domain ID is preferred, the switch requests preferred domain ID to the principal switch.
- You can change the domain ID only when the vfabric is in an inactive state. To activate vfabric, add vlan and fcmap configuration under the vfabric configuration view. Ensure to configure the domain ID before configuring the vlan and fcmap in the vfabric configuration view.
- When disruptive fabric reconfiguration (RCF) occurs, the switch transmits RDI request sequence with preferred domain ID. During nondisruptive reconfiguration (BF), the switch requests for previously allocated domain ID (previous runtime domain ID), if available. Otherwise, use the preferred domain ID.
- The `no` form of this command resets to the default, dynamic value.

Example

```
OS10(conf-vfabric-<vfabric-id>)#domain-id preferred 2
```

Supported Releases 10.5.1.0 or later

e_d_tov

Configures the E_D_TOV FC timer value for every vfabric.

Syntax `e_d_tov timeout-val`

Parameters *timeout-val*—Valid values are from 1000 to 10000.

Defaults 2000 ms

Command Mode Vfabric CONFIGURATION

Usage Information

- The configurations are supported only in the multiswitch mode.
- If you do not receive an expected response within the expected time, then consider the condition as an error condition. This timer is used for the error conditions during link initialization, and the principal switch election. Match this value with the other end during port initialization. This type of configuration is not permitted when vfabric is active.
- If the configured `E_D_TOV` value is not same on both the sides of the port, then the port is isolated. Ensure to configure the same `E_D_TOV` value on both the sides.
- You can change the `E_D_TOV` value only when vfabric is in inactive state. The vfabric is activated only by adding vlan and fcmap configuration under the vfabric configuration view. Ensure to configure `E_D_TOV` before configuring the vlan and fcmap in the vfabric configuration view.
- The `no` version of this command resets to the default value.

Example

```
OS10(conf-vfabric-<vfabric-id>)#e_d_tov 3000
```

Supported Releases 10.5.1.0 or later

fc port-mode F | E

Configures the FC switch port mode.

Syntax `fc port-mode F | E`

Parameters None

Defaults The port mode is:

- F—Multiswitch mode
- N—NPG mode

Command Mode Fibre Channel INTERFACE

Usage Information

- The configurations are supported only in the multiswitch mode. In F_port mode, all the ports operate as F Port. On enabling the multiswitch mode, a port works as either a F_port or an E_port.
- To change modes, disable current mode and enable the new mode. This operation leads to traffic disruption on the corresponding port.
- You can disable the multiswitch mode only if you delete the related configurations.
- For NPG switch mode, the default port mode is `N`. You can change the port mode to `F`. The NPG switch mode does not support `E` port mode.
- In F port switch mode, you cannot change the port mode to `E` or `F`.
- The `no` form of this command resets the fc port mode to the default value.

Example

```
OS10(config-if-fc-1/1/1)#fc port-mode E
```

Supported Releases 10.5.1.0 or later

feature fc

Enables the multiswitch feature.

Syntax

```
feature fc [domain-id domain-id-val | npg | fip-snooping [with-cvl] | multi-switch]
```

Parameters

- `with-cvl`—To enable CVL.
- `domain-id`—Enter the domain ID of the E_Port.
- *`domain-id-val`*—Valid values are from 1 to 239.

Defaults

Disabled

Command Mode

GLOBAL CONFIGURATION

Usage Information

- Use the multiswitch option to support the multiswitch fabric mode.
- Delete multiswitch configurations when disabling a feature.
- You can disable the multiswitch mode only if you delete the related configurations.
- The `no` form of this command deletes the configuration.

Example

```
OS10(config)# feature fc multi-switch
```

Supported Releases

10.5.1.0 or later

fspf cost

Configures the FSPF cost value for every interface.

Syntax

```
fspf cost cost-val
```

Parameters

`cost-val`—Valid values are from 1 to 65535.

Defaults

FSPF cost for the following is:

- 8G-125
- 16G-62
- 32G-31

Command Mode

Fibre Channel INTERFACE

Usage Information

- The configurations are supported only in the multiswitch mode.
- This command configures the cost of the selected interface. Also, it configures the same cost value on both ends of the link.
- Different cost values lead to repeat the request repeatedly or even indefinitely.
- The `no` version of this command resets the command to default value, for the interface speed.

Example

```
OS10(config-if-fc-1/1/1)#fspf cost 90
```

Supported Releases

10.5.1.0 or later

fspf dead-interval

Configures the FSPF dead Interval value for every interface.

Syntax

```
fspf dead-interval timeout-val
```

Parameters

`timeout-val`—Valid values are from 1 to 65535.

Defaults

80 s

Command Mode

Fiber channel INTERFACE

Usage Information

- The configurations are supported only in the multiswitch mode.
- This command specifies the maximum interval. You must first receive a hello message on the selected interface before the neighbor is considered lost and removed from the database.
- The `no` form of this command resets the command to default value, 80 s.

Example

```
OS10(config-if-fc-1/1/1)#fspf dead-interval 90
```

Supported Releases

10.5.1.0 or later

fspf hello-interval

Configures the FSPF hello interval value for every interface.

Syntax

`fspf hello-interval` *`timeout-val`*

Parameters

`timeout-val`—Valid values are from 1 to 65535.

Defaults

20 s

Command Mode

Fiber Channel INTERFACE

Usage Information

- The configurations are supported only in multiswitch mode.
- This command specifies the hello message interval to verify the health of the link in the VSAN.
- The `no` version of this command resets to the default value.

Example

```
OS10(config-if-fc-1/1/1)#fspf hello-interval 30
```

Supported Releases

10.5.1.0 or later

fspf hold-time

Configures the FSPF hold-time value for vfabric.

Syntax

`fspf hold-time` *`timeout-val`*

Parameters

`timeout-val`—Valid values are from 0 to 65535.

Defaults

0ms

Command Mode

VFABRIC CONFIGURATION

Usage Information

- The configurations are supported only in multiswitch mode.
- This command configures the hold-time between two consecutive route computations in milliseconds, for the entire vfabric. If the specified time is shorter, the routing update is faster. However, the processor consumption increases accordingly.

  NOTE: Configure the same hold timer value on all the switches for consistent route convergence, and to avoid intermittent traffic loop.
- The `no` version of this command resets to the default value of 0ms.

Example

```
OS10(conf-vfabric-<vfabric-id>)#fspf hold-time 5000
```

Supported Releases

10.5.1.0 or later

fspf retransmit-interval

Configures the FSPF retransmit interval value for every interface.

Syntax `fspf retransmit-interval timeout-val`

Parameters `timeout-val`—Valid values are from 1 to 65535.

Defaults 5 s

Command Mode Fibre Channel INTERFACE

Usage Information
- The configurations are supported only in multiswitch mode.
- This command specifies the retransmit time interval for unacknowledged link state updates.
- The `no` version of this command resets to the default value.

Example

```
OS10(config-if-fc-1/1/1)#fspf retransmit-interval 10
```

Supported Releases 10.5.1.0 or later

principal-priority

Configures the switch priority for every vfabric.

Syntax `principal-priority priority-val`

Parameters `priority-val`—Valid values are 1, and from 3 to 255.

Defaults 128

Command Mode Vfabric CONFIGURATION

Usage Information
- The configurations are supported only in the multiswitch mode. 1 has the highest priority. A switch with priority 255 cannot become the principal switch. Priority 2 is not allowed during configuration.
- If two switches have the same priority, the switch with lower WWN becomes the principal switch. A switch with priority 255 cannot become the principal switch. Once elected, if the principal switch has a priority greater than 2, then it is changed to 2.
- You can modify the switch priority only when the vfabric is in inactive state. You can activate the vfabric only by adding VLAN and fcmap configuration under the vfabric configuration view. Ensure to configure the switch priority before configuring the VLAN and fcmap in the vfabric configuration view.
- The `no` version of this command resets to the default value of 128.

Example

```
OS10(conf-vfabric-<vfabric-id>)#principal-priority 3
```

Supported Releases 10.5.1.0 or later

r_a_tov

Configures the R_A_TOV FC timer value for vfabric.

Syntax `r_a_tov timeout-val`

Parameters `timeout-val`—Valid values are from 5000 to 10000.

Defaults 10000ms

Command Mode VFabric CONFIGURATION

Usage Information
- The configurations are supported only in multiswitch mode.

- This timer is used to mark the error conditions during domain ID allocation, SW-RSCN, and NS QUERY. Match this value with the other end, during port initialization. This type of configuration is not permitted when vfabric is active.
- If the configured `R_A_TOV` value is not the same on both the sides of the port, then the port is isolated. Ensure to configure the same `R_A_TOV` value on both the sides.
- You can change the `R_A_TOV` value only when vfabric is in inactive state. You can activate the vfabric only by adding VLAN and fcmap configuration under the vfabric configuration view. Ensure to configure the `R_A_TOV` before configuring the vlan, and fcmap in the vfabric configuration view.
- The `no` version of this command resets to default value of 10000ms.

Example

```
OS10(conf-vfabric-<vfabric-id>)#r_a_tov 3000
```

Supported Releases 10.5.1.0 or later

show fc fabric

Shows switches in the FC fabric.

Syntax `show fc fabric`

Parameters None

Defaults Not applicable

Command Mode Fibre Channel INTERFACE

Usage Information

- The configurations are supported only in multiswitch mode.
- This command specifies the retransmit time interval for unacknowledged link state updates.
- The `no` version of this command resets to the default value.

Example

```
OS10#show fc fabric
Number of FC Switches = 2

Vfabric-Id          Domain ID                Switch WWNN
-----------------------------------------------------------------
100                0x02(02)           *20:01:00:05:9b:00:11:5f
100                0x66(102)          >10:00:00:05:1e:03:ae:56

> Principal
*Local Switch
```

Supported Releases 10.5.1.0 or later

show fc fabric interface

Shows the summary of the principal switch election states, ILS link type, port state, reason code, remote switch, and port name.

Syntax `show fc fabric interface`

Parameters None

Defaults Not applicable

Command Mode EXEC

Usage Information

- Use this command to display the summary of principal switch election states, ILS link type, port state, remote switch, and port name.
- The Fabric states are Build Fabric, Reconfigure Fabric, EFP-Idle, EFP-Send, Principal-Switch, Non-Principal-Switch, No Domain, and Stable states.
- The Link types are Unknown, Non-Principal ISL, Upstream Principal ISL, and Downstream Principal ISL.
- The Reason codes are:

- BB Credit Isolation
- R_A_TOV Mismatch
- E_D_TOV Mismatch
- Flow Control Not Supported
- Class of Services Not Supported
- Port Mode mismatch Isolation
- Invalid Switch Name Isolation
- Not Capable Principal Switch
- Domain ID Overlap
- Isolation due to ELP Failure
- Isolation due to Loop Back Connection
- Isolation due to EFP Max Retransmission Exceeded
- Isolation due to BF Max Retransmission Exceeded
- Isolation due to RCF Max Retransmission Exceeded
- Isolation due to DIA Max Retransmission Exceeded
- Isolation due to RDI Max Retransmission Exceeded

Example

```
OS10(config)# do show fc fabric interface
Fabric-State : Stable

Vfabric Intf    Link     Port  Reason    Remote           Remote
Id              type     State Code    Switch Name      Port Name

-----------------------------------------------------------------
2  fc1/1/25:2 DOWNSTREAM EPORT NONE 10:00:e4:f0:04:3e:3d:95
20:00:e4:f0:04:3e:3e:0f

2  fc1/1/25:1 NONPRINPLISL EPORT NONE 10:00:e4:f0:04:3e:3d:95
20:00:e4:f0:04:3e:3e:0e
```

Supported Releases 10.5.1.0 or later

show fc fabric statistics

Shows the FC fabric statistics for an interface.

Syntax `show fc fabric statistics [interface type node/slot/port[:subport] | vfabric vfabric-id]`

Parameters

- `node/slot/port[:subport]`—Enter the Interface type details.
- `vfabric-ID`—Enter the vfabric ID.

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the fabric statistics for an interface.

Example

```
OS10#show fc fabric statistics interface
fibrechannel 1/1/1
Number of Request packets received : ELP 8 EFP 12 BF 3 RCF 2 DIA 5
RDI 5
Number of Accept packets received : ELP ACC 8 EFP ACC 12 BF ACC 3 RCF
ACC 2 DIA ACC 5
RDI ACC 5
Number of Reject packets received : ELP RJT 8 EFP RJT 12 BF RJT 3 RCF
RJT 2 DIA RJT 5
RDI RJT 5
Number of Request packets transmitted : ELP 8 EFP 12 BF 3 RCF 2 DIA 5
RDI 5
Number of Accept packets transmitted : ELP ACC 8 EFP ACC 12 BF ACC 3 RCF
```

```
ACC 2 DIA ACC 5
RDI ACC 5
Number of Reject packets transmitted : ELP RJT 8 EFP RJT 12 BF RJT 3 RCF
RJT 2 DIA RJT 5
RDI RJT 5
```

Supported Releases 10.5.1.0 or later

show fc flow-control-statistics

Displays flow-control counters for a specific domain or all domains.

Syntax `show fc flow-control-statistics [domain domain-id | vfabric vfabric-id]`

Parameters

- *domain-id*—Enter the domain ID of the E_Port, from 1 to 239.
- *vfabric-id*—Enter the vfabric ID.

Default None

Command Mode EXEC

Usage Information If multiswitch mode is disabled, this command does not return any output. If you do not specify a domain ID, this command displays counters for all domains. If you do not specify a vfabric ID, this command displays counters for all domains in all vfabrics.

Example

```
OS10# show fc flow-control-statistics

S_E2E    : Start e2e credit  C_E2E : Current e2e credit
REC       : Number of times credit was recovered
Z_credit : Number of times credit became zero
W_ACK1 : Frames waiting to get ACK1
W_credit : Transmit Frames waiting on credit

vfabric : 10     Source Domain : 36
-----------------------------------------------------------
D_ID | S_E2E | C_E2E | REC | Z_credit | W_ACK1 | W_credit
-----------------------------------------------------------
34     10      10       0       68       0          0
32     10      10       0       68       0          0
31     10      10       0       68       0          0
33     10      10       0       68       0          0
35     10      10       0       68       0          0
-----------------------------------------------------------
D_ID | NS_SENT | NS_ACK1_RECV | NS_ACK1_SENT
-----------------------------------------------------------
34       77          77             46
32       77          77             169
31       77          77             184
33       77          77             46
35       77          77             153
```

Supported Releases 10.5.1.0 or later

show fc fspf database

Displays the FSPF link state database information of a switch.

Syntax `show fc fspf database`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the FSPF link state database information of a switch. The database information includes the entire LSR information of the fabric that is constructed based on the LSRs received from other switches.

Example

```
OS10#show fc fspf database
Total number of Link State Data Base Entries = 2
FSPF Link State Database for Vfabric-Id 100 Domain 0x0c(12)
LSR Type = 1
Advertising domain ID = 0x0c(12)
LSR Age = 100
LSR Incarnation number = 0x80000005
LSR Checksum = 0x3caf
Number of links = 1
NbrDomainId   IfIndex     NbrIfIndex   Link Type     Cost
--------------------------------------------------------------
0x65(101)     0x00001095   0x00001085      1          125
FSPF Link State Database for Vfabric-Id 100 Domain 0x65(101)
LSR Type = 1
Advertising domain ID = 0x65(101)
LSR Age = 100
LSR Incarnation number = 0x80000005
LSR Checksum = 0x8443
Number of links = 1
NbrDomainId  IfIndex     NbrIfIndex    Link Type     Cost
--------------------------------------------------------------
0x0c(12)     0x00001085  0x00001095      1           125
```

Supported Releases 10.5.1.0 or later

show fc fspf neighbor

Displays the FSPF neighbor information.

Syntax `show fc fspf neighbor`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the FSPF neighbor information.

Example

```
OS10#show fc fspf neighbor
Vfabric-Id  Interface  Neighbor-DomainID  State    Dead-Time
--------------------------------------------------------------
100         fc1/1/2     0x66(102)         Full      00:00:39
```

Supported Releases 10.5.1.0 or later

show fc fspf route

Displays the server and target ports.

Syntax `show fc fspf route`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the FSPF route information, and the route to reach every other switch in the fabric.

Example

```
OS10#show fc fspf route
vfabric-Id      Dest-Domain      Route-Cost       Next-hop
-----------------------------------------------------------------
100              0x66(102)         125            fc1/1/2
```

Supported Releases 10.5.1.0 or later

show fc ns fabric

Shows all the Name Server entries in the FC fabric shared among the fabric switches.

Syntax `show fc ns fabric`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display all the remote name server entries in the FC fabric.

Example

```
OS10#show fc ns fabric
Total number of devices = 1
Switch Name 10:00:5c:f9:dd:ef:0d:00
Domain Id 3
FC-Id 03:28:00
Port Name 20:01:f4:e9:d4:f9:fc:43
Node Name 20:00:f4:e9:d4:f9:fc:43
Class of Service 8
Symbolic Port Name XXX
Symbolic Node Name XXX
Port Type N_Port
FC4-Types:FC4-Features fcp(0x08):0x1
```

Supported Releases 10.5.1.0 or later

show fc ns fabric brief

Shows the name server entries that are shared among the Fabric switches in the FC fabric briefly.

Syntax `show fc ns fabric brief`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to briefly display all the remote name server entries in the FC fabric.

Example

```
OS10#show fc ns fabric brief
Total number of devices = 2
Domain   FC-ID          WWPN                          WWNN
-----------------------------------------------------------------------
2      02:09:00   32:11:0e:fc:00:00:00:88  22:11:0e:fc:00:00:00:88
1      01:04:00   10:00:8c:7c:ff:17:f8:01  20:00:8c:7c:ff:17:f8:01
```

Supported Releases 10.5.1.0 or later

show fc ns switch statistics

Shows the Name Server statistics for an interface.

Syntax `show fc ns switch statistics [interface type node/slot/port[:subport]| vfabric vfabric-id|vfabric vfabric-id domain [domain-id]]`

Parameters

- `node/slot/port[:subport]`—Enter interface information.
- `vfabric-id`—Enter the vfabric ID.
- `domain-id`—Enter the vfabric domain ID.

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the Name Server statistics for an interface.

Example

```
show fc ns switch statistics
fibrechannel 1/1/6
       ReqRx    AccTx    RejTx
SCR      0        0        0
RNN_ID   0        0        0
RCS_ID   0        0        0
RFT_ID   0        0        0
RSPN_ID  0        0        0
RHA_ID   0        0        0
RFF_ID   0        0        0
RSNN_NN  0        0        0
GA_NXT   0        0        0
GPN_ID   0        0        0
GNN_ID   0        0        0
GCS_ID   0        0        0
GFT_ID   0        0        0
GSPN_ID  0        0        0
GPT_ID   0        0        0
GFPN_ID  0        0        0
GHA_ID   0        0        0
GFF_ID   0        0        0
GID_PN   0        0        0
GID_NN   0        0        0
GPN_NN   0        0        0
GSNN_NN  0        0        0
GID_FT   0        0        0
GPN_FT   0        0        0
GNN_FT   0        0        0
GNN_FF   0        0        0
GPN_FF   0        0        0
GID_PT   0        0        0
GID_FPN  0        0        0
GPNN_ID  0        0        0
GID_FF   0        0        0
GID_DP   0        0        0

       ReqTx
RSCN     0

         ReqRx   ReqTx  AccRx  AccTx  RejRx  RejTx   ReqReTx
SW_RSCN    0      0       0      0      0      0       0
GE_PT      0      0       0      0      0      0       0
GE_ID      0      0       0      0      0      0       0
```

Supported Releases 10.5.1.0 or later

show fc switch

Shows the multiswitch mode.

Syntax `show fc switch`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the current configured switch mode.

Example

```
OS10# show fc switch
```

Supported Releases 10.5.1.0 or later

show interface fibre channel

Shows the fibre channel interface port type, BB_Credit, and other port configurations.

Syntax `show interface fibrechannel` *node/slot/port[:subport]*

Parameters `node/slot/port[:subport]`—Enter the interface information.

Defaults Not applicable

Command Mode INTERFACE CONFIGURATION

Usage Information Use this command to display the type of fibre channel port, E or F port, BB credit, WWPN, open status, and other port statistics.

Example

```
OS10#show interface fibrechannel 1/1/1

Fibrechannel 1/1/1 is down, FC link is down
Address is 14:18:77:20:73:d0, Current address is 14:18:77:20:73:d0
Pluggable media present, SFP28 type is SFP28 25GBASE-SR
Wavelength is 850
Receive power reading is -2.378468 dBm
FC MTU 2188 bytes
LineSpeed 0
Operational Speed 0 over 20G
Port type is E_Port, Max BB credit is 8
WWN is 20:01:14:18:77:20:73:cf
Last clearing of "show interface" counters: 1 day 16:33:56
Input statistics:
0 frames, 0 bytes
0 class 2 good frames, 0 class 3 good frames
0 frame too long, 0 frame truncated, 0 CRC
0 link fail, 0 sync loss
0 primitive seq err, 0 LIP count
0 BB credit 0, 0 BB credit 0 packet drops
Output statistics:
0 frames, 0 bytes
0 class 2 frames, 0 class 3 frames
0 BB credit 0, 0 oversize frames
0 total errors
Rate Info:
Input 0 bytes/sec, 0 frames/sec, 0% of line rate
Output 0 bytes/sec, 0 frames/sec, 0% of line rate
Time since last interface status change: 1 day 16:33:57
```

Supported Releases 10.5.1.0 or later

show vfabric

Shows the fc timer, E_D_TOV, R_A_TOV, principal switch priority, and domain ID values in the show vfabric command.

Syntax `show vfabric value`

Parameters `value`—Valid values are from 1 to 255.

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the fc timers, E_D_TOVand R_A_TOV, principal switch priority and domain ID values. Also, this command shows the configured domain ID, run-time domain ID, and the principal switch priority of the switch.

Example

```
OS10# show vfabric
Fabric Name SAN_FABRIC
Fabric Type Multi-Switch
Fabric Id 10
VlanId 1002
FC-MAP 0xEFC00
FCF Priority 128
FKA-Adv-Period Enabled, 8
Config-State ACTIVE
Oper-State UP
================================================
Switch Config Parameters
================================================
Domain ID 3
Switch Priority 3
E-D-TOV(ms) 1000
R-A-TOV(ms) 5000
================================================
Switch Fabric Parameters
================================================
Run Time Domain ID 4
Run Time Switch Priority 3
================================================
Switch Zoning Parameters
================================================
Default Zone Mode: Deny
Active ZoneSet: zoneset5
========================================
Members
fibrechannel1/1/11
fibrechannel1/1/17
fibrechannel1/1/22
```

Supported Releases 10.5.1.0 or later

show vfabric fspf

Displays FSPF information at the vfabric level.

Syntax `show vfabric fspf`

Parameters None

Defaults Not applicable

Command Mode GLOBAL CONFIGURATION

Usage Information Use this command to display the FSPF information of an interface.

Example

```
OS10#show vfabric fspf
FSPF routing for vfabric 10
SPF hold time is 0 msec
MinLsArrival = 1000 msec , MinLsInterval = 5000 msec
Local Domain is 0x64 (100)
Number of LSRs = 3, Total Checksum = 0x0001288b
Refresh time = 1800 sec
Max age = 3600 sec
Statistic counters :
Number of SPF computations = 3
Number of checksum errors = 0
Number of transmitted packets : LSU 10 LSA 10 Hello 25 Retransmitted LSU
10
Number of received packets: LSU 10 LSA 10 Hello 25 Error packets 5
```

Supported Releases 10.5.1.0 or later

Multi-hop FIP-snooping bridge

In typical deployments, ENode-connected switches are not directly connected to the core FC switch. Multiple intermediate switches are connected in between the switches. To establish a point-to-point connection and for secure transmission between the ENode and the FCF, all intermediate switches must support FSB to pass the FIP and FCoE traffic.

OS10 switches support the multi-hop FIP-snooping bridge. You can interconnect multiple FSBs to communicate with an upstream FC switch.

- Access FSB— This is the node that is directly connected to ENode. In the following example, FSB1 is the access FSB.
- Core FSB— This is the node that is directly connected to the FCF. In the following example, FSB2 is the core FSB.

The default port mode is the ENode. You must explicitly configure the other modes using the `fip-snooping port-mode` command. The following port modes are supported:

- ENode—Only one ENode MAC address per interface can be learnt. Configure this mode on the port connected to the ENode.
- FCF—If you configure the FSB with FCF port mode, all the FIP packets sent between the ENode and the FCF are snooped and the sessions and ENodes are learnt. Configure the FCF mode on the access FSB ports connected to the FCF-facing side.
- ENode-transit—This mode is configured on the intermediate FSBs or Layer 2 (L2) DCBX switches to which ENodes are connected.
- FCF-transit—Only the FCF advertisement and VLAN responses are snooped to learn the FCF. The FCF-transit does not learn the ENodes and session information. Configure the FCF-transit mode on the FCF-facing side of the core FSB switch.

The FCF can be in NPG or F-Port mode. The access FSB switches validate the frames and installs ACLs per the FCF to allow only FCoE and FIP traffic across the FCF.

NOTE: Port-pinning is not supported on ENodes connected to an FSB switch that is in FCF-transit mode. You cannot view the ENodes or session information using the `show` commands.

Clear virtual link frames

When an FSB clears an FCoE session for some reason, the other devices in the network, such as the ENode, FCF, and transit switches, are not informed and considers the session to be intact. FSB drops the FCoE data corresponding to the cleared session. The ENode takes a long time to identify the issue and to recover from it. At times, interface flapping occurs and might require manual intervention to recover. To recover automatically, FSB sends a Clear Virtual Link (CVL) frame from the FCF to the ENode.

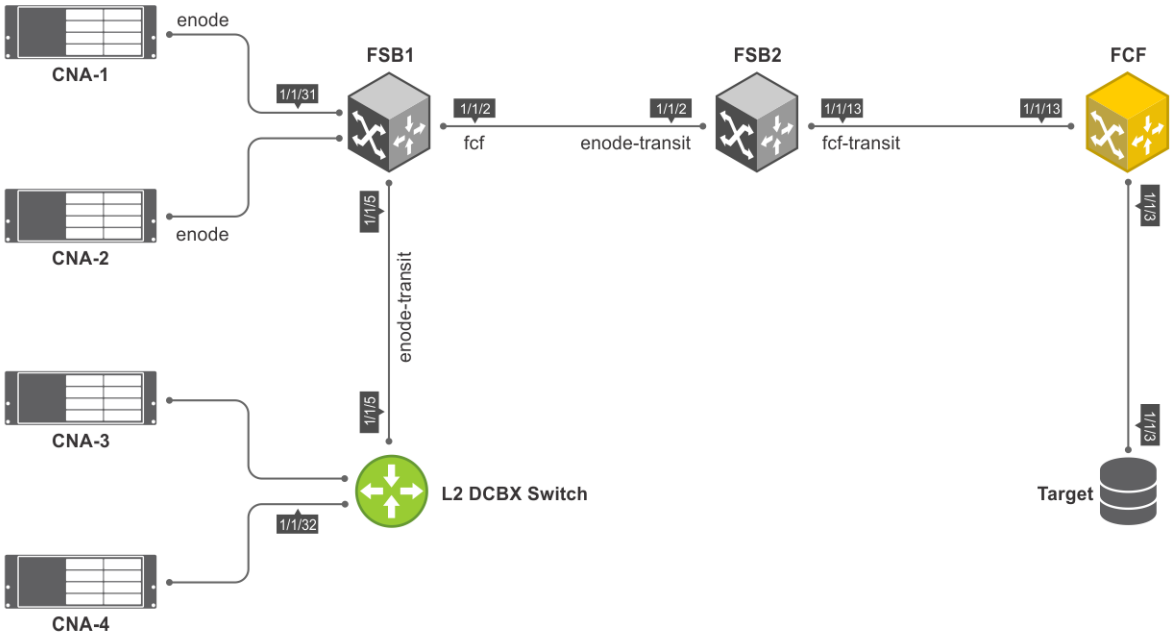
Configuration notes

- If you configure FSB with port pinning on the uplink or downlink side, you must configure the FCF-facing interface as FCF port mode.
- OS10 currently does not support a topology where a single port must be configured as both an ENode and an FCF-related port mode.
- If you configure FCF-transit port mode on an FSB, Dell Technologies recommends not directly connecting ENodes on it.

Configure multi-hop FSB

The following example shows a simple multi-hop FSB setup. CNA-2 and CNA-3 shown in this topology are for illustrative purposes only. The following example does not include CNA-2 and CNA-3 configurations.

Ensure that the access and core FSB switches are running in FSB mode.



To configure multi-hop FSB:

1. Configure the L2 switch.
   a. Disable flow control on the interfaces connected to CNA-4 and FSB1.

```
L2switch(config)# interface ethernet 1/1/32
L2switch(conf-if-eth1/1/32)# no flowcontrol receive
L2switch(conf-if-eth1/1/32)# no flowcontrol transmit

L2switch(config)# interface ethernet 1/1/5
L2switch(conf-if-eth1/1/5)# no flowcontrol receive
L2switch(conf-if-eth1/1/5)# no flowcontrol transmit
```

   b. Enable DCBX.

```
L2switch(config)# dcbx enable
```

   c. Create a VLAN for FCoE traffic to pass through.

```
L2switch(config)# interface vlan 777
```

   d. Create class-maps.

```
L2switch(config)# class-map type network-qos c3
L2switch(config-cmap-nqos)# match qos-group 3
```

```
L2switch(config)# class-map type queuing q0
L2switch(config-cmap-queuing)# match queue 0
L2switch(config-cmap-queuing)# exit
L2switch(config)# class-map type queuing q3
L2switch(config-cmap-queuing)# match queue 3
L2switch(config-cmap-queuing)# exit
```

   e. Create policy-maps.

```
L2switch# configure terminal
L2switch(config)# policy-map type network-qos nqpolicy
```

```
L2switch(config-pmap-network-qos)# class c3
L2switch(config-pmap-c-nqos)# pause
L2switch(config-pmap-c-nqos)# pfc-cos 3
```

```
L2switch(config)# policy-map type queuing ets_policy
L2switch(config-pmap-queuing)# class q0
L2switch(config-pmap-c-que)# bandwidth percent 30
L2switch(config-pmap-c-que)# class q3
L2switch(config-pmap-c-que)# bandwidth percent 70
```

f. Create a qos-map.

```
L2switch(config)# qos-map traffic-class tc-q-map1
L2switch(config-qos-map)# queue 3 qos-group 3
L2switch(config-qos-map)# queue 0 qos-group 0-2,4-7
```

g. Apply the QoS configurations on CNA-4 and FSB1 connected interfaces.

```
L2switch(config)# interface ethernet 1/1/32
L2switch(conf-if-eth1/1/32)# priority-flow-control mode on
L2switch(conf-if-eth1/1/32)# ets mode on
L2switch(conf-if-eth1/1/32)# trust-map dot1p default
L2switch(conf-if-eth1/1/32)# qos-map traffic-class tc-q-map1
L2switch(conf-if-eth1/1/32)# service-policy input type network-qos nqpolicy
L2switch(conf-if-eth1/1/32)# service-policy output type queuing ets_policy

L2switch(config)# interface ethernet 1/1/5
L2switch(conf-if-eth1/1/5)# priority-flow-control mode on
L2switch(conf-if-eth1/1/5)# ets mode on
L2switch(conf-if-eth1/1/5)# trust-map dot1p default
L2switch(conf-if-eth1/1/5)# qos-map traffic-class tc-q-map1
L2switch(conf-if-eth1/1/5)# service-policy input type network-qos nqpolicy
L2switch(conf-if-eth1/1/5)# service-policy output type queuing ets_policy
```

h. Configure VLAN on CNA-4 and FSB1 connected interfaces.

```
L2switch(config)# interface ethernet 1/1/32
L2switch(conf-if-eth1/1/32)# switchport mode trunk
L2switch(conf-if-eth1/1/32)# switchport trunk allowed vlan 777

L2switch(config)# interface ethernet 1/1/5
L2switch(conf-if-eth1/1/5)# switchport mode trunk
L2switch(conf-if-eth1/1/5)# switchport trunk allowed vlan 777
```

2. Configure the access FSB, FSB1. This example describes
   a. Disable flow control on the interfaces connected to CNA1, L2 switch, and FSB2.

```
FSB1(config)# interface ethernet 1/1/31
FSB1(conf-if-eth1/1/31)# no flowcontrol receive
FSB1(conf-if-eth1/1/31)# no flowcontrol transmit

FSB1(config)# interface ethernet 1/1/5
FSB1(conf-if-eth1/1/5)# no flowcontrol receive
FSB1(conf-if-eth1/1/5)# no flowcontrol transmit

FSB1(config)# interface ethernet 1/1/2
FSB1(conf-if-eth1/1/2)# no flowcontrol receive
FSB1(conf-if-eth1/1/2)# no flowcontrol transmit
```

   b. Enable FIP snooping with cvl option.

```
FSB1(config)# feature fip-snooping with-cvl
```

   c. Enable DCBX.

```
FSB1(config)# dcbx enable
```

   d. Create an FCoE VLAN and configure FIP snooping on the FCoE VLAN.

```
FSB1(config)# interface vlan 777
FSB1(conf-if-vl-777)# fip-snooping enable
```

e. Create class-maps.

```
FSB1(config)# class-map type network-qos c3
FSB1(config-cmap-nqos)# match qos-group 3
```

```
FSB1(config)# class-map type queuing q0
FSB1(config-cmap-queuing)# match queue 0
FSB1(config-cmap-queuing)# exit
FSB1(config)# class-map type queuing q3
FSB1(config-cmap-queuing)# match queue 3
FSB1(config-cmap-queuing)# exit
```

f. Create policy-maps.

```
FSB1(config)# policy-map type network-qos nqpolicy
FSB1(config-pmap-network-qos)# class c3
FSB1(config-pmap-c-nqos)# pause
FSB1(config-pmap-c-nqos)# pfc-cos 3
```

```
FSB1(config)# policy-map type queuing ets_policy
FSB1(config-pmap-queuing)# class q0
FSB1(config-pmap-c-que)# bandwidth percent 30
FSB1(config-pmap-c-que)# class q3
FSB1(config-pmap-c-que)# bandwidth percent 70
```

g. Create a qos-map.

```
FSB1(config)# qos-map traffic-class tc-q-map1
FSB1(config-qos-map)# queue 3 qos-group 3
FSB1(config-qos-map)# queue 0 qos-group 0-2,4-7
```

h. Apply the QoS configurations on CNA1, L2 switch, and FSB2 connected interfaces.

```
FSB1(config)# interface ethernet 1/1/31
FSB1(conf-if-eth1/1/31)# priority-flow-control mode on
FSB1(conf-if-eth1/1/31)# ets mode on
FSB1(conf-if-eth1/1/31)# trust-map dot1p default
FSB1(conf-if-eth1/1/31)# qos-map traffic-class tc-q-map1
FSB1(conf-if-eth1/1/31)# service-policy input type network-qos nqpolicy
FSB1(conf-if-eth1/1/31)# service-policy output type queuing ets_policy

FSB1(config)# interface ethernet 1/1/5
FSB1(conf-if-eth1/1/5)# priority-flow-control mode on
FSB1(conf-if-eth1/1/5)# ets mode on
FSB1(conf-if-eth1/1/5)# trust-map dot1p default
FSB1(conf-if-eth1/1/5)# qos-map traffic-class tc-q-map1
FSB1(conf-if-eth1/1/5)# service-policy input type network-qos nqpolicy
FSB1(conf-if-eth1/1/5)# service-policy output type queuing ets_policy

FSB1(config)# interface ethernet 1/1/2
FSB1(conf-if-eth1/1/2)# priority-flow-control mode on
FSB1(conf-if-eth1/1/2)# ets mode on
FSB1(conf-if-eth1/1/2)# trust-map dot1p default
FSB1(conf-if-eth1/1/2)# qos-map traffic-class tc-q-map1
FSB1(conf-if-eth1/1/2)# service-policy input type network-qos nqpolicy
FSB1(conf-if-eth1/1/2)# service-policy output type queuing ets_policy
```

i. Configure VLAN on CNA1, L2 switch, and FSB2 connected interfaces.

```
FSB1(config)# interface ethernet 1/1/31
FSB1(conf-if-eth1/1/31)# switchport mode trunk
FSB1(conf-if-eth1/1/31)# switchport trunk allowed vlan 777

FSB1(config)# interface ethernet 1/1/5
FSB1(conf-if-eth1/1/5)# switchport mode trunk
FSB1(conf-if-eth1/1/5)# switchport trunk allowed vlan 777

FSB1(config)# interface ethernet 1/1/2
FSB1(conf-if-eth1/1/2)# switchport mode trunk
FSB1(conf-if-eth1/1/2)# switchport trunk allowed vlan 777
```

j. Configure FIP snooping port mode on the L2 DCBX switch connected interface and FSB2 connected interface. The default port mode is ENode. Hence, CNA1-connected interface does not require additional configuration.

On the L2 DCBX switch-connected interface:

```
FSB1(config)# interface ethernet 1/1/5
FSB1(conf-if-eth1/1/5)# fip-snooping port-mode enode-transit
```

On the FSB-connected interfaces:

```
FSB1(config)# interface ethernet 1/1/2
FSB1(conf-if-eth1/1/2)# fip-snooping port-mode fcf
```

3. Configure the core FSB, FSB2.
   a. Disable flow control on the interfaces connected to FSB1 and FCF.

```
FSB2(config)# interface ethernet 1/1/2
FSB2(conf-if-eth1/1/2)# no flowcontrol receive
FSB2(conf-if-eth1/1/2)# no flowcontrol transmit

FSB2(config)# interface ethernet 1/1/13
FSB2(conf-if-eth1/1/13)# no flowcontrol receive
FSB2(conf-if-eth1/1/13)# no flowcontrol transmit
```

   b. Enable FIP snooping with cvl option.

```
FSB2(config)# feature fip-snooping with-cvl
```

   c. Enable DCBX.

```
FSB2(config)# dcbx enable
```

   d. Create an FCoE VLAN and configure FIP snooping on the FCoE VLAN.

```
FSB2(config)# interface vlan 777
FSB2(conf-if-vl-777)# fip-snooping enable
```

   e. Create class-maps.

```
FSB2(config)# class-map type network-qos c3
FSB2(config-cmap-nqos)# match qos-group 3
```

```
FSB2(config)# class-map type queuing q0
FSB2(config-cmap-queuing)# match queue 0
FSB2(config-cmap-queuing)# exit
FSB2(config)# class-map type queuing q3
FSB2(config-cmap-queuing)# match queue 3
FSB2(config-cmap-queuing)# exit
```

   f. Create policy-maps.

```
FSB2(config)# policy-map type network-qos nqpolicy
FSB2(config-pmap-network-qos)# class c3
FSB2(config-pmap-c-nqos)# pause
FSB2(config-pmap-c-nqos)# pfc-cos 3
```

```
FSB2(config)# policy-map type queuing ets_policy
FSB2(config-pmap-queuing)# class q0
FSB2(config-pmap-c-que)# bandwidth percent 30
FSB2(config-pmap-c-que)# class q3
FSB2(config-pmap-c-que)# bandwidth percent 70
```

   g. Create a qos-map.

```
FSB2(config)# qos-map traffic-class tc-q-map1
FSB2(config-qos-map)# queue 3 qos-group 3
FSB2(config-qos-map)# queue 0 qos-group 0-2,4-7
```

h. Apply the QoS configurations on FSB1 and FCF connected interfaces.

```
FSB2(config)# interface ethernet 1/1/2
FSB2(conf-if-eth1/1/2)# priority-flow-control mode on
FSB2(conf-if-eth1/1/2)# ets mode on
FSB2(conf-if-eth1/1/2)# trust-map dot1p default
FSB2(conf-if-eth1/1/2)# qos-map traffic-class tc-q-map1
FSB2(conf-if-eth1/1/2)# service-policy input type network-qos nqpolicy
FSB2(conf-if-eth1/1/2)# service-policy output type queuing ets_policy

FSB2(config)# interface ethernet 1/1/13
FSB2(conf-if-eth1/1/13)# priority-flow-control mode on
FSB2(conf-if-eth1/1/13)# ets mode on
FSB2(conf-if-eth1/1/13)# trust-map dot1p default
FSB2(conf-if-eth1/1/13)# qos-map traffic-class tc-q-map1
FSB2(conf-if-eth1/1/13)# service-policy input type network-qos nqpolicy
FSB2(conf-if-eth1/1/13)# service-policy output type queuing ets_policy
```

i. Configure VLAN on FSB1 and FCF connected interfaces.

```
FSB2(config)# interface ethernet 1/1/2
FSB2(conf-if-eth1/1/2)# switchport mode trunk
FSB2(conf-if-eth1/1/2)# switchport trunk allowed vlan 777

FSB2(config)# interface ethernet 1/1/13
FSB2(conf-if-eth1/1/13)# switchport mode trunk
FSB2(conf-if-eth1/1/13)# switchport trunk allowed vlan 777
```

j. Configure FIP snooping port mode on FSB1 and FCF connected interfaces.

On the FSB1-connected interface:

```
FSB2(config)# interface ethernet 1/1/2
FSB2(conf-if-eth1/1/2)# fip-snooping port-mode enode-transit
```

On the FCF-connected interface:

```
FSB2(config)# interface ethernet 1/1/13
FSB2(conf-if-eth1/1/13)# fip-snooping port-mode fcf-transit
```

4. Configure the FCF. The following configuration assumes that the FCF is in F-Port mode.
   a. Disable flow control on the interface connected to FSB2.

```
FCF(config)# interface ethernet 1/1/13
FCF(conf-if-eth1/1/13)# no flowcontrol receive
FCF(conf-if-eth1/1/13)# no flowcontrol transmit
```

   b. Enable Fiber Channel F-Port mode globally.

```
FCF(config)# feature fc domain-id 2
```

   c. Create zones.

```
FCF(config)# fc zone zoneA
FCF(config-fc-zone-zoneA)# member wwn 20:01:f4:e9:d4:a4:7d:c3
FCF(config-fc-zone-zoneA)# member wwn 21:00:00:24:ff:7c:ae:0e
```

   d. Create zoneset.

```
FCF(config)# fc zoneset zonesetA
FCF(conf-fc-zoneset-set)# member zoneA
```

   e. Create a vfabric VLAN.

```
FCF(config)# interface vlan 777
```

   f. Create vfabric and activate the zoneset.

```
FCF(config)# vfabric 2
FCF(conf-vfabric-2)# vlan 777
```

```
FCF(conf-vfabric-2)# fcoe fcmap 0xEFC00
FCF(conf-vfabric-2)# zoneset activate zonesetA
```

g. Enable DCBX.

```
FCF(config)# dcbx enable
```

h. Create class maps and policy maps.

```
FCF(config)# class-map type network-qos c3
FCF(config-cmap-nqos)# match qos-group 3
```

```
FCF(config)# class-map type queuing q0
FCF(config-cmap-queuing)# match queue 0
FCF(config-cmap-queuing)# exit
FCF(config)# class-map type queuing q3
FCF(config-cmap-queuing)# match queue 3
FCF(config-cmap-queuing)# exit
```

```
FCF(config)# policy-map type network-qos nqpolicy
FCF(config-pmap-network-qos)# class c3
FCF(config-pmap-c-nqos)# pause
FCF(config-pmap-c-nqos)# pfc-cos 3
```

```
FCF(config)# policy-map type queuing ets_policy
FCF(config-pmap-queuing)# class q0
FCF(config-pmap-c-que)# bandwidth percent 30
FCF(config-pmap-c-que)# class q3
FCF(config-pmap-c-que)# bandwidth percent 70
```

i. Create a qos-map.

```
FCF(config)# qos-map traffic-class tc-q-map1
FCF(config-qos-map)# queue 3 qos-group 3
FCF(config-qos-map)# queue 0 qos-group 0-2,4-7
```

j. Apply vfabric on FSB2 and target connected interfaces.

```
FCF(config)# interface ethernet 1/1/13
FCF(conf-if-eth1/1/13)# no shutdown
FCF(conf-if-eth1/1/13)# switchport access vlan 1
FCF(conf-if-eth1/1/13)# vfabric 2
```

```
FCF(config)# interface fibrechannel 1/1/3
FCF(conf-if-fc1/1/3)# description target_connected_port
FCF(conf-if-fc1/1/3)# no shutdown
FCF(conf-if-fc1/1/3)# vfabric 2
```

k. Apply QoS configurations on the interface connected to FSB2.

```
FCF(config)# interface ethernet 1/1/13
FCF(conf-if-eth1/1/13)# priority-flow-control mode on
FCF(conf-if-eth1/1/13)# ets mode on
FCF(conf-if-eth1/1/13)# trust-map dot1p default
FCF(conf-if-eth1/1/13)# qos-map traffic-class tc-q-map1
FCF(conf-if-eth1/1/13)# service-policy input type network-qos nqpolicy
FCF(conf-if-eth1/1/13)# service-policy output type queuing ets_policy
```

Verify multi-hop FSB configuration

Verify the configuration using the following `show` commands:

- To verify FSB mode and the CVL status, use the `show fcoe system` command.

```
FSB1# show fcoe system
Mode                          : FSB
CVL Status                    : Enabled
```

```
FCOE VLAN List (Operational) : 777
FCFs                         : 1
Enodes                       : 2
Sessions                     : 2
```

- To verify the discovered ENodes, use the `show fcoe enode` command.

```
FSB1# show fcoe enode
Enode MAC           Enode Interface     VLAN     FCFs    Sessions
------------------------------------------------------------------
32:03:cf:45:00:00   Eth 1/1/31           777      1        1
f4:e9:d4:f9:fc:40   Eth 1/1/5            777      1        1
```

- To verify the discovered FCFs, use the `show fcoe fcf` command.

```
FSB1# show fcoe fcf
FCF MAC             FCF Interface       VLAN     FC-MAP         FKA_ADV_PERIOD    No.
of Enodes      FCF Mode
-------------------------------------------------------------------------------------
------------------------
14:18:77:20:86:ce   Eth 1/1/2            777      0e:fc:00       8000
2                   F
```

```
FSB2# show fcoe fcf
FCF MAC             FCF Interface       VLAN     FC-MAP         FKA_ADV_PERIOD     No.
of Enodes      FCF Mode
-------------------------------------------------------------------------------------
------------------------
14:18:77:20:86:ce   Eth 1/1/13           777      0e:fc:00       8000
0                   FT
```

- To verify the list of FCoE sessions, use the `show fcoe sessions` command.

```
FSB1# show fcoe sessions
Enode MAC         Enode Interface  FCF MAC         FCF interface  VLAN  FCoE
MAC          FC-ID    PORT WWPN
PORT WWNN
-------------------------------------------------------------------------------------
-------------------------
32:03:cf:45:00:00 Eth 1/1/31    14:18:77:20:86:ce  Eth 1/1/2     777
0e:fc:00:05:00:05 05:00:05 33:00:55:2c:cf:55:00:00
23:00:55:2c:cf:55:00:00
f4:e9:d4:f9:fc:40 Eth 1/1/5     14:18:77:20:86:ce  Eth 1/1/2     777
0e:fc:00:02:01:00 02:01:00 20:01:f4:e9:d4:a4:7d:c3
20:00:f4:e9:d4:a4:7d:c3
```

- To verify the name server entries on the FCF, use the `show fc ns switch brief` command.

```
FCF# show fc ns switch brief
Total number of devices = 3

Intf#                     Domain     FC-ID      Enode-WWPN              Enode-WWNN

fibrechannel1/1/3           2       02:00:00  21:00:00:24:ff:7c:ae:0e
20:04:00:11:0d:64:67:00
ethernet1/1/13              2       02:01:00  20:01:f4:e9:d4:a4:7d:c3
23:00:55:2c:cf:55:00:00
```

- To verify the active zoneset on the FCF, use the `show fc zoneset active` command.

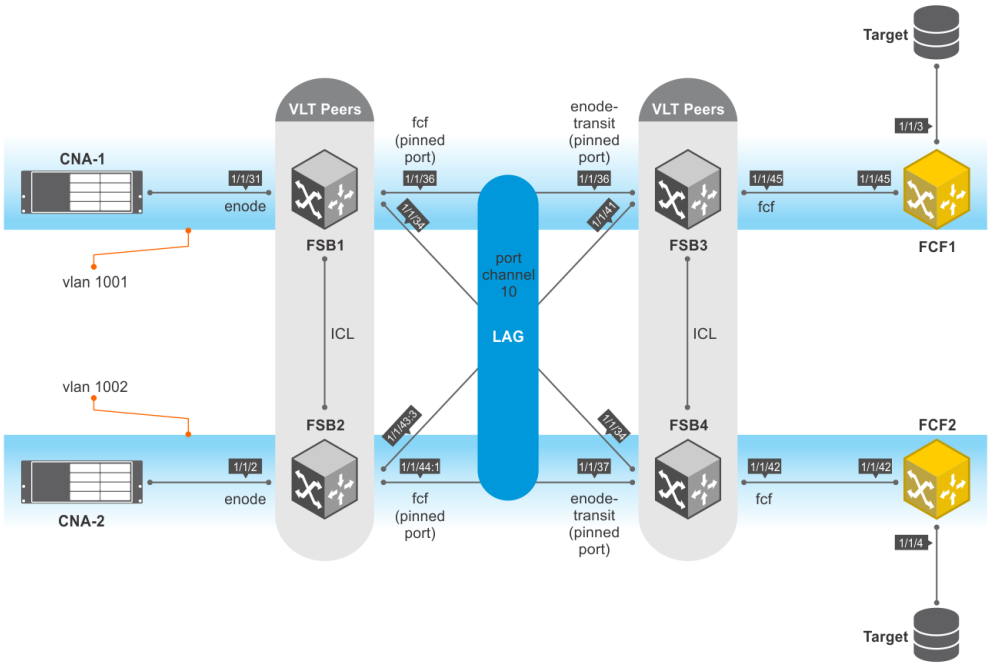
```
FCF# show fc zoneset active

vFabric id: 2
Active Zoneset: zonesetA
ZoneName                          ZoneMember
==========================================================
zoneA                             20:01:f4:e9:d4:a4:7d:c3

                                  21:00:00:24:ff:7c:ae:0e
```

Sample Multi-hop FSB configuration

The following is a sample multi-hop FSB topology.



In this topology:

- FSB1 and FSB2—access FSBs.
- FSB3 and FSB4—core FSBs.
- VLT is configured between FSB1 and FSB2, and requires port-pinning for VLT port channels configured between access FSBs and core FSBs. The port modes are:
  - Directly-connected CNA ports—ENode
  - Ports connected to FSB3 and FSB4—FCF
- VLT is configured between FSB3 and FSB4, and requires port-pinning for VLT port channels configured between access and core FSBs. The port modes are:
  - Ports connected to FSB1 and FSB2—ENode-transit
  - Ports connected to FCFs, for pinning to work at ENode port—FCF

The following table lists the high-level configurations on FSB1, FSB3, and FCF1. These configurations apply to FSB2, FSB4, and FCF2, respectively.

Table 36. High-level configurations on FSB1, FSB3, and FCF1

FSB1/FSB2	FSB3/FSB4	FCF1/FCF2
1. Enable FIP snooping. 2. Enable DCBX. 3. Create FCoE VLAN and configure FIP snooping. 4. Create class-maps. 5. Create policy-maps. 6. Create a qos-map. 7. Configure port channel. 8. Configure VLTi interface member links. 9. Configure VLT domain. 10. Configure VLAN. 11. Apply QoS configurations on uplink (FSB3/FSB4) and downlink interfaces (CNA-1/CNA-2).	1. Enable FIP snooping. 2. Enable DCBX. 3. Create FCoE VLAN and configure FIP snooping. 4. Create class-maps. 5. Create policy-maps. 6. Create a qos-map. 7. Configure port channel. 8. Configure VLTi interface member links. 9. Configure VLT domain. 10. Configure VLAN. 11. Apply QoS configurations on the uplink (FCF1/FCF2) and downlink interfaces (FSB1/FSB2). Configure	1. Enable Fiber Channel F-Port mode globally. 2. Create zones. 3. Create zoneset. 4. Create a vfabric VLAN. 5. Create vfabric and activate the zoneset. 6. Enable DCBX. 7. Create class-maps. 8. Create policy-maps. 9. Create a qos-map. 10. Apply QoS configurations on the downlink interface (FSB3/FSB4). 11. Apply vfabric on the downlink and uplink (target-connected) interfaces.

Table 36. High-level configurations on FSB1, FSB3, and FCF1

FSB1/FSB2	FSB3/FSB4	FCF1/FCF2
Configure the uplink interface as pinned-port. 12. Configure FIP snooping port mode on the uplink interface.	the downlink interface as pinned-port. 12. Configure FIP snooping port mode on the uplink interface and the port channel.	

FSB1 configuration

1. Enable FIP snooping.

```
FSB1(config)# feature fip-snooping with-cvl
```

2. Enable DCBX.

```
FSB1(config)# dcbx enable
```

3. Create FCoE VLAN and configure FIP snooping.

```
FSB1(config)#interface vlan1001
FSB1(conf-if-vl-1001)# fip-snooping enable
FSB1(conf-if-vl-1001)# no shutdown
```

```
FSB1(config)#interface vlan1002
FSB1(conf-if-vl-1002)# fip-snooping enable
FSB1(conf-if-vl-1002)# no shutdown
```

4. Create class-maps.

```
FSB1(config)# class-map type network-qos c3
FSB1(config-cmap-nqos)# match qos-group 3
```

```
FSB1(config)# class-map type queuing q0
FSB1(config-cmap-queuing)# match queue 0
FSB1(config-cmap-queuing)# exit
FSB1(config)# class-map type queuing q3
FSB1(config-cmap-queuing)# match queue 3
FSB1(config-cmap-queuing)# exit
```

5. Create policy-maps.

```
FSB1(config)# policy-map type network-qos nqpolicy
FSB1(config-pmap-network-qos)# class c3
FSB1(config-pmap-c-nqos)# pause
FSB1(config-pmap-c-nqos)# pfc-cos 3
```

```
FSB1(config)# policy-map type queuing ets_policy
FSB1(config-pmap-queuing)# class q0
FSB1(config-pmap-c-que)# bandwidth percent 30
FSB1(config-pmap-c-que)# class q3
FSB1(config-pmap-c-que)# bandwidth percent 70
```

6. Create a qos-map.

```
FSB1(config)# qos-map traffic-class tc-q-map1
FSB1(config-qos-map)# queue 3 qos-group 3
FSB1(config-qos-map)# queue 0 qos-group 0-2,4-7
```

7. Configure port channel.

```
FSB1(config)# interface port-channel 10
FSB1(conf-if-po-10)# no shutdown
FSB1(conf-if-po-10)# vlt-port-channel 1
```

8. Configure VLTi interface member links.

```
FSB1(config)# interface ethernet1/1/32
FSB1(conf-if-eth1/1/32)# no shutdown
FSB1(conf-if-eth1/1/32)# no switchport
```

```
FSB1(config)# interface ethernet1/1/33
FSB1(conf-if-eth1/1/33)# no shutdown
FSB1(conf-if-eth1/1/33)# no switchport
```

```
FSB1(config)# interface ethernet1/1/34
FSB1(conf-if-eth1/1/34)# no shutdown
FSB1(conf-if-eth1/1/34)# no switchport
FSB1(conf-if-eth1/1/34)# channel-group 10
```

```
FSB1(config)# interface ethernet 1/1/36
FSB1(conf-if-eth1/1/36)# no shutdown
FSB1(conf-if-eth1/1/36)# no switchport
FSB1(conf-if-eth1/1/36)# channel-group 10
```

9. Configure VLT domain.

```
FSB1(config)# vlt-domain 2
FSB1(conf-vlt-2)# discovery-interface ethernet1/1/32-1/1/33
FSB1(conf-vlt-2)# vlt-mac 1a:2b:3c:0a:0b:0c
```

10. Configure VLAN on FSB1.

```
FSB1(config)# interface ethernet 1/1/31
FSB1(conf-if-eth1/1/31)# no shutdown
FSB1(conf-if-eth1/1/31)# switchport mode trunk
FSB1(conf-if-eth1/1/31)# switchport access vlan 1
FSB1(conf-if-eth1/1/31)# switchport trunk allowed vlan 1001
```

```
FSB1(config)# interface port-channel 10
FSB1(conf-if-po-10)# switchport mode trunk
FSB1(conf-if-po-10)# switchport access vlan 1
FSB1(conf-if-po-10)# switchport trunk allowed vlan 1001-1002
```

11. Apply QoS configurations on the interfaces connected to FSB2 and CNA-1. Configure the interface connected to FSB2 as pinned-port.

```
FSB1(config)# interface ethernet 1/1/36
FSB1(conf-if-eth1/1/36)# flowcontrol receive off
FSB1(conf-if-eth1/1/36)# priority-flow-control mode on
FSB1(conf-if-eth1/1/36)# ets mode on
FSB1(conf-if-eth1/1/36)# trust-map dot1p default
FSB1(conf-if-eth1/1/36)# qos-map traffic-class tc-q-map1
FSB1(conf-if-eth1/1/36)# service-policy input type network-qos nqpolicy
FSB1(conf-if-eth1/1/36)# service-policy output type queuing ets_policy
FSB1(conf-if-eth1/1/36)# fcoe-pinned-port
```

```
FSB1(config)# interface ethernet 1/1/31
FSB1(conf-if-eth1/1/31)# flowcontrol receive off
FSB1(conf-if-eth1/1/31)# priority-flow-control mode on
FSB1(conf-if-eth1/1/31)# ets mode on
FSB1(conf-if-eth1/1/31)# trust-map dot1p default
FSB1(conf-if-eth1/1/31)# qos-map traffic-class tc-q-map1
FSB1(conf-if-eth1/1/31)# service-policy input type network-qos nqpolicy
FSB1(conf-if-eth1/1/31)# service-policy output type queuing ets_policy
```

12. Configure FIP snooping port mode on the port channel interface. The default port mode is ENode. Hence, the interface connected to CNA-1 does not require additional configuration.

```
FSB1(config)# interface port-channel 10
FSB1(conf-if-po-10)# fip-snooping port-mode fcf
```

FSB2 configuration

1. Enable FIP snooping.

```
FSB2(config)# feature fip-snooping with-cvl
```

2. Enable DCBX.

```
FSB2(config)# dcbx enable
```

3. Create FCoE VLAN and configure FIP snooping.

```
FSB2(config)#interface vlan1001
FSB2(conf-if-vl-1001)# fip-snooping enable
FSB2(conf-if-vl-1001)# no shutdown
```

```
FSB2(config)#interface vlan1002
FSB2(conf-if-vl-1002)# fip-snooping enable
FSB2(conf-if-vl-1002)# no shutdown
```

4. Create class-maps.

```
FSB2(config)# class-map type network-qos c3
FSB2(config-cmap-nqos)# match qos-group 3
```

```
FSB2(config)# class-map type queuing q0
FSB2(config-cmap-queuing)# match queue 0
FSB2(config-cmap-queuing)# exit
FSB2(config)# class-map type queuing q3
FSB2(config-cmap-queuing)# match queue 3
FSB2(config-cmap-queuing)# exit
```

5. Create policy-maps.

```
FSB2(config)# policy-map type network-qos nqpolicy
FSB2(config-pmap-network-qos)# class c3
FSB2(config-pmap-c-nqos)# pause
FSB2(config-pmap-c-nqos)# pfc-cos 3
```

```
FSB2(config)# policy-map type queuing ets_policy
FSB2(config-pmap-queuing)# class q0
FSB2(config-pmap-c-que)# bandwidth percent 30
FSB2(config-pmap-c-que)# class q3
FSB2(config-pmap-c-que)# bandwidth percent 70
```

6. Create a qos-map.

```
FSB2(config)# qos-map traffic-class tc-q-map1
FSB2(config-qos-map)# queue 3 qos-group 3
FSB2(config-qos-map)# queue 0 qos-group 0-2,4-7
```

7. Configure port channel.

```
FSB2(config)# interface port-channel 10
FSB2(conf-if-po-10)# no shutdown
FSB2(conf-if-po-10)# vlt-port-channel 1
```

8. Configure VLTi interface member links.

```
FSB2(config)# interface ethernet1/1/43:1
FSB2(conf-if-eth1/1/43:1)# no shutdown
FSB2(conf-if-eth1/1/43:1)# no switchport
```

```
FSB2(config)# interface ethernet1/1/43:2
FSB2(conf-if-eth1/1/43:2)# no shutdown
FSB2(conf-if-eth1/1/43:2)# no switchport
```

```
FSB2(config)# interface ethernet 1/1/43:3
FSB2(conf-if-eth1/1/43:3)# no shutdown
FSB2(conf-if-eth1/1/43:3)# no switchport
FSB2(conf-if-eth1/1/43:3)# channel-group 10
```

```
FSB2(config)# interface ethernet1/1/44:1
FSB2(conf-if-eth1/1/44:1)# no shutdown
FSB2(conf-if-eth1/1/44:1)# no switchport
FSB2(conf-if-eth1/1/44:1)# channel-group 10
```

9. Configure VLT domain.

```
FSB2(config)# vlt-domain 2
FSB2(conf-vlt-2)# discovery-interface ethernet1/1/43:1-1/1/43:2
FSB2(conf-vlt-2)# vlt-mac 1a:2b:3c:0a:0b:0c
```

10. Configure VLAN on FSB2.

```
FSB2(config)# interface ethernet 1/1/2
FSB2(conf-if-eth1/1/2)# no shutdown
FSB2(conf-if-eth1/1/2)# switchport mode trunk
FSB2(conf-if-eth1/1/2)# switchport access vlan 1
FSB2(conf-if-eth1/1/2)# switchport trunk allowed vlan 1002
```

```
FSB2(config)# interface port-channel 10
FSB2(conf-if-po-10)# switchport mode trunk
FSB2(conf-if-po-10)# switchport access vlan 1
FSB2(conf-if-po-10)# switchport trunk allowed vlan 1001-1002
```

11. Apply QoS configurations on the interfaces connected to FSB4 and CNA-2. Configure the interface connected to FSB4 as pinned-port.

```
FSB2(config)# interface ethernet 1/1/44:1
FSB2(conf-if-eth1/1/44:1)# flowcontrol receive off
FSB2(conf-if-eth1/1/44:1)# priority-flow-control mode on
FSB2(conf-if-eth1/1/44:1)# ets mode on
FSB2(conf-if-eth1/1/44:1)# trust-map dot1p default
FSB2(conf-if-eth1/1/44:1)# qos-map traffic-class tc-q-map1
FSB2(conf-if-eth1/1/44:1)# service-policy input type network-qos nqpolicy
FSB2(conf-if-eth1/1/44:1)# service-policy output type queuing ets_policy
FSB2(conf-if-eth1/1/44:1)# fcoe-pinned-port
```

```
FSB2(config)# interface ethernet 1/1/2
FSB2(conf-if-eth1/1/2)# flowcontrol receive off
FSB2(conf-if-eth1/1/2)# priority-flow-control mode on
FSB2(conf-if-eth1/1/2)# ets mode on
FSB2(conf-if-eth1/1/2)# trust-map dot1p default
FSB2(conf-if-eth1/1/2)# qos-map traffic-class tc-q-map1
FSB2(conf-if-eth1/1/2)# service-policy input type network-qos nqpolicy
FSB2(conf-if-eth1/1/2)# service-policy output type queuing ets_policy
```

12. Configure FIP snooping port mode on the port channel interface. The default port mode is ENode. Hence, the interface connected to CNA-2 does not require additional configuration.

```
FSB2(config)# interface port-channel 10
FSB2(conf-if-po-10)# fip-snooping port-mode fcf
```

FSB3 configuration

1. Enable FIP snooping.

```
FSB3(config)# feature fip-snooping with-cvl
```

2. Enable DCBX.

```
FSB3(config)# dcbx enable
```

3. Create FCoE VLAN and configure FIP snooping.

```
FSB3(config)#interface vlan1001
FSB3(conf-if-vl-1001)# fip-snooping enable
FSB3(conf-if-vl-1001)# no shutdown
```

```
FSB3(config)#interface vlan1002
FSB3(conf-if-vl-1002)# fip-snooping enable
FSB3(conf-if-vl-1002)# no shutdown
```

4. Create class-maps.

```
FSB3(config)# class-map type network-qos c3
FSB3(config-cmap-nqos)# match qos-group 3
```

```
FSB3(config)# class-map type queuing q0
FSB3(config-cmap-queuing)# match queue 0
FSB3(config-cmap-queuing)# exit
FSB3(config)# class-map type queuing q3
FSB3(config-cmap-queuing)# match queue 3
FSB3(config-cmap-queuing)# exit
```

5. Create policy-maps.

```
FSB3(config)# policy-map type network-qos nqpolicy
FSB3(config-pmap-network-qos)# class c3
FSB3(config-pmap-c-nqos)# pause
FSB3(config-pmap-c-nqos)# pfc-cos 3
```

```
FSB3(config)# policy-map type queuing ets_policy
FSB3(config-pmap-queuing)# class q0
FSB3(config-pmap-c-que)# bandwidth percent 30
FSB3(config-pmap-c-que)# class q3
FSB3(config-pmap-c-que)# bandwidth percent 70
```

6. Create a qos-map.

```
FSB3(config)# qos-map traffic-class tc-q-map1
FSB3(config-qos-map)# queue 3 qos-group 3
FSB3(config-qos-map)# queue 0 qos-group 0-2,4-7
```

7. Configure port channel.

```
FSB3(config)# interface port-channel 10
FSB3(conf-if-po-10)# no shutdown
FSB3(conf-if-po-10)# vlt-port-channel 1
```

8. Configure VLTi interface member links.

```
FSB3(config)# interface ethernet1/1/39
FSB3(conf-if-eth1/1/39)# no shutdown
FSB3(conf-if-eth1/1/39)# no switchport
```

```
FSB3(config)# interface ethernet1/1/40
FSB3(conf-if-eth1/1/40)# no shutdown
FSB3(conf-if-eth1/1/40)# no switchport
```

```
FSB3(config)# interface ethernet1/1/41
FSB3(conf-if-eth1/1/41)# no shutdown
FSB3(conf-if-eth1/1/41)# no switchport
FSB3(conf-if-eth1/1/41)# channel-group 10
```

```
FSB3(config)# interface ethernet 1/1/36
FSB3(conf-if-eth1/1/36)# no shutdown
FSB3(conf-if-eth1/1/36)# no switchport
FSB3(conf-if-eth1/1/36)# channel-group 10
```

9. Configure VLT domain.

```
FSB3(config)# vlt-domain 3
FSB3(conf-vlt-3)# discovery-interface ethernet1/1/39-1/1/40
FSB3(conf-vlt-3)# vlt-mac 1a:2b:3c:2a:1b:1c
```

10. Configure VLAN on FSB3.

```
FSB3(config)# interface ethernet 1/1/45
FSB3(conf-if-eth1/1/45)# no shutdown
FSB3(conf-if-eth1/1/45)# switchport mode trunk
FSB3(conf-if-eth1/1/45)# switchport access vlan 1
FSB3(conf-if-eth1/1/45)# switchport trunk allowed vlan 1001
```

```
FSB3(config)# interface port-channel 10
FSB3(conf-if-po-10)# switchport mode trunk
FSB3(conf-if-po-10)# switchport access vlan 1
FSB3(conf-if-po-10)# switchport trunk allowed vlan 1001-1002
```

11. Apply QoS configurations on the interfaces connected to FCF1 and FSB1. Configure the interface connected to FSB1 as pinned-port.

```
FSB3(config)# interface ethernet 1/1/45
FSB3(conf-if-eth1/1/45)# flowcontrol receive off
FSB3(conf-if-eth1/1/45)# priority-flow-control mode on
FSB3(conf-if-eth1/1/45)# ets mode on
FSB3(conf-if-eth1/1/45)# trust-map dot1p default
FSB3(conf-if-eth1/1/45)# qos-map traffic-class tc-q-map1
FSB3(conf-if-eth1/1/45)# service-policy input type network-qos nqpolicy
FSB3(conf-if-eth1/1/45)# service-policy output type queuing ets_policy
```

```
FSB3(config)# interface ethernet 1/1/36
FSB3(conf-if-eth1/1/36)# flowcontrol receive off
FSB3(conf-if-eth1/1/36)# priority-flow-control mode on
FSB3(conf-if-eth1/1/36)# ets mode on
FSB3(conf-if-eth1/1/36)# trust-map dot1p default
FSB3(conf-if-eth1/1/36)# qos-map traffic-class tc-q-map1
FSB3(conf-if-eth1/1/36)# service-policy input type network-qos nqpolicy
FSB3(conf-if-eth1/1/36)# service-policy output type queuing ets_policy
FSB3(conf-if-eth1/1/36)# fcoe-pinned-port
```

12. Configure FIP snooping port mode on the port channel and the interface connected to FCF1.

```
FSB3(config)# interface port-channel 10
FSB3(conf-if-po-10)# fip-snooping port-mode enode-transit
```

```
FSB3(config)# interface ethernet 1/1/45
FSB3(conf-if-eth1/1/45)# fip-snooping port-mode fcf
```

FSB4 configuration

1. Enable FIP snooping.

```
FSB4(config)# feature fip-snooping with-cvl
```

2. Enable DCBX.

```
FSB4(config)# dcbx enable
```

3. Create FCoE VLAN and configure FIP snooping.

```
FSB4(config)#interface vlan1001
FSB4(conf-if-vl-1001)# fip-snooping enable
FSB4(conf-if-vl-1001)# no shutdown
```

```
FSB4(config)#interface vlan1002
FSB4(conf-if-vl-1002)# fip-snooping enable
FSB4(conf-if-vl-1002)# no shutdown
```

4. Create class-maps.

```
FSB4(config)# class-map type network-qos c3
FSB4(config-cmap-nqos)# match qos-group 3
```

```
FSB4(config)# class-map type queuing q0
FSB4(config-cmap-queuing)# match queue 0
FSB4(config-cmap-queuing)# exit
FSB4(config)# class-map type queuing q3
FSB4(config-cmap-queuing)# match queue 3
FSB4(config-cmap-queuing)# exit
```

5. Create policy-maps.

```
FSB4(config)# policy-map type network-qos nqpolicy
FSB4(config-pmap-network-qos)# class c3
FSB4(config-pmap-c-nqos)# pause
FSB4(config-pmap-c-nqos)# pfc-cos 3
```

```
FSB4(config)# policy-map type queuing ets_policy
FSB4(config-pmap-queuing)# class q0
FSB4(config-pmap-c-que)# bandwidth percent 30
FSB4(config-pmap-c-que)# class q3
FSB4(config-pmap-c-que)# bandwidth percent 70
```

6. Create a qos-map.

```
FSB4(config)# qos-map traffic-class tc-q-map1
FSB4(config-qos-map)# queue 3 qos-group 3
FSB4(config-qos-map)# queue 0 qos-group 0-2,4-7
```

7. Configure port channel.

```
FSB4(config)# interface port-channel 10
FSB4(conf-if-po-10)# no shutdown
FSB4(conf-if-po-10)# vlt-port-channel 1
```

8. Configure VLTi interface member links.

```
FSB4(config)# interface ethernet1/1/34
FSB4(conf-if-eth1/1/34)# no shutdown
FSB4(conf-if-eth1/1/34)# no switchport
FSB4(conf-if-eth1/1/34)# channel-group 10
```

```
FSB4(config)# interface ethernet1/1/37
FSB4(conf-if-eth1/1/37)# no shutdown
FSB4(conf-if-eth1/1/37)# no switchport
FSB4(conf-if-eth1/1/37)# channel-group 10
```

9. Configure VLT domain.

```
FSB4(config)# vlt-domain 3
FSB4(conf-vlt-2)# discovery-interface ethernet1/1/40
FSB4(conf-vlt-2)# vlt-mac 1a:2b:3c:2a:1b:1c
```

10. Configure VLAN on FSB4.

```
FSB4(config)# interface ethernet 1/1/42
FSB4(conf-if-eth1/1/42)# no shutdown
FSB4(conf-if-eth1/1/42)# switchport mode trunk
FSB4(conf-if-eth1/1/42)# switchport access vlan 1
FSB4(conf-if-eth1/1/42)# switchport trunk allowed vlan 1002
```

```
FSB4(config)# interface port-channel 10
FSB4(conf-if-po-10)# switchport mode trunk
FSB4(conf-if-po-10)# switchport access vlan 1
FSB4(conf-if-po-10)# switchport trunk allowed vlan 1001-1002
```

11. Apply QoS configurations on the interfaces connected to FCF2.

```
FSB4(config)# interface ethernet 1/1/42
FSB4(conf-if-eth1/1/42)# flowcontrol receive off
FSB4(conf-if-eth1/1/42)# priority-flow-control mode on
FSB4(conf-if-eth1/1/42)# ets mode on
FSB4(conf-if-eth1/1/42)# trust-map dot1p default
FSB4(conf-if-eth1/1/42)# qos-map traffic-class tc-q-map1
FSB4(conf-if-eth1/1/42)# service-policy input type network-qos nqpolicy
FSB4(conf-if-eth1/1/42)# service-policy output type queuing ets_policy
```

12. Configure FIP snooping port mode on the port channel and the interface connected to FCF2. Configure the interface connected to FSB2 as pinned-port.

```
FSB4(config)# interface port-channel 10
FSB4(conf-if-po-10)# fip-snooping port-mode enode-transit
```

```
FSB4(config)# interface ethernet 1/1/42
FSB4(conf-if-eth1/1/42)# fip-snooping port-mode fcf
```

```
FSB4(config)# interface ethernet 1/1/37
FSB4(conf-if-eth1/1/37)# fcoe-pinned-port
```

FCF1 configuration

1. Enable Fiber Channel F-Port mode globally.

```
FCF1(config)# feature fc domain-id 2
```

2. Create zones.

```
FCF1(config)# fc zone zoneA
FCF1(config-fc-zone-zoneA)# member wwn 23:05:22:11:0d:64:67:11
FCF1(config-fc-zone-zoneA)# member wwn 50:00:d3:10:00:ec:f9:00
```

3. Create zoneset.

```
FCF1(config)# fc zoneset zonesetA
FCF1(conf-fc-zoneset-setA)# member zoneA
```

4. Create a vfabric VLAN.

```
FCF1(config)# interface vlan 1001
```

5. Create vfabric and activate the zoneset.

```
FCF1(config)# vfabric 1
FCF1(conf-vfabric-1)# vlan 1001
FCF1(conf-vfabric-1)# fcoe fcmap 0xEFC00
FCF1(conf-vfabric-1)# zoneset activate zonesetA
```

6. Enable DCBX.

```
FCF1(config)# dcbx enable
```

7. Create class-maps.

```
FCF1(config)# class-map type network-qos c3
FCF1(config-cmap-nqos)# match qos-group 3
```

```
FCF1(config)# class-map type queuing q0
FCF1(config-cmap-queuing)# match queue 0
FCF1(config-cmap-queuing)# exit
FCF1(config)# class-map type queuing q3
FCF1(config-cmap-queuing)# match queue 3
FCF1(config-cmap-queuing)# exit
```

8. Create policy-maps.

```
FCF1(config)# policy-map type network-qos nqpolicy
FCF1(config-pmap-network-qos)# class c3
FCF1(config-pmap-c-nqos)# pause
FCF1(config-pmap-c-nqos)# pfc-cos 3
```

```
FCF1(config)# policy-map type queuing ets_policy
FCF1(config-pmap-queuing)# class q0
FCF1(config-pmap-c-que)# bandwidth percent 30
FCF1(config-pmap-c-que)# class q3
FCF1(config-pmap-c-que)# bandwidth percent 70
```

9. Create a qos-map.

```
FCF1(config)# qos-map traffic-class tc-q-map1
FCF1(config-qos-map)# queue 3 qos-group 3
FCF1(config-qos-map)# queue 0 qos-group 0-2,4-7
```

10. Apply QoS configurations on the interface connected to FSB3.

```
FCF1(config)# interface ethernet 1/1/45
FCF1(conf-if-eth1/1/45)# no shutdown
FCF1(conf-if-eth1/1/45)# flowcontrol receive off
FCF1(conf-if-eth1/1/45)# priority-flow-control mode on
FCF1(conf-if-eth1/1/45)# ets mode on
FCF1(conf-if-eth1/1/45)# trust-map dot1p default
FCF1(conf-if-eth1/1/45)# qos-map traffic-class tc-q-map1
FCF1(conf-if-eth1/1/45)# service-policy input type network-qos nqpolicy
FCF1(conf-if-eth1/1/45)# service-policy output type queuing ets_policy
```

11. Apply vfabric on the interfaces connected to FSB3 and the target.

```
FCF1(config)# interface ethernet 1/1/45
FCF1(conf-if-eth1/1/45)# switchport access vlan 1
FCF1(conf-if-eth1/1/45)# vfabric 1
```

```
FCF1(config)# interface fibrechannel 1/1/3
FCF1(conf-if-fc1/1/3)# description target_connected_port
FCF1(conf-if-fc1/1/3)# no shutdown
FCF1(conf-if-fc1/1/3)# vfabric 1
```

FCF2 configuration

1. Enable Fiber Channel F-Port mode globally.

```
FCF2(config)# feature fc domain-id 3
```

2. Create zones.

```
FCF2(config)# fc zone zoneB
FCF2(config-fc-zone-zoneB)# member wwn 20:01:00:0e:1e:f1:f1:84
FCF2(config-fc-zone-zoneB)# member wwn 53:00:a3:10:00:ec:f9:01
```

3. Create zoneset.

```
FCF2(config)# fc zoneset zonesetB
FCF2(conf-fc-zoneset-setB)# member zoneB
```

4. Create a vfabric VLAN.

```
FCF2(config)# interface vlan 1002
```

5. Create vfabric and activate the zoneset.

```
FCF2(config)# vfabric 2
FCF2(conf-vfabric-2)# vlan 1002
FCF2(conf-vfabric-2)# fcoe fcmap 0xEFC00
FCF2(conf-vfabric-2)# zoneset activate zonesetB
```

6. Enable DCBX.

```
FCF2(config)# dcbx enable
```

7. Create class-maps.

```
FCF2(config)# class-map type network-qos c3
FCF2(config-cmap-nqos)# match qos-group 3
```

```
FCF2(config)# class-map type queuing q0
FCF2(config-cmap-queuing)# match queue 0
FCF2(config-cmap-queuing)# exit
FCF2(config)# class-map type queuing q3
FCF2(config-cmap-queuing)# match queue 3
FCF2(config-cmap-queuing)# exit
```

8. Create policy-maps.

```
FCF2(config)# policy-map type network-qos nqpolicy
FCF2(config-pmap-network-qos)# class c3
FCF2(config-pmap-c-nqos)# pause
FCF2(config-pmap-c-nqos)# pfc-cos 3
```

```
FCF2(config)# policy-map type queuing ets_policy
FCF2(config-pmap-queuing)# class q0
FCF2(config-pmap-c-que)# bandwidth percent 30
```

```
FCF2(config-pmap-c-que)# class q3
FCF2(config-pmap-c-que)# bandwidth percent 70
```

9. Create a qos-map.

```
FCF2(config)# qos-map traffic-class tc-q-map1
FCF2(config-qos-map)# queue 3 qos-group 3
FCF2(config-qos-map)# queue 0 qos-group 0-2,4-7
```

10. Apply QoS configurations on the interface connected to FSB4.

```
FCF2(config)# interface ethernet 1/1/42
FCF2(conf-if-eth1/1/42)# no shutdown
FCF2(conf-if-eth1/1/42)# flowcontrol receive off
FCF2(conf-if-eth1/1/42)# priority-flow-control mode on
FCF2(conf-if-eth1/1/42)# ets mode on
FCF2(conf-if-eth1/1/42)# trust-map dot1p default
FCF2(conf-if-eth1/1/42)# qos-map traffic-class tc-q-map1
FCF2(conf-if-eth1/1/42)# service-policy input type network-qos nqpolicy
FCF2(conf-if-eth1/1/42)# service-policy output type queuing ets_policy
```

11. Apply vfabric on the interfaces connected to FSB4 and the target.

```
FCF2(config)# interface ethernet 1/1/42
FCF2(conf-if-eth1/1/42)# switchport access vlan 1
FCF2(conf-if-eth1/1/42)# vfabric 1
```

```
FCF2(config)# interface fibrechannel 1/1/4
FCF2(conf-if-fc1/1/4)# description target_connected_port
FCF2(conf-if-fc1/1/4)# no shutdown
FCF2(conf-if-fc1/1/4)# vfabric 2
```

Verify the configuration

Use the following `show` commands to verify the configuration:

Configuration guidelines

When configuring different modes; for example, F_Port, NPG, or FSB, consider the following:

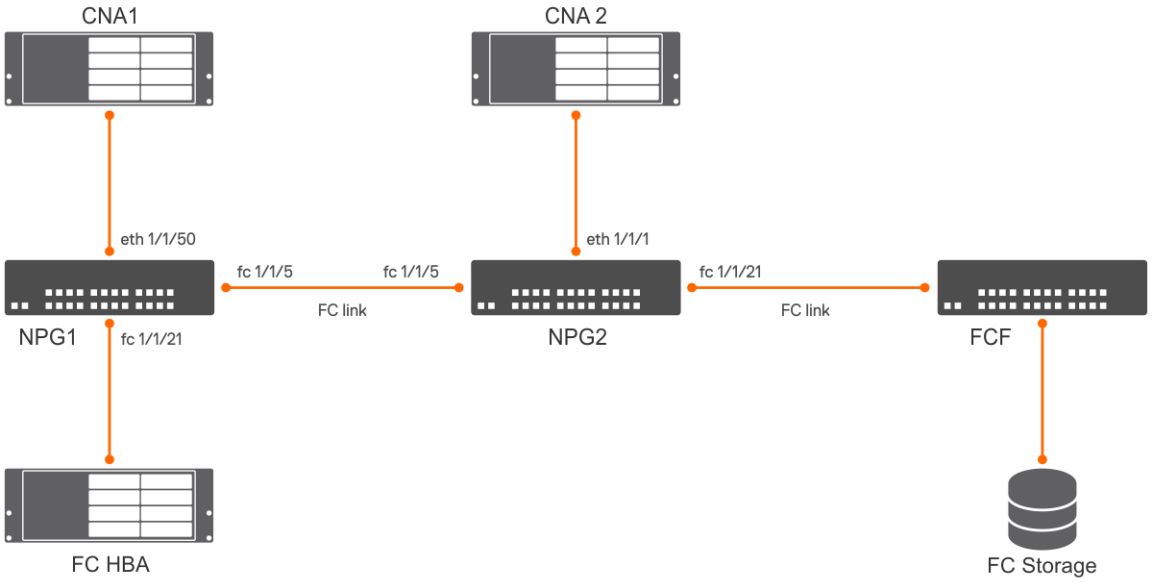
- F_Port, NPG, and FSB modes are mutually exclusive. You can enable only one at a time.
- You can enable the mode-specific commands only after enabling the specific feature.
- Before you disable the F_Port and NPG features, delete the mode-specific configurations. When you disable FSB, the system automatically removes the configurations.
- If you connect a storage device (target) to the IOM Fibrechannel port and if the port is operationally UP, then the storage device will induce a port flap until you configure the FC DirectAttach uplink (vfabric) configuration on this port. This is because, the storage device tries to login to the IOM switch and flaps the port in case it does not receive the response. This is because the IOM side needs to be configured yet. Once you complete the configuration on the IOM side, then flaps are stopped and storage device logs in to the IOM switch.

- While configuring or unconfiguring the FC-Gateway uplink, the uplink interface flaps. As UFD is enabled by default for NPG (FCGateway Uplink) in SmartFabric mode; UFD brings down the server facing ports which are deployed with same FCoE VLAN as FCGateway uplink.
- Fibrechannel port flaps are observed on the IOM side if the IOM is operationally up and is connected to a storage device without configuring the FCDirectAttach uplink (vfabric) on this port. These flaps are induced by the storage device, as the storage device is unable to login to the IOM until the configuration on this port is applied. After the FCDirectAttach uplink (vfabric) configuration is completed on this port, the flaps stop and the storage device logs in to the IOM switch.
- You must enable the `with-cvl` option while configuring FSB mode of operation for standalone devices and FSB cascading. Also, you must enable the `with-cvl` option while configuring single link and link aggregation.

NPIV Proxy Gateway cascading

OS10 supports connecting two switches as NPIV Proxy Gateways (NPIVs) between Converged Network Adapters (CNAs) or Fibre Channel Host Bus Adapters (FC HBAs) and FCoE Forwarder (FCF) switches.

In the following figure, NPG1 and NPG2 connect to each other which provide FCoE and FC services for CNA1 and FC HBA1, and the FCF1 switch.



NPG1 switch configuration

1. Enable the NPG feature.

```
OS10(config)# feature fc npg
```

2. Configure vFabric.

```
OS10(config)# vfabric 2
OS10(conf-vfabric-2)# vlan 1000
OS10(conf-vfabric-2)# name fcoe_fabric
OS10(conf-vfabric-2)# fcoe fcmap 0efc02
```

3. Apply the vFabric configuration on the interface that connects to FC HBA and change the port mode to F_Port.

```
OS10(config)# interface fibrechannel 1/1/21
OS10(conf-if-fc1/1/21)# vfabric 2
```

4. Apply the vFabric configuration on the interface that connects to CNA 1.

```
OS10(config)# interface ethernet 1/1/50
OS10(conf-if-eth1/1/50)# vfabric 2
```

5. Enable DCBX globally.

```
OS10(config)# dcbx enable
```

6. Create a class map and policy map.

```
OS10(config)# class-map type network-qos cmap1
OS10(config-cmap-nqos)# match qos-group 3
OS10(config)# policy-map type network-qos pmap1
OS10(config-pmap-network-qos)# class cmap1
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 3
```

7. Disable LLFC on the interface that connects to CNA 1.

```
OS10(config)# interface ethernet 1/1/50
OS10(conf-if-eth1/1/50)# no flowcontrol receive
```

8. Enable the PFC mode on the interface that connects to CNA 1.

```
OS10(config)# interface ethernet 1/1/50
OS10(conf-if-eth1/1/50)# priority-flow-control mode on
```

9. Apply the service policy on the interface that connects to CNA 1.

```
OS10(config)# interface ethernet 1/1/50
OS10(conf-if-eth1/1/50)# service-policy input type network-qos pmap1
```

10. Configure the interface that connects to NPG2.

```
OS10(config)# interface fibrechannel 1/1/5
OS10(config-if-fc1/1/5)# vfabric 2
```

NPG2 switch configuration

1. Enable the NPG feature.

```
OS10(config)# feature fc npg
```

2. Configure vFabric.

```
OS10(config)# vfabric 2
OS10(conf-vfabric-2)# vlan 1000
OS10(conf-vfabric-2)# name fcoe_fabric
OS10(conf-vfabric-2)# fcoe fcmap 0efc02
```

3. Apply the vFabric configuration on the interface that connects to the NPG1 switch. Change port mode to F_Port.

```
OS10(config)# interface fibrechannel 1/1/5
OS10(conf-if-fc1/1/21)# vfabric 2
OS10(conf-if-fc1/1/21)# fc port-mode f
```

4. Apply the vFabric configuration on the interface that connect to CNA 2.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# vfabric 2
```

5. Enable DCBX globally.

```
OS10(config)# dcbx enable
```

6. Create a class map and policy map.

```
OS10(config)# class-map type network-qos cmap1
OS10(config-cmap-nqos)# match qos-group 3
OS10(config)# policy-map type network-qos pmap1
OS10(config-pmap-network-qos)# class cmap1
```

```
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 3
```

7. Disable LLFC on the interface that connects to CNA 2.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no flowcontrol receive
```

8. Enable PFC mode on the interface that connects to CNA 2.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# priority-flow-control mode on
```

9. Apply the service policy on the interface that connects to CNA 2.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# service-policy input type network-qos pmap1
```

10. Configure the interface that connects to FCF.

```
OS10(config)# interface fibrechannel 1/1/21
OS10(config-if-fc1/1/21)# vfabric 2
```

Support for untagged VLAN in FCoE

In SmartFabric mode, OS10 provides support to use any untagged VLAN for FCoE Ethernet uplinks and Ethernet server ports, which are part of the FCoE VLAN.

The FCoE uplink identifies FIP Snooping bridge (FSB) mode at the switch. You must configure the same untagged VLAN on the FCoE uplinks and server ports for the FCoE sessions to come up.

In SmartFabric mode, you can assign any untagged VLAN to Ethernet server ports that belong to a FCoE VLAN that has one or more FC Gateway uplinks. The FC Gateway uplink identifies N-Port Proxy Gateway (NPG) mode at the switch. Also you can assign any untagged VLAN to Ethernet server ports that belong to a FCoE VLAN that has one or more FC Direct attach uplinks. The FC Direct attach uplink identifies F-Port mode at the switch.

Restrictions

- SmartFabric mode does not support multiple FCoE uplinks from the same IOM.
- In FCoE mode, the untagged VLAN on the server port and the FCoE uplink must be the same. This condition ensures that the untagged FIP VLAN discovery packets in the L2 frame, switch to the untagged VLAN.
- You cannot configure multiple FCoE uplinks corresponding to different untagged VLANs.

Single FCF per vFabric

This feature presents all available operational Fibre Channel uplinks in a fabric as a single logical unit. The uplinks are presented as one logical Fibre Channel Forwarder (FCF) to the end points connected to the same fabric.

Whenever the first FC uplink becomes operationally up and completes the initial login to upstream switch successfully, the logical FCF becomes active and is projected to the end devices.

NOTE: This behavior may vary if the you have configured a delay FCF advertisement timer.

The logical FCF must be projected only if there is at least one operationally up FC uplink; this FC uplink must have successfully completed the initial login with upstream switch at the time of timer expiry. This behavior achieves better load balancing during boot-up and bulk configuration.

Even though all the uplinks are projected as one FCF, when a request for session establishment is received, the system finds the optimally loaded FC uplink. The load balancing algorithm makes use of the link's session count and the link speed as factors for session re-balancing. Session count of the uplink is the count of both Fabric login sessions (FLOGI) and Fabric discovery sessions (FDISC) in that uplink. Link speed will be the speed of the FC uplinks. End devices do not have control over the link chosen for session establishment. This behavior ensures better load balancing across the available uplinks. After the session is established, the FCoE/FC data traffic is re-directed to the appropriate port to which the login request was associated.

Now the logical FCF takes care of the FIP functionality in the VLAN configured for the fabric. With this implementation, all control frames originating from the logical FCF use a system generated MAC address instead of the port's MAC address. This system generated MAC address of logical FCF is same for all the fabrics configured in the gateway switch; because, every FCF is uniquely identified by the end device using VLAN-MAC address pair and the VLAN used is unique for every fabric. As a result, the same MAC address is used for all the fabrics.

The control frames such as FCF Discovery Advertisement and Login Request or Response from logical FCF(s) in a gateway switch have the gateway switch's world wide name(WWN) instead of upstream switch's WWN as Fabric name inside Fabric descriptor. As a result, while forwarding the control traffic from upstream, it is the responsibility of the gateway switch to modify the fabric descriptor in those frames with the logical FCF's fabric name.

When an uplink interface in the gateway switch becomes operationally down, all the sessions associated with that uplink are terminated by sending a session termination request(CVL/FLOGO) to the corresponding end devices. When the end devices requests for re-establishment of those sessions, those devices are allocated to the next optimal (least loaded) link available in the fabric.

The manual load re-balance done using a management interface command has no impact and it continues to do load re-balancing across the upstream ports(instead of FCFs) available in the gateway switch. You must mention the fabric id while triggering and can monitor the load re-balancing in the gateway switch using the corresponding management interface display commands such as show npg uplink-interface.

NOTE: This feature is currently supported in S4148U platforms as NPG mode is supported only in platforms where Fibre Channel ports are available.

Restrictions and Limitations

Connecting uplinks of the same fabric in a Gateway switch to two different SAN networks is an invalid configuration. If you connect the same fabric in a gateway to two different SAN networks, the following scenarios may occur:

- There is no conflict in FC address assignment between the fabrics - This scenario leads to reduced visibility. End devices can only talk to the other end devices connected to the same fabric.
- There is conflict in FC address assignment. The following scenarios may further occur:
  - If the conflict occurs for the FC uplink interface's initial login, the corresponding FC session is closed. Initial login is retried till an unique address within NPG fabric context is assigned with a longer retry time out period(10 seconds). Untill login succeeds, this interface will not be a part of the logical FCF.
  - If the conflict occurs for a forwarded login request (FLOGI/FDISC), the older session with the same FC-ID survives and the newer session is teared down or rejected. This behavior is notified to the user through logs visible to the customer. The reason for the error is set and the duplicate FC Id counter variable is incremented.

Usecase 1 - NPG fabric is connected to an FCF switch through multiple links

Consider a topology where the gateway switch is connected to an upstream switch through multiple links.

The gateway switch is an OS10 switch operating in NPG mode and with two FC upstream interfaces (fc 1/1/1 and fc 1/1/2) having a speed of 16G.

Two FCoE end points(CNAs) are attached to ports eth 1/1/54 and eth 1/1/55 and they carry FCoE traffic. FC end points (HBAs) are attached to ports fc 1/1/9 and fc 1/1/10 and they carry pure FC traffic.

Both FCoE traffic and FC traffic is balanced across the FC upstream interfaces (fc 1/1/1 and fc 1/1/2) available in the NPG switch.

Following configurations are to be done in the NPG switch:

NPG Device Configuration

Enable NPG Mode of operation

```
OS10# show fc switch
Switch Mode : Disabled
Switch WWN :

OS10(config)# feature fc npg

OS10# show fc switch
Switch Mode : NPG
```

```
Switch WWN : 10:00:14:18:77:20:73:cf
OS10#
```

VLAN creation

```
OS10(config)# interface vlan 100
```

vFabric Creation

```
OS10(config)# vfabric 100
OS10(conf-vfabric-100)# vlan 100
OS10(conf-vfabric-100)# name NPG_Fabric
OS10(conf-vfabric-100)# fcoe fcmap 0efc01
OS10(conf-vfabric-100)# exit
```

Apply vFabric configuration on the FC upstream interfaces

```
OS10(config)# interface range fibrechannel 1/1/1,1/1/2
OS10(conf-range-fc1/1/1,1/1/2)# vfabric 100
OS10(conf-range-fc1/1/1,1/1/2)# no shut
OS10(conf-range-fc1/1/1,1/1/2)# exit
```

Apply vFabric and FC port-mode configuration on the interface that connects to FC End points(HBA)

```
OS10(config)# interface range fibrechannel 1/1/9,1/1/10
OS10(conf-range-fc1/1/9,1/1/10)# vfabric 100
OS10(conf-range-fc1/1/9,1/1/10)# fc port-mode F
OS10(conf-range-fc1/1/9,1/1/10)# no shut
OS10(conf-range-fc1/1/9,1/1/10)# exit
```

Enable DCBx Globally

```
OS10(config)# dcbx enable
```

Class map and Policy map creation

```
OS10(config)# class-map type network-qos cmap1
OS10(config-cmap-nqos)# match qos-group 3
OS10(config)# policy-map type network-qos pmap1
OS10(config-pmap-network-qos)# class cmap1
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 3
OS10(config-pmap-c-nqos)# exit
```

Disable LLFC on the interface that connects to FCoE End points(CNA)

```
OS10(config)# interface range ethernet 1/1/54,1/1/55
OS10(conf-range-eth1/1/54,1/1/55)# no flowcontrol receive
```

Apply Service policy and Enable PFC mode on the interface that connects to FCoE End points(CNA)

```
OS10(conf-range-eth1/1/54,1/1/55)# service-policy input type network-qos pmap1

OS10(conf-range-eth1/1/54,1/1/55)# priority-flow-control mode on
```

Apply vFabric configuration on the interface that connects to FCoE End points(CNA)

```
OS10(conf-range-eth1/1/54,1/1/55)# vfabric 100

OS10(conf-range-eth1/1/54,1/1/55)# no shut

OS10(conf-range-eth1/1/54,1/1/55)# exit
```

Apply fcoe delay FCF advertisement configuration globally (This is optional)

```
OS10(config)# fcoe delay fcf-adv 15
```

Upstream switch(FPORT/Multi-switch) Configuration

Enable FPORT/Multi-switch Mode of operation

```
OS10# show fc switch
Switch Mode : Disabled
Switch WWN :

If user want FPORT mode then,

OS10(config)# feature fc domain id 10

OS10# show fc switch
Switch Mode : FPORT
Switch WWN : 10:00:14:18:77:20:73:cf
OS10#

or if they want Multi-switch mode then configure the following,

OS10(config)# feature fc multi-switch

OS10# show fc switch
Switch Mode : MULTI-SWITCH
Switch WWN : 10:00:14:18:77:20:73:cf
OS10#
```

VLAN creation

```
OS10(config)# interface vlan 10
```

vFabric Creation

```
OS10(config)# vfabric 10

OS10(conf-vfabric-10)# vlan 10

OS10(conf-vfabric-10)# name FPORT_Fabric

OS10(conf-vfabric-10)# fcoe fcmap 0efc01

OS10(conf-vfabric-10)# exit
```

Apply vFabric configuration on the FC interfaces connected to NPG device

```
OS10(config)# interface range fibrechannel 1/1/1,1/1/2

OS10(conf-range-fc1/1/1,1/1/2)# vfabric 10

OS10(conf-range-fc1/1/1,1/1/2)# no shut

OS10(conf-range-fc1/1/1,1/1/2)# exit
```

Use case 2 - NPG fabric is connected to multiple upstream switches belonging to the same SAN fabric

In this topology, the NPG device is connected to multiple FCF switches and all those FCF switches are part of same SAN fabric.

Configurations in NPG device remains same as in Use case 1.

Configuration in upstream devices remains same as well and it needs to be done in both the switches in the SAN fabric.

Use case 3 - Multiple NPG Fabrics connected to upstream switches belonging to different SAN fabrics

In this topology the NPG device will have multiple fabrics configured and each fabric connected to upstream switch in different SAN fabrics.

For this topology, the configurations mentioned for NPG fabric in topology 1 has to be extended to multiple fabric in NPG device.

Configurations in upstream switches(Multi-switch) remains same.

F_Port commands

The following commands are supported on F_Port mode:

fc alias

Creates an FC alias. After creating the alias, add members to the FC alias. An FC alias can have a maximum of 255 unique members.

Syntax	`fc alias` *alias-name*
Parameters	*alias-name* — Enter a name for the FC alias.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command deletes the FC alias. To delete an FC alias, first remove it from the FC zone.

Example	`OS10(config)# fc alias test`
	`OS10(config-fc-alias-test)# member wwn 21:00:00:24:ff:7b:f5:c9`
	`OS10(config-fc-alias-test)# member wwn 20:25:78:2b:cb:6f:65:57`

Supported Releases	10.3.1E or later

fc zone

Creates an FC zone and adds members to the zone. An FC zone can have a maximum of 255 unique members.

Syntax	`fc zone` *zone-name*
Parameters	*zone-name* — Enter a name for the zone.
Defaults	Not configured
Command Mode	CONFIGURATION

Usage Information	The `no` version of this command deletes the FC zone. To delete an FC zone, first remove it from the FC zoneset.

Example	`OS10(config)# fc zone hba1`
	`OS10(config-fc-zone-hba1)# member wwn 10:00:00:90:fa:b8:22:19`
	`OS10(config-fc-zone-hba1)# member wwn 21:00:00:24:ff:7b:f5:c8`

Supported Releases	10.3.1E or later

fc zoneset

Creates an FC zoneset and adds the existing FC zones to the zoneset.

Syntax	`fc zoneset` *`zoneset-name`*
Parameters	*`zoneset-name`* — Enter a name for the FC zoneset. The name must start with a letter and may contain these characters: A-Z, a-z, 0-9, $, _, -, ^
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the FC zoneset.
Example	`OS10(config)# fc zoneset set` `OS10(conf-fc-zoneset-set)# member hba1`
Supported Releases	10.3.1E or later

feature fc

Enables the F_Port globally.

Syntax	`feature fc domain-id` *`domain-id`*
Parameters	*`domain-id`* — Enter the domain ID of the F_Port, from 1 to 239.
Defaults	Disabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the F_Port. You can disable the F_Port only when vfabric and zoning configurations are not available. Before disabling the F_Port, remove the vfabric and zoning configurations. You can enable only one of the following at a time: F_Port, NPG, or FSB.
Example	`OS10(config)# feature fc domain-id 100`
Supported Releases	10.3.1E or later

member (alias)

Add members to existing FC aliases. Identify a member by an FC alias, a world wide name (WWN), or an FC ID.

Syntax	`member {wwn` *`wwn-ID`* `| fc-id` *`fc-id`*`}`
Parameters	• *`wwn-ID`* — Enter the WWN name. • *`fc-id`* — Enter the FC ID name.

Defaults	Not configured
Command Mode	Alias CONFIGURATION
Usage Information	The `no` version of this command removes the member from the FC alias.

Example	`OS10(config)# fc alias test`
	`OS10(config-fc-alias-test)# member wwn 21:00:00:24:ff:7b:f5:c9`
	`OS10(config-fc-alias-test)# member wwn 20:25:78:2b:cb:6f:65:57`

Supported Releases	10.3.1E or later

member (zone)

Adds members to existing zones. Identify a member by an FC alias, a world wide name (WWN), or an FC ID.

Syntax	`member {alias-name` *`alias-name`* `| wwn` *`wwn-ID`* `| fc-id` *`fc-id`*`}`
Parameters	• *`alias-name`* — Enter the FC alias name. • *`wwn-ID`* — Enter the WWN name. • *`fc-id`* — Enter the FC ID name.
Defaults	Not configured
Command Mode	Zone CONFIGURATION
Usage Information	The `no` version of this command removes the member from the zone.

Example	`OS10(config)# fc zone hba1`
	`OS10(config-fc-zone-hba1)# member wwn 10:00:00:90:fa:b8:22:19`
	`OS10(config-fc-zone-hba1)# member wwn 21:00:00:24:ff:7b:f5:c8`

Supported Releases	10.3.1E or later

member (zoneset)

Adds zones to an existing zoneset.

Syntax	`member` *`zone-name`*
Parameters	*`zone-name`* — Enter an existing zone name.
Defaults	Not configured
Command Mode	Zoneset CONFIGURATION
Usage Information	The `no` version of this command removes the zone from the zoneset.
Example	`OS10(config)# fc zoneset set` `OS10(conf-fc-zoneset-set)# member hba1`
Supported Releases	10.3.1E or later

show fc alias

Displays the details of a FC alias and its members.

Syntax `show fc alias [alias-name]`

Parameters *alias-name* — (Optional) Enter the FC alias name.

Default Not configured

Command Mode EXEC

Usage Information

Example

```
OS10# show fc alias

Alias Name               Alias Member
=============================================
test                     21:00:00:24:ff:7b:f5:c9
                         20:25:78:2b:cb:6f:65:57

OS10#
```

Supported Releases 10.3.1E or later

show fc interface-area-id mapping

Displays the FC ID to interface mapping details.

Syntax `show fc interface-area-id mapping`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fc interface-area-id mapping
Intf Name                  FC-ID          Status
=================================================
ethernet1/1/40           0a:02:00        Active
```

Supported Releases 10.4.1.0 or later

show fc ns switch

Displays the details of the FC NS switch parameters.

Syntax `show fc ns switch [brief]`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fc ns switch

Total number of devices = 1
Switch Name                  10:00:14:18:77:13:38:28
Domain Id                    4
Switch Port                  port-channel10(Eth 1/1/9)
FC-Id                        04:00:00
Port Name                    50:00:d3:10:00:ec:f9:05
Node Name                    50:00:d3:10:00:ec:f9:00
Class of Service             8
Symbolic Port Name           Compellent Port QLGC FC 8Gbps; Slot=06
Port=01 in Controller: SN 60665 of Storage Center: DEVTEST 60665
Symbolic Node Name           Compellent Storage Center: DEVTEST 60665
Port Type                    N_PORT
Registered with NameServer   Yes
Registered for SCN           No
```

Example (brief)

```
OS10# show fc ns switch brief
Total number of devices = 1
Intf#                        Domain    FC-ID       Enode-WWPN
Enode-WWNN
port-channel10(Eth 1/1/9)      4      04:00:00    10:00:00:90:fa:b8:22:18
20:00:00:90:fa:b8:22:18
```

Supported Releases 10.3.1E or later

show fc zone

Displays the FC zones and the zone members.

Syntax `show fc zone [zone-name]`

Parameters *zone-name* — Enter the FC zone name.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fc zone

Zone Name                    Zone Member
================================================
hba1                        21:00:00:24:ff:7b:f5:c8
                            10:00:00:90:fa:b8:22:19
                            21:00:00:24:ff:7f:ce:ee
                            21:00:00:24:ff:7f:ce:ef
hba2                        20:01:00:0e:1e:e8:e4:99
                            50:00:d3:10:00:ec:f9:1b
                            50:00:d3:10:00:ec:f9:05
                            50:00:d3:10:00:ec:f9:1f
                            20:35:78:2b:cb:6f:65:57
```

Example (with zone name)

```
OS10# show fc zone hba1

Zone Name                    Zone Member
================================================
hba1                        21:00:00:24:ff:7b:f5:c8
                            10:00:00:90:fa:b8:22:19
                            21:00:00:24:ff:7f:ce:ee
                            21:00:00:24:ff:7f:ce:ef
```

Supported Releases 10.3.1E or later

show fc zoneset

Displays the FC zonesets, the zones in the zoneset, and the zone members.

Syntax `show fc zoneset [active | zoneset-name]`

Parameters *zoneset-name* — Enter the FC zoneset name.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fc zoneset
ZoneSetName      ZoneName          ZoneMember
=============================================================
set              hba1              21:00:00:24:ff:7b:f5:c8
                                   10:00:00:90:fa:b8:22:19
                                   21:00:00:24:ff:7f:ce:ee
                                   21:00:00:24:ff:7f:ce:ef

                 hba2              20:01:00:0e:1e:e8:e4:99
                                   50:00:d3:10:00:ec:f9:1b
                                   50:00:d3:10:00:ec:f9:05
                                   50:00:d3:10:00:ec:f9:1f
                                   20:35:78:2b:cb:6f:65:57

vFabric id: 100
Active Zoneset: set
ZoneName                ZoneMember
=============================================
hba2                    20:01:00:0e:1e:e8:e4:99
                        20:35:78:2b:cb:6f:65:57
                        50:00:d3:10:00:ec:f9:05
                        50:00:d3:10:00:ec:f9:1b
                        50:00:d3:10:00:ec:f9:1f

hba1                   *10:00:00:90:fa:b8:22:19
                       *21:00:00:24:ff:7b:f5:c8
                        21:00:00:24:ff:7f:ce:ee
                        21:00:00:24:ff:7f:ce:ef
```

Example (active zoneset)

```
OS10# show fc zoneset active

vFabric id: 100
Active Zoneset: set
ZoneName                          ZoneMember
=============================================================
hba2                              20:01:00:0e:1e:e8:e4:99
                                  20:35:78:2b:cb:6f:65:57
                                  50:00:d3:10:00:ec:f9:05
                                  50:00:d3:10:00:ec:f9:1b
                                  50:00:d3:10:00:ec:f9:1f

hba1                             *10:00:00:90:fa:b8:22:19
                                 *21:00:00:24:ff:7b:f5:c8
                                  21:00:00:24:ff:7f:ce:ee
                                  21:00:00:24:ff:7f:ce:ef
```

Example (with zoneset name)

```
OS10# show fc zoneset set
ZoneSetName             ZoneName             ZoneMember
```

```
=================================================================
set                       hba1                21:00:00:24:ff:7b:f5:c8
                                              10:00:00:90:fa:b8:22:19
                                              21:00:00:24:ff:7f:ce:ee
                                              21:00:00:24:ff:7f:ce:ef

                          hba2                20:01:00:0e:1e:e8:e4:99
                                              50:00:d3:10:00:ec:f9:1b
                                              50:00:d3:10:00:ec:f9:05
                                              50:00:d3:10:00:ec:f9:1f
                                              20:35:78:2b:cb:6f:65:57
```

Supported Releases 10.3.1E or later

zone default-zone permit

Enables access between all logged-in FC nodes of the vfabric in the absence of an active zoneset configuration.

Syntax `zone default-zone permit`

Parameters None

Defaults Not configured

Command Mode Vfabric CONFIGURATION

Usage Information A default zone advertises a maximum of 255 members in the registered state change notification (RSCN) message. The `no` version of this command disables access between the FC nodes in the absence of an active zoneset.

Example

```
OS10(config)# vfabric 100
OS10(conf-vfabric-100)# zone default-zone permit
```

Supported Releases 10.3.1E or later

zoneset activate

Activates an existing zoneset. You can activate only one zoneset in a vfabric.

Syntax `zoneset activate` *`zoneset-name`*

Parameters *`zoneset-name`* — Enter an existing zoneset name.

Defaults Not configured

Command Mode vfabric CONFIGURATION

Usage Information After you disable an active zoneset, the `zone default-zone permit` command configuration takes effect. Based on this configuration, the default zone allows or denies access between all the logged-in FC nodes of the vfabric. The `no` version of this command deactivates the zoneset.

Example

```
OS10(config)# vfabric 100
OS10(conf-vfabric-100)# zoneset activate set
```

Supported Releases 10.3.1E or later

NPG commands

The following commands are supported on NPG mode:

fc port-mode F

Configures port mode on Fibre Channel interfaces.

Syntax	`fc port-mode F`
Parameters	None
Defaults	N_Port
Command Mode	Fibre Channel INTERFACE
Usage Information	Configure the port mode when the port is in Shut mode and when NPG mode is enabled. The `no` version of this command returns the port mode to default.
Example	`OS10(config)# interface fibrechannel 1/1/1` `OS10(conf-if-fc1/1/1)# fc port-mode F`
Supported Releases	10.4.1.0 or later

feature fc npg

Enables the NPG mode globally.

Syntax	`feature fc npg`
Parameters	None
Defaults	Disabled
Command Mode	CONFIGURATION
Usage Information	You can enable only one of the following at a time: F_Port, NPG, or FSB. The `no` version of this command disables NPG mode.
Example	`OS10(config)# feature fc npg`
Supported Releases	10.4.0E(R1) or later

show npg devices

Displays the NPG devices connected to the switch.

Syntax	`show npg devices [brief]`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	Use the `brief` option to display minimum details.

Example	`OS10# show npg devices`
	`Enode[0]:`
	`Enode MAC :d4:ae:52:1a:ee:54`
	`Enode Interface: port-channel10(Eth 1/1/9)`
	`FCF MAC :14:18:77:20:7c:e3`
	`Fabric Interface :Fc 1/1/25`
	`FCoE Vlan :1001`
	`Vfabric Id :10`
	`ENode WWPN :20:01:d4:ae:52:1a:ee:54`

```
ENode WWNN :20:00:d4:ae:52:1a:ee:54
FCoE MAC :0e:fc:00:01:04:02
FC-ID :01:04:02
Login Method :FLOGI
Time since discovered(in Secs) :6253
Status :LOGGED_IN
```

Example (brief)

```
Total NPG Devices = 1
ENode-Interface   ENode-WWPN              FCoE-Vlan  Fabric-Intf   Vfabric-Id  Log
-------------------------------------------------------------------------------
Po 10(Eth 1/1/9)  20:01:d4:ae:52:1a:ee:54  1001      Fc 1/1/25     10          FLO
LOGGED_IN
```

Supported Releases 10.4.0E(R1) or later

show npg uplink-interface

Display information in a FC upstream interface.

Syntax `show npg uplink-interfaces [vfabric vfabric-id [fcf-info] | [fcf-info]]`

Parameters

- `fcf-info` - FCF Availability Status, fabric name of the FC upstream switch connected, error reason, FCF advertisement delay timeout left and duplicate FC id assignment counter.

Default Not configured

Command Mode EXEC

Usage Information Displays the details of FC upstream interfaces in all the available or specified vFabrics along with the FC Id and BB Credit.

This command is supported in NPG mode.

The fields and the corresponding descriptions are described as follows:

- **Uplink Intf**—The name of the FC uplink interface.
- **FCF Availability Status**—Status of the logical FCF of that fabric, whether it is available to establish session or not. This field takes values as Yes or No.
- **FAD timeout left**—Number of seconds left for the FCF Advertisement Delay timer to expire.
- **Upstream fabric name**—Fabric name of the upstream FC switch/Multi-switch to which this interface is connected.
- **Error reason**—Reason for error in the FC uplink interface. Following are few possible error reasons:
  1. FC Port Down
  2. No Response For FLOGI
  3. Duplicate FC ID
  4. FLOGI Rejected
- **Duplicate FC IDs**—Number of Duplicate address(FC ID) assignments happened in the interface.
- **FC ID**—FC-ID allocated to the initial FLOGI request from NPG switch on the interface.
- **BB Credit**—Transmit Buffer to Buffer Credit.
- **Speed**—Link speed of the FC uplink interface.
- **FLOGI**—Number of Fabric Login Sessions in the FC uplink interface.
- **FDISC**—Number of Fabric Discovery Session in the FC uplink interface.
- **Total**—Total number of sessions (FLOGI and FDISC) in the FC uplink interface.
- **Re-distributed**—Number of sessions redistributed for better load balancing in the interface.

Example

```
OS10#show npg uplink-interfaces vfabric 100

VFabric Id : 100
Uplink                          Speed
Intf       FC Id    BB Credit   (Gbps) FLOGI  FDISC  Total   Re-distributed
--------------------------------------------------------------------------
```

```
Fc 1/1/1   01:00:01     8       8      3      3      6       6
Fc 1/1/2   01:00:02     8       16     1      9      10      15
```

```
OS10#show npg uplink-interfaces

VFabric Id : 100
Uplink                          Speed

Fc 1/1/12  10:01:d4:ae:52:2b:ff:52  NONE                   0
```

Supported Releases 10.5.2.0 or later

F_Port and NPG commands

The following commands are supported on both F_Port and NPG modes:

clear fc statistics

Clears FC statistics for specified vfabric or fibre channel interface.

Syntax `clear fc statistics [vfabric vfabric-ID | interface fibrechannel]`

Parameters
- *vfabric-ID* — Enter the vfabric ID.
- *fibrechannel* — Enter the fibre channel interface name.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# clear fc statistics vfabric 100
OS10# clear fc statistics interface fibrechannel1/1/25
```

Supported Releases 10.4.1.0 or later

fcoe

Adds FCoE parameters to the vfabric.

Syntax `fcoe {fcmap fc-map | fcf-priority fcf-priority-value | fka-adv-period adv-period | vlan-priority vlan-priority-value | keep-alive}`

Parameters
- *fc-map* — Enter the FC map ID, from `0xefc00` to `0xefcff`.
- *fcf-priority-value* — Enter the FCF priority value, from 1 to 255.
- *adv-period* — Enter the FCF keepalive advertisement period, from 8 to 90 seconds.
- *vlan-priority-value* — Enter the VLAN priority value, from 0 to 7.

Defaults
- `fcmap`—0x0EFC00
- `fcf-priority`—128
- `fka-adv-period`—8
- `vlan-priority`—3
- `keep-alive`—True

Command Mode Vfabric CONFIGURATION

Usage Information The `no` version of this command disables the FCoE parameters.

Example

```
OS10(config)# vfabric 10
OS10(conf-vfabric-10)# name 10
OS10(conf-vfabric-10)# fcoe fcmap 0x0efc01
OS10(conf-vfabric-10)# fcoe fcf-priority 128
OS10(conf-vfabric-10)# fcoe fka-adv-period 8
OS10(conf-vfabric-10)# fcoe vlan-priority 3
```

Supported Releases 10.3.1E or later

fcoe delay fcf-adv

Delay the Multicast Discovery Advertisement from FCFs to be sent to Enodes.

Syntax	`fcoe delay fcf-adv` *timeout*
Parameters	timeout - Timeout range specified in seconds. Range is 1 to 30 seconds.
Default	Not configured
Command Mode	Global config
Usage Information	Time to wait after the first FCF in the vFabric connects to the NPG switch to send the Multicast discovery Advertisement. This command is supported in NPG mode.
Example	`OS10(config)# fcoe delay fcf-adv 16`
Supported Releases	10.5.2.0 or later. In previous releases, the command is not available in full switch mode. From this release, the command is available both in full switch mode and fabric mode.

name

Configures a vfabric name.

Syntax	`name` *vfabric-name*
Parameters	*vfabric-name* — Enter a name for the vfabric.
Defaults	Not configured
Command Mode	Vfabric CONFIGURATION
Usage Information	The `no` version of this command removes the vfabric name..
Example	`OS10(config)# vfabric 100` `OS10(conf-vfabric-100)# name test_vfab`
Supported Releases	10.3.1E or later

rebalance fc npg sessions

Re-balances the FC sessions across FC uplinks.

Syntax	`re-balance fc npg sessions vfabric` *vfabric-id* `[dry-run][brief]`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	Triggers the load-balancing mechanism to redistribute the sessions across the FC uplinks. The `dry-run` option displays the current state of the system, sessions that are cleared, and the system state after balancing is done without actually doing it. You can use the `brief` option (both in dry run and actual run) to view or session redistribution information. You can configure `fcoe delay fcf-adv` timer that is based on the switch configuration to balance the system d reload. Even if the system is unbalanced after reload, you can use this command in the switch to balance the session the uplinks. This command is supported in the NPG mode. The following fields are displayed in this command:

- `Uplink Intf`—The name of the FC uplink interface.
- `FLOGI`—Number of Fabric Login Sessions in the FC uplink interface.
- `FDISC`—Number of Fabric Discovery Sessions in the FC uplink interface.
- `Load`—Total number of sessions (FLOGI and FDISC) in the FC uplink interface.
- `Speed`—Link speed of the FC uplink interface.
- `Excess Load`—Excess load is the absolute (Current load on the link - ((Minimum load per 8G speed in current * port-speed/8G)). It captures the level to which the corresponding link is oversubscribed when compared to ot upstream links in the system.
- `Node WWPN`—World-Wide Port Name is used for the Fabric Login Request of the Server that is connected to th switch. It can be an FCoE server or an FC server.
- `From Uplink Intf`—Interface name of the FC uplink from which the sessions from the server are redistribut
- `To Uplink Intf`—Interface name of the FC uplink to which the sessions are mapped when the server logins.
- `No. of sessions`—Count of redistributed sessions.

Example

```
OS10#re-balance npg sessions vfabric 100 dry-run

Fabric Id 100 Current State
Uplink      FLOGI   FDISC   Load   Speed             Excess

```

Supported Releases 10.4.0E(R1) or later

show npg uplink-interface

Display information in a FC upstream interface.

Syntax `show npg uplink-interfaces [vfabric vfabric-id [fcf-info] | [fcf-info]]`

Parameters

- `fcf-info` - FCF Availability Status, fabric name of the FC upstream switch connected, error reason, FCF advertisement delay timeout left and duplicate FC id assignment counter.

Default Not configured

Command Mode EXEC

Usage Information Displays the details of FC upstream interfaces in all the available or specified vFabrics along with the FC Id and BB Credit.

This command is supported in NPG mode.

The fields and the corresponding descriptions are described as follows:

- **Uplink Intf**—The name of the FC uplink interface.
- **FCF Availability Status**—Status of the logical FCF of that fabric, whether it is available to establish session or not. This field takes values as Yes or No.
- **FAD timeout left**—Number of seconds left for the FCF Advertisement Delay timer to expire.
- **Upstream fabric name**—Fabric name of the upstream FC switch/Multi-switch to which this interface is connected.
- **Error reason**—Reason for error in the FC uplink interface. Following are few possible error reasons:
  1. FC Port Down
  2. No Response For FLOGI
  3. Duplicate FC ID
  4. FLOGI Rejected
- **Duplicate FC IDs**—Number of Duplicate address(FC ID) assignments happened in the interface.
- **FC ID**—FC-ID allocated to the initial FLOGI request from NPG switch on the interface.
- **BB Credit**—Transmit Buffer to Buffer Credit.

- **Speed**—Link speed of the FC uplink interface.
- **FLOGI**—Number of Fabric Login Sessions in the FC uplink interface.
- **FDISC**—Number of Fabric Discovery Session in the FC uplink interface.
- **Total**—Total number of sessions (FLOGI and FDISC) in the FC uplink interface.
- **Re-distributed**—Number of sessions redistributed for better load balancing in the interface.

Example

```
OS10#show npg uplink-interfaces vfabric 100

VFabric Id : 100
Uplink                          Speed
Intf       FC Id    BB Credit  (Gbps) FLOGI  FDISC  Total   Re-distributed
-------------------------------------------------------------------------
Fc 1/1/1   01:00:01     8       8      3      3      6       6

Supported Releases 10.5.2.0 or later

show npg node-interface

Display details in a Node-facing interface.

Syntax `show npg node-interfaces [vfabric vfabric-id]`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Displays the statistics of node facing interfaces in all available or specified vFabrics.

This command is supported in NPG mode.

The following table lists the fields and descriptions displayed in the output:

Table 37. Fields and Descriptions

Fields	Description
Node Intf	Interface name of the port to which a FCoE or FC Node (Server) is connected
FLOGI	Number of Fabric Login Sessions in the node-facing interface
FDISC	Number of Fabric Discovery Sessions in the node-facing interface
Re-distributed	Number of sessions redistributed for better load balancing in the interface

Example

```
OS10#show npg node-interfaces vfabric 100
VFabric Id : 100
-------------------------------------------------
Node Intf       FLOGI       FDISC      Re-distributed
-------------------------------------------------
Fc 1/1/9        1           1          2
Fc 1/1/10       1           1          2
Eth 1/1/54      1           1          2
Eth 1/1/55      1           9          10
```

```
OS10#show npg node-interfaces

VFabric Id : 100
Node Intf       FLOGI       FDISC      Re-distributed
-------------------------------------------------
Fc 1/1/9        1           1          2
Fc 1/1/10       1           1          2
Eth 1/1/54      1           1          2
Eth 1/1/55      1           9          10

VFabric Id : 200
Node Intf       FLOGI       FDISC      Re-distributed
-------------------------------------------------
Fc 1/1/7        1           1          2
```

```
VFabric Id : 300
Node Intf     FLOGI       FDISC     Re-distributed
-------------------------------------------------
Eth 1/1/51    1           9         10
```

Supported Releases 10.5.2.0 or later

show fc statistics

Displays the FC statistics.

Syntax `show fc statistics {vfabric vfabric-ID | interface fibrechannel}`

Parameters

- *vfabric-ID* — Enter the vfabric ID.
- *fibrechannel* — Enter the Fibre Channel interface name.

Default Not configured

Command Mode EXEC

Usage Information None

Example (vfabric)

```
OS10# show fc statistics vfabric 100
Number of FLOGI                          : 43
Number of FDISC                          : 6
Number of FLOGO                          : 0
Number of FLOGI Accepts                  : 43
Number of FLOGI Rejects                  : 0
Number of FDISC Accepts                  : 6
Number of FDISC Rejects                  : 0
Number of FLOGO Accepts                  : 0
Number of FLOGO Rejects                  : 0
```

Example (interface)

```
OS10# show fc statistics interface fibrechannel1/1/25:1
Number of FLOGI                          : 1
Number of FDISC                          : 0
Number of FLOGO                          : 0
Number of FLOGI Accepts                  : 1
Number of FLOGI Rejects                  : 0
Number of FDISC Accepts                  : 0
Number of FDISC Rejects                  : 0
Number of FLOGO Accepts                  : 0
Number of FLOGO Rejects                  : 0
```

Supported Releases 10.3.1E or later

show fc switch

Displays FC switch parameters.

Syntax `show fc switch`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fc switch
Switch Mode : FPORT
Switch WWN  : 10:00:14:18:77:20:8d:cf
```

Supported Releases 10.3.1E or later

show running-config vfabric

Displays the running configuration for the vfabric.

Syntax `show running-config vfabric`

Parameters None

Defaults Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show running-configuration vfabric
!
 vfabric 10
 vlan 100
 fcoe fcmap 0xEFC00
 fcoe fcf-priority 140
 fcoe fka-adv-period 13
```

Supported Releases 10.4.0E(R1) or later

show vfabric

Displays vfabric details.

Syntax `show vfabric`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show vfabric
Fabric Name                  SAN_FABRIC
Fabric Type                    FPORT
Fabric Id                        10
VlanId                            1001
FC-MAP                          0EFC00
Config-State                   ACTIVE
Oper-State                      UP
=========================================

   port-channel10(Eth 1/1/9)
```

Supported Releases 10.3.1E or later

vfabric

Configures a vfabric.

Syntax `vfabric fabric-ID`

Parameters *fabric-ID* — Enter the fabric ID, from 1 to 255.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information Enable the F_Port or NPG feature before configuring a vfabric. You can configure only one vfabric in F_Port mode. The vfabric becomes active only when you configure the vfabric with a valid VLAN and FC map. Do not use spanned VLAN as vfabric VLAN.

The `no` version of this command removes the vfabric. You can remove a vfabric only when it is not applied on any interface.

Example

```
OS10(config)# vfabric 100
```

Supported Releases 10.3.1E or later

vfabric (interface)

Applies an existing vfabric to an Ethernet or FC interface.

Syntax `vfabric fabric-ID`

Parameters *fabric-ID* — Enter the fabric ID, from 1 to 255.

Defaults Not configured

Command Mode INTERFACE

Usage Information The `no` version of this command removes the vfabric from the interface.

Example

```
OS10(config)# interface fibrechannel 1/1/1
OS10(conf-if-fc1/1/1)# vfabric 100
```

```
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# vfabric 200
```

Supported Releases 10.3.1E or later

vlan

Associates an existing VLAN ID to the vfabric to carry traffic.

Syntax `vlan vlan-ID`

Parameters	*vlan-ID* — Enter an existing VLAN ID.
Defaults	Not configured
Command Mode	Vfabric CONFIGURATION
Usage Information	Create the VLAN ID before associating it to the vfabric. Do not use spanned VLAN as vfabric VLAN. The `no` version of this command removes the VLAN ID from the vfabric.

Example	`OS10(config)# interface vlan 1023`
	`OS10(conf-if-vl-1023)# exit`
	`OS10(config)# vfabric 100`
	`OS10(conf-vfabric-100)# vlan 1023`

Supported Releases	10.3.1E or later

FIP-snooping commands

The following commands are supported on FIP-snooping mode:

feature fip-snooping with-cvl

Enables the FIP snooping feature globally.

Syntax	`feature fip-snooping with-cvl [with-cvl]`
Parameters	`with-cvl`—To enable CVL.
Defaults	Disabled
Command Mode	CONFIGURATION
Usage Information	You can enable only one of the following at a time: F_Port, NPG, or FSB. You can include the `with-cvl` option to send a Clear Virtual Link (CVL) frame from the FCF to the ENode. This option helps the system to recover automatically if an FCoE session drops. If FIP snooping is already enabled, you can enter the `feature fip-snooping with-cvl` command to enable CVL. You do not have to explicitly disable FIP snooping to enable CVL. However, to disable CVL, you must disable FIP snooping and then re-enable it without the `with-cvl` option. The `no` version of this command disables FIP snooping. When you disable FIP snooping, the system automatically deletes all the FIP snooping VLAN and port mode configurations. If any FIP snooping-related configurations are present in the system, OS10 returns an error message. You can only disable FIP snooping after you remove all the FIP snooping-related configurations from the system.
Example	`OS10(config)# feature fip-snooping with-cvl`
Supported Releases	10.4.0E(R1) or later

fip-snooping enable

Enables FIP snooping on a specified VLAN.

Syntax	`fip-snooping enable`
Parameters	None
Defaults	Disabled
Command Mode	VLAN INTERFACE

Usage Information	Enable FIP snooping on a VLAN only after enabling the FIP snooping feature globally using the `feature fip-snooping with-cvl` command. OS10 supports FIP snooping on a maximum of 12 VLANs. The `no` version of this command disables FIP snooping on the VLAN.
Example	`OS10(config)# interface vlan 3` `OS10(conf-if-vl-3)# fip-snooping enable`
Supported Releases	10.4.0E(R1) or later

fip-snooping fc-map

Configures the FC map value for a specific VLAN.

Syntax	`fip-snooping fc-map` *`fc-map`*
Parameters	*`fc-map`* — Enter the FC map ID, from `0xefc00` to `0xefcff`.
Defaults	Not configured
Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command disables the FC map configuration.
Example	`OS10(config)# interface vlan 3` `OS10(conf-if-vl-3)# fip-snooping fc-map 0xEFC64`
Supported Releases	10.4.0E(R1) or later

fip-snooping port-mode

Sets FIP snooping port mode for interfaces.

Syntax	`fip-snooping port-mode {enode | enode-transit | fcf | fcf-transit}`
Parameters	`enode | enode-transit | fcf | fcf-transit`—Enter the keyword to set FIP snooping port mode.
Defaults	ENode port mode
Command Mode	INTERFACE
Usage Information	OS10 supports this configuration only on a switch running FSB mode, and on Ethernet and port-channel interfaces. You cannot configure FIP snooping port mode on a port channel member. Use this command to change the port mode. By default, the port mode of an interface is set to ENode. Configure the port mode only after you enable FIP snooping. Before you disable FIP snooping, reset the port mode to its default value, ENode. You cannot disable FIP snooping when the port mode is set to a non-default value (enode-transit, fcf, or fcf-transit). If you want to change the port mode from one value to another, you can directly use the `fip-snooping port mode` command. You do not have to explicitly use the `no` form of the command. The `no` version of this command resets the port mode to ENode.
Example	`OS10(config)# interface ethernet 1/1/32` `OS10(conf-if-eth1/1/32)# fip-snooping port-mode fcf`

Supported Releases	10.4.0E(R1) or later10.4.3.0 or later—Support for enode-transit and fcf-transit port modes added.

FCoE commands

The following commands are supported on all the three modes: F_Port, NPG, and FSB.

clear fcoe database

Clears the FCoE database for the specified VLAN.

Syntax

```
clear fcoe database vlan vlan-id {enode enode-mac-address | fcf fcf-mac-address | session fcoe-mac-address}
```

Parameters

- *vlan-id* — Enter the VLAN ID.
- *enode-mac-address* — Enter the MAC address of the ENode.
- *fcf-mac-address* — Enter the MAC address of the FCF.
- *fcoe-mac-address* — Enter the MAC address of the FCoE session.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# clear fcoe database vlan 100 enode aa:bb:cc:00:00:00
```

Supported Releases 10.4.0E(R1) or later

clear fcoe statistics

Clears FCoE statistics for specified interface.

Syntax

```
clear fcoe statistics [interface interface-type]
```

Parameters *interface-type* — (Optional) Enter the interface type. The interface may be ethernet, VLAN, or port-channel.

Default Not configured

Command Mode EXEC

Usage Information If you do not specify the `interface interface-type` information, the command clears the statistics for all the interfaces and VLANs.

Example

```
OS10# clear fcoe statistics interface ethernet 1/1/1
OS10# clear fcoe statistics interface port-channel 5
```

Supported Releases 10.4.0E(R1) or later

fcoe delay fcf-adv

Delay the Multicast Discovery Advertisement from FCFs to be sent to Enodes.

Syntax

```
fcoe delay fcf-adv timeout
```

Parameters timeout - Timeout range specified in seconds. Range is 1 to 30 seconds.

Default	Not configured
Command Mode	Global config
Usage Information	Time to wait after the first FCF in the vFabric connects to the NPG switch to send the Multicast discovery Advertisement. This command is supported in NPG mode.
Example	`OS10(config)# fcoe delay fcf-adv 16`
Supported Releases	10.5.2.0 or later. In previous releases, the command is not available in full switch mode. From this release, the command is available both in full switch mode and fabric mode.

fcoe-pinned-port

Marks a port as a pinned port in the port-channel. This configuration is supported on FSB, Ethernet port-channel in NPG, and F_Port mode. It is not supported on a VLTi port-channel.

Syntax	`fcoe-pinned-port`
Parameters	*node/slot/port[:subport]*—Enter the interface type details.
Defaults	Disabled
Command Mode	Port-channel INTERFACE
Usage Information	You can configure only single port per port-channel. If the port is not configured properly, or if the pinned port goes down, the other ports in the port-channel are not used even if the ports have valid path to server. The `no` version of this command removes the pinned port configuration.

Example	`OS10(conf-if-eth-1/1/9)# channel-member 10`
	`OS10(conf-if-eth-1/1/9)# fcoe-pinned-port`
	`Warning: Any existing FCoE session in port-channel will get cleared. Do you want to continue(yes/no)?yes`

Supported Releases	10.4.2.0 or later

fcoe max-sessions-per-enodemac

Configures the maximum number of sessions allowed for an ENode.

Syntax	`fcoe max-sessions-per-enodemac` *max-session-number*
Parameters	*max-session-number* — Enter the maximum number of sessions to be allowed, from 1 to 64.
Defaults	32
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command resets the number of sessions to the default value.
Example	`OS10(config)# fcoe max-sessions-per-enodemac 64`
Supported Releases	10.4.0E(R1) or later

fcoe priority-bits

Configures the priority bits for FCoE application TLVs.

Syntax	`fcoe priority-bits` *priority-value*

Parameter	*priority-value* — Enter PFC priority value advertised in FCoE application TLV. You can enter one of the following values: `0x01, 0x02, 0x04, 0x08, 0x10, 0x20, 0x40, or 0x80`.
Default	0x08
Command Mode	CONFIGURATION
Usage Information	You can configure only one PFC priority at a time. The `no` version of this command returns the configuration to default value.
Example	`OS10(config)# fcoe priority-bits 0x08`
Supported Releases	10.4.0E(R3) or later

lldp tlv-select dcbxp-appln fcoe

Enables FCoE application TLV for an interface.

Syntax	`lldp tlv-select dcbxp-appln fcoe`
Parameter	None
Default	Enabled
Command Mode	INTERFACE
Usage Information	The default priority value advertised in FCoE application TLV is 3. If the PFC configuration in an interface matches 3, then the FCoE application TLV is advertised as 3. Otherwise, FCoE application TLV is not advertised. When you configure the application priority using `fcoe priority-bits` command, the configured value is advertised in the TLV, which is not dependent on PFC configuration. The `no` version of this command disables the FCoE application TLV.
Example	`OS10(conf-if-eth1/1/1)# lldp tlv-select dcbx-appln fcoe`
Supported Releases	10.4.0E(R3) or later

re-balance fc npg sessions vfabric

Rebalances both FCoE and FC sessions across FC uplinks.

Syntax	`re-balance fc npg sessions vfabric` *vfabric-id* `[dry-run][brief]`
Parameters	None
Defaults	Not configured
Command Mode	EXEC
Usage Information	Triggers the load-balancing mechanism to redistribute the sessions across the FC uplinks. The `dry-run` option displays the current state of the system, sessions that would be cleared, and the system state after the load balancing is done without actually doing it. You can use the `brief` option (both in dry run and actual run) to view only the session redistribution information. You can use the `fcoe delay fcf-adv` configuration command to load balance the system during a switch reload. If the system is unbalanced after the reload and after configuring the `fcoe delay fcf-adv` command, then use the `rebalance` command to balance the sessions. This command is supported in the NPG mode. **NOTE:** Dell Technologies recommends that you do not use this command in an NPG cascading topology. The fields and their corresponding descriptions that are displayed in this command are as follows:

- Uplink Intf—The name of the FC uplink interface.
- FLOGI—Number of Fabric Login Sessions in the FC uplink interface.
- FDISC—Number of Fabric Discovery Sessions in the FC uplink interface.
- Load—Total number of sessions (FLOGI and FDISC) in the FC uplink interface.
- Speed—Link speed of the FC uplink interface.
- Excess Load—Excess load is the absolute (Current load on the link - ((Minimum load per 8G speed in current state) * port-speed/8G)). It captures the level to which the corresponding link is oversubscribed when compared to other FC upstream links in the system.
- Node WWPN—World-Wide Port Name, which is used for the Fabric Login request of the Server that is connected to the OS10 switch. It can be an FCoE server or an FC server.
- From Uplink Intf—Interface name of the FC uplink from which the sessions from the server are redistributed.
- To Uplink Intf—Interface name of the FC uplink to which the sessions are mapped when the server logs back in.
- No. of sessions—Count of redistributed sessions.

Example

```
OS10#re-balance npg sessions vfabric 100 dry-run

Fabric Id 100 Current State
Uplink      FLOGI   FDISC   Load   Speed        Excess
Intf                                (Gbps)       Load
-----------------------------------------------------------------
Fc 1/1/1    1       9       10     8             7
Fc 1/1/2    3       3       6      16            0
-----------------------------------------------------------------
            4       12      16     24            7
-----------------------------------------------------------------
Session Re-distributions:

16 Session Re-distribution(s)
-------------------------------------------------------------------------
Node WWPN              From Uplink Intf  To Uplink Intf  No.of sessions
-------------------------------------------------------------------------
20:01:d4:ae:52:1a:ee:54  Fc 1/1/1          Fc 1/1/2         10

Supported Releases 10.5.2.0 or later

show fcoe enode

Displays the details of ENodes connected to the switch.

Syntax `show fcoe enode [enode-mac-address]`

Parameters *enode-mac-address* — (Optional) Enter the MAC address of ENode. This option displays details pertaining to the specified ENode.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fcoe enode
Enode MAC          Enode Interface  VLAN FCFs Sessions
-----------------  ---------------- ---- ---- --------
d4:ae:52:1b:e3:cd  Po 20(Eth 1/1/3)  1001  1    1
```

Supported Releases 10.4.0E(R1) or later

show fcoe fcf

Displays details of the FCFs connected to the switch.

Syntax `show fcoe fcf [fcf-mac-address]`

Parameters *fcf-mac-address* — (Optional) Enter the MAC address of the FCF. This option displays details of the specified FCF.

Default Not configured

Command Mode EXEC

Usage Information

In NPG mode, displays all the logical FCF(s) associated with various fabrics available in the gateway switch. Since this logical FCF is not associated with any particular interface, the FCF interface column of this command's output will display a '~' symbol instead of the interface name. This convention is similar to the one used in FPORT and Multi-switch mode of operation.

Starting from Release 10.5.2.0, the FCF interface column in the command output displays a tilde (~) symbol instead of the interface name.

Example

```
OS10# show fcoe fcf
FCF MAC           FCF Interface VLAN FC-MAP    FKA_ADV_PERIOD No. of
Enodes
--------------    ------------- ---- --------  --------------
--------------
00:04:96:70:8a:12 ~             100  0e:fc:00  4000           2

00:04:96:70:8a:12 ~             200  0e:fc:01  4000           0

OS10# show fcoe fcf 54:7f:ee:37:34:40
FCF MAC           FCF Interface VLAN FC-MAP    FKA_ADV_PERIOD No. of
Enodes
--------------    ------------- ---- --------  --------------
--------------
00:04:96:70:8a:12 ~             100  0e:fc:00  4000           2

00:04:96:70:8a:12 ~             200  0e:fc:01  4000           0
```

Supported Releases

10.4.0E(R1) or later

show fcoe pinned-port

Displays the port-channel, the corresponding pinned-port configuration, and the port status if the FCoE sessions are formed.

Syntax

```
show fcoe pinned-port [port-channel port-channel-id]
```

Parameters

port-channel-id—Enter the port-channel ID to display the corresponding configuration.

Default

Not configured

Command Mode

EXEC

Usage Information

None

Example

```
OS10# show fcoe pinned-port

Interface pinned-port FCoE Status

-----------------  ---------------- -----------------

Po 10 Eth 1/1/1 Up

Po 20 Eth 1/1/3 Up

Po 30 Eth 1/1/7 Down
```

Supported Releases

10.4.2.0 or later

show fcoe sessions

Displays the details of the established FCoE sessions.

Syntax `show fcoe sessions [interface vlan vlan-id]`

Parameters *vlan-id* — (Optional) Enter the VLAN ID. This option displays the sessions established on the specified VLAN.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
Enode MAC          Enode Interface  FCF MAC           FCF interface
VLAN   FCoE MAC           FC-ID    PORT WWPN

1/1/1) 100    0e:fc:00:01:00:01  01:00:01 31:00:0e:fc:00:00:00:00
21:00:0e:fc:00:00:00:00
aa:bb:cc:00:00:00  Po 20(Eth 1/1/3) aa:bb:cd:00:00:00 Po 10(Eth
1/1/1) 100    0e:fc:00:01:00:02  01:00:02 31:00:0e:fc:00:00:00:00
21:00:0e:fc:00:00:00:00
```

Supported Releases 10.4.0E(R1) or later

show fcoe statistics

Displays the statistical details of the FCoE control plane.

Syntax `show fcoe statistics [interface interface-type]`

Parameters *interface-type* — (Optional) Enter the type of interface. This option displays statistics of the specified interface.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show fcoe statistics interface port-channel10
Number of Vlan Requests                      :0
Number of Vlan Notifications                 :0
Number of Multicast Discovery Solicits       :2
Number of Unicast Discovery Solicits         :0
Number of FLOGI                              :2
Number of FDISC                              :16
Number of FLOGO                              :0
Number of Enode Keep Alive                   :9021
Number of VN Port Keep Alive                 :3349
Number of Multicast Discovery Advertisement :4437
Number of Unicast Discovery Advertisement    :2
Number of FLOGI Accepts                      :2
Number of FLOGI Rejects                      :0
Number of FDISC Accepts                      :16
Number of FDISC Rejects                      :0
Number of FLOGO Accepts                      :0
Number of FLOGO Rejects                      :0
Number of CVL                                :0
Number of FCF Discovery Timeouts             :0
Number of VN Port Session Timeouts           :0
Number of Session failures due to Hardware Config :0
```

Supported Releases	10.4.0E(R1) or later

show fcoe system

Displays system information related to the FCoE.

Syntax	`show fcoe system`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	

```
OS10# show fcoe system
Mode: FIP Snooping Bridge
CVL Status: Enabled
FCOE VLAN List (Operational) : 1, 100
FCFs                         : 1
Enodes                       : 2
Sessions                     : 17
```

Supported Releases	10.4.0E(R1) or later

show fcoe vlan

Displays details of FIP-snooping VLANs.

Syntax	`show fcoe vlan`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	

```
OS10# show fcoe vlan
* = Default VLAN
VLAN FC-MAP  FCFs Enodes Sessions
---- ------  ---- ------ --------
*1   -       -    -      -
100 0X0EFC00 1    2      17
```

Supported Releases	10.4.0E(R1) or later

show npg node-interface

Display details in a Node-facing interface.

Syntax	`show npg node-interfaces [vfabric` *`vfabric-id`*`]`
Parameters	None
Default	Not configured
Command Mode	EXEC

Usage Information

Displays the statistics of node facing interfaces in all available or specified vFabrics.

This command is supported in NPG mode.

The following table lists the fields and descriptions displayed in the output:

Table 38. Fields and Descriptions

Fields	Description
Node Intf	Interface name of the port to which a FCoE or FC Node (Server) is connected
FLOGI	Number of Fabric Login Sessions in the node-facing interface
FDISC	Number of Fabric Discovery Sessions in the node-facing interface
Re-distributed	Number of sessions redistributed for better load balancing in the interface

Example

```
OS10#show npg node-interfaces vfabric 100
VFabric Id : 100
-------------------------------------------------
Node Intf       FLOGI      FDISC     Re-distributed
-------------------------------------------------
Fc 1/1/9        1          1         2
Fc 1/1/10       1          1         2
Eth 1/1/54      1          1         2
Eth 1/1/55      1          9         10
```

```
OS10#show npg node-interfaces

VFabric Id : 100
Node Intf       FLOGI      FDISC     Re-distributed
-------------------------------------------------
Fc 1/1/9        1          1         2
Fc 1/1/10       1          1         2
Eth 1/1/54      1          1         2
Eth 1/1/55      1          9         10

VFabric Id : 200
Node Intf       FLOGI      FDISC     Re-distributed
-------------------------------------------------
Fc 1/1/7        1          1         2

VFabric Id : 300
Node Intf      FLOGI       FDISC     Re-distributed
-------------------------------------------------
Eth 1/1/51     1           9         10
```

Supported Releases

10.5.2.0 or later

show npg uplink-interface

Display information in a FC upstream interface.

Syntax

```
show npg uplink-interfaces [vfabric vfabric-id [fcf-info] | [fcf-info]]
```

Parameters

- `fcf-info` - FCF Availability Status, fabric name of the FC upstream switch connected, error reason, FCF advertisement delay timeout left and duplicate FC id assignment counter.

Default

Not configured

Command Mode

EXEC

Usage Information

Displays the details of FC upstream interfaces in all the available or specified vFabrics along with the FC Id and BB Credit.

This command is supported in NPG mode.

The fields and the corresponding descriptions are described as follows:

- **Uplink Intf**—The name of the FC uplink interface.
- **FCF Availability Status**—Status of the logical FCF of that fabric, whether it is available to establish session or not. This field takes values as Yes or No.
- **FAD timeout left**—Number of seconds left for the FCF Advertisement Delay timer to expire.
- **Upstream fabric name**—Fabric name of the upstream FC switch/Multi-switch to which this interface is connected.
- **Error reason**—Reason for error in the FC uplink interface. Following are few possible error reasons:
  1. FC Port Down
  2. No Response For FLOGI
  3. Duplicate FC ID
  4. FLOGI Rejected
- **Duplicate FC IDs**—Number of Duplicate address(FC ID) assignments happened in the interface.
- **FC ID**—FC-ID allocated to the initial FLOGI request from NPG switch on the interface.
- **BB Credit**—Transmit Buffer to Buffer Credit.
- **Speed**—Link speed of the FC uplink interface.
- **FLOGI**—Number of Fabric Login Sessions in the FC uplink interface.
- **FDISC**—Number of Fabric Discovery Session in the FC uplink interface.
- **Total**—Total number of sessions (FLOGI and FDISC) in the FC uplink interface.
- **Re-distributed**—Number of sessions redistributed for better load balancing in the interface.

Example

```
OS10#show npg uplink-interfaces vfabric 100

VFabric Id : 100
Uplink                          Speed
Intf       FC Id    BB Credit   (Gbps) FLOGI  FDISC  Total   Re-distributed
-------------------------------------------------------------------------
Fc 1/1/1   01:00:01     8        8      3      3      6       6
Fc 1/1/2   01:00:02     8        16     1      9      10      15
```

```

```

Supported Releases 10.5.2.0 or later

Debug FC commands

The following commands are supported on all the modes: F_Port, NPG, FSB, and Multiswitch.

debug fc

Enables and disables the debug options for the FC module.

Syntax

```
debug fc {all | error| info | acl | port | tx | pse | ns | fspf | rx-{all
| disc | virt-inst | virt-mnt | vlan-disc | ns | pse | fspf | sw-rscn}
[interface {fibrechannel | ethernet} node | slot | portid]}
```

Parameters

- `all`—Enables debug messages for all FC debug log-levels.
- `error`—Enables error debug log messages.
- `info`—Enables information log messages.
- `acl`—Enables debug messages that relate to the Access Control List (ACL).
- `port`—Enables debug messages that relate to the interface.
- `tx`—Enables debug messages that are involved during packet transmission (Tx).
- `pse`—Enables debug messages that are generated during the Principal Switch Election (PSE) phase of the Multi-switch mode.
- `ns`—Enables debug messages that are generated during the name server registration and management process.
- `fspf`—Enables debug messages that are generated during the Fabric Shortest Path First (FSPF) process of Multi-switch mode.
- `rx`—Enables debug messages that generate during packet reception (Rx) according to the specified sublevels.
- `disc`—Enables debug messages corresponding to the Rx discovery packet.
- `virt-inst`—Enables debug messages corresponding to the Rx Virtual Link Instantiation frames.

- `virt-mnt`—Enables debug messages corresponding to the Rx Virtual Link Maintenance frames.
- `vlan-disc`—Enables debug messages corresponding to the Rx VLAN Discovery packet.
- `sw-rscn`—Enables debug messages that are involved during the Switch-Registered State Change Notification(Sw-RSCN).

Default Disabled

Command Mode EXEC

Usage Information

Before using this command, run the following commands:

- `logging enable`
- `logging console enable`
- `terminal monitor`

Enable debug logs globally or on a specific interface using the `rx debug` subcommands. Before you enable the `rx debug` logs, configure the switch mode using the following command:

- `feature fc {multi-switch | npg | fsb | domain-id [`*`domain-id`*`]}`

OS10 does not support the `interface range` option with this command.

The `no` form of this command removes the configured debug level.

Examples

```
OS10# debug fc
all  error  info  acl  port  tx  pse  ns  fspf  rx
OS10# debug fc acl
```

```
OS10# debug fc rx
all  disc  virt-inst  virt-mnt  vlan-disc  ns  pse  fspf
sw-rscn
OS10# debug fc rx disc
```

```
OS10# debug fc rx sw-rscn interface fibrechannel 1/1/1
```

```
OS10# no debug fc pse
```

Supported Releases 10.5.2.0 or later

show debug fc

Displays the list of debug options that are enabled for the FC module.

Syntax `show debug fc`

Parameters None

Default Not applicable

Command Mode EXEC

Usage Information Displays the list of debug types that are enabled globally and at the specific interface level.

Examples

```
OS10# show debug fc

FC global debug settings:
debug fc acl
debug fc pse
debug fc rx-disc
FC interface specific debug settings:
debug fc rx-sw-rscn interface fibrechannel1/1/1
```

Supported Releases	10.5.2.0 or later

11

Layer 2

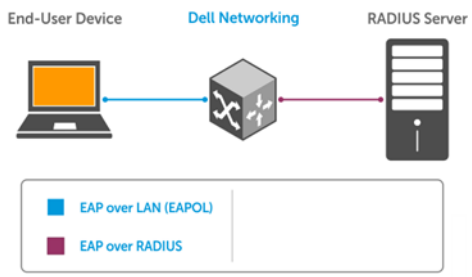
802.1X	Verifies device credentials before sending or receiving packets using the Extensible Authentication Protocol (EAP), see 802.1X Commands.
Link Aggregation Control Protocol (LACP)	Exchanges information between two systems and automatically establishes a port channel between the systems, see LACP Commands.
Link Layer Discovery Protocol (LLDP)	Enables a local area network (LAN) device to advertise its configuration and receive configuration information from adjacent LLDP-enabled infrastructure devices, see LLDP Commands.
Media Access Control (MAC)	Configures limits, redundancy, balancing, and failure detection settings for devices on your network using tables, see MAC Commands.
Multiple Spanning-Tree (MST)	Maps MST instances and maps many virtual local area networks (VLANs) to a single spanning-tree instance, reducing the number of required instances, see MST Commands.
Rapid Per-VLAN Spanning-Tree Plus (RPVST+)	Combination of rapid spanning-tree and per-VLAN spanning-tree plus for faster convergence and interoperability, see RPVST+ Commands.
Rapid Spanning-Tree Protocol (RSTP)	Faster convergence and interoperability with devices configured with the Spanning-Tree and Multiple Spanning-Tree Protocols (STPs and MSTPs), see RSTP Commands.
Virtual LANs (VLANs)	Improved security to isolate groups of users into different VLANs and the ability to create a single VLAN across multiple devices, see VLAN Commands.
Port Monitoring (Local/Remote)	Port monitoring of ingress or egress traffic, or both ingress and egress traffic, on specified port(s). Monitoring methods include port-mirroring, remote port monitoring, and encapsulated remote-port monitoring (see Local/Remote Commands).

802.1X

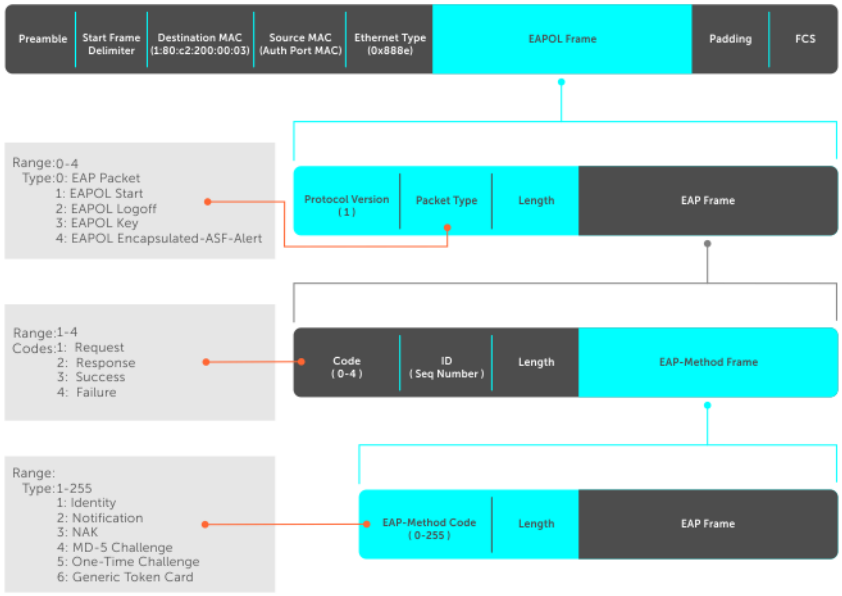
The IEEE 802.1X standard defines a client and server-based access control that prevents unauthorized clients from connecting to a LAN through publicly accessible ports. Authentication is only required in OS10 for inbound traffic. Outbound traffic transmits regardless of the authentication state.

802.1X employs the extensible authentication protocol (EAP) to provide device credentials to an authentication server, typically remote authentication dial-in service (RADIUS), using an intermediary network access device. The network access device mediates all communication between the end-user device and the authentication server so the network remains secure.

The network access device uses EAP-over-Ethernet, also known as EAPOL—EAP over LAN, to communicate with the end-user device and EAP-over-RADIUS to communicate with the server.



NOTE: OS10 supports only RADIUS as the back-end authentication server.



The authentication process contains three devices:

- **Supplicant** — The device attempting to access the network performs the role of supplicant. Regular traffic from this device does not reach the network until the port associated to the device is authorized. Before that, the supplicant can only exchange 802.1x messages (EAPOL frames) with the authenticator.
- **Authenticator** — The authenticator is the gate keeper of the network, translating and forwarding requests and responses between the authentication server and the supplicant. The authenticator also changes the status of the port based on the results of the authentication process. The authenticator runs on the Dell device.
- **Authentication-server** — The authentication-server selects the authentication method, verifies the information that the supplicant provides, and grants network access privileges.

Configuration notes

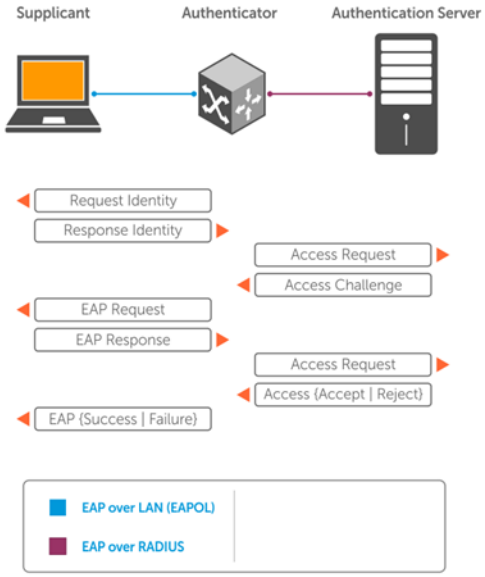
All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

802.1X becomes fully functional only when the feature is enabled globally. If you do not enable 802.1X globally but enable only at the interface level, the system displays the Dot1x Not Enabled message.

Port authentication

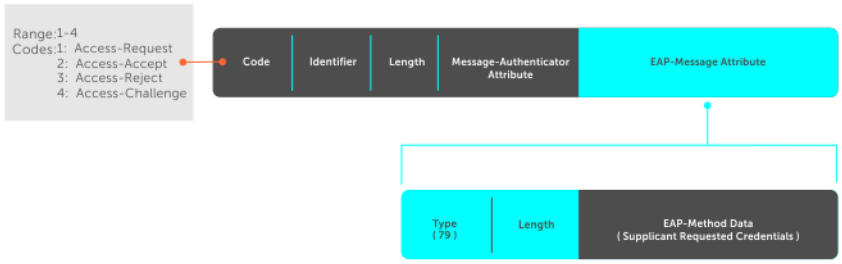
The process begins when the authenticator senses a link status change from down to up:

1. The authenticator requests that the supplicant identify itself using an EAP *Request Identity* frame.
2. The supplicant responds with its identity in an EAP *Response Identity* frame.
3. The authenticator decapsulates the EAP response from the EAPOL frame, encapsulates it in a RADIUS *Access Request* frame, and forwards the frame to the authentication server.
4. The authentication server replies with an *Access Challenge* frame who requests that the supplicant verifies its identity using an EAP-Method. The authenticator translates and forwards the challenge to the supplicant.
5. The supplicant negotiates the authentication method and provides the *EAP Request* information in an *EAP Response*. Another *Access Request* frame translates and forwards the response to the authentication server.
6. If the identity information the supplicant provides is valid, the authentication server sends an *Access Accept* frame that specifies the network privileges. The authenticator changes the port state to authorize and forwards an *EAP Success* frame. If the identity information is invalid, the server sends an *Access Reject* frame. If the port state remains unauthorized, the authenticator forwards an *EAP Failure* frame.



EAP over RADIUS

802.1X uses RADIUS to transfer EAP packets between the authenticator and the authentication server. EAP messages are encapsulated in RADIUS packets as an attribute of type, length, value (TLV) format—the *type* value for EAP messages is 79.

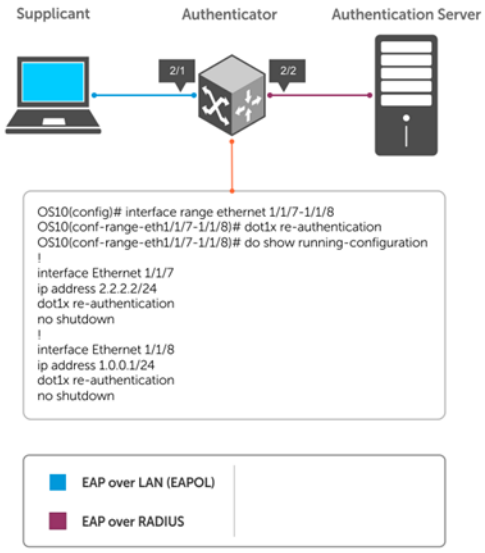


Configure 802.1X

You can configure and enable 802.1X on a port in a single process. OS10 supports 802.1X with EAP-MD5, EAP-TLS, and EAP-TTLS. All platforms support RADIUS as the authentication server.

If the primary RADIUS server becomes unresponsive, the authenticator begins using a secondary RADIUS server if configured.

NOTE: 802.1X is not supported on port channels or port channel members.



Enable 802.1X

1. Enable 802.1X globally in CONFIGURATION mode.

```
dot1x system-auth-control
```

2. Enter an interface or a range of interfaces in CONFIGURATION mode.

```
interface range
```

3. Enable 802.1X on the supplicant interface only in INTERFACE mode.

```
dot1x port-control auto
```

Configure and verify 802.1X configuration

```
OS10(config)# dot1x system-auth-control
OS10(config)# interface range ethernet 1/1/7-1/1/8
OS10(conf-range-eth1/1/7-1/1/8)# dot1x port-control auto
OS10(conf-range-eth1/1/7-1/1/8)# dot1x re-authentication
OS10(conf-range-eth1/1/7-1/1/8)# do show dot1x interface ethernet 1/1/7

802.1x information on ethernet1/1/7
-----------------------------------
Dot1x Status:              Enable
Port Control:              AUTO
Port Auth Status:          UNAUTHORIZED
Re-Authentication:         Enable
Tx Period:                 60 seconds
Quiet Period:              60 seconds
Supplicant Timeout:        30 seconds
Server Timeout:            30 seconds
Re-Auth Interval:          3600 seconds
Max-EAP-Req:               2
Host Mode:                 MULTI_HOST
Auth PAE State:            Initialize
Backend State:             Idle
```

Identity retransmissions

If the authenticator sends a *Request Identity* frame but the supplicant does not respond, the authenticator waits 30 seconds and then retransmits the frame. There are several reasons why the supplicant might fail to respond—the supplicant maybe booting when the request arrived, there may be a physical layer problem, and so on.

1. Configure the amount of time that the authenticator waits before retransmitting an EAP *Request Identity* frame in INTERFACE mode, from 1 to 65535 – 1 year, default 60.

   ```
   dot1x timeout tx-period seconds
   ```

2. Configure a maximum number of times the authenticator retransmits a *Request Identity* frame in INTERFACE mode from 1 to 10, default 2.

   ```
   dot1x max-req retry-count
   ```

Configure and verify retransmission time

```
OS10(config)# dot1x system-auth-control
OS10(config)# interface range ethernet 1/1/7-1/1/8
OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout tx-period 120
OS10(conf-range-eth1/1/7-1/1/8)# dot1x max-req 5
OS10(conf-range-eth1/1/7-1/1/8)# do show dot1x interface ethernet 1/1/7

802.1x information on ethernet1/1/7
-----------------------------------
Dot1x Status:              Enable
Port Control:              AUTO
Port Auth Status:          UNAUTHORIZED
Re-Authentication:         Enable
Tx Period:                 120 seconds
Quiet Period:              60 seconds
Supplicant Timeout:        30 seconds
Server Timeout:            30 seconds
Re-Auth Interval:          3600 seconds
Max-EAP-Req:               5
Host Mode:                 MULTI_HOST
Auth PAE State:            Initialize
Backend State:             Idle
```

View interface running configuration

```
OS10(conf-range-eth1/1/7-1/1/8)# do show running-configuration interface
...
!
interface ethernet1/1/7
 no shutdown
 dot1x max-req 5
 dot1x port-control auto
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout tx-period 120
!
interface ethernet1/1/8
 no shutdown
 dot1x max-req 5
 dot1x port-control auto
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout tx-period 120
...
```

Failure quiet period

If the supplicant fails the authentication process, the authenticator sends another Request Identity frame after 30 seconds by default. The quiet period is a transmit interval time after a failed authentication.

The Request Identity Retransmit interval is for an unresponsive supplicant. You can configure the interval for a maximum of 10 times for an unresponsive supplicant.

1. Configure the amount of time that the authenticator waits to retransmit a *Request Identity* frame after a failed authentication in INTERFACE mode from 1 to 65535, default 60 seconds.

```
dot1x timeout quiet-period seconds
```

Configure and verify port authentication

```
OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout quiet-period 120
OS10(conf-range-eth1/1/7-1/1/8)# do show dot1x interface ethernet 1/1/7
802.1x information on ethernet1/1/7
-----------------------------------
Dot1x Status:              Enable

 dot1x max-req 5
 dot1x port-control auto
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout tx-period 120
!
interface ethernet1/1/8
 no shutdown
 dot1x max-req 5
 dot1x port-control auto
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout tx-period 120
...
```

Port control mode

802.1X requires a port to be in one of three states—force-authorized, force-unauthorized, or auto.

force-authorized (default)	This is an *authorized state*. A device connected to this port does not use the authentication process but can communicate on the network. Placing the port in this state is the same as disabling 802.1X on the port. `force-authorized` is the default mode.
force-unauthorized	This is an *unauthorized state*. A device connected to a port does not use the authentication process but is *not* allowed to communicate on the network. Placing the port in this state is the same as shutting down the port. Any attempt by the supplicant to initiate authentication is ignored.
auto	This is an *unauthorized state* by default. A device connected to this port is subject to the authentication process. If the process is successful, the port is authorized and the connected device communicates on the network.

- Place a port in the auto, force-authorized (default), or force-unauthorized state in INTERFACE mode.

```
dot1x port-control {auto | force-authorized | force-unauthorized}
```

Configure and verify force-authorized state

```
OS10(conf-range-eth1/1/7-1/1/8)# dot1x port-control force-authorized
OS10(conf-range-eth1/1/7-1/1/8)# do show dot1x interface ethernet 1/1/7

802.1x information on ethernet1/1/7
-----------------------------------
Dot1x Status:              Enable
Port Control:              AUTHORIZED
Port Auth Status:          UNAUTHORIZED
Re-Authentication:         Enable
Tx Period:                 120 seconds
Quiet Period:              120 seconds
Supplicant Timeout:        30 seconds
Server Timeout:            30 seconds
Re-Auth Interval:          3600 seconds
Max-EAP-Req:               5
Host Mode:                 MULTI_HOST
Auth PAE State:            Initialize
Backend State:             Initialize
```

View interface running configuration

```
OS10(conf-range-eth1/1/7-1/1/8)# do show running-configuration interface
...
!
interface ethernet1/1/7
 no shutdown
 dot1x max-req 5
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout tx-period 120
!
interface ethernet1/1/8
 no shutdown
 dot1x max-req 5
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout tx-period 120
...
```

Reauthenticate a port

Configures the time period for reauthentication. After the supplicant is authenticated and the port is authorized, configure the authenticator to reauthenticate the supplicant. If you enable reauthentication, the supplicant reauthenticates every 3600 seconds.

- Reauthenticate the supplicant in INTERFACE mode, from 1 to 65535, default 3600.

```
dot1x timeout re-authperiod seconds
```

Configure and verify reauthentication time period

```
OS10(config)# interface range ethernet 1/1/7-1/1/8
OS10(conf-range-eth1/1/7-1/1/8)# dot1x re-authentication
OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout re-authperiod 3600
OS10(conf-range-eth1/1/7-1/1/8)# show dot1x interface ethernet 1/1/7

802.1x information on ethernet1/1/7
-----------------------------------
Dot1x Status:              Enable
Port Control:              AUTHORIZED
Port Auth Status:          UNAUTHORIZED
Re-Authentication:         Enable
```

```
Tx Period:                  120 seconds
Quiet Period:               120 seconds
Supplicant Timeout:         30 seconds
Server Timeout:             30 seconds
Re-Auth Interval:           3600 seconds
Max-EAP-Req:                5
Host Mode:                  MULTI_HOST
Auth PAE State:             Initialize
Backend State:              Initialize
```

View interface running configuration

```
OS10(conf-range-eth1/1/7-1/1/8)# do show running-configuration interface
...
!
interface ethernet1/1/7
 no shutdown
 dot1x max-req 5
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout re-authperiod 3600
 dot1x timeout tx-period 120
!
interface ethernet1/1/8
 no shutdown
 dot1x max-req 5
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout re-authperiod 3600
 dot1x timeout tx-period 120
...
```

Configure timeouts

If the supplicant or authentication server is unresponsive, the authenticator terminates the authentication process after 30 seconds by default. Configure the amount of time the authenticator waits for a response before termination.

- Terminate the authentication process due to an unresponsive supplicant in INTERFACE mode, from 1 to 65535, default 30.

  ```
  dot1x timeout supp-timeout seconds
  ```

- Terminate the authentication process due to an unresponsive authentication server in INTERFACE mode, from 1 to 65535, default 30.

  ```
  dot1x timeout server-timeout seconds
  ```

Configure and verify server timeouts

```
OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout supp-timeout 45
OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout server-timeout 60
OS10(conf-range-eth1/1/7-1/1/8)# do show dot1x interface ethernet 1/1/7

802.1x information on ethernet1/1/7
-------------------------------------
Dot1x Status:               Enable

Host Mode:                  MULTI_HOST
Auth PAE State:             Initialize
Backend State:              Initialize
```

View interface running configuration

```
OS10(conf-range-eth1/1/7-1/1/8)# do show running-configuration interface
...
!
interface ethernet1/1/7
 no shutdown
 dot1x max-req 5
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout re-authperiod 3600
 dot1x timeout server-timeout 60
 dot1x timeout supp-timeout 45
 dot1x timeout tx-period 120
!
interface ethernet1/1/8
 no shutdown
 dot1x max-req 5
 dot1x re-authentication
 dot1x timeout quiet-period 120
 dot1x timeout re-authperiod 3600
 dot1x timeout server-timeout 60
 dot1x timeout supp-timeout 45
 dot1x timeout tx-period 120
...
```

Configure RADIUS server

To configure RADIUS server for 802.1x authentication, use the `radius-server host` command. Enter the server IP address or host name, and the shared secret key used to authenticate the OS10 switch on a RADIUS host.

- Configure a RADIUS over TLS authentication on a RADIUS server in CONFIGURATION mode.

```
radius-server host {hostname | ip-address} key {0 authentication-key | 9
authentication-key | authentication-key} [auth-port port-number]
```

To configure more than one RADIUS server for 802.1x authentication, re-enter the `radius-server host tls` command multiple times. If you configure multiple RADIUS servers, OS10 attempts to connect in the order you configured them. An OS10 switch connects with the configured RADIUS servers one at a time, until a RADIUS server responds with an accept or reject response. The switch tries to connect with a server for the configured number of retransmit retries and timeout period.

Configure global settings for the timeout and retransmit attempts allowed on RADIUS servers as described in RADIUS authentication.

Configure RADIUS for 802.1x authentication

```
OS10(config)# radius-server host 1.5.6.4 key secret1
OS10(config)# radius-server retransmit 10
OS10(config)# radius-server timeout 10
```

802.1X commands

dot1x host-mode

Allows 802.1X authentication for either a single supplicant or multiple supplicants on an interface.

Syntax `dot1x host-mode {multi-host | multi-auth}`

Parameters

- `multi-host` — Allows attachment of multiple hosts to a single 802.1X-enabled port. You can only authorize one of the attached clients for all clients to grant network access. If the port becomes unauthorized (reauthentication fails or receives an EAPOL-logoff message), the device denies network access to all the attached clients.
- `multi-auth` — Allows 802.1X authentication for each connected host.

Default Multihost

Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x host-mode multi-host`
Supported Releases	10.2.0E or later

dot1x max-req

Changes the maximum number of requests that the device sends to a supplicant before restarting 802.1X authentication.

Syntax	`dot1x max-req retry-count`
Parameters	`max-req retry-count` — Enter the retry count for the request sent to the supplicant before restarting 802.1X reauthentication, from 1 to 10.
Default	2
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x max-req 4`
Supported Releases	10.2.0E or later

dot1x port-control

Controls the 802.1X authentication that is performed on the interface.

Syntax	`dot1x port-control {force-authorized | force-unauthorized | auto}`
Parameters	• `force-authorized` — Disables 802.1X authentication on the interface and allows all traffic on the interface without authentication. • `force-unauthorized` — Keeps the port in the unauthorized state, ignoring all attempts by the client to authenticate. • `auto` — Enables 802.1X authentication on the interface.
Default	Force-authorized
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# interface range ethernet 1/1/7-1/1/8` `OS10(conf-range-eth1/1/7-1/1/8)# dot1x port-control auto`
Supported Releases	10.2.0E or later

dot1x reauthentication

Enables periodic reauthentication of 802.1X supplicants.

Syntax	`dot1x re-authentication`
Parameters	None

Default	Disabled
Command Mode	INTERFACE
Usage Information	The `no` version of this command disables the periodic reauthentication of 8021.X supplicants.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x re-authentication`
Supported Releases	10.2.0E or later

dot1x timeout quiet-period

Sets the number of seconds that the device remains in the quiet state following a failed authentication exchange with a supplicant.

Syntax	`dot1x timeout quiet-period` *seconds*
Parameters	`quiet period` *seconds* — Enter the number of seconds for the 802.1X quiet period timeout, from 1 to 65535.
Default	60 seconds
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout quiet-period 120`
Supported Releases	10.2.0E or later

dot1x timeout re-authperiod

Sets the number of seconds between reauthentication attempts.

Syntax	`dot1x timeout re-authperiod` *seconds*
Parameters	`re-authperiod` *seconds* — Enter the number of seconds for the 802.1X reauthentication timeout, from 1 to 65535.
Default	3600 seconds
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout re-authperiod 7200`
Supported Releases	10.2.0E or later

dot1x timeout server-timeout

Sets the number of seconds that the device waits before retransmitting a packet to the authentication server.

Syntax	`dot1x timeout server-timeout` *seconds*
Parameters	`server-timeout` *seconds* — Enter the number of seconds for the 802.1X server timeout, from 1 to 65535.

Default	30 seconds
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x server-timeout 60`
Supported Releases	10.2.0E or later

dot1x timeout supp-timeout

Sets the number of seconds that the device waits for the supplicant to respond to an EAP request frame before the device retransmits the frame.

Syntax	`dot1x timeout supp-timeout` *seconds*
Parameters	`supp-timeout` *seconds* — Enter the number of seconds for the 802.1X supplicant timeout, from 1 to 65535.
Default	30 seconds
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout supp-timeout 45`
Supported Releases	10.2.0E or later

dot1x timeout tx-period

Sets the number of seconds that the device waits for a response to an EAP-request/identity frame from the supplicant before retransmitting the request.

Syntax	`dot1x timeout tx-period` *seconds*
Parameters	`tx-period` *seconds* — Enter the number of seconds for the 802.1X transmission timeout, from 1 to 65535.
Default	60 seconds
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# dot1x timeout tx-period 120`
Supported Releases	10.2.0E or later

show dot1x

Displays global 802.1X configuration information.

Syntax	`show dot1x`
Parameters	None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show dot1x
PAE Capability:         Authenticator only
Protocol Version:       2
System Auth Control:    Enable
Auth Server:            Radius
```

Supported Releases 10.2.0E or later

show dot1x interface

Displays 802.1X configuration information.

Syntax `show dot1x interface ethernet node/slot/port[:subport]`

Parameters `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information.

Command Mode EXEC

Usage Information Use this command to view the dot1x interface configuration for a specific interface.

Example

```
OS10# show dot1x interface
802.1x information on ethernet1/1/1
-------------------------------------
Dot1x Status:              Enable
802.1x information on ethernet1/1/2
-------------------------------------
Dot1x Status:              Enable
802.1x information on ethernet1/1/3
-------------------------------------
Dot1x Status:              Enable
802.1x information on ethernet1/1/4
-------------------------------------
Dot1x Status:              Enable
802.1x information on ethernet1/1/5
-------------------------------------
Dot1x Status:              Enable
802.1x information on ethernet1/1/6
-------------------------------------
Dot1x Status:              Enable
802.1x information on ethernet1/1/7
-------------------------------------
Dot1x Status:              Enable
Port Control:              AUTO
Port Auth Status:          UNAUTHORIZED
--more--
```

Example (when dot1x is not enabled globally)

```
OS10# show dot1x interface
802.1x not enabled in the system
OS10#
```

Supported Releases 10.2.0E or later

RADIUS server commands

radius-server host

Configures a RADIUS server and the key used to authenticate the switch on the server.

Syntax

```
radius-server host {hostname | ip-address} key {0 authentication-key | 9
authentication-key | authentication-key} [auth-port port-number]
```

Parameters

- *hostname* — Enter the host name of the RADIUS server.
- *ip-address* — Enter the IPv4 (A.B.C.D) or IPv6 (x:x:x:x::x) address of the RADIUS server.
- `key 0` *authentication-key* — Enter an authentication key in plain text. A maximum of 42 characters.
- `key 9` *authentication-key* — Enter an authentication key in encrypted format. A maximum of 128 characters.
- *authentication-key* — Enter an authentication in plain text. A maximum of 42 characters. It is not necessary to enter `0` before the key.
- `auth-port` *port-number* — (Optional) Enter the UDP port number used on the server for authentication, from 1 to 65535, default 1812.

Default Not configured

Command Mode CONFIGURATION

Usage Information The authentication key must match the key configured on the RADIUS server. You cannot enter spaces in the key. The `show running-configuration` output displays both unencrypted and encrypted keys in encrypted format. Configure global settings for the timeout and retransmit attempts allowed on RADIUS servers using the `radius-server retransmit` and `radius-server timeout` commands. The `no` version of this command removes a RADIUS server configuration.

Example

```
OS10(config)# radius-server host 1.5.6.4 key secret1
```

Supported Releases 10.2.0E or later

radius-server host tls

Configures a RADIUS server for RADIUS over TLS user authentication and secure communication. For RADIUS over TLS authentication, the `radsec` shared key and a security profile that uses an X.509v3 certificate are required.

Syntax

```
radius-server host {hostname | ip-address} tls security-profile profile-
name [auth-port tcp-port-number] key {0 authentication-key | 9
authentication-key | authentication-key}
```

Parameters

- *hostname* — Enter the host name of the RADIUS server.
- *ip-address* — Enter the IPv4 (A.B.C.D) or IPv6 (x:x:x:x::x) address of the RADIUS server.
- `tls` — Enter `tls` to secure RADIUS server communication using the TLS protocol.
- `security-profile` *profile-name* — Enter the name of an X.509v3 security profile to use with RADIUS over TLS authentication. To configure a security profile for an OS10 application, see Security profiles.
- `auth-port` *tcp-port-number* — (Optional) Enter the TCP port number that the server uses for authentication. The range is from 1 to 65535. The default is 2083.
- `key 0` *authentication-key* — Enter the `radsec` shared key in plain text.
- `key 9` *authentication-key* — Enter the `radsec` shared key in encrypted format.
- *authentication-key* — Enter the `radsec` shared key in plain text. It is not necessary to enter `0` before the key.

Default TCP port 2083 on a RADIUS server for RADIUS over TLS communication

Command Mode CONFIGURATION

Usage Information

For RADIUS over TLS authentication, configure the `radsec` shared key on the server and OS10 switch. The `show running-configuration` output displays both the unencrypted and encrypted key in encrypted format. Configure global settings for the timeout and retransmit attempts allowed on a RADIUS over TLS servers using the `radius-server retransmit` and `radius-server timeout` commands.

RADIUS over TLS authentication requires that X.509v3 PKI certificates are configured on a certification authority and installed on the switch. For more information, including a complete RADIUS over TLS example, see X.509v3 certificates.

The `no` version of this command removes a RADIUS server from RADIUS over TLS communication.

Example

```
OS10(config)# radius-server host 1.5.6.4 tls security-profile radius-
admin key radsec
```

Supported Releases

10.4.3.0 or later

radius-server nas-ip-address

Configures RADIUS attribute 4, NAS-IP-Address in the RADIUS request packet.

Syntax

`radius-server nas-ip-address` *`ipv4-address`*

Parameters

`ipv4-address`—Enter an arbitrary IP address to be configured as the NAS IP address in `A.B.C.D` format.

Defaults

By default, the NAS IP attribute uses the management ethernet IP address. If management VRF is used for RADIUS authentication, this attribute uses a static IP address, 127.100.100.2.

Command Mode

CONFIGURATION

Usage Information

Use this command when you use the management VRF for RADIUS authentication. This command configures an arbitrary IP address to be used as RADIUS attribute 4, NAS-IP-Address without changing the source IP address in the IP header of the RADIUS packets.

The `no` version of this command removes the configuration.

Example

```
OS10(config)# radius-server nas-ip-address 10.5.1.1
```

Supported Releases

10.5.1.0 or later

radius-server retransmit

Configures the number of authentication attempts allowed on RADIUS servers.

Syntax

`radius-server retransmit` *`retries`*

Parameters

`retries` — Enter the number of retry attempts, from 0 to 10.

Default

An OS10 switch retransmits a RADIUS authentication request three times.

Command Mode

CONFIGURATION

Usage Information

Use this command to globally configure the number of retransmit attempts allowed for authentication requests on RADIUS servers. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# radius-server retransmit 5
```

Supported Releases

10.2.0E or later

radius-server timeout

Configures the timeout used to resend RADIUS authentication requests.

Syntax	`radius-server timeout seconds`
Parameters	*seconds* — Enter the time in seconds for retransmission, from 1 to 100.
Default	An OS10 switch stops sending RADIUS authentication requests after five seconds.
Command Mode	CONFIGURATION
Usage Information	Use this command to globally configure the timeout value used on RADIUS servers. The `no` version of this command resets the value to the default.
Example	`OS10(config)# radius-server timeout 90`
Supported Releases	10.2.0E or later

radius-server vrf

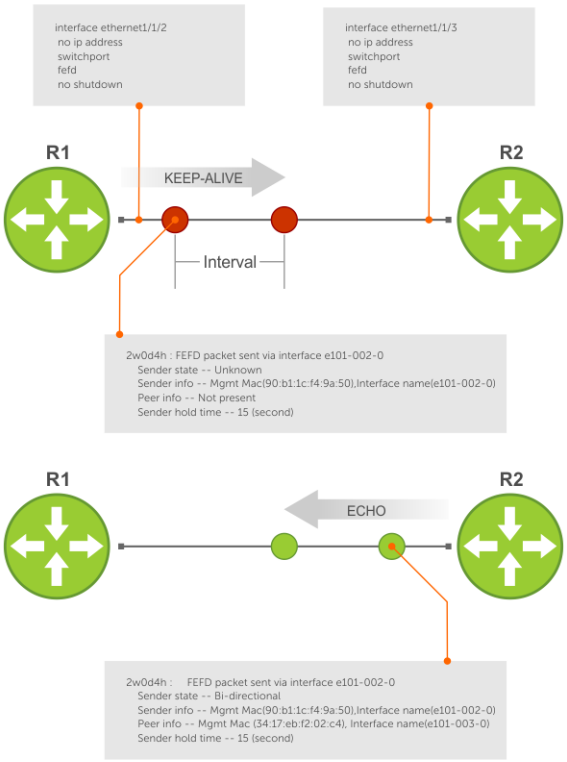
Configures the RADIUS server for the management or non-default VRF instance.

Syntax	`radius-server vrf {management | vrf-name}`
Parameters	• `management` — Enter the keyword to configure the RADIUS server for the management VRF instance. • *vrf-name* — Enter the keyword then the name of the VRF to configure the RADIUS server for that non-default VRF instance.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	Use this command to associate RADIUS servers with a VRF. If you do not configure a VRF on the RADIUS server list, the servers are on the default VRF. RADIUS server lists and VRFs have one-to-one mapping. The `no` version of this command removes the RADIUS server from the management VRF instance.
Example	`OS10(config)# radius-server vrf management` `OS10(config)# radius-server vrf blue`
Supported Releases	10.4.0E(R1) or later

Far-end failure detection

Far-End Failure Detection (FEFD) is a protocol that detects remote data link errors in a network.

FEFD uses a link layer echo protocol to detect and signal far-end failures over Ethernet and optical links. When you enable FEFD, switches periodically exchange FEFD echo frames to identify link failures. If the local switch does not receive an echo from its peer for the time interval of three times the configured FEFD message interval, the local switch assumes that the peer link is down. The default interval for FEFD message interval is 15 seconds. For example, with the default configuration, if the local switch does not receive an echo message for 45 seconds from its peer, it brings the peer link down.



FEFD helps detect far-end failure when the following problems occur:

- Only one side receives packets although the physical layer (L1) of the link is up on both sides.
- Transceivers are not connected to the correct ports.

FEFD states

FEFD comprises the following four states:

- `Idle`—FEFD is disabled.
- `Unknown`—Shown when FEFD is enabled and changes to `bi-directional` after successful handshake with the peer. Also shown if the peer goes down in `normal` mode.
- `bi-directional`—Interface is up, connected, and receiving echoes of its neighbor.
- `err-disabled`—Only found when FEFD mode is `aggressive` and when the interface has not received three echoes of its neighbor. To reset an interface in this state, use the `fefd reset` command.

FEFD modes

FEFD operates in two modes—Normal mode and aggressive mode.

- Normal mode—When you enable Normal mode on an interface and a far-end failure is detected, no intervention is required to reset the interface to bring it back to an FEFD operational state.
- Aggressive mode—When you enable Aggressive mode on an interface in the same state, you must manually reset the interface.

The following events explain how FEFD state transition occurs:

- When you enable FEFD on an interface a link transitions from idle state to unknown state.
- In the unknown state, the interface starts transmitting link state information at a regular interval. The interface state changes to bi-directional when a handshake is complete with the peer.
- When an interface is in bi-directional state, if it does not receive an echo from its peer for the time interval of three times the configured FEFD message interval, the interface state changes to unknown in Normal mode. In Aggressive mode, the interface state changes to err-disabled.

If the interface state changes to err-disabled, use the `fefd reset [interface]` global command to reset these interfaces. The unknown or err-disabled state brings the line protocol down so that the protocols above it can detect that the peer link is down.

Table 39. FEFD state changes

Local event (User intervention)	Configured FEFD mode	Local state (Show display) (Result)	Local admin State (Result)	Local line protocol Status (Result)	Remote state (Show display) (Result)	Remote admin state	Remote line protocol status
Shutdown(user configuration)	Normal	Admin Shutdown	Down	Down	Line protocol is down.	Up	Down
Shutdown(user configuration)	Aggressive	Admin Shutdown	Down	Down	Line protocol is down.	Up	Down
FEFD+ FEFD disable(user configuration)	Normal	Locally disabled	Up	Up	Unknown	Up	Down
FEFD + FEFD disable(user configuration)	Aggressive	Locally disabled	Up	Down	Err-disabled	Up	Down
Link Failure (Remove cable or transceiver)	Normal	Unknown	Up	Down	Unknown	Up	Down
Link Failure(Remove cable or transceiver)	Aggressive	Unknown	Up	Down	Unknown	Up	Down
FEFD enable(user configuration)	Normal	Bi-directional	Up	Up	Bi-directional	Up	Up
FEFD enable(user configuration)	Aggressive	Bi-directional	Up	Up	Bi-directional	Up	Up

Restrictions

- You can enable FEFD globally or on an interface. If FEFD is enabled globally, the FEFD interface configuration overrides global FEFD configuration.
- OS10 supports FEFD only on physical interfaces. FEFD is not supported on any other interfaces. However, you can enable FEFD on individual physical interfaces that belong to a port channel.

Enable FEFD globally

To configure FEFD globally:

1. Do one of the following:
   - Configure FEFD Normal mode globally using the `fefd-global` command in CONFIGURATION mode.

     ```
     OS10(Config)# fefd-global
     ```

   - Configure FEFD Normal mode globally using the `fefd-global mode normal` command in CONFIGURATION mode.

     ```
     OS10(Config)# fefd-global mode normal
     ```

- Configure FEFD Aggressive mode globally using the `fefd-global mode aggressive` command in CONFIGURATION mode.

```
OS10(Config)# fefd-global mode aggressive
```

2. (Optional) Configure the FEFD interval using the `fefd-global interval` command in CONFIGURATION mode and enter the interval in seconds. The range is from 3 to 255 seconds.

```
OS10(Config)# fefd-global interval 20
```

3. (Optional) Disable FEFD on a specific interface if required using the `fefd disable` command in INTERFACE mode.

```
OS10(Conf-if-eth1/1/1)# no fefd interval 20
```

Enable FEFD on interface

To configure FEFD on an interface:

1. Do one of the following:
   - Configure FEFD Normal mode on an interface using the `fefd` command in INTERFACE mode.

```
OS10(Conf-if-eth1/1/1)# fefd
```

   - Configure FEFD Normal mode on an interface using the `fefd mode normal` command in INTERFACE mode.

```
OS10(Conf-if-eth1/1/1)# fefd mode normal
```

   - Configure FEFD Aggressive mode on an interface using the `fefd mode aggressive` command in INTERFACE mode.

```
OS10(Conf-if-eth1/1/1)# fefd mode aggressive
```

2. (Optional) Configure the FEFD interval using the `fefd interval` command in INTERFACE mode and enter the interval in seconds. The range is from 3 to 255 seconds.

```
OS10(Conf-if-eth1/1/1)# fefd interval 20
```

Reset FEFD err-disabled interface

When the system detects a far-end failure in FEFD aggressive mode, the interface moves to err-disabled state. To bring back the interface to FEFD operational state:

- Enter the `fefd reset` command in EXEC mode.

```
OS10# fefd reset ethernet 1/1/1
```

Display FEFD information

To view FEFD information:

- To view FEFD information globally, use the `show fefd` command in EXEC mode.
- To view FEFD information for an interface, use the `show fefd` **`interface`** command in EXEC mode.

The following is a sample output of FEFD global information:

```
OS10# show fefd
FEFD is globally 'ON', interval is 15 seconds, mode is Normal.
INTERFACE      MODE          INTERVAL      STATE
============================================================
eth1/1/1       NA            NA            Idle (Not running)
eth1/1/2       NA            NA            Idle (Not running)
eth1/1/3       NA            NA            Idle (Not running)
```

```
eth1/1/4        NA              NA              Idle (Not running)
eth1/1/5        NA              NA              Idle (Not running)
eth1/1/6        NA              NA              Idle (Not running)
eth1/1/7        NA              NA              Idle (Not running)
```

The following is a sample output of FEFD information for an interface:

```
rt-maa-s4248FBL-3# show fefd ethernet 1/1/1
FEFD is globally 'ON', interval is 15 seconds, mode is Normal.
INTERFACE       MODE            INTERVAL        STATE
============================================================
eth1/1/1        NA              NA              Idle (Not running)
```

FEFD Commands

debug fefd

Enables debugging of FEFD.

Syntax `debug fefd {all | events | packets} [interface]`

Parameters

- `all`—Enter the keyword to view all FEFD debug information.
- `events`—Enter the keyword to view debug information about FEFD state changes.
- `packets`—Enter the keyword to view debug information about FEFD packets that are sent and received.
- (Optional) *`interface`*—Enter interface information.

Default Not configured

Command Mode EXEC Privilege

Example

```
OS10# debug fefd
```

Supported Releases 10.4.3.0 or later

fefd

Configures FEFD on an interface.

Syntax `fefd [mode {normal | aggressive} | interval` **`seconds`** `| disable]`

Parameters

- (Optional) `mode`—Enter the keyword and enter either `normal` to enable the normal mode or `aggressive` to enable the aggressive mode.
- `interval`—Enter the keyword and enter the FEFD interval in seconds to configure the interval between FEFD control packets on an interface. The range is from 3 to 255. The default value is 15 seconds.
- `disable`—Enter the keyword to disable FEFD on a specific interface when you configure FEFD globally.

Default Not configured

Command Mode INTERFACE

Usage Information

The `fefd` command without any arguments enables the normal mode with the default FEFD interval of 15 seconds.

If you use the `no fefd` command, the system does not disable FEFD if the `fefd mode` command is already present in the configuration. Similarly, if you use the `no fefd mode` command, the system does not disable FEFD if the `fefd` command is already present in the configuration.

To disable FEFD on an interface when FEFD globally enabled, use the `fefd disable` command on the interface.

To unconfigure FEFD on an interface, use either the `no fefd` command or the `no fefd mode` command. To return to the default FEFD interval, use the `no fefd interval` command.

Example

```
OS10(conf-if-eth1/1/9)# fefd
```

```
OS10(conf-if-eth1/1/9)# fefd mode aggressive
```

```
OS10(conf-if-eth1/1/9)# fefd mode interval 10
```

Supported Releases 10.4.3.0 or later

fefd-global

Configures FEFD globally.

Syntax `fefd-global [mode {normal | aggressive} | interval` **`seconds`**`]`

Parameters

- (Optional) `mode`—Enter the keyword and enter either `normal` to enable the Normal mode or `aggressive` to enable the aggressive mode.
- (Optional) `interval`—Enter the keyword and enter the FEFD interval in seconds to configure the interval between FEFD control packets globally. The range is from 3 to 255. The default value is 15 seconds.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `fefd-global` command without arguments enables Normal mode with the default FEFD interval of 15 sseconds.

If you use the `no fefd-global` command, the system does not disable FEFD if the `fefd-global mode` command is already present in the configuration. Similarly, if you use the `no fefd-global mode` command, the system does not disable FEFD if the `fefd-global` command is already present in the configuration.

To unconfigure FEFD globally, use either the `no fefd-global` command or the `no fefd-global mode` command. To return to the default FEFD interval, use the `no fefd-global interval` command.

Example

```
OS10(config)# fefd-global
```

```
OS10(config)# fefd-global mode aggressive
```

```
OS10(config)# fefd mode interval 10
```

Supported Releases 10.4.3.0 or later

fefd reset

Resets interfaces that are in error-disabled state because FEFD is set to Aggressive mode.

Syntax `fefd reset [`*`interface`*`]`

Parameters

- (Optional) *`interface`*—Enter the interface name to reset the error-disabled state of the interface because FEFD is set to Aggressive mode.

Default Not configured

Command Mode EXEC

Usage Information

If you do not enter the interface name, this command resets the error-disabled state of all interfaces because FEFD is set to Aggressive mode.

Example

```
OS10# fefd reset
```

```
OS10# fefd reset ethernet 1/1/2
```

Supported Releases

10.4.3.0 or later

show fefd

Displays FEFD information globally or for a specific interface.

Syntax

```
show fefd [interface]
```

Parameters

- (Optional) *interface*—Enter the interface information.

Default

Not configured

Command Mode

EXEC and EXEC Privilege

Usage Information

The following table describes the fields in the `show fefd` command output:

Field	Description
Interface	Displays the interface name
Mode	Displays the mode—Aggressive, Normal, or NA when the interface contains `fefd reset` in its configuration.
Interval	Displays the interval between FEFD packets.
State	Displays the state of the interface and can be one of the following: • Bi-directional—Interface is up, connected, and receiving echoes of its neighbor. • Err-disabled—Only found when FEFD mode is Aggressive and when the interface has not received three echoes of its neighbor. To reset an interface in this state, use the `fefd reset` command. • `Unknown`—Shown when FEFD is enabled and changes to `bi-directional` after successful handshake with the peer. Also shown if the peer goes down in `normal` mode. • Locally disabled—Interface contains the `fefd reset` command in its configuration. • Admin Shutdown—Interface is disabled using the shutdown command. • Line protocol is down—The state on the remote device when an interface of the local device is disabled with the `shutdown` command.

Example

```
OS10# show fefd
FEFD is globally 'ON', interval is 22 seconds,mode is NORMAL.
INTERFACE MODE       INTERVAL STATE
============================================================
eth1/1/1  Normal     22       Unknown
eth1/1/2  Normal     22       Unknown
eth1/1/3  Normal     22       Unknown
eth1/1/4  Normal     22       Unknown
eth1/1/5  Normal     22       Unknown
eth1/1/6  Normal     22       Unknown
eth1/1/7  Normal     22       Unknown
eth1/1/8  Normal     22       Unknown
eth1/1/9  Aggressive 22       Err-disabled
eth1/1/10 Normal     22       Unknown
```

Supported Releases

10.4.3.0 or later

Link Aggregation Control Protocol

Group Ethernet interfaces to form a single link layer interface called a port channel. Aggregating multiple links between physical interfaces creates a single logical port-channel, which balances traffic across the member links within an aggregated Ethernet bundle and increases the uplink bandwidth. If one member link fails, the port-channel continues to carry traffic over the remaining links. For information about port-channel load balancing and hashing, see Load balancing.

You can use LACP to create dynamic port-channels exchanging information between two systems (also called Partner Systems) and automatically establishing the port-channel between the systems. LACP permits the exchange of messages on a link to:

- Agree on the identity of the port-channel to which the link belongs.
- Move the link to that port-channel.
- Enable the transmission and reception functions.

LACP functions by constantly exchanging custom MAC PDUs across LAN Ethernet links. The protocol only exchanges packets between ports you configure as LACP-capable.

LACP individual

Typically, the LACP port-channel members that do not receive LACP PDUs are set to Inactive state. However, in certain deployments, port-channel members that are in Inactive state must be isolated, so that they can be viewed as separate individual ports.

Individual ports are not a part of the port channel. Normal network traffic flows through these individual ports. The objective of this feature is to make the individual ports available for normal traffic flow, even though they remain as inactive members of the parent port-channel.

You can enable the LACP individual feature only on the port-channels. The isolated ports are known as LACP individual ports.

NOTE: You cannot configure the LACP individual ports and LACP fallback features on a port-channel at the same time as they are mutually exclusive.

If the peer switch connected to the port-channel that contains the LACP individual (isolated) ports do not switch or forward packets among its ports, Dell Technologies recommends enabling `port-fast` and `bpdu-guard` on that LACP individually enabled port-channel, so that, the LACP individual ports can move to the forwarding state ASAP.

If the peer switch connected to the port-channel that contains the LACP individual (isolated) ports switch or forward packets and is xSTP aware, Dell Technologies recommends enabling xSTP on LACP individually enabled port-channel. This way, data loops involving individual ports are prevented.

If the peer switch connected to the port-channel that contains the LACP individual (isolated) ports switch or forward packets and is xSTP unaware and switches xSTP BPDUs also (for example, a PXE booting device), Dell Technologies recommends enabling xSTP on that LACP individually enabled port-channel. As the peer switch forwards the xSTP BPDUs, loops caused by creating multiple individual ports are prevented.

Restrictions and Limitations

LACP fallback restrictions and limitations:

NOTE: You can avoid loops in VLAN deployments by enabling spanning tree protocol (STP) on LACP individual port-channels. But, the same is not possible in VXLAN deployments, as xSTP is not supported in VXLAN deployments.

- VXLAN features have platform restrictions that apply to features configured with the LACP individual feature. Except for these restrictions, no other platform-specific dependencies exist for this feature.
- You must enable the LACP individual feature on both VLT Peers.
- The LACP individual feature is not supported on port-channels whose VXLAN configurations are managed by the NSX controller. The following configurations are mutually exclusive: `nve-controller` and `lacp individual`.
- You can enable the LACP individual feature on port-channels with Layer2 modes. The following configurations are mutually exclusive: `no switchport` and `lacp individual`.
- Auto-port channel is supported only in Fabric mode and is not available in Normal Full-switch mode. Because the LACP individual feature works only on Full-switch (Normal OS10) mode, the LACP individual and Auto-port channel features become mutually exclusive inherently by the modes on which they operate.

LACP individual port feature interactions

The following table lists various SmartFabric OS10 modules and their interactions with the LACP individual port feature:

Table 40. LACP individual port feature interactions

Module name	Interactions
LACP	Detects the presence or absence of LACP PDUs in member interfaces. Makes decisions on the transitions of member interfaces into an individual port.
Interface Module (VLAN and MTU)	VLAN memberships and MTU are inherited from the parent port channel to the individual member ports.
VXLAN	Virtual-network configurations are inherited from the parent port channel to the individual member ports. In virtual networks for which the parent port-channel is an access port that is associated with either Switch-scope or Port-scope mode, the individual member ports also become access ports along with the parent port channel.
xSTP	The following xSTP configurations are inherited from the parent port channel to the individual member ports: 1. bpdufilter. 2. bpduguard. 3. Spanning-tree enable or disable status of the port channel interface. 4. Port type edge (edge-port). 5. Guard - Guard type Loop, Root, or None. 6. Priority - Port-channel priority based on the STP flavor enabled. 7. Cost - Port-channel cost based on the STP flavor enabled. Cost can be either configured through the CLI command or calculated using the port-speed of its member-ports. a. If you configure the port channel cost, this cost is inherited from the parent port channel. b. If you do not configure the cost, the cost is calculated based on its member port speed. The LACP individual port need not inherit this cost from its parent port channel as it is updated automatically using the port's speed. 8. Spanning-tree rapid-pvst default-behaviour - This configuration is applicable only in rapid-pvst flavor. 9. Link-type. 10. VLAN-membership of port channel - This information is published by the interface module.

LACP individual port - Use case

The LACP individual port use case is required in VxRail deployment use case and PXE Booting use case.

After enabling the LACP individual port feature, the LACP member-ports transition to individual ports, certain properties such as VLAN, VXLAN, and xSTP-port properties copy from the parent port channel to the individual ports. For a complete list of properties that are inherited for each module, see List of properties that are inherited to individual ports

You can enable this feature only on the port channel interfaces, and it is operational only on LACP port-channels.

Example Scenario

This section describes a typical LACP individual port feature configuration.

Port-channel 100 is a tagged member of VLAN 2 that is configured with MTU 5000 and xSTP bpduguard features. VLAN 2 is associated to virtual-network 2000.

Consider a scenario where the port channel 100 contains two member-ports: ethernet1/1/1 and ethernet1/1/2.

Consider that the port ethernet1/1/2 has transitioned to a LACP individual port. All restrictions corresponding to the normal port member configurations are also applicable to the LACP individual ports.

Following list displays the show command output after the member port transitions to a LACP individual port:

- `show port-channel summary`

```
OS10# show port-channel summary

Flags:  D - Down    I - member up but inactive    P - member up and active
        U - Up (port-channel)    F - Fallback Activated
        IND - LACP Individual

--------------------------------------------------------------------------------
Group Port-Channel      Type Protocol            Member Ports
--------------------------------------------------------------------------------

```

These show commands information corresponding to the VLAN (VLAN 2), MTU (5000), xSTP bpdugaurd, and VXLAN properties are copied from the parent port channel 100 to the LACP individual port eth1/1/2.

PVLAN and port-security configurations corresponding to the port channel are not inherited on the LACP individual ports.

When a port-channel member become an individual port, it is treated as a separate port on all other modules. Hence, the MAC address learned on the individual port is independent of the MAC address learned on the port channel.

NOTE: The operational-status of the LACP individual ports do not effect the operational-status of the parent port channel.

VLT Use case

In case of VLT, you must configure the LACP individual feature at both the VLT peers. In case of VLT mismatch scenario, the feature starts to work as expected only after you correct the mismatch configuration.

The following list displays the show command outputs and VLT mismatch outputs:

- `show port-channel summary`

```
Flags: D - Down I - member up but inactive
P - member up and active
U - Up (port-channel) F - Fallback Activated IND
- LACP Individual

--------------------------------------------------------------------------------
Group Port-Channel     Type    Protocol Member Ports

* 2             disable
```

Loop handling in deployment scenarios

This section describes loop handling scenarios.

LACP individual port-channel connects to the ESXi host

In general, VMware standard switch (VSS) and virtual distributed switch (VDS) do not support spanning tree protocol (STP). Hence, it is not possible for SmartFabric OS10 switches to receive xSTP BPDUs on ESXi host-facing ports.

By default, an ESXi host does not perform switching or bridging functions; however, it is possible (in rare scenarios) for a VM to perform the bridging or switching functions.

If no switching or bridging functions are enabled on the ESXi hosts, Dell Technologies recommends enabling the port-fast and BPDU-guard features.

LACP individual port-channel connects to non-ESXi nodes

For deployments with VLANs - If the peer node supports bridging functionality and xSTP, Dell Technologies recommends enabling STP to aviod loops on the LACP individual port-channel connecting that node.

For deployments with VXLANs - As STP is not supported on VXLAN networks, Dell Technologies recommends ensuring that there are no loops in the topology.

VxRail VSS to VDS migration scaling numbers

The following table describes the VxRail VSS to VDS migration use case specific scaling numbers.

Table 41. VxRail VSS to VDS scaling numbers

Number of VLANs	In case Long time-out is configured for all the port-channel member ports both in actor and partner	In case Short time-out is configured for at least one port-channel member port either in actor or partner
5	80	2
10	50	1

An ESXi server can have a maximum of four uplink ports. Also, individual - to - port-channel member transition and vice versa in a LACP individual port channel that is connected to an ESXi server can only happen for two ports simultaneously, not for all four ports.

With long timeout configured on port-channel members (actor and partner), it is possible to scale up to:

- 80 LACP individual port channels with four members and five VLANs per port channel.
- 50 LACP individual port channels with four members and 10 VLANs per port channel.

With short timeout configured on at least a port-channel member, the following are the scale numbers:

- ○ Two LACP individual port channels with four members and five VLANs per port channel.
  ○ One LACP individual port channel with four members and 10 VLANs per port channel.
- With LACP short timeout port-channels, the scale number decreases.

NOTE: The time taken to transition an individual port to a port-channel member is more (due to VLAN programming time) and it makes the LACP process wait. If this wait time exceeds three seconds, the LACP short timeout port-channels may timeout and flap. Hence, the scale number with short timeout port-channels are less.

Recommendations

The following recommendations apply for the VxRail VSS - to - VDS migration use case specific scaling numbers:

- Configure Long timeout for all port-channel members in this node, and in the peer.
- After the VSS - to - VDS migration completes, disable the LACP individual feature on all port-channels.

VxRail deployment use cases

This section describes the VxRail deployment use cases.

VxRail deployment with port channel

VxRail node bring up occurs in the following sequence:

- After ESXi host initialization, a VSS with a management port group is created. After this port-group is created, communication with vCenter is establishes.
  - Through vCenter, a VDS is created in the host.
  - All the uplinks and port-groups from VSS move to VDS. This operation is called VSS - to - VDS migration.

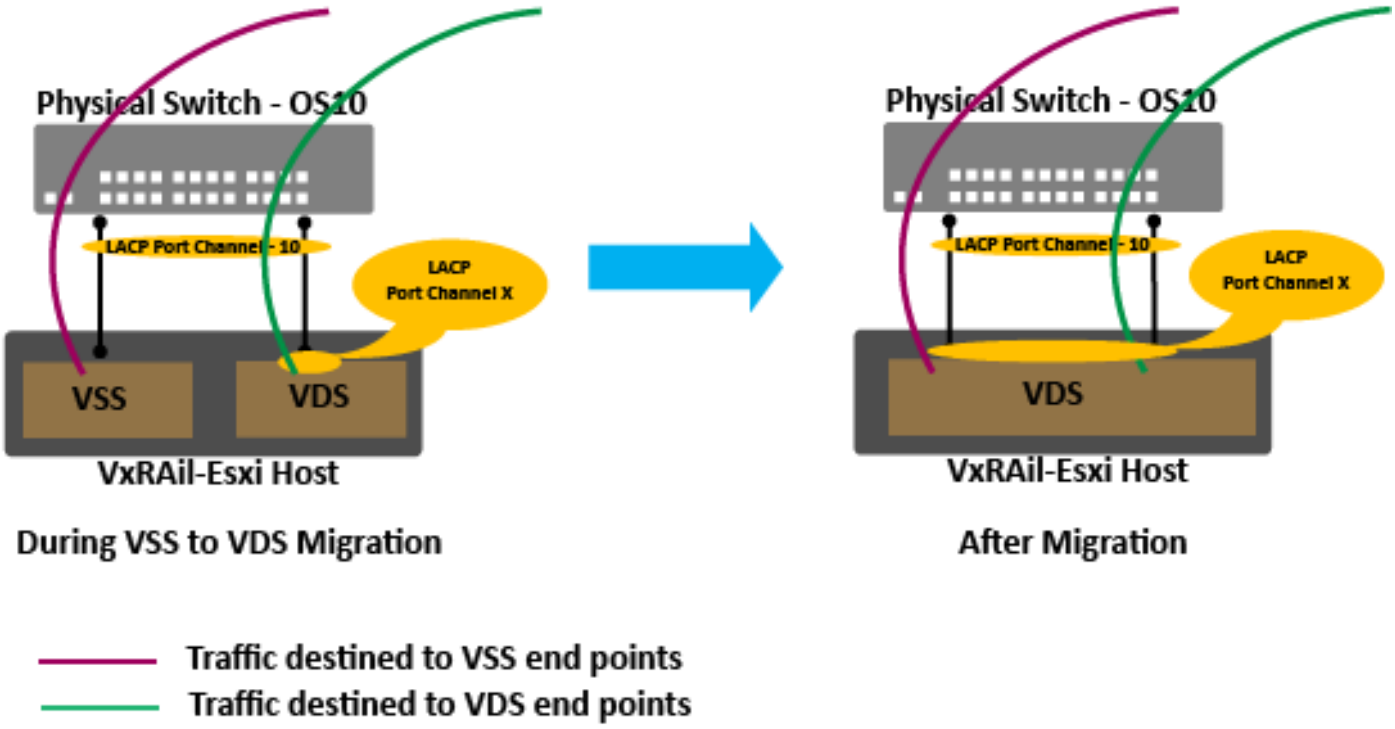
Perform the following steps to migrate VSS to VDS:

1. Create VDS and duplicate the port groups present in VSS to VDS.
2. Add hosts to VDS. ESXi hosts are added to VDS.
3. Assign redundant VMNICS to VDS. If there are two VMNICS, assign one to VDS. If there are four uplinks, then assign two of them to VDS.
   - Initially, all the uplinks (VMNICS) from the host are owned by VSS. VSS keeps half of the uplinks in Active mode and the rest of the half in Standby mode.
   - Moving these standby links to VDS does not disturb the traffic that is already running from VSS.
   - As a result, all the uplinks in Standby mode move to VDS when you assign redundant VMNICS to VDS.

   NOTE: To migrate the management network non-disruptively, keep the uplinks from VSS and VDS to be Active before you perform Step 4.
4. Migrate VMs and VM kernel ports to VDS.
   - As a result, port groups migrate from VSS to VDS one after the other.
5. Move the remaining NICs to VDS.

VDS supports LACP port-channels with load balancing. Dell Technologies recommends putting all the uplinks (VMNICS) corresponding to VDS in a LACP port-channel.

The following topology shows the VxRail deployment with port channel:



As traffic to VSS and VDS is destined to different end points, during migration links connected to VSS and VDS must not be a part of the same port channel that belongs to a data plane in a physical switch. This condition applies even though all the links are configured in the same port channel. As a result, the MACs and ARPs corresponding to the end points that are reachable through VSS must point to the links connected to VSS (and must not point to the port channel). Similarly, the MACs and ARPs corresponding to the end points that are reachable through VDS must point to the port channel (and must not point to the links connected to VSS).

In VxRail deployments with SFS, the VSS - to - VDS migration feature is not required. In a VxRail setup, SFS operates SmartFabric OS10 in Fabric mode. In Fabric mode, auto-port channel is created based on the LACP PDUs that are received from the host (server). Auto-port channel takes care of VSS - to - VDS migration without traffic loss.

However, in VxRail deployments without SFS, for example VCF on VxRail, SmartFabric OS10 works in Full-switch mode. In this deployment, you must enable the VSS-to-VDS migration feature on the port channel that is connected to the host (server).

VxRail deployment with VLT port channel

You can connect an ESXi host to a VLT-port-channel to achieve node-level redundancy.

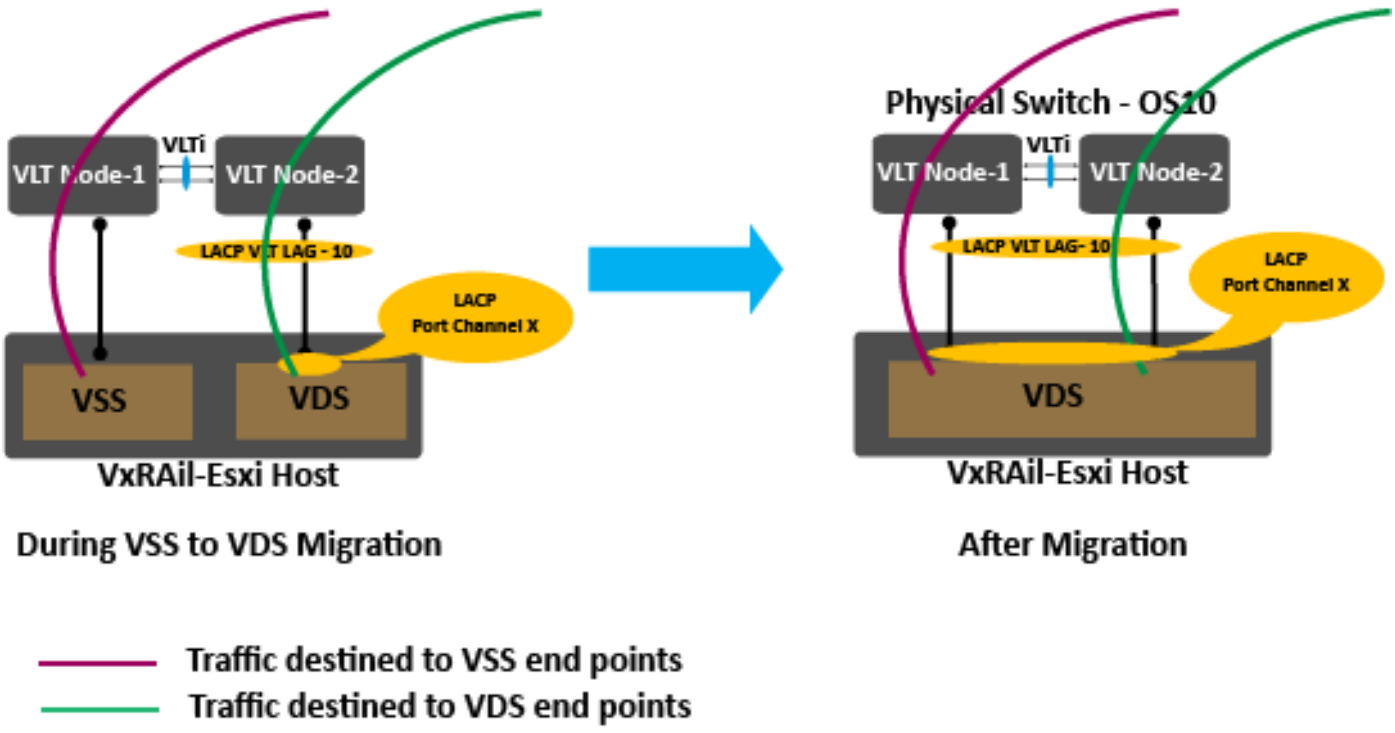
The VxRail node bring up occurs in the following sequence:

1. After ESXi host initialization, a Vstandard Switch (VSS) with management group is created. After this event, communication with vCenter establishes.
2. Virtual distributed switch (VDS) is created in the host through vCenter.
3. All the uplinks and port-groups from VSS move to VDS.

To migrate VSS to VDS, perform the following steps in order:

1. Create a VDS and duplicate the port groups present in VSS to VDS.
2. Add hosts to the VDS. Exsi hosts are added to VDS.
3. Assign redundant VMNICS to VDS. If there are two VMNICS, assign one to VDS. If there are four uplinks, assign two of them to VDS.

The following topology depicts the VxRail deployment with VLT port channels:



As traffic to VSS and VDS is destined to different end points, during migration, links connected to VSS and VDS must not be a part of the same port channel that belongs to a data plane in a physical switch. This condition applies even though all the links are configured in the same port channel. As a result, the MACs and ARPs corresponding to the end points that are reachable through VSS must point to the links connected to VSS (and must not point to the port channel). Similarly, the MACs and ARPs corresponding to the end points that are reachable through VDS must point to the port channel (and must not point to the links connected to VSS).

In VxRail deployments with SFS, the VSS - to - VDS migration feature is not required. In a VxRail setup, SFS operates SmartFabric OS10 in Fabric mode. In Fabric mode, auto-port channel is created based on the LACP PDUs that are received from the host (server). Auto-port channel itself takes care of the VSS - to - VDS migration without traffic loss.

However, in VxRail deployments without SFS, for example VCF on VxRail, SmartFabric OS10 works in Full-switch mode. In this deployment, you must enable the VSS - to - VDS feature on the port channel that is connected to the host (server).

NOTE: After the migration completes, Dell Technologies recommends disabling the LACP individual port feature on the port channel that connects to the ESXi port.

Scaling numbers during VSS to VDS migration

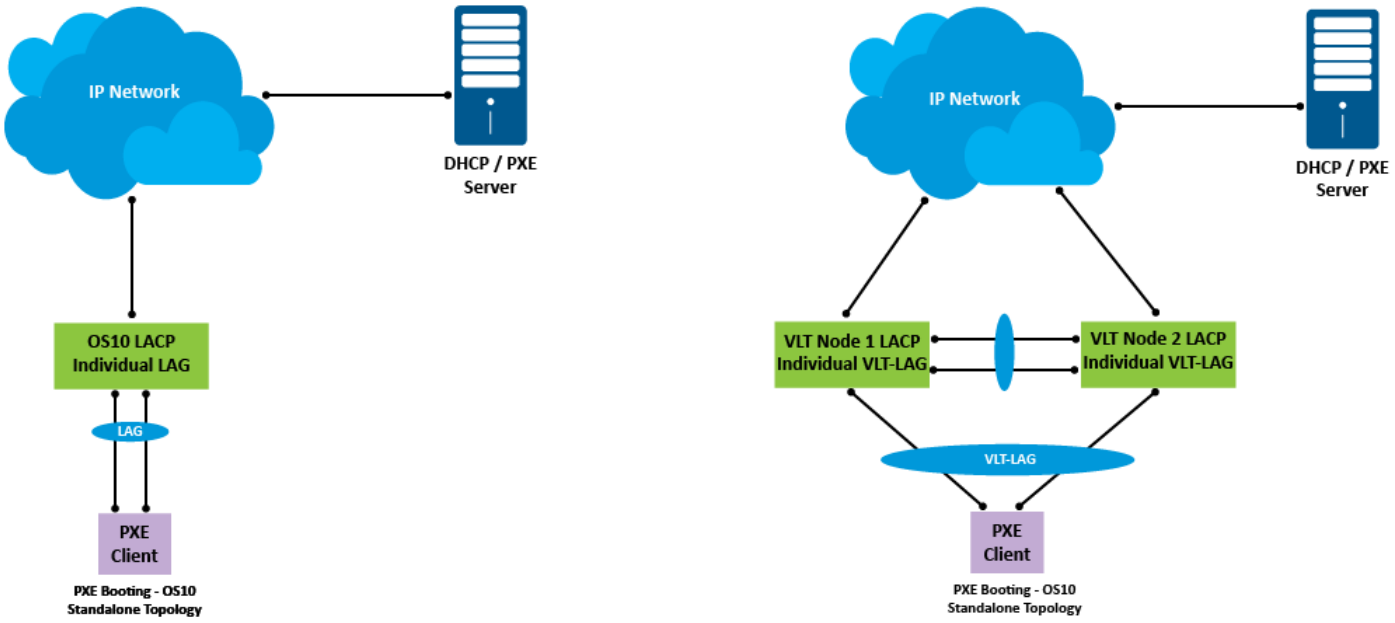
Following are the the VSS - to - VDS migration possibilities:

- The VSS - to - VDS migration occurs during VxRail cluster bring up.
- The VSS - to - VDS migration is not expected to happen later.
- During an ESXi host software upgrade, the VSS - to - VDS migration does not happen, as the host already has VDS configurations. As a result, during this migration only few VLANs or VXLANs (<50) are used.

NOTE: For the VSS - to - VDS migration scaling numbers, see VxRail VSS to VDS migration scaling numbers.

PXE booting use case

The following topology depicts the use of the LACP individual feature in a PXE booting use case:



PXE booting occurs in the following sequence:

1. The SmartFabric OS10 switch and PXE client connect through a LACP port-channel. The port-channel can be a normal port-channel or a VLT-port-channel.
2. After starting up, the PXE client does not have LACP configurations and does not send LACP PDUs. As a result, ports in the SmartFabric OS10 switch connected to the PXE client become LACP individual ports.
3. The PXE client sends DHCP requests on all ports.
4. In the PXE client, a DHCP offer with an IP address and DHCP or PXE server details are received on multiple ports.
5. The PXE client chooses the DHCP offer from one of the ports and uses that port for further PXE boot communication, such as accessing the OS configuration file and so on.

   NOTE: Some of the PXE clients shut down ports that are not used for PXE booting.

   a. Most of the PXE clients do not support switching before a PXE boot. As a result, data loops do not form between the SmartFabric OS10 nodes and PXE clients on or before PXE boot process. For such cases, Dell Technologies recommends enabling port-fast on the LACP individual port channel that connects to the PXE client.
   b. If the PXE client supports Layer two switching before the PXE booting, you must enable xSTP (port-fast disabled) on the LACP individual port channel.
6. After receiving the SmartFabric OS10 and configuration files, the PXE client reboots and comes up with SmartFabric OS10.

Modes

A port-channel includes three configuration modes—on, active, and passive.

On	Sets Channeling mode to Static. The interface acts as a member of the static port-channel.
Active	Sets the interface in the Active Negotiating state. LACP runs on any link that is configured in this mode. A port in Active mode automatically initiates negotiations with other ports by using LACP packets. A port in Active mode can set up a port channel with another port in Active mode or Passive mode.
Passive	Sets the interface in the Inactive Negotiating state, but LACP runs on the link. A port in Passive mode also responds to negotiation requests (from ports in Active mode). Ports in Passive mode respond to LACP packets. A port in Passive mode cannot set up a port-channel with another port in Passive mode.

- There is no dual-membership in static and dynamic port-channels:
  - If a physical interface is a part of a static port-channel, the `channel-group id mode {active | passive}` command is rejected on that interface.
  - If a physical interface is a part of a dynamic port-channel, the `channel-group id` command is rejected on that interface.
- You cannot add static and dynamic members to the same port-channel.
- There is a difference between the `shutdown` and `no interface port-channel` commands:
  - The `shutdown` command on port-channel *xyz* disables the port-channel and retains the user commands.

- The `no interface port-channel` *`channel-number`* command deletes the specified port-channel, including a dynamically created port-channel. The interfaces restore and are ready for configuration.

- A maximum of 128 port channels with up to 32 members per port channel are allowed.

Configuration

By default, LACP is enabled globally. You can configure aggregated ports with compatible Active and Passive LACP modes to automatically link them.

1. Configure the system priority in CONFIGURATION mode (1 to 65535; the higher the number, the lower the priority; default 32768).

   ```
   lacp system-priority priority-value
   ```

2. Configure the LACP port priority in INTERFACE mode (1 to 65535; the higher the number, the lower the priority; default 32768).

   ```
   lacp port-priority priority-value
   ```

3. Configure the LACP rate in INTERFACE mode (default normal).

   ```
   lacp rate [fast | normal]
   ```

Configure LACP

```
OS10(config)# lacp system-priority 65535
OS10(config)# interface range ethernet 1/1/7-1/1/8
OS10(conf-range-eth1/1/7-1/1/8)# lacp port-priority 4096
OS10(conf-range-eth1/1/7-1/1/8)# lacp rate fast
```

Verify LACP configuration

```
OS10(conf-range-eth1/1/7-1/1/8)# do show running-configuration
...
!
interface ethernet1/1/7
 lacp port-priority 4096
 lacp rate fast
 no shutdown
!
interface ethernet1/1/8
 lacp port-priority 4096
 lacp rate fast
 no shutdown
!
...
```

Interfaces

Create a port-channel, and add port-channel member interfaces. By default, all interfaces are in `no shutdown` and `switchport` modes.

1. Create a port-channel in CONFIGURATION mode.

   ```
   interface port-channel port-channel number
   ```

2. Enter INTERFACE mode.

   ```
   interface ethernet node/slot/port[:subport]
   ```

3. Set the channel group mode to Active in INTERFACE mode.

   ```
   channel-group number mode active
   ```

Configure dynamic port-channel interfaces

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# exit
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# no switchport
OS10(conf-if-eth1/1/10)# channel-group 10 mode active
OS10(conf-if-eth1/1/10)# exit
OS10(config)# interface ethernet 1/1/11
OS10(conf-if-eth1/1/11)# no switchport
OS10(conf-if-eth1/1/11)# channel-group 10 mode active
```

Rates

Protocol data units (PDUs) exchange between port channel interfaces to maintain LACP sessions. PDUs are transmitted at either a slow or fast transmission rate, depending on the LACP timeout value. The configured rate interval is used to check whether the partner link is alive or not. The links are ungrouped if three consecutive LACP PDUs are missed. The timeout value depends on the configured rate interval. If the rate interval is fast, the LACP PDUs are sent once every second. If the rate interval is normal, the LACP PDUs are sent once every 30 seconds.

By default, the LACP rate is `normal` (long timeout). If you configure a `fast` LACP rate, a short timeout sets.

- Set the LACP rate in CONFIGURATION mode.

```
lacp rate [fast | normal]
```

Configure LACP timeout

```
OS10(conf-if-eth1/1/29)# lacp rate fast
```

View port status

```
OS10# show lacp port-channel

LACP fallback

LACP fallback allows downstream devices, like servers which are connected to ports of a switch configured as LACP, to establish a link when the system is not able to finalize the LACP handshake.

For example, when servers boot in PXE mode, the server cannot exchange LACP PDUs and the switch does not enable the ports.

Whenever a PXE server reboots, both the port channel and ports go down. While rebooting, the ports come up, but not the port channel. LACP fallback enables the port-channel to be up and keeps sending packets to the PXE server.

When you enable LACP fallback, the switch starts a timer. If the timer expires before LACP completes, then the switch selects one port of the port group and makes it operational.

You can set the timer using the `lacp fallback timeout` *`timer-value`* command.

The LACP fallback feature adds a member port to LACP port channel if it does not receive LACP PDUs from the peer for a particular period.

The server uses the fallback port to finalize the PXE-boot process. When the server starts with the operating system, the process completes the LACP handshake and the fallback port reunites the other members. The member port becomes active and sends packets to the PXE server.

When the switch starts receiving LACP PDU, OS10 ungroups the statically added member port from LACP port channel and resumes with normal LACP functionality.

When you enable LACP fallback, the port that comes up is selected based on the following:

- LACP port priority configuration allows deterministic port allocation. The port with the least priority is placed in the active state when a port channel is in LACP fallback mode.
- If all the ports in a port channel have same port priority, the switch internally compares the interface names by base name, module number, port number, and then selects the lowest one to be active. For example, ethernet 1/1/1 is less than ethernet 1/1/2 and hence Ethernet 1 becomes active.
- In a VLT network, if the interface name is the same on both the VLT peers, then the port in switch with lower system MAC address becomes active.

If you do not enable LACP fallback in one of the VLT peers, or configure different time-out values in the peers, then the switch might behave differently.

Limitations

- OS10 switches cannot be a PXE client irrespective of whether it acts as a VLT peer or ToR switch.
- If you are configuring LACP fallback in a VLT domain, configure `lacp fallback` commands in both the VLT peers.
- The LACP fallback feature adds or groups a member port to the port channel only when the switch does not receive LACP PDUs from the peer, to make the link that is connected to the PXE client device as operational. As PXE clients handle untagged DHCP request, you need to configure the LACP fallback only on an untagged VLAN to reach the DHCP/PXE server.
- After the LACP fallback election, if a port with lower priority port is configured to be part of the same port channel, it would trigger reelection.

Configure LACP fallback

1. Enable LACP fallback with the `lacp fallback enable` command in port channel INTERFACE mode.
2. Set a timer for receiving LACP PDUs using `lacp fallback timeout` *`timer-value`* in port channel INTERFACE mode.
3. (Optional) Enable or disable LACP fallback port preemption using `lacp fallback preemption {enable | disable}` in port channel INTERFACE mode.

Example configuration

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# lacp fallback enable
OS10(conf-if-po-1)# lacp fallback timeout 20
OS10(conf-if-po-1)# lacp fallback preemption enable
```

View LACP fallback configuration

```
OS10# show port-channel summary

Flags:  D - Down    I - member up but inactive    P - member up and active

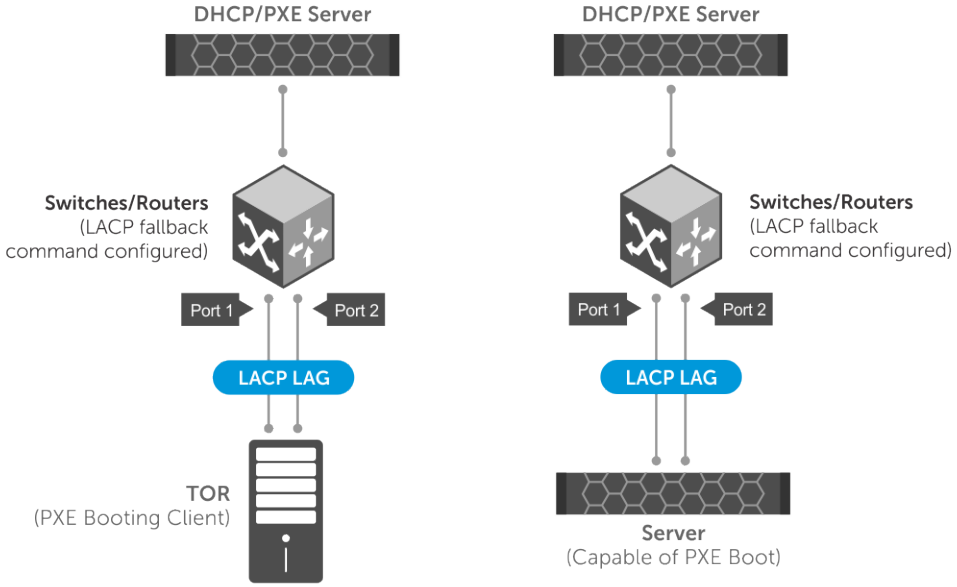
        U - Up (port-channel) F - Fallback enabled

--------------------------------------------------------------------------------
Group Port-Channel      Type     Protocol  Member Ports
--------------------------------------------------------------------------------

1    port-channel1  (UF) Eth      DYNAMIC   1/1/10(P) 1/1/11(I)
```

LACP fallback in non-VLT network

In a non-VLT network, LACP fallback enables rebooting of ToR or server that is connected to the switch through normal LACP. The other end of the switch is connected to a DHCP/PXE server, as shown in the following figure:



In the above scenario, LACP fallback works as follows:

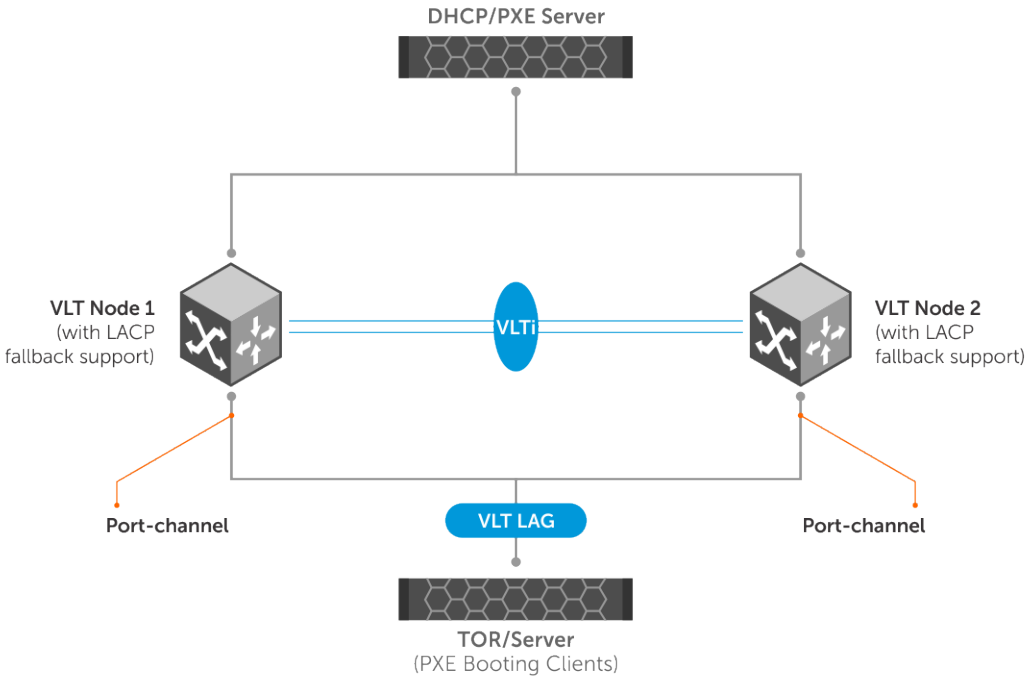
1. The ToR/server boots
2. The switch detects the link that is up and checks fallback enabled status. If fallback is enabled, the device waits for the time-out period for any LACP BPDUs. If there are no LACP BPDUs received within the time period, then the port-channel

enters into fallback mode and adds the first operationally UP port to the port channel instead of placing it in an inactive state.

3. Now the ToR/server has one port up and active. The active port sends packets to the DHCP/PXE server.
4. After receiving response from the DHCP server, the ToR/server boots from the TFTP/NFS server.
5. When the ToR/server is fully loaded with the boot image and configurations, the server starts sending LACP PDUs.
6. When the switch receives LACP PDUs from ToR/server, the device comes out of the fallback mode and activates the port-channel through normal LACP process.

LACP fallback in VLT domain

In a VLT domain, LACP fallback enables rebooting of ToR or server that is connected to VLT nodes through VLT port channel. The other end of the VLT nodes is connected to a DHCP/PXE server, as shown in the following figure:



In the above scenario, LACP fallback works as follows:

1. The ToR/server boots
2. One of the VLT peers takes care of controlling the LACP fallback mode. All events are sent to the controlling VLT peer for deciding the port that should be brought up and then the decision is passed on to peer device.
3. The controlling VLT peer can decide to bring up one of the ports in either the local port channel or in the peer VLT port channel.
4. One of the ports, local, or peer, becomes active based on the decision of the controlling VLT peer.
5. Now the ToR/server has one port up and active. The active port sends packets to the DHCP/PXE server.
6. After receiving response from the DHCP server, the ToR/server boots from the TFTP/NFS server.
7. When the ToR/server is fully loaded with the boot image and configurations, the server starts sending LACP PDUs.
8. When the switch receives LACP PDUs from ToR/server, the controlling VLT peer makes the LACP port to come out of the fallback mode and to resume the normal functionality.

LACP commands

channel-group

Assigns and configures a physical interface to a port channel group.

Syntax `channel-group number mode {active | on | passive}`

Parameters

- *number*—Enter the port channel group number. Valid values are from 1 to 999 or 1001 to 2000. The maximum number of port channels is 128.
- `mode`—Enter the interface port channel mode.
- `active`—Enter to enable the LACP interface. The interface is in the Active Negotiating state when the port starts negotiations with other ports by sending LACP packets.
- `on`—Enter so that the interface is not part of a dynamic port-channel but acts as a static port-channel member.
- `passive`—Enter to only enable LACP if it detects a device. The interface is in the Passive Negotiation state when the port responds to the LACP packets that it receives but does not initiate negotiation until it detects a device.

Default Not configured

Command Mode INTERFACE

Usage Information When you delete the last physical interface from a port channel, the port channel remains. Configure these attributes on an individual member port. If you configure a member port with an incompatible attribute, OS10 suspends that port in the port channel. The member ports in a port channel must have the same setting for link speed capability and duplex capability. The `no` version of this command removes the interface from the port channel.

Example

```
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# channel-group 10 mode active
OS10(conf-if-eth1/1/10)# exit
OS10(config)# interface ethernet 1/1/11
OS10(conf-if-eth1/1/11)# channel-group 10 mode active
```

Supported Releases 10.2.0E or later

clear lacp counters

Clears the statistics for all interfaces for LACP groups.

Syntax `clear lacp counters [interface port-channel channel-number]`

Parameters

- `interface port channel`—(Optional) Enter the interface port channel number.
- *channel-number*—(Optional) Enter the LACP port channel number. Valid values are from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information If you use this command for a static port channel group without enabling the aggregation protocol, the device ignores the command. If you do not enter a port channel number, the LACP counters for all LACP port groups clear.

Example

```
OS10# clear lacp counters
```

Example (port channel)

```
OS10# clear lacp counters interface port-channel 20
```

Supported Releases 10.2.0E or later

lacp individual

Enables or disables the LACP individual feature.

Syntax `[no] lacp individual`

Parameters None.

Default Disabled

Command Mode PORT-CHANNEL INTERFACE CONFIGURATION MODE

Security and access `sysadmin` or `secadmini` with any privilege level.

Usage Information

Use this command is used to enable or disable the LACP individual feature on the port channel. The LACP Individual feature operates only on LACP port channels. On a static port channel, enabling or disabling this feature has no impact. The LACP Individual and LACP fallback features are mutually exclusive. The LACP individual and `no switchport` configurations are mutually exclusive.

The LACP fallback and LACP individual features cannot co-exist on the same interface.

Example

```
OS10(config)# interface port-channel 100

OS10(conf-if-po-100)# lacp Individual

<165>1 2020-11-25T09:19:26.722956+00:00 OS10 dn_alm 984 - - Node.1-
Unit.1:PRI [event], Dell EMC (OS10) %LACP_INDIVIDUAL:
Warning ! Enable LACP Individual feature only on port-channel with edge
ports. Enabling this on network port-channel could lead
to loops : port-channel100
```

If you enable the LACP fallback feature on an interface, you cannot configure the the LACP individual feature on the same interface, as both these features are mutually exclusive. If you try to enable LACP individual feature on an interface on which LACP fallback is already configured, the following error message is displays:

```
OS10(conf-if-po-100)# show configuration
!
interface port-channel100
no shutdown
switchport access vlan 1
lacp max-bundle 20
lacp fallback enable
OS10(conf-if-po-100)# lacp individual
% Error: Interface port-channel100, LACP Fallback and LACP Individual features cannot
co-exist on same interface.
```

If you try to configure LACP fallback on an interface that is already configured with the LACP individual feature, the following message is displays:

```
OS10(conf-if-po-100)# show configuration
!
interface port-channel100
no shutdown
switchport access vlan 1
lacp individual
OS10(conf-if-po-100)# lacp fallback enable
% Error: Interface port-channel100, LACP Individual config is supported only on L2 modes.
```

You cannot configure LACP fallback and no switch configurations on an interface simultaneously. If you try to configure no switch on an interface that is already configured with LACP fallback, the following error message is displays.

```
OS10(conf-if-po-100)# show configuration
!
interface port-channel100
no shutdown
switchport access vlan 1
```

```
lacp individual
OS10(conf-if-po-100)# no switchport
% Error: Interface port-channel100, LACP Fallback and LACP Individual features cannot
co-exist on same interface.
```

Similarly, if you try to configure LCAP fallback on an interface that is already configured with no switch configuration, the following error message is displays:

```
OS10(conf-if-po-100)# show configuration
!
interface port-channel100
no shutdown
no switchport
lacp max-bundle 20

OS10(conf-if-po-100)# lacp individual
% Error: Interface port-channel100, LACP Individual config is supported only on L2 modes.
```

Supported Releases 10.5.3 or later

lacp fallback enable

Enables LACP fallback mode.

Syntax `lacp fallback enable`

Parameters None

Default Disabled

Command Mode Port-channel INTERFACE

Usage Information The `no` version of this command disables LACP fallback mode.

Example

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# lacp fallback enable
```

Supported Releases 10.3.2E(R3) or later

lacp fallback preemption

Enables or disables LACP fallback port preemption.

Syntax `lacp fallback preemption {enable | disable}`

Parameters

- `enable`—Enables preemption on the port channel.
- `disable`—Disables preemption on the port channel.

Default Enabled

Command Mode Port-channel INTERFACE

Usage Information When you enable preemption, the fallback port election preempts the already elected fallback port and elects a new fallback port.

The new port is elected based on the following events:

- When a nonfallback port is configured with low priority.
- When a low-priority port becomes operationally UP.
- When a port with the least numbering is operationally UP.
- If nondefault LACP port priority is configured on a port even though preemption is disabled, aport with the lowest priority is elected as fallback port,

- The `lacp fallback preemption disable` command is not applicable on port priority events that you have configured or triggered.

Example

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# lacp fallback preemption enable
```

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# lacp fallback preemption disable
```

Supported Releases 10.4.1.0 or later

lacp fallback timeout

Configures LACP fallback time-out period.

Syntax `lacp fallback timeout timer-value`

Parameters *timer-value*—Enter the timer values in seconds, ranging from 0 to 100 seconds.

Default 15 seconds

Command Mode Port-channel INTERFACE

Usage Information The `no` version of this command returns the timer to default value.

Example

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# lacp fallback timeout 20
```

Supported Releases 10.3.2E(R3) or later

lacp max-bundle

Configures the maximum number of active members that are allowed in a port channel.

Syntax `lacp max-bundle max-bundle-number`

Parameters *max-bundle-number* — Enter the maximum bundle size (1 to 32).

Default 32

Command Mode INTERFACE

Usage Information The `no` version of this command resets the maximum bundle size to the default value.

Example

```
OS10(conf-if-po-10)# lacp max-bundle 10
```

Supported Releases 10.2.0E or later

Lacp port-priority

Sets the priority for the physical interfaces for LACP.

Syntax `lacp port-priority priority`

Parameters *priority* — Enter the priority for the physical interfaces (0 to 65535).

Default	32768
Command Mode	INTERFACE
Usage Information	LACP uses the port priority with the port number to create the port identifier. The port priority decides which ports are put into Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, or when you have up to 32 ports configured for the channel group. When setting the priority, a higher number means a lower priority. The `no` version of this command returns the port priority to the default value.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# lacp port-priority 32768`
Supported Releases	10.2.0E or later

lacp rate

Sets the rate at which LACP sends control packets.

Syntax	`lacp rate {fast | normal}`
Parameters	• `fast` — Enter the fast rate of 1 second. • `normal` — Enter the default rate of 30 seconds.
Default	30 seconds
Command Mode	INTERFACE
Usage Information	Change the LACP timer rate to modify the duration of the LACP timeout. The `no` version of this command resets the rate to the default value.
Example	`OS10(conf-range-eth1/1/7-1/1/8)# lacp rate fast`
Supported Releases	10.2.0E or later

lacp system-priority

Sets the system priority of the device for LACP.

Parameters	*priority* — Enter the priority value for physical interfaces (0 to 65535).
Default	32768
Command Mode	CONFIGURATION
Usage Information	Each device that runs LACP has an LACP system priority value. LACP uses the system priority with the MAC address to form the system ID and also during negotiation with other systems. The system ID is unique for each device. The `no` version of this command resets the system priority to the default value.
Example	`OS10(config)# lacp system-priority 32768`
Supported Releases	10.2.0E or later

show interface port-channel

Displays port-channel and port-channel members summary information.

Syntax	`show interface port-channel [channel-number] summary`
Parameters	*channel-number* `(node/slot/port)` - Enter the channel number corresponding to the port-channel in `node/slot/port` format.

Defaults None.

Command Mode EXEC

Usage Information This command is useful to determine the status of the port-channel and its member ports. The output of this command shows whether the member ports have transitioned to Individual ports or they still exist as normal port-channel members.

Security and access `sysadmin` or `secadmin` with any privilege level

Example

```
OS10# show interface port-channel summary
LAG   Mode   Status   Uptime    Ports
---   ----   ------   ------    -----
100    L2    down     00:00:00  Eth 1/1/50 (Down)
                                 Eth 1/1/51 (IND)

Eth 1/1/51 is an Individual Port.
```

Supported Releases 10.5.3. or later

show lacp counter

Displays information about LACP statistics.

Syntax `show lacp counter [interface port-channel channel-number]`

Parameters

- `interface port channel`—(Optional) Enter the interface port channel.
- *`channel-number`*—(Optional) Enter the LACP channel group number. Valid values are from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information If you do not enter the *`channel-number`* parameter, all channel groups display.

Example

```
OS10# show lacp counter interface port-channel 11
LACPDUs Port      Marker          Marker Response    LACPDUs
                  Sent  Recv      Sent   Recv      Sent    Recv   Err Pkts
--------------------------------------------------------------------------
ethernet1/1/1:1   0     0         0      0         7950    7948   0
ethernet1/1/2:1   0     0         0      0         7950    7948   0
ethernet1/1/3:1   0     0         0      0         7950    7948   0
ethernet1/1/4:1   0     0         0      0         7950    7948   0
ethernet1/1/5:1   0     0         0      0         7950    7948   0
ethernet1/1/6:1   0     0         0      0         7950    7948   0
ethernet1/1/7:1   0     0         0      0         7950    7948   0
ethernet1/1/8:1   0     0         0      0         7950    7948   0
ethernet1/1/9:1   0     0         0      0         7967    7961   0
ethernet1/1/10:1  0     0         0      0         7967    7961   0
ethernet1/1/11:1  0     0
```

Supported Releases 10.2.0E or later

show lacp interface

Displays information about specific LACP interfaces.

Syntax `show lacp interface ethernet` *`node/slot/port`*

Parameters *`node/slot/port`* — Enter the interface information.

Default Not configured

Command Mode EXEC

Usage Information The *LACP_activity* field displays if you configure the link in Active or Passive port channel mode. The *Port Identifier* field displays the port priority as part of the information including the port number. For example, `Port Identifier=0x8000,0x101`, where the port priority value is `0x8000` and the port number value is `0x101`.

This command is useful to determine the status of each port in a port-channel. This command shows whether the ports have transitioned to LACP individual port status or they still exist as normal port-channel members.

Example

```
OS10# show lacp interface ethernet 1/1/129
Invalid Port id, Max. Port Id is: 32
OS10# show lacp interface ethernet 1/1/29

 Interface ethernet1/1/1 is up
  Channel group is 51 port channel is 51
  PDUS sent: 27913
  PDUS rcvd: 27882
  Marker sent: 0

```

Supported Releases 10.2.0E or later

show lacp neighbor

Displays information about LACP neighbors.

Syntax `show lacp neighbor [interface port-channel` *`channel-number`*`]`

Parameters

- `interface port channel`—(Optional) Enter the interface port channel.
- *`channel-number`*—(Optional) Enter the port channel number for the LACP neighbor. Valid values are from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information All channel groups display in case you do not enter the *channel-number* parameter.

Example

```
OS10# show lacp neighbor interface port-channel 1

Flags:S-Device is sending Slow LACPDUs F-Device is sending Fast LACPdus
      A-Device is in Active mode       P-Device is in Passive mode
Port-channel port-channel1 neighbors
Port: ethernet1/1/29
Partner System Priority: 32768
Partner System ID: 00:01:e8:8a:fd:9e
Partner Port: 178
Partner Port Priority: 32768
Partner Oper Key: 1
Partner Oper State:aggregation synchronization collecting distributing
defaulted expired
```

Supported Releases 10.2.0E or later

show lacp port channel

Displays information about LACP port channels.

Syntax `show lacp port-channel [interface port-channel channel-number]`

Parameters

- `interface port channel`—(Optional) Enter the interface port channel.
- *channel-number*—(Optional) Enter the port channel number for the LACP neighbor. Valid values are from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information All channel groups display if you do not enter the *channel-number* parameter.

This command is useful to determine if the LACP individual port feature is enabled or disabled on the port-channel interface.

Example

```
OS10# show lacp port-channel 1

Port-channel 1 admin up, oper up, mode lacp
Actor System ID: Priority 32768, Address 90:b1:1c:f4:9b:8a
Partner System ID: Priority 32768, Address 00:01:e8:8a:fd:9e
Actor Admin Key 1, Oper Key 1, Partner Oper Key 1
LACP LAG ID 1 is an aggregatable link
A-Active LACP, B-Passive LACP, C-Short Timeout, D-Long Timeout
E-Aggregatable Link, F-Individual Link, G-IN_SYNC, H-OUT_OF_SYNC,
I-Collection enabled, J-Collection disabled, K-Distribution enabled,
L-Distribution disabled, M-Partner Defaulted, N-Partner Non-defaulted,
O-Receiver is in expired state, P-Receiver is not in expired state
Port ethernet1/1/29 is Enabled, LACP is enabled and mode is lacp
 Actor Admin: State BCFHJKNO Key 1 Priority 32768
     Oper: State BDEGIKNO Key 1 Priority 32768
 Partner Admin: State BCEGIKNP Key 0 Priority 0
     Oper: State BDEGIKMO Key 1 Priority 32768
```

Example (LACP individual port)

```
OS10# show lacp port-channel interface port-channel 100

Port-channel 100 admin up, oper down, mode lacp

Actor System ID: Priority 32768, Address 14:18:77:09:d2:80

Partner System ID: Priority 0, Address 00:00:00:00:00:00
```

```
Actor Admin Key 100, Oper Key 100, Partner Oper Key 0

Individual: Enabled

Fallback: Not configured, Fallback port preemption: Configured, Fallback
timeout: 15 seconds

Fallback Port Elected:

LACP LAG ID 100 is an aggregatable link

A - Active LACP, B - Passive LACP, C - Short Timeout, D - Long Timeout

E - Aggregatable Link, F - Individual Link, G - IN_SYNC, H - OUT_OF_SYNC,

I - Collection enabled, J - Collection disabled, K - Distribution
enabled,

L - Distribution disabled, M - Partner Defaulted, N - Partner Non-
defaulted,

O - Receiver is in expired state, P - Receiver is not in expired state

Port ethernet1/1/1 is Disabled, LACP is enabled and mode is

Actor Admin: State BDFHJLNP Key  Priority

     Oper: State BDFHJLNP Key  Priority

Partner Admin: State BDFHJLNP Key  Priority

     Oper: State BDFHJLNP Key  Priority
```

Supported Releases	10.2.0E or later

show lacp system-identifier

Displays the LACP system identifier for a device.

Syntax	`show lacp system-identifier`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	The LACP system ID is a combination of the configurable LACP system priority value and the MAC address. Each system that runs LACP has an LACP system priority value. Configure a value between 1 and 65535. The default value is 32768. LACP uses the system priority with the MAC address to form the system ID and uses the system priority during negotiation with other devices. A higher system priority value means a lower priority. The system ID is different for each device.

Example

```
OS10# show lacp system-identifier

Actor System ID: Priority 32768, Address 90:b1:1c:f4:9b:8a
```

Supported Releases	10.2.0E or later

Link Layer Discovery Protocol

Dell SmartFabric OS10 supports:

- Link Layer Discovery protocol (LLDP)

- Link Layer Discovery Protocol — Media Endpoint Discovery (LLDP-MED)

LLDP is a one-way protocol that enables network devices on a local area network (LAN) to discover and advertise its capabilities to adjacent LAN devices. LLDP devices advertise its capabilities in the form of LLDP data units (LLDPDUs).

LLDP-MED is an LLDP enhancement that enables endpoint devices and network connected devices to advertise their characteristics and configuration information.

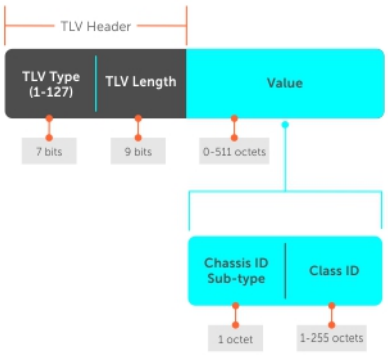
LLDP-MED network connected devices such as switches provide access to the IEEE 802-based LAN infrastructure for LLDP-MED endpoint devices, such as IP phones. OS10 switch acts as an LLDP-MED network connected device.

- By default, LLDP and LLDP-MED are enabled on the interfaces.

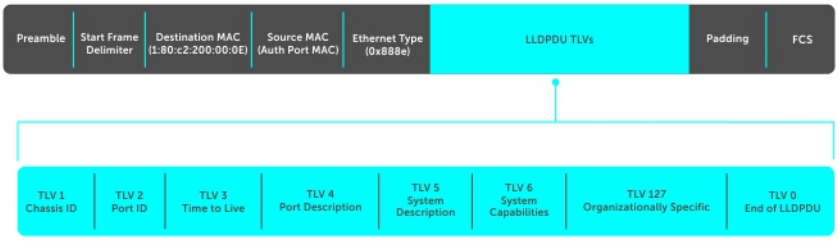
  NOTE: You cannot configure LLDP-MED on the management interface.
- An LLDP-enabled interface supports up to eight neighbors. OS10 switch supports a maximum of 250 neighbors per system.
- OS10 switches periodically transmit LLDPDUs. The default transmission interval is 30 seconds.
- OS10 switches receive LLDPDU information from a neighbor. The information expires after a specific amount of time, called time to live (TTL). The default TTL value is 120 seconds.
- OS10 switches allow LLDPDUs in spanning-tree blocked ports.
- OS10 switches do not allow LLDPDUs in 802.1X-controlled ports until the connected device is authenticated.

LLDPDU is a sequence of type, length, and value (TLV).

- Type — Contains the TLV type.
- Length — Size of the value field, in bytes.
- Value — Contains the capability information of the device to be advertised.



LLDPDUs include mandatory and optional TLVs. Each LLDPDU starts with three mandatory TLVs, zero or more optional TLVs, and end of LLDPDU TLV.



NOTE: When the physical port is part of the LAG and the LAG is configured in access VLAN, port VLAN ID and VLAN name will not be part of LLDP TLV.

Mandatory TLVs

OS10 supports the three mandatory TLVs. These mandatory TLVs are at the beginning of the LLDPDU in the following order:

- Chassis ID TLV
- Port ID TLV
- Time-to-live TLV

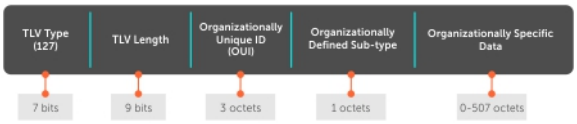
Table 42. Mandatory TLVs

Mandatory TLVs	Type	Description
Chassis ID	1	Identifies the chassis.
Port ID	2	Identifies a port through which the LAN device transmits LLDPDUs.
Time-to-live	3	Number of seconds that the received information in this LLDPDU is valid.
End of LLDPDU	0	Marks the end of an LLDPDU.

Optional TLVs

Optional TLVs include:

- Basic TLVs
- Organizationally specific TLVs
- Custom TLVs



NOTE: The maximum size of the LLDPDUs supported on the transmission side is 1500 bytes. If the size of the TLVs that are transmitted exceeds 1500 bytes when adding one optional TLV of a particular type, the complete optional TLVs of that type are removed and only the optional TLVs that fit the maximum supported size are allowed.

Basic TLVs

Table 43. Basic TLVs

TLV	Type	Description
Port description	4	User-defined alphanumeric string that describes the port (port ID or interface description).
System name	5	User-defined alphanumeric string that identifies the system.
System description	6	Includes the following information: • Host description • Dell OS version • Dell application software version • Build timestamp
System capabilities	7	Determines the capabilities of the system.
Management address	8	Network address of the management interface.

Organizationally specific TLVs

Table 44. 802.1x organizationally specific TLVs (Type – 127, OUI – 00-80-C2)

TLV	Subtype	Description
Link aggregation	7	• Indicates whether the link associated with the port on which the LLDPDU is transmitted is aggregated. • Provides the aggregated port identifier.
Port VLAN ID	1	Untagged VLAN to which a port belongs.
Protocol identity	4	Not supported.
VLAN name	3	Allows an IEEE 802.1Q-compatible device to advertise the assigned name of any VLAN with which it is configured. **NOTE:** By default, VLAN name TLV will be disabled.

Table 45. 802.3 organizationally-specific TLVs (Type – 127, OUI – 00-12-0F)

TLV	Subtype	Description
MAC/PHY configuration/status	1	Indicates: • Duplex and bit rate capability and the current duplex and bit rate settings of the sending device. • Whether the current settings are due to auto-negotiation or manual configuration.
Power through MDI	2	Not supported.
Maximum frame size	4	Maximum frame size capability of the MAC and PHY.

Table 46. Service tag TLV (Type – 127, OUI – 0xF8-0xB1-0x56)

TLV	Subtype	Description
Service tag	21	Indicates the service tag that is associated with the device.

Table 47. Solution ID TLVs (Type – 127, OUI – 0xF8-0xB1-0x56)

TLV	Subtype	Description
Product base	22	Indicates the product base.
Product serial number	23	Indicates the product serial number.
Product part number	24	Indicates the product part number.

Custom TLVs

iDRAC organizationally specific TLVs

Table 48. iDRAC organizationally specific TLVs; Subtypes used in iDRAC custom TLVs (Type – 127, OUI – 0xF8-0xB1-0x56)

TLV	Subtype	Description
Originator	1	Indicates the iDRAC string that is used as the originator. This string enables external switches to identify iDRAC LLDPDUs.
Port type	2	Following are the applicable port types: 1. iDRAC port (dedicated) 2. NIC port 3. iDRAC and NIC port (shared)
Port FQDD	3	Port number that uniquely identifies a NIC port within a server.
Server service tag	4	Service tag ID of the server.
Server model name	5	Model name of the server. For example, PowerEdge FC640.
Server slot number	6	Slot number of the server. For example, 1, 2, 3, 1a, and 1b.
Chassis service tag	7	Service tag ID of the chassis. (Applicable only to blade servers.)
Chassis model	8	Model name of the chassis. (Applicable only to blade servers.)
IOM service tag	9	Service tag ID of the IOM device. (Applicable only to blade servers.)
IOM model name	10	Model name of the IOM device. (Applicable only to blade servers.)
IOM slot label	11	Slot label of the IOM device. For example, A1, B1, A2, and B2 (applicable only to blade servers).
IOM port number	12	Port number of the NIC. For example, 1, 2, and 3.

Isilon organizationally-specific TLVs

Table 49. Isilon-related TLVs (Type – 127, OUI – 0xF8-0xB1-0x56)

TLV	Subtype	Description
Subtypes used in LLDP custom TLVs that are transacted by the Isilon nodes		
Originator	1	Indicates the Isilon string that is used as the originator. This string enables the OS10 switches to identify the Isilon originated LLDPDUs.
RA prefix	2	Indicates the IPV6 address prefix for SLAAC. Isilon nodes uses this prefix to communicate with the master and the OS10 switch to compute the Virtual IP

Table 49. Isilon-related TLVs (Type – 127, OUI – 0xF8-0xB1-0x56) (continued)

TLV	Subtype	Description
		address for the specific fabric instance. The RA prefix is different for each fabric.
Fabric ID	3	Indicates the ID of the fabric the LLDPDU is originating from.
Isilon-related TLVs – Subtypes used in LLDP custom TLVs that are transacted by the OS10 switches		
Originator	1	Indicates the OS10 string that is used as the originator. The string enables the OS10 switches to identify LLDPDUs.
Role	2	Following are the applicable roles: 1. LEAF 2. SPINE 3. UNKNOWN
IP address	3	Indicates the IPv6 address of the originator.
Virtual IP address of the fabric	4	Virtual IP address of the master node. The Isilon nodes can also use this IPv6 address when needed.
MAC address of the physical interface	5	MAC address used by the OS10 switches for ND.

Configure LLDP

Enable LLDP globally or on an interface and advertise the TLVs out of an interface.

Disable and reenable LLDP

By default, LLDP is enabled globally, on each physical interface, and on management port. You can disable LLDP globally and on an interface. If you disable LLDP globally, LLDP is disabled on all interfaces irrespective of whether LLDP is previously enabled or disabled on an interface. When you enable LLDP globally, the interface-level LLDP configuration takes precedence over the global LLDP configuration.

Disable LLDP

- Disable LLDP globally in CONFIGURATION mode.

```
OS10(config)# no lldp enable
```

- Disable LLDP on an interface, use the `lldp transmit` and `lldp receive` commands in INTERFACE mode.

```
OS10(conf-if-eth1/1/2)# no lldp transmit
OS10(conf-if-eth1/1/2)# no lldp receive
```

  Management interface:

```
OS10(conf-if-ma-1/1/1)# no lldp transmit
OS10(conf-if-ma-1/1/1)# no lldp receive
```

Enable LLDP

When LLDP is disabled on a switch, you can reenable LLDP globally or on an interface.

- To enable LLDP globally:

Enable LLDP globally in CONFIGURATION mode.

```
OS10(config)# lldp enable
```

- To enable LLDP on an interface:

  When you enable LLDP globally, it is enabled on all interfaces. You can enable or disable LLDP on individual interfaces to both transmit and receive LLDP information. Also, you can configure an interface to only transmit or receive LLDP information.

  Enable LLDP in INTERFACE mode.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# lldp transmit
OS10(conf-if-eth1/1/1)# lldp receive
```

  Management interface:

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# lldp transmit
OS10(conf-if-ma-1/1/1)# lldp receive
```

Set the LLDP packet timer values

You can configure LLDP packet timer values for LLDPDU transmission.

Set the LLDP timer

Configure the rate in seconds at which LLDP packets send to the peers. The default value of the LLDP timer is 30 seconds.

Configure the LLDP packet timer value in CONFIGURATION mode.

```
lldp timer seconds
```

Set the LLDP reinitialization timer

Change the delay time in seconds for LLDP to initialize on any interface. The default delay timer value is 2 seconds.

Enter the time delay in seconds in CONFIGURATION mode.

```
lldp reinit seconds
```

Set the multiplier value for the hold time

Configure the multiplier value for the hold time. The system uses the multiple value to calculate the TTL value for the LLDP advertisements. The default holdtime-multiplier value is 4.

Enter the multiplier value for the hold time in CONFIGURATION mode.

```
lldp holdtime-multiplier
```

```
OS10(config)# lldp timer 60
OS10(config)# lldp reinit 5
```

View LLDP timers

```
OS10# show lldp timers
LLDP Timers:
Holdtime in seconds: 240
Reinit-time in seconds: 5
Transmit interval in seconds: 60
```

Time to live

TTL or hold time is the amount of time, in seconds, that a receiving system waits to hold the information before discarding it. The formula to calculate the hold time = LLDP timer value x holdtime-multiplier value. The `no` version of this command resets the value to the default.

For example, LLDP timer transmit interval is set to 30 seconds and the holdtime-multiplier is set to 4, the TTL is 120 seconds (30 x 4). The default TTL of 120 seconds. You can adjust the TTL value by changing the multiplier value of the holdtime.

1. Adjust the TTL value in CONFIGURATION mode.

```
lldp holdtime-multiplier
```

2. Return to the default multiplier value in CONFIGURATION mode.

```
no lldp holdtime-multiplier
```

```
OS10(config)# lldp holdtime-multiplier 2
```

View LLDP timers

```
OS10# show lldp timers
LLDP Timers:
Holdtime in seconds: 60
Reinit-time in seconds: 2
Transmit interval in seconds: 30
```

Configure LLDP to advertise TLVs

Configure the system to advertise TLVs from specific interfaces. If you configure the LLDP to advertise TLVs on an interface, only the interface sends LLDPDUs with the specified TLVs.

By default, all LLDP TLVs except VLAN name TLV are advertised. To advertise VLAN name TLV, you can configure the system to advertise the names of VLANs in LLDPDUs. For more information, see Advertise VLAN name TLVs.

1. Enable basic TLV attributes to transmit and receive LLDP packets in INTERFACE mode.

```
lldp tlv-select basic-tlv {port-description | system-name | system-description |
system-capabilities | management-address}
```

2. Enable dot3 TLVs to transmit and receive LLDP packets in INTERFACE mode.

```
lldp tlv-select dot3tlv {macphy-config | max-framesize}
```

3. Enable dot1 TLVs to transmit and receive LLDP packets in INTERFACE mode.

```
lldp tlv-select dot1tlv {port-vlan-id | link-aggregation | vlan-name}
```

Advertise VLAN Name TLVs

You can configure the system to advertise the names of VLANs in LLDPDUs. Configure the VLAN names before you configure the system to advertise VLAN names.

By default, this feature is disabled. After you enable this feature, the system starts sending LLDPDUs with the configured name of the default VLAN. If the default VLAN does not have a configured name, the system does not send an LLDPDU with a VLAN name TLV.

Transmit VLAN name of the default VLAN

1. Enter INTERFACE mode from CONFIGURATION mode.

```
interface ethernet 1/1/1
```

2. Enable the `vlan-name` option in INTERFACE mode.

```
lldp tlv-select dot1-tlv vlan-name
```

3. Enter INTERFACE VLAN mode from CONFIGURATION mode.

```
interface vlan 1
```

4. Specify a name for VLAN 1 in INTERFACE VLAN mode.

```
vlan-name vlan1
```

Transmit the VLAN names of a specific set of VLANs

When you configure the interface to send the names of specific VLANs using `lldp vlan-name-tlv allowed vlan` command, the interface can transmit a maximum of eight VLAN names. If you specify 10 VLANs and the default VLAN has a name, the interface transmits LLDPDUs with VLAN names of the default VLAN and the first seven VLANs configured with a name. If the default VLAN does not have a name, the interface transmits the VLAN names of the first eight VLANs that have a name.

1. Create a VLAN in CONFIGURATION mode.

```
interface vlan vlan-id
```

2. Specify a name for the required VLANs in INTERFACE mode.

```
vlan-name vlan-name
```

3. Configure Port mode as trunk from INTERFACE mode.

```
switchport mode trunk
```

4. Enable the `vlan-name` option in INTERFACE mode.

```
lldp tlv-select dot1-tlv vlan-name
```

5. Configure the interface to be an untagged member of the created VLANs in INTERFACE mode.

```
switchport trunk allowed vlan vlan-range
```

6. Configure the interface to send the names of specific VLANs in PDUs in INTERFACE mode.

```
lldp vlan-name-tlv allowed vlan vlan-ids
```

Examples for configuring the system to transmit VLAN name in TLVs

Specify names for VLANs from 1 to 10 and configure `ethernet 1/1/1` interface to transmit the names of nine VLANs. The interface is not explicitly configured to transmit the name of the default VLAN which is `VLAN 1`.

```
OS10# configure terminal
OS10(config)# interface vlan 1
OS10(conf-if-vl-1)#vlan-name vlan1
OS10(conf-if-vl-1)# exit
OS10(config)# interface vlan 2
OS10(conf-if-vl-2)#vlan-name vlan2
OS10(config)# interface vlan 3
OS10(conf-if-vl-3)#vlan-name vlan4
OS10(config)# interface vlan 4
OS10(conf-if-vl-4)#vlan-name vlan4
OS10(config)# interface vlan 5
OS10(conf-if-vl-5)#vlan-name vlan5
OS10(config)# interface vlan 6
OS10(conf-if-vl-6)#vlan-name vlan6
OS10(config)# interface vlan 7
OS10(conf-if-vl-7)#vlan-name vlan7
OS10(config)# interface vlan 8
OS10(conf-if-vl-8)#vlan-name vlan8
OS10(config)# interface vlan 9
OS10(conf-if-vl-9)#vlan-name vlan9
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)#vlan-name vlan10
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# switchport mode trunk
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 2-10
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)#lldp vlan-name-tlv allowed vlan 2,3,4,5,6,7,8,9,10
```

The interface transmits the name of the default VLAN even if the default VLAN ID is not explicitly configured. The interface transmits the first eight VLAN names and excludes the names of VLAN 9 and VLAN 10. Following shows that the interface transmits the names of VLANs 1 to 8:

```
OS10# show lldp interface ethernet 1/1/1 local-device
Device ID: 34:17:eb:f2:05:c4
Port ID: ethernet1/1/1
System Name: OS10
Capabilities: Router, Bridge, Repeater
System description:
    Dell EMC Networking OS10 Enterprise.
    Copyright (c) 1999-2019 by Dell Inc. All Rights Reserved.
    System Description: OS10 Enterprise.
    OS Version: 10.4.9999EX.
    System Type: S4048-ON
Port description: ethernet1/1/1
Time To Live: 120
Maximum size of LLDP PDU: 1500
Current LLDP PDU Size: 387
LLDP PDU Truncated(Too many TLV's): false
VLAN Name(s):
    VLAN         NAME
 --------------------
     1        vlan1
     2        vlan2
     3        vlan3
     4        vlan4
     5        vlan5
     6        vlan6
     7        vlan7
     8        vlan8
Maximum size of LLDP PDU: 1500
Current LLDP PDU Size: 386
LLDP PDU Truncated(Too many TLV's): false
LLDP MED Capabilities:
    Supported:
           LLDP-MED Capabilities,
           Network Policy,
           Inventory Management
    Current:
           LLDP-MED Capabilities,
           Network Policy
LLDP MED Device Type: Network connectivity
```

Following example shows the name of VLAN 3 is deleted:

```
OS10(conf-if-eth1/1/1)# no lldp vlan-name-tlv allowed vlan 3
```

Following output shows that the interface deletes VLAN 3 and starts sending the name of VLAN 9:

```
OS10# show lldp interface ethernet 1/1/1 local-device
Device ID: 34:17:eb:f2:05:c4
Port ID: ethernet1/1/1
System Name: OS10
Capabilities: Router, Bridge, Repeater

           LLDP-MED Capabilities,
           Network Policy,
           Inventory Management
    Current:
           LLDP-MED Capabilities,
           Network Policy
LLDP MED Device Type: Network connectivity
```

Disable and reenable LLDP TLVs

By default, the interfaces advertise all LLDP TLVs except VLAN name TLV.

- Disable LLDP TLVs in INTERFACE mode.

```
no lldp tlv-select basic-tlv {port-description | system-name | system-description |
system-capabilities | management-address}
no lldp tlv-select dot1tlv {port-vlan-id | link-aggregation | vlan-name}
no lldp tlv-select dot3tlv {macphy-config | max-framesize}
```

Disable LLDP TLVs

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no lldp tlv-select basic-tlv system-name system-description
OS10(conf-if-eth1/1/2)# no lldp tlv-select dot1tlv port-vlan-id
OS10(conf-if-eth1/1/2)# no lldo tlv-select dot3tlv max-framesize
```

To reenable LLDP TLVs advertise on an interface, use the following commands:

Enable LLDP TLVs

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# lldp tlv-select basic-tlv system-name system-description
OS10(conf-if-eth1/1/2)# lldp tlv-select dot1tlv port-vlan-id
```

Disable and enable LLDP TLVs on management ports

By default, management ports advertise all LLDP TLVs except VLAN name TLV. You can disable the LLDP TLV advertisement on management ports using the following commands:

- Disable LLDP TLVs in INTERFACE mode.

```
no lldp tlv-select basic-tlv {port-description | system-name | system-description |
system-capabilities | management-address}
no lldp tlv-select dot1tlv {port-vlan-id | vlan-name}
```

Disable LLDP TLVs

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# no lldp tlv-select basic-tlv system-name system-description
OS10(conf-if-ma-1/1/1)# no lldp tlv-select dot1tlv port-vlan-id
```

To advertise LLDP TLVs from the management ports, use the following commands:

Enable LLDP TLVs

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# lldp tlv-select basic-tlv system-name system-description
OS10(conf-if-ma-1/1/1)# lldp tlv-select dot1tlv port-vlan-id
```

Advertise management address TLVs in a VLT domain

The management address TLV advertises the IP address of the management interface to adjacent LAN devices. The system advertises this information in the management address TLV of all the physical ports. In a VLT domain, peer VLT devices transmit the IP address of their local management interface in the management address TLV.

To integrate with solutions such as the Cisco Application Centric Infrastructure (ACI), OS10 switches that are VLT peers, must advertise one common IP address in the management address TLV of the LLDPDU. This common IP address is also known as a virtual IP address, so that the VLT peers appear as a single switch to the Cisco ACI.

Configure OS10 switches that are part of a VLT pair to select a single IPv4 or IPv6 address as the virtual IP address. When you enable this feature, OS10 selects the lowest IP address per subnet that is configured on the management interface or management VLAN as the virtual IP address. LLDP advertises this virtual IP address in the management address TLV.

NOTE: This feature works only on devices that are part of a VLT domain.

Advertise virtual management IP address in management address TLV

You can enable the system to select a single IP address in a VLT pair, using the `lldp management-addr-tlv {ipv4 | ipv6} virtual-ip` command globally or on a specific interface. LLDP advertises the elected virtual IP address in the management address TLV.

To enable the service to send the virtual management IP address in the management address TLV:

- Enable the service to send the virtual IP address in the management address TLV using `lldp management-addr-tlv {ipv4 | ipv6} virtual-ip` in CONFIGURATION mode.

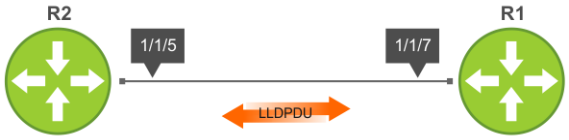
  When enabled in CONFIGURATION mode, the configuration applies globally and the system advertises the elected IP address in the management address TLV.
- Enable the service to send the virtual IP address in the management address TLV using `lldp management-addr-tlv {ipv4 | ipv6} virtual-ip` in INTERFACE mode.

  When enabled in INTERFACE mode, the configuration applies to the specific interface and the system advertises the elected IP address in the management address TLV.

```
OS10(config)#lldp management-addr-tlv ipv4 virtual-ip
OS10(config-if-eth1/1/6)#lldp management-addr-tlv ipv4 virtual-ip
OS10(config-if-eth1/1/6)#lldp management-addr-tlv ipv6 virtual-ip
```

Example: Advertise TLVs configuration

The following configuration example describes how to configure the system to advertise LLDP TLVs.



Sample configuration on R1:

Enable the list of LLDP TLVs needs to be advertised from R1.

```
R1# configure terminal
R1(config)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# switchport
R1(conf-if-eth1/1/7)# no shutdown
```

```
R1(conf-if-eth1/1/7)# lldp tlv-select basic-tlv system-name
R1(conf-if-eth1/1/7)# lldp tlv-select dot3tlv macphy-config
R1(conf-if-eth1/1/7)# lldp tlv-select dot3tlv max-framesize
R1(conf-if-eth1/1/7)# lldp tlv-select dot1tlv link-aggregation
R1(conf-if-eth1/1/7)# lldp tlv-select dot1tlv port-vlan-id
R1(conf-if-eth1/1/7)# lldp management-addr-tlv ipv4 virtual-ip
```

Sample configuration on R2:

Enable the list of LLDP TLVs needs to be advertised from R2.

```
R1# configure terminal
R2(config)# interface ethernet 1/1/5
R2(conf-if-eth1/1/5)# switchport
R2(conf-if-eth1/1/5)# no shutdown
R2(conf-if-eth1/1/5)# lldp tlv-select basic-tlv system-name
R2(conf-if-eth1/1/5)# lldp tlv-select dot3tlv macphy-config
R2(conf-if-eth1/1/5)# lldp tlv-select dot3tlv max-framesize
R2(conf-if-eth1/1/5)# lldp tlv-select dot1tlv link-aggregation
R2(conf-if-eth1/1/5)# lldp tlv-select dot1tlv port-vlan-id
R1(conf-if-eth1/1/5)# lldp management-addr-tlv ipv4 virtual-ip
```

LLDP-MED

Network connectivity devices and endpoint devices exchange LLDP-MED TLVs for interoperability and store advertised information.

OS supports the following LLDP-MED TLVs:

- LLDP-MED capabilities
- Network policy
- Inventory management
- Location identification
- Extended power via MDI

NOTE: LLDP-MED is designed for but not limited to VoIP endpoints.

Table 50. LLDP-MED organizationally specific TLVs (Type – 127)

TLV	Subtype	Description
LLDP-MED capabilities	1	• If the transmitting device supports LLDP-MED • What LLDP-MED TLVs are supported • LLDP device class
Network policy	2	• Application type • VLAN ID • L2 priority • DSCP value
Local identification	3	Physical location of the device expressed in one of three formats:

Table 50. LLDP-MED organizationally specific TLVs (Type – 127) (continued)

TLV	Subtype	Description
		• Coordinate-based LCI • Civic address LCI • Emergency call services ELIN
Extended power-via-MDI	4	• Power requirements • Priority • Power status

NOTE: Only Rx function is supported for location identification and extended power via MDI TLVs.

LLDP-MED capabilities TLV

The LLDP-MED capabilities TLV communicates the types of TLVs that the endpoint device and network-connectivity device support. The value of the LLDP-MED capabilities field in the TLV is a 2–octet bitmap. Each bit represents an LLDP-MED capability.

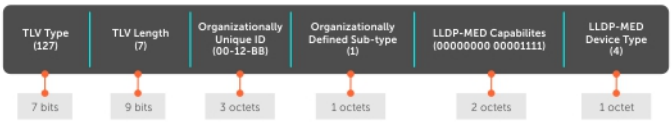

Table 51. LLDP-MED capabilities TLV

Bit position	TLV
0	LLDP-MED capabilities
1	Network policy
2	Location ID
3	Extended power over MDI-PSE
4	Extended power over MDI-PD
5	Inventory
6-15	Reserved

Table 52. LLDP-MED device types

Bit position	Device type
0	Not defined
1	Endpoint Class 1
2	Endpoint Class 2
3	Endpoint Class 3
4	Network connectivity
5-255	Reserved

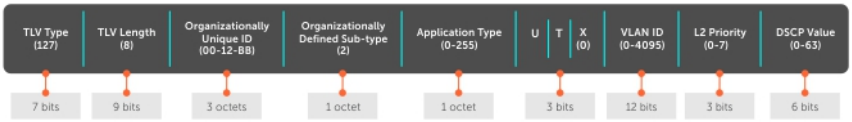
LLED-MED network policies TLVs

A network policy in the context of LLDP-MED is a VLAN configuration of a device and associated L2 and L3 configurations.

LLDP-MED network policies TLV include:

- VLAN ID

- VLAN tagged or untagged status
- L2 priority
- DSCP value



You can configure a LLDP-MED network policy to generate an individual network policy TLV for each application type. For more information, see Define network policies.

NOTE: Signaling is a series of control packets that are exchanged between an endpoint device and a network-connectivity device to establish and maintain a connection. These signal packets might require a different network policy than the media packets where a connection is made. In this case, configure the signaling application.

Table 53. LLDP-MED Network policies TLVs

Type	Application	Description
0	Reserved	—
1	Voice	Used for dedicated IP telephony handsets and other appliances supporting interactive voice services.
2	Voice signaling	Used only if voice control packets use a separate network policy than voice data.
3	Guest voice	Used only for a separate limited voice service for guest users with their own IP telephony handsets and other appliances supporting interactive voice services.
4	Guest voice signaling	Used only if guest voice control packets use a separate network policy than voice data.
5	SoftPhone voice	Used for softphone applications on a device such as a personal computer or laptop. This class does not support multiple VLANs and if required, uses an untagged VLAN or a single tagged data-specific VLAN.
6	Video conferencing	Used only for dedicated video conferencing and similar appliances supporting real-time interactive video.
7	Streaming video	Used for broadcast or multicast-based video content distribution and similar applications supporting streaming video services that require specific network policy treatment.
8	Video signaling	Used only if video control packets use a separate network policy than the video data.
9-255	Reserved	—

Disable and reenable LLDP-MED

By default, LLDP-MED is enabled on all interfaces except on the management interface.

Disable LLDP-MED

- Disable LLDP-MED on an interface, use the `lldp med disable` command in INTERFACE mode.

```
OS10(conf-if-eth1/1/1)# lldp med disable
```

Enable LLDP-MED

When LLDP-MED is disabled, you can reenable LLDP-MED on an interface.

- Enable LLDP-MED on an interface, use `lldp med enable` command in INTERFACE mode.

```
OS10(conf-if-eth1/1/1)# lldp med enable
```

NOTE: If you enable LLDP MED on an interface, the system transmits MED TLVs only when it receives a TLV from a peer.

Define LLDP-MED network policies

You can define one or more LLDP-MED network policies using the `lldp med` commands for any application and attach any network policies to the ports.

NOTE: You can create a maximum of 32 LLDP-MED network policies.

- Define the LLDP-MED network policy in CONFIGURATION mode.

```
lldp med network-policy number app {voice | voice-signaling | guest-voice |
guestvoice-signaling | softphone-voice | streaming-video | video-conferencing | video-
signaling} {vlan vlan-id vlan-type {tag | untag} priority priority dscp dscp value}
```

- Attach any defined network policy to the ports in INTERFACE mode.

```
lldp med network-policy {add | remove}
```

Configure LLDP-MED network policy on an interface

```
OS10(config)# lldp med network-policy 1 app voice-signaling vlan 10 vlan-type tag
priority 2 dscp 1
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# lldp med network-policy add 1
```

Network policy advertisement

LLDP-MED is enabled on all interfaces by default. Configure OS10 to advertise LLDP-MED TLVs from configured interfaces. Define LLDP-MED network policies before applying the policies to an interface. Attach only one network policy per interface.

- Define an LLDP-MED network-policy in INTERFACE mode.

```
lldp med network-policy {add | remove} number
```

  - `add` — Attach the network policy to an interface.
  - `remove` — Remove the network policy from an interface.
  - *`number`* — Enter a network policy index number, from 1 to 32.

Configure advertise LLDP-MED network policies

```
OS10(conf-if-eth1/1/5)# lldp med network-policy add 1
```

Change the fast start repeat count

Fast start repeat enables a network-connectivity device to advertise itself at a faster rate for a limited amount of time. The fast start timer starts when a network-connectivity device receives the first LLDP frame from a newly detected endpoint.

The LLDP-MED fast start repeat count specifies the number of LLDP packets that are sent during the LLDP-MED fast start period. By default, the device sends three packets per interval. The number of packets that are sent during activation ranges from 1 to10.

Rapid availability is crucial for applications such as emergency call service location (E911).

- Configure fast start repeat count which is the number of packets that are sent during activation in CONFIGURATION mode, from 1 to 10, default 3.

```
lldp-med fast-start-repeat-count number
```

Configure fast start repeat count

```
OS10(config)# lldp med fast-start-repeat-count 5
```

LLDP commands

clear lldp counters

Clears LLDP and LLDP-MED transmit, receive, and discard statistics from all physical interfaces.

Syntax	`clear lldp counters`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	The counter default value resets to zero for all physical interfaces.
Example	`OS10# clear lldp counters`
Supported Releases	10.2.0E or later

clear lldp table

Clears LLDP neighbor information for all interfaces.

Syntax	`clear lldp table`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	Neighbor information clears on all interfaces.
Example	`OS10# clear lldp table`
Supported Releases	10.2.0E or later

lldp enable

Enables or disables LLDP globally.

Syntax	`lldp enable`
Parameters	None
Default	Enabled

Command Mode	CONFIGURATION
Usage Information	This command enables LLDP globally for all Ethernet PHY interfaces, except on those interfaces where you manually disable LLDP. The `no` version of this command disables LLDP globally irrespective of whether you manually disable LLDP on an interface.
Example	`OS10(config)# lldp enable`
Supported Releases	10.3.1E or later

lldp holdtime-multiplier

Configures the multiplier value for the hold time.

Syntax	`lldp holdtime-multiplier` *integer*
Parameters	*integer* — Enter the holdtime-multiplier value, from 2 to 10.
Default	4
Command Mode	CONFIGURATION
Usage Information	Hold time is the amount of time in seconds that a receiving system waits to hold the information before discarding it. Formula: Hold Time = (Updated Frequency Interval) x (Hold Time Multiplier). The `no` version of this command resets the value to the default.
Example	`OS10(config)# lldp holdtime-multiplier 2`
Supported Releases	10.2.0E or later

lldp med fast-start-repeat-count

Configures the number of packets that are sent during the activation of the fast start mechanism.

Syntax	`lldp-med fast-start-repeat-count` *number*
Parameters	*number* — Enter the number of packets sent during the activation of the fast start mechanism, from 1 to 10.
Default	3
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# lldp med fast-start-repeat-count 5`
Supported Releases	10.2.0E or later

lldp med

Enables or disables LLDP-MED on an interface.

Syntax	`lldp med {enable | disable}`
Parameters	• `enable` — Enable LLDP-MED on the interface. • `disable` — Disable LLDP-MED on the interface.
Default	Enabled with network-policy TLV

Command Mode	INTERFACE
Usage Information	LLDP-MED communicates the types of TLVs that the endpoint device and network-connectivity device support. Use the `no lldp med` or `lldp med disable` command to disable LLDP-MED on a specific interface.
Example	`OS10(conf-if-eth1/1/1)# lldp med disable`
Supported Releases	10.2.0E or later

lldp med network-policy

Manually defines an LLDP-MED network policy.

Syntax

```
lldp med network-policy number app {voice | voice-signaling | guest-voice | guestvoice-signaling | softphone-voice | streaming-video | video-conferencing | video-signaling} {vlan vlan-id vlan-type {tag | untag} priority priority dscp dscp value}
```

Parameters

- *number* — Enter a network policy index number, from 1 to 32.
- app — Enter the type of applications available for the network policy:
  - voice — Voice network-policy application
  - voice-signaling — Voice-signaling network-policy application
  - guest-voice — Guest voice network-policy application
  - guestvoice-signaling — Guest voice signaling network policy application
  - softphone-voice — SoftPhone voice network-policy application
  - streaming-video — Streaming video network-policy application
  - video-conferencing — Voice conference network-policy application
  - video-signaling — Video signaling network-policy application
- vlan *vlan-id* — Enter the VLAN number for the selected application, from 1 to 4093.
- vlan-type — Enter the type of VLAN the application uses.
- tag — Enter a tagged VLAN number.
- untag — Enter an untagged VLAN number.
- priority *priority* — Enter the user priority set for the application.
- dscp *dscp value* — Enter the DSCP value set for the application.

Default	Not configured
Command Mode	CONFIGURATION
Usage Information	You can create a maximum of 32 network policies and associate the LLDP-MED network policies to a port.
Example	`OS10(config)# lldp med network-policy 10 app voice vlan 10 vlan-type tag priority 2 dscp 1`
Supported Releases	10.2.0E or later

lldp med network-policy (Interface)

Attaches or deletes an LLDP-MED network policy to or from an interface.

Syntax

```
lldp med network-policy {add | remove} number
```

Parameters

- add — Attach the network policy to an interface.
- remove — Remove the network policy from an interface.
- *number* — Enter a network policy index number, from 1 to 32.

Default	Not configured
Command Mode	INTERFACE
Usage Information	Attach only one network policy for per interface.
Example	`OS10(conf-if-eth1/1/5)# lldp med network-policy add 1`
Supported Release	10.2.0E or later

lldp med tlv-select

Configures the LLDP-MED TLV type to transmit or receive.

Syntax	`lldp med tlv-select {network—policy | inventory}`
Parameters	• `network-policy` — Enable or disable the port description TLV. • `inventory` — Enable or disable the system TLV.
Default	Enabled
Command Mode	INTERFACE
Usage Information	None
Example	`OS10(conf-if-eth1/1/3)# lldp med tlv-select network-policy`
Supported Releases	10.2.0E or later

lldp port-description-tlv advertise

Specifies whether to advertise the interface description or the port id in the port description TLV.

Syntax	`lldp port-description-tlv advertise [description | port-id]`
Parameters	• `description` — Advertise interface description. • `port-id` — Advertise port id.
Default	Interface description is advertised.
Command Mode	INTERFACE
Usage Information	Determines whether to advertise the interface description or the port ID in the port description TLV. According to RFC 2863, the `LLDPLocPortDesc` and `ifDescr` object values must be identical. To be compliant with RFC 2863, use the `port-id` option with the `lldp port-description-tlv advertise` command. The `port-id` option in this command returns the same value (port ID) for both LLDPLocPortDesc and ifDescr objects.
Example	`OS10(conf-if-eth1/1/1)# lldp port-description-tlv advertise description` `OS10(conf-if-eth1/1/1)# lldp port-description-tlv advertise port-id`
Supported Releases	10.4.3.0 or later

lldp receive

Enables or disables the LLDP packet reception on a specific interface.

Syntax	`lldp receive`
Parameters	None
Default	Not configured
Command Mode	INTERFACE
Usage Information	Enable LLDP globally on the system before using the `lldp receive` command. The `no` version of this command disables the reception of LLDP packets.
Example	`OS10(conf-if-eth1/1/3)# lldp receive`
Supported Releases	10.2.0E or later

lldp reinit

Configures the delay time in seconds for LLDP to initialize on any interface.

Syntax	`lldp reinit` *seconds*
Parameters	*seconds* — Enter the delay timer value in seconds, from 1 to 10.
Default	2 seconds
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# lldp reinit 5`
Supported Releases	10.2.0E or later

lldp timer

Configures the rate in seconds at which LLDP packets send to the peers.

Syntax	`lldp timer` *seconds*
Parameters	*seconds* — Enter the LLDP timer rate in seconds, from 5 to 254.
Default	30 seconds
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command sets the LLDP timer back to its default value.
Example	`OS10(config)# lldp timer 25`
Supported Releases	10.2.0E or later

lldp tlv-select basic-tlv

Enables or disables TLV attributes to transmit and receive LLDP packets.

Syntax

```
lldp tlv-select basic-tlv {port-description | system-name | system-
description | system-capabilities | management-address [ipv4 | ipv6]}
```

Parameters

- `port-description` — Enable or disable the port description TLV.
- `system-name` — Enable or disable the system TLV.
- `system-description` — Enable or disable the system description TLV.
- `system-capabilities` — Enable or disable the system capabilities TLV.
- `management-address` — Enable or disable the management address TLV (IPv4 and IPv6).
- `management-address ipv4` - Enable or disable only the IPv4 management address TLV.
- `management-address ipv6` - Enable or disable only the IPv6 management address TLV.

Default Enabled

Command Mode INTERFACE

Usage Information The `no` form of the command disables TLV attribute transmission and reception in LLDP packets.

Example

```
OS10(conf-if-eth1/1/3)# lldp tlv-select basic-tlv system-name
```

Supported Releases 10.2.0E or later

lldp management-addr-tlv virtual-ip

Enables VLT peers to send the elected virtual IP address in the management address TLV.

Syntax

```
lldp management-addr-tlv {ipv4 | ipv6} virtual-ip
```

Parameters

- `ipv4` — Select `ipv4` for the VLT peers to send the virtual IPv4 address in the management TLV.
- `ipv6` — Select `ipv6` for the VLT peers to send the virtual IPv6 address in the management TLV.

Default Disabled

Command Mode

- CONFIGURATION
- INTERFACE

Usage Information

When enabled in CONFIGURATION mode, the system advertises the elected IP address in the management address TLV of all the interfaces.

When enabled in INTERFACE mode, the system advertises the elected IP address in the management address TLV of that specific interface.

The `no` version of this command resets to default. By default, the system transmits the local management IP address.

Example

```
OS10(config)# lldp management-addr-tlv ipv4 virtual-ip
OS10(conf-if-eth1/1/3)# lldp management-addr-tlv ipv6 virtual-ip
```

Supported Releases 10.5.0 or later

lldp tlv-select dot1tlv

Enables or disables the dot.1 TLVs to transmit in LLDP packets.

Syntax

```
lldp tlv-select dot1tlv { port-vlan-id | link-aggregation | vlan-name}
```

Parameters

- `port-vlan-id` — Enter the port VLAN ID.

- `link-aggregation` — Enable the link aggregation TLV.
- `vlan-name` — Configure dot1 TLVs to send and receive the names of VLANs in LLDP frames.

Default Enabled. `vlan-name` is disabled.

Command Mode INTERFACE

Usage Information The `link-aggregation` parameter advertises link aggregation as a dot1 TLV in the LLDPDUs.

The `vlan-name` parameter advertises the names of VLANs in LLDP frames.

The `no` version of this command disables TLV transmissions.

Example (Port)
```
OS10(conf-if-eth1/1/3)# lldp tlv-select dot1tlv port-vlan-id
```

Example (Link Aggregation)
```
OS10(conf-if-eth1/1/3)# lldp tlv-select dot1tlv link-aggregation
```

Example (VLAN name)
```
OS10(conf-if-eth1/1/3)# lldp tlv-select dot1tlv vlan-name
```

Supported Releases 10.2.0E or later

lldp tlv-select dot3tlv

Enables or disables the dot3 TLVs to transmit in LLDP packets.

Syntax `lldp tlv-select dot3tlv {macphy-config | max-framesize}`

Parameters
- `macphy-config` — Enable the port VLAN ID TLV.
- `max-framesize` — Enable maximum frame size TLV.

Default Enabled

Command Mode INTERFACE

Usage Information The `no` version of this command disables TLV transmission.

Example
```
OS10(conf-if-eth1/1/3)# lldp tlv-select dot3tlv macphy-config
```

Supported Releases 10.2.0E or later

lldp transmit

Enables the transmission of LLDP packets on a specific interface.

Syntax `lldp transmit`

Parameters None

Default Not configured

Command Mode INTERFACE

Usage Information The `no` version of this command disables the transmission of LLDP packets on a specific interface.

Example
```
OS10(conf-if-eth1/1/9)# lldp transmit
```

Supported Releases 10.2.0E or later

lldp vlan-name-tlv allowed vlan

Specifies a single or multiple VLANs' names to transmit in LLDPDUs.

Syntax `lldp vlan-name-tlv allowed vlan` **`vlan-id`**

Parameters **`vlan-id`**—Specify a single VLAN or multiple VLANs.

Default Disabled

Command Mode INTERFACE

Usage Information

This command specifies VLANs' names to transmit in LLDPDUs along with the configured default VLAN. If you do not use this command, the interface sends the name of the default VLAN if a name is configured.

If you use this command to transmit multiple VLAN names, any VLAN configured without a name is excluded.

An interface can transmit a maximum of eight VLAN names. If you specify 10 VLANs and if the default VLAN configured has a name, the interface transmits LLDPDUs with VLAN names of the default VLAN and the first seven VLANs that have a name configured. If the default VLAN does not have a name configured, the interface transmits the VLAN names of the first eight VLANs that have a name configured and excludes the default VLAN.

This command is accessible to users with `sysadmin`, `secadmin`, and `netadmin` roles.

Example

```
OS10(conf-if-eth1/1/1)# lldp vlan-name-tlv allowed vlan vlan2
```

```
OS10(conf-if-eth1/1/1)# lldp vlan-name-tlv allowed vlan
2-10,12,14-16,20,24
```

Supported Releases 10.5.0 or later

show lldp interface

Displays the LLDP information that is advertised from a specific interface.

Syntax `show lldp interface ethernet` *`node/slot/port[:subport]`* `[local—device | med]`

Parameters

- `ethernet` *`node/slot/port[:subport]`* — Enter the Ethernet interface information.
- `local-device` — Enter the interface to view the local-device information.
- `med` — Enter the interface to view the MED information.

Default None

Command Mode EXEC

Usage Information Use the `med` parameter to view MED information for a specific interface. Use the `local-device` parameter to view inventory details.

Example

```
OS10# show lldp interface ethernet 1/1/5
ethernet1/1/5
Tx State             : Enabled
Rx State             : Enabled
Tx SEM State         : initialize
Rx SEM State         : wait-port-operational
Notification Status  : Disabled
Notification Type    : mis-configuration
DestinationMacAddr   : 01:80:c2:00:00:0e
```

Example (Local Device)

```
OS10# show lldp interface ethernet 1/1/1 local-device

Device ID: 90:b1:1c:f4:a6:25
Port ID: ethernet1/1/2:1
```

```
System Name: 0075
Capabilities: Router, Bridge, Repeater
System description:

Dell EMC Networking OS10 Enterprise.
Copyright (c) 1999-2019 by Dell Inc. All Rights Reserved.
System Description: OS10 Enterprise.
OS Version: 10.4.9999EX.
System Type: S4048-ON

Port description: ethernet1/1/2:1
VLAN Name(s):
         VLAN      NAME
         ----------------------------------------
         2             VLAN2
         3             VLAN3
Maximum size of LLDP PDU: 1500
Current LLDP PDU Size: 359
LLDP PDU Truncated(Too many TLV's): false
Time To Live: 150
LLDP MED Capabilities:
Supported:
LLDP-MED Capabilities,
Network Policy,
Inventory Management
Current:
LLDP-MED Capabilities,
Network Policy
LLDP MED Device Type: Network connectivity
```

Example (MED)

```
OS10# show lldp interface ethernet 1/1/20:1 med
Port            |Capabilities|Network Policy|Location|Inventory|POE
----------------|------------|--------------|--------|---------|---
ethernet1/1/20:1|         Yes|           Yes|      No|       No| No
Network Polices :
```

Supported Releases 10.2.0E or later

show lldp errors

Displays the LLDP errors that are related to memory allocation failures, queue overflows, and table overflows.

Syntax `show lldp errors`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show lldp errors
Total Memory Allocation Failures: 0
Total Input Queue Overflows: 0
Total Table Overflows: 0
```

Supported Release 10.2.0E or later

show lldp med

Displays the LLDP MED information for all the interfaces.

Syntax `show lldp med`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Use the `show lldp interface` command to view MED information for a specific interface.

Example

```
OS10# show lldp med
Fast Start Repeat Count: 3
LLDP MED Device Type: Network Connectivity
Port            |Capabilities|Network Policy|Location|Inventory|POE
----------------|------------|--------------|--------|---------|---
ethernet1/1/1   |         Yes|           Yes|      No|       No| No
ethernet1/1/2   |         Yes|           Yes|      No|       No| No
ethernet1/1/3   |         Yes|           Yes|      No|       No| No
ethernet1/1/4   |         Yes|           Yes|      No|      Yes| No
ethernet1/1/5   |         Yes|           Yes|      No|       No| No
ethernet1/1/6   |         Yes|           Yes|      No|       No| No
ethernet1/1/7   |         Yes|           Yes|      No|      Yes| No
ethernet1/1/8   |         Yes|           Yes|      No|       No| No
ethernet1/1/9   |         Yes|           Yes|      No|       No| No
ethernet1/1/10  |         Yes|           Yes|      No|       No| No
ethernet1/1/11  |         Yes|           Yes|      No|       No| No
ethernet1/1/12  |         Yes|           Yes|      No|       No| No
ethernet1/1/13  |         Yes|           Yes|      No|       No| No
ethernet1/1/14  |         Yes|           Yes|      No|       No| No
ethernet1/1/15  |         Yes|           Yes|      No|       No| No
ethernet1/1/16  |         Yes|           Yes|      No|       No| No
ethernet1/1/17  |         Yes|           Yes|      No|       No| No
ethernet1/1/18  |         Yes|           Yes|      No|       No| No
ethernet1/1/19  |         Yes|           Yes|      No|       No| No
ethernet1/1/20  |         Yes|           Yes|      No|       No| No
ethernet1/1/21  |         Yes|           Yes|      No|       No| No
ethernet1/1/22  |         Yes|           Yes|      No|       No| No
ethernet1/1/23  |         Yes|           Yes|      No|       No| No
ethernet1/1/24  |         Yes|           Yes|      No|       No| No
ethernet1/1/25  |         Yes|           Yes|      No|       No| No
ethernet1/1/26  |         Yes|           Yes|      No|       No| No
ethernet1/1/27  |         Yes|           Yes|      No|       No| No
ethernet1/1/28  |         Yes|           Yes|      No|       No| No
ethernet1/1/29  |         Yes|           Yes|      No|       No| No
ethernet1/1/30  |         Yes|           Yes|      No|       No| No
ethernet1/1/31  |         Yes|           Yes|      No|       No| No
ethernet1/1/32  |         Yes|           Yes|      No|       No| No
```

Supported Releases 10.2.0E or later

show lldp neighbors

Displays the system information of the LLDP neighbors.

Syntax `show lldp neighbors [detail | interface ethernet node/slot/port[:subport]]`

Parameters

- `detail` — View LLDP neighbor detailed information
- `interface ethernet node/slot/port[:subport]` — Enter the Ethernet interface information.

Command Mode EXEC

Usage Information This command status information includes local port ID, remote hostname, remote port ID, remote VLAN names, and remote node ID.

Example

```
OS10# show lldp neighbors
Loc PortID         Rem Host Name   Rem Port Id          Rem Chassis Id
-------------------------------------------------------------------------
ethernet1/1/2      Not Advertised  fortyGigE 0/56       00:01:e8:8a:fd:35
ethernet1/1/20:1   Not Advertised  GigabitEthernet 1/0  00:01:e8:05:db:05
```

Example (Detail)

```
OS10# show lldp neighbors interface ethernet 1/1/1 detail

Remote Chassis ID Subtype: Mac address (4)
Remote Chassis ID: 00:50:56:a6:29:54
Remote Port Subtype: Interface alias (1)
Remote Port ID: ethernet1/1/1
Remote Port Description: ethernet1/1/1
Local Port ID: ethernet1/1/1
Locally assigned remote Neighbor Index: 2
Remote TTL: 120
Information valid for next 99 seconds
Time since last information change of this neighbor: 15:51:41
Remote System Name: OS10
Remote System Desc: OS10
Existing System Capabilities: Repeater, Bridge, Router
Enabled System Capabilities: Repeater, Bridge, Router
Remote Port Vlan ID: 1
Remote VLAN Name(s):
         VLAN        NAME
         ----------------------------------------
         2               VLAN2
         6               VLAN6
Remote Max Frame Size: 1532
Remote Aggregation Status: false
MAC PHY Configuration:
Auto-neg supported: 1
Auto-neg enabled: 1
Auto-neg advertised capabilities:
1000BASE-T half duplex mode
Dell EMC Organization Specific Detail:
Originator: Switch
Service Tag: B8D1XC2
Product Base: base1
Product Serial Number: sn1
Product Part Number: pn1
```

Example (Interface)

```
OS10# show lldp neighbors interface ethernet 1/1/1
Loc PortID          Rem Host Name       Rem Port Id      Rem Chassis Id
-------------------------------------------------------------------------
ethernet1/1/1       OS10                ethernet1/1/2  4:17:eb:f7:06:c4
```

Supported Releases 10.2.0E or later

show lldp timers

Displays the LLDP hold time, delay time, and update frequency interval configuration information.

Syntax `show lldp timers`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show lldp timers
LLDP Timers:
Holdtime in seconds: 120
Reinit-time in seconds: 6
Transmit interval in seconds: 30
```

Supported Releases 10.2.0E or later

show lldp tlv-select interface

Displays the TLVs enabled for an interface.

Syntax `show lldp tlv-select interface ethernet node/slot/port[:subport]`

Parameters `ethernet node/slot/port[:subport]` — Enter the Ethernet interface information, from 1 to 253.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show lldp tlv-select interface ethernet 1/1/1
port-description
system-capabilities
system-description
system-name
port-vlan
mac-phy-config
link-aggregation
max-frame-size
vlan-name
```

Supported Releases 10.2.0E or later

show lldp traffic

Displays LLDP traffic information including counters, packets that are transmitted and received, discarded packets, and unrecognized TLVs.

Syntax `show lldp traffic [interface ethernet node/slot/port[:subport]]`

Parameters `interface ethernet node/slot/port[:subport]` — (Optional) Enter the Ethernet interface information to view the LLDP traffic.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show lldp traffic
LLDP Traffic Statistics:
Total Frames Out                    : 1504
Total Entries Aged                  : 2
Total Frames In                     : 67
Total Frames Received In Error      : 0
Total Frames Discarded              : 0
Total TLVS Unrecognized             : 0
Total TLVs Discarded                : 0
```

Example (Interface)

```
OS10# show lldp traffic interface ethernet 1/1/2
LLDP Traffic Statistics:
Total Frames Out                    : 45
Total Entries Aged                  : 1
Total Frames In                     : 33
Total Frames Received In Error      : 0
Total Frames Discarded              : 0
Total TLVS Unrecognized             : 0
Total TLVs Discarded                : 0

LLDP MED Traffic Statistics:
Total Med Frames Out                : 2
Total Med Frames In                 : 1
Total Med Frames Discarded          : 0
Total Med TLVS Discarded            : 0
Total Med Capability TLVS Discarded: 0
Total Med Policy TLVS Discarded     : 0
Total Med Inventory TLVS Discarded : 0
```

Supported Releases 10.2.0E or later

show network-policy profile

Displays network policy profiles.

Syntax `show network-policy profile [profile number]`

Parameters *profile number* — (Optional) Enter the network policy profile number, from 1 to 32.

Default Not configured

Command Mode EXEC

Usage Information If you do not enter the network profile ID, all configured network policy profiles display.

Example

```
OS10# show network-policy profile 10
Network Policy Profile 10
   voice vlan 17 cos 4
  Interface:
   none
Network Policy Profile 30
   voice vlan 30 cos 5
  Interface:
   none
Network Policy Profile 36
   voice vlan 4 cos 3
  Interface:
       ethernet 1/1/1,ethernet 1/1/3-5
```

Supported Releases 10.2.0E or later

Media Access Control

All Ethernet switching ports maintain media access control (MAC) address tables. Each physical device in your network contains a MAC address. OS10 devices automatically enter learned MAC addresses as dynamic entries in the MAC address table.

Learned MAC address entries are subject to aging. Set the aging timer to zero (0) to disable MAC aging. For any dynamic entry, if no packet arrives on the device with the MAC address as the source or destination address within the timer period, the address is removed from the table.

- Enter an aging time (in seconds) in CONFIGURATION mode, from 0 to 1000000, default 1800.

```
mac address-table aging-time seconds
```

NOTE: On the Dell PowerSwitch S4200-ON series, the default MAC aging time is set as 550 seconds. This is the maximum value that can be configured.

Configure Aging Time

```
OS10(config)# mac address-table aging-time 900
```

Disable Aging Time

```
OS10(config)# mac address-table aging-time 0
```

NOTE: When continuous MAC address movement occurs in a Virtual Link Trunking (VLT) environment, it results in MAC pointing to VLT interconnect on both nodes and it causes traffic loss. This condition gets resolved automatically when the MAC aging time lapses or when MAC is assigned to a single port after the continuous MAC movement stops. To solve this issue manually, use the `clear mac address-table` command to remove the MAC address entry from the MAC address table. This limitation is applicable to both VLAN and PVLAN.

Static MAC Address

You manually configure a static MAC address entry. A static entry is not subject to aging.

- Create a static MAC address entry in the MAC address table in CONFIGURATION mode.

```
mac-address-table static nn:nn:nn:nn:nn vlan vlan-id interface [ethernet node/slot/
port[:subport] | port-channel channel-number]
```

NOTE: Before using the `mac-address-table static` command, create the required VLANs. If you do not create a VLAN before configuring a static MAC address entry, the system displays an error message.

Set Static MAC Address

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-11)# exit
OS10(config)# mac address-table static 34:17:eb:f2:ab:c6 vlan 10 interface ethernet 1/1/5
```

MAC address table

OS10 maintains a list of MAC address table entries.

- View the contents of the MAC address table in EXEC mode.

```
show mac address-table {dynamic | static} [address mac-address | vlan vlan-id |
interface {ethernet node/slot/port[:subport] | port-channel number}] [count [vlan
vlan-id] [interface {type node/slot/port[:subport] | port-channel number}]
```

  - `dynamic`—(Optional) Displays dynamic MAC address table entry information.
  - `static`—(Optional) Displays static MAC address table entry information.
  - `address mac-address`—(Optional) Displays MAC address information.
  - `interface ethernet node/slot/port[:subport]`—(Optional) Displays a list of dynamic and static MAC address entries.
  - `interface port-channel number`—(Optional) Displays port channel information, from 1 to 999 or 1001 to 2000.
  - `count`—(Optional) Displays the number of dynamic and static MAC address entries.
  - `vlan vlan-id`—(Optional) Displays information for a specified VLAN only, from 1 to 4093.

View MAC address table entries

```
OS10# show mac address-table
VlanId  Mac Address             Type            Interface
1       00:00:15:c6:ca:49       dynamic         ethernet1/1/21
1       00:00:20:2a:25:55       dynamic         ethernet1/1/21
1       90:b1:1c:f4:aa:ce       dynamic         ethernet1/1/21
1       90:b1:1c:f4:aa:c6       dynamic         ethernet1/1/21
10      34:17:eb:02:8c:33       static          ethernet1/1/1
```

View MAC address table count

```
OS10# show mac address-table count
MAC Entries for all vlans :
Dynamic Address Count :                 4
Static Address (User-defined) Count :   1
Total MAC Addresses in Use:             5
```

Clear MAC address table

You can clear dynamic address entries that in the MAC address table maintains.

- Clear the MAC address table of dynamic entries in EXEC mode.

  ```
  clear mac address-table dynamic [[all] [address mac_addr] [vlan vlan-id] [interface
  {ethernet type node/slot/port[:subport] | port-channel number}]
  ```

  - `all`—(Optional) Clears all dynamic entries.
  - `address mac_address`—(Optional) Clears a MAC address entry.
  - `vlan vlan-id`—(Optional) Clears a MAC address table entry from a VLAN number, from 1 to 4093.
  - `ethernet node/slot/port[:subport]`—(Optional) Clears an Ethernet interface entry.
  - `port–channel number`—(Optional) Clears a port channel number, from 1 to 999 or 1001 to 2000.

Clear MAC address table

```
OS10# clear mac address-table dynamic vlan 20 interface ethernet 1/2/20
```

MAC Commands

clear mac address-table dynamic

Clears Layer 2 dynamic address entries from the MAC address table.

Syntax `clear mac address-table secure {dynamic | sticky} {all | address mac_addr | vlan vlan-id | interface {ethernet node/slot/port[:subport] | port-channel number}}`

Parameters

- `secure`—Indicates a secure MAC address.
- `sticky`—Indicates a sticky MAC address.
- `all`—(Optional) Deletes all MAC address table entries.
- `address mac_addr`—(Optional) Deletes a configured MAC address from the address table in nn:nn:nn:nn:nn:nn format.
- `vlan vlan-id`—(Optional) Deletes all entries based on the VLAN number from the address table, from 1 to 4093.
- `interface`—(Optional) Clears the interface type:
  - `ethernet node/slot/port[:subport]`—Deletes the Ethernet interface configuration from the address table.
  - `port-channel channel-number`—Deletes the port channel interface configuration from the address table, from 1 to 999 or 1001 to 2000.

Default	Not configured
Command Mode	EXEC
Usage Information	Use the `all` parameter to remove all dynamic entries from the address table. You can use this commands to flush only secure dynamic and sticky MACs.
Example	`OS10# clear mac address-table dynamic all`
Example (VLAN)	`OS10# clear mac address-table dynamic vlan 20`

Example (secure and sticky)	`OS10# clear mac address-table secure sticky vlan 1`
	`OS10#clear mac address-table secure sticky interface port-channel 128`
	`OS10#clear mac address-table secure sticky address 00:00:00:00:00:01 vlan 100`

Supported Releases	10.2.0E or later

mac address-table aging-time

Configures the aging time for entries in the L2 address table.

Syntax	`mac address-table aging-time` *seconds*
Parameters	*seconds* — Enter the aging time for MAC table entries in seconds, from 0 to 1000000.
Default	1800 seconds
Command Mode	CONFIGURATION
Usage Information	Set the aging timer to zero (`0`) to disable MAC address aging for all dynamic entries. The aging time counts from the last time that the device detected the MAC address.
Example	`OS10(config)# mac address-table aging-time 3600`
Supported Releases	10.2.0E or later

mac address-table static

Configures a static entry for the Layer 2 MAC address table.

Syntax	`mac address-table static` *mac-address* `{vlan` *vlan-id* `| virtual-network` *VNI*`}` `interface {ethernet` *node/slot/port[:subport]* `| port-channel` *number* `| VLTi}`

Parameters	• `mac-address`—Enter the MAC address to add to the table in nn:nn:nn:nn:nn:nn format.
	• `vlan` *vlan-id*—Enter the VLAN to apply the static MAC address to, from 1 to 4093.
	• `virtual-network` *VNI*—Enter the virtual network to apply the static MAC address to, from 1 to 65535.
	• `interface`—Enter the interface type:
	  ○ `ethernet` *node/slot/port[:subport]*—Enter the Ethernet information.
	  ○ `port-channel` *channel-number*—Enter a port channel interface number, from 1 to 999 or 1001 to 2000.
	  ○ `VLTi`—Enter `VLTi` to configure static MAC address on VLTi interfaces.

Default	Not configured
Command Mode	CONFIGURATION

Usage Information

The `no` version of this command removes the static MAC address.

When a static MAC configured on a non-VLT port-channel, is not supposed to be learnt on any other port in the VLT peer nodes, then you must configure the same MAC as static MAC on VLTi in the peer VLT node.

You can configure a static MAC on a VLTi even before the VLT domain or VLTi are created.

Un till the time when VLTi is created, the MAC is not installed in the NPU or kernel. Whenever the VLTi is discovered and created, the MAC is installed in the NPU or kernel.

The MAC is removed when the VLTi is removed or the VLT domain is deleted. This option is supported for both VLAN and VN configurations.

Example (VLAN)

```
OS10(config)# mac address-table static 34:17:eb:f2:ab:c6 vlan 1
interface ethernet 1/1/30
```

Example (Port-Channel)

```
OS10(config)# mac address-table static 34:17:eb:02:8c:33 vlan 10
interface port-channel 1
```

Example (VLTi)

```
OS10(config)#  mac  address-table static 00:00:00:00:00:01 vlan 1
interface vlti

OS10(config)#  no mac address-table static 00:00:00:00:00:01 vlan 1
interface vlti

OS10(config)#  mac  address-table static 00:00:00:00:00:aa virtual-
network 1 interface vlti

OS10(config)#  no mac address-table static 00:00:00:00:00:aa virtual-
network 1 interface vlti
```

Supported Releases

10.2.0E or later

show mac address-table

Displays information about the MAC address table.

Syntax

`show mac address-table [all | address` *`mac-address`* `| aging-time | [count [vlan` *`vlan-`*
`static] | interface {`*`ethernet node/slot/port[:subport]`* `| port-channel` *`number`*`}]| sta`
`vlan` *`vlan-id`*`]`

Parameters

- `all`—(Optional) Displays all MAC address table entries.
- `address` *`mac-address`*—(Optional) Displays MAC address table information.
- `aging-time`—(Optional) Displays MAC address table aging-time information.
- `count`—(Optional) Displays the number of dynamic and static MAC address entries.
- `dynamic`—(Optional) Displays dynamic MAC address table entries only.
- `sticky`—(Optional) Displays sticky MAC address table entries only.
- `static`—(Optional) Displays static MAC address table entries only.
- `interface`—Set the interface type:
  - `ethernet` *`node/slot/port[:subport]`*—Displays MAC address table information for a physical interfa
  - `port-channel` *`channel-number`*—Displays MAC address table information for a port channel interface,
- `static`—(Optional) Displays static MAC address table entries only.
- `vlan` *`vlan-id`*—(Optional) Displays VLAN information only, from 1 to 4093.

Default

Not configured

Command Mode

EXEC

Usage Information

The network device maintains static MAC address entries that are saved in the startup configuration file, and reboot

Example

```
OS10# show mac address-table
pv <vlan-id> - private vlan where the mac is originally learnt
VlanId        Mac Address         Type        Interface
10            00:00:00:00:00:01   dynamic     ethernet1/1/11          pv 100
10            00:00:00:00:00:02   dynamic     ethernet1/1/12
10            00:00:00:00:00:05   dynamic     port-channel1000        pv 100
10            00:00:00:00:00:06   dynamic     port-channel1000
10            00:00:00:00:00:09   dynamic     port-channel100         pv 100
10            00:00:00:00:00:10   dynamic     port-channel10
10            00:00:00:00:00:14   dynamic     port-channel101
```

Example (address)

```
OS10# show mac address-table address 90:b1:1c:f4:a6:8f
VlanId  Mac Address             Type           Interface
1       90:b1:1c:f4:a6:8f       dynamic         ethernet1/1/3
```

Example (aging time)

```
OS10# show mac address-table aging-time
Global Mac-address-table aging time : 1800
```

Example (count)

```
OS10# show mac address-table count
MAC Entries for all vlans :
Dynamic Address Count : 5
Static Address (User-defined) Count : 0
Total MAC Addresses in Use: 5
```

Example (dynamic)

```
OS10# show mac address-table dynamic
VlanId  Mac Address          Type     Interface
1       90:b1:1c:f4:a6:8f    dynamic  ethernet1/1/3
```

Example (Ethernet)

```
OS10# show mac address-table interface ethernet 1/1/3
VlanId  Mac Address         Type     Interface
1       66:38:3a:62:31:3a   dynamic  ethernet1/1/3
```

Example (secure and virtual-network)

```
os10# show mac address-table secure sticky  all

VlanId   MAC Address                    Type                    Interface

1            4c:76:25:e5:4f:51            sticky                   ethernet1/1/5

1            4c:76:25:e5:4f:55            sticky                   ethernet1/1/6

1            4c:76:25:e5:4f:59            sticky                   ethernet1/1/7

os10#show mac address-table secure dynamic  all

VlanId   MAC Address                    Type                    Interface

10            4c:76:25:e5:4f:51           dynamic                 port-channel120

11          4c:76:25:e5:4f:55            dynamic               ethernet1/1/6

12           4c:76:25:e5:4f:59            dynamic                    ethernet1/1/7

os10# show mac address-table secure  static  all

VlanId   MAC Address                    Type                    Interface

10            4c:76:25:e5:4f:51            static                 port-channel120

11          4c:76:25:e5:4f:55             static                ethernet1/1/6

12           4c:76:25:e5:4f:59            static                   ethernet1/1/7

os10# show mac address-table
```

```
Codes: pv <vlan-id> - private vlan where the mac is originally learnt

VlanId   MAC Address               Type             Interface

1           00:00:00:00:00:01       static           port-channel1000

OS10# show mac address-table virtual-network
Virtual-Network           VlanId            MAC Address               Type
-------------------------------------------------------------------------------
100                       100               00:00:00:00:11:00         static
```

Supported Releases	10.2.0E or later

Spanning-tree protocol

This section describes how spanning-tree features work and also about the different variants of STP.

Introduction to STP

The spanning-tree protocol is a Layer 2 network protocol that prevents loops in a network topology. Spanning-tree is useful when more than one network path exists and devices in the network are either competing for or sharing these paths.

By eliminating loops, the protocol improves scalability in a large network and allows you to implement redundant paths, which can be activated when the active paths fail.

Layer 2 loops occur in a network due to poor network design and without enabling xSTP protocols, can cause high switch CPU utilization and memory consumption.

NOTE: In L2 single rack, OS10 CLI is used to configure the spanning tree. For L3 fabric, SFS GUI is used to configure the spanning tree.

Configuration notes

Dell PowerSwitch S5200-ON Series and Z9332F-ON Series:

For RPVST with force-version STP convergence to work, ensure that the default VLAN is set to VLAN1. You must not configure it to any VLAN number other than VLAN1.

Supported STP modes

The following variants of spanning-tree protocols are used in OS10 to provide a loop free layer 2 topology:

- Rapid Spanning Tree protocol can be seen as an evolution of the 802.1D standard. Primarily RSTP is created to address the slow convergence nature of STP protocol (802.1D).
- Multiple Spanning Tree protocol (MSTP) defined in IEEE standard (802.1s), is an evolution of spanning tree protocols allowing creation of multiple instance of spanning tree and mapping multiple VLANs to a specific spanning tree instance.
- Rapid per-VLAN spanning-tree protocol (Rapid-PVST) is a variant of RSTP protocol and supports creation of per VLAN spanning tree instance to isolate link fluctuations only to a particular VLAN segment and also helps in load balancing across different links.
- 802.1D STP Compatibility mode support. This mode enables the bridge to function as an IEEE Std 802.1D legacy STP compatible mode while the system is running RSTP or MSTP modes of the spanning tree protocol.
- RSTP and MSTP are backward compatible with STP 802.1D. When an interface receives STP BPDU, the system responds with the STP version of BPDU.

Change STP modes

The default xSTP variant running in OS10 is Rapid-PVST. You can change the mode to RSTP or MSTP using the `spanning-tree mode {rstp | mst | rapid-pvst}` command.

Mode specific functionality

Enable and disable STP

Spanning Tree Protocol (STP) is enabled by default on the switches. You can disable the STP globally on the switch or at the interface level.

Disabling spanning tree at an instance level causes all the port members of that instance to disable the spanning tree. This moves the port to the Forwarding / Blocking state based on the operational status of the ports.

Use the `spanning-tree disable` command to disable the STP.

Backward compatibility and interoperability

Spanning tree modes are backward compatible and interoperable with the STP version.

The OS10 interoperability feature is designed to support the convergence when the peer switch is running PVST+.

When an OS10 switch that is configured in RPVST+ mode is connected to a vendor switch running PVST+ mode, convergence happens on all VLANs in the domain. Use the `spanning-tree rapid-pvst default behavior` command to enable or disable the transmission of RSTP BPDUs in VLAN 1 when the port is an untagged member other than VLAN 1. By default, OS10 sends RSTP BPDU for the untagged VLAN. The `no` version of this command handles the RSTP BPDU for VLAN 1 if the port is a member of VLAN 1.

NOTE: Use this command on the ports that are connected to vendors other than OS9 and OS10.

BPDU extensions

STP extensions provide a means to ensure efficient network convergence by securely enforcing the active network topology. OS10 supports BPDU filtering, BPDU guard, root guard, and loop guard STP extensions.

The system discards regular data traffic after a BPDU violation.

BPDU filtering	Stops sending or receiving BPDUs from a faulty device, there by protecting the network from unexpected flooding of BPDUs. Enabling BPDU Filtering on an interface causes the system to stop sending or receiving BPDUs.
BPDU guard	Blocks the L2 bridged ports and port-channel ports connected to end hosts and servers from receiving any BPDUs. When you enable BPDU guard and when the BPDU frames are being received on the interface, the bridge or port-channel is placed in the blocking state. In case of a port-channel, ports are either STP blocked or shutdown based on the error disable command action. The data traffic is dropped but the port continues to forward BPDUs to the CPU that are later dropped. To prevent further reception of BPDUs, configure a port to shut down using the `error disable` command. For more information on this command.
Root guard	Preserves the root bridge position during network transitions. STP selects the root bridge with the lowest priority value. During network transitions, another bridge with a lower priority may attempt to become the root bridge and cause unpredictable network behavior. To avoid such an attempt and to preserve the position of the root bridge, configure the `spanning-tree guard root` command. This configuration places the port in an inconsistent state if the port receives superior BPDU. Root guard is enabled only on designated ports. The root guard configuration applies to all VLANs configured on the port.
Loop guard	Prevents L2 forwarding loops caused by a cable or interface hardware failure. When a hardware failure occurs, a participating spanning-tree link becomes unidirectional and the port stops receiving BPDUs. When the blocked port stops receiving BPDUs, it transitions to a Forwarding state causing spanning-tree loops in the network. Enable loop guard using the `spanning-tree guard loop` command on an interface so that it transitions to the Loop-Inconsistent state until it receives BPDUs. After BPDUs are received, the port moves out of the Loop-Inconsistent or Blocking state and transitions to an appropriate state determined by STP. Enabling loop guard on a per-port basis enables it on all VLANs configured on the port.

NOTE:

1. Root guard and Loop guard are mutually exclusive.

2. Configuring one overwrites the other from the active configuration.

1. Enable spanning-tree BPDU filter in INTERFACE mode.

```
spanning-tree bpdufilter enable
```

2. Enable STP BPDU guard in INTERFACE mode.

```
spanning-tree bpduguard enable
```

BPDU guard violation causes the system to perform the following actions in the port channel:

- The interface and all member ports are disabled in the hardware.
- When the port is added to the port channel that is in the Error Disable state, the new member port is disabled in the hardware.
- When the port is removed from the port channel that is in the Error Disable state, the system clears the Error_Disabled state on the physical port and enables it in the hardware.

To clear the Error Disabled state:

- Use the `shutdown` command on the interface.
- Use the `spanning-tree bpduguard disable` command to disable the BPDU guard on the interface.
- Use the `spanning-tree disable` command to disable STP on the interface.

3. Set the guard types to avoid loops in INTERFACE mode.

```
spanning-tree guard {loop | root | none}
```

- `loop` — Set the guard type to loop.
- `root` — Set the guard type to root.
- `none` — Set the guard type to none.

Port enabled with loop guard conditions

- Loop guard is supported on any STP-enabled port or port-channel interface.
- You cannot enable root guard and loop guard at the same time on an STP port. The loop guard configuration overwrites an existing root guard configuration and vice versa.
- Enabling BPDU guard and loop guard at the same time on a port results in a port that remains in blocking state and prevents traffic from flowing through it. For example, when you configure both Portfast BPDU guard and loop guard:
  - If a BPDU is received from a remote device, BPDU guard places the port in the Err-Disabled Blocking state and no traffic forwards on the port.
  - If no BPDU is received from a remote device which was sending BPDUs, loop guard places the port in the Loop-Inconsistent Blocking state and no traffic forwards on the port.
- When used in a Rapid-PVST network, STP loop guard performs per-port or per port-channel at a VLAN level. If no BPDUs are received on a port-channel interface, the port or port-channel transitions to a Loop-Inconsistent or Blocking state only for this VLAN.

BPDU filter

```
os10(conf-if-eth1/1/7)# spanning-tree bpdufilter enable
os10(conf-if-eth1/1/7)# do show spanning-tree interface ethernet 1/1/7
ethernet1/1/7 of vlan 1 is Designated Forwarding

```

Recover from BPDU guard violations

1. When there is BPDU guard violation on a port, OS10 either shuts down the port or moves it to BLOCKED state. Use the following command in CONFIGURATION mode to shutdown the port. The `no` version of the command moves the port to BLOCKED state.

   ```
   errdisable detect cause bpduguard
   ```

2. In CONFIGURATION mode, use the following command to recover the ports from shutting down due to the detection of a BPDU Guard violation. When the recovery option is enabled, the port is brought up after the recovery timer expires. The default recovery timer value is 300 seconds. When the recovery option is disabled, the port remains shut down indefinitely. You must manually bring up the port using the `shutdown` and `no shutdown` commands.

   ```
   errdisable recovery cause bpduguard
   ```

   The `no` version of the command disables the recovery option.

3. To change the recover timer value, use the following command in CONFIGURATION mode. This recovery timer value is applicable only for shutdown case. For Blocking case, the default value of 300 seconds is used.

```
errdisable recovery interval interval-value
```

Example configuration

```
OS10(config)# errdisable detect cause bpduguard
OS10(config)# errdisable recovery interval 45
OS10(config)# errdisable recovery cause bpduguard
```

View detect and recovery details

```
OS10# show errdisable detect

Error-Disable Cause               Detect Status
-------------------------------------------
bpduguard                          Enabled
```

```
OS10# show errdisable recovery

Error-Disable Recovery Timer Interval: 300 seconds

Error-Disable Reason               Recovery Status
-------------------------------------------------
bpduguard                          Enabled

```

MAC flush optimization

OS10 offers a MAC address clearing technique that optimizes the number of MAC flush calls sent by the Spanning Tree Protocol (STP) module.

If the number of calls sent to the hardware is too high, traffic is dropped or flooded impacting system performance. To prevent traffic drops and flooding, you can use the MAC flush optimization feature.

This feature fine-tunes the MAC flush-related parameters, such as the MAC flush threshold and the MAC flush timer to reduce the number of calls sent to the hardware. The clear request sent to clear the MAC address table entry is called a flush indication. The number of calls that are sent is displayed as flush invocations in the show spanning-tree command.

You can enable the MAC flush optimization feature by setting the MAC flush timer to a non-zero value. This feature is enabled by default with a default timer value of 200 centi-seconds.

To disable MAC flush optimization, configure the MAC flush timer value to 0.

When you configure the MAC flush timer to a non-zero value and the threshold to zero, the system invokes instance-based flush once and starts the timer. When the timer expires, the system invokes an instance-based flush again.

The `show spanning-tree {brief | details | active}` command displays the following information:

```
Flush Interval 200 centi-sec, Flush Invocations 32
Flush Indication threshold 2
```

By default, this feature is enabled for RSTP, Rapid-PVST and MSTP. This feature is useful in a scalable topology with MSTP & rapid-PVST (multi-instance), where multiple MAC flush calls are invoked.

RSTP

RSTP allows per port-based flush until the number of calls sent is equal to the MAC flush threshold value that you have configured.

When the number of calls that are sent reaches the configured threshold, RSTP ignores further per-port based flush and starts the MAC flush timer. When the timer expires, RSTP invokes an entire table flush, where it requests one flush for all the ports.

RSTP is a single instance and hence, MAC flush optimization is not required. However, to enable this feature, configure the MAC flush timer to a non-zero value. This configuration is applied globally and applies for RSTP, MSTP, and rapid-PVST. This configuration is retained when you change the STP mode.

For RSTP, the threshold is set to a higher value (65,535) because RSTP does not require this optimization. Even when this feature is enabled, the global flush is invoked only after the flush count reaches 65,535.

MSTP

MSTP allows (VLAN-list, port) based flush until the number of calls sent is equal to the MAC flush threshold value that you have configured.

When the number of calls exceeds the configured threshold, MSTP ignores further (VLAN-list, port) based flush and starts the MAC flush timer. When the timer starts, the system blocks all further flush indications. When the timer expires for that specific instance, the system triggers instance-based flushing.

The default MAC flush threshold value for MSTP is 5.

Rapid-PVST

Rapid-PVST allows (VLAN, port) based flush until the number of calls sent is equal to the MAC flush threshold value that is configured.

When the number of calls sent exceeds the configured threshold, rapid-PVST ignores further (VLAN, port) based flush and starts the MAC flush timer. When the timer starts, the system blocks further flush. When the timer expires for that specific instance, the system triggers VLAN-based flushing.

By default, the MAC flush threshold value is set to 5. However, Dell Technologies recommends that you configure this value based on the number of ports that participate in the STP topology.

Spanning-tree link type for rapid state transitions

As specified in IEEE 802.1w, OS10 assumes a port that runs in full-duplex mode is a point-to-point link. A point-to-point link transitions to forwarding state faster. By default, OS10 derives the link type of a port from the duplex mode. You can override the duplex mode using the `spanning-tree link-type` command.

OS10 assumes a port that runs in half-duplex mode is a shared link, to which the fast transition feature is not applicable. Also, If you explicitly designate a port as a shared link, you cannot use the fast transition feature, regardless of the duplex setting.

To hasten the spanning-tree state transitions, you can set the link type to point-to-point. To set the link type to point-to-point:

- Use the following command in INTERFACE mode.

```
spanning-tree link-type point-to-point
```

Dynamic path cost calculation

Path cost of an interface (physical or port-channel) is calculated based on the speed of the port or port-channel. When the speed of the port or port-channel changes, the past cost recalculation is triggered based on the user defined configuration.

You can enable/disable dynamic recalculation of path cost using the `spanning-tree path-cost` command.

This cmd allows the protocol to do dynamic cost calculation whenever the channel-members are added or deleted. By default, this dynamic path cost calculation is enabled.

When dynamic path cost is disabled , protocol calculate the path cost when the port channel is coming up for the first time after creation or whenever dynamic path cost calculation is enabled and then disabled by management or when the user adds/removes member port to/from the port channel.

This feature allows the user to disable path cost re-calculation on link flap events. If disabled, the path cost of the port-channel is calculated based on the below formula port-channel speed = speed of a single member * number of configured member ports (irrespective of its operational status).

Path cost changes only for the user event [addition/removal of channel-member]. Path cost is calculated based on the number of configured ports.

Dynamic path cost disable functionality is supported for VLT port channel.

Debug facilities

Use the `debug spanning-tree bpdu` command to monitor and verify that the MST configuration is communicating as configured. To ensure all necessary parameters match — region name, region version, and VLAN to instance mapping, examine your individual devices. Use the `show spanning-tree mst` command to view the MST configuration, or use the `show running-configuration` command to view the overall MST configuration.

MST flags for communication received from the same region	The MST routers are located in the same region. If the debug logs indicate that packets are coming from a *Different Region*, one of the key parameters does not match.
MST region name and revision	The configured name and revisions must be identical among all devices. If the region name is blank, a name was configured on one device and was not configured or was configured differently on another — spelling and capitalization count.
MST instances	Verify the VLAN-to-MST instance mapping using the `show` commands. If you see *extra* MST instances in the Sending or Received logs, an additional MST instance was configured on one router but not the others.

- View BPDUs in EXEC mode.

```
debug spanning-tree bpdu
```

- View MST-triggered topology change messages in EXEC mode.

```
debug spanning-tree events
```

View MST configuration

```
OS10# show spanning-tree mst configuration
Region Name: force10
Revision: 100
MSTI    VID
0       1,31-4093
1       2-10
2       11-20
3       21-30
```

EdgePort

EdgePort allows the interface to forward traffic approximately 30 seconds sooner as it skips the Blocking and Learning states.

CAUTION: Configure EdgePort only on links connecting to an end station. EdgePort can cause loops if you enable it on an interface connected to a network. Edge ports do not receive BPDUs.

NOTE: Whenever a port becomes a designated port, it will start a timer called the edge delay while timer (hello-time + 1/2 * hello-time); if the hello-time is set to 2 seconds, the edge delay while timer is 3 seconds. If BPDUs are not received for 3 seconds, then the port is declared as oper edge on the fly and is moved to forwarding state.

OS10 supports auto edge feature . If the port does not receive BPDU for the hello-time + one second interval then it places the port into auto edge mode.

If the edge port receives any BPDU, it looses the edge port property.

- Enable EdgePort on an interface in INTERFACE mode.

```
spanning-tree port type edge
```

Configure EdgePort

```
OS10(conf-if-eth1/1/4)# spanning-tree port type edge
```

View interface status

```
os10# show spanning-tree interface ethernet 1/1/7
ethernet1/1/7 of vlan 1 is Designated Forwarding
Edge port: No (default)
Link type: point-to-point (auto)

128.56
```

Common STP commands

This section explains about the common commands in STP. STP variant specific commands are explained in the individual sections under RSTP, MSTP, and Rapid-PVST.

There are two sets of STP related commands.

- STP commands that are common and can be used irrespective of the STP variant enabled on the device.
- STP commands that are specific to the particular STP variant.

clear spanning-tree counters

Clears the counters for STP.

Syntax `clear spanning-tree counters [interface {ethernet node/slot/port[:subport] | port–channel number}}]`

Parameters

- `interface`—Enter the interface type:
  - `ethernet node/slot/port[:subport]`—Deletes the spanning-tree counters from a physical port.
  - `port-channel number`—Deletes the spanning-tree counters for a port channel interface, from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information Use this command to clear all STP counters on the device per the Ethernet interface or port channel.

Example

```
OS10# clear spanning-tree counters interface port-channel 10
```

Supported Releases 10.2.0E or later

debug spanning-tree

Enables STP to debug and display protocol information.

Syntax `debug spanning-tree {all | bpdu [tx | rx] | events}`

Parameters

- `all` — Debugs all spanning-tree operations.
- `bpdu` — Enter transmit (`tx`) or receive (`rx`) to enable the debug direction.
- `events` — Debugs STP events.

Default Not configured

Command Mode	EXEC
Usage Information	None
Example	`OS10# debug spanning-tree bpdu rx`
Supported Releases	10.5.0 or later

errdisable detect cause bpduguard

Configures the port to be shut down or moves the port to blocked state on detecting a BPDU guard violation.

Syntax	`errdisable detect cause bpduguard`
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	This command applies only to STP-enabled ports. The command takes effect only when the BPDU guard is configured on a port. When the detect cause option is enabled, the port is shut down whenever there is a BPDU guard violation. When the option is disabled, the port is not shut down but moved to BLOCKING state whenever there is a BPDU guard violation. In this case, the port is operationally DOWN in spanning-tree mode and when the recovery timer expires after 300 seconds, the port is UP irrespective of the recovery cause configuration. The `no` version of the command disables the detect cause option.
Example	`OS10(config)# errdisable detect cause bpduguard`
Supported Releases	10.4.2.0 or later

errdisable recovery cause bpduguard

Enables to recover the ports shut down due to BPDU Guard violation.

Syntax	`errdisable recovery cause bpduguard`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	This command applies only to STP-enabled ports. The command takes effect only when BPDU guard is configured on a port and `errdisable detect cause bpduguard` is enabled. When the recovery option is enabled, the port is brought up after the recovery timer expires. When the recovery option is disabled, the port is shut down indefinitely. You must manually bring up the port using the `shutdown` and `no shutdown` commands. The `no` version of the command disables the recovery option.
Example	`OS10(config)# errdisable recovery cause bpduguard`
Supported Releases	10.4.2.0 or later

errdisable recovery interval

Configures recovery interval timer to delay the recovery of ports when there is a BPDU Guard violation.

Syntax `errdisable recovery interval interval-value`

Parameters *interval-value*—Enter the time interval in seconds. The range is from 30 to 65535.

Default 300 seconds

Command Mode CONFIGURATION

Usage Information This command applies only to STP-enabled ports. The command takes effect only when the BPDU guard is configured on a port. The recovery timer value is applicable only for shutdown case. For blocking case, the default value of 300 seconds is used.

The recovery timer starts whenever there is a BPDU guard violation.

The `no` version of the command resets the timer to the default value.

Example

```
OS10(config)# errdisable recovery interval 45
```

Supported Releases 10.4.2.0 or later

clear spanning-tree detected-protocol

Forces the ports to renegotiate with neighbors.

Syntax `clear spanning-tree detected-protocol [interface {ethernet node/slot/port[:subport] | port-channel number}]`

Parameters

- `interface` — Enter the interface type:
  - `ethernet node/slot/port[:subport]` — Enter the Ethernet interface information, from 1 to 48.
  - `port-channel number` — Enter the port-channel number, from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information Use this command to force the port to re-negotiate with neighbors. If you use this command without parameters, the command applies to each device port.

Example

```
OS10# clear spanning-tree detected-protocol interface ethernet 1/1/1
```

Supported Release 10.2.0E or later

spanning-tree bpdufilter

Enables or disables BPDU filtering on an interface.

Syntax `spanning-tree bpdufilter {enable | disable}`

Parameters

- `enable` — Enables the BPDU filter on an interface.
- `disable` — Disables the BPDU filter on an interface.

Default Disabled

Command Mode INTERFACE

Usage Information Use the `enable` parameter to enable BPDU filtering.

Example	`OS10(conf-if-eth1/1/4)# spanning-tree bpdufilter enable`
Supported Releases	10.2.0E or later

spanning-tree bpduguard

Enables or disables the BPDU guard on an interface.

Syntax	`spanning-tree bpduguard {enable | disable}`
Parameters	• `enable` — Enables the BPDU guard filter on an interface. • `disable` — Disables the BPDU guard filter on an interface.
Default	Disabled
Command Mode	INTERFACE
Usage Information	BPDU guard prevents a port from receiving BPDUs. If the port receives a BPDU, it is placed in the Error-Disabled state.
Example	`OS10(conf-if-eth1/1/4)# spanning-tree bpduguard enable`
Supported Releases	10.2.0E or later

spanning-tree disable

Disables Spanning-Tree mode configured with the `spanning-tree mode` command globally on the switch or specified interfaces.

Syntax	`spanning-tree disable`
Parameters	None
Default	Not configured.
Usage Information	The `no` version of this command re-enables STP and applies the currently configured spanning-tree settings.
Command Mode	CONFIGURATION INTERFACE
Example	`OS10(config)# interface ethernet 1/1/4` `OS10(config-if-eth1/1/4)# spanning-tree disable`
Supported Releases	10.3.0E or later

spanning-tree guard

Enables or disables loop guard or root guard on an interface.

Syntax	`spanning-tree guard {loop | root | none}`
Parameters	• `loop` — Enables loop guard on an interface. • `root` — Enables root guard on an interface. • `none` — Sets the guard mode to none.
Default	Not configured

Usage Information	Root guard and loop guard configurations are mutually exclusive. Configuring one overwrites the other from the active configuration.
Command Mode	INTERFACE
Example	`OS10(conf-if-eth1/1/4)# spanning-tree guard root`
Supported Releases	10.2.0E or later

spanning-tree link-type

Sets the spanning-tree link-type for faster convergence.

Syntax	`spanning-tree link-type {auto | point-to-point | shared}`
Parameters	• `auto` — Enter the keyword to sets the link-type based on the duplex setting of the interface. • `point-to-point`—Specifies that the interface is a point-to-point or full-duplex link. • `shared`—Specifies that the interface is a half-duplex medium.
Default	Auto
Command Mode	INTERFACE
Usage Information	As specified in IEEE 802.1w, OS10 assumes a port that runs in full-duplex mode as a point-to-point link. A point-to-point link transitions to forwarding state faster. By default, OS10 derives the link-type of a port from the duplex mode. You can override the duplex mode using the `spanning-tree link-type` command. As half-duplex mode is considered as a shared link, the fast transition feature is not applicable for shared links. If you designate a port as a shared link, you cannot use the fast transition feature, regardless of the duplex setting.
Example	`OS10(config-inf)# spanning-tree link-type point-to-point`
Supported Releases	OS10 legacy command.

spanning-tree mac-flush-timer

Enables or disables MAC flush optimization.

Syntax	`spanning-tree mac-flush-timer` *`timer-interval`*
Parameters	*`timer-interval`*—Enter the timer interval in centi-seconds, from 0 to 500. The default value is 200 milli-seconds.
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	This command configures the flush interval time in centi-seconds, and controls the number of calls invoked from the spanning-tree module. If the timer is set to 0, MAC flush optimization is disabled. If the timer is set to a non-zero value, instance-based flushing occurs based on the MAC flush threshold value. The `no` version of this command resets the flush-interval timer to the default value.
Example	`OS10(config)# spanning-tree mac-flush-timer 500` `OS10(config)# no spanning-tree mac-flush-timer`
Supported Releases	10.4.3.0 or later

spanning-tree mode rstp

Enables an STP type: RSTP.

Syntax	`spanning-tree mode rstp`
Parameters	• `rstp` — Sets STP mode to RSTP.
Default	Rapid-PVST
Command Mode	CONFIGURATION
Usage Information	All STP instances stop in the previous STP mode and restart in the new mode. You can also change to RSTP/MST mode.
Example	`OS10(config)# spanning-tree mode rstp`
Supported Releases	10.2.0E or later

spanning-tree port

Sets the port type as the EdgePort.

Syntax	`spanning-tree port type edge`
Parameters	None
Default	Not configured
Command Mode	INTERFACE
Usage Information	When you configure an EdgePort on a device running STP, the port immediately transitions to the Forwarding state. Only configured ports connected to end hosts act as EdgePorts.
Example	`OS10(config-inf)# spanning-tree port type edge`
Supported Releases	10.2.0E or later

show errdisable

Displays information on errdisable configurations and port recovery status.

Syntax	`show errdisable [detect | recovery]`
Parameters	• `detect`—Displays whether error disable detection is enabled. • `recovery`—Displays details of recovery cause, recovery interval, and recovery status of the error disabled port.
Default	None
Command Mode	EXEC
Usage Information	The `Errdisable Cause` column displays one or more reasons for the error-disabled state of an interface. If an interface is put in to error disabled state for multiple reasons, the interface does not come up unless you enable automatic recovery for all reasons.

Example	`OS10# show errdisable detect`
	
	`Error-Disable Cause  Detect Status`

```
-------------------------------------------
bpduguard                          Enabled
```

```
OS10# show errdisable recovery

Error-Disable Recovery Timer Interval : 300 seconds

Error-Disable Reason Recovery Status
-------------------------------------
bpduguard                     Enabled

MLL violation                 Enabled

MAC-move-violation            Enabled

Mac-Learn-Disable violation   Enabled

                                                                    Recovery
Time Left
Interface          Errdisable Cause                                 (seconds)
-------------------------------------------------------------------------------
-
ethernet1/1/1:1    bpduguard                                         30
ethernet1/1/1:2    bpduguard                                         1
ethernet1/1/10     bpduguard/mac-learning-limit/mac-move             10
port-channel100    Mac-learning-limit                                50
port-channel128    mac-move                                          49
port-channel128    Mac-learn-disable                                  9
```

Supported Releases 10.4.2.0 or later

show spanning-tree interface

Displays spanning-tree interface information for Ethernet and port channels.

Syntax `show spanning-tree interface {ethernet node/slot/port [:subport] | port-channel port-id} [detail]`

Parameters

- `ethernet node/slot/port[:subport]`—Displays spanning-tree information for a physical interface.
- `port-channel port-id`—Displays spanning-tree information for a port channel number, from 1 to 999 or 1001 to 2000.
- `detail`—(Optional) Displays detailed information about the interface.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
os10# show spanning-tree interface ethernet 1/1/7 detail
Port 56 (ethernet1/1/7) of vlan1 is designated Forwarding
Port path cost 500, Port priority 128, Port Identifier 128.56
Designated root priority: 32769, address: 34:17:ec:37:14:00
Designated bridge priority: 32769, address: 90:b1:1c:f4:a6:25
Designated port ID: 128.56, designated path cost: 500
Number of transitions to forwarding state: 1
Edge port: No (default)
Link Type: Point-to-Point
BPDU Sent: 6, Received: 6410
```

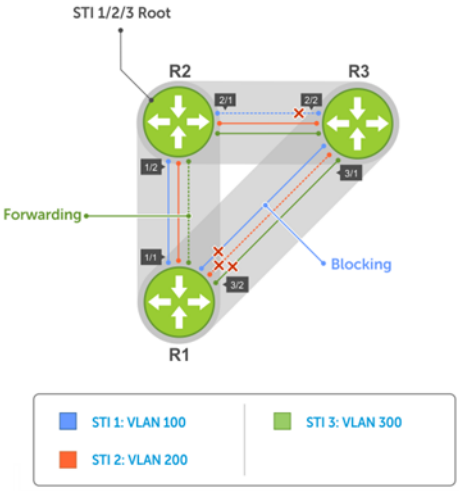
Supported Releases 10.2.0E or later

Rapid per-VLAN spanning-tree

Rapid per-VLAN spanning-tree (Rapid-PVST) is used to create a single topology per VLAN. Rapid-PVST is enabled by default; it provides faster convergence than STP and runs on the default VLAN (VLAN 1).

Configuring Rapid-PVST is a four-step process:

1. Ensure the interfaces are in L2 mode.
2. Place the interfaces in VLANs. By default, switchport interfaces are members of the default (VLAN1).
3. Enable Rapid-PVST. This step is only required if another variation of STP is present.
4. (Optional) Select a non-default bridge-priority for the VLAN for load balancing.



Each VLAN is assigned an incremental default bridge priority. For example, if VLAN 1 is assigned a bridge priority value of 32769, then VLAN 2 (if created) is assigned a bridge priority value of 32770; similarly, VLAN 10 (if created) is assigned a bridge priority value of 32778, and so on. All three instances have the same forwarding topology.

NOTE: Z9332F-ON supports a total of 64 instances, of which 3 VLANs are used for internal purposes. When you run Rapid-PVST flavor, each VLAN allocates one instance until the VLAN count reaches 61 and map the default instance after that.

NOTE: The number of RPVST+ Port VLAN (PV) count supported in SmartFabric OS10 is 400. For example, if you configure 200 RPVST+ VLANs, you can add them to a maximum of two ports and not beyond that count. Similarly, if you have configured 50 RPVST+ VLANs, you can add them to 8 ports.

RSTP/MSTP/Rapid-PVST Force Version

RSTP/MSTP/Rapid-PVST is compatible and interoperable with the Spanning Tree Algorithm and Protocol (STP). An administrative Force Protocol Version parameter allows you to emulate the behavior of the previous versions of the spanning tree protocol that are not required for interoperability. The parameter applies to all the Bridge Ports.

Force protocol version in RSTP

Spanning-tree RSTP force-version (STP)

- Setting the force version to STP forces the RSTP protocol to operate in 802.1D STP mode instead of the default protocol mode, RSTP.
- If the force version is STP, the rapid transitions are disabled.
- Default behavior is RSTP operation mode, which supports faster convergence.

Force protocol version in MSTP

Spanning-tree MST force-version (STP/RSTP)

- Setting the force version to STP forces the MSTP protocol to operate in 802.1D STP mode instead of the default protocol mode, MSTP.
- If Force Protocol Version is STP, rapid transitions are disabled.
- Setting the force version to RSTP forces the MSTP protocol to operate in 802.1w RSTP mode instead of the default protocol mode, MSTP. In this mode, it transmits RST BPDU which skips the MSTI information.

- If Force Protocol Version is STP or RSTP, the received BPDUs are considered from a different MST Region.
- Default behavior is MSTP operation mode, which allows full MSTP behavior.
- OS10 does not support enabling force version per MST instance.

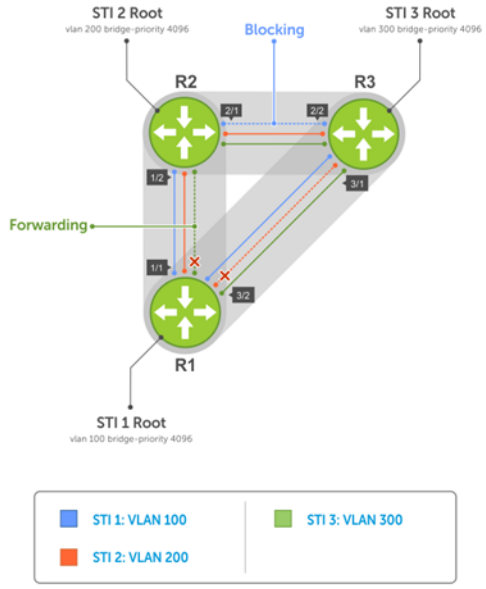
Force protocol version in Rapid-PVST

Spanning-tree Rapid-PVST force-version (STP)

- Setting the force version to STP forces the Rapid-PVST protocol to operate in 802.1D STP mode instead of the default protocol mode RSTP on VLAN 1.
- If force version is STP, the rapid transitions are disabled on VLAN 1.
- OS10 does not support running force version STP on per VLAN level.

Load balance and root selection

By default, all VLANs use the same forwarding topology — R2 is elected as the root and all 10G Ethernet ports have the same cost. Bridge priority can be modified for each VLAN to enable different forwarding topologies.



To achieve Rapid-PVST load balancing, assign a different priority on each bridge.

Enable Rapid-PVST

By default, Rapid-PVST is enabled and creates an instance during VLAN creation. To participate in Rapid-PVST, port-channel or physical interfaces must be a member of a VLAN.

- Enable Rapid-PVST mode in CONFIGURATION mode.

```
spanning-tree mode rapid-pvst
```

Configure Rapid-PVST

```
OS10(config)# spanning-tree mode rapid-pvst
```

View Rapid-PVST configuration

```
os10# show spanning-tree active

```

Select the root bridge

Rapid-PVST determines the root bridge by the VLAN bridge priority. Assign one bridge a lower priority to increase the likelihood that it becomes the root bridge. The `show spanning-tree brief` command displays information about all ports regardless of the operational status.

- Assign a number as the bridge priority or designate it as the root in CONFIGURATION mode, from 0 to 61440.

  ```
  spanning-tree {vlan vlan-id priority priority-value}
  ```

  - *vlan-id* — Enter a value between 1 to 4093.
  - priority *priority-value* — Enter the priority value in increments of 4096, default is 32768. The lower the number assigned, the more likely this bridge becomes the root bridge. The bridge priority the valid values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, or 61440. All other values are rejected.

Configure root bridge

```
OS10(config)# spanning-tree vlan 1 priority 4096
```

Root assignment

Rapid-PVST assigns the root bridge according to the lowest bridge ID. Primary configuration assigns 24576 as the bridge priority whereas secondary configuration assigns 28672 as the bridge priority.

`spanning-tree vlan` *`vlan-id`* `root primary` command ensures that the switch has the lowest bridge priority value by setting the predefined value of 24,576. If an alternate root bridge is required, use the `spanning-tree vlan` *`vlan-id`* `root secondary` command. The command sets the priority for the switch to the predefined value of 28,672. If the primary root bridge fails, the command ensures that the alternate switch becomes the root bridge. It also assumes that the other switches in the network have a defined default priority value of 32,768.

- Configure the device as the root or secondary root in CONFIGURATION mode.

```
spanning-tree vlan vlan-id root {primary | secondary}
```

  - *`vlan-id`* — Enter the VLAN ID number, from 1 to 4093.
  - `primary` — Enter the bridge as primary or root bridge. The primary bridge value is 24576.
  - `secondary` — Enter the bridge as the secondary root bridge. The secondary bridge value is 28672.

Configure root bridge as primary

```
OS10(config)# spanning-tree vlan 1 root primary
```

Verify root bridge information

```
OS10# show spanning-tree active

Global parameters

All non-root bridges accept the timer values on the root bridge.

Forward-time	Amount of time required for an interface to transition from the Discarding state to the Learning state or from the Learning state to the Forwarding state.
Hello-time	Time interval within which the bridge sends BPDUs.
Max-age	Length of time the bridge maintains configuration information before it refreshes information by recomputing the Rapid-PVST topology.

- Modify the forward-time in seconds in CONFIGURATION mode, from 4 to 30, default 15.

```
spanning-tree vlan vlan-id forward-time seconds
```

- Modify the hello-time in seconds in CONFIGURATION mode, from 1 to 10, default 2. With large configurations involving more numbers of ports, Dell Technologies recommends increasing the hello-time.

```
spanning-tree vlan vlan-id hello-time seconds
```

- Modify the max-age (in seconds) in CONFIGURATION mode, from 6 to 40, default 20.

```
spanning-tree vlan vlan-id max-age seconds
```

View Rapid-PVST global parameters

```

Rapid-PVST commands

show spanning-tree vlan

Displays Rapid-PVST status and configuration information by VLAN ID.

Syntax `show spanning-tree vlan vlan-id`

Parameters `vlan vlan-id` — Enter the VLAN ID number, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show spanning-tree
Spanning tree enabled protocol rapid-pvst with force-version rstp
VLAN 1
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32769, Address 3417.eb3a.c080
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 32769, Address 54bf.64be.f640
Configured hello time 2, max age 20, forward delay 15
Flush Interval 200 centi-sec, Flush Invocations 285
Flush Indication threshold 5
```

Supported Releases 10.2.0E or later

spanning-tree vlan cost

Sets the path cost of the interface per VLAN for PVST calculations.

Syntax `spanning-tree vlan vlan-id cost {value}`

Parameters `value` — Enter a port cost value to set the path cost of the interface for PVST calculations, from 1 to 200000000.

Defaults

- 100- Mb/s Ethernet interface = 200000
- 1 Gigabit Ethernet interface = 20000
- 10-Gigabit Ethernet interface = 2000
- Port-channel interface with one 100 Mb/s Ethernet = 200000

- Port-channel interface with one 1 Gigabit Ethernet = 20000
- Port-channel interface with one 10 Gigabit Ethernet = 2000
- Port-channel with two 1 Gigabit Ethernet = 10000
- Port-channel with two 10 Gigabit Ethernet = 1000
- Port-channel with two 100 Mbps Ethernet = 100000

Command Mode INTERFACE

Usage Information The media speed of a LAN interface determines the STP port path cost default value.

Example

```
OS10(conf-if-eth1/1/4)# spanning-tree vlan 10 cost 1000
```

Supported Releases 10.2.0E or later

spanning-tree vlan disable

Disables spanning tree on a specified VLAN.

Syntax `spanning-tree vlan vlan-id disable`

Parameters *vlan-id* — Enter the VLAN ID number, from 1 to 4093.

Default Enabled

Command Mode CONFIGURATION

Usage Information The `no` version of this command enables spanning tree on the specified VLAN.

Example

```
OS10(config)# spanning-tree vlan 100 disable
```

Supported Releases 10.4.0E(R1) or later

spanning-tree vlan forward-time

Configures a time interval for the interface to wait in the Blocking state or Learning state before moving to the Forwarding state.

Syntax `spanning-tree vlan vlan-id forward-time seconds`

Parameters

- *vlan-id*— Enter a VLAN ID number, from 1 to 4093.
- *seconds* — Enter the forward-delay time in seconds, from 4 to 30.

Default 15 seconds

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(config)# spanning-tree vlan 10 forward-time 16
```

Supported Releases 10.2.0E or later

spanning-tree vlan force-version

Configures a forced version of spanning-tree to transmit BPDUs.

Syntax `spanning-tree vlan vlan-id force-version stp`

Parameters	• `stp` — Forces the version for the BPDUs transmitted by MST to STP
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Forces a bridge that supports Rapid-PVST to operate in an STP-compatible mode.
Example	`OS10(config)# spanning-tree rpvst force-version stp`
Supported Releases	10.2.0E or later

spanning-tree vlan hello-time

Sets the time interval between generation and transmission of Rapid-PVST BPDUs.

Syntax	`spanning-tree vlan` *`vlan-id`* `hello-time` *`seconds`*
Parameters	• *`vlan-id`*—Enter the VLAN ID number, from 1 to 4093. • *`seconds`*—Enter a hello-time interval value in seconds, from 1 to 10.
Default	2 seconds
Command Mode	CONFIGURATION
Usage Information	Dell Technologies recommends increasing the hello-time for large configurations, especially configurations with multiple ports.
Example	`OS10(config)# spanning-tree vlan 10 hello-time 5`
Supported Releases	10.2.0E or later

spanning-tree vlan mac-flush-threshold

Configures the MAC-flush threshold value for the specified VLAN.

Syntax	`spanning-tree vlan` *`vlan-id`* `mac-flush-threshold` *`threshold-value`*
Parameters	• *`vlan-id`* — Enter the spanning-tree VLAN ID number, from 1 to 4093. • *`threshold-value`*—Enter the threshold value for the number of flushes, from 0 to 65535. The default value is 5.
Default	5
Command Mode	CONFIGURATION
Usage Information	The threshold value indicates the number of port-based flush requests allowed to be invoked before starting the flush optimization. When the flush interval value is non-zero, port-and-instance-based flushing is triggered until the threshold is reached. Once the threshold is reached, MAC-flush timer starts. On timer expiry, the system triggers VLAN-based flushing. When the timer is running, any port-and-vlan-based flushing is suppressed. The `no` form of the command resets the flush indication threshold of the specific instance to its default value.
Example	`OS10(config)# spanning-tree vlan 100 mac-flush-threshold 255`
Supported Releases	10.4.0E(R1) or later

spanning-tree vlan max-age

Configures the time period the bridge maintains configuration information before refreshing the information by recomputing Rapid-PVST.

Syntax	`spanning-tree vlan vlan-id max-age seconds`
Parameters	`max-age seconds` — Enter a maximum age value in seconds, from 6 to 40.
Default	20 seconds
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# spanning-tree vlan 10 max-age 10`
Supported Releases	10.2.0E or later

spanning-tree vlan priority

Sets the priority value for Rapid-PVST.

Syntax	`spanning-tree vlan vlan-id priority priority value`
Parameters	`priority priority value` — Enter a bridge-priority value in increments of 4096, from 0 to 61440. Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.
Default	32768
Command Mode	CONFIGURATION
Usage Information	The Rapid-PVST protocol determines the root bridge. Assign one bridge a lower priority to increase the probability of it being the root bridge. A lower `priority value` increases the probability of the bridge becoming a root bridge.
Example	`OS10(config)# spanning-tree vlan 10 priority 0`
Supported Releases	10.2.0E or later

spanning-tree vlan priority (Interface)

Sets an interface priority when two bridges compete for position as the root bridge.

Syntax	`spanning-tree vlan vlan-id priority value`
Parameters	`value` — Enter a priority value in the increments of 16, from 0 to 240.
Default	128
Command Mode	INTERFACE
Usage Information	Identifies the interface to be placed into the forwarding mode when resolving a loop. Ports with lower numerical priority values have higher precedence.
Example	`OS10(conf-if-eth1/1/4)# spanning-tree vlan 10 priority 16`
Supported Releases	10.2.0E or later

spanning-tree vlan root

Designates a device as the primary or secondary root bridge.

Syntax `spanning-tree vlan vlan-id root {primary | secondary}`

Parameters
- *vlan-id* — Enter a VLAN ID number, from 1 to 4093.
- `root` — Designate the bridge as the primary or secondary root.
- `primary` — Designate the bridge as the primary or root bridge.
- `secondary` — Designate the bridge as the secondary or secondary root bridge.

Default Not configured

Command Mode CONFIGURATION

Usage Information None

Example
```
OS10(config)# spanning-tree vlan 1 root primary
```

Supported Releases 10.2.0E or later

spanning-tree rapid-pvst default behavior

Allows Rapid PVST+ switching between the current OS10 behavior and behavior expected by vendors other than OS9 or OS10.

Syntax `spanning-tree rapid-pvst default-behavior`

Parameters None

Default Enabled

Command Mode INTERFACE CONFIGURATION

Security and Access Sysadmin, secadmin and netadmin

Usage Information The command is used to enable/disable transmission of RSTP BPDUs in VLAN 1, when the port is an untagged member other than VLAN 1.By default, OS10 sends RSTP BPDU for the untagged VLAN. The `no` version of this command handles the RSTP BPDU for VLAN 1 if the port is a member of VLAN 1. This command should be used on the ports that are connected to vendors other than OS9/OS10.

Example
```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# spanning-tree rapid-pvst default-behavior   RSTP
BPDU is handled for access VLAN
```

```
OS10(conf-if-eth1/1/1)# no spanning-tree rapid-pvst default-behavior
RSTP BPDU is handled for VLAN 1
```

Supported Releases 10.5.2.1 or later

show spanning-tree compatibility-mode

Displays the compatibility mode in which the port is operating.

Syntax `show spanning-tree compatibility-mode [ethernet node/slot/port[:subport] | port-channel channel-number]`

Parameters
- `ethernet` *node/slot/port*`[:`*subport*—Enter the Ethernet information for which the information is to be displayed.

- `port-channel` *`channel-number`*—Enter a port channel interface number, from 1 to 999 or 1001 to 2000.

Default None

Command Mode EXEC

Security and Access sysadmin, secadmin, and netadmin

Usage Information None

Example (Rapid-PVST mode)

```
OS10# show spanning-tree compatibility-mode
Interface
Name               Instance  Compatibility-mode
-------------------------------------------------
ethernet1/1/1      VLAN 1    RSTP
ethernet1/1/1      VLAN 2    RSTP
ethernet1/1/1      VLAN 3    RSTP
ethernet1/1/1      VLAN 4    RSTP
ethernet1/1/1      VLAN 5    RSTP
ethernet1/1/2      VLAN 1    STP
ethernet1/1/2      VLAN 2    STP
ethernet1/1/2      VLAN 3    STP
ethernet1/1/2      VLAN 4    STP
ethernet1/1/2      VLAN 5    STP
```

```
OS10# show spanning-tree compatibility-mode port-channel 1
Interface
Name            Instance     Compatibility Mode
-------------------------------------------------
port-channel1  VLAN 1       STP
```

```
OS10# show spanning-tree compatibility-mode ethernet 1/1/1
Interface
Name           Instance      Compatibility Mode
-------------------------------------------------
ethernet1/1/1 VLAN 1        RSTP
```

Example (MSTP mode)

```
OS10# show spanning-tree compatibility-mode
Interface
Name               Instance  Compatibility-mode
-------------------------------------------------
ethernet1/1/1      MSTI 0    RSTP
ethernet1/1/1      MSTI 1    RSTP
ethernet1/1/1      MSTI 2    RSTP
ethernet1/1/2      MSTI 0    RSTP
ethernet1/1/2      MSTI 1    RSTP
ethernet1/1/2      MSTI 2    RSTP
ethernet1/1/3:1    MSTI 0    STP
ethernet1/1/3:1    MSTI 1    STP
ethernet1/1/3:1    MSTI 2    STP
```

Example (RSTP mode)

```
OS10# show spanning-tree compatibility-mode
Interface
Name               Instance  Compatibility-mode
-------------------------------------------------
ethernet1/1/1      RSTP 1    RSTP
ethernet1/1/2      RSTP 1    RSTP
ethernet1/1/3:1    RSTP1     RSTP
```

Supported Releases 10.5.2.1 or later

spanning-tree rapid-pvst force-version

Configures a forced version of spanning-tree to transmit BPDUs.

Syntax	`spanning-tree rapid-pvst force-version stp`
Parameters	• `stp` — Forces the version for the BPDUs transmitted by Rapid-PVST to STP
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Forces a bridge that supports Rapid-PVST to operate in an STP-compatible mode.
Example	`OS10(config)# spanning-tree rapid-pvst force-version stp`
Supported Releases	10.2.0E or later

Rapid Spanning-Tree Protocol

Rapid Spanning-Tree Protocol (RSTP) is similar to STP, but provides faster convergence and interoperability with devices configured with STP and MSTP. RSTP is disabled by default. All enabled interfaces in L2 mode automatically add to the RSTP topology.

Configuring RSTP is a two-step process:

1. Ensure that the interfaces are in L2 mode.
2. Globally enable RSTP.

Enable STP globally and at interface

RSTP enables STP on all physical and port-channel interfaces which are in L2 mode to automatically include the interfaces as part of the RSTP topology. Only one path from a bridge to any other bridge is enabled. Bridges block a redundant path by disabling one of the link ports.

Enable globally

- Configure Spanning-Tree mode to RSTP in CONFIGURATION mode.

```
spanning-tree mode rstp
```

- Disable RSTP globally for all L2 interfaces in CONFIGURATION mode.

```
spanning-tree disable
```

- Re-enable RSTP globally for all L2 interfaces in CONFIGURATION mode.

```
no spanning-tree disable
```

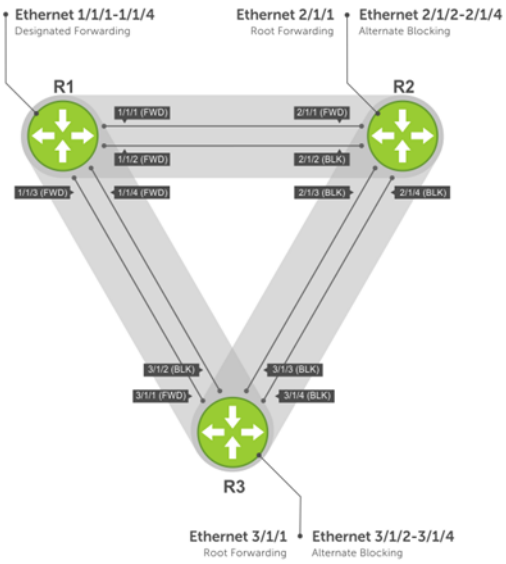
Enable at interface

- Remove an interface from the RSTP topology in INTERFACE mode.

```
spanning-tree disable
```

- Re-enable an interface in INTERFACE mode.

```
no spanning-tree disable
```



View all port participating in RSTP

```

```

NOTE: In a VLAN setup that contains IOM fabrics running more than 100 VLANs, enable RSTP before deploying the template from OME-M.

Global parameters

The root bridge sets the values for forward-time, hello-time, and max-age, and overwrites the values set on other bridges participating in the RSTP group.

NOTE: Dell Technologies recommends that only experienced network administrators change the RSTP group parameters. Poorly planned modification of the RSTP parameters can negatively affect network performance.

Forward-time	15 seconds — Amount of time an interface waits in the Learning state before it transitions to the Forwarding state.
Hello-time	2 seconds — Time interval in which the bridge sends RSTP BPDUs.
Max-age	20 seconds — Length of time the bridge maintains configuration information before it refreshes that information by recomputing the RSTP topology.
Port cost	Port cost values to set the path cost of the interface: • 100-Mb/s Ethernet interfaces — 200000 • 1-Gigabit Ethernet interfaces — 20000 • 10-Gigabit Ethernet interfaces — 2000 • 40-Gigabit Ethernet interfaces — 500 • Port-channel with 100 Mb/s Ethernet interfaces — 200000 • Port-channel with 1-Gigabit Ethernet interfaces — 20000 • Port-channel with 10-Gigabit Ethernet interfaces — 2000 • Port-channel with 1x40Gigabit Ethernet interface — 500 • Port-channel with 2x40Gigabit Ethernet interfaces — 250

- Change the forward-time in CONFIGURATION mode, from 4 to 30, default 15.

```
spanning-tree rstp forward-time seconds
```

- Change the hello-time in CONFIGURATION mode, from 1 to 10, default 2. With large configurations, especially those configurations with more ports, Dell Technologies recommends increasing the hello-time.

```
spanning-tree rstp hello-time seconds
```

- Change the max-age in CONFIGURATION mode, from 6 to 40, default 20.

```
spanning-tree rstp max-age seconds
```

Interface parameters

Set the port cost and port priority values on interfaces in L2 mode.

Port cost	Value based on the interface type. The previous table lists the default values. The greater the port cost, the less likely the port is selected as a forwarding port.
Port priority	Influences the likelihood a port is selected to be a forwarding port in case several ports have the same port cost.

- Change the port cost of an interface in INTERFACE mode, from 1 to 200000000.

```
spanning-tree rstp cost cost
```

- Change the port priority of an interface in INTERFACE mode, from 0 to 240, default 128.

```

```

Root bridge selection

RSTP determines the root bridge. Assign one bridge a lower priority to increase the likelihood that it is selected as the root bridge.

- Assign a number as the bridge priority or designate it as the primary or secondary root bridge in CONFIGURATION mode. Configure the priority value range, from 0 to 65535 in multiples of 4096, default 32768. The lower the number assigned, the more likely the bridge becomes the root bridge.

```

Spanning-tree link type for rapid state transitions

As specified in IEEE 802.1w, OS10 assumes a port that runs in full-duplex mode is a point-to-point link. A point-to-point link transitions to forwarding state faster. By default, OS10 derives the link type of a port from the duplex mode. You can override the duplex mode using the `spanning-tree link-type` command.

OS10 assumes a port that runs in half-duplex mode is a shared link, to which the fast transition feature is not applicable. Also, If you explicitly designate a port as a shared link, you cannot use the fast transition feature, regardless of the duplex setting.

To hasten the spanning-tree state transitions, you can set the link type to point-to-point. To set the link type to point-to-point:

- Use the following command in INTERFACE mode.

```
spanning-tree link-type point-to-point
```

RSTP commands

show spanning-tree active

Displays the RSTP configuration and information for RSTP-active interfaces.

Syntax	`show spanning-tree active`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	

```
OS10# show spanning-tree active

Spanning tree enabled protocol rstp with force-version rstp
Executing IEEE compatible Spanning Tree Protocol

```

Supported Releases 10.2.0E or later

spanning-tree mode rstp

Enables an STP type: RSTP.

Syntax `spanning-tree mode rstp`

Parameters
- `rstp` — Sets STP mode to RSTP.

Default Rapid-PVST

Command Mode CONFIGURATION

Usage Information All STP instances stop in the previous STP mode and restart in the new mode. You can also change to RSTP/MST mode.

Example

```
OS10(config)# spanning-tree mode rstp
```

Supported Releases 10.2.0E or later

spanning-tree rstp force-version

Configures a forced version of spanning tree to transmit BPDUs.

Syntax `spanning-tree rstp force-version` *stp*

Parameters *stp* — Force the version for the BPDUs transmitted by RSTP.

Default Not configured

Command Mode CONFIGURATION

Usage Information Forces a bridge to operate in an STP-compatible manner to avoid frame mis-ordering and duplication in known LAN protocols that are sensitive.

Example

```
OS10(config)# spanning-tree rstp force-version stp
```

Supported Releases 10.2.0E or later

spanning-tree rstp forward-time

Configures a time interval for the interface to wait in the Blocking state or Learning state before moving to the Forwarding state.

Syntax `spanning-tree rstp forward-time` *seconds*

Parameters *seconds* — Enter the number of seconds an interface waits in the Blocking or Learning States before moving to the Forwarding state, from 4 to 30.

Default 15 seconds

Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# spanning-tree rstp forward-time 16`
Supported Releases	10.2.0E or later

spanning-tree rstp hello-time

Sets the time interval between generation and transmission of RSTP BPDUs.

Syntax	`spanning-tree rstp hello-time` *seconds*
Parameters	*seconds*—Enter a hello-time interval value in seconds, from 1 to 10.
Default	2 seconds
Command Mode	CONFIGURATION
Usage Information	Dell Technologies recommends increasing the hello-time for large configurations, especially configurations with multiple ports.
Example	`OS10(config)# spanning-tree rstp hello-time 5`
Supported Releases	10.2.0E or later

spanning-tree rstp mac-flush-threshold

Sets the flush indication threshold value on the RSTP instance.

Syntax	`spanning-tree rstp mac-flush-threshold` *threshold-value*
Parameters	*threshold-value*—Enter the threshold value for the number of flushes, from 0 to 65535. The default value is 65535.
Default	65535
Command Mode	CONFIGURATION
Usage Information	The threshold value indicates the number of flush indications to go before the flush interval timer is triggered. When flush indication threshold is set to the default value and the flush interval is set to a non-default value, flushing occurs during the first flush indication trigger. When the flush indication threshold value is non-default (n) and flush interval value is non-default, port-based flushing is triggered until the threshold (n) is reached. Once the threshold is reached, the MAC flush timer starts. On timer expiry, the system triggers instance-based flushing. When the timer is running, all port-and-instance-based flushing is suppressed. The `no` form of the command sets the flush indication threshold to its default value.
Example	`OS10(config)# spanning-tree rstp mac-flush-threshold 255`
Supported Releases	10.4.0E(R1) or later

spanning-tree rstp max-age

Configures the time period the bridge maintains configuration information before refreshing the information by recomputing the RSTP topology.

Syntax	`max-age` *seconds*
Parameters	*seconds* — Enter a maximum age value in seconds, from 6 to 40.

Default	20 seconds
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# spanning-tree rstp max-age 10`
Supported Releases	10.2.0E or later

spanning-tree rstp priority

Sets the priority value for RSTP.

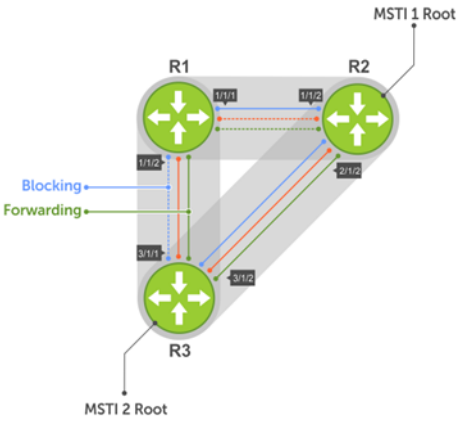
Syntax	`spanning-tree rspt priority priority value`
Parameters	`priority priority value` — Enter a bridge-priority value in increments of 4096, from 0 to 61440. Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	RSTP determines the root bridge but you can assign one bridge a lower priority to increase the probability of it being the root bridge. A lower `priority value` increases the probability of the bridge becoming a root bridge.
Example	`OS10(config)# spanning-tree rstp priority 5002`
Supported Releases	10.2.0E or later

Multiple Spanning-Tree

MSTP is one of the variations of the rapid spanning-tree protocol that mitigates some of the challenges of Rapid-PVST. Rapid-PVST allows a spanning-tree instance for each VLAN. This 1:1 approach is not suitable if you have multiple VLANs — each spanning-tree instance costs bandwidth and processing resources. You can configure Multiple Spanning-Tree Instances (MSTIs) and map multiple VLANs to one spanning-tree instance to reduce the total number of instances..

When you enable MST, all ports in Layer 2 (L2) mode participate in all instances of MST. OS10 only supports one MST region.

You can achieve load balancing using the MST protocol (MSTP). For example, as shown in the following figure, when you map three VLANs to two multiple spanning-tree instances (MSTIs), VLAN 100 traffic takes a different path than VLAN 200 and 300 traffic.



Configuring MST is a four-step process:

1. Enable MST, if the current running spanning-tree protocol (STP) version is not MST.
2. (Optional) Map the VLAN to different instances in such a way that the traffic is load balanced well and the link utilization is efficient.
3. Ensure the same region name is configured in all the bridges running MST.
4. (Optional) Configure the revision number. The revision number is the same on all the bridges.

Configure MSTP

When you enable MST globally, all switch ports, port-channels, and VLAN interfaces get automatically assigned to MSTI zero (0). In a MSTI, only one path is enabled for forwarding.

- Enable MST in CONFIGURATION mode.

```
spanning-tree mode mst
```

Configure and verify MSTP

```
OS10(config)# spanning-tree mode mst
OS10(config)# do show spanning-tree
show spanning-tree mst configuration
Region Name: abc
Revision: 0
MSTI    VID
0       1,7-4093
1       2
2       3
3       4
4       5
5       6
```

Add or remove interfaces

By default, all interfaces are enabled in L2 switchport mode, and all L2 interfaces are part of spanning-tree.

- Disable spanning-tree on an interface in INTERFACE mode.

```
spanning-tree disable
```

- Enable MST on an interface in INTERFACE mode.

```
no spanning-tree disable
```

Create instances

You can create multiple MSTP instances and map VLANs. To take full advantage of the MSTP, create multiple MSTIs and map VLANs to them.

1. Enter an instance number in CONFIGURATION mode.

```
spanning tree mst configuration
```

2. Enter the MST instance number in MULTIPLE-SPANNING-TREE mode, from 0 to 63. For Z9332F-ON platform, the MULTIPLE-SPANNING-TREE mode is from 0 to 61.

```
instance instance-number
```

3. Enter the VLAN and IDs to participate in the MST instance in MULTIPLE-SPANNING-TREE mode, from 1 to 4096.

```
instance vlan-id
```

Create MST instances

```
OS10(config)# spanning-tree mst configuration
OS10(conf-mst)# name Dell
```

```
OS10(conf-mst)# revision 100
OS10(conf-mst)# instance 1 vlan 2-10
OS10(conf-mst)# instance 2 vlan 11-20
OS10(conf-mst)# instance 3 vlan 21-30
```

View VLAN instance mapping

```
OS10# show spanning-tree mst configuration
Region Name: Dell
Revision: 100
MSTI    VID
0       1,31-4093
1       2-10
2       11-20
3       21-30
```

View port forwarding/discarding state

```

```

Root selection

MSTP determines the root bridge according to the lowest bridge ID. To increase the likelihood of a bridge to be selected as a root bridge, assign a lower bridge priority numerical value to that bridge.

You can set the priority value to `0` to force a switch to become the root switch. Value `0` is the highest priority.

- Assign a bridge priority number to a specific instance in CONFIGURATION mode, from 0 to 61440 in increments of 4096, default 32768.

  ```
  spanning-tree mst instance-number priority priority
  ```

Assign root bridge priority

```
OS10(config)# spanning-tree mst 0 priority 32768
```

Verify root bridge priority

```
OS10# show spanning-tree active
Spanning tree enabled protocol msti with force-version mst
MSTI 0 VLANs mapped 1,31-4093
```

```
Executing IEEE compatible Spanning Tree Protocol

```

Non-Dell Technologies hardware

OS10 supports only one MST region. For a bridge to be in the same MST region as another, the following attributes must match the unique name, revision, and VLAN mapping. The default value for name is system mac. In case of Dell Technologies, the user has to manually configure an unique name in all the nodes to be in a single region. If you have non-Dell Technologies hardware that participates in MST, ensure these values match on all devices.

A region is a combination of three unique attributes:

- Name — A mnemonic string you assign to the region. The default is the system MAC address.
- Revision — A 2-byte number. The default is 0.
- VLAN-to-instance mapping — Placement of a VLAN in an MSTI.

Region name or revision

You can change the MSTP region name or revision.

- Change the region name in MULTIPLE-SPANNING-TREE mode. A maximum of 32 characters.

  ```
  name name
  ```

- Change the region revision number in MULTIPLE-SPANNING-TREE mode, from 0 to 65535, default 0.

  ```
  revision number
  ```

Configure and verify region name

```
OS10(conf-mstp)# name my-mstp-region
OS10(conf-mstp)# do show spanning-tree mst config
MST region name: my-mstp-region
Revision: 0
MSTI   VID
  1    100
  2    200-300
```

Modify parameters

The root bridge sets the values for forward-delay, hello-time, max-age, and max-hops and overwrites the values set on other MST bridges.

Forward-time	Time an interface waits in the Discarding state and Learning state before it transitions to the Forwarding state.
Hello-time	Interval in which the bridge sends MST BPDUs.
Max-age	Length of time the bridge maintains configuration information before it refreshes that information by recomputing the MST topology.

Max-hops A maximum number of hops a BPDU travels before a receiving device discards it.

NOTE: Dell Technologies recommends that only experienced network administrators change MST parameters. Poorly planned modification of MST parameters can negatively affect network performance.

1. Change the forward-time parameter in CONFIGURATION mode, from 4 to 30, default 15.

```
spanning-tree mst forward-time seconds
```

2. Change the hello-time parameter in CONFIGURATION mode, from 1 to 10, default 2. Dell Technologies recommends increasing the hello-time for large configurations, especially configurations with more ports.

```
spanning-tree mst hello-time seconds
```

3. Change the max-age parameter in CONFIGURATION mode, from 6 to 40, default 20.

```
spanning-tree mst max-age seconds
```

4. Change the max-hops parameter in CONFIGURATION mode, from 1 to 40, default 20.

```
spanning-tree mst max-hops number
```

MST configuration

```
OS10(config)# spanning-tree mst
OS10(config)# spanning-tree mst forward-time 16
OS10(config)# spanning-tree mst hello-time 5
OS10(config)# spanning-tree mst max-age 10
OS10(config)# spanning-tree mst max-hops 30
```

View MSTP parameter values

```

```

Interface parameters

Adjust two interface parameters to increase or decrease the likelihood that a port becomes a forwarding port.

Port cost Interface type value. The greater the port cost, the less likely the port is a forwarding port.

Port priority Influences the likelihood that a port is selected as a forwarding port if several ports have the same port cost.

Default values for the port cost by interface:

- 100-Mb/s Ethernet interfaces — 200000
- 1-Gigabit Ethernet interfaces — 20000
- 10-Gigabit Ethernet interfaces — 2000
- Port-channel with 100 Mb/s Ethernet interfaces — 200000

- Port-channel with 1-Gigabit Ethernet interfaces — 20000
- Port-channel with 10-Gigabit Ethernet interfaces — 2000

1. Change the port cost of an interface in INTERFACE mode, from 1 to 200000000.

```
spanning-tree msti number cost 1
```

2. Change the port priority of an interface in INTERFACE mode, from 0 to 240 in increments of 16, default 128.

```
spanning-tree msti number priority 32
```

View MSTi interface configuration

```
OS10(conf-if-eth1/1/7)# do show spanning-tree msti 0 interface ethernet 1/1/7
ethernet1/1/7 of MSTI 0 is Designated Forwarding
Edge port: No (default)
Link type: point-to-point (auto)

```

MST commands

instance

Configures MST instances and one or multiple VLANs mapped to the MST instance.

Syntax	`instance instance-number {vlan vlan-range}`
Parameters	• *instance* — Enter a MST instance value, from 0 to 63. For Z9332F-ON platform, enter a MST instance value from 0 to 61. • `vlan range` — Enter a VLAN range value, from 1 to 4093.
Default	Not configured
Command Mode	MULTIPLE-SPANNING-TREE
Usage Information	By default, all VLANs map to MST instance zero (0) unless you are using the `vlan range` command to map the VLANs to a non-zero instance. The `no` version of this command removes the instance-related configuration.

Example	`OS10(conf-mst)# instance 1 vlan 2-10`
	`OS10(conf-mst)# instance 2 vlan 11-20`
	`OS10(conf-mst)# instance 3 vlan 21-30`

Supported Releases	10.2.0E or later

name

Assigns a name to the MST region.

Syntax	`name` **`region-name`**
Parameters	**`region-name`** — Enter a name for an MST region. A maximum of 32 characters.
Default	System MAC address
Command Mode	MULTIPLE-SPANNING-TREE

Usage Information	By default, the MST protocol assigns the system MAC address as the region name. Two MST devices within the same region must share the same region name, including matching case.
Example	`OS10(conf-mst)# name my-mst-region`
Supported Releases	10.2.0E or later

revision

Configures a revision number for the MSTP configuration.

Syntax	`revision` *`number`*
Parameters	*`number`* — Enter a revision number for the MSTP configuration, from 0 to 65535.
Default	0
Command Mode	MULTIPLE-SPANNING-TREE
Usage Information	To have a bridge in the same MST region as another, the default values for the revision number must match on all Dell Technologies hardware devices. If there are non-Dell Technologies devices, ensure the revision number value matches on all the devices. For more information, see Non-Dell Hardware.
Example	`OS10(conf-mst)# revision 10`
Supported Releases	10.2.0E or later

spanning-tree mst

Configures an MST instance and determines root and bridge priorities.

Syntax	`spanning-tree mst` *`instance number`* `priority | root {primary | secondary}`
Parameters	• *`instance number`* — Enter an MST instance number, from 0 to 63. For Z9332F-ON platform, enter a MST instance value from 0 to 61. • `priority` *`priority value`* — Set a bridge priority value in increments of 4096, from 0 to 61440. Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected. • `root` — Enter a primary or secondary root. • `primary` — Enter a device as a primary root. • `secondary` — Enter a device as a secondary root.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The MSTP determines the root bridge but you can assign one bridge a lower priority to increase the probability it being the root bridge. A lower *`priority-value`* increases the probability of the bridge becoming a root bridge. The `no` version of this command resets the value to the default.
Example	`OS10(config)# spanning-tree mst 0 priority 0` `OS10(config)# spanning-tree mst 2 root primary`
Supported Releases	10.2.0E or later

spanning-tree msti

Configures the MSTI, cost, and priority values for an interface.

Syntax `spanning-tree msti instance {cost cost | priority value}`

Parameters

- `msti instance` — Enter the MST instance number, from 0 to 63. For Z9332F-ON platform, enter a MST instance value from 0 to 61.
- `cost cost` — (Optional) Enter a port cost value, from 1 to 200000000. Default values:
  - 100 Mb/s Ethernet interface = 200000
  - 1-Gigabit Ethernet interface = 20000
  - 10-Gigabit Ethernet interface = 2000
  - Port-channel interface with one 100 Mb/s Ethernet = 200000
  - Port-channel interface with one 1 Gigabit Ethernet = 20000
  - Port-channel interface with one 10 Gigabit Ethernet = 2000
  - Port-channel with two 1 Gigabit Ethernet = 18000
  - Port-channel with two 10 Gigabit Ethernet = 1800
  - Port-channel with two 100 Mbps Ethernet = 180000
- `priority value` — Enter a value in increments of 16 as the priority, from 0 to 240, default 128.

Default Priority value is 128

Command Mode INTERFACE

Usage Information The `cost` value is based on the interface type. The greater the `cost` value, the less likely the port is selected to be a forwarding port. The `priority` influences the likelihood that a port is selected to be a forwarding port if several ports have the same cost value.

Example

```
OS10(conf-if-eth1/1/1)# spanning-tree msti 1 priority 0
OS10(conf-if-eth1/1/1)# spanning-tree msti 1 cost 3
```

Supported Releases 10.2.0E or later

spanning-tree mst configuration

Enters MST mode to configure MSTP from Configuration mode.

Syntax `spanning-tree mst configuration`

Parameters None

Default Disabled

Command Mode CONFIGURATION

Usage Information Use this command to enter STP MST configuration mode.

Example

```
OS10(config)# spanning-tree mst configuration
OS10(conf-mst)#
```

Supported Releases 10.2.0E or later

spanning-tree mst disable

Disables spanning tree on the specified MST instance.

Syntax `spanning-tree mst instance-number disable`

Parameters *instance-number*—Enter the instance number, from 0 to 63.For Z9332F-ON platform, enter a MST instance value from 0 to 61.

Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command enables spanning tree on the specified MST instance.
Example	`OS10(config)# spanning-tree mst 10 disable`
Supported Releases	10.4.0E(R1) or later

spanning-tree mst force-version

Configures a forced version of STP to transmit BPDUs.

Syntax	`spanning-tree mst force-version {stp | rstp}`
Parameters	• `stp` — Forces the version for the BPDUs transmitted by MST to STP. • `rstp` — Forces the version for the BPDUs transmitted by MST to RSTP.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Forces a bridge that supports MST to operate in a STP-compatible mode.
Example	`OS10(config)# spanning-tree mst force-version stp` `OS10(config)# spanning-tree mst force-version rstp`
Supported Releases	10.2.0E or later

spanning-tree mst forward-time

Configures a time interval for the interface to wait in the Blocking state or the Learning state before moving to the Forwarding state.

Syntax	`spanning-tree mst forward-time` *seconds*
Parameters	*seconds* — Enter the number of seconds an interface waits in the Blocking or Learning States before moving to the Forwarding state, from 4 to 30.
Default	15 seconds
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# spanning-tree mst forward-time 16`
Supported Releases	10.2.0E or later

spanning-tree mst hello-time

Sets the time interval between generation and transmission of MSTP BPDUs.

Syntax	`spanning-tree mst hello-time` *seconds*
Parameters	*seconds* — Enter a hello-time interval value in seconds, from 1 to 10.

Default	2 seconds
Command Mode	CONFIGURATION
Usage Information	Dell Technologies recommends increasing the hello-time for large configurations, especially configurations with multiple ports. The `no` version of this command resets the value to the default.
Example	`OS10(config)# spanning-tree mst hello-time 5`
Supported Releases	10.2.0E or later

spanning-tree mst mac-flush-threshold

Configures the mac-flush threshold value for a specific instance.

Syntax	`spanning-tree mst` *`instance-number`* `mac-flush-threshold` *`threshold-value`*
Parameters	• *`instance-number`*—Enter the instance number, from 0 to 4094. • *`threshold-value`*—Enter the threshold value for the number of flushes, from 0 to 65535. The default value is 5.
Default	5
Command Mode	CONFIGURATION
Usage Information	This threshold indicates the number of port-based flush requests allowed to be invoked before starting the flush optimization. When the flush interval value is non-zero, port-and-instance-based flushing is triggered until the threshold is reached. Once the threshold is reached the MAC flush timer starts. On timer expiry, the system triggers instance-based flushing. When the timer is running, all port-and-instance-based flushing is suppressed. The `no` form of the command sets the flush indication threshold of the specific instance to its default value.
Example	`OS10(config)# spanning-tree mst 10 mac-flush-threshold 255`
Supported Releases	10.4.0E(R1) or later

spanning-tree mst max-age

Configures the time period the bridge maintains configuration information before refreshing the information by recomputing the MST topology.

Syntax	`max-age` *`seconds`*
Parameters	*`seconds`* — Enter a maximum age value in seconds, from 6 to 40.
Default	20 seconds
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# spanning-tree mst max-age 10`
Supported Releases	10.2.0E or later

spanning-tree mst max-hops

Configures the maximum hop count for a BPDU to travel before it is discarded.

Syntax `spanning-tree mst max-hops number`

Parameters *number* — Enter a maximum hop value, from 6 to 40.

Default 20

Command Mode CONFIGURATION

Usage Information A device receiving BPDUs waits until the `max-hops` value expires before discarding it. When a device receives the BPDUs, it decrements the received value of the remaining hops and uses the resulting value as remaining-hops in the BPDUs. If the remaining MSTP 1333 hops reach zero, the device discards the BPDU and ages out any information that it holds for the port. The command configuration applies to all common IST (CIST) in the MST region.

Example

```
OS10(config)# spanning-tree mst max-hops 30
```

Supported Releases 10.2.0E or later

show spanning-tree mst

Displays MST configuration information.

Syntax `show spanning-tree mst configuration`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Enable MSTI before using this command.

Example

```
OS10# show spanning-tree mst configuration
Region Name: asia
Revision: 0
MSTI    VID
0       1,7-4093
1       2
2       3
3       4
4       5
5       6
```

Supported Releases 10.2.0E or later

show spanning-tree msti

Displays MST instance information.

Syntax `show spanning-tree msti [instance-number [brief | guard | virtual-interface | interface interface]]`

Parameters

- *instance-number*—(Optional) Displays MST instance information, from 0 to 63. For Z9332F-ON platform, enter a MST instance value from 0 to 61.
- `brief`—(Optional) Displays MST instance summary information.
- `guard`—(Optional) Displays which guard is enabled and the current port state.
- `virtual-interface`—(Optional) Displays MST information specific to VLT.
- `interface interface`—(Optional) Displays interface type information:

- `ethernet node/slot/port[:subport]`—Enter the Ethernet port information, from 1 to 48.
- `port-channel`—Enter the port channel interface information, from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information View the MST instance information for a specific MST instance number in detail or brief, or view physical Ethernet ports or port channel information.

Example (Brief)

```
OS10# show spanning-tree msti 0 brief
Spanning tree enabled protocol msti with force-version mst
MSTI 0 VLANs mapped 1-99,101-199,301-4093
Executing IEEE compatible Spanning Tree Protocol
Root ID    Priority 32768, Address 90b1.1cf4.9b8a

```

Command History

10.2.0E or later

Virtual LANs

VLANs segment a single flat L2 broadcast domain into multiple logical L2 networks. Each VLAN is uniquely identified by a VLAN ID or tag consisting of 12 bits in the Ethernet frame. VLAN IDs range from 1 to 4093 and provide a total of 4093 logical networks.

You can assign ports on a single physical device to one or more VLANs creating multiple logical instances on a single physical device. The virtual logical switches spanning across different physical devices emulate multiple logically segmented L2 networks on a single physical network.

Each VLAN has its own broadcast domain. The unicast, multicast, and broadcast network traffic from ports that belong to a VLAN forwards or floods to ports in the same VLAN only. Traffic between VLANs routes from one VLAN to another. You can also assign each VLAN an IP address to group all the ports within a single IP subnet.

Segment a L2 network using VLANs to:

- Minimize broadcast and multicast traffic in the L2 network
- Increase security by isolating ports into different VLANs
- Ease network management

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

The valid VLAN ID range displays as 1-4093. VLAN IDs 4094 and 4095 are reserved for internal use.

Default VLAN

All interface ports are administratively up in L2 mode and are automatically placed in the default VLAN as untagged interfaces.

When you assign a port to a non-default VLAN in Trunk mode, the interface remains an untagged member of the default VLAN and a tagged member of the new VLAN. When you assign a port to a non-default VLAN in Access mode, it removes from the default VLAN and is assigned to the new VLAN as an untagged member of the new VLAN.

- VLAN 1 is the default VLAN.
- You cannot delete the default VLAN. However, you can change the default VLAN ID number using the `default vlan-id` command.

Use the `show vlan` command to verify that the interface is part of the default VLAN (VLAN 1).

Default VLAN configuration

```
OS10# show vlan
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description   Q Ports
*   1      Active                  A Eth1/1/1-1/1/54
```

Default Management VLAN

SFS sets the MAC of the default management VLAN 4020 to the system MAC. This is different from the MAC that is used for Data VLAN. If you change the default management VLAN, the new management VLAN will also have the system MAC.

NOTE: When the network operator initiates the upgrade, the management VLAN MAC will change automatically. Due to this change you may observe a change in the IP when MAC-IP binding is enabled.

Create or remove VLANs

You can create VLANs and add physical interfaces or port-channel interfaces to the VLAN as tagged or untagged members. You can add an Ethernet interface as a trunk port or as an access port, but it cannot be added as both simultaneously.

Multiple non-default vlans with physical and port channel ports in Access and Trunk modes

```
OS10# show vlan
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
     NUM    Status    Description                    Q Ports
*    1      Active                                   A Eth1/1/1,1/1/4-1/1/21,1/1/24
                                                     A Po20,41-48,101
                                                     A Po40
     200    Active                                   T Eth1/1/3:2
                                                     T Po40
                                                     A Eth1/1/31
     320    Active                                   T Eth1/1/25:4 1/1/32
                                                     T Po40
                                                     A Eth1/1/3:1 49 1/1/50 1/1/51 1/1/52
```

The `shutdown` command stops L3–routed traffic only. L2 traffic continues to pass through the VLAN. If the VLAN is not a routed VLAN configured with an IP address, the `shutdown` command has no effect on VLAN traffic.

When you delete a VLAN using the `no interface vlan` *vlan-id* command, any interfaces that are assigned to that VLAN are assigned to the default VLAN as untagged interfaces.

To configure a port-based VLAN, enter INTERFACE-VLAN mode for VLAN-related configuration tasks and create a VLAN. To enable the VLAN, assign member interfaces in L2 mode.

1. Create a VLAN or a range of VLANs in CONFIGURATION mode. Enter the VLAN ID numbers from 1 to 4093.

   ```
   interface vlan vlan-id
   ```

   ```
   interface range vlan vlanID-vlanID,[...]
   ```

2. Delete a VLAN or a range of VLANs in CONFIGURATION mode.

   ```
   no interface vlan vlan-id
   ```

   ```
   no interface range vlan vlanID-vlanID,[...]
   ```

Create VLAN

```
OS10(config)# interface vlan 108
```

Create a range of VLANs

```
OS10(config)# interface range vlan 2-10
```

Delete VLAN

```
OS10(config)# no interface vlan 108
```

Delete a range of VLANs

```
OS10(config)# no interface range vlan 2-10
```

View configured VLANs

```
OS10# show interface vlan

Vlan 1 is up, line protocol is up
Address is 00:00:00:00:00:c9, Current address is 00:00:00:00:10:c9
Interface index is 69208865
Internet address is 10.1.1.1/24
Mode of IPv4 Address Assignment: MANUAL
Interface IPv6 oper status: Enabled
Link local IPv6 address: fe00::0000:0000:0000:10c0/64
Global IPv6 address: 2001:200:1:1::5/64
MTU 1532 bytes, IP MTU 1500 bytes

Output statistics:
    0 packets, 0 octets
Time since last interface status change: 15:47:04
```

Access mode

An access port is an untagged member of only one VLAN. Configure a port in Access mode and configure which VLAN carries the traffic for that interface. If you do not configure the VLAN for a port in Access mode, or an access port, the interface carries traffic for VLAN 1, the default VLAN.

Change the access port membership in a VLAN by specifying the new VLAN. You must create the VLAN before you can assign the port in Access mode to that VLAN. Use the `no switchport access vlan` command to reset to default VLAN.

1. Configure a port in CONFIGURATION mode.

```
interface ethernet node/slot/port[:subport]
```

2. Set the interface to Switchport mode as access in INTERFACE mode.

```
switchport mode access
```

3. Enter the VLAN number for the untagged port in INTERFACE mode.

```
switchport access vlan vlan-id
```

Configure port in Access mode

```
OS10(config)# interface ethernet 1/1/9
OS10(config-if-eth1/1/9)# switchport mode access
OS10(config-if-eth1/1/9)# switchport access vlan 604
```

Show running configuration

```
OS10# show running-configuration
...
!
 interface ethernet1/1/5
...
 switchport access vlan 604
 no shutdown
!
interface vlan1
 no shutdown
...
```

Trunk mode

A trunk port can be a member of multiple VLANs set up on an interface. A trunk port transmits traffic for all VLANs. To transmit traffic on a trunk port with multiple VLANs, OS10 uses tagging or the 802.1q encapsulation method.

1. Configure a port in CONFIGURATION mode.

```
interface ethernet node/slot/port[:subport]
```

2. Change Switchport mode to Trunk mode in INTERFACE mode.

```
switchport mode trunk
```

3. Enter the allowed VLANs on the trunk port in INTERFACE mode.

```
switchport trunk allowed vlan vlan-id
```

Configure port in Trunk mode

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# switchport mode trunk
OS10(conf-if-eth1/1/6)# switchport trunk allowed vlan 108
```

View running configuration

```
OS10# show running-configuration
...
!
 interface ethernet1/1/8
  switchport mode trunk
 switchport trunk allowed vlan 108
 no shutdown
!
interface vlan1
 no shutdown
```

```
!
...
```

Assign IP address

You can assign an IP address to each VLAN to make it a L3 VLAN. All the ports in that VLAN belong to that particular IP subnet.

The traffic between the ports in different VLANs route using the IP address. Configure the L3 VLAN interface to remain administratively UP or DOWN using the `shutdown` and `no shutdown` commands. This provisioning only affects the L3 traffic across the members of a VLAN and does not affect the L2 traffic.

Do not assign an IP address to the default VLAN (VLAN 1).

NOTE: However, the zero-touch deployment (ZTD) application requires this functionality. While ZTD is in progress, the system assigns an IP address to the default VLAN to establish connectivity. After ZTD is complete, the system removes the IP address that is assigned to the default VLAN.

You can place VLANs and other logical interfaces in L3 mode to receive and send routed traffic.

1. Create a VLAN in CONFIGURATION mode, from 1 to 4093.

```
interface vlan vlan-id
```

2. Assign an IP address and mask to the VLAN in INTERFACE-VLAN mode.

```
ip address ip-address/prefix-length [secondary]
```

- *ip-address/prefix–length*—Enter the IP address in dotted-decimal A.B.C.D/x format.
- `secondary`—Enter the interface backup IP address.

Assign IP address to VLAN

```
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# ip address 10.1.15.1/8
```

View VLAN configuration

```
OS10# show interface vlan

Vlan 1 is up, line protocol is up
Address is 00:00:00:00:00:c9, Current address is 00:00:00:00:10:c9

VLAN Scaling

When VLANs are created, traffic class is specified for each VLAN that maps the VLAN traffic to a specific queue on the egress port. Class-maps are created for each VLAN matching and the action is specified in the policymap that maps it to a specific traffic class. Using traffic class-to-queue mapping, the traffic gets mapped to the corresponding queue.

Since ACL rules are created on a per VLAN basis, the scale of VLANs is dependent on the number of ACL rules available. The ACL space is also shared by other applications such as FCoE. When more VLANs are created, the L2 QoS ACL space for the VLAN ACLs get exhausted. If the VLAN ACL creation fails, it results in VLAN creation failure. As a result, there cannot be more than 256 VLANs in Fabric mode.

When a VLAN is created with the uplink ports, a traffic class such as gold, silver, or platinum is assigned to the traffic on the VLAN. On receiving the configuration from GUI through DNV, the Fabric agent creates a classmap of type qos with the name CM<vlanid> which matches the same <vlanid>. For example when vlanid 100 with a traffic class of type 4 the classmap created will be:

```
classmap type qos  CM100
match vlan 100
```

A single policymap is created to hold all the VLAN classmaps and its applied at the system qos level which gets applied to all the interfaces.

```
policymap type qos PM_VLAN
class CM100
set qos-group 4
```

Any addition, deletion, or modification to the VLAN or the traffic class happens within the same policymap.

In the NPU, each classmap maps to an ACL entry in the L2QOS region matching the vlanid in the classmap.

Constraints

VLAN scaling is limited to the Fabric mode.

Currently Dynamic ARP Inspection (DAI) uses the vlan-group id. NAS implicitly programs the VLAN-group id in the Vlan table. But DAI feature is not enabled in Fabric mode.

Use of vlan-group id is limited only to applications which require grouping for the purpose of using ACLs.

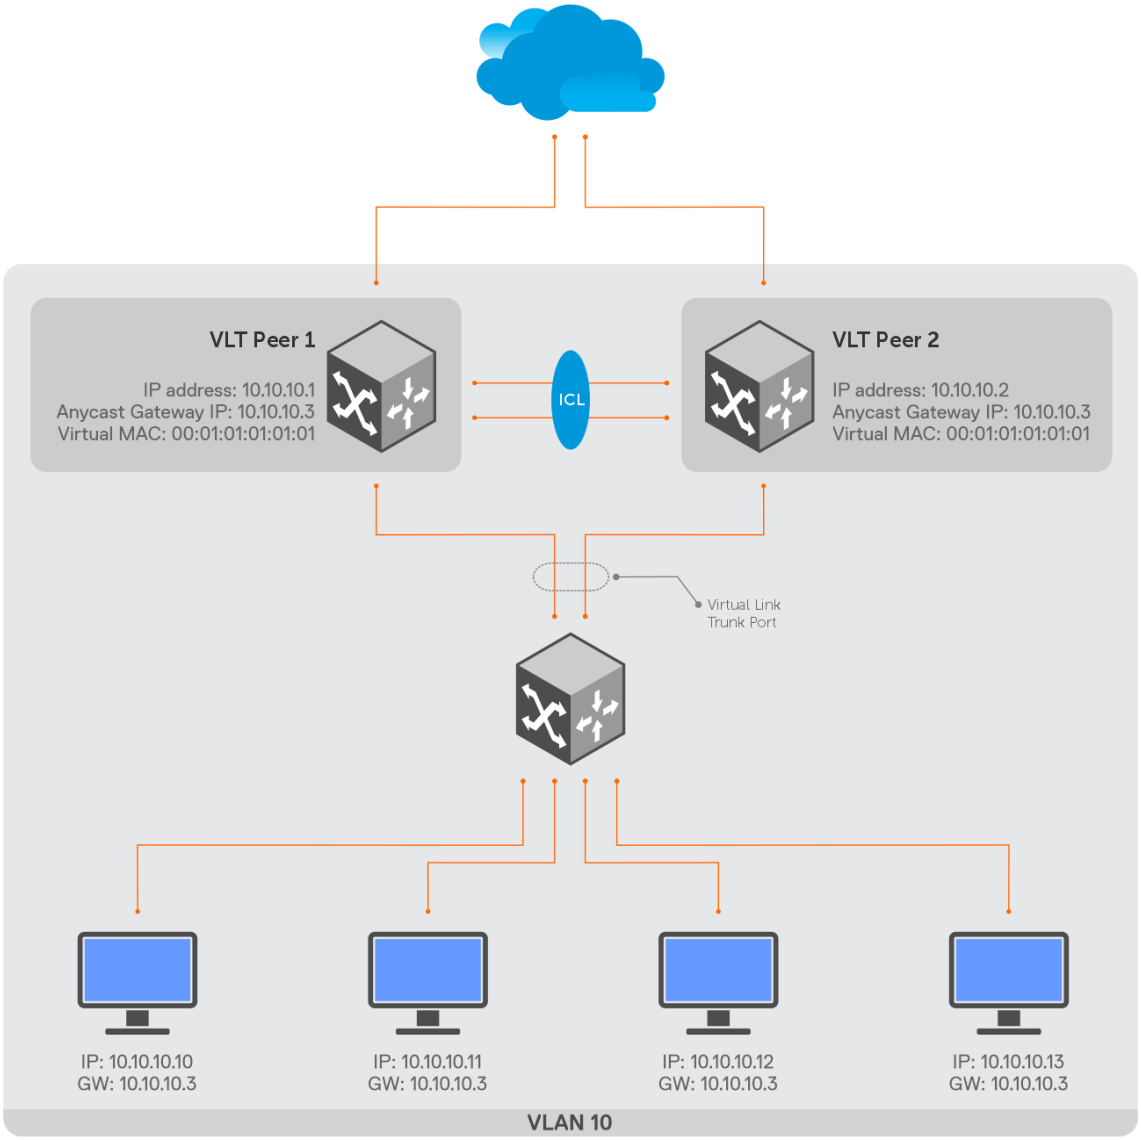
Anycast IP Gateway for VLANs

Anycast IP is a network addressing and routing method that allows for multiple devices to share the same IP address in a network.

Starting with Release 10.5.2.0 or later, you can configure anycast IP functionality for VLAN interfaces in a VLT domain. In earlier releases, this feature was applicable only for the virtual-network interfaces. For more information, see Enable overlay routing between virtual networks.

Anycast IP is a lightweight gateway router redundancy protocol that allows the hosts to use a virtual IP and a virtual MAC address to forward traffic out of a VLT domain. You can configure virtual IP addresses on VLAN interfaces in addition to a primary address, and the anycast gateway MAC address is configured to be the same on all the VLT switches. This configuration allows devices to use a common IP address as their network gateway. The VLT domain-specific information is used to determine the primary node, which responds to ARP requests for anycast IP. If the primary VLT node goes down, the secondary VLT node owns the gateway IP addresses and starts responding to ARP requests.

The following figure shows the anycast IP-based gateway configuration for a VLAN:



The `ip virtual-router address` and `ipv6 virtual-router address` commands assign the specified address as the virtual IPv4 or IPv6 address for the VLAN interface, respectively. Before assigning the anycast IP address to a VLAN interface, configure a virtual MAC address to the switch using the `ip virtual-router mac-address` command. All virtual addresses on all VLAN interfaces resolve to the configured virtual MAC address.

This feature supports only Active-Active mode of data plane forwarding. That means, the traffic is processed by any switch that is configured with a virtual gateway address. As the requests come into a single IP address associated with the anycast network, the network distributes the data among the switches based on best route in the routing table. Anycast IP gateway routing is able to route incoming connection requests across multiple data centers.

Deployment considerations

- Anycast IP gateway feature works only when VLT configurations are present in the switch. If you enable this feature without VLT domain configuration, the anycast IP gateway configuration remains inactive.
- For anycast IP to work in VLT domain, configure the same anycast IPv4 or IPv6 address and same global virtual MAC address on both VLT nodes.
- When you use VRRP MAC as an anycast gateway MAC, do not use the underlying VRRP group ID in VLANs or interfaces where you configured VRRP. Use a non-VRRP MAC as the anycast gateway MAC to avoid such conflicts.
- Anycast IP gateway routing and VRRP are mutually exclusive. You cannot configure both simultaneously on VLANs.
- You can enable the anycast IP gateway for up to 512 Layer 3 (L3) VLANs.

- Ensure that the anycast IPv4 or IPv6 address is different from the primary IPv4 or IPv6 address, respectively. For IPv6, you can configure more than one primary IP address. Even when more than one primary IPv6 addresses or subnets are configured, you can only configure one IPv6 address as gateway IP address.
- To ping an IPv6 host present in a remote VLAN, use the `ping -I` command and specify the interface IP address. The `-I` option is not required when you ping an IPv6 local host in a VLAN. For more information, see `ping`.

Configure anycast IP for a VLAN

To configure anycast gateway routing for a VLAN:

1. Configure the anycast gateway MAC address in GLOBAL CONFIGURATION mode. All virtual addresses on all VLAN interfaces resolve to this MAC address.

   NOTE: Only unicast MAC addresses are accepted

   ```
   ip virtual-router mac-address mac-address
   ```

2. Configure a primary IPv4 or IPv6 address for the VLAN interface in INTERFACE-VLAN mode.

   ```
   ip address A.B.C.D/mask
   ```

   ```
   ipv6 address A:B/prefix-length
   ```

3. Configure an IPv4 or IPv6 anycast address for the VLAN interface in INTERFACE-VLAN mode.

   ```
   ip virtual-router address ipv4-address
   ```

   ```
   ipv6 virtual-router address ipv6-address
   ```

Configure IPv4 anycast gateway on VLAN interface

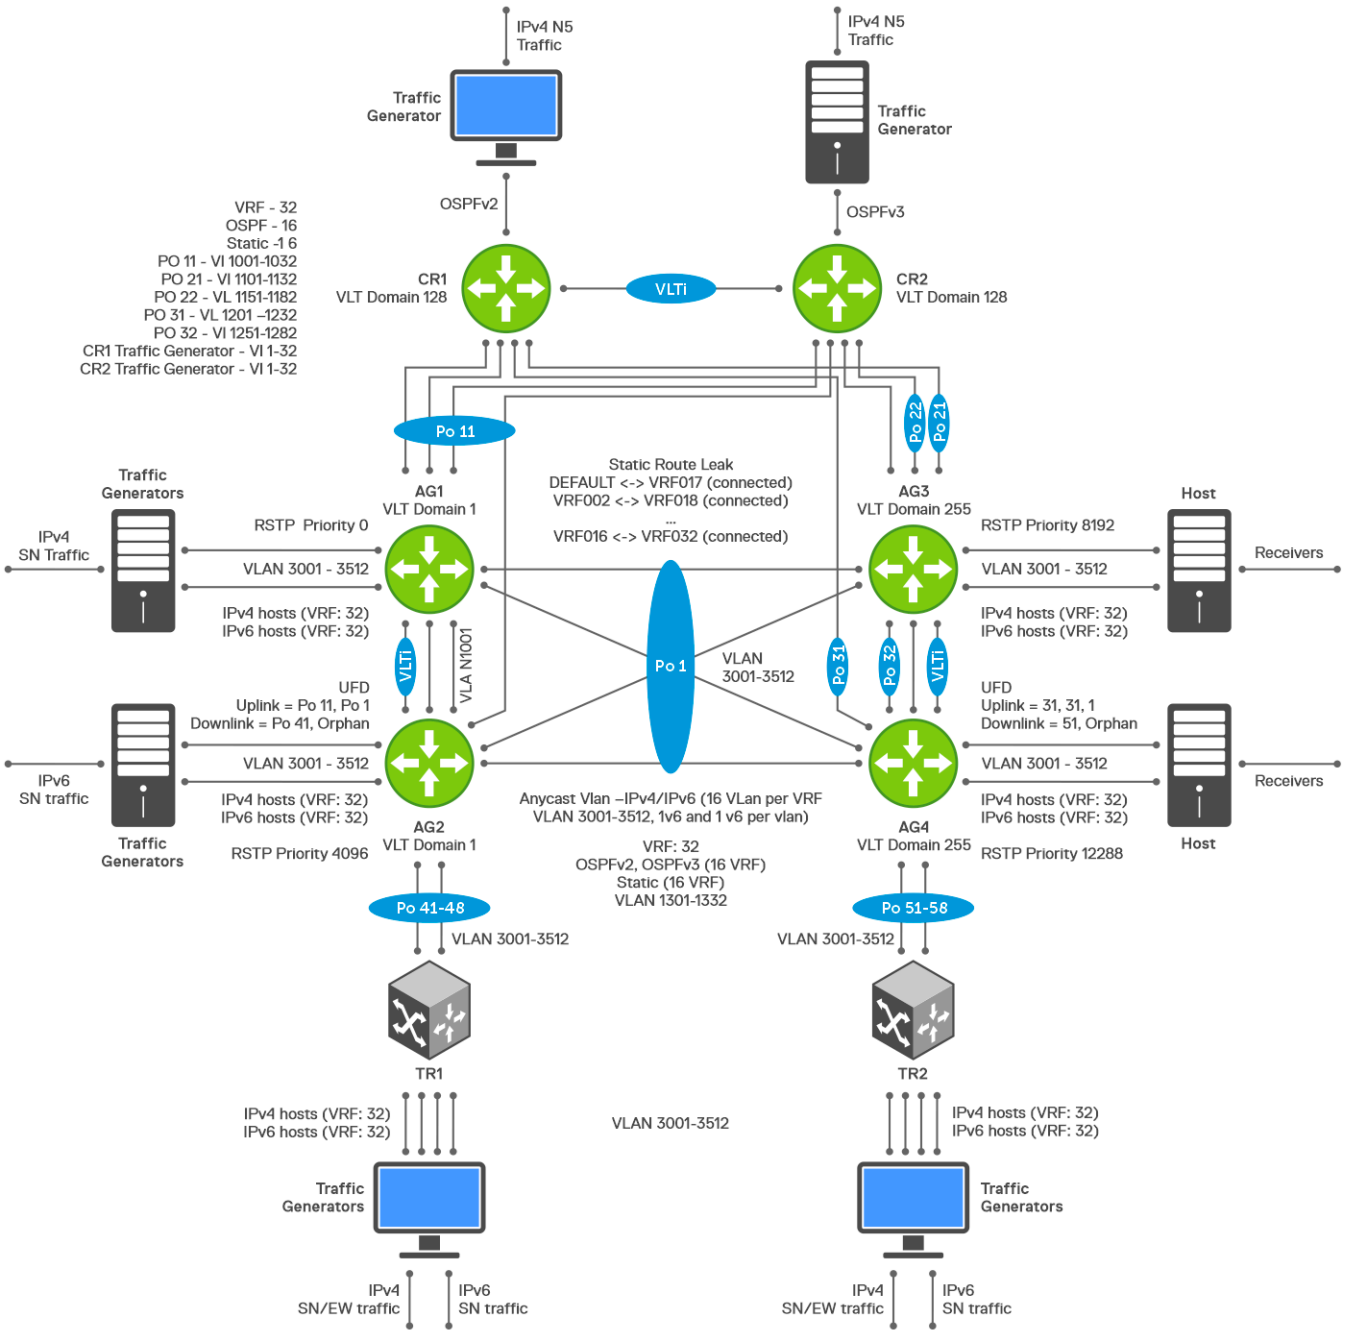
```
OS10# configure terminal
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip address 10.10.10.1/24
OS10(conf-if-vl-100)# ip virtual-router address 10.10.10.3
```

Configure IPv6 anycast gateway on VLAN interface

```
OS10# configure terminal
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ipv6 address 3001::1/64
OS10(conf-if-vl-100)# ipv6 virtual-router address 3001::3
```

Example - Anycast IP Gateway for VLANs in VLT topology

This section provides a sample anycast IP gateway configuration for VLANs in a VLT topology.



AG1 configuration

1. Configure a global anycast MAC address.

```
AG1# configure terminal
AG1(config)# ip virtual-router mac-address 00:00:5e:00:01:01
```

2. Configure a VLAN Interface with the anycast virtual address.

```
AG1(config)# interface vlan 3001
AG1(conf-if-vl-3001)# no shutdown
AG1(conf-if-vl-3001)# ip address 10.1.1.1/24
AG1(conf-if-vl-3001)# ip virtual-router address 10.1.1.5
AG1(conf-if-vl-3001)# ipv6 address 10:1:1::1/64
```

```
AG1(conf-if-vl-3001)# ipv6 virtual-router address 10:1:1::5
AG1(conf-if-vl-3001)# exit
```

3. Configure the VLT domain.

```
AG1(config)# vlt-domain 1
AG1(conf-vlt-1)# backup destination 172.16.1.4 interval 3
AG1(conf-vlt-1)# delay-restore 300
AG1(conf-vlt-1)# discovery-interface ethernet1/1/25:1-1/1/25:4
AG1(conf-vlt-1)# peer-routing
AG1(conf-vlt-1)# primary-priority 1
AG1(conf-vlt-1)# vlt-mac de:11:de:11:de:11
AG1(conf-vlt-1)# multicast peer-routing timeout 450
AG1(conf-vlt-1)# exit
```

4. Configure a port channel interface towards AG3, AG4, TR1, CR1, and CR2.

```
AG1(config)# interface port-channel 1
AG1(conf-if-po-1)# vlt-port-channel 1

AG1(config)# interface port-channel 11
AG1(conf-if-po-11)# vlt-port-channel 11

AG1(config)# interface port-channel 41
AG1(conf-if-po-41)# vlt-port-channel 41

AG1(config)# interface port-channel 42
AG1(conf-if-po-42)# vlt-port-channel 42

AG1(config)# interface port-channel 43
AG1(conf-if-po-43)# vlt-port-channel 43

AG1(config)# interface port-channel 44
AG1(conf-if-po-44)# vlt-port-channel 44

AG1(config)# interface port-channel 45
AG1(conf-if-po-45)# vlt-port-channel 45

AG1(config)# interface port-channel 46
AG1(conf-if-po-46)# vlt-port-channel 46

AG1(config)# interface port-channel 47
AG1(conf-if-po-47)# vlt-port-channel 47

AG1(config)# interface port-channel 48
AG1(conf-if-po-48)# vlt-port-channel 48
```

5. Configure the interfaces as VLAN trunk ports and specify the allowed VLANs.

```
AG1(config)# interface range port-channel 41-48
AG1(conf-range-po-41-48)# no shutdown
AG1(conf-range-po-41-48)# switchport mode trunk
AG1(conf-range-po-41-48)# switchport trunk allowed vlan 3001

AG1(config)# interface range ethernet 1/1/9:1-1/1/9:2
AG1(conf-range-eth1/1/9:1-1/1/9:2)# no shutdown
AG1(conf-range-eth1/1/9:1-1/1/9:2)# switchport mode trunk
AG1(conf-range-eth1/1/9:1-1/1/9:2)# switchport trunk allowed vlan 3001
```

6. View LLDP neighbors.

```
AG1# show lldp neighbors

```

AG2 configuration

1. Configure a global anycast MAC address.

```
AG2# configure terminal
AG2(config)# ip virtual-router mac-address 00:00:5e:00:01:01
```

2. Configure a VLAN Interface with the anycast virtual address.

```
AG2(config)# interface vlan 3001
AG2(conf-if-vl-3001)# no shutdown
AG2(conf-if-vl-3001)# ip address 10.1.1.2/24
AG2(conf-if-vl-3001)# ip virtual-router address 10.1.1.5
AG2(conf-if-vl-3001)# ipv6 address 10:1:1::2/64
AG2(conf-if-vl-3001)# ipv6 virtual-router address 10:1:1::5
AG2(conf-if-vl-3001)# exit
```

3. Configure the VLT domain.

```
AG2(config)# vlt-domain 1
AG2(conf-vlt-1)# backup destination 172.16.1.3 interval 3
AG2(conf-vlt-1)# delay-restore 300
AG2(conf-vlt-1)# discovery-interface ethernet1/1/25:1-1/1/25:4
AG2(conf-vlt-1)# peer-routing
AG2(conf-vlt-1)# primary-priority 65535
AG2(conf-vlt-1)# vlt-mac de:11:de:11:de:11
AG2(conf-vlt-1)# multicast peer-routing timeout 450
AG2(conf-vlt-1)# exit
```

4. Configure a port channel interface towards AG3, AG4, TR1, CR1, and CR2.

```
AG2(config)# interface port-channel 1
AG2(conf-if-po-1)# vlt-port-channel 1

AG2(config)# interface port-channel 11
AG2(conf-if-po-11)# vlt-port-channel 11

AG2(config)# interface port-channel 41
AG2(conf-if-po-41)# vlt-port-channel 41

AG2(config)# interface port-channel 42
AG2(conf-if-po-42)# vlt-port-channel 42

AG2(config)# interface port-channel 43
AG2(conf-if-po-43)# vlt-port-channel 43

AG2(config)# interface port-channel 44
AG2(conf-if-po-44)# vlt-port-channel 44

AG2(config)# interface port-channel 45
AG2(conf-if-po-45)# vlt-port-channel 45

AG2(config)# interface port-channel 46
AG2(conf-if-po-46)# vlt-port-channel 46

AG2(config)# interface port-channel 47
AG2(conf-if-po-47)# vlt-port-channel 47

AG2(config)# interface port-channel 48
AG2(conf-if-po-48)# vlt-port-channel 48
```

5. Configure the interfaces as VLAN trunk ports and specify the allowed VLANs.

```
AG2(config)# interface range port-channel 41-48
AG2(conf-range-po-41-48)# no shutdown
AG2(conf-range-po-41-48)# switchport mode trunk
AG2(conf-range-po-41-48)# switchport trunk allowed vlan 3001

AG2(config)# interface range ethernet 1/1/9:1-1/1/9:2
AG2(conf-range-eth1/1/9:1-1/1/9:2)# no shutdown
AG2(conf-range-eth1/1/9:1-1/1/9:2)# switchport mode trunk
AG2(conf-range-eth1/1/9:1-1/1/9:2)# switchport trunk allowed vlan 3001
```

6. View LLDP neighbors.

```
AG2# show lldp neighbors

AG3 configuration

1. Configure a global anycast MAC address.

```
AG3# configure terminal
AG3(config)# ip virtual-router mac-address 00:00:5e:00:01:01
```

2. Configure a VLAN Interface with the anycast virtual address.

```
AG3(config)# interface vlan 3001
AG3(conf-if-vl-3001)# no shutdown
AG3(conf-if-vl-3001)# ip address 10.1.1.3/24
AG3(conf-if-vl-3001)# ip virtual-router address 10.1.1.5
AG3(conf-if-vl-3001)# ipv6 address 10:1:1::3/64
AG3(conf-if-vl-3001)# ipv6 virtual-router address 10:1:1::5
AG3(conf-if-vl-3001)# exit
```

3. Configure the VLT domain.

```
AG3(config)# vlt-domain 255
AG3(conf-vlt-1)# backup destination 172.16.1.6
AG3(conf-vlt-1)# delay-restore 300
AG3(conf-vlt-1)# discovery-interface ethernet1/1/25:1-1/1/25:4
AG3(conf-vlt-1)# peer-routing
AG3(conf-vlt-1)# primary-priority 1
AG3(conf-vlt-1)# vlt-mac f0:ce:10:f0:ce:10
AG3(conf-vlt-1)# multicast peer-routing timeout 450
AG3(conf-vlt-1)# exit
```

4. Configure a port channel interface towards AG1, AG2, and TR2.

```
AG3(config)# interface port-channel 1
AG3(conf-if-po-1)# vlt-port-channel 1

AG3(config)# interface port-channel 51
AG3(conf-if-po-51)# vlt-port-channel 51

AG3(config)# interface port-channel 52
AG3(conf-if-po-52)# vlt-port-channel 52
```

```
AG3(config)# interface port-channel 53
AG3(conf-if-po-53)# vlt-port-channel 53

AG3(config)# interface port-channel 54
AG3(conf-if-po-54)# vlt-port-channel 54

AG3(config)# interface port-channel 55
AG3(conf-if-po-55)# vlt-port-channel 55

AG3(config)# interface port-channel 56
AG3(conf-if-po-56)# vlt-port-channel 56

AG3(config)# interface port-channel 57
AG3(conf-if-po-57)# vlt-port-channel 57

AG3(config)# interface port-channel 58
AG3(conf-if-po-58)# vlt-port-channel 58
```

5. Configure the interfaces as VLAN trunk ports and specify the allowed VLANs.

```
AG3(config)# interface range port-channel 51-58
AG3(conf-range-po-51-58)# no shutdown
AG3(conf-range-po-51-58)# switchport mode trunk
AG3(conf-range-po-51-58)# switchport trunk allowed vlan 3001

AG3(config)# interface range ethernet 1/1/31:1-1/1/31:2
AG3(conf-range-eth1/1/31:1-1/1/31:2)# no shutdown
AG3(conf-range-eth1/1/31:1-1/1/31:2)# switchport mode trunk
AG3(conf-range-eth1/1/31:1-1/1/31:2)# switchport trunk allowed vlan 3001
```

6. View LLDP neighbors.

```
AG3# show lldp neighbors

AG4 configuration

1. Configure a global anycast MAC address.

```
AG4# configure terminal
AG4(config)# ip virtual-router mac-address 00:00:5e:00:01:01
```

2. Configure a VLAN Interface with the anycast virtual address.

```
AG4(config)# interface vlan 3001
AG4(conf-if-vl-3001)# no shutdown
AG4(conf-if-vl-3001)# ip address 10.1.1.4/24
AG4(conf-if-vl-3001)# ip virtual-router address 10.1.1.5
AG4(conf-if-vl-3001)# ipv6 address 10:1:1::4/64
AG4(conf-if-vl-3001)# ipv6 virtual-router address 10:1:1::5
AG4(conf-if-vl-3001)# exit
```

3. Configure the VLT domain.

```
AG4(config)# vlt-domain 255
AG4(conf-vlt-1)# backup destination 172.16.1.5
AG4(conf-vlt-1)# delay-restore 300
AG4(conf-vlt-1)# discovery-interface ethernet1/1/25:1-1/1/25:4
AG4(conf-vlt-1)# peer-routing
AG4(conf-vlt-1)# primary-priority 65535
AG4(conf-vlt-1)# vlt-mac f0:ce:10:f0:ce:10
AG4(conf-vlt-1)# multicast peer-routing timeout 450
AG4(conf-vlt-1)# exit
```

4. Configure a port channel interface towards AG1, AG2, and TR2.

```
AG4(config)# interface port-channel 1
AG4(conf-if-po-1)# vlt-port-channel 1

AG4(config)# interface port-channel 51
AG4(conf-if-po-51)# vlt-port-channel 51

AG4(config)# interface port-channel 52
AG4(conf-if-po-52)# vlt-port-channel 52

AG4(config)# interface port-channel 53
AG4(conf-if-po-53)# vlt-port-channel 53

AG4(config)# interface port-channel 54
AG4(conf-if-po-54)# vlt-port-channel 54

AG4(config)# interface port-channel 55
AG4(conf-if-po-55)# vlt-port-channel 55

AG4(config)# interface port-channel 56
AG4(conf-if-po-56)# vlt-port-channel 56

AG4(config)# interface port-channel 57
AG4(conf-if-po-57)# vlt-port-channel 57

AG4(config)# interface port-channel 58
AG4(conf-if-po-58)# vlt-port-channel 58
```

5. Configure the interfaces as VLAN trunk ports and specify the allowed VLANs.

```
AG4(config)# interface range port-channel 51-58
AG4(conf-range-po-51-58)# no shutdown
AG4(conf-range-po-51-58)# switchport mode trunk
AG4(conf-range-po-51-58)# switchport trunk allowed vlan 3001

AG4(config)# interface range ethernet 1/1/31:1-1/1/31:2
AG4(conf-range-eth1/1/31:1-1/1/31:2)# no shutdown
AG4(conf-range-eth1/1/31:1-1/1/31:2)# switchport mode trunk
AG4(conf-range-eth1/1/31:1-1/1/31:2)# switchport trunk allowed vlan 3001
```

6. View LLDP neighbors.

```
AG4# show lldp neighbors

AG4#
```

VLAN stacking

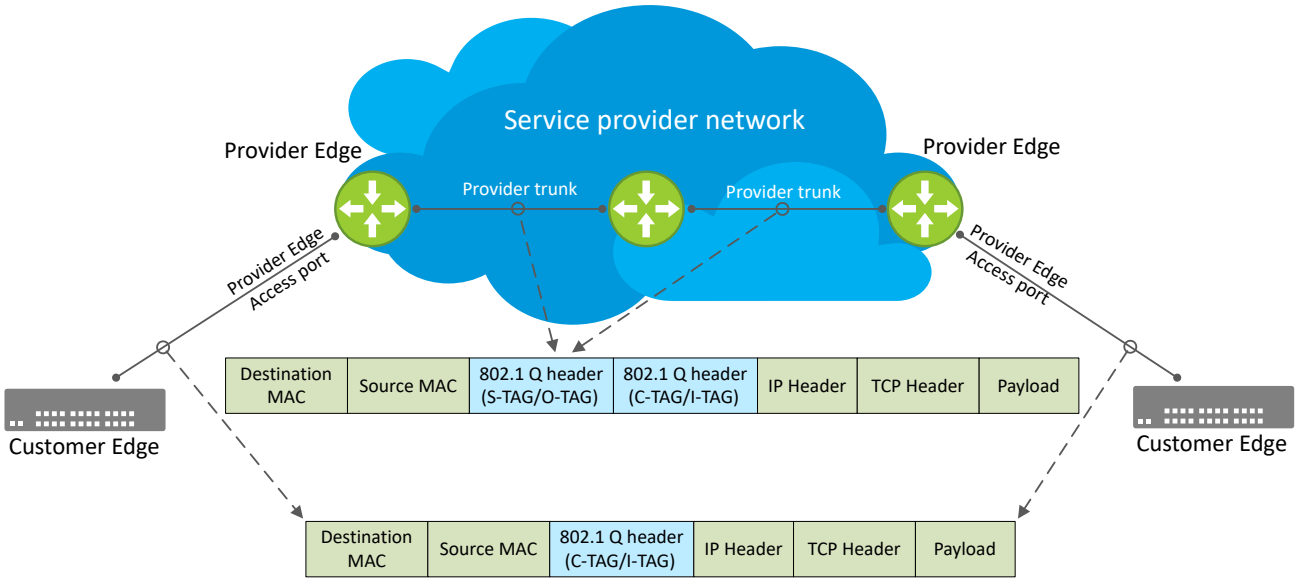
VLAN stacking enables service providers to offer separate VLANs to customers with no coordination between customers, with minimal coordination between customers and the provider.

Using only 802.1Q VLAN tagging, all customers must use unique VLAN IDs to ensure that traffic is segregated, and customers and the service provider must coordinate to ensure that traffic is mapped correctly across the provider network. Even under ideal conditions, customers and the provider may share the 4094 available VLANs.

Instead, VLAN stacking allows service providers to add their own VLAN tag to frames traversing the provider network. The provider can differentiate customers even if they use the same VLAN ID, and providers can map multiple customers to a single VLAN to overcome the 4094 VLAN limitation. The providers network forwarding decisions are based on the provider VLAN tag only. This tag enables the provider to map traffic through the core independently of the customer; the customer and provider only coordinate at the provider edge.

At the access point of a VLAN-stacking network, service providers add a VLAN tag, the S-Tag, to each frame before the 802.1Q tag. From this point on, the frame is double tagged. The service provider uses the S-Tag to forward frame traffic across its network. At the egress edge, the provider removes the S-Tag so that the customer receives the frame in its original condition, as shown in the following figure.

NOTE: VLAN Priority Code Point (PCP) bits from C-Tags are copied to S-Tags and conversely.



Restrictions and limitations

The following restrictions and limitations apply to the VLAN stacking feature:

- Dell Technologies recommends configuring up to a maximum of 1000 VLAN-stack VLANs.
- You cannot configure IP addresses on stack VLAN.
- You cannot configure the default VLAN as a stack VLAN and conversely.
- You cannot configure private VLAN (PVLAN) as a stack VLAN and conversely.
- You cannot configure remote-span VLAN as a stack VLAN and conversely.
- You cannot configure FCoE VLAN as a stack VLAN and conversely.
- You cannot configure remote-span VLAN as a stack VLAN and conversely.
- Do not attach the stack VLAN to a virtual network.
- VLAN PCP bits are not copied from inner tag to outer tag on the S5448F-ON, Z9332F-ON, and Z9432F-ON platforms.

Configuration notes

When configuring VLAN-stacking in the service provider network, consider the following:

- In Provider Edge (PE), on the access port of stack VLAN, Spanning Tree Protocol (STP) must be disabled.
- Do not connect multiple interconnected Customer Edge (CE) devices to a single PE device. The system cannot detect this loop because STP is disabled on the PE access ports.
- The CE devices can be connected to the PE switches in VLT for redundancy.
- The PE port must be an access member of the stack VLAN in switchport access mode.
- Configure the ports between the PE and Provider Core as pure trunk ports without any access VLAN membership. This configuration is to drop any untagged or tagged (with other than configured TPID) traffic on those ports.
- When a TPID value is configured on a port, all traffic egressing the port uses this TPID value on the VLAN tags.

  NOTE:
  - If a regular VLAN is tagged to the trunk port, the traffic on that VLAN is sent out with the configured TPID value.
  - If the other end of the trunk port is not configured with the same TPID value, the traffic is classified as untagged.
- Switches in the service provider networks must be configured to handle the increase in MTU size caused by double tagging.

- IGMP snooping must be disabled on the stack VLANs.

Configure access port

To create a stack VLAN and configure access port:

1. Enter the CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)#
```

2. Create a VLAN to assign as service provider VLAN.

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)#
```

3. Configure the VLAN as a stack VLAN.

```
OS10(conf-if-vl-10)# vlan-stack
```

4. Exit the INTERFACE-VLAN mode.

```
OS10(conf-if-vl-10)# exit
OS10(config)#
```

5. Enter the INTERFACE CONFIGURATION mode.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)#
```

6. Disable spanning tree on the port.

```
OS10(conf-if-eth1/1/1)# spanning-tree disable
```

7. Assign the port to the stack VLAN access group.

```
OS10(conf-if-eth1/1/1)# switchport access vlan 10
```

Configure trunk port

To create a stack VLAN and configure trunk port:

1. Enter the CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)#
```

2. Create a VLAN to assign as service provider VLAN.

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)#
```

3. Configure the VLAN as a stack VLAN.

```
OS10(conf-if-vl-100)# vlan-stack
```

4. Exit the INTERFACE-VLAN mode.

```
OS10(conf-if-vl-100)# exit
OS10(config)#
```

5. Enter the INTERFACE CONFIGURATION mode.

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)#
```

6. Set the switchport to trunk mode.

```
OS10(conf-if-eth1/1/5)# switchport mode trunk
```

7. Remove access VLAN membership.

```
OS10(conf-if-eth1/1/5)# no switchport access vlan
```

8. Configure the TPID value.

NOTE: This value is used in the S-Tags.

```
OS10(conf-if-eth1/1/5)# switchport trunk tpid 9100
```

9. Assign the port to the service provider VLAN as a trunk member.

```
OS10(conf-if-eth1/1/5)# switchport trunk allowed vlan 100
```

Traffic flow use cases

This section describes how VLAN stacking can be used to achieve Layer 2 and Layer 3 traffic flows.

Layer 2 use case

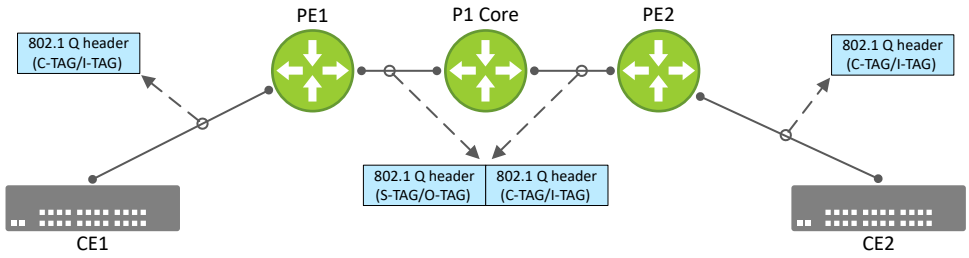
The access port of the PE1 device is an untagged member of the stack VLAN, which is connected to CE1. The Ingress TPID check on this access port is disabled, so the port treats all the ingress traffic as untagged.

When traffic egresses from the stack VLAN trunk port, an additional tag (outer Tag or S-Tag) with the stack VLAN ID is added to the frame. The TPID value used in the S-Tag is the TPID value configured on that trunk port.

NOTE:

- The default TPID value on all ports is 0x8100.
- If CE1 sends untagged traffic, it is single-tagged when it egresses out of the stack VLAN trunk port.
- If CE1 sends tagged traffic (C-Tag), it is double-tagged (C-Tag + S-Tag) when it egresses out of the stack VLAN trunk port.

When the traffic reaches the PE2 and leaves the egress access port, the access port removes the added S-TAG. This action changes the single-tagged packets to untagged and double-tagged packets to single-tagged, which is similar to the packets sent by CE1, and then reaches CE2.



Layer 3 use case

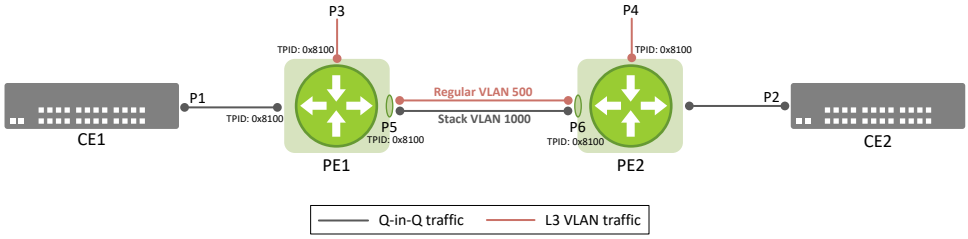
Stack VLANs are Layer 2 VLANs. Layer 3 traffic flow in VLAN stacking can be achieved with a stack VLAN trunk port or a non-stack VLAN trunk port.

Traffic flow over the stack VLAN trunk port

If you set the TPID value for the stack trunk port to 0x8100, regular Layer 3 VLAN traffic can also transit across the stack VLAN trunk ports.

In the figure below, Q-in-Q traffic runs over stack VLAN 1000. The trunk ports P5 and P6 of stack VLAN have a TPID of 0x8100.

A regular Layer 3 VLAN 500 with ports P3, P4, P5, and P6 as VLAN members is also created. While the ports P5 and P6 are tagged members, Layer 3 traffic can still transit across the stack VLAN trunk ports.

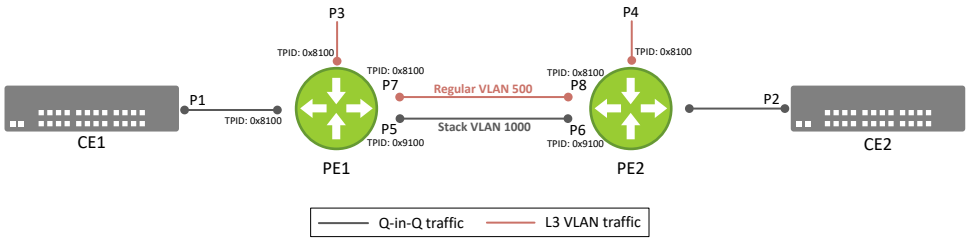


Traffic flow over a non-stack VLAN trunk port

The TPID value for the stack trunk ports is set to 0x9100, which is different from the default TPID value of 0x8100. To achieve Layer 3 VLAN traffic over the Q-in-Q nodes, a new link is created between the nodes with a TPID value of 0x8100. Layer 3 traffic can transit across this new link.

In the figure below, you can see that Q-in-Q traffic runs over stack VLAN 1000. stack VLAN trunk ports P5 and P6 use the TPID value of 0x9100.

A regular Layer 3 VLAN 500 with ports P3, P4, P5, P6, P7, and P8 as VLAN members is also created. While the ports P7 and P8 are tagged members, Layer 3 traffic can transit across the non-stack VLAN trunk ports P7 and P8 with a TPID value of 0x8100. The stack VLAN trunk ports P7 and P8 do not participate in the Q-in-Q traffic with stack VLAN 1000.



VLAN commands

description (VLAN)

Adds a description to the selected VLAN.

Syntax	`description` *description*
Parameters	*description* — Enter a text string to identify the VLAN. A maximum of 240 characters.

Default	Not configured
Command Mode	INTERFACE-VLAN
Usage Information	• To use special characters as a part of the description string, enclose the string in double quotes. • To use comma as a part of the description string add double back slash before the comma.
Example	`OS10(config)# interface vlan 3` `OS10(conf-if-vl-3)# description vlan3`
Supported Releases	10.2.0E or later

interface vlan

Creates a VLAN interface.

Syntax	`interface vlan` *vlan-id*
Parameters	*vlan-id* — Enter the VLAN ID number, from 1 to 4093.
Default	VLAN 1
Command Mode	CONFIGURATION
Usage Information	FTP, TFTP, MAC ACLs, and SNMP operations are not supported. IP ACLs are supported on VLANs only. The `no` version of this command deletes the interface. **NOTE:** In SmartFabric Services mode, you can create VLAN using the `interface vlan` command through OS10 CLI but you cannot delete the VLAN from the CLI. Therefore, Dell Technologies recommends you to use the SFS GUI to create, edit, or delete a VLAN.
Example	`OS10(config)# interface vlan 10` `OS10(conf-if-vl-10)#`
Supported Releases	10.2.0E or later

ip virtual-router address

Configures an anycast gateway IP address for a VLAN interface.

Syntax	`ip virtual-router address` *ipv4-address*
Parameters	`address` *ipv4-address*—Enter the IP address of the anycast L3 gateway.
Default	Not configured
Command mode	INTERFACE-VLAN
Usage information	Use this command to configure an anycast IP gateway for VLAN routing interfaces. Configure the same anycast gateway IP address on all switches in a VLAN. Ensure that the anycast IP address is different from the primary IP address. To assign an anycast IPv6 address to a VLAN interface, use the `ipv6 virtual-router address` command. Before assigning the anycast IP address to a VLAN interface, configure a virtual MAC address to the switch using the `ip virtual-router mac-address` command. All virtual addresses on all VLAN interfaces resolve to the configured virtual MAC address. The `no` version of this command removes the specified anycast IP address from a VLAN interface.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ip virtual-router address 10.10.10.3`
Supported releases	10.5.2.0 or later

ip virtual-router mac-address

Configures the MAC address of an anycast L3 gateway for VLAN routing.

Syntax	`ip virtual-router mac-address` *mac-address*
Parameters	`mac-address` *mac-address*—Enter the MAC address of the anycast L3 gateway.
Default	Not configured
Command mode	CONFIGURATION
Usage information	Configure the same MAC address on all VLT switches. As the configured MAC address is automatically used for all VLANs, configure it in Global Configuration mode. The `no` version of this command removes the specified virtual MAC address.
Example	`OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01`
Supported releases	10.5.2.0 or later

ipv6 virtual-router address

Configures an anycast gateway IPv6 address to a VLAN interface.

Syntax	`ipv6 virtual-router address` *ipv6-address*
Parameters	`address` *ipv6-address*—Enter the IPv6 address of the anycast L3 gateway.
Default	Not configured
Command mode	INTERFACE-VLAN
Usage information	Use this command to configure an anycast IP gateway for VLAN routing interfaces. Ensure that the anycast IP address is different from the primary IP address. To assign an anycast IPv4 address to a VLAN interface, use the `ip virtual-router address` command. Before assigning the anycast IP address to a VLAN interface, configure a virtual MAC address to the switch using the `ip virtual-router mac-address` command. All virtual addresses on all VLAN interfaces resolve to the configured virtual MAC address. The `no` version of this command removes the specified anycast IPv6 address from the VLAN interface.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 virtual-router address 3001::3`
Supported releases	10.5.2.0 or later

show vlan

Displays VLAN configurations.

Syntax	`show vlan [`*vlan-id* `| private-vlan]`
Parameters	• *vlan-id*—(Optional) Enter a VLAN ID number, from 1 to 4093. • `private-vlan`—(Optional) Displays configuration details of private VLAN.
Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to view VLAN configuration information for a specific VLAN ID.

Example

```
OS10#show vlan

Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring
VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I -
Isolated,
       S - VLAN-Stack VLAN
Q: A - Access (Untagged), T - Tagged
    NUM    Status   Description                    Q Ports
    10     Active                                  T Po20
                                                   A Eth1/1/4
S   4000   Active                                  A Eth1/1/3
                                                   T Eth1/1/1,1/1/6,
Po10
S   4001   Active                                  T Eth1/1/6
```

Supported Releases 10.2.0E or later

show vlt mismatch

Displays the anycast IP configuration mismatch between VLT peers.

Syntax `show vlt domain-id mismatch [vlan-anycast]`

Parameters *domain-id*—Enter the VLT domain ID.

Command Mode EXEC

Usage Information Use this command to identify anycast IPv4 or IPv6 configuration mismatch on VLT nodes for VLAN interfaces.

Example

```
OS10# show vlt 1 mismatch vlan-anycast
VLAN anycast ip Mismatch:

VLAN: 2000

VLT Unit ID    Anycast-IPs
-------------------------------------------------
* 1            10::100, 10.10.10.10

  2            100::100, 100.101.101.100

VLAN: 3000

VLT Unit ID    Anycast-IPs
-------------------------------------------------
* 1            100.100.101.100

  2            Not configured

VLAN: 4000

VLT Unit ID    Anycast-IPs
-------------------------------------------------
* 1            Not configured

  2            10.10.10.15
```

Supported Releases 10.5.2.0 or later

switchport trunk tpid

Configures Tag Protocol Identifier (TPID) value for stack-VLAN trunk port.

Syntax `switchport trunk tpid {tpid-value}`

Parameters `tpid-value`—Enter the TPID value of an interface.

Default 0x8100

Command Mode INTERFACE CONFIGURATION

Security and access `sysadmin` and `netadmin`

Usage Information You can configure TPID values only if the port is in the switchport trunk mode. This value is used as TPID in VLAN tags of the trunk port. All the packets egressing from the trunk port has the configured TPID value. Ingress packets with different TPIDs on this port is classified as untagged. The action that is taken on untagged packets is based on the port access membership.

NOTE: BCM chipset can allow a maximum of four unique TPID values.

Example To configure TPID value:

```
OS10(conf)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# switchport trunk tpid 0x9100
```

To unconfigure TPID value:

```
OS10(conf)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport trunk tpid
```

Supported Releases 10.5.4.0 or later

vlan-stack

Configures the VLAN as stack VLAN.

Syntax `vlan-stack`

Parameters None

Default VLANs are regular data VLANs.

Command Mode INTERFACE-VLAN

Security and access `sysadmin` and `netadmin`

Usage Information This command is used to configure a VLAN as stack VLAN.

NOTE: The VLAN should not have any member ports before configuring the stack VLAN.

The `no` version of this command sets the VLAN mode back to regular VLAN.

NOTE: VLAN members should be removed before removing the stack VLAN.

To make a port as an access member of a stack VLAN:

- The port must be in switchport mode access only.
- The spanning tree of the port must be disabled.

Example To configure a VLAN as a stack VLAN:

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# vlan-stack
```

To unconfigure a stack VLAN as a VLAN:

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# no vlan-stack
```

Supported Releases 10.5.4.0 or later

Private VLANs

Private VLANs (PVLANs) enhance the security of Dell SmartFabric OS10 by providing L2 isolation between ports within the same virtual local area network (VLAN). A PVLAN partitions a traditional VLAN in to subdomains identified by primary and secondary VLAN pairs. PVLANs block all traffic to isolated ports except for traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous or trunk ports.

Example PVLAN uses:

- Guest access management—The network administrator in a hotel uses an isolated VLAN for providing guest users access to the Internet. Using isolated VLANs restricts direct access between the guest users.
- Service provider networks—Using PVLAN, a service provider can provide L2 security for customers and use IP addresses more efficiently. For example, the service provider can have a separate community VLAN per customer. They can use the same IP subnet address space for all community and isolated VLANs associated with the same primary VLAN.

  Community VLANs are useful in the service provider environment because multiple customers prefer to have servers in strictly separated customer-specific groups. For example, a community VLAN could include a set of servers owned by a customer. These servers could communicate with each other, but would be isolated from other customers. Another customer might have a different set of servers in a different community VLAN. Some customers might want an isolated VLAN, which has one or more ports that are also isolated from each other.

PVLAN components

A PVLAN domain consists of a primary VLAN and one or more secondary VLANs. Traffic within a PVLAN is L2 communication. The types of VLANs in a PVLAN include:

- **Primary VLAN**—The primary VLAN is the base VLAN of a PVLAN domain.
  - The primary VLAN ID is used as the PVLAN domain ID.
  - A switch can have one or more primary VLANs, or it can have none.
  - A primary VLAN can have one or more secondary VLANs.
  - A primary VLAN can have any number of community VLANs and a single isolated VLAN associated with it.
  - If a primary VLAN does not have any secondary VLAN associated with it, it functions as a regular VLAN.
  - A primary VLAN can have one or more promiscuous ports.
  - Promiscuous ports can be tagged or untagged ports.
  - Any device that is connected to a promiscuous port can communicate with all the ports in the primary and secondary VLANs.
- **Secondary VLANs**—A secondary VLAN can be associated with only one primary VLAN. The following are the types of secondary VLANs:
  - **Community VLAN**—A type of secondary VLAN where:
    - Hosts that are connected to ports in a community VLAN can communicate with each other.
    - Hosts that are connected to ports in a community VLAN can communicate with all promiscuous ports in the primary VLAN.
    - Hosts that are connected to ports in a community VLAN cannot communicate with ports in an isolated or any other secondary VLANs.
    - There can be multiple community VLANs within a single PVLAN domain.
  - **Isolated VLAN**—A type of secondary VLAN where:
    - Hosts that are connected to ports in an isolated VLAN cannot communicate directly with each other.
    - Hosts that are connected to ports in an isolated VLAN can only communicate with promiscuous ports in the primary VLAN.

NOTE: You cannot configure the default VLAN as a primary or secondary VLAN.

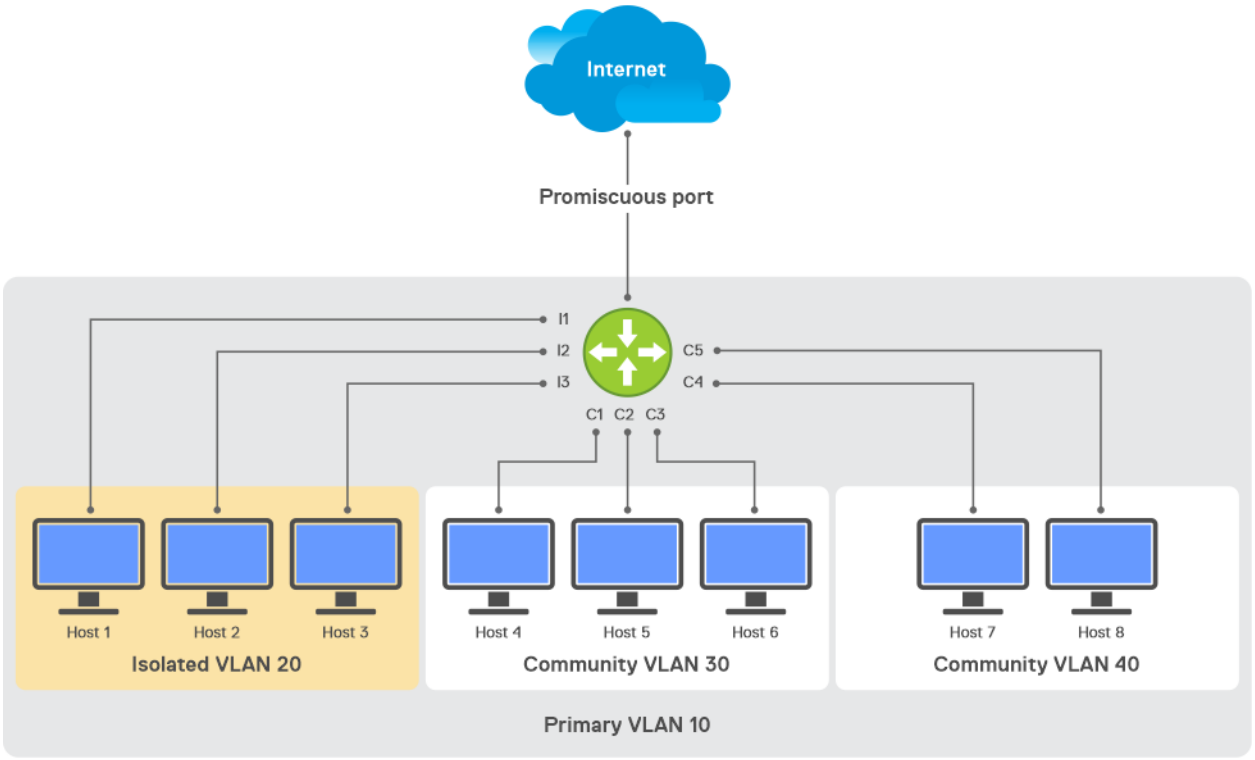
PVLAN port types include:

- **Promiscuous port**—A member of a primary VLAN:
  - A promiscuous port can communicate with any other port in the PVLAN.
  - It can be a member of one or more primary VLANs.
  - It can be a member of a regular VLAN.
- **Community port**—A port that belongs to a community VLAN:
  - A community port can communicate with all other ports in the same community VLAN.
  - It can communicate with the promiscuous ports in the primary VLAN.
- **Isolated port**—A port that belongs to an isolated VLAN:
  - An isolated port can only communicate with the promiscuous ports that are in the same PVLAN.
  - There can be multiple isolated ports within an isolated VLAN. These ports cannot communicate with each other or with other community ports.
- **PVLAN trunk port**—A PVLAN trunk port extends the PVLAN domain across switches. It carries VLAN traffic across switches:
  - A regular L2 switch trunk port associated with PVLANs is called a PVLAN trunk port.
  - You can associate the PVLAN trunk port to both primary and secondary VLANs. This port carries traffic from both the primary and secondary VLANs.
  - To configure a PVLAN trunk port, associate a regular tagged port that is not a promiscuous or secondary port to a VLAN within a PVLAN domain. There are no specific CLI commands to configure a port as a PVLAN trunk port.

NOTE: OS10 supports MAC address movement within a PVLAN domain. MAC address movement is supported:

- From primary to secondary VLAN
- From secondary to primary VLAN
- Between secondary VLANs

The following figure shows the different components in a PVLAN domain.



Private VLAN Domain ID (Primary VLAN ID)	10
Private VLAN ID	10
Secondary VLAN IDs	20, 30, 40
Isolated VLAN	20

Isolated Ports (VLAN 20 Member Ports)	I1, I2, I3
Community VLAN	30, 40
Community Ports	C1, C2, C3, C4, C5

Limitations

- OS10 does not support PVLANs on the S4200-ON and Z9300-ON series switches, and Z9664F-ON.
- Enabling multiple PVLAN domains with Virtual Router Redundancy Protocol (VRRP) groups consumes a significant amount of TCAM space.
- If a packet enters through a VLAN and exits through another VLAN, the VLAN statistics counter increments the ingress VLAN counter twice. The system does not update the egress VLAN counter.
- IPv6 communication is not supported between devices in:
  - Community and isolated VLANs
  - One community VLAN and another community VLAN
  - Isolated VLANs
- The maximum number of PVLAN domains that you can create depends of the total hardware resources of the OS10 platform. The total hardware resources used is the sum of hardware resources used for all the PVLAN domains and hardware resources used for attaching the PVLAN ports to the regular VLANs. The following are the maximum hardware resource that can be used on existing OS10 platforms:
  - S5200-ON Series: 7372
  - S4100-ON Series, S6010-ON, and Z9200-ON Series: 14746

Configuration notes

- Do not configure the default VLAN as a PVLAN, primary or secondary.
- Do not configure a PVLAN secondary port as a member of more than one VLAN within the same PVLAN domain.
- You can configure a regular VLAN as a PVLAN only when it does not have any member ports associated with it. Remove the member ports from a VLAN before you configure it as a PVLAN.
- To convert a PVLAN to a regular VLAN, you must remove the PVLAN mode. Ensure that you remove the member ports from the PVLAN and the primary and secondary VLAN mapping before you remove the PVLAN mode.
- You can configure an L2 switch port as a PVLAN port using the `private-vlan mode {promiscuous | secondary-port}` command. To convert the PVLAN port back to a regular L2 port, ensure that the port is not part of any PVLAN.
- You can configure 802.1x authentication on PVLAN member ports.
- For scaled L2 deployments, configure L2 VLAN scale profile using the `scale-profile vlan` command to scale the VLANs in an optimal way.
- If L3 routing is required in an L2-scale profile, use the `mode L3` command in the primary VLAN.
- You cannot configure PVLAN and virtual extensible LAN (VXLAN) on the same set of VLANs and ports.
- Enable local proxy ARP and configure an IPv4 address on the primary VLAN for IPv4 communication between devices that are connected to different secondary VLANs or isolated ports within the same PVLAN.
- Dell Technologies recommends the following:
  - Enable peer routing in a VLT topology.
  - Configure unique, static MAC addresses in a PVLAN domain including all the associated VLANs.
- Associating a PVLAN port, secondary or promiscuous, to a VLAN consumes additional hardware resources.
- For information about PVLAN interaction with other features, see PVLAN and other features.

Configure a PVLAN domain

This section describes how to configure a PVLAN domain.

This task includes configuring primary, community, and isolated VLANs and associating a member port with each of these VLANs.

1. Configure a primary VLAN.
   a. Create a VLAN.

```
OS10# configure terminal
OS10(config)# interface vlan 10
```

   b. Configure the VLAN mode as primary VLAN.

```
OS10(conf-if-vl-10)# private-vlan mode primary
```

c. Configure a promiscuous port.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# private-vlan mode promiscuous
OS10(conf-if-eth1/1/1)# switchport mode trunk
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 10
```

2. Create an isolated VLAN.
   a. Create a VLAN.

```
OS10(config)# interface vlan 20
```

   b. Configure the PVLAN mode as an isolated VLAN.

```
OS10(conf-if-vl-20)# private-vlan mode isolated
```

   c. Configure a secondary port.

   Configure the Switchport mode as `trunk` to tag the port in multiple VLANs.

```
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# switchport mode trunk
OS10(conf-if-eth1/1/2)# private-vlan mode secondary-port
```

   d. Associate the secondary port to the isolated VLAN.

```
OS10(conf-if-eth1/1/2)# switchport trunk allowed vlan 20
```

3. Create a community VLAN.
   a. Create a VLAN.

```
OS10(config)# interface vlan 30
```

   b. Configure the PVLAN mode as a community VLAN.

```
OS10(conf-if-vl-30)# private-vlan mode community
```

   c. Configure a secondary port.

```
OS10(config)# interface ethernet 1/1/3
OS10(conf-if-eth1/1/3)# switchport mode trunk
OS10(conf-if-eth1/1/3)# private-vlan mode secondary-port
```

   d. Associate the secondary port to the community VLAN.

```
OS10(conf-if-eth1/1/2)# switchport trunk allowed vlan 30
```

4. Associate the list of secondary VLANs to the primary VLAN.

```
OS10# configure terminal
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# private-vlan mapping secondary-vlans 20, 30
```

```
OS10# show vlan private-vlan mapping

Private Vlan:
 Primary   : 10
 Isolated  : 20
 Community : 30
```

```
OS10# show vlan private-vlan

 Primary Secondary Type      Active Ports
 ------- --------- --------- ------ -----------------------------------------------
 10                Primary   Yes    Eth1/1/1,1/1/5
```

```
          20        Isolated  Yes    Eth1/1/2
          30        Community Yes    Eth1/1/3
```

```
OS10# show vlan

Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
*   1      Active                                   A Eth1/1/4,1/1/6-1/1/32
P   10     Active                                   A Eth1/1/1
                                                    T Eth1/1/5
I   20     Active                                   T Eth1/1/2
C   30     Active                                   A Eth1/1/3
```

Private VLANs on SmartFabric OS10

How to configure a private VLAN on a SmartFabric OS10 device?

Extend PVLAN domain to another switch

This section describes how to extend a PVLAN domain to another switch.

To extend the primary and secondary VLANs to a connected device, add a regular switch port in Trunk mode to the VLANs of the PVLAN. The regular switch port in Trunk mode is also called an Inter-Switch Link (ISL) trunk port or PVLAN trunk.

Dell Technologies recommends that you do not configure the ISL as a promiscuous or secondary port.

NOTE:

- For a regular switch port in Trunk mode, you must tag all VLANs of the PVLAN domain.
- If you enable `local proxy arp` in the primary VLAN, both the host and the primary VLAN (as the local proxy) send an ARP reply.

1. Enter Configuration mode.

```
OS10# configure terminal
```

2. Enter Interface Configuration mode.

```
OS10(config)# interface ethernet 1/1/4
```

3. Configure the Switchport mode as `trunk` for the port to carry more than single VLAN traffic.

```
OS10(conf-if-eth1/1/4)# switchport mode trunk
```

4. Associate the port to be a trunk member of the primary and secondary VLANs.

```
OS10(conf-if-eth1/1/4)# switchport trunk allowed vlan 10
OS10(conf-if-eth1/1/4)# switchport trunk allowed vlan 20
OS10(conf-if-eth1/1/4)# switchport trunk allowed vlan 30
```

```
OS10# show vlan

Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
*   1      Active                                   A Eth1/1/6-1/1/32
P   10     Active                                   A Eth1/1/1
                                                    T Eth1/1/4-1/1/5
I   20     Active                                   T Eth1/1/2
                                                    T Eth1/1/4
```

```
C   30      Active                                          A Eth1/1/3
                                                            T Eth1/1/4
```

Configure PVLAN ports in a regular VLAN

This section describes how to configure PVLAN ports in regular VLANs.

You can configure a PVLAN port as a tagged and untagged member of regular VLANs.

Configure a PVLAN port as tagged and untagged member of regular VLANs

You can configure a PVLAN port as tagged and untagged member of regular VLANs.

Configure the port to be a trunk member of a secondary VLAN and a regular VLAN.

1. Enter Configuration mode.

```
OS10# configure terminal
```

2. Enter Interface Configuration mode.

```
OS10(config)# interface ethernet 1/1/2
```

3. Configure Switchport mode as a PVLAN secondary port.

```
OS10(conf-if-eth1/1/2)# private-vlan mode secondary-port
```

4. Configure Switchport mode as `trunk` to carry more than single VLAN traffic.

```
OS10(conf-if-eth1/1/2)# switchport mode trunk
```

5. Associate the port to be a trunk member of a PVLAN secondary VLAN. In this example, `vlan 20` is an isolated secondary VLAN.

```
OS10(conf-if-eth1/1/2)# switchport trunk allowed vlan 20
```

6. Associate the port to be a trunk member of a regular VLAN (non-PVLAN).

```
OS10(conf-if-eth1/1/2)# switchport trunk allowed vlan 100
```

7. Configure the PVLAN port as member of untagged VLAN. Here `VLAN 101` is a regular VLAN.

```
OS10(conf-if-eth1/1/2)#switchport access vlan 101
```

```
OS10(conf-if-eth1/1/2)# show configuration
!
interface ethernet1/1/2
no shutdown
private-vlan mode secondary-port
switchport access vlan 101
switchport mode trunk
switchport trunk allowed vlan 20,100
OS10(conf-if-eth1/1/2)#
```

The PVLAN port `ethernet 1/1/2` is a tagged member of VLAN 100 and VLAN 20. It is also an access member of the regular VLAN 101.

Configure an access PVLAN port as tagged member of regular VLANs

You can configure an access PVLAN port as tagged member of regular VLANs.

1. Enter Configuration mode.

```
OS10# configure terminal
```

2. Enter Interface Configuration mode.

```
OS10(config)# interface ethernet 1/1/1
```

3. Configure the port as a promiscuous port.

```
OS10(conf-if-eth1/1/1)# private-vlan mode promiscuous
```

You can configure the Switchport mode as a promiscuous or secondary port.

```
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
private-vlan mode promiscuous
switchport access vlan 1
OS10(conf-if-eth1/1/1)#
```

NOTE: Notice that the port continues to be in the default VLAN, even though it is in PVLAN mode.

4. Associate the promiscuous port to a primary VLAN.

```
OS10(conf-if-eth1/1/1)# switchport access vlan 10
```

5. Configure the Switchport mode as `trunk` to carry traffic from more than a single VLAN.

```
OS10(conf-if-eth1/1/1)# switchport mode trunk
```

6. Associate the port to be a trunk member of regular VLAN.

```
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 100
```

```
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
private-vlan mode promiscuous
switchport access vlan 10
switchport trunk allowed vlan 100
OS10(conf-if-eth1/1/1)#
```

Configure an IPv4 address and local proxy ARP on a PVLAN interface

Enable the Local Proxy ARP feature in the primary VLAN to allow communication between isolated hosts and between hosts connected to different community VLANs within the same PVLAN domain.

You can configure a Layer 3 (L3) VLAN interface, assign an IPv4 address, and enable local proxy ARP in the primary VLAN.

NOTE: To enable the Local Proxy ARP feature, you must assign an IPv4 address to the primary VLAN.

1. Enter Configuration mode.

```
OS10# configure terminal
```

2. Enter VLAN Interface mode.

```
OS10(config)# interface vlan 10
```

3. Configure an IP address.

```
OS10(conf-if-vl-10)# ip address 10.1.1.1/24
```

4. Enable the local proxy ARP in the primary VLAN.

```
OS10(conf-if-vl-10)# ip local-proxy-arp
```

```
OS10(conf-if-vl-10)# show configuration
!
interface vlan10
private-vlan mode primary
private-vlan mapping secondary-vlans 20, 30
no shutdown
ip address 10.1.1.1/24
ip local-proxy-arp
OS10(conf-if-vl-10)#
```

Convert a secondary or promiscuous port to a regular L2 port

You can convert a secondary or promiscuous port to a regular L2 port.

Remove the secondary or promiscuous port from the PVLANs before you convert it to a regular port. If you change the PVLAN port mode while the port is a member of a primary VLAN, the following message appears:

```
%Error: interface is a member of private-vlan
```

A promiscuous port is a member of a primary VLAN. OS10 does not allow you to change the PVLAN port mode when the port is a member of the primary VLAN.

1. Enter Configuration mode.

```
OS10# configure terminal
```

2. Enter Interface Configuration mode.

```
OS10(config)# interface ethernet 1/1/5
```

3. Remove the port from the PVLANs.

```
OS10(conf-if-eth1/1/5)# no switchport access vlan
OS10(conf-if-eth1/1/5)# no switchport trunk allowed vlan 10
```

```
OS10(conf-if-eth1/1/5)# show configuration
!
interface ethernet1/1/5
no shutdown
private-vlan mode promiscuous
switchport mode trunk
```

4. Reset PVLAN Port mode.

```
OS10(conf-if-eth1/1/5)# no private-vlan mode
```

```
OS10(conf-if-eth1/1/5)# show configuration
!
interface ethernet1/1/5
no shutdown
switchport mode trunk
```

Delete the primary and secondary VLANs

You can delete primary and secondary VLANs.

Before you delete primary and secondary VLANs, you must remove the member ports from the secondary VLANs and primary VLAN.

To delete primary and secondary VLANs, follow the order specified in this section.

1. Delete the secondary VLAN.
   a. Delete the secondary-VLAN-to-primary-VLAN association.

```
OS10# configure terminal
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# no private-vlan mapping secondary-vlans 30
```

   b. Delete the secondary VLAN, `vlan 30`.

```
OS10(config)# no interface vlan 30
```

```
OS10# show vlan private-vlan mapping

Private Vlan:
 Primary   : 10
 Isolated  : 20
```

2. Delete the primary VLAN.

```
OS10(config)# no interface vlan 10
```

```
OS10# show vlan private-vlan mapping
```

```
OS10(conf-if-vl-20)# show configuration
!
interface vlan20
no shutdown
private-vlan mode secondary-port
OS10(conf-if-vl-20)#
```

View PVLAN information

View PVLAN mapping information

```
OS10# show vlan private-vlan mapping

Private Vlan:
 Primary   : 10
 Isolated  : 20
 Community : 30
```

```
OS10# show vlan private-vlan

 Primary Secondary Type      Active Ports
 ------- --------- --------- ------ -----------------------------------------
 10                Primary   Yes    Eth1/1/1,1/1/5
         20        Isolated  Yes    Eth1/1/2
         30        Community Yes    Eth1/1/3
```

```
OS10# show vlan

Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
*   1      Active                                   A Eth1/1/4,1/1/6-1/1/32
P   10     Active                                   A Eth1/1/1
                                                    T Eth1/1/5
I   20     Active                                   T Eth1/1/2
C   30     Active                                   A Eth1/1/3
```

View replicated MAC addresses

MAC addresses that are statically configured or dynamically learned are shared between primary and secondary VLANs. The `show mac address-table` command shows the VLAN where the MAC address was originally learned.

In the following example, the term `pv vlan-id` indicates the VLAN where the MAC address is originally learned:

- MAC address `00:00:01:01:01:10` learned from primary VLAN replicates to the secondary VLANs.
- MAC addresses `00:00:01:01:01:20` and `00:00:01:01:01:30` learned from the secondary VLANs replicate to the primary VLAN.

```
OS10# show mac address-table
Codes: pv <vlan id> private vlan where the mac is originally learnt
VlanId Mac Address        Type    Interface
10     00:00:01:01:01:10  dynamic ethernet1/1/1
20     00:00:01:01:01:10  dynamic ethernet1/1/1 pv 10
30     00:00:01:01:01:10  dynamic ethernet1/1/1 pv 10

10     00:00:01:01:01:20  dynamic ethernet1/1/2 pv 20
20     00:00:01:01:01:20  dynamic ethernet1/1/2

10     00:00:01:01:01:30  dynamic ethernet1/1/3 pv 30
30     00:00:01:01:01:30  dynamic ethernet1/1/3
```

The `show ip arp` and `show ipv6 neighbors` commands also display the VLAN where the MAC address is originally learned.

View PVLAN ARP entries

To view PVLAN ARP entries that are resolved or configured through a secondary VLAN, use the `show ip arp` command.

```
OS10# show ip arp
Codes: pv <vlan-id> - private vlan where the mac is originally learnt

Address         Hardware address    Interface          Egress Interface
-------------------------------------------------------------------------
11.1.1.2        90:b1:1c:f4:a6:ee ethernet1/1/25:1   ethernet1/1/25:1
41.1.1.2        4c:d9:8f:fa:2b:59 vlan100            port-channel100     pv 20
12.1.1.2                            4b:d9:6f:fa:2c:40 ethernet1/1/25:2
ethernet1/1/25:2    pv 30
```

View IPv6 neighbor entries

To view the IPv6 neighbor entries that are learned through the secondary VLANs, use the `show ipv6 neighbors` command.

```
OS10# show ipv6 neighbors
Codes: pv <vlan-id> - private vlan where the mac is originally learnt

IPv6 Address  Hardware Address    State       Interface  Egress Int
-------------------------------------------------------------------------------
10::12        90:b1:1d:f4:a6:ee   reachable   vlan10     ethernet1/1/13      pv 20
```

View mismatched PVLAN configurations

To view mismatched PVLAN configurations in VLT peers, use the `show vlt` command.

- To view `local-proxy-arp` mismatch:

```
OS10# show vlt 100 mismatch vlan
VLAN mismatch:
VLAN L2 mismatch:
No mismatch
VLAN L3-IPv4 mismatch:
No mismatch
VLAN L3-IPv6 mismatch:
No mismatch
VLAN Local-Proxy-ARP enabled mismatch:
VLT Unit ID    Mismatch VLAN List
--------------------------------------------------------------------------
* 1              100
  2              -
Private VLAN mode mismatch:
No mismatch
```

- To view VLT port channel and VLAN mismatch:

```
OS10# show vlt 1 mismatch vlt-vlan
VLT VLAN mismatch:
vlt-port-channel ID : 100
VLT Unit ID    Mismatch VLAN List
--------------------------------
* 1              1001
  2              -
```

- To view PVLAN-mapping mismatch:

```
OS10# show vlt 1 mismatch private-vlan mapping
Private VLAN mapping mismatch:
Primary vlan: 100
VLT Unit ID    Configured Secondary VLAN(s)
--------------------------------------------------------------------------------
  1              20
* 2              -
```

- To view Port mode configuration mismatch:

```
OS10# show vlt 1 mismatch private-vlan port-mode
Private VLAN port mode mismatch:
vlt-port-channel ID : 10
VLT Unit ID    Configured port-mode
--------------------------------------------------------------------------------
  1              Secondary-port
* 2              -
vlt-port-channel ID : 30
VLT Unit ID    Configured port-mode
--------------------------------------------------------------------------------
  1              Secondary-port
* 2              -
```

- To view VLAN mode configuration mismatch:

```
OS10# show vlt 1 mismatch private-vlan vlan-mode
Private VLAN mode mismatch:
VLAN: 10
VLT Unit ID    Configured PVLAN mode
--------------------------------------------------------------------------------
  1              Isolated
* 2              Community
```

Interaction with other features

Port security

OS10 supports the following port security features on promiscuous, secondary, and ISL ports: MAC address learning limit, sticky MAC, MAC address movement control, and MAC address aging.

For MAC address movement between secondary ports that are associated with different secondary VLANs within the PVLAN domain:

- The `shutdown-original` and `shutdown-offending` violation actions are supported.
- The `drop` and `drop-and-log` violation actions are not supported.

For more information on the Port Security feature, see Port security.

L3 interfaces, protocols, and applications

OS10 supports configuring IP addresses, both IPv4 and IPv6 addresses, only on primary VLANs including secondary IP addresses. Secondary VLANs are L2 VLANs.

In a PVLAN, Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), and VRRP are supported only on the primary VLAN.

NOTE: Even though you can configure VRRP only on the primary VLAN, the system adds virtual MAC address entries for that VRRP group in the TCAM table for both the primary and secondary VLANs. Enabling multiple PVLAN domains with VRRP groups consumes a significant amount of TCAM space.

OS10 supports only the default VRF in a PVLAN domain. Nondefault VRF is not supported.

Spanning Tree Protocol

In a PVLAN, Rapid-PVST, RSTP, and MSTP are supported on the primary and secondary VLANs. Dell Technologies recommends that if you connect the secondary ports to servers or host devices and not to a switch:

- Configure secondary ports as edge ports for faster convergence.
- Enable BPDU guard to prevent loops that might occur because of misconfigurations.

NOTE: If you enable MSTP, ensure that all VLANs in the PVLAN domain, including the primary and associated secondary VLANs, are mapped to a single MSTP instance.

Address Resolution Protocol

For communication between the PVLAN secondary port-connected devices, OS10 uses the Local Proxy ARP feature that Linux supports.

L2 communication is not permitted between hosts connected to ports in an isolated VLAN and hosts connected to ports in any of the secondary VLANs. Also, hosts connected to ports in a community VLAN cannot communicate with hosts connected to ports in another community or isolated VLAN.

However, these hosts can communicate with each other over L3 through the primary VLAN. To configure an L3 VLAN interface, enable the local proxy ARP feature. For more information, see Configure Layer 3 VLAN interface. For ARP requests from hosts in the secondary VLANs, the primary VLAN responds with an ARP reply and routes the packets between them.

NOTE: When you enable the Local Proxy ARP feature in the primary VLAN, the devices in the PVLAN domain might receive more than one ARP response. For example, an ARP response from the actual destination device and an ARP response from the router that performs proxy ARP.

Access control lists

You can apply IP ACLs and MAC ACLs on the primary VLAN, and MAC ACLs on the secondary VLAN ports.

Multicast support for PVLAN

OS10 supports enabling Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Protocol snooping in a PVLAN domain. Enabling IGMP and MLD snooping allows switches to forward multicast traffic only to IGMP and MLD receivers and hence conserve network resources. It offers the following benefits:

- Improves network bandwidth utilization by forwarding multicast traffic only to multicast receiver ports.
- Provides increased security by preventing an unknown multicast flood to all the VLAN member ports.

Important notes

- OS10 supports enabling IGMP and MLD snooping only on primary VLANs, and it automatically enables IGMP and MLD snooping on all the associated secondary VLANs. When you disable IGMP and MLD snooping on a primary VLAN, the system disables it from the associated secondary VLANs as well.
- IGMP and MLD snooping commands are not allowed on secondary VLANs.
- OS10 supports the Multicast Flood Restrict feature in a PVLAN domain.
- You cannot configure a secondary port as an mrouter port. Dynamic mrouter port learning is disabled on secondary ports.
- OS10 does not support L3 IGMP and PIM configuration commands in a PVLAN domain. These features are not allowed on primary, isolated, and community VLANs.

PVLAN with VLT

You can configure Virtual Link Trunking (VLT) peer nodes in a PVLAN domain. With VLT being an L2 redundancy mechanism, support for VLT nodes in a PVLAN:

- Provides a loop-free network with optimal bandwidth utilization.
- Enables L2 security functionalities.

Important notes

- PVLAN configurations of VLT-VLAN and VLT port channels must be identical on both VLT peer nodes. PVLAN IDs and mappings must be identical on both VLT peer nodes as well.
- Enable local proxy ARP in the primary VLAN on both VLT peers. Even though you configure the local proxy ARP on both the VLT peer nodes, only the VLT primary node processes the ARP requests. When the primary VLT node reboots and the secondary VLT node transitions to become the primary VLT node, it processes the ARP requests.
- If you enable the Local Proxy ARP feature, enable VLT peer routing on both the VLT peer nodes.
- A VLT port channel can be a promiscuous port, secondary VLAN port, or ISL trunk port.
- MAC address replication in a PVLAN domain is based on the local configuration of the VLT peer node.

PVLAN commands

ip local-proxy-arp

Enables the local proxy Address Resolution Protocol (ARP) on an interface.

Syntax	`ip local-proxy-arp`
Parameters	None
Default	Not applicable
Command Mode	VLAN INTERFACE CONFIGURATION
Usage Information	• The router responds to ARP requests for addresses that are on the same subnetwork of that interface. • This command is applicable only for the primary VLAN. • Ensure that you configure an IPv4 address on the primary VLAN before you enable local proxy ARP. • In a VLT setup, you must configure this command on both the primary and secondary VLT nodes. The secondary VLT node suppresses the local proxy ARP functionality. • The `no` form of this command disables the local proxy ARP functionality.
Example—To enable local proxy ARP in a VLAN.	`OS10(conf-if-vl-10)# ip local-proxy-arp`
Supported Releases	10.5.2.0 or later

private-vlan mapping secondary-vlans

Maps a list of secondary VLANs to the primary VLAN.

Syntax	`private-vlan mapping secondary-vlans` *`vlan-list`*
Parameters	*`vlan-list`*—List of secondary VLANs to map to the primary VLAN.
Default	Regular VLAN
Command Mode	VLAN INTERFACE CONFIGURATION
Usage Information	• This command is applicable only for the primary VLAN. • This command maps a list of secondary VLANs to a primary VLAN. Before you map the secondary VLANs to the primary VLAN, create the secondary VLANs and configure PVLAN mode as secondary.

If the secondary VLANs are not created when you map them to a primary VLAN, this configuration takes effect only after you create the secondary VLANs.

- The `no` form of this command removes the mapping of the secondary VLANs to the primary VLAN.

Example—To map secondary VLANs 20 and 50 to the primary VLAN 10.

```
OS10(conf-if-vl-10)# private-vlan mapping secondary-vlans 20, 50
```

Supported Releases 10.5.2.0 or later

private-vlan mode (VLAN mode)

Configures PVLAN mode and specifies the PVLAN as primary, community, or isolated VLAN.

Syntax `private-vlan mode {community | isolated | primary}`

Parameters

- `community`—Configures the VLAN as a community VLAN.
- `isolated`—Configures the VLAN as an isolated VLAN.
- `primary`—Configures the VLAN as a primary VLAN.

Default Regular VLAN

Command Mode VLAN INTERFACE CONFIGURATION

Usage Information

- Configures a PVLAN as a community, isolated, or primary VLAN. You must not add VLAN members before you configure PVLAN mode.
- You can add the following port types to community, isolated, and primary VLANs:
  - PVLAN promiscuous to the primary VLAN
  - PVLAN secondary-port to community and isolated VLANs
  - Regular L2 switch ports in Access or Trunk mode to primary, community, and isolated VLANs
- To change a PVLAN mode, for example, from isolated to community, remove the current PVLAN mode and then configure the new PVLAN mode.
- If secondary VLANs are mapped to a primary VLAN, remove the secondary-VLAN-to-primary-VLAN mapping before you change the PVLAN mode of the VLANs.
- The `no` form of the command configures the VLAN mode back to a regular VLAN. You must remove the VLAN members before you use the `no` form of the command.

Example—To configure a primary VLAN.

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# private-vlan mode primary
```

Example—To configure an isolated VLAN.

```
OS10(config)# interface vlan 20
OS10(conf-if-vl-20)# private-vlan mode isolated
```

Example—To configure a community VLAN.

```
OS10(config)# interface vlan 30
OS10(conf-if-vl-30)# private-vlan mode community
```

Supported Releases 10.5.2.0 or later

private-vlan mode (Port mode)

Configures PVLAN port mode.

Syntax `private-vlan mode {promiscuous | secondary-port}`

Parameters

- `promiscuous`—Configures the port as a promiscuous port.
- `secondary-port`—Configures the port as a secondary port.

Default None

Command Mode INTERFACE CONFIGURATION

Usage Information

- This command is applicable only for physical and port channel interfaces. Configures an interface as one of the following PVLAN ports:
  - Promiscuous port: Depending on the Switchport mode configuration, this port can be an Access or a Trunk port.
  - Secondary port: A secondary port can be an isolated or a community port. Depending on the Switchport mode configuration, this port can be an Access or a Trunk port.
- This configuration takes effect only when this interface is associated with a PVLAN. Unless this interface is associated with a PVLAN, it continues to function as a normal access or trunk port.
- The `no` form of this command removes PVLAN port mode.

NOTE: If this port is a member of a primary or secondary VLAN, you cannot configure or reset PVLAN port mode.

Example—To configure an interface as PVLAN promiscuous port.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# private-vlan mode promiscuous
OS10(conf-if-po-20)#exit
```

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# private-vlan mode promiscuous
```

Example—To configure an interface as a secondary port.

```
OS10(conf-if-po-20)# private-vlan mode secondary-port
OS10(conf-if-po-20)# no private-vlan mode
```

Example—To configure a secondary port as a trunk port.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# private-vlan mode secondary-port
```

Example—To configure a promiscuous port as a trunk port.

```
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# private-vlan mode promiscuous
```

Supported Releases 10.5.2.0 or later

show interface private-vlan

Displays the PVLAN-specific details of an interface.

Syntax `show interface private-vlan [interface-name]`

Parameters *interface-name*—Enter the interface information in *node/slot/port[:subport]* format.

Command Mode EXEC

Usage Information The `show interface` command provides information about the PVLAN-specific details of an interface. This command displays the VLAN ID associated with the interface, PVLAN type, and PVLAN port mode.

Examples

```
OS10# show interface private-vlan

 Interface  Vlan PVLAN-Type Interface Type Status
 ---------  ---- ---------- -------------- ------
 Eth1/1/1   4000 Primary    Promiscuous    Up
 Eth1/1/1   4003 Primary    Promiscuous    Up
 Eth1/1/3   4000 Primary    PVLAN-Trunk    Up
 Eth1/1/4   4003 Primary    PVLAN-Trunk    Up
```

```
 Eth1/1/5   4001 Isolated   Secondary-port Up
 Eth1/1/6   4001 Isolated   Secondary-port Up
```

```
OS10# show interface private-vlan ethernet 1/1/11
Interface   Vlan PVLAN-Type Interface Type Status
---------   ---- ---------- -------------- --------
Eth1/1/11   100  Primary    Promiscuous    true
Eth1/1/11   101  Primary    Promiscuous    true
```

Supported Releases 10.5.2.0 or later

show vlan private-vlan

Displays PVLAN-specific information.

Syntax `show vlan private-vlan vlan-id`

Parameters *vlan-id*—(Optional) Enter a VLAN ID, from 1 to 4093.

Command Mode EXEC

Usage Information This command displays information about primary and secondary VLANs. Use this command to view the following information:

- A list of primary VLANs and their member ports
- A list of secondary VLANs and their member ports
- The primary-VLAN-to-secondary-VLAN mapping information

Example

```
OS10# show vlan private-vlan
Primary Secondary Type      Active Ports
------- --------- --------- ------
-----------------------------------------
100               Primary   Yes    Eth1/1/11
                                   Po100-101,1000
        10        Isolated  Yes    Eth1/1/12
                                   Po10,101,1000
        20        Community Yes    Eth1/1/13
                                   Po20,101,1000
        30        Community Yes    Eth1/1/14
                                   Po30,101,1000
101               Primary   Yes    Eth1/1/11
                                   Po100,1000
        11        Isolated  Yes    Eth1/1/12
                                   Po10,1000
        21        Community Yes    Eth1/1/13
                                   Po20,1000
        31        Community Yes    Eth1/1/14
                                   Po30,1000
```

Example (with VLAN ID)

```
OS10# show vlan private-vlan 10
Primary Secondary Type      Active Ports
------- --------- --------- ------ ---------------
100               Primary   Yes    Eth1/1/11
                                   Po100-101,1000
        10        Community Yes    Po1000
```

Supported Releases 10.5.2.0 or later

show vlan private-vlan primary

Displays the primary VLANs and their members (promiscuous) in the device.

Syntax `show vlan private-vlan primary`

Parameters None

Command Mode EXEC

Usage Information Use this command to verify information about the primary VLANs.

Example

```
OS10# show vlan private-vlan primary
Primary Secondary Type      Active Ports
------- --------- --------- ------ --------------
100               Primary   Yes    Eth1/1/11
                                   Po100-101,1000
101               Primary   Yes    Eth1/1/11
                                   Po100,1000
```

Supported Releases 10.5.2.0 or later

show vlan private-vlan isolated

Displays the isolated VLANs and their members (secondary-port) in the device.

Syntax `show vlan private-vlan isolated`

Parameters None

Command Mode EXEC

Usage Information Use this command to verify information about the isolated VLANs and the associated primary VLAN.

Example

```
OS10# show vlan private-vlan isolated
Primary Secondary Type      Active Ports
------- --------- --------- ------ --------------
100               Primary   Yes    Eth1/1/11
                                   Po100-101,1000
        10        Isolated  Yes    Eth1/1/12
                                   Po10,101,1000
101               Primary   Yes    Eth1/1/11
                                   Po100,1000
        11        Isolated  Yes    Eth1/1/12
                                   Po10,1000
```

Supported Releases 10.5.2.0 or later

show vlan private-vlan community

Displays the community VLANs and their members (secondary-port) in the device.

Syntax `show vlan private-vlan community`

Parameters None

Command Mode EXEC

Usage Information Use this command to verify information about the community VLANs and the associated primary VLAN.

Example

```
OS10# show vlan private-vlan community
Primary Secondary Type      Active Ports
------- --------- --------- ------
-----------------------------------------
100               Primary   Yes    Eth1/1/11
                                   Po100-101,1000
        20        Community Yes    Eth1/1/13
                                   Po20,101,1000
        30        Community Yes    Eth1/1/14
                                   Po30,101,1000
101               Primary   Yes    Eth1/1/11
                                   Po100,1000
        21        Community Yes    Eth1/1/13
                                   Po20,1000
        31        Community Yes    Eth1/1/14
                                   Po30,1000
```

Supported Releases 10.5.2.0 or later

show vlan private-vlan interface

Displays the PVLAN-specific details of an interface.

Syntax `show vlan private-vlan interface` *interface-name*

Parameters *interface-name*—Enter the interface information in *node/slot/port[:subport]* format.

Command Mode EXEC

Usage Information Use this command to verify information about the PVLAN-specific details of an interface. This command displays the VLAN ID associated with the interface.

Examples

```
OS10# show vlan private-vlan interface ethernet 1/1/11
Primary Secondary Type      Active Ports
------- --------- --------- ------ ---------
100               Primary   Yes    Eth1/1/11
101               Primary   Yes    Eth1/1/11
```

```
OS10# show vlan private-vlan interface ethernet 1/1/7

Primary Secondary Type      Active Ports
------- --------- --------- ------ ---------
        4002      Community Yes    Eth1/1/7
```

```
OS10# show vlan private-vlan interface ethernet 1/1/5

Primary Secondary Type      Active Ports
------- --------- --------- ------ --------
        4001      Isolated  Yes    Eth1/1/5
```

```
OS10# show vlan private-vlan interface port-channel 101
Primary Secondary Type      Active Ports
------- --------- --------- ------ -----------------------------
        10        Isolated  No     Po101
        20        Community No     Po101
        30        Community No     Po101
100               Primary   No     Po101
```

Supported Releases 10.5.2.0 or later

show vlan private-vlan mapping

Displays primary-to-secondary PVLAN mappings.

Syntax	`show vlan private-vlan mapping`
Parameters	None
Command Mode	EXEC
Usage Information	Use this command to view the following information: • A list of primary VLANs • A list of secondary VLANs • The primary-VLAN-to-secondary-VLAN mapping information

Example	`OS10# show vlan private-vlan mapping`
	`Private Vlan:`
	` Primary   : 100`
	` Isolated  : 10`
	` Community : 20,30`
	
	`Private Vlan:`
	` Primary   : 101`
	` Isolated  : 11`
	` Community : 21,31`

Supported Releases	10.5.2.0 or later

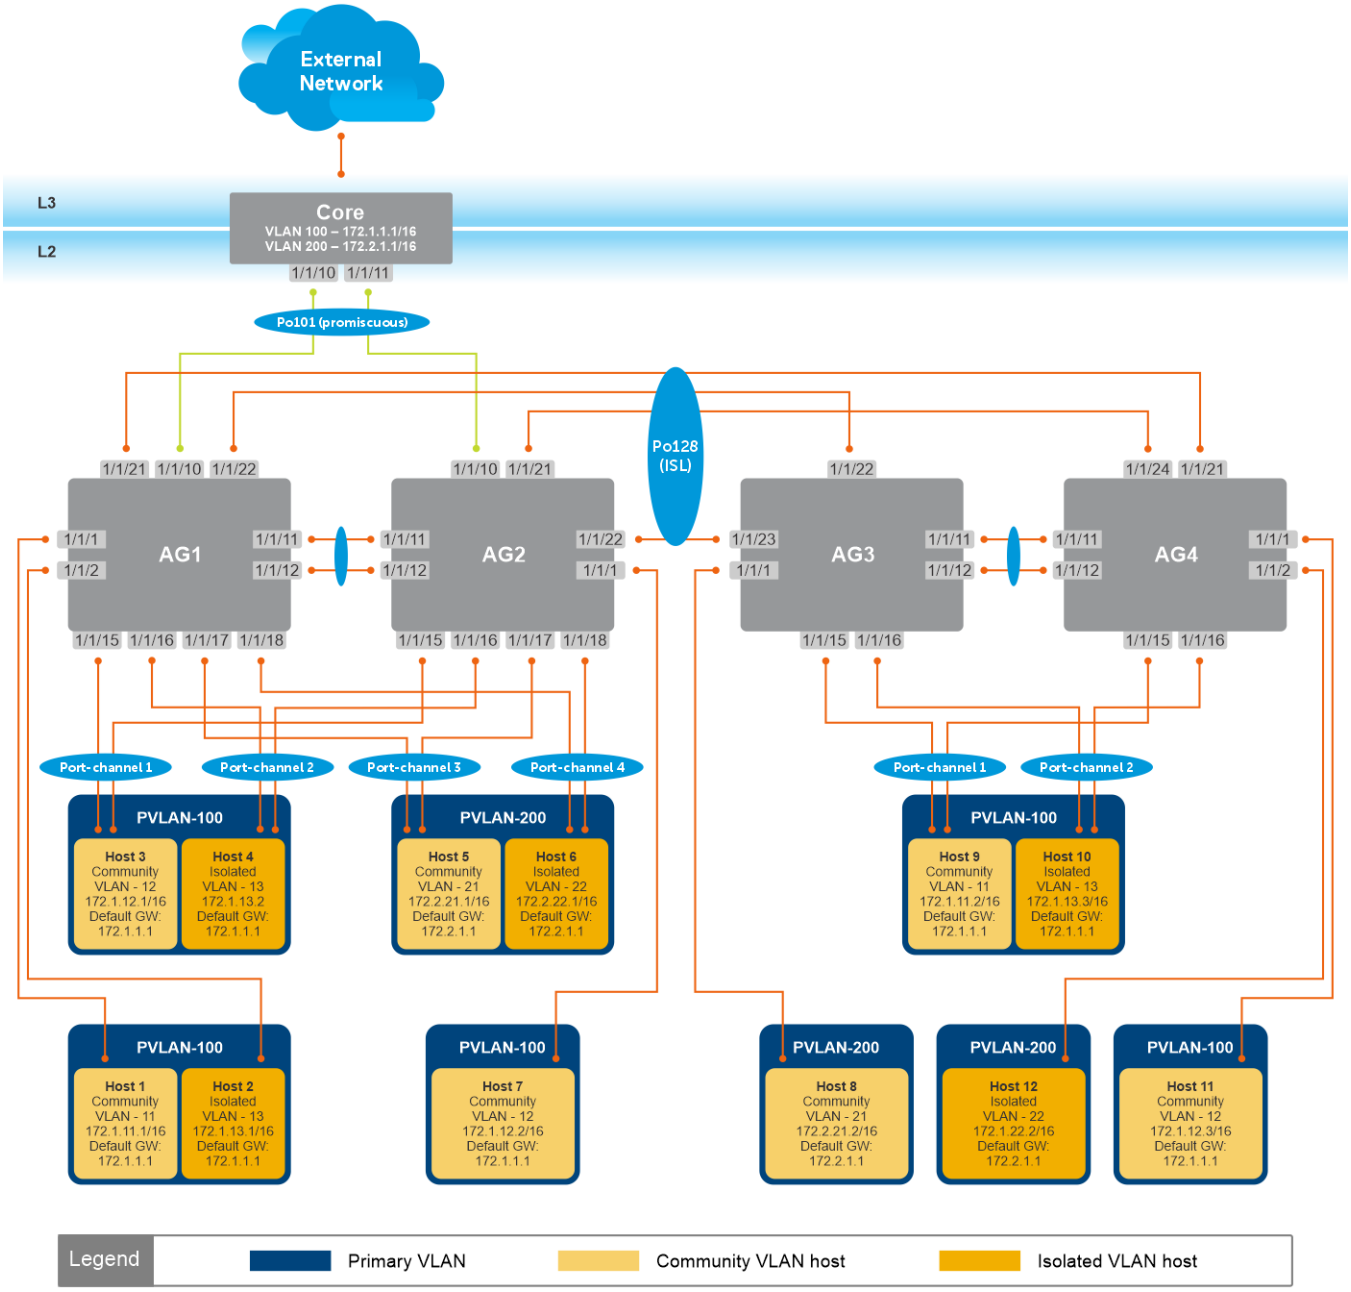
Example: PVLAN deployment with L2-L3 boundary at the spine layer

The following use case illustrates a deployment scenario in which the end devices that belong to different tenants are separated using secondary VLANs. Here, the private VLAN domain is spanned across two data centers using an ISL trunk port. In this example:

- The configured trunk port carries the traffic for both the primary and secondary VLANs.
- A router that is reachable through a promiscuous port provides L3 connectivity to the external network and between end devices in the secondary VLANs.

Configuration notes

- Only the primary VLANs are extended to the core L3 switch (spine).
- On the leaf nodes, the primary VLAN port that is connected to the spine switch is the promiscuous port.
- The spine switch is PVLAN agnostic. On the spine switch, the ports that connect to the leaf nodes AG1 and AG2 are normal trunk ports in the respective VLANs.
- Primary VLANs on the leaf nodes do not have an IP address. IP address is configured only on the spine switch, which is the gateway for all hosts in the PVLAN domains. The spine switch performs the L3 IPv4 and IPv6 routing.



AG1 Leaf Switch

1. Configure the VLTi member links between AG1 and AG2.

```
AG1(config)# interface ethernet1/1/11
AG1(conf-if-eth1/1/11)# no shutdown
AG1(conf-if-eth1/1/11)# no switchport
AG1(conf-if-eth1/1/11)# exit

AG1(config)# interface ethernet1/1/12
AG1(conf-if-eth1/1/12)# no shutdown
AG1(conf-if-eth1/1/12)# no switchport
AG1(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG1(config)# vlt-domain 255
AG1(conf-vlt-255)# backup destination 100.104.80.12
```

```
AG1(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG1(conf-vlt-255)# peer-routing
AG1(conf-vlt-255)# primary-priority 1
AG1(conf-vlt-255)# vlt-mac 06:00:00:00:01:01
AG1(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG1(config)# interface ethernet1/1/15
AG1(conf-if-eth1/1/15)# no shutdown
AG1(conf-if-eth1/1/15)# no switchport
AG1(conf-if-eth1/1/15)# channel-group 1 mode active
AG1(conf-if-eth1/1/15)# exit

AG1(config)# interface port-channel 1
AG1(conf-if-po-1)# vlt-port-channel 1
AG1(conf-if-po-1)# exit

AG1(config)# interface ethernet1/1/16
AG1(conf-if-eth1/1/16)# no shutdown
AG1(conf-if-eth1/1/16)# no switchport
AG1(conf-if-eth1/1/16)# channel-group 2 mode active
AG1(conf-if-eth1/1/16)# exit

AG1(config)# interface port-channel 2
AG1(conf-if-po-2)# vlt-port-channel 2
AG1(conf-if-po-2)# exit

AG1(config)# interface ethernet1/1/17
AG1(conf-if-eth1/1/17)# no shutdown
AG1(conf-if-eth1/1/17)# no switchport
AG1(conf-if-eth1/1/17)# channel-group 3 mode active
AG1(conf-if-eth1/1/17)# exit

AG1(config)# interface port-channel 3
AG1(conf-if-po-3)# vlt-port-channel 3
AG1(conf-if-po-3)# exit

AG1(config)# interface ethernet1/1/18
AG1(conf-if-eth1/1/18)# no shutdown
AG1(conf-if-eth1/1/18)# no switchport
AG1(conf-if-eth1/1/18)# channel-group 4 mode active
AG1(conf-if-eth1/1/18)# exit

AG1(config)# interface port-channel 4
AG1(conf-if-po-4)# vlt-port-channel 4
AG1(conf-if-po-4)# exit

AG1(config)# interface ethernet1/1/21
AG1(conf-if-eth1/1/21)# no shutdown
AG1(conf-if-eth1/1/21)# no switchport
AG1(conf-if-eth1/1/21)# channel-group 128 mode active
AG1(conf-if-eth1/1/21)# exit

AG1(config)# interface ethernet1/1/22
AG1(conf-if-eth1/1/22)# no shutdown
AG1(conf-if-eth1/1/22)# no switchport
AG1(conf-if-eth1/1/22)# channel-group 128 mode active
AG1(conf-if-eth1/1/22)# exit

AG1(config)# interface port-channel 128
AG1(conf-if-po-128)# vlt-port-channel 1024
AG1(conf-if-po-128)# exit

AG1(config)# interface ethernet1/1/10
AG1(conf-if-eth1/1/10)# no shutdown
AG1(conf-if-eth1/1/10)# no switchport
AG1(conf-if-eth1/1/10)# channel-group 101 mode active
AG1(conf-if-eth1/1/10)# exit

AG1(config)# interface port-channel 101
```

```
AG1(conf-if-po-101)# vlt-port-channel 1022
AG1(conf-if-po-101)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG1(config)# interface vlan 100
AG1(conf-if-vl-100)# private-vlan mode primary
AG1(conf-if-vl-100)# exit

AG1(config)# interface vlan 200
AG1(conf-if-vl-200)# private-vlan mode primary
AG1(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG1(config)# interface vlan 11
AG1(conf-if-vl-11)# private-vlan mode community
AG1(conf-if-vl-11)# exit

AG1(config)# interface vlan 12
AG1(conf-if-vl-12)# private-vlan mode community
AG1(conf-if-vl-12)# exit

AG1(config)# interface vlan 13
AG1(conf-if-vl-13)# private-vlan mode isolated
AG1(conf-if-vl-13)# exit

AG1(config)# interface vlan 21
AG1(conf-if-vl-21)# private-vlan mode community
AG1(conf-if-vl-21)# exit

AG1(config)# interface vlan 22
AG1(conf-if-vl-22)# private-vlan mode isolated
AG1(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG1(config)# interface vlan 100
AG1(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG1(conf-if-vl-100)# exit

AG1(config)# interface vlan 200
AG1(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG1(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG1(config)# interface port-channel1
AG1(conf-if-po-1)# no shutdown
AG1(conf-if-po-1)# private-vlan mode secondary-port
AG1(conf-if-po-1)# exit

AG1(config)# interface port-channel2
AG1(conf-if-po-2)# no shutdown
AG1(conf-if-po-2)# private-vlan mode secondary-port
AG1(conf-if-po-2)# exit

AG1(config)# interface port-channel3
AG1(conf-if-po-3)# no shutdown
AG1(conf-if-po-3)# private-vlan mode secondary-port
AG1(conf-if-po-3)# exit

AG1(config)# interface port-channel4
AG1(conf-if-po-4)# no shutdown
AG1(conf-if-po-4)# private-vlan mode secondary-port
AG1(conf-if-po-4)# exit

AG1(config)# interface ethernet1/1/1
AG1(conf-if-eth1/1/1)# no shutdown
AG1(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG1(conf-if-eth1/1/1)# exit

AG1(config)# interface ethernet1/1/2
```

```
AG1(conf-if-eth1/1/2)# no shutdown
AG1(conf-if-eth1/1/2)# private-vlan mode secondary-port
AG1(conf-if-eth1/1/2)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG1(config)# interface port-channel1
AG1(conf-if-po-1)# switchport mode trunk
AG1(conf-if-po-1)# switchport trunk allowed vlan 12
AG1(conf-if-po-1)# exit

AG1(config)# interface port-channel2
AG1(conf-if-po-2)# switchport mode trunk
AG1(conf-if-po-2)# switchport trunk allowed vlan 13
AG1(conf-if-po-2)# exit

AG1(config)# interface port-channel3
AG1(conf-if-po-3)# switchport mode trunk
AG1(conf-if-po-3)# switchport trunk allowed vlan 21
AG1(conf-if-po-3)# exit

AG1(config)# interface port-channel4
AG1(conf-if-po-4)# switchport mode trunk
AG1(conf-if-po-4)# switchport trunk allowed vlan 22
AG1(conf-if-po-4)# exit

AG1(config)# interface ethernet1/1/1
AG1(conf-if-eth1/1/1)# switchport mode trunk
AG1(conf-if-eth1/1/1)# switchport trunk allowed vlan 11
AG1(conf-if-eth1/1/1)# exit

AG1(config)# interface ethernet1/1/2
AG1(conf-if-eth1/1/2)# switchport mode trunk
AG1(conf-if-eth1/1/2)# switchport trunk allowed vlan 13
AG1(conf-if-eth1/1/2)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG1(config)# interface port-channel128
AG1(conf-if-po-128)# switchport mode trunk
AG1(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG1(conf-if-po-128)# exit
```

10. Configure the spine-facing port in promiscuous mode.

```
AG1(config)# interface port-channel101
AG1(conf-if-po-101)# no shutdown
AG1(conf-if-po-101)# private-vlan mode promiscuous
AG1(conf-if-po-101)# exit
```

11. Associate the promiscuous port to the primary VLANs.

```
AG1(config)# interface port-channel101
AG1(conf-if-po-101)# switchport mode trunk
AG1(conf-if-po-101)# switchport trunk allowed vlan 100,200
AG1(conf-if-po-101)# exit
```

AG2 Leaf Switch

1. Configure the VLTi member links between AG1 and AG2.

```
AG2(config)# interface ethernet1/1/11
AG2(conf-if-eth1/1/11)# no shutdown
AG2(conf-if-eth1/1/11)# no switchport
AG2(conf-if-eth1/1/11)# exit

AG2(config)# interface ethernet1/1/12
AG2(conf-if-eth1/1/12)# no shutdown
```

```
AG2(conf-if-eth1/1/12)# no switchport
AG2(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG2(config)# vlt-domain 255
AG2(conf-vlt-255)# backup destination 100.104.80.14
AG2(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG2(conf-vlt-255)# peer-routing
AG2(conf-vlt-255)# primary-priority 65535
AG2(conf-vlt-255)# vlt-mac 06:00:00:00:01:01
AG2(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG2(config)# interface ethernet1/1/15
AG2(conf-if-eth1/1/15)# no shutdown
AG2(conf-if-eth1/1/15)# no switchport
AG2(conf-if-eth1/1/15)# channel-group 1 mode active
AG2(conf-if-eth1/1/15)# exit

AG2(config)# interface port-channel1
AG2(conf-if-po-1)# vlt-port-channel 1
AG2(conf-if-po-1)# exit

AG2(config)# interface ethernet1/1/16
AG2(conf-if-eth1/1/16)# no shutdown
AG2(conf-if-eth1/1/16)# no switchport
AG2(conf-if-eth1/1/16)# channel-group 2 mode active
AG2(conf-if-eth1/1/16)# exit

AG2(config)# interface port-channel2
AG2(conf-if-po-2)# vlt-port-channel 2
AG2(conf-if-po-2)# exit

AG2(config)# interface ethernet1/1/17
AG2(conf-if-eth1/1/17)# no shutdown
AG2(conf-if-eth1/1/17)# no switchport
AG2(conf-if-eth1/1/17)# channel-group 3 mode active
AG2(conf-if-eth1/1/17)# exit

AG2(config)# interface port-channel3
AG2(conf-if-po-3)# vlt-port-channel 3
AG2(conf-if-po-3)# exit

AG2(config)# interface ethernet1/1/18
AG2(conf-if-eth1/1/18)# no shutdown
AG2(conf-if-eth1/1/18)# no switchport
AG2(conf-if-eth1/1/18)# channel-group 4 mode active
AG2(conf-if-eth1/1/18)# exit

AG2(config)# interface port-channel4
AG2(conf-if-po-4)# vlt-port-channel 4
AG2(conf-if-po-4)# exit

AG2(config)# interface ethernet1/1/21
AG2(conf-if-eth1/1/21)# no shutdown
AG2(conf-if-eth1/1/21)# no switchport
AG2(conf-if-eth1/1/21)# channel-group 128 mode active
AG2(conf-if-eth1/1/21)# exit

AG2(config)# interface ethernet1/1/22
AG2(conf-if-eth1/1/22)# no shutdown
AG2(conf-if-eth1/1/22)# no switchport
AG2(conf-if-eth1/1/22)# channel-group 128 mode active
AG2(conf-if-eth1/1/22)# exit

AG2(config)# interface port-channel 128
AG2(conf-if-po-128)# vlt-port-channel 1024
AG2(conf-if-po-128)# exit

AG2(config)# interface ethernet1/1/10
AG2(conf-if-eth1/1/10)# no shutdown
```

```
AG2(conf-if-eth1/1/10)# no switchport
AG2(conf-if-eth1/1/10)# channel-group 101 mode active
AG2(conf-if-eth1/1/10)# exit

AG2(config)# interface port-channel 101
AG2(conf-if-po-101)# vlt-port-channel 1022
AG2(conf-if-po-101)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG2(config)# interface vlan 100
AG2(conf-if-vl-100)# private-vlan mode primary
AG2(conf-if-vl-100)# exit

AG2(config)# interface vlan 200
AG2(conf-if-vl-200)# private-vlan mode primary
AG2(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG2(config)# interface vlan 11
AG2(conf-if-vl-11)# private-vlan mode community
AG2(conf-if-vl-11)# exit

AG2(config)# interface vlan 12
AG2(conf-if-vl-12)# private-vlan mode community
AG2(conf-if-vl-12)# exit

AG2(config)# interface vlan 13
AG2(conf-if-vl-13)# private-vlan mode isolated
AG2(conf-if-vl-13)# exit

AG2(config)# interface vlan 21
AG2(conf-if-vl-21)# private-vlan mode community
AG2(conf-if-vl-21)# exit

AG2(config)# interface vlan 22
AG2(conf-if-vl-22)# private-vlan mode isolated
AG2(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG2(config)# interface vlan 100
AG2(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG2(conf-if-vl-100)# exit

AG2(config)# interface vlan 200
AG2(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG2(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG2(config)# interface port-channel1
AG2(conf-if-po-1)# no shutdown
AG2(conf-if-po-1)# private-vlan mode secondary-port
AG2(conf-if-po-1)# exit

AG2(config)# interface port-channel2
AG2(conf-if-po-2)# no shutdown
AG2(conf-if-po-2)# private-vlan mode secondary-port
AG2(conf-if-po-2)# exit

AG2(config)# interface port-channel3
AG2(conf-if-po-3)# no shutdown
AG2(conf-if-po-3)# private-vlan mode secondary-port
AG2(conf-if-po-3)# exit

AG2(config)# interface port-channel4
AG2(conf-if-po-4)# no shutdown
AG2(conf-if-po-4)# private-vlan mode secondary-port
AG2(conf-if-po-4)# exit

AG2(config)# interface ethernet1/1/1
```

```
AG2(conf-if-eth1/1/1)# no shutdown
AG2(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG2(conf-if-eth1/1/1)# exit

AG2(config)# interface ethernet1/1/2
AG2(conf-if-eth1/1/2)# no shutdown
AG2(conf-if-eth1/1/2)# private-vlan mode secondary-port
AG2(conf-if-eth1/1/2)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG2(config)# interface port-channel1
AG2(conf-if-po-1)# switchport mode trunk
AG2(conf-if-po-1)# switchport trunk allowed vlan 12
AG2(conf-if-po-1)# exit

AG2(config)# interface port-channel2
AG2(conf-if-po-2)# switchport mode trunk
AG2(conf-if-po-2)# switchport trunk allowed vlan 13
AG2(conf-if-po-2)# exit

AG2(config)# interface port-channel3
AG2(conf-if-po-3)# switchport mode trunk
AG2(conf-if-po-3)# switchport trunk allowed vlan 21
AG2(conf-if-po-3)# exit

AG2(config)# interface port-channel4
AG2(conf-if-po-4)# switchport mode trunk
AG2(conf-if-po-4)# switchport trunk allowed vlan 22
AG2(conf-if-po-4)# exit

AG2(config)# interface ethernet1/1/1
AG2(conf-if-eth1/1/1)# switchport mode trunk
AG2(conf-if-eth1/1/1)# switchport trunk allowed vlan 12
AG2(conf-if-eth1/1/1)# exit

AG2(config)# interface ethernet1/1/2
AG2(conf-if-eth1/1/2)# switchport mode trunk
AG2(conf-if-eth1/1/2)# switchport trunk allowed vlan 13
AG2(conf-if-eth1/1/2)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG2(config)# interface port-channel128
AG2(conf-if-po-128)# switchport mode trunk
AG2(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG2(conf-if-po-128)# exit
```

10. Configure the spine-facing port in promiscuous mode.

```
AG2(config)# interface port-channel101
AG2(conf-if-po-101)# no shutdown
AG2(conf-if-po-101)# private-vlan mode promiscuous
AG2(conf-if-po-101)# exit
```

11. Associate the promiscuous port to the primary VLANs.

```
AG2(config)# interface port-channel101
AG2(conf-if-po-101)# switchport mode trunk
AG2(conf-if-po-101)# switchport trunk allowed vlan 100,200
AG2(conf-if-po-101)# exit
```

AG3 Leaf Switch

1. Configure the VLTi member links between AG3 and AG4.

```
AG3(config)# interface ethernet1/1/11
AG3(conf-if-eth1/1/11)# no shutdown
AG3(conf-if-eth1/1/11)# no switchport
AG3(conf-if-eth1/1/11)# exit
```

```
AG3(config)# interface ethernet1/1/12
AG3(conf-if-eth1/1/12)# no shutdown
AG3(conf-if-eth1/1/12)# no switchport
AG3(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG3(config)# vlt-domain 255
AG3(conf-vlt-255)# backup destination 100.104.80.15
AG3(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG3(conf-vlt-255)# peer-routing
AG3(conf-vlt-255)# primary-priority 1
AG3(conf-vlt-255)# vlt-mac 02:00:00:00:00:02
AG3(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG3(config)# interface ethernet1/1/15
AG3(conf-if-eth1/1/15)# no shutdown
AG3(conf-if-eth1/1/15)# no switchport
AG3(conf-if-eth1/1/15)# channel-group 1 mode active
AG3(conf-if-eth1/1/15)# exit

AG3(config)# interface port-channel 1
AG3(conf-if-po-1)# vlt-port-channel 1
AG3(conf-if-po-1)# exit

AG3(config)# interface ethernet1/1/16
AG3(conf-if-eth1/1/16)# no shutdown
AG3(conf-if-eth1/1/16)# no switchport
AG3(conf-if-eth1/1/16)# channel-group 2 mode active
AG3(conf-if-eth1/1/16)# exit

AG3(config)# interface port-channel 2
AG3(conf-if-po-2)# vlt-port-channel 2
AG3(conf-if-po-2)# exit

AG3(config)# interface ethernet1/1/22
AG3(conf-if-eth1/1/22)# no shutdown
AG3(conf-if-eth1/1/22)# no switchport
AG3(conf-if-eth1/1/22)# channel-group 128 mode active
AG3(conf-if-eth1/1/22)# exit

AG3(config)# interface ethernet1/1/23
AG3(conf-if-eth1/1/23)# no shutdown
AG3(conf-if-eth1/1/23)# no switchport
AG3(conf-if-eth1/1/23)# channel-group 128 mode active
AG3(conf-if-eth1/1/23)# exit

AG3(config)# interface port-channel 128
AG3(conf-if-po-128)# vlt-port-channel 1024
AG3(conf-if-po-128)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG3(config)# interface vlan 100
AG3(conf-if-vl-100)# private-vlan mode primary
AG3(conf-if-vl-100)# exit

AG3(config)# interface vlan 200
AG3(conf-if-vl-200)# private-vlan mode primary
AG3(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG3(config)# interface vlan 11
AG3(conf-if-vl-11)# private-vlan mode community
AG3(conf-if-vl-11)# exit

AG3(config)# interface vlan 12
AG3(conf-if-vl-12)# private-vlan mode community
AG3(conf-if-vl-12)# exit
```

```
AG3(config)# interface vlan 13
AG3(conf-if-vl-13)# private-vlan mode isolated
AG3(conf-if-vl-13)# exit

AG3(config)# interface vlan 21
AG3(conf-if-vl-21)# private-vlan mode community
AG3(conf-if-vl-21)# exit

AG3(config)# interface vlan 22
AG3(conf-if-vl-22)# private-vlan mode isolated
AG3(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG3(config)# interface vlan 100
AG3(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG3(conf-if-vl-100)# exit

AG3(config)# interface vlan 200
AG3(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG3(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG3(config)# interface port-channel1
AG3(conf-if-po-1)# no shutdown
AG3(conf-if-po-1)# private-vlan mode secondary-port
AG3(conf-if-po-1)# exit

AG3(config)# interface port-channel2
AG3(conf-if-po-2)# no shutdown
AG3(conf-if-po-2)# private-vlan mode secondary-port
AG3(conf-if-po-2)# exit

AG3(config)# interface ethernet1/1/1
AG3(conf-if-eth1/1/1)# no shutdown
AG3(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG3(conf-if-eth1/1/1)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG3(config)# interface port-channel1
AG3(conf-if-po-1)# switchport mode trunk
AG3(conf-if-po-1)# switchport trunk allowed vlan 11
AG3(conf-if-po-1)# exit

AG3(config)# interface port-channel2
AG3(conf-if-po-2)# switchport mode trunk
AG3(conf-if-po-2)# switchport trunk allowed vlan 13
AG3(conf-if-po-2)# exit

AG3(config)# interface ethernet1/1/1
AG3(conf-if-eth1/1/1)# switchport mode trunk
AG3(conf-if-eth1/1/1)# switchport trunk allowed vlan 21
AG3(conf-if-eth1/1/1)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG3(config)# interface port-channel128
AG3(conf-if-po-128)# switchport mode trunk
AG3(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG3(conf-if-po-128)# exit
```

AG4 Leaf Switch

1. Configure the VLTi member links between AG3 and AG4.

```
AG4(config)# interface ethernet1/1/11
AG4(conf-if-eth1/1/11)# no shutdown
```

```
AG4(conf-if-eth1/1/11)# no switchport
AG4(conf-if-eth1/1/11)# exit

AG4(config)# interface ethernet1/1/12
AG4(conf-if-eth1/1/12)# no shutdown
AG4(conf-if-eth1/1/12)# no switchport
AG4(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG4(config)# vlt-domain 255
AG4(conf-vlt-255)# backup destination 100.104.80.16
AG4(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG4(conf-vlt-255)# peer-routing
AG4(conf-vlt-255)# primary-priority 65535
AG4(conf-vlt-255)# vlt-mac 02:00:00:00:00:02
AG4(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG4(config)# interface ethernet1/1/15
AG4(conf-if-eth1/1/15)# no shutdown
AG4(conf-if-eth1/1/15)# no switchport
AG4(conf-if-eth1/1/15)# channel-group 1 mode active
AG4(conf-if-eth1/1/15)# exit

AG4(config)# interface port-channel1
AG4(conf-if-po-1)# vlt-port-channel 1
AG4(conf-if-po-1)# exit

AG4(config)# interface ethernet1/1/16
AG4(conf-if-eth1/1/16)# no shutdown
AG4(conf-if-eth1/1/16)# no switchport
AG4(conf-if-eth1/1/16)# channel-group 2 mode active
AG4(conf-if-eth1/1/16)# exit

AG4(config)# interface port-channel2
AG4(conf-if-po-2)# vlt-port-channel 2
AG4(conf-if-po-2)# exit

AG4(config)# interface ethernet1/1/21
AG4(conf-if-eth1/1/21)# no shutdown
AG4(conf-if-eth1/1/21)# no switchport
AG4(conf-if-eth1/1/21)# channel-group 128 mode active
AG4(conf-if-eth1/1/21)# exit

AG4(config)# interface ethernet1/1/24
AG4(conf-if-eth1/1/24)# no shutdown
AG4(conf-if-eth1/1/24)# no switchport
AG4(conf-if-eth1/1/24)# channel-group 128 mode active
AG4(conf-if-eth1/1/24)# exit

AG4(config)# interface port-channel128
AG4(conf-if-po-128)# vlt-port-channel 1024
AG4(conf-if-po-128)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG4(config)# interface vlan 100
AG4(conf-if-vl-100)# private-vlan mode primary
AG4(conf-if-vl-100)# exit

AG4(config)# interface vlan 200
AG4(conf-if-vl-200)# private-vlan mode primary
AG4(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG4(config)# interface vlan 11
AG4(conf-if-vl-11)# private-vlan mode community
AG4(conf-if-vl-11)# exit

AG4(config)# interface vlan 12
```

```
AG4(conf-if-vl-12)# private-vlan mode community
AG4(conf-if-vl-12)# exit

AG4(config)# interface vlan 13
AG4(conf-if-vl-13)# private-vlan mode isolated
AG4(conf-if-vl-13)# exit

AG4(config)# interface vlan 21
AG4(conf-if-vl-21)# private-vlan mode community
AG4(conf-if-vl-21)# exit

AG4(config)# interface vlan 22
AG4(conf-if-vl-22)# private-vlan mode isolated
AG4(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG4(config)# interface vlan 100
AG4(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG4(conf-if-vl-100)# exit

AG4(config)# interface vlan 200
AG4(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG4(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG4(config)# interface port-channel1
AG4(conf-if-po-1)# no shutdown
AG4(conf-if-po-1)# private-vlan mode secondary-port
AG4(conf-if-po-1)# exit

AG4(config)# interface port-channel2
AG4(conf-if-po-2)# no shutdown
AG4(conf-if-po-2)# private-vlan mode secondary-port
AG4(conf-if-po-2)# exit

AG4(config)# interface ethernet1/1/1
AG4(conf-if-eth1/1/1)# no shutdown
AG4(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG4(conf-if-eth1/1/1)# exit

AG4(config)# interface ethernet1/1/2
AG4(conf-if-eth1/1/2)# no shutdown
AG4(conf-if-eth1/1/2)# private-vlan mode secondary-port
AG4(conf-if-eth1/1/2)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG4(config)# interface port-channel1
AG4(conf-if-po-1)# switchport mode trunk
AG4(conf-if-po-1)# switchport trunk allowed vlan 11
AG4(conf-if-po-1)# exit

AG4(config)# interface port-channel2
AG4(conf-if-po-2)# switchport mode trunk
AG4(conf-if-po-2)# switchport trunk allowed vlan 13
AG4(conf-if-po-2)# exit

AG4(config)# interface ethernet1/1/1
AG4(conf-if-eth1/1/1)# switchport mode trunk
AG4(conf-if-eth1/1/1)# switchport trunk allowed vlan 12
AG4(conf-if-eth1/1/1)# exit

AG4(config)# interface ethernet1/1/2
AG4(conf-if-eth1/1/2)# switchport mode trunk
AG4(conf-if-eth1/1/2)# switchport trunk allowed vlan 22
AG4(conf-if-eth1/1/2)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG4(config)# interface port-channel128
AG4(conf-if-po-128)# switchport mode trunk
```

```
AG4(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG4(conf-if-po-128)# exit
```

Spine Switch

1. Create the primary VLANs extended from AG1 and AG2.

```
SPINE(config)# interface vlan 100
SPINE(conf-if-vl-100)# ip address 172.1.1.1/16
SPINE(conf-if-vl-100)# exit

SPINE(config)# interface vlan 200
SPINE(conf-if-vl-200)# ip address 172.2.1.1/16
SPINE(conf-if-vl-200)# exit
```

2. Associate the VLT LAGs to the primary VLANs extended from AG1 and AG2.

```
SPINE(config)# interface ethernet1/1/10
SPINE(conf-if-eth1/1/10)# no shutdown
SPINE(conf-if-eth1/1/10)# no switchport
SPINE(conf-if-eth1/1/10)# channel-group 101 mode active
SPINE(conf-if-eth1/1/10)# exit

SPINE(config)# interface ethernet1/1/11
SPINE(conf-if-eth1/1/11)# no shutdown
SPINE(conf-if-eth1/1/11)# no switchport
SPINE(conf-if-eth1/1/11)# channel-group 101 mode active
SPINE(conf-if-eth1/1/11)# exit
```

3. (Optional) To enable connectivity between end devices that belong to different secondary VLANs (community or isolated or both) of a PVLAN domain, enable `ip local-proxy arp` on the VLAN in the spine switch.

```
SPINE(config)# interface vlan100
SPINE(conf-if-vl-100)# ip address 172.1.1.1/16
SPINE(conf-if-vl-100)# ip local-proxy-arp

SPINE(config)# interface vlan200
SPINE(conf-if-vl-200)# ip address 172.2.1.1/16
SPINE(conf-if-vl-200)# ip local-proxy-arp
```

Verify the configuration

To verify the configuration, use the `show vlan private-vlan` command on the leaf nodes:

PVLAN 100

```
AG1# show vlan private-vlan 100
Primary Secondary Type      Active Ports
------- --------- --------- ------ --------------
100               Primary   Yes    Po101,128,1000
        11        Community Yes    Eth1/1/1
                                   Po128,1000
        12        Community Yes    Po1,128,1000
        13        Isolated  Yes    Eth1/1/2
                                   Po2,128,1000
```

PVLAN 200

```
AG1# show vlan private-vlan 200
Primary Secondary Type      Active Ports
------- --------- --------- ------ --------------
200               Primary   Yes    Po101,128,1000
        21        Community Yes    Po3,128,1000
        22        Isolated  Yes    Po4,128,1000
```

To verify private VLAN configurations, use the `show vlan private-vlan mapping` command.

```
AG1# show vlan private-vlan mapping
Private Vlan:
 Primary   : 100
 Isolated  : 13
 Community : 11-12

Private Vlan:
 Primary   : 200
 Isolated  : 22
 Community : 21
AG1#
```

To verify the MAC address table entries for the primary VLAN, use the `show mac address-table` command.

On primary VLAN

The output of this `show` command displays:

- The MAC addresses that are learned on the primary VLAN.
- The MAC addresses that are learned on the secondary VLANs being replicated to the primary VLAN.

```
AG1# show mac address-table vlan 100
Codes: pv <vlan-id> - private vlan where the mac is originally learnt
VlanId        Mac Address         Type        Interface
100           54:bf:64:bd:d8:45   dynamic     port-channel101
100           00:00:06:00:88:01   dynamic     ethernet1/1/1           pv 11
100           00:00:06:00:89:01   dynamic     port-channel1           pv 12
100           00:00:06:00:8a:01   dynamic     port-channel2           pv 13
```

On secondary VLAN

The output of this `show` command displays:

- The MAC addresses that are learned on the secondary VLAN.
- The MAC addresses that are learned on the primary VLAN being replicated to the secondary VLAN.

```
AG1# show mac address-table vlan 11
Codes: pv <vlan-id> - private vlan where the mac is originally learnt
VlanId        Mac Address         Type        Interface
11            00:00:06:00:88:01   dynamic     ethernet1/1/1
11            54:bf:64:bd:d8:45   dynamic     port-channel101         pv 100
```

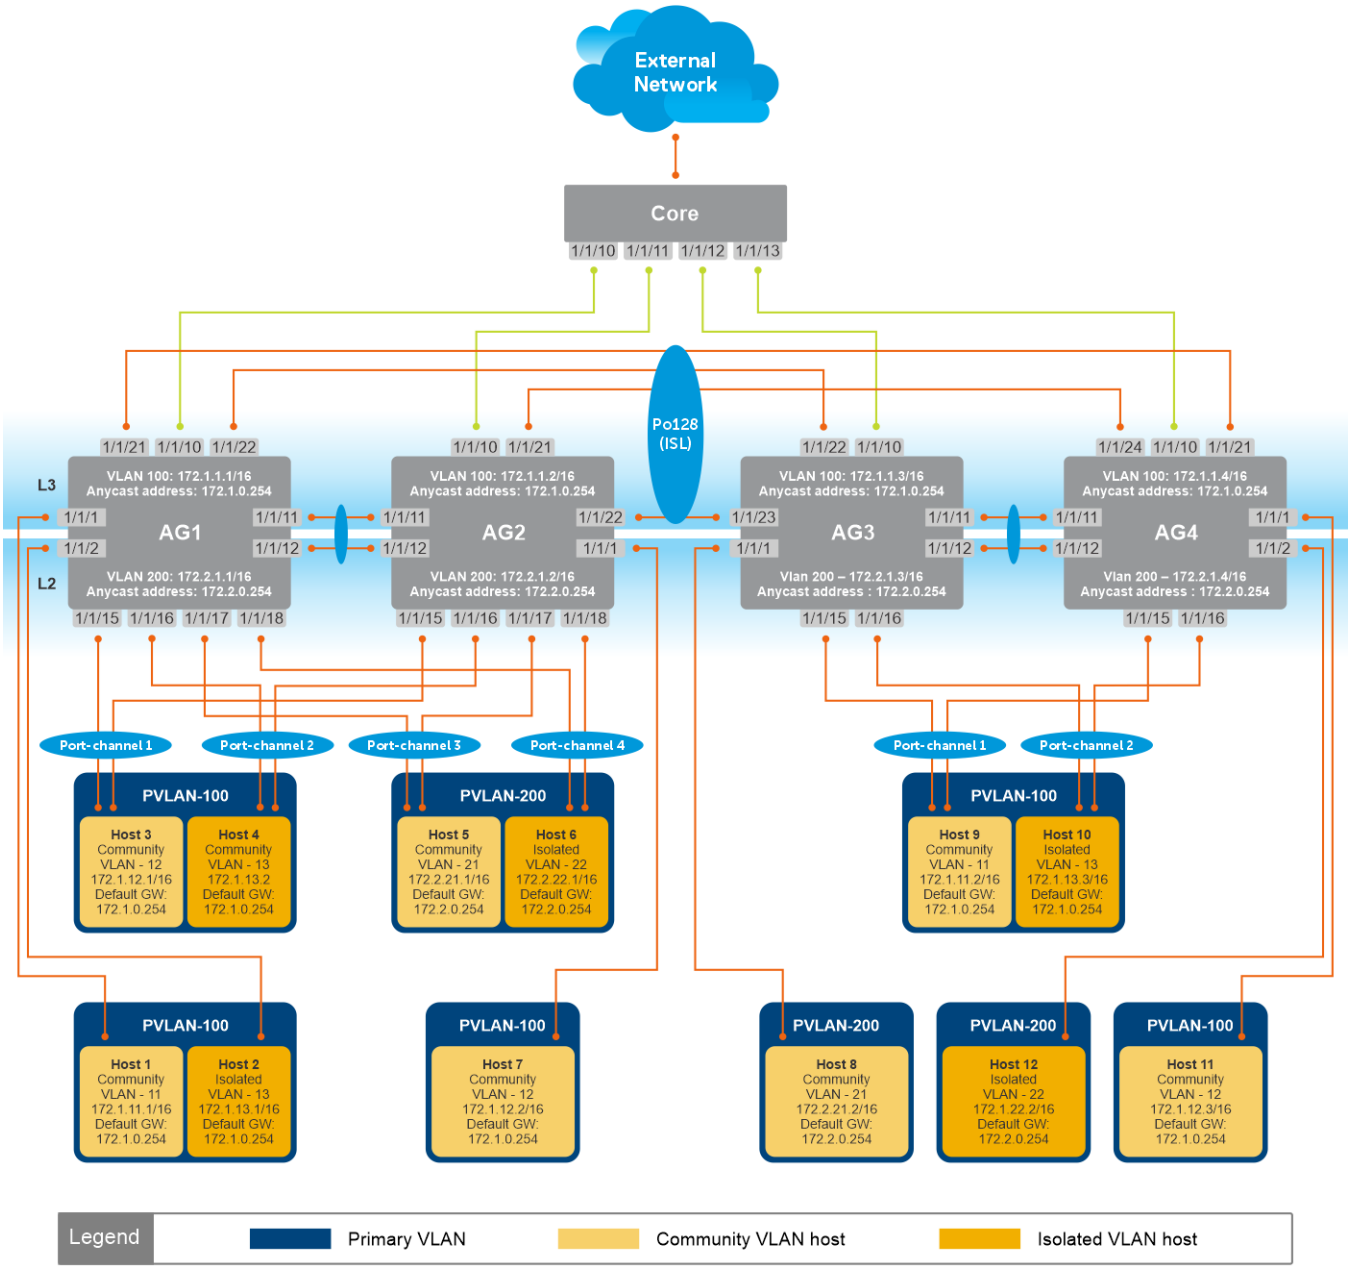
Example: PVLAN deployment with L2-L3 boundary at the leaf layer

The following use case illustrates a deployment scenario in which the end devices that belong to different tenants are separated using secondary VLANs. Here, the private VLAN domain is spanned across two data centers using an ISL trunk port. In this example:

- The configured trunk port carries the traffic for both the primary and secondary VLANs.
- The leaf nodes provide L3 connectivity to the external network and between end devices in secondary VLANs. The gateway for all the hosts in the PVLAN domains is the anycast ip address on the primary VLANs.

Configuration notes

- IP addresses are configured on the primary VLANs of the leaf nodes.
- Anycast IP address is also configured on the primary VLANs.
- The anycast IP address remains the same for PVLAN domains that are extended across the data centers.
- Configure IP Local Proxy ARP feature on the primary VLANs of the leaf nodes to enable connectivity between end devices that belong to different secondary VLANs (community or isolated or both) of a PVLAN domain.
- The uplink ports from the leaf nodes to the spine switch are non-PVLAN L3 networks.



AG1 Leaf Switch

1. Configure the VLTi member links between AG1 and AG2.

```
AG1(config)# interface ethernet1/1/11
AG1(conf-if-eth1/1/11)# no shutdown
AG1(conf-if-eth1/1/11)# no switchport
AG1(conf-if-eth1/1/11)# exit

AG1(config)# interface ethernet1/1/12
AG1(conf-if-eth1/1/12)# no shutdown
AG1(conf-if-eth1/1/12)# no switchport
AG1(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG1(config)# vlt-domain 255
AG1(conf-vlt-255)# backup destination 100.104.80.12
```

```
AG1(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG1(conf-vlt-255)# peer-routing
AG1(conf-vlt-255)# primary-priority 1
AG1(conf-vlt-255)# vlt-mac 06:00:00:00:01:01
AG1(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG1(config)# interface ethernet1/1/15
AG1(conf-if-eth1/1/15)# no shutdown
AG1(conf-if-eth1/1/15)# no switchport
AG1(conf-if-eth1/1/15)# channel-group 1 mode active
AG1(conf-if-eth1/1/15)# exit

AG1(config)# interface port-channel 1
AG1(conf-if-po-1)# vlt-port-channel 1
AG1(conf-if-po-1)# exit

AG1(config)# interface ethernet1/1/16
AG1(conf-if-eth1/1/16)# no shutdown
AG1(conf-if-eth1/1/16)# no switchport
AG1(conf-if-eth1/1/16)# channel-group 2 mode active
AG1(conf-if-eth1/1/16)# exit

AG1(config)# interface port-channel 2
AG1(conf-if-po-2)# vlt-port-channel 2
AG1(conf-if-po-2)# exit

AG1(config)# interface ethernet1/1/17
AG1(conf-if-eth1/1/17)# no shutdown
AG1(conf-if-eth1/1/17)# no switchport
AG1(conf-if-eth1/1/17)# channel-group 3 mode active
AG1(conf-if-eth1/1/17)# exit

AG1(config)# interface port-channel 3
AG1(conf-if-po-3)# vlt-port-channel 3
AG1(conf-if-po-3)# exit

AG1(config)# interface ethernet1/1/18
AG1(conf-if-eth1/1/18)# no shutdown
AG1(conf-if-eth1/1/18)# no switchport
AG1(conf-if-eth1/1/18)# channel-group 4 mode active
AG1(conf-if-eth1/1/18)# exit

AG1(config)# interface port-channel 4
AG1(conf-if-po-4)# vlt-port-channel 4
AG1(conf-if-po-4)# exit

AG1(config)# interface ethernet1/1/21
AG1(conf-if-eth1/1/21)# no shutdown
AG1(conf-if-eth1/1/21)# no switchport
AG1(conf-if-eth1/1/21)# channel-group 128 mode active
AG1(conf-if-eth1/1/21)# exit

AG1(config)# interface ethernet1/1/22
AG1(conf-if-eth1/1/22)# no shutdown
AG1(conf-if-eth1/1/22)# no switchport
AG1(conf-if-eth1/1/22)# channel-group 128 mode active
AG1(conf-if-eth1/1/22)# exit

AG1(config)# interface port-channel 128
AG1(conf-if-po-3)# vlt-port-channel 1024
AG1(conf-if-po-3)# exit

AG1(config)# interface ethernet1/1/10
AG1(conf-if-eth1/1/10)# no shutdown
AG1(conf-if-eth1/1/10)# no switchport
AG1(conf-if-eth1/1/10)# channel-group 101 mode active
AG1(conf-if-eth1/1/10)# exit

AG1(config)# interface port-channel 101
```

```
AG1(conf-if-po-3)# vlt-port-channel 1022
AG1(conf-if-po-3)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG1(config)# interface vlan 100
AG1(conf-if-vl-100)# private-vlan mode primary
AG1(conf-if-vl-100)# exit

AG1(config)# interface vlan 200
AG1(conf-if-vl-200)# private-vlan mode primary
AG1(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG1(config)# interface vlan 11
AG1(conf-if-vl-11)# private-vlan mode community
AG1(conf-if-vl-11)# exit

AG1(config)# interface vlan 12
AG1(conf-if-vl-12)# private-vlan mode community
AG1(conf-if-vl-12)# exit

AG1(config)# interface vlan 13
AG1(conf-if-vl-13)# private-vlan mode isolated
AG1(conf-if-vl-13)# exit

AG1(config)# interface vlan 21
AG1(conf-if-vl-21)# private-vlan mode community
AG1(conf-if-vl-21)# exit

AG1(config)# interface vlan 22
AG1(conf-if-vl-22)# private-vlan mode isolated
AG1(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG1(config)# interface vlan 100
AG1(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG1(conf-if-vl-100)# exit

AG1(config)# interface vlan 200
AG1(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG1(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG1(config)# interface port-channel1
AG1(conf-if-po-1)# no shutdown
AG1(conf-if-po-1)# private-vlan mode secondary-port
AG1(conf-if-po-1)# exit

AG1(config)# interface port-channel2
AG1(conf-if-po-2)# no shutdown
AG1(conf-if-po-2)# private-vlan mode secondary-port
AG1(conf-if-po-2)# exit

AG1(config)# interface port-channel3
AG1(conf-if-po-3)# no shutdown
AG1(conf-if-po-3)# private-vlan mode secondary-port
AG1(conf-if-po-3)# exit

AG1(config)# interface port-channel4
AG1(conf-if-po-4)# no shutdown
AG1(conf-if-po-4)# private-vlan mode secondary-port
AG1(conf-if-po-4)# exit

AG1(config)# interface ethernet1/1/1
AG1(conf-if-eth1/1/1)# no shutdown
AG1(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG1(conf-if-eth1/1/1)# exit

AG1(config)# interface ethernet1/1/2
```

```
AG1(conf-if-eth1/1/2)# no shutdown
AG1(conf-if-eth1/1/2)# private-vlan mode secondary-port
AG1(conf-if-eth1/1/2)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG1(config)# interface port-channel1
AG1(conf-if-po-1)# switchport mode trunk
AG1(conf-if-po-1)# switchport trunk allowed vlan 12
AG1(conf-if-po-1)# exit

AG1(config)# interface port-channel2
AG1(conf-if-po-2)# switchport mode trunk
AG1(conf-if-po-2)# switchport trunk allowed vlan 13
AG1(conf-if-po-2)# exit

AG1(config)# interface port-channel3
AG1(conf-if-po-3)# switchport mode trunk
AG1(conf-if-po-3)# switchport trunk allowed vlan 21
AG1(conf-if-po-3)# exit

AG1(config)# interface port-channel4
AG1(conf-if-po-4)# switchport mode trunk
AG1(conf-if-po-4)# switchport trunk allowed vlan 22
AG1(conf-if-po-4)# exit

AG1(config)# interface ethernet1/1/1
AG1(conf-if-eth1/1/1)# switchport mode trunk
AG1(conf-if-eth1/1/1)# switchport trunk allowed vlan 12
AG1(conf-if-eth1/1/1)# exit

AG1(config)# interface ethernet1/1/2
AG1(conf-if-eth1/1/2)# switchport mode trunk
AG1(conf-if-eth1/1/2)# switchport trunk allowed vlan 13
AG1(conf-if-eth1/1/2)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG1(config)# interface port-channel128
AG1(conf-if-po-128)# switchport mode trunk
AG1(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG1(conf-if-po-128)# exit
```

10. Configure anycast MAC address.

```
AG1(config)# ip virtual-router mac-address 00:00:00:44:44:44
```

11. Configure IP address and anycast IP address on the primary VLANs.

```
AG1(config)# interface vlan 100
AG1(conf-if-vl-100)# ip address 172.1.1.1/16
AG1(conf-if-vl-100)# ip virtual-router address 172.1.0.254
AG1(conf-if-vl-100)# exit

AG1(config)# interface vlan 200
AG1(conf-if-vl-200)# ip address 172.2.1.1/16
AG1(conf-if-vl-200)# ip virtual-router address 172.2.0.254
AG1(conf-if-vl-200)# exit
```

12. (Optional) If connectivity between end devices that belong to secondary vlans (community or isolated or both) of the same PVLAN domain is required, configure IP Local Proxy ARP on the primary VLANs.

```
AG1(config)# interface vlan 100
AG1(conf-if-vl-100)# ip local-proxy-arp
AG1(conf-if-vl-100)# exit
```

AG2 Leaf Switch

1. Configure the VLTi member links between AG1 and AG2.

```
AG2(config)# interface ethernet1/1/11
AG2(conf-if-eth1/1/11)# no shutdown
AG2(conf-if-eth1/1/11)# no switchport
AG2(conf-if-eth1/1/11)# exit

AG2(config)# interface ethernet1/1/12
AG2(conf-if-eth1/1/12)# no shutdown
AG2(conf-if-eth1/1/12)# no switchport
AG2(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG2(config)# vlt-domain 255
AG2(conf-vlt-255)# backup destination 100.104.80.14
AG2(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG2(conf-vlt-255)# peer-routing
AG2(conf-vlt-255)# primary-priority 65535
AG2(conf-vlt-255)# vlt-mac 06:00:00:00:01:01
AG2(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG2(config)# interface ethernet1/1/15
AG2(conf-if-eth1/1/15)# no shutdown
AG2(conf-if-eth1/1/15)# no switchport
AG2(conf-if-eth1/1/15)# channel-group 1 mode active
AG2(conf-if-eth1/1/15)# exit

AG2(config)# interface port-channel 1
AG2(conf-if-po-1)# vlt-port-channel 1
AG2(conf-if-po-1)# exit

AG2(config)# interface ethernet1/1/16
AG2(conf-if-eth1/1/16)# no shutdown
AG2(conf-if-eth1/1/16)# no switchport
AG2(conf-if-eth1/1/16)# channel-group 2 mode active
AG2(conf-if-eth1/1/16)# exit

AG2(config)# interface port-channel 2
AG2(conf-if-po-2)# vlt-port-channel 2
AG2(conf-if-po-2)# exit

AG2(config)# interface ethernet1/1/17
AG2(conf-if-eth1/1/17)# no shutdown
AG2(conf-if-eth1/1/17)# no switchport
AG2(conf-if-eth1/1/17)# channel-group 3 mode active
AG2(conf-if-eth1/1/17)# exit

AG2(config)# interface port-channel 3
AG2(conf-if-po-3)# vlt-port-channel 3
AG2(conf-if-po-3)# exit

AG2(config)# interface ethernet1/1/18
AG2(conf-if-eth1/1/18)# no shutdown
AG2(conf-if-eth1/1/18)# no switchport
AG2(conf-if-eth1/1/18)# channel-group 4 mode active
AG2(conf-if-eth1/1/18)# exit

AG2(config)# interface port-channel 4
AG2(conf-if-po-4)# vlt-port-channel 4
AG2(conf-if-po-4)# exit

AG2(config)# interface ethernet1/1/21
AG2(conf-if-eth1/1/21)# no shutdown
AG2(conf-if-eth1/1/21)# no switchport
AG2(conf-if-eth1/1/21)# channel-group 128 mode active
AG2(conf-if-eth1/1/21)# exit
```

```
AG2(config)# interface ethernet1/1/22
AG2(conf-if-eth1/1/22)# no shutdown
AG2(conf-if-eth1/1/22)# no switchport
AG2(conf-if-eth1/1/22)# channel-group 128 mode active
AG2(conf-if-eth1/1/22)# exit

AG2(config)# interface port-channel 128
AG2(conf-if-po-3)# vlt-port-channel 1024
AG2(conf-if-po-3)# exit

AG2(config)# interface ethernet1/1/10
AG2(conf-if-eth1/1/10)# no shutdown
AG2(conf-if-eth1/1/10)# no switchport
AG2(conf-if-eth1/1/10)# channel-group 101 mode active
AG2(conf-if-eth1/1/10)# exit

AG2(config)# interface port-channel 101
AG2(conf-if-po-3)# vlt-port-channel 1022
AG2(conf-if-po-3)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG2(config)# interface vlan 100
AG2(conf-if-vl-100)# private-vlan mode primary
AG2(conf-if-vl-100)# exit

AG2(config)# interface vlan 200
AG2(conf-if-vl-200)# private-vlan mode primary
AG2(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG2(config)# interface vlan 11
AG2(conf-if-vl-11)# private-vlan mode community
AG2(conf-if-vl-11)# exit

AG2(config)# interface vlan 12
AG2(conf-if-vl-12)# private-vlan mode community
AG2(conf-if-vl-12)# exit

AG2(config)# interface vlan 13
AG2(conf-if-vl-13)# private-vlan mode isolated
AG2(conf-if-vl-13)# exit

AG2(config)# interface vlan 21
AG2(conf-if-vl-21)# private-vlan mode community
AG2(conf-if-vl-21)# exit

AG2(config)# interface vlan 22
AG2(conf-if-vl-22)# private-vlan mode isolated
AG2(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG2(config)# interface vlan 100
AG2(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG2(conf-if-vl-100)# exit

AG2(config)# interface vlan 200
AG2(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG2(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG2(config)# interface port-channel1
AG2(conf-if-po-1)# no shutdown
AG2(conf-if-po-1)# private-vlan mode secondary-port
AG2(conf-if-po-1)# exit

AG2(config)# interface port-channel2
AG2(conf-if-po-2)# no shutdown
AG2(conf-if-po-2)# private-vlan mode secondary-port
AG2(conf-if-po-2)# exit
```

```
AG2(config)# interface port-channel3
AG2(conf-if-po-3)# no shutdown
AG2(conf-if-po-3)# private-vlan mode secondary-port
AG2(conf-if-po-3)# exit

AG2(config)# interface port-channel4
AG2(conf-if-po-4)# no shutdown
AG2(conf-if-po-4)# private-vlan mode secondary-port
AG2(conf-if-po-4)# exit

AG2(config)# interface ethernet1/1/1
AG2(conf-if-eth1/1/1)# no shutdown
AG2(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG2(conf-if-eth1/1/1)# exit

AG2(config)# interface ethernet1/1/2
AG2(conf-if-eth1/1/2)# no shutdown
AG2(conf-if-eth1/1/2)# private-vlan mode secondary-port
AG2(conf-if-eth1/1/2)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG2(config)# interface port-channel1
AG2(conf-if-po-1)# switchport mode trunk
AG2(conf-if-po-1)# switchport trunk allowed vlan 12
AG2(conf-if-po-1)# exit

AG2(config)# interface port-channel2
AG2(conf-if-po-2)# switchport mode trunk
AG2(conf-if-po-2)# switchport trunk allowed vlan 13
AG2(conf-if-po-2)# exit

AG2(config)# interface port-channel3
AG2(conf-if-po-3)# switchport mode trunk
AG2(conf-if-po-3)# switchport trunk allowed vlan 21
AG2(conf-if-po-3)# exit

AG2(config)# interface port-channel4
AG2(conf-if-po-4)# switchport mode trunk
AG2(conf-if-po-4)# switchport trunk allowed vlan 22
AG2(conf-if-po-4)# exit

AG2(config)# interface ethernet1/1/1
AG2(conf-if-eth1/1/1)# switchport mode trunk
AG2(conf-if-eth1/1/1)# switchport trunk allowed vlan 12
AG2(conf-if-eth1/1/1)# exit

AG2(config)# interface ethernet1/1/2
AG2(conf-if-eth1/1/2)# switchport mode trunk
AG2(conf-if-eth1/1/2)# switchport trunk allowed vlan 13
AG2(conf-if-eth1/1/2)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG2(config)# interface port-channel128
AG2(conf-if-po-128)# switchport mode trunk
AG2(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG2(conf-if-po-128)# exit
```

10. Configure anycast MAC address.

```
AG2(config)# ip virtual-router mac-address 00:00:00:44:44:44
```

11. Configure IP address and anycast IP address on the primary VLANs.

```
AG2(config)# interface vlan 100
AG2(conf-if-vl-100)# ip address 172.1.1.2/16
AG2(conf-if-vl-100)# ip virtual-router address 172.1.0.254
AG2(conf-if-vl-100)# exit

AG2(config)# interface vlan 200
AG2(conf-if-vl-200)# ip address 172.2.1.2/16
```

```
AG2(conf-if-vl-200)# ip virtual-router address 172.2.0.254
AG2(conf-if-vl-200)# exit
```

AG3 Leaf Switch

1. Configure the VLTi member links between AG1 and AG2.

```
AG3(config)# interface ethernet1/1/11
AG3(conf-if-eth1/1/11)# no shutdown
AG3(conf-if-eth1/1/11)# no switchport
AG3(conf-if-eth1/1/11)# exit

AG3(config)# interface ethernet1/1/12
AG3(conf-if-eth1/1/12)# no shutdown
AG3(conf-if-eth1/1/12)# no switchport
AG3(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG3(config)# vlt-domain 255
AG3(conf-vlt-255)# backup destination 100.104.80.15
AG3(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG3(conf-vlt-255)# peer-routing
AG3(conf-vlt-255)# primary-priority 1
AG3(conf-vlt-255)# vlt-mac 02:00:00:00:00:02
AG3(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG3(config)# interface ethernet1/1/15
AG3(conf-if-eth1/1/15)# no shutdown
AG3(conf-if-eth1/1/15)# no switchport
AG3(conf-if-eth1/1/15)# channel-group 1 mode active
AG3(conf-if-eth1/1/15)# exit

AG3(config)# interface port-channel 1
AG3(conf-if-po-1)# vlt-port-channel 1
AG3(conf-if-po-1)# exit

AG3(config)# interface ethernet1/1/16
AG3(conf-if-eth1/1/16)# no shutdown
AG3(conf-if-eth1/1/16)# no switchport
AG3(conf-if-eth1/1/16)# channel-group 2 mode active
AG3(conf-if-eth1/1/16)# exit

AG3(config)# interface port-channel 2
AG3(conf-if-po-2)# vlt-port-channel 2
AG3(conf-if-po-2)# exit

AG3(config)# interface ethernet1/1/22
AG3(conf-if-eth1/1/22)# no shutdown
AG3(conf-if-eth1/1/22)# no switchport
AG3(conf-if-eth1/1/22)# channel-group 128 mode active
AG3(conf-if-eth1/1/22)# exit

AG3(config)# interface ethernet1/1/23
AG3(conf-if-eth1/1/23)# no shutdown
AG3(conf-if-eth1/1/23)# no switchport
AG3(conf-if-eth1/1/23)# channel-group 128 mode active
AG3(conf-if-eth1/1/23)# exit

AG3(config)# interface port-channel 128
AG3(conf-if-po-128)# vlt-port-channel 1024
AG3(conf-if-po-128)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG3(config)# interface vlan 100
AG3(conf-if-vl-100)# private-vlan mode primary
AG3(conf-if-vl-100)# exit
```

```
AG3(config)# interface vlan 200
AG3(conf-if-vl-200)# private-vlan mode primary
AG3(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG3(config)# interface vlan 11
AG3(conf-if-vl-11)# private-vlan mode community
AG3(conf-if-vl-11)# exit

AG3(config)# interface vlan 12
AG3(conf-if-vl-12)# private-vlan mode community
AG3(conf-if-vl-12)# exit

AG3(config)# interface vlan 13
AG3(conf-if-vl-13)# private-vlan mode isolated
AG3(conf-if-vl-13)# exit

AG3(config)# interface vlan 21
AG3(conf-if-vl-21)# private-vlan mode community
AG3(conf-if-vl-21)# exit

AG3(config)# interface vlan 22
AG3(conf-if-vl-22)# private-vlan mode isolated
AG3(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG3(config)# interface vlan 100
AG3(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG3(conf-if-vl-100)# exit

AG3(config)# interface vlan 200
AG3(conf-if-vl-200)# private-vlan mapping secondary-vlans 21
AG3(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG3(config)# interface port-channel1
AG3(conf-if-po-1)# no shutdown
AG3(conf-if-po-1)# private-vlan mode secondary-port
AG3(conf-if-po-1)# exit

AG3(config)# interface port-channel2
AG3(conf-if-po-2)# no shutdown
AG3(conf-if-po-2)# private-vlan mode secondary-port
AG3(conf-if-po-2)# exit

AG3(config)# interface ethernet1/1/1
AG3(conf-if-eth1/1/1)# no shutdown
AG3(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG3(conf-if-eth1/1/1)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG3(config)# interface port-channel1
AG3(conf-if-po-1)# switchport mode trunk
AG3(conf-if-po-1)# switchport trunk allowed vlan 11
AG3(conf-if-po-1)# exit

AG3(config)# interface port-channel2
AG3(conf-if-po-2)# switchport mode trunk
AG3(conf-if-po-2)# switchport trunk allowed vlan 13
AG3(conf-if-po-2)# exit

AG3(config)# interface ethernet1/1/1
AG3(conf-if-eth1/1/1)# switchport mode trunk
AG3(conf-if-eth1/1/1)# switchport trunk allowed vlan 21-22
AG3(conf-if-eth1/1/1)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG3(config)# interface port-channel128
AG3(conf-if-po-128)# switchport mode trunk
AG3(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG3(conf-if-po-128)# exit
```

10. Configure anycast MAC address.

```
AG3(config)# ip virtual-router mac-address 00:00:00:44:44:44
```

11. Configure IP address and anycast IP address on the primary VLANs.

```
AG3(config)# interface vlan 100
AG3(conf-if-vl-100)# ip address 172.1.1.3/16
AG3(conf-if-vl-100)# ip virtual-router address 172.1.0.254
AG3(conf-if-vl-100)# exit

AG3(config)# interface vlan 200
AG3(conf-if-vl-200)# ip address 172.2.1.3/16
AG3(conf-if-vl-200)# ip virtual-router address 172.2.0.254
AG3(conf-if-vl-200)# exit
```

AG4 Leaf Switch

1. Configure the VLTi member links between AG1 and AG2.

```
AG4(config)# interface ethernet1/1/11
AG4(conf-if-eth1/1/11)# no shutdown
AG4(conf-if-eth1/1/11)# no switchport
AG4(conf-if-eth1/1/11)# exit

AG4(config)# interface ethernet1/1/12
AG4(conf-if-eth1/1/12)# no shutdown
AG4(conf-if-eth1/1/12)# no switchport
AG4(conf-if-eth1/1/12)# exit
```

2. Configure the VLT domain.

```
AG4(config)# vlt-domain 255
AG4(conf-vlt-255)# backup destination 100.104.80.16
AG4(conf-vlt-255)# discovery-interface ethernet1/1/11-1/1/12
AG4(conf-vlt-255)# peer-routing
AG4(conf-vlt-255)# primary-priority 65535
AG4(conf-vlt-255)# vlt-mac 02:00:00:00:00:02
AG4(conf-vlt-255)# exit
```

3. Configure the VLT LAGs.

```
AG4(config)# interface ethernet1/1/15
AG4(conf-if-eth1/1/15)# no shutdown
AG4(conf-if-eth1/1/15)# no switchport
AG4(conf-if-eth1/1/15)# channel-group 1 mode active
AG4(conf-if-eth1/1/15)# exit

AG4(config)# interface port-channel1
AG4(conf-if-po-1)# vlt-port-channel 1
AG4(conf-if-po-1)# exit

AG4(config)# interface ethernet1/1/16
AG4(conf-if-eth1/1/16)# no shutdown
AG4(conf-if-eth1/1/16)# no switchport
AG4(conf-if-eth1/1/16)# channel-group 2 mode active
AG4(conf-if-eth1/1/16)# exit

AG4(config)# interface port-channel2
AG4(conf-if-po-2)# vlt-port-channel 2
AG4(conf-if-po-2)# exit

AG4(config)# interface ethernet1/1/21
```

```
AG4(conf-if-eth1/1/21)# no shutdown
AG4(conf-if-eth1/1/21)# no switchport
AG4(conf-if-eth1/1/21)# channel-group 128 mode active
AG4(conf-if-eth1/1/21)# exit

AG4(config)# interface ethernet1/1/24
AG4(conf-if-eth1/1/24)# no shutdown
AG4(conf-if-eth1/1/24)# no switchport
AG4(conf-if-eth1/1/24)# channel-group 128 mode active
AG4(conf-if-eth1/1/24)# exit

AG4(config)# interface port-channel128
AG4(conf-if-po-128)# vlt-port-channel 1024
AG4(conf-if-po-128)# exit
```

4. Configure the primary VLANs and the PVLAN mode.

```
AG4(config)# interface vlan 100
AG4(conf-if-vl-100)# private-vlan mode primary
AG4(conf-if-vl-100)# exit

AG4(config)# interface vlan 200
AG4(conf-if-vl-200)# private-vlan mode primary
AG4(conf-if-vl-200)# exit
```

5. Configure the secondary VLANs and the respective PVLAN modes.

```
AG4(config)# interface vlan 11
AG4(conf-if-vl-11)# private-vlan mode community
AG4(conf-if-vl-11)# exit

AG4(config)# interface vlan 12
AG4(conf-if-vl-12)# private-vlan mode community
AG4(conf-if-vl-12)# exit

AG4(config)# interface vlan 13
AG4(conf-if-vl-13)# private-vlan mode isolated
AG4(conf-if-vl-13)# exit

AG4(config)# interface vlan 21
AG4(conf-if-vl-21)# private-vlan mode community
AG4(conf-if-vl-21)# exit

AG4(config)# interface vlan 22
AG4(conf-if-vl-22)# private-vlan mode isolated
AG4(conf-if-vl-22)# exit
```

6. Associate the secondary VLANs to the primary VLAN.

```
AG4(config)# interface vlan 100
AG4(conf-if-vl-100)# private-vlan mapping secondary-vlans 11-13
AG4(conf-if-vl-100)# exit

AG4(config)# interface vlan 200
AG4(conf-if-vl-200)# private-vlan mapping secondary-vlans 21-22
AG4(conf-if-vl-200)# exit
```

7. Configure the port mode on the community and isolated ports.

```
AG4(config)# interface port-channel1
AG4(conf-if-po-1)# no shutdown
AG4(conf-if-po-1)# private-vlan mode secondary-port
AG4(conf-if-po-1)# exit

AG4(config)# interface port-channel2
AG4(conf-if-po-2)# no shutdown
AG4(conf-if-po-2)# private-vlan mode secondary-port
AG4(conf-if-po-2)# exit

AG4(config)# interface ethernet1/1/1
AG4(conf-if-eth1/1/1)# no shutdown
AG4(conf-if-eth1/1/1)# private-vlan mode secondary-port
AG4(conf-if-eth1/1/1)# exit
```

```
AG4(config)# interface ethernet1/1/2
AG4(conf-if-eth1/1/2)# no shutdown
AG4(conf-if-eth1/1/2)# private-vlan mode secondary-port
AG4(conf-if-eth1/1/2)# exit
```

8. Associate the member ports to the secondary VLANs.

```
AG4(config)# interface port-channel1
AG4(conf-if-po-1)# switchport mode trunk
AG4(conf-if-po-1)# switchport trunk allowed vlan 11
AG4(conf-if-po-1)# exit

AG4(config)# interface port-channel2
AG4(conf-if-po-2)# switchport mode trunk
AG4(conf-if-po-2)# switchport trunk allowed vlan 13
AG4(conf-if-po-2)# exit

AG4(config)# interface ethernet1/1/1
AG4(conf-if-eth1/1/1)# switchport mode trunk
AG4(conf-if-eth1/1/1)# switchport trunk allowed vlan 12
AG4(conf-if-eth1/1/1)# exit

AG4(config)# interface ethernet1/1/2
AG4(conf-if-eth1/1/2)# switchport mode trunk
AG4(conf-if-eth1/1/2)# switchport trunk allowed vlan 22
AG4(conf-if-eth1/1/2)# exit
```

9. Associate the ISL to the primary and the secondary VLANs as a normal trunk port.

```
AG4(config)# interface port-channel128
AG4(conf-if-po-128)# switchport mode trunk
AG4(conf-if-po-128)# switchport trunk allowed vlan 11-13,21-22,100,200
AG4(conf-if-po-128)# exit
```

10. Configure anycast MAC address.

```
AG4(config)# ip virtual-router mac-address 00:00:00:44:44:44
```

11. Configure IP address and anycast IP address on the primary VLANs.

```
AG4(config)# interface vlan 100
AG4(conf-if-vl-100)# ip address 172.1.1.4/16
AG4(conf-if-vl-100)# ip virtual-router address 172.1.0.254
AG4(conf-if-vl-100)# exit

AG4(config)# interface vlan 200
AG4(conf-if-vl-200)# ip address 172.2.1.4/16
AG4(conf-if-vl-200)# ip virtual-router address 172.2.0.254
AG4(conf-if-vl-200)# exit
```

Spine Switch

1. Create the primary VLANs extended from AG1 and AG2.

```
SPINE(config)# interface vlan 100
SPINE(conf-if-vl-100)# ip address 172.1.1.1/16
SPINE(conf-if-vl-100)# exit

SPINE(config)# interface vlan 200
SPINE(conf-if-vl-200)# ip address 172.2.1.1/16
SPINE(conf-if-vl-200)# exit
```

2. Associate the VLT LAGs to the primary VLANs extended from AG1 and AG2.

```
SPINE(config)# interface ethernet1/1/10
SPINE(conf-if-eth1/1/10)# no shutdown
SPINE(conf-if-eth1/1/10)# no switchport
SPINE(conf-if-eth1/1/10)# channel-group 101 mode active
SPINE(conf-if-eth1/1/10)# exit
```

```
SPINE(config)# interface ethernet1/1/11
SPINE(conf-if-eth1/1/11)# no shutdown
SPINE(conf-if-eth1/1/11)# no switchport
SPINE(conf-if-eth1/1/11)# channel-group 101 mode active
SPINE(conf-if-eth1/1/11)# exit
```

3. (Optional) To enable connectivity between end devices that belong to different secondary VLANs (community or isolated or both) of a PVLAN domain, enable `ip local-proxy arp` on the VLAN in the spine switch.

```
SPINE(config)# interface vlan100
SPINE(conf-if-vl-100)# ip address 172.1.1.1/16
SPINE(conf-if-vl-100)# ip local-proxy-arp

SPINE(config)# interface vlan200
SPINE(conf-if-vl-200)# ip address 172.2.1.1/16
SPINE(conf-if-vl-200)# ip local-proxy-arp
```

Port monitoring

Port monitoring is an application that mirrors the ingress or egress traffic of one port to another for analysis.

A monitoring port, or destination port, is the port where the monitored traffic is sent for analysis. A monitored port, or source port, is the source interface that is monitored for traffic analysis.

NOTE: This feature is not supported on the Z9332F-ON platforms. On Z9664F-ON, mirroring on destination port channel is not supported.

The different types of port monitoring are:

- **Local port monitoring**—Port monitoring is done in the same switch. The switch forwards a copy of incoming and outgoing traffic from one port to another port for further analysis.
- **Remote port monitoring (RPM)**—Port monitoring is done on traffic running across a remote device in the same network. The L2 network carries the monitored traffic.
- **Encapsulated remote port monitoring (ERPM)**—Port monitoring is done on the L3 network. The traffic from the source port is encapsulated and forwarded to the destination port in another switch.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

- When you configure a port as a source interface, and add the same port to the remote VLAN used for monitoring traffic, the configuration fails and the system does not display an error message. Dell Technologies recommends adding the ports to the destination remote VLAN first and then configuring the source interface. In this case, when you configure the destination port as source, the system displays an error message.
- When you configure remote port mirroring and overwrite the transport VLAN by re-entering the destination remotevlan vlan-id command with a different VLAN ID, an error message displays. The new remote VLAN configuration is not accepted. You must first remove the configured remote VLAN using the no version of the command, and then re-enter the command with the new remote VLAN ID.
- VLAN statistics on the remote port mirroring (RPM) VLAN interface are not incremented on the following switches: S4048-ON, S4048T-ON, S4100-ON, S6010-ON, and Z9264F-ON. For these switches, the show interface vlan rpm_vlanid command does not display statistics for the mirrored traffic.

Supported mirroring sessions

- You can configure two monitoring sessions if the monitoring involves both directions.
- You can configure four monitoring sessions if the monitoring involves either ingress or egress direction. In such case, you can configure a total of four unique destination ports.
- The maximum supported source ports per mirroring session is 108.
- You can configure one destination port per mirroring session.
- There is no bandwidth limit for mirroring.
- If SmartFabric OS10 generates packets as a response to ARP or ICMP requests; such as ARP responses or ICMP reply packets, the port monitoring sessions do not mirror these packets. To be able to capture these packets, Dell Technologies recommends using the `tcpdump -i any` command on the root prompt of the SmartFabric OS10 switch.

Supported number of interfaces

The maximum number of interfaces that can be associated with the remote port mirroring VLAN is as follows:

On S4148F-ON:

- Up to four interfaces can be associated with remote port mirroring VLAN when the source direction is both egress and ingress.
- Up to four interfaces can be associated with remote port mirroring VLAN when the source direction is either egress or ingress.

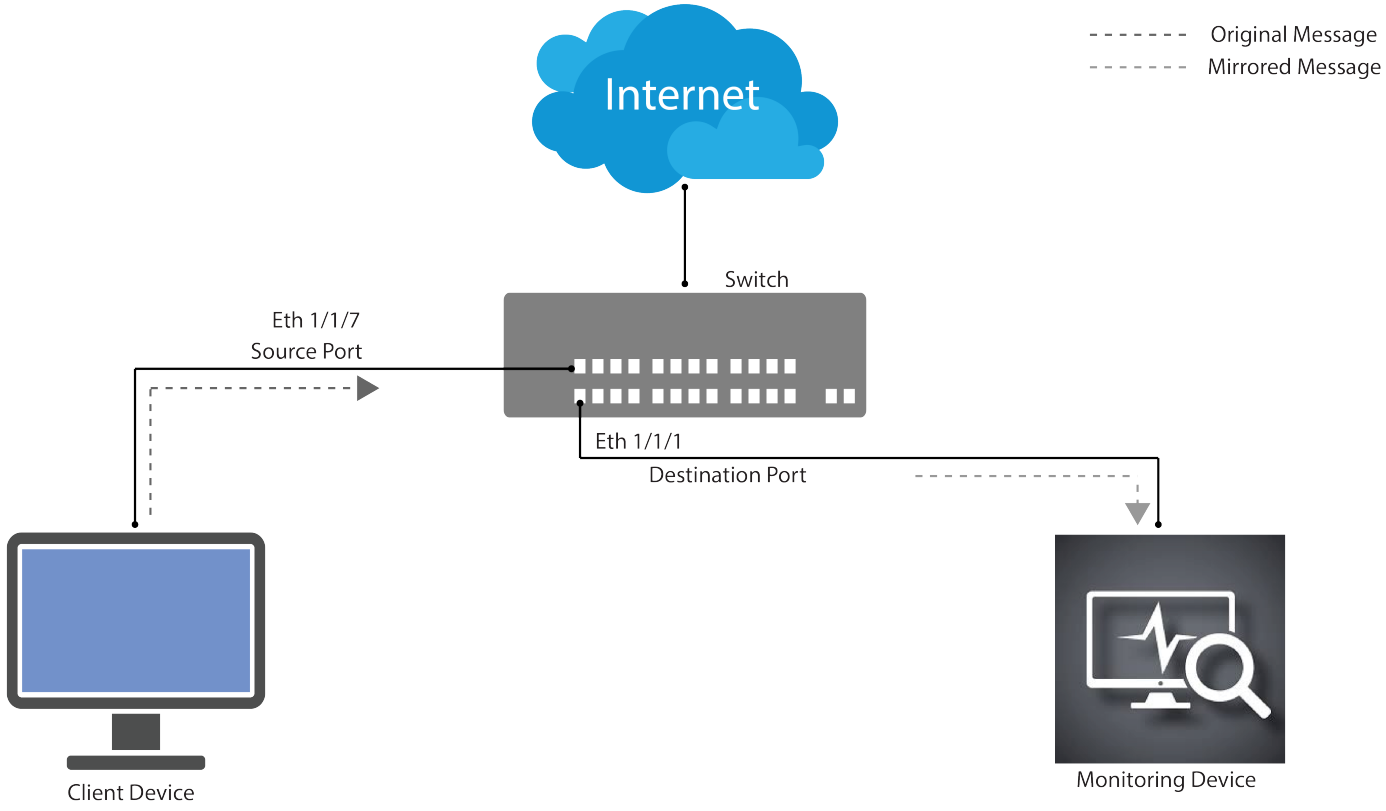
On other Dell PowerSwitches:

- Up to two interfaces can be associated with remote port mirroring VLAN when the source direction is both egress and ingress.
- Up to four interfaces can be associated with remote port mirroring VLAN when the source direction is either egress or ingress.

Local port monitoring

In local port monitoring, the monitored source ports and monitoring destination ports are on the same device.

In the following diagram, the local port mirroring enables the network switch to forward the copy of the packet on the source port (Eth 1/1/7) to the destination port (Eth 1/1/1). The monitoring device connected with the destination port analyzes the packet.



Configure local monitoring session

To configure a local monitoring session, configure the source and destination ports, and the traffic direction.

1. Verify that the intended monitoring port has no configuration other than `no shutdown` and `no switchport`.

```
show running-configuration
```

2. Create a monitoring session in CONFIGURATION mode.

```
monitor session session-id [local]
```

3. Enter the source and direction of the monitored traffic in MONITOR-SESSION mode.

```
source interface interface-type {both | rx | tx}
```

4. Enter the destination of traffic in MONITOR-SESSION mode.

```
destination interface interface-type
```

Example output to create a monitoring session

```
OS10(config)# monitor session 1
OS10(conf-mon-local-1)#
```

Configure source and destination port, and traffic direction

```
OS10(conf-mon-local-1)# source interface Eth1/1/1 rx
OS10(conf-mon-local-1)# destination interface Eth1/1/2
OS10(conf-mon-local-1)# no shut
```

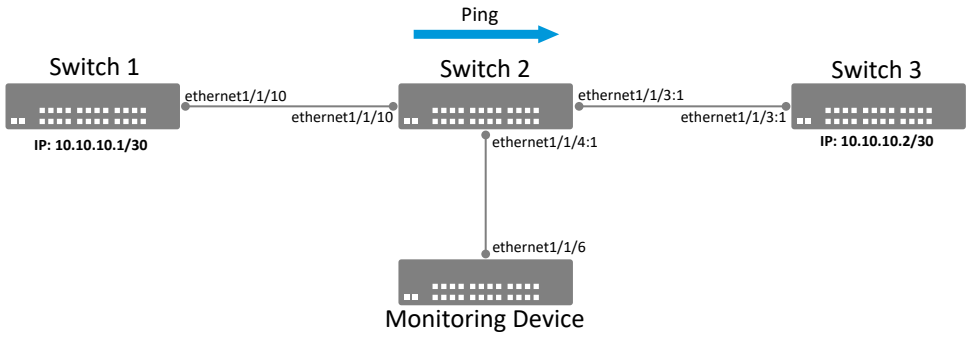
View configured monitoring sessions

In the State field, `true` indicates that the port is enabled. In the Reason field, `Is UP` indicates that hardware resources are allocated.

```
OS10# show monitor session all
S.Id  Source        Destination    Dir SrcIP DstIP DSCP TTL  State Reason
-------------------------------------------------------------------------
1    ethernet1/1/7  ethernet1/1/1 rx  N/A   N/A   N/A  N/A  true  Is UP
```

Example: Configure local port monitoring with VLAN as the source

The following example describes how to configure local port monitoring with VLAN as the source.



Switch 1

```
switch1# show running-configuration interface ethernet 1/1/10
!
interface ethernet1/1/10
 no shutdown
 switchport mode trunk
 switchport access vlan 1
 switchport trunk allowed vlan 137
 flowcontrol receive off

switch1# show running-configuration interface vlan 137
!
interface vlan137
 no shutdown
 ip address 10.10.10.1/30
```

```
switch1# show vlan 137
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
    137    Active                                   T Eth1/1/10
```

Switch 2

```
switch2# show running-configuration interface ethernet 1/1/10
!
interface ethernet1/1/10
 no shutdown
 switchport mode trunk
 switchport trunk allowed vlan 137
 flowcontrol receive off

switch2# show running-configuration interface ethernet 1/1/3:1
!
interface ethernet1/1/3:1
 no shutdown
 switchport mode trunk
 switchport trunk allowed vlan 137
 flowcontrol receive off

switch2# Show running-configuration access-list
!
ip access-list TEST
 seq 10 permit ip host 10.10.10.1 host 10.10.10.2 capture session 1 log count
 seq 20 permit ip any any

!

switch2# show running-configuration monitor
!
monitor session 1
 destination interface ethernet1/1/4:1
 flow-based enable
 source interface vlan137 rx
 no shutdown

switch2# show vlan 137
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Port
    137    Active                                   T Eth1/1/3:1,1/1/10
```

Switch 3

```
switch3# show running-configuration interface ethernet 1/1/3:1
!
interface ethernet1/1/3:1
 no shutdown
 switchport mode trunk
 switchport trunk allowed vlan 137
 flowcontrol receive off vlan 137
 flowcontrol receive off

switch3# show running-configuration interface vlan 137
!
interface vlan137
 no shutdown
 ip address 10.10.10.2/30

switch3# show vlan 137
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
```

```
       @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
    NUM    Status    Description                    Q Ports
    137    Active                                   T Eth1/1/3:1
```

Switch 4

```
switch4# show running-configuration interface ethernet1/1/6
!
interface ethernet1/1/6
 no shutdown
flowcontrol receive on
```

Monitoring packet transfer

To monitor the packet transfer, the ping command (`ping -s 1200 -c 10 10.10.10.2`) is sent from switch 1 to switch 3.

Packet flow at switch 1

```
switch1# show interface ethernet 1/1/10
Ethernet 1/1/10 is up, line protocol is up
Hardware is Eth, address is 0c:29:ef:e9:f6:0a

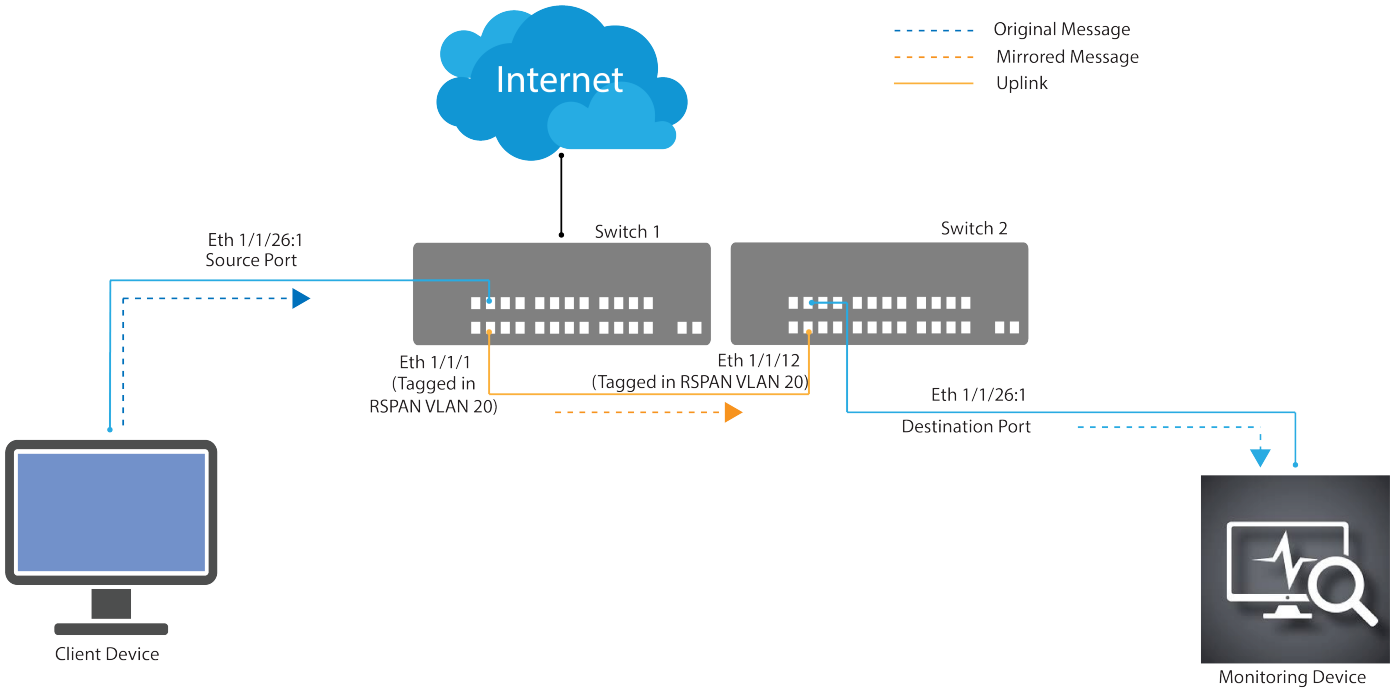
Remote port monitoring

Remote port monitoring monitors ingress traffic, egress traffic, or both, on multiple source ports of multiple devices.

It forwards the monitored traffic to multiple destination ports on different remote devices. Remote port monitoring helps network administrators monitor and analyze traffic to troubleshoot network problems.

In a remote port monitoring session, monitored traffic is tagged with a VLAN ID and switched on a user-defined, nonroutable L2 VLAN. The VLAN is reserved to carry only monitored traffic, which is forwarded on all egress ports of the VLAN. You must configure each intermediate switch that participates in transporting the monitored traffic with the reserved L2 VLAN.

In the following diagram, the source port (Eth 1/1/26:1) is on one switch, and destination port (Eth 1/1/26:1) is on the other switch. The source port forwards the packet copy to the destination port through the uplink connection. This enables data monitoring and analysis across devices.



Session and VLAN requirements

Remote port monitoring requires configuring source and destinations sessions, and also a tagged VLAN for transporting monitored traffic.

RPM requires the following:

- Source session, such as monitored ports on different source devices.
- Reserved tagged VLAN for transporting monitored traffic configured on source, intermediate, and destination devices.
- Destination session, where destination ports connect to analyzers on destination devices.

Configure any network device with source and destination ports. Enable the network device to function in an intermediate transport session for a reserved VLAN for multiple remote port monitoring sessions. You can enable and disable individual monitoring sessions.

VLAN requirements when configuring an RPM session:

- A remote port monitoring session mirrors the monitored traffic by prefixing the reserved VLAN tag to the monitored packets to transmit using the reserved VLAN.
- The source address, destination address, and original VLAN ID of the mirrored packet are prefixed with the tagged VLAN header. Untagged source packets are tagged with the reserved VLAN ID.
- The member port of the reserved VLAN must have the MTU and IPMTU value as `MAX+4` to hold the VLAN tag parameter.
- To associate with the source session, the reserved VLAN can have up to four member ports.
- To associate with the destination session, the reserved VLAN can have multiple member ports.
- The reserved VLAN cannot have untagged ports.

Restrictions

When you configure an RPM session, VLAN has certain restrictions.

- When you use a source VLAN, enable flow-based monitoring using the `flow-based enable` command.
- In a source VLAN, only received (`rx`) traffic is monitored.
- Destination port in a remote port monitoring session must not be a Layer 2 or Layer 3 port.
- You cannot configure a destination port for remote port monitoring as a source port.
- The reserved VLAN used to transport mirrored traffic must be an L2 VLAN. L3 VLANs are not supported.

Reserved L2 VLAN

In an RPM session, the reserved VLAN is automatically disabled and the default VLAN ID is not supported.

- MAC address learning in the reserved VLAN is automatically disabled.
- There is no restriction on the VLAN IDs used for the reserved remote monitoring VLAN. Valid VLAN IDs are from 2 to 4093. The default VLAN ID is not supported.
- When the traffic is monitored in a device where L3 VLAN is configured, the packets, which has the same MAC address as that of an intermediate or destination device in the path that the VLAN uses to transport, the mirrored traffic is dropped by the device that receives the traffic

Source session

In an RPM session, you can configure sources and use the different VLANs available as the source VLAN.

- Configure physical ports and port channels as sources in remote port monitoring and use them in the same source session. You can use both L2, configured with the `switchport` command, and L3 ports as source ports. Optionally, to monitor the configured VLAN traffic on source ports, configure one or more source VLANs.
- Use the default VLAN and native VLANs as a source VLAN.
- You cannot configure the dedicated VLAN used to transport mirrored traffic as a source VLAN.

Configure remote port monitoring

Remote port monitoring requires the following for transporting mirrored traffic configured on the source, intermediate, and destination devices:

- A source interface
- Monitored ports on different source network devices
- A reserved tagged VLAN

1. Create a remote monitoring session in CONFIGURATION mode.

```
monitor session session-id type rpm-source
```

2. Enter the source to monitor traffic in MONITOR-SESSION mode.

```
source interface interface-type {both | rx | tx}interface-range direction
```

3. Enter the destination to send the traffic to in MONITOR-SESSION mode.

```
destination remote-vlan vlan-id
```

4. Enable the monitoring interface in MONITOR-SESSION mode.

```
no shut
```

Create remote monitoring session

```
OS10(config)# monitor session 10 type rpm-source
OS10(conf-mon-rpm-source-10)#
```

Configure source and destination port, and traffic direction

```
source# show running-configuration interface ethernet 1/1/26:1
!
interface ethernet1/1/26:1
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 10
flowcontrol receive on
```

NOTE: This is the interface through which the traffic is sent to the source and is monitored.

```
source# show running-configuration interface ethernet 1/1/1
!
interface ethernet1/1/1
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 20
flowcontrol receive on
```

NOTE: This is the interface connected to the intermediate switch and the RSPAN vlan is tagged.

Monitor session configs

```
source# show running-configuration monitor
!
monitor session 1 type rpm-source
destination remote-vlan 20
source interface ethernet1/1/26:1 rx // The source interface can be either a physical
interface
or a VLAN no shut

source# show monitor session all
S.Id Source           Destination Dir Mode  Source IP Dest IP DSCP  TTL  Gre-Protocol
State Reason
-------------------------------------------------------------------------------------
---------
1    ethernet1/1/26:1 vlan20      rx  port  N/A        N/A    N/A   N/A  N/A
true  Is UP
```

intermediate switch:

```
intermediate# show running-configuration interface vlan

interface vlan20
no shutdown
```

Interface connected to source

```
intermediate# show running-configuration interface ethernet 1/1/1
!
interface ethernet1/1/1
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 20
flowcontrol receive on
```

Interface connected to destination

```
intermediate# show running-configuration interface ethernet 1/1/4
!
interface ethernet1/1/4
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 20
flowcontrol receive on
```

Destination switch:

```
interface vlan20
no shutdown

destination# show running-configuration access-list
!
mac access-list rspan
seq 10 permit any any capture session 1 vlan 20
```

Interface connected to intermediate switch

```
destination# show running-configuration interface ethernet 1/1/12
!
interface ethernet1/1/12
no shutdown
switchport mode trunk
switchport access vlan 1
switchport trunk allowed vlan 20
flowcontrol receive on
mac access-group rspan in

destination# show running-configuration interface ethernet 1/1/26:1
!
interface ethernet1/1/26:1
no shutdown
no switchport
flowcontrol receive on

destination# show running-configuration monitor
!
monitor session 1
destination interface ethernet1/1/26:1
flow-based enable
source interface ethernet1/1/12 rx
no shut

destination#
destination# show monitor session all
S.Id Source         Destination      Dir Mode Source IP Dest IP DSCP TTL Gre-Protocol
State Reason
-------------------------------------------------------------------------------------

1    ethernet1/1/12 ethernet1/1/26:1 rx  flow N/A       N/A     N/A  N/A N/A
```

```
true   Is UP
```

NOTE: In OS10, the RSPAN vlan tag is not removed from the mirrored traffic.

View monitoring session

```
OS10(conf-mon-rpm-source-10)# do show monitor session all
S.Id  Source  Destination Dir SrcIP DstIP DSCP TTL  State Reason
---------------------------------------------------------------
1     vlan10  vlan 100   rx   N/A   N/A   N/A  N/A  true  Is UP
```

Encapsulated remote port monitoring

You can also have the monitored traffic transmitted over a port-channel network to a remote analyzer. The encapsulated remote port monitoring (ERPM) session mirrors traffic from the source ports, LAGs, or source VLANs. It forwards the traffic using routable GRE-encapsulated packets to the destination IP address specified in the session.

Restrictions and limitations

IP address:

- The source IP address must be a valid local IP address for the session.
- The destination IP address must be on a remote L3 node that supports standard GRE decapsulation.
- If the destination IP address is not reachable, the session goes down.

Session:

- OS10 supports only the ERPM source session and the encapsulated packets terminate at the destination IP address (the remote analyzer).
- OS10 does not support an ERPM destination session and decapsulation of ERPM packets at the destination switch.
- You can configure a maximum of four ERPM sessions with a maximum of 128 source ports in each session. You can configure the four ERPM sessions by one of the following methods:
  - Single directional with either four ingress or four egress sessions.
  - Bi-directional with two ingress and two egress sessions.

Monitor:

- You can monitor a source VLAN only through flow-based monitoring. Only ingress is supported in flow-based source VLAN monitoring.
- You cannot monitor an RPM VLAN as a source.
- OS10 does not support monitoring VLAN subinterfaces and CPU-generated packets.

Configuration:

- You cannot configure an interface with ERPM traffic as a source for an ERPM session.
- You cannot configure the same destination IP address for two sessions.
- You cannot configure an interface that serves as egress for a GRE tunnel as a source interface.
- ERPM supports only GRE-over-IPv4 tunneling.
- ERPM does not support Equal Cost Multi Path (ECMP).
- You can use third-party devices as only tunnel-transit devices.

Configure encapsulated remote port monitoring

Encapsulated remote port monitoring requires valid source and destination IP addresses. Ensure that the source IP address is local and destination IP address is remote. You can also configure the time-to-live (TTL), which defines the life span of the data transmitted through the network and differentiated services code point (DSCP) values.

1. Create monitoring session in CONFIGURATION mode.

   ```
   monitor session session-id type erpm-source
   ```

2. Configure source port in MONITOR-SESSION mode.

   ```
   source interface interface-type {both | rx | tx}
   ```

3. Configure source and destination IP addresses, and protocol type in MONITOR-SESSION mode.

```
source-ip source ip-address destination-ip destination ip-address [gre-protocol
protocol-value]
```

4. Configure TTL and DSCP values in MONITOR-SESSION mode.

```
ip {ttl ttl-number | dscp dscp-number}
```

5. Enable the monitoring interface in MONITOR-SESSION mode.

```
no shut
```

Create monitoring session

```
OS10(config)# monitor session 10 type erpm-source
OS10(conf-mon-erpm-source-10)#
```

Configure source port, source and destination IP addresses, and protocol type

```
OS10(conf-mon-erpm-source-10)# source interface ethernet 1/1/2
OS10(conf-mon-erpm-source-10)# source-ip 1.1.1.1 destination-ip 3.3.3.3 gre-protocol
35006
OS10(conf-mon-erpm-source-10)# ip ttl 16
OS10(conf-mon-erpm-source-10)# ip dscp 63
OS10(conf-mon-erpm-source-10)# no shut
```

View configured ERPM session

```
OS10(conf-mon-erpm-source-6)# do show monitor session all

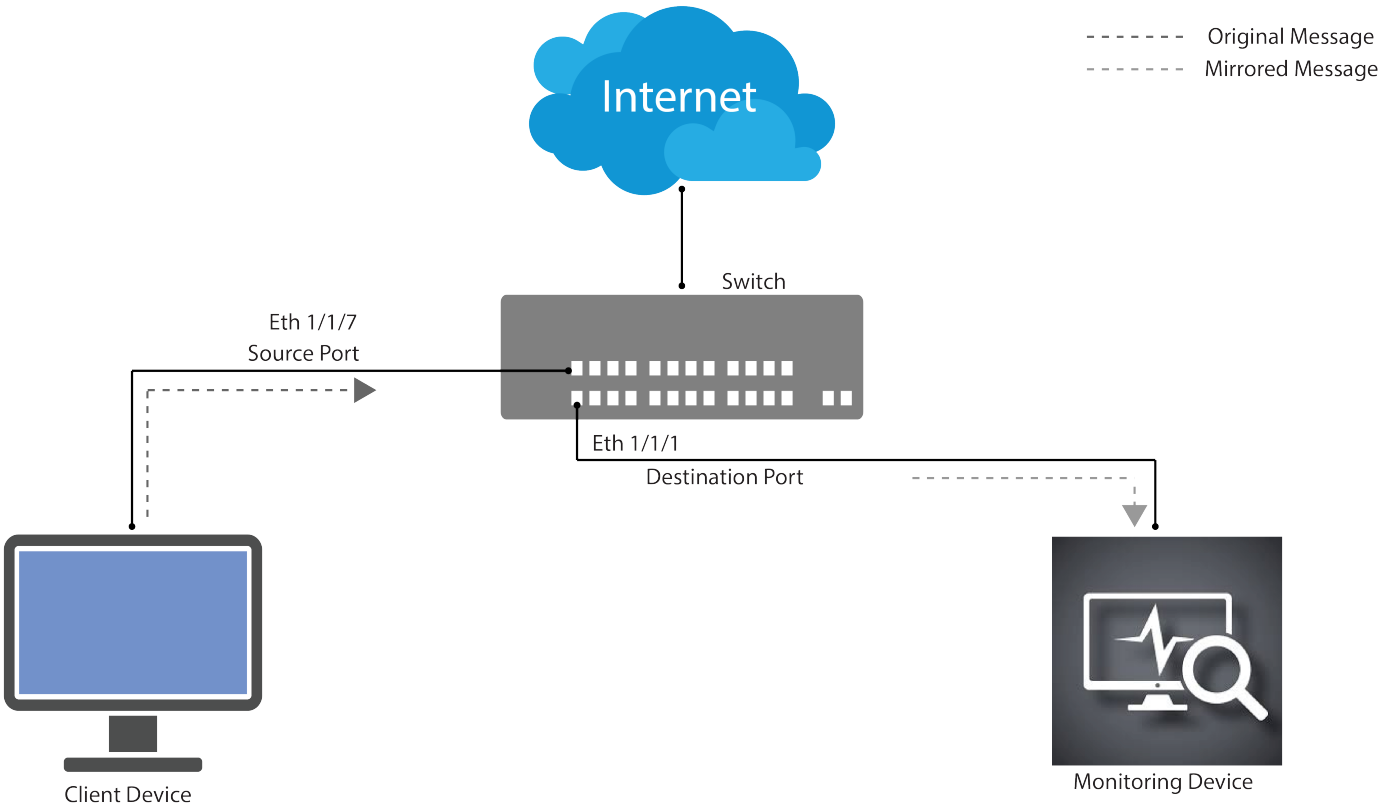
S.Id  Source     Destination  Dir   Mode  Source IP  Dest IP  DSCP  TTL  Gre-Protocol
State Reason
-------------------------------------------------------------------------------------
---------
6   ethernet1/1/2 remote-ip   both  port  1.1.1.1    3.3.3.3   63    16  35006
true  Is UP
```

View running configuration of monitor session

```
OS10# show running-configuration monitor
!
monitor session 10 type erpm-source
source-ip 1.1.1.1 destination-ip 3.3.3.3
source interface ethernet1/1/2
no shut
```

Flow-based monitoring

Flow-based monitoring conserves bandwidth by inspecting only specified traffic instead of all interface traffic. Using flow-based monitoring, you can monitor only traffic received by the source port that matches criteria in ingress access-lists (ACLs). IPv4 ACLs, IPv6 ACLs, and MAC ACLs support flow-based monitoring.



1. Enable flow-based monitoring for a monitoring session in MONITOR-SESSION mode.

```
flow-based enable
```

2. Return to CONFIGURATION mode.

```
exit
```

3. Create an access list in CONFIGURATION mode.

```
ip access-list access-list-name
```

4. Define access-list rules using `seq`, `permit`, and `deny` statements in CONFIG-ACL mode. ACL rules describe the traffic to monitor.

```
seq sequence-number {deny | permit} {source [mask] | any | host ip-address} [count
[byte]] [fragments] [threshold-in-msgs count] [capture session session-id]
```

5. Return to CONFIGURATION mode.

```
exit
```

6. Apply the flow-based monitoring ACL to the monitored source port in CONFIGURATION mode. The access list name can have a maximum of 140 characters.

```
ip access-group access-list-name {in | out}
```

Enable flow-based monitoring

```
OS10(config)# monitor session 1
OS10(conf-mon-local-1)# flow-based enable
OS10(conf-mon-local-1)# exit
OS10(config)# ip access-list ipacl1
OS10(conf-ipv4-acl)# deny ip host 1.1.1.23 any capture session 1 count
OS10(conf-ipv4-acl)# exit
OS10(config)# mac access-list mac1
OS10(conf-mac-acl)# deny any any capture session 1
OS10(conf-mac-acl)# exit
OS10(config)# interface ethernet 1/1/9
```

```
OS10(conf-if-eth1/1/9)# mac access-group mac1 in
OS10(conf-if-eth1/1/9)# end
OS10# show mac access-lists in
Ingress MAC access-list mac1
 Active on interfaces :
  ethernet1/1/9
 seq 10 deny any any capture session 1 count (0 packets)
```

Remote port monitoring on VLT

In a network, devices you configure with peer VLT nodes are considered as a single device. You can apply remote port monitoring (RPM) on the VLT devices in a network.

In a failover case, the monitored traffic reaches the packet analyzer connected to the top-of-rack (ToR) through the VLT interconnect link.

NOTE:

- In VLT devices configured with RPM, when the VLT link is down, the monitored packets might drop for some time. The time is equivalent to the VLT failover recovery time, the delay restore.
- ERPM does not work on VLT devices.

RPM on VLT scenarios

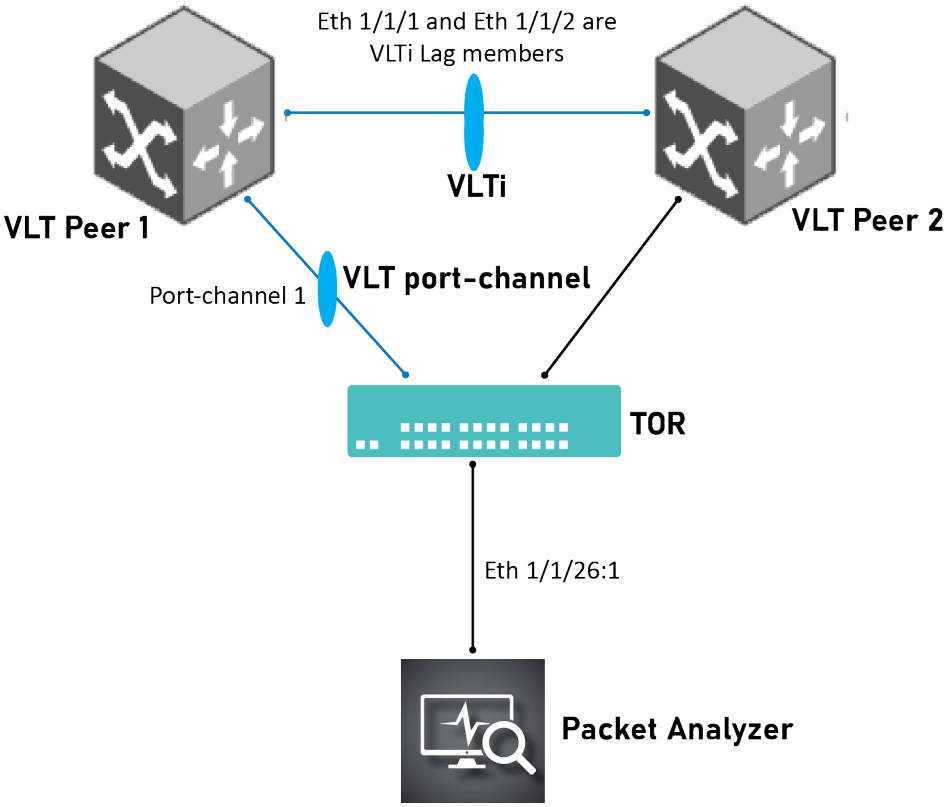
Consider a simple VLT setup where two VLT devices are connected using VLTi and a top-of-rack switch is connected to both the VLT peers using VLT port-channels in a ring topology. In this setup, the following table describes the possible scenarios when you use RPM to mirror traffic.

NOTE: Ports that connect to the VLT domain, but not part of the VLT port-channel, are called orphan ports.

RPM on VLT Scenarios

Scenario 1

Mirror VLTi member ports traffic to a VLT port-channel. The packet analyzer connects to the ToR switch.



Configs on VLTPeer1 device

```
Monitor session configs:

monitor session 1 type rpm-source
 destination remote-vlan 100
 source interface ethernet1/1/1 //VLTi member port
 source interface ethernet1/1/2 //VLTi member port
 no shut

RSPAN-VLAN:

interface vlan100
 no shutdown
 remote-span

Config on VLT port-channel:

interface port-channel1
 no shutdown
 switchport mode trunk
 switchport access vlan 1
 switchport trunk allowed vlan 100
 vlt-port-channel 1

ToR switch configs:

interface vlan100
 no shutdown

mac access-list rspan
 seq 10 permit any any capture session 1 vlan 100
!

Connect port channel to VLT:

interface port-channel 1
 no shutdown
 switchport mode trunk
```

```
 switchport access vlan 1
 switchport trunk allowed vlan 100
 mac access-group rspan in
!

monitor session 1
 destination interface ethernet1/1/26:1
 flow-based enable
 source interface port-channel1 rx
 no shut
!

Connect port to packet analyzer:

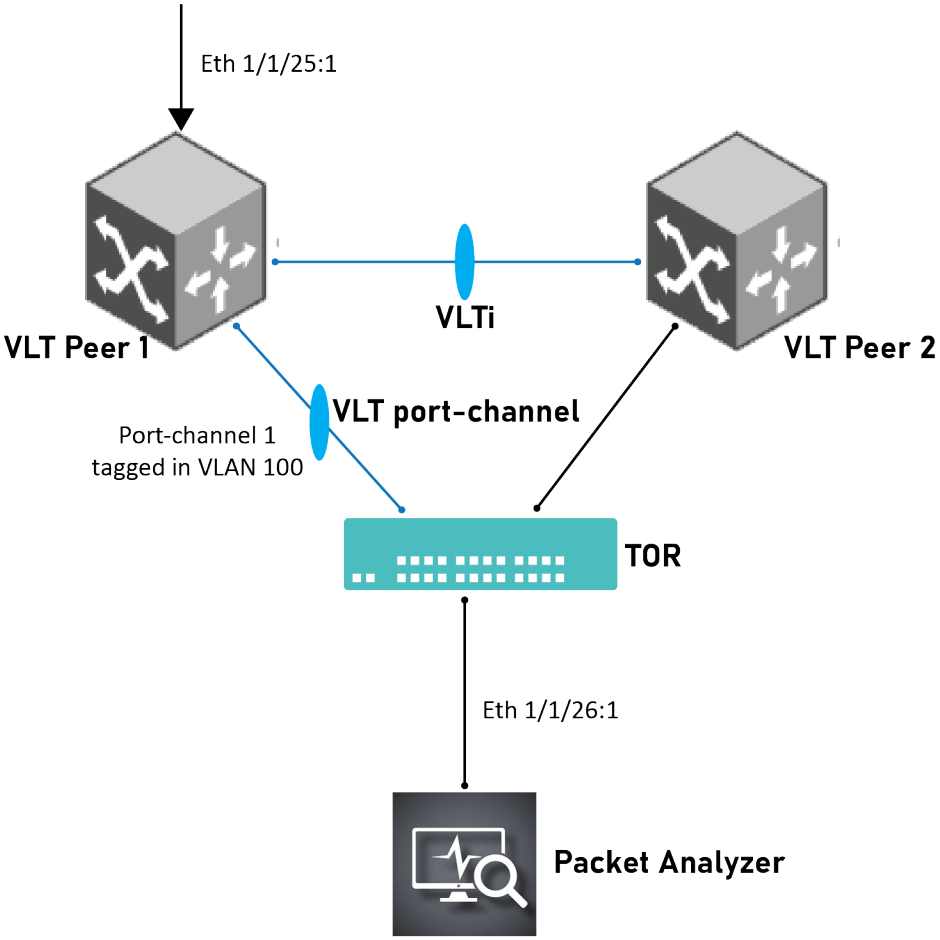
interface ethernet 1/1/26:1
 no shutdown
 no switchport
 flowcontrol receive on
!
```

NOTE:

- An access-list can not be applied on the member ports of a port-channel and flow based monitor seession is not applicable to VLTi member ports.
- In OS10, in the mirrored traffic, the RSPAN vlan tag is not stripped off or removed.

Scenario 2

Mirror orphan port traffic to a VLT port-channel. The packet analyzer connects to the ToR switch.



Configs on VLTPeer1

```
interface vlan 100
 no shutdown
```

```
 remote-span

mac access-list rspan
 seq 10 permit any any capture session 1 vlan 10
!
Orphan port:

interface ethernet 1/1/25:1
 no shutdown
 switchport mode trunk
 switchport access vlan 1
 switchport trunk allowed vlan 10
 flowcontrol receive on
 mac access-group rspan in
!

interface port-channel 1
 no shutdown
 switchport mode trunk
 switchport access vlan 1
 switchport trunk allowed vlan 100
 vlt-port-channel 1
!

monitor session 1 type rpm-source
 destination remote-vlan 100
 flow-based enable
 source interface ethernet1/1/25:1 rx
 no shut
!
```

TOR switch configs

```
interface vlan100
 no shutdown

mac access-list rspan
 seq 10 permit any any capture session 1 vlan 100
!

Connect port channel to VLT:

interface port-channel 1
 no shutdown
 switchport mode trunk
 switchport access vlan 1
 switchport trunk allowed vlan 100
 mac access-group rspan in
!

monitor session 1
 destination interface ethernet1/1/26:1
 flow-based enable
 source interface port-channel1 rx
 no shut
!

Connect port to packet analyzer:

interface ethernet 1/1/26:1
 no shutdown
 no switchport
 flowcontrol receive on
!
```

Port monitoring commands

description

Configures a description for the port monitoring session. The monitoring session can be: local, RPM, or ERPM.

Syntax `description string`

Parameters *string*—Enter a description of the monitoring session. A maximum of 255 characters.

Default Not configured

Command Mode MONITOR-SESSION

Usage Information
- To use special characters as a part of the description string, enclose the string in double quotes.
- To use comma as a part of the description string add double back slash before the comma.
- The `no` version of this command removes the description text.

Example

```
OS10(conf-mon-local-1)# description remote
```

```
OS10(conf-mon-rpm-source-5)# description "RPM Sesssion"
```

```
OS10(conf-mon-erpm-source-10)# description "ERPM Session"
```

Supported Releases 10.2.0E or later

destination

Sets the destination where monitored traffic is sent to. The monitoring session can be local, RPM, or ERPM.

Syntax `destination {interface interface-type | remote-vlan vlan-id}`

Parameters *interface-type*—Enter the interface type for a local monitoring session.
- `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information as the destination.
- `port-channel id-number`—Enter a port channel number as the destination, from 1 to 999 or 1001 to 2000.
- `vlan vlan-id`—Enter a VLAN ID as the destination, from 1 to 4093.

`remote-vlan vlan-id`—Enter a remote VLAN ID as the destination for the RPM monitoring session, from 1 to 4093.

Default Not configured

Command Mode MONITOR-SESSION

Usage Information The `no` version of this command resets the value to the default.

Example

```
OS10(conf-mon-local-10)# destination interface port-channel 10
```

```
OS10(conf-mon-rpm-source-3)# destination remote-vlan 20
```

Supported Releases 10.2.0E or later

flow-based

Enables flow-based monitoring. The monitoring session can be: local, RPM, or ERPM.

Syntax `flow-based enable`

Parameters None

Default Disabled

Command Mode MONITOR-SESSION

Usage Information The `no` version of this command disables the flow-based monitoring.

Example

```
OS10(conf-mon-local-1)# flow-based enable
```

```
OS10(conf-mon-rpm-source-2)# flow-based enable
```

```
OS10(conf-mon-erpm-source-3)# flow-based enable
```

Supported Releases 10.2.0E or later

ip

Configures the IP time-to-live (TTL) value and the differentiated services code point (DSCP) value for the ERPM traffic.

Syntax `ip {ttl` *`ttl-number`* `| dscp` *`dscp-number`*`}`

Parameters

- *`ttl-number`*—Enter the TTL value, from 1 to 255.
- *`dscp-number`*—Enter the DSCP value, from 0 to 63.

Default

- TTL: 255
- DSCP: 0

Command Mode MONITOR-SESSION (ERPM)

Usage Information The `no` version of this command removes the configured TTL and DSCP values.

Example

```
OS10(conf-mon-erpm-source-10)#  ip ttl 16
OS10(conf-mon-erpm-source-10)#  ip DSCP 63
```

Supported Releases 10.4.0E(R1) or later

monitor session

Creates a session for monitoring traffic with port monitoring.

Syntax `monitor session` *`session-id`* `type [local | rpm-source | erpm-source]`

Parameters

- *`session-id`*—Enter a monitor session ID, from 1 to 18.
- `local`—(Optional) Enter a local monitoring session.
- `rpm-source`—(Optional) Enter a remote monitoring session.
- `erpm-source`—(Optional) Enter an encapsulated remote monitoring session.

Default local

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the monitor session.

Example

```
OS10(config)# monitor session 1
OS10(conf-mon-local-1)#
```

Example (RPM)

```
OS10(config)# monitor session 5 type rpm-source
OS10(conf-mon-rpm-source-5)#
```

Example (ERPM)

```
OS10(config)# monitor session 10 type erpm-source
OS10(conf-mon-erpm-source-10)#
```

Supported Releases 10.2.0E or later

show monitor session

Displays information about a monitoring session.

Syntax `show monitor session {session-id | all}`

Parameters

- *session-id*—Enter the session ID number, from 1 to 18.
- `all`—View all monitoring sessions.

Default All

Command Mode EXEC

Usage Information In the State field, `true` indicates that the port is enabled. In the Reason field, `Is UP` indicates that hardware resou

Example (specific session)

```
OS10# show monitor session 1
S.Id Source      Destination Dir   Mode  Source IP   Dest IP     DSCP  TTL  Gre-Pr
-------------------------------------------------------------------------------
1   ethernet1/1/1 remote-ip  both  port  11.11.11.1  11.11.11.11    0  255  35006
```

Example (all sessions)

```
OS10# show monitor session all
S.Id  Source        Destination  Dir  Mode  Source IP    Dest IP     DSCP  TTL  Gr
-------------------------------------------------------------------------------
1    ethernet1/1/1  remote-ip    both  port  11.11.11.1  11.11.11.11  0    255  35
9    ethernet1/1/9               both  port  N/A         N/A               N/A
7    ethernet1/1/9    vlan40     both  port  N/A         N/A               N/A
4    ethernet1/1/1               both  port  N/A         N/A          0    255  35
Destination is not resolved
6    ethernet1/1/2  remote-ip    both  port  11.11.11.1  2.2.2.1      0    255  35
session does not exist
```

Supported Releases 10.2.0E or later

shut

Disables the monitoring session. The monitoring session can be: local, RPM, or ERPM.

Syntax `shut`

Parameters None

Default Disabled

Command Mode MONITOR-SESSION

Usage Information The `no` version of this command enables the monitoring session.

Example

```
OS10(config)# monitor session 1
OS10(conf-mon-local-1)# no shut
```

```
OS10(config)# monitor session 5 type rpm-source
OS10(conf-mon-rpm-source-5)# no shut
```

```
OS10(config)# monitor session 10 type erpm-source
OS10(conf-mon-erpm-source-10)# no shut
```

Supported Releases 10.2.0E or later

source

Configures a source for port monitoring. The monitoring session can be: local, RPM, or ERPM.

Syntax `source interface interface-type {both | rx | tx}`

Parameters

- *interface-type*—Enter the interface type:
  - `ethernet` *node/slot/port[:subport]*—Enter the Ethernet interface information as the monitored source.
  - `port-channel` *id-number*—Enter the port channel interface number as the monitored source, from 1 to 999 or 1001 to 2000.
  - `vlan` *vlan-id*—Enter the VLAN identifier as the monitored source, from 1 to 4093.
- `both`—Monitor both receiving and transmitting packets. This option is not supported on VLAN interfaces.
- `rx`—Monitor only received packets.
- `tx`—Monitor only transmitted packets. This option is not supported on VLAN interfaces.

Default Not configured

Command Mode MONITOR-SESSION

Usage Information

Example

```
OS10(config)# monitor session 1
OS10(conf-mon-local-1)# source interface ethernet 1/1/7 rx
```

```
OS10(config)# monitor session 5 type rpm-source
OS10(conf-mon-rpm-source-5)# source interface ethernet 1/1/10 rx
```

```
OS10(config)# monitor session 10 type erpm-source
OS10(conf-mon-erpm-source-10)# source interface ethernet 1/1/5 rx
```

Supported Releases 10.2.0E or later

source-ip

Configures the source, destination, and protocol type of the monitored port for an ERPM monitoring session.

Syntax `source-ip` *source ip-address* `destination-ip` *destination ip-address* `[gre-protocol` *protocol-value*`]`

Parameters

- *source ip-address*—Enter the source IP address.
- *destination ip-address*—Enter the destination IP address.
- *protocol-value*—Enter the GRE protocol value, from 1 to 65535, default: 35006.

Default Not configured

Command Mode MONITOR-SESSION

Usage Information

Example

```
OS10(config)# monitor session 10
OS10(conf-mon-erpm-source-10)# source-ip 10.16.132.181 destination-ip
172.16.10.11 gre-protocol 35006
```

Supported Releases 10.4.0E(R1) or later

12

Layer 3

Bidirectional forwarding detection (BFD)	Provides rapid failure detection in links with adjacent routers (see BFD commands).
Border Gateway Protocol (BGP)	Provides an external gateway protocol that transmits inter-domain routing information within and between autonomous systems (see BGP Commands).
Equal Cost Multi-Path (ECMP)	Provides next-hop packet forwarding to a single destination over multiple best paths (see ECMP Commands).
IPv4 Routing	Provides forwarding of packets to a destination IP address, based on a routing table. This routing table defines how packets are routed — dynamically, broadcasted directly to, using proxy ARP, as well as what type of information is included with the packets (see IPv4 Routing Commands).
IPv6 Routing	Provides routing for the IPv6 address space, stateless auto-configuration, header format simplifications, and improved support for options and extensions (see IPv6 Routing Commands).
Open Shortest Path First (OSPF)	Provides a link-state routing protocol that communicates with all other devices in the same autonomous system area using link-state advertisements (LSAs). OS10 supports up to 10,000 OSPF routes for OSPFv2 to designate up to 8,000 routes as external, and up to 2,000 as inter/intra area routes (see OSPF Commands).
Virtual Router Redundancy Protocol (VRRP)	Provides a mechanism to eliminate a single point of failure in a statically routed network (see VRRP Commands).
Virtual Routing and Forwarding (VRF)	Provides a mechanism to partition a physical router into multiple virtual routers (see VRF Commands).

Configuration notes

Dell PowerSwitch S4200-ON Series:

Though it is possible to configure more VRIDs in VRRP, the S4200-ON Series switches support only up to 16 VRIDs. This number decreases when VLT peer routing is enabled.

Virtual routing and forwarding

VRF partitions a physical router into multiple virtual routers (VRs). The control and data plane are isolated in each VR; traffic does not flow across VRs. VRF allows multiple instances of routing tables to co-exist within the same router simultaneously.

OS10 supports a management VRF instance, a default VRF instance, a maximum of 512 non-default VRF instances with static routing, and 128 VRF instances with dynamic routing. Use the default and non-default VRF instances to configure routing.

You can move the management interface from the default to management VRF instance. You need not create the management VRF instance as it already exists in the system by default.

By default, OS10 initially assigns all physical interfaces and all logical interfaces to the default VRF instance.

NOTE: E3224F-ON supports only the management VRF and static route leaking in non-default VRF features.

Configure management VRF

You can assign only management interfaces to the management VRF instance.

Before you assign the management interface to the management VRF instance, delete all the configured settings, including the IP address, on the management interface.

1. Enter the `ip vrf management` command in CONFIGURATION mode. Use Non-Transaction-Based Configuration mode only. Do not use Transaction-Based mode.
2. Add the management interface using the `interface management` command in VRF CONFIGURATION mode.

Configure management VRF

```
OS10(config)# ip vrf management
OS10(conf-vrf)# interface management
```

You can enable various services in both management or default VRF instances. The services that are supported in the management and default VRF instances are:

Table 54. Services supported

Application	Management VRF	Default VRF	Non-default VRF
BGP	No	Yes	Yes
COPP ACL	Yes	Yes	No
DHCP client	Yes	Yes	Yes
DHCP relay	No	Yes	Yes
DHCP server	No	Yes	No
DNS client	Yes	Yes	Yes
FTP client	Yes	Yes	Yes
HTTP client	Yes	Yes	Yes
HTTP server	No	Yes	No
ICMP/Ping	Yes	Yes	Yes
NTP client	Yes	Yes	Yes
NTP server	Yes	Yes	Yes
OSPFV2 /OSPFV3	No	Yes	Yes
RADIUS server	Yes	Yes	Yes
SCP client	Yes	Yes	Yes
sFlow®	Yes	Yes	Yes
SFTP	Yes	Yes	Yes
SNMP server	Yes	Yes	No
SNMP traps	Yes	Yes	No
SSH server	Yes	Yes	Yes
Syslog	Yes	Yes	Yes
TACACS+ server	Yes	Yes	Yes
Telnet server	Yes	Yes	Yes
TFTP client	Yes	Yes	Yes
Traceroute	Yes	Yes	Yes
VLT backup link	Yes	Yes	No
VRRP	Yes	Yes	Yes

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

Before you assign the management port to the management VRF instance, you must remove all configured settings on the management port, including the IP address. Perform this action from the console. Removing the IP address disconnects all existing SSH and Telnet sessions on the switch.

The following example shows removing IP address, configuring management VRF, and then adding IP address:

```

```

Configure a static route for a management VRF instance

Configure a static route that directs traffic to the management interface:

`management route` *`ip-address mask`* `managementethernet`

Or

`management route` *`ipv6-address prefix-length`* `managementethernet`

You can also configure the management route to direct traffic to a physical interface. For example:

```
management route 10.1.1.0/24 managementethernet
```

Or

```
management route 2::/64 managementethernet
```

Configure non-default VRF instances

In addition to a management VRF instance and default VRF, OS10 also supports non-default VRF instances. You can create a maximum of 512 non-default VRF instances with static routing and 128 VRF instances with dynamic routing.

While you can assign management interfaces only to the management VRF instance, you can assign any physical or logical interface – VLAN, port channel, or loopback, to a non-default VRF instance.

When you create a new non-default VRF instance, OS10 does not assign any interface to it. You can assign the new VRF instance to any of the existing physical or logical interfaces, provided they are not already assigned to another non-default VRF.

NOTE: When you create a new logical interface, OS10 assigns it automatically to the default VRF instance. In addition, OS10 initially assigns all physical Layer 3 interfaces to the default VRF instance.

You can reassign any interface that is assigned to a non-default VRF instance back to the default VRF instance.

- To create a non-default VRF instance, from the CONFIGURATION mode, specify a name and enter the VRF configuration mode:

  CONFIGURATION

  ```
  ip vrf vrf-name
  ```

Assign an interface to a non-default VRF instance

After creating a non-default VRF instance, you can associate an interface to the VRF instance that you created.

To assign an interface to a non-default VRF, perform the following steps:

1. Enter the interface that you want to assign to a non-default VRF instance.

   CONFIGURATION

   ```
   interface ethernet 1/1/1
   ```

2. Remove the interface from L2 switching.

   INTERFACE

   ```
   no switchport
   ```

3. Assign the interface to a non-default VRF.

   INTERFACE CONFIGURATION

   ```
   ip vrf forwarding vrf-test
   ```

   Before assigning an interface to a VRF instance, ensure that no IP address is configured on the interface.

4. Assign an IPv4 address to the interface.

   INTERFACE CONFIGURATION

   ```
   ip address 10.1.1.1/24
   ```

5. Assign an IPv6 address to the interface.

   INTERFACE CONFIGURATION

   ```
   ipv6 address 1::1/64
   ```

   You can also auto configure an IPv6 address using the `ipv6 address autoconfig` command.

   NOTE: Before configuring any routing protocol in a VRF instance, you must first assign an IP address to at least one of the interfaces assigned to the VRF instance on which you want to configure routing protocols.

Assigning a loopback interface to a non-default VRF instance

After creating a non-default VRF instance you can associate a loopback interface to the VRF instance that you created.

To assign a loopback interface to a non-default VRF, perform the following steps:

1. Enter the loopback interface that you want to assign to a non-default VRF instance.

   CONFIGURATION

   ```
   interface loopback 5
   ```

2. Assign the interface to a non-default VRF.

INTERFACE CONFIGURATION

```
ip vrf forwarding vrf-test
```

Before assigning a n interface to a VRF instance, ensure that no IP address is configured on the interface.

3. Assign an IPv4 address to the interface.
   INTERFACE CONFIGURATION

   ```
   ip address 10.1.1.1/24
   ```

4. Assign an IPv6 address to the interface.
   INTERFACE CONFIGURATION

   ```
   ipv6 address 1::1/64
   ```

   You can also auto configure an IPv6 address using the `ipv6 address autoconfig` command.

Assign an interface back to the default VRF instance

Table 55. Configurations to be deleted

CONFIGURATION	MODE	COMMAND
IP address—In interface configuration mode, undo the IP address configuration.	INTERFACE CONFIGURATION	`OS10(conf-if-eth1/1/10:1)#no ip address` *ipv4-address* or `no ipv6 address` *ipv6-address*
Port—In interface configuration mode, delete the interface association corresponding to the VRF instance that you want to delete.	INTERFACE CONFIGURATION	`OS10(conf-if-eth1/1/10:1)#no ip vrf forwarding`

To assign an interface back to the default VRF, perform the following steps:

1. Enter the interface that you want to assign back to the default VRF instance.
   CONFIGURATION

   ```
   interface ethernet 1/1/1
   ```

2. Remove the IPv4 address associated with the interface.
   INTERFACE CONFIGURATION

   ```
   no ip address
   ```

3. Remove the IPv6 address associated with the interface.
   INTERFACE CONFIGURATION

   ```
   no ipv6 address
   ```

4. Assign the interface back to the default VRF instance.
   INTERFACE CONFIGURATION

   ```
   no ip vrf forwarding
   ```

Assigning the management interface back to the default VRF instance

To assign the management interface back to the default VRF, perform the following steps:

1. Enter the management VRF instance.
   CONFIGURATION

   ```
   ip vrf management
   ```

2. Remove the IPv4 address associated with the interface.
   INTERFACE CONFIGURATION

   ```
   no ip address
   ```

3. Remove the IPv6 address associated with the interface.
   INTERFACE CONFIGURATION

```
no ipv6 address
```

4. Assign the management interface back to the default VRF instance.

   CONFIGURATION VRF

   ```
   no interface management
   ```

Deleting a non-default VRF instance

Before deleting a non-default VRF instance, ensure all the dependencies and associations corresponding to that VRF instance are first deleted or disabled. The following procedure describes how to delete a non-default VRF instance:

After deleting all dependencies, you can delete the non-default VRF instances that you have created.

- Delete a non-default VRF instance using the following command:

  CONFIGURATION

  `no ip vrf vrf-name`

  NOTE: You cannot delete the default VRF instance.

Configure a static route for a non-default VRF instance

- Configure a static route in a non-default VRF instance. Static routes contain IP addresses of the next-hop neighbors that are reachable through the non-default VRF. These IP addresses could also belong to the interfaces that are part of the non-default VRF instance.

  CONFIGURATION

  `ip route vrf vrf-name ip-address mask next-hop-ip-address` or `ipv6 route vrf vrf-name ipv6-address prefix-length next-hop-ipv6-address`

  For example: `ip route vrf red 10.1.1.0/24 20.1.1.6 or ipv6 route vrf red 2::/64 3::1`
- Configure the route to direct traffic to a front-panel port in case of a non-default VRF instance.

  CONFIGURATION

  `ip route ip-address-mask ethernet interface-type or ipv6 route ipv6-address-mask ethernet interface-type`

  For example: `ip route 10.1.1.0/24 ethernet 1/1/1` or `ipv6 route 2::/64 ethernet 1/1/1`. Where ethernet 1/1/1 is part of the non-default VRF.

Configuring static entry in IPv6 neighbor

- Configure a static entry in the IPv6 neighbor discovery.

  CONFIGURATION

  ```
  ipv6 neighbor vrf vrf-test 1::1 ethernet 1/1/1 xx:xx:xx:xx:xx:xx
  ```

VRF configuration

The following configuration illustrates a typical VRF setup:

View VRF instance information

To display information about a VRF configuration, use the `show ip vrf` command. To display information about all VRF instances including the default VRF 0, do not enter a value for *vrf-name*.

- Display the VRF instance interfaces.

  EXEC

  `show ip vrf [vrf-name]`

Static route leaking

Route leaking enables routes that are configured in a default or non-default VRF instance to be made available to another VRF instance. You can leak routes from a source VRF instance to a destination VRF instance.

The routes need to be leaked in both source and destination VRFs to achieve end-to-end traffic flow.

If there are any connected routes in the same subnet as statically leaked routes, then the connected routes take precedence.

Limitations

- In VLT scenarios, the resolved ARP entry for the leaked route is not synchronized between the VLT peers. The ARP entry resolved in the source VRF is programmed into the leaked VRF when the leaked route configuration is active.

Configuring static route leaking

To configure static route leaking:

1. Enter the interface in the source VRF instance that contains the static routes that you want to leak.
   `interface interface-name`
   CONFIGURATION Mode
2. In INTERFACE CONFIGURATION Mode, assign the interface to the source VRF instance.
   `ip vrf forwarding vrf1`
   INTERFACE CONFIGURATION Mode
3. Assign an IP address to the interface.
   `ip address ip-address`
   VRF CONFIGURATION Mode
4. Enter the interface of the VRF instance to which you want to leak the static routes.
   `interface interface-name`
   CONFIGURATION Mode
5. In INTERFACE CONFIGURATION Mode, assign the interface to the destination VRF instance.
   `ip vrf forwarding vrf2`
   INTERFACE CONFIGURATION Mode
6. Configure the static route that you want to leak on the destination VRF instance.
   `ip route vrf dest-vrf-name route nexthop-interface`
7. Configure the static route that you have configured earlier in the source VRF instance to be available in the destination VRF instance also.
   `ip route vrf src-vrf-name route nexthop-interface`

```
OS10(config)#interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip vrf forwarding VRF1
OS10(conf-if-eth1/1/1)# ip address 120.0.0.1/24
OS10(config)#interface ethernet 1/1/2
OS10(conf-if-eth1/1/1)# ip vrf forwarding VRF2
OS10(conf-if-eth1/1/1)# ip address 140.0.0.1/24
OS10(config)#ip route vrf VRF1 140.0.0.0/24 interface ethernet 1/1/2
OS10(config)#ip route vrf VRF2 120.0.0.0/24 interface ethernet 1/1/1

Configuring source IP address for a leaked route

If the source IP is not mentioned explicitly for any self-originating packet (for example, ping or traceroute) to the leaked route destined through the parent VRF, the system chooses a source based on its source selection algorithm.

NOTE: For end-to-end traffic to flow, you must specify the source for self-originating packets and leak the same into the destination VRF.

To mitigate this issue and have control over the source IP address for leaked routes, you can create a loopback interface and associate it with the leaked VRF.

To explicitly mention the source interface for the leaked VRF:

Enter the following command:

`update-source-ip`

VRF CONFIGURATION Mode

After you configure the source IP address in a leaked VRF, if ping is initiated without -I option, then the source IP address will be that of the loopback interface.

Example: Route leaking between VRFs with asymmetric IRB routing

With asymmetric IRB routing, the virtual networks that you configure are present in all the VXLAN tunnel endpoints (VTEPs). If the DHCP server and client reside in different VRFs within the same or different VTEPs, request from the client does not reach the server.

In this scenario, the server network must be leaked to the client VRF for the client request to reach the server. The client network must be leaked to the server VRF for the server reply to reach the client.

In this example, the DHCP client is connected to GREEN VRF in VTEP1 and the server is connected to RED VRF in VTEP 2. The client is not able to reach the server. The client and server connected networks from the GREEN and RED VRFs must be leaked to the other tenant VRFs respectively. Route leaking enables server connectivity for hosts connected to different VRFs.

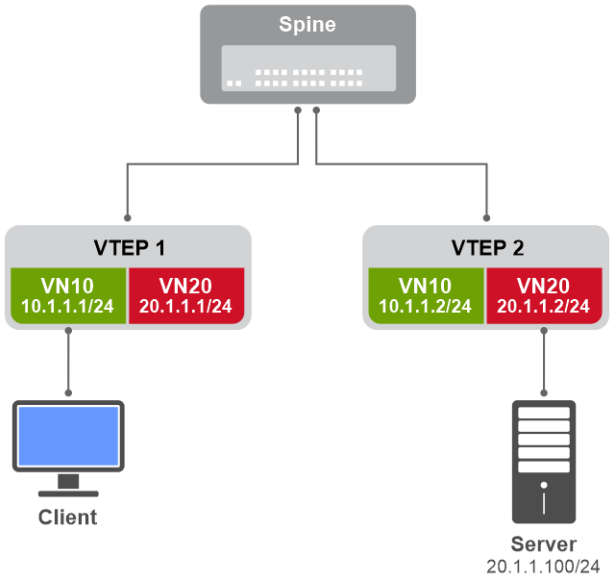

Figure 5. Route leaking between VRFs with asymmetric IRB routing

For VXLAN-related configurations, see Configure VXLAN. To configure route leaking between VRFs with asymmetric IRB routing:

VTEP1

1. Configure IP helper address specifying the DHCP server ip address in the client-connected virtual networks with the client-connected VRF name. For IPv6 DHCP helper address, specify the server VRF in the `helper-address` command.

```
VTEP1(config)# interface virtual-network 10
VTEP1(conf-if-vn-10)# ip helper-address 20.1.1.100 vrf GREEN
```

2. Configure loopback interfaces. Assign the loopback interfaces as source interfaces for the VRF.

```
VTEP1(config)# interface loopback 2
VTEP1(conf-if-lo-2)# ip vrf forwarding GREEN
VTEP1(conf-if-lo-2)# ip address 51.1.1.1/32
VTEP1(conf-if-lo-2)# exit

VTEP1(config)# interface loopback 3
VTEP1(conf-if-lo-3)# ip vrf forwarding RED
VTEP1(conf-if-lo-3)# ip address 52.1.1.1/32
VTEP1(conf-if-lo-3)# exit

VTEP1(config)# ip vrf GREEN
VTEP1(conf-vrf)# update-source-ip loopback 2
VTEP1(conf-vrf)# exit

VTEP1(config)# ip vrf RED
VTEP1(conf-vrf)# update-source-ip loopback 3
VTEP1(conf-vrf)# exit
```

3. Leak the server-connected networks to the tenant VRF to which the client is connected.

```
VTEP1(config)# ip route vrf GREEN 20.1.1.0/24 interface virtual-network 20
VTEP1(config)# ip route vrf GREEN 52.1.1.1/32 interface loopback 3
```

4. Leak the client-connected networks to the tenant VRF to which the server is connected.

```
VTEP1(config)# ip route vrf RED 10.1.1.0/24 interface virtual-network 10
VTEP1(config)# ip route vrf RED 51.1.1.1/32 interface loopback 2
```

VTEP2

1. Configure IP helper address specifying the DHCP server ip address in the client-connected virtual networks with the client-connected VRF name. For IPv6 DHCP helper address, specify the server VRF in the `helper-address` command.

```
VTEP2(config)# interface virtual-network 10
VTEP2(conf-if-vn-10)# ip helper-address 20.1.1.100 vrf GREEN
```

2. Configure loopback interfaces. Assign the loopback interfaces as source interfaces for the VRF.

```
VTEP2(config)# interface loopback 2
VTEP2(conf-if-lo-2)# ip vrf forwarding GREEN
VTEP2(conf-if-lo-2)# ip address 51.1.1.2/32
VTEP2(conf-if-lo-2)# exit

VTEP2(config)# interface loopback 3
VTEP2(conf-if-lo-3)# ip vrf forwarding RED
VTEP2(conf-if-lo-3)# ip address 52.1.1.2/32
VTEP2(conf-if-lo-3)# exit

VTEP2(config)# ip vrf GREEN
VTEP2(conf-vrf)# update-source-ip loopback 2
VTEP2(conf-vrf)# exit

VTEP2(config)# ip vrf RED
VTEP2(conf-vrf)# update-source-ip loopback 3
VTEP2(conf-vrf)# exit
```

3. Leak the server-connected networks to the tenant VRF to which the client is connected.

```
VTEP2(config)# ip route vrf GREEN 20.1.1.0/24 interface virtual-network 20
VTEP2(config)# ip route vrf GREEN 52.1.1.2/32 interface loopback 3
```

4. Leak the client-connected networks to the tenant VRF to which the server is connected.

```
VTEP2(config)# ip route vrf RED 10.1.1.0/24 interface virtual-network 10
VTEP2(config)# ip route vrf RED 51.1.1.2/32 interface loopback 2
```

Dynamic route leaking

Dynamic route leaking enables routes that are configured in the default or a nondefault VRF instance to be made available to another VRF instance. You can leak routes from a source VRF instance to a destination VRF instance.

OS10 supports leaking routes for static and dynamic routes. The leaked routes retain the type of the route, whether they are static, OSPF, BGP, or connected routes in the destination VRF. For example, leaked OSPF routes from one VRF are imported as OSPF routes in the destination VRF. You can use a route map for route filtering when importing routes to a VRF.

The routes must be leaked in both source and destination VRFs to achieve end-to-end traffic flow.

NOTE: Dell Technologies recommends configuring unique route targets in every VRF.

Restrictions for route leaking

- BFD attributes are not carried over to a leaked static route. If BFD removes a static route from the VRF that leaks the route, the leaked route is removed from the VRF that imports it. When the static route is restored in the VRF that leaks the route, the leaked route is restored in the VRF that imports it.
- Using route targets does not leak /32 prefixes on loopback interfaces. You can use static route leaking to leak /32 prefixes on loopback interfaces.
- The following lists the maximum number of leaked routes supported by the system with ECMP:
  - 4000 IPv4 routes and 2000 IPv6 routes with 64 ECMP paths.
  - 2000 IPv4 routes and 1000 IPv6 routes with 128 ECMP paths.

Table 56. Unsupported export and import route map attributes

Route map option	Attribute	Protocol
set	as-path	BGP
set	community	BGP
set	comm-list	BGP
set	tag	OSPF
set	extcommunity	BGP
set	extcomm-list	BGP
set	local-preference	BGP
set	origin	BGP
set	metric-type	BGP
set	weight	BGP
set	route-type local	BGP

Table 57. List of supported `set` attributes in a route map at export

Route map option	Attribute
set	ip next-hop
set	ipv6 next-hop
set	ip vrf next hop
set	ipv6 vrf next hop

Table 58. Supported match attributes for importing and exporting routes

Route map option	Attribute	Protocol
match	route-type	OSPF
match	tag	OSPF
match	ip	IP prefix list
match	ipv6	IPv6 prefix list
match	origin	BGP
match	metric	routes matched against route's metric
match	interface	routes matched against Source VRF egress interface of the domain
match	source-protocol	routes matched against Source Protocol

Table 59. Supported routing protocol attributes in leaked route

Attribute	Routing protocol
route-type	OSPF
tag	OSPF
origin	BGP
metric	OSPF

Prerequisites for dynamic route leaking

When BGP route is leaked from a parent VRF to child VRF, a BGP instance must be present in the child VRF for route leaking to work. This prerequisite is applicable to OSPF and EVPN routes as well.

Table 60. Behavior of dynamic route leaking feature

Protocol	Dynamic routing protocol instance configuration in parent VRF	Dynamic routing protocol instance configuration in child VRF	Behavior of dynamic route leaking feature

BGP	1. Configure route leaking from the default VRF to the child VRF, DELL.
	`! ip vrf default ip route-export 1:1 ! ip vrf dell ip route-import 1:1`
	2. Configure BGP instance in the default VRF.
	`! router bgp 100 ! neighbor 10.1.1.2 remote-as 100 no shutdown ! neighbour 100::2 remote-as 100 no shut !`
		Configure BGP instance in the child VRF.
		`! router bgp 100 ! vrf dell`
			When BGP instance is not configured in the child VRF, BGP routes in the default VRF are not leaked to the child VRF. However, when the child VRF is configured under router BGP, the leaked BGP routes are installed in the child routing table manager (RTM).
			NOTE:
			• An active BGP session is not required to honor the leaked BGP routes in the child VRF. Configuration of BGP instance in the child VRF is sufficient for the route leaking feature to install the BGP routes in RTM.
			• An active BGP session is required to redistribute leaked BGP routes in the child VRF.

OSPFv2	1. Configure route leaking from default VRF to the child VRF, DELL.
	`! ip vrf default ip route-export 1:1 ! ip vrf red ip route-import 1:1`
	2. Configure OSPF instance in the default VRF.
	`router ospf 10`
		Configure OSPF instance in the child VRF.
		`router ospf 11 vrf dell`
			In this scenario, when OSPF routes in the default VRF are leaked to the child VRF, they are not honored in the child VRF. When OSPF instance is configured in the child VRF, the leaked OSPF routes are installed in the child RTM.
			NOTE:
			• An active OSPF session is not required to honor the leaked OSPF routes in the child VRF. Configuration of OSPFv2 instance in the child VRF is sufficient for the route leaking feature to install the routes in RTM.
			• An active OSPF session is required to redistribute the leaked OSPF routes in the child VRF.

Table 60. Behavior of dynamic route leaking feature (continued)

Protocol	Dynamic routing protocol instance configuration in parent VRF	Dynamic routing protocol instance configuration in child VRF	Behavior of dynamic route leaking feature

OSPFv3	1. Configure route leaking from the default VRF to the child VRF, DELL.
	`! ip vrf default ip route-export 1:1 ! ip vrf red ip route-import 1:1`
	2. Configure OSPFv3 instance in the default VRF.
	`router ospfv3 10`
		Configure OSPFv3 instance in the child VRF.
		`router ospfv3 11 vrf dell`
			In this scenario, when OSPFv3 routes in the default VRF are leaked to the child VRF, the leaked routes are not honored in the child VRF. When OSPFv3 instance is configured in the child VRF, the leaked OSPFv3 routes are installed in the child RTM.
			NOTE:
			• An active OSPFv3 session is not required to honor the leaked OSPFv3 routes in the child VRF. Configuration of OSPFv3 instance in the child VRF is sufficient for the route leaking feature to install the routes in RTM.
			• An active OSPFv3 session is required to redistribute the leaked OSPFv3 routes in the child VRF.

EVPN	Configure route leaking from default VRF to the child VRF. `! ip vrf default ip route-export 1:1 ! ip vrf red ip route-import 1:1`	Configure a EVPN instance in the child VRF. `evpn ! vrf dell`	When a child VRF is configured under EVPN, the leaked EVPN routes are installed in the child RTM. **NOTE:** • Configuration of EVPN instance in the child VRF is sufficient for the route leaking feature to install the EVPN routes in RTM. • An active EVPN instance is required to redistribute leaked EVPN routes in the child VRF.

Route selection in the leaked VRF

- If a route is present in the local VRF and the same route is leaked from another VRF, OS10 prefers the route with the lowest administrative distance.
- If a route is present in the local VRF and the same route is leaked from another VRF with the same administrative distance, OS10 prefers the local route.
- When OS10 compares routes that are received from different sources, the software prefers routes with the lowest administrative distance. If the administrative distance is the same, the software prefers the route with lowest metric value. If the metric is also the same, the software prefers the local route, if available.
- If a VRF receives the same route from multiple VRFs, OS10 prefers the route that it received first. When the active route fails, OS10 applies the route that it received after the first route to the routing table.
- If a VRF receives the same route from multiple VRFs with the same route target values, OS10 prefers the route that it received first.
- If a VRF receives ECMP paths from another VRF, the VRF that receives the routes treats the routes as ECMP paths.

Redistribution of leaked routes

After you configure the system to leak routes from one VRF instance to another VRF instance, you can redistribute the leaked routes to the same routing protocol. The following lists the commands that you use for redistribution of leaked routes:

- Redistribute leaked BGP routes to BGP—Use the `redistribute imported-bgp-routes vrf vrf-name` command.
- Redistribute leaked OSPF routes to OSPF—Use the `redistribute imported-ospf-routes` command.
- Redistribute leaked BGP EVPN routes to the BGP peer—Use the `redistribute l2vpn evpn` command.

Leak all IPv4 routes from one VRF to another VRF

Use the following procedure to export (leak) all IPv4 routes from all routing protocols from one VRF instance to another VRF instance:

1. Enter the VRF from which you want to leak routes in CONFIGURATION mode.

   ```
   ip vrf source-vrf-name
   ```

2. Export all routes that belong to one VRF instance in VRF-CONFIGURATION mode.

   ```
   ip route-export route-target
   ```

3. Enter the VRF instance to which you want to leak routes in CONFIGURATION mode.

   ```
   ip vrf destination-vrf-name
   ```

4. Import routes from another VRF instance in VRF-CONFIGURATION mode using the same route target.

   ```
   ip route-import route-target
   ```

5. Export routes from the second VRF instance to the first VRF instance in VRF-CONFIGURATION mode using a different route target.

   ```
   ip route-import route-target
   ```

6. Import routes to the first VRF instance from the second VRF instance in VRF-CONFIGURATION mode using the same route target that you use to export from the second VRF instance.

   ```
   ip route-import route-target
   ```

Example - Leak all IPv4 routes

```
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2
```

Leak all IPv6 routes from one VRF to another VRF

Use the following procedure to export (leak) all IPv6 routes from all routing protocols from one VRF instance to another VRF instance:

1. Enter the VRF from which you want to leak routes in CONFIGURATION mode.

   ```
   ip vrf source-vrf-name
   ```

2. Export all routes that belong to one VRF instance in VRF-CONFIGURATION mode.

   ```
   ipv6 route-export route-target
   ```

3. Enter the VRF instance to which you want to leak routes in CONFIGURATION mode.

```
ip vrf destination-vrf-name
```

4. Import routes from another VRF instance in VRF-CONFIGURATION mode using the same route target.

```
ipv6 route-import route-target
```

5. Export routes from the second VRF instance to the first VRF instance in VRF-CONFIGURATION mode using a different route target.

```
ipv6 route-import route-target
```

6. Import routes to the first VRF instance from the second VRF instance in VRF-CONFIGURATION mode using the same route target that you use to export from the second VRF instance.

```
ip route-import route-target
```

Example - Leak all IPv6 routes

```
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2
```

Leak specific IPv4 routes from one VRF to another VRF

Use the following procedure to export (leak) specific IPv4 routes from one VRF instance to another VRF instance:

NOTE: You can apply a route map either at the source VRF instance or the destination VRF instance.

- Create a route map.

  ```
  route-map route-map-name
  ```

  Use any of the supported `match` or `set` attributes as required.
- Enter the VRF from which you want to leak routes in CONFIGURATION mode.

  ```
  ip vrf source-vrf-name
  ```

- Export all routes that belong to one VRF instance in VRF-CONFIGURATION mode.

  ```
  ip route-export route-target route-map route-map-name
  ```

  Or

  ```
  ipv6 route-export route-target route-map route-map-name
  ```

  Use any of the supported `match` or `set` attributes as required.
- Enter the VRF instance to which you want to leak routes in CONFIGURATION mode.

  ```
  ip vrf destination-vrf-name
  ```

- Import routes from another VRF instance in VRF-CONFIGURATION mode using the same route target.

  ```
  ip route-import route-target route-map route-map-name
  ```

  Or

  ```
  ipv6 route-import route-target route-map route-map-name
  ```

Use any of the supported `match` or `set` attributes as required.

- Export routes from the second VRF instance to the first VRF instance in VRF-CONFIGURATION mode using a different route target.

```
ip route-import route-target route-map route-map-name
```

Or

```
ipv6 route-import route-target route-map route-map-name
```

Use any of the supported `match` or `set` attributes as required.

- Import routes to the first VRF instance from the second VRF instance in VRF-CONFIGURATION mode using the same route target that you use to export from the second VRF instance.

```
ip route-import route-target route-map route-map-name
```

Or

```
ipv6 route-import route-target route-map route-map-name
```

Use any of the supported `match` or `set` attributes as required.

Example - Leak only IPv4 OSPF routes

In the following example, a route map exports only the external Type 2 OSPF routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_ospf
OS10(config-route-map)# match source-protocol ospf
OS10(config-route-map)# match route-type external type-2
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_ospf
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_ospf
```

Example - Leak only IPv6 OSPF routes

In the following example, a route map exports only the OSPF routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_ospf
OS10(config-route-map)# match source-protocol ospf
OS10(config-route-map)# match route-type external type-2
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_ospf
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_ospf
```

Example - Leak only IPv4 static routes

In the following example, a route map exports only the static routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_static
OS10(config-route-map)# match source-protocol static
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_static
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_static
```

Example - Leak only IPv6 static routes

In the following example, a route map exports only the static routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_static
OS10(config-route-map)# match source-protocol static
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_static
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_static
```

Example - Leak only IPv4 connected routes

In the following example, a route map exports only the connected routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_connected
OS10(config-route-map)# match source-protocol connected
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_connected
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_connected
```

Example - Leak only IPv6 connected routes

In the following example, a route map exports only the connected routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_connected
OS10(config-route-map)# match source-protocol connected
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_connected
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_connected
```

Example - Leak only IPv4 iBGP routes

In the following example, a route map exports only the iBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_iBGP
OS10(config-route-map)# match source-protocol bgp ibgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_iBGP
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_iBGP
```

Example - Leak only IPv6 iBGP routes

In the following example, a route map exports only the iBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_iBGP
OS10(config-route-map)# match source-protocol bgp ibgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_iBGP
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_iBGP
```

Example - Leak only IPv4 eBGP routes

In the following example, a route map exports only the eBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_eBGP
OS10(config-route-map)# match source-protocol bgp ebgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_eBGP
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_eBGP
```

Example - Leak only IPv6 eBGP routes

In the following example, a route map exports only the eBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_eBGP
OS10(config-route-map)# match source-protocol bgp ebgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_eBGP
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_eBGP
```

Example - Leak only IPv4 EVPN routes to the default VRF instance

In the following example, a route map exports only the EVPN routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_EVPN
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_EVPN
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip route-import 1:1
OS10(config)# ip route-export 2:2 route-map export_EVPN
```

Example - Leak only IPv6 EVPN routes to the default VRF instance

In the following example, a route map exports only the EVPN routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_EVPN
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_EVPN
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ipv6 route-import 1:1
OS10(config)# ipv6 route-export 2:2 route-map export_EVPN
```

Redistribute leaked routes from one VRF to another VRF

Use the following procedure to export (leak) and redistribute specific IPv4 routes from one VRF instance to another VRF instance:

- Create a route map.

  ```
  route-map route-map-name
  ```

  Use any of the supported `match` or `set` attributes as required.
- Enter the VRF from which you want to leak routes in CONFIGURATION mode.

  ```
  ip vrf source-vrf-name
  ```

- Export all routes that belong to one VRF instance in VRF-CONFIGURATION mode.

  ```
  ip route-export route-target [route-map route-map-name]
  ```

  Or

  ```
  ipv6 route-export route-target [route-map route-map-name]
  ```

  Use any of the supported `match` or `set` attributes as required.
- Enter the VRF instance to which you want to leak routes in CONFIGURATION mode.

  ```
  ip vrf destination-vrf-name]
  ```
- Import routes from another VRF instance in VRF-CONFIGURATION mode using the same route target.

  ```
  ip route-import route-target [route-map route-map-name]
  ```

  Or

  ```
  ipv6 route-import route-target [route-map route-map-name]
  ```

  Use any of the supported `match` or `set` attributes as required.
- Export routes from the second VRF instance to the first VRF instance in VRF-CONFIGURATION mode using a different route target.

  ```
  ip route-import route-target [route-map route-map-name]
  ```

  Or

  ```
  ipv6 route-import route-target [route-map route-map-name]
  ```

  Use any of the supported `match` or `set` attributes as required.
- Import routes to the first VRF instance from the second VRF instance in VRF-CONFIGURATION mode using the same route target that you use to export from the second VRF instance.

  ```
  ip route-import route-target [route-map route-map-name]
  ```

  Or

  ```
  ipv6 route-import route-target [route-map route-map-name]
  ```

  Use any of the supported `match` or `set` attributes as required.
- Redistribute leaked routes:
  - Redistribute leaked BGP routes in BGP-AF-CONFIGURATION mode.

    ```
    redistribute imported-bgp-routes vrf source-vrf-name [route-map rmap-name]
    ```
  - Redistribute leaked OSPF routes in ROUTER-OSPF-CONFIGURATION mode.

    ```
    redistribute imported-ospf-routes [route-map rmap-name]
    ```
  - Redistribute leaked EVPN routes in BGP-AF-CONFIGURATION mode.

    ```
    redistribute l2vpn evpn [route-map rmap-name]
    ```
  - Use the following command to redistribute leaked routes across routing protocols as available:

    ```
    redistribute {connected | bgp | ospf | static | l2vpn evpn}
    ```

  Use any of the supported `match` or `set` attributes as required.

Example - Redistribute leaked IPv4 OSPF routes from one VRF instance to the OSPF process of another VRF instance

In the following example, a route map exports only the OSPF routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_ospf
OS10(config-route-map)# match source-protocol ospf
OS10(config-route-map)# match route-type external type-2
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_ospf
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_ospf
OS10(conf-vrf)# exit
OS10(config)# router ospf 1 vrf vrf2
OS10(config-router-ospf-1)# redistribute imported-ospf-routes
```

Example - Redistribute leaked IPv6 OSPF routes from one VRF instance to the OSPF process of another VRF instance

In the following example, a route map exports only the OSPF routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_ospf
OS10(config-route-map)# match source-protocol ospf
OS10(config-route-map)# match route-type external type-2
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_ospf
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_ospf
OS10(conf-vrf)# exit
OS10(config)# router ospfv3 1 vrf vrf2
OS10(config-router-ospfv3-1)# redistribute imported-ospf-routes
```

Example - Redistribute leaked IPv4 iBGP routes from one VRF instance to the BGP process of another VRF instance

In the following example, a route map exports only the iBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_iBGP
OS10(config-route-map)# match source-protocol bgp ibgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_iBGP
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_iBGP
OS10(config)# router bgp 65000
OS10(config-router-bgp-65000)# vrf vrf2
OS10(config-router-bgp-65000-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute imported-bgp-routes vrf vrf1
```

Example - Redistribute leaked IPv6 iBGP routes from one VRF instance to the BGP process of another VRF instance

In the following example, a route map exports only the iBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_iBGP
OS10(config-route-map)# match source-protocol bgp ibgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_iBGP
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_iBGP
OS10(config)# router bgp 65000
OS10(config-router-bgp-65000)# vrf vrf2
OS10(config-router-bgp-65000-vrf)# address-family ipv6 unicast
OS10(configure-router-bgpv6-vrf-af)# redistribute imported-bgp-routes vrf vrf1
```

Example - Redistribute leaked IPv4 eBGP routes from one VRF instance to the BGP process of another VRF instance

In the following example, a route map exports only the eBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_eBGP
OS10(config-route-map)# match source-protocol bgp ebgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_eBGP
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# ip route-export 2:2 route-map export_eBGP
OS10(config)# router bgp 65000
OS10(config-router-bgp-65000)# vrf vrf2
OS10(config-router-bgp-65000-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute imported-bgp-routes vrf vrf1
```

Example - Redistribute leaked IPv6 eBGP routes from one VRF instance to the BGP process of another VRF instance

In the following example, a route map exports only the eBGP routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_eBGP
OS10(config-route-map)# match source-protocol bgp ebgp
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_eBGP
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip vrf vrf2
OS10(conf-vrf)# ipv6 route-import 1:1
OS10(conf-vrf)# ipv6 route-export 2:2 route-map export_eBGP
OS10(config)# router bgp 65000
OS10(config-router-bgp-65000)# vrf vrf2
OS10(config-router-bgp-65000-vrf)# address-family ipv6 unicast
OS10(configure-router-bgpv6-vrf-af)# redistribute imported-bgp-routes vrf vrf1
```

Example - Redistribute leaked IPv4 EVPN routes from one VRF instance to the BGP process of the default VRF instance

In the following example, a route map exports only the EVPN routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_EVPN
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ip route-export 1:1 route-map export_EVPN
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ip route-import 1:1
OS10(config)# ip route-export 2:2 route-map export_EVPN
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
```

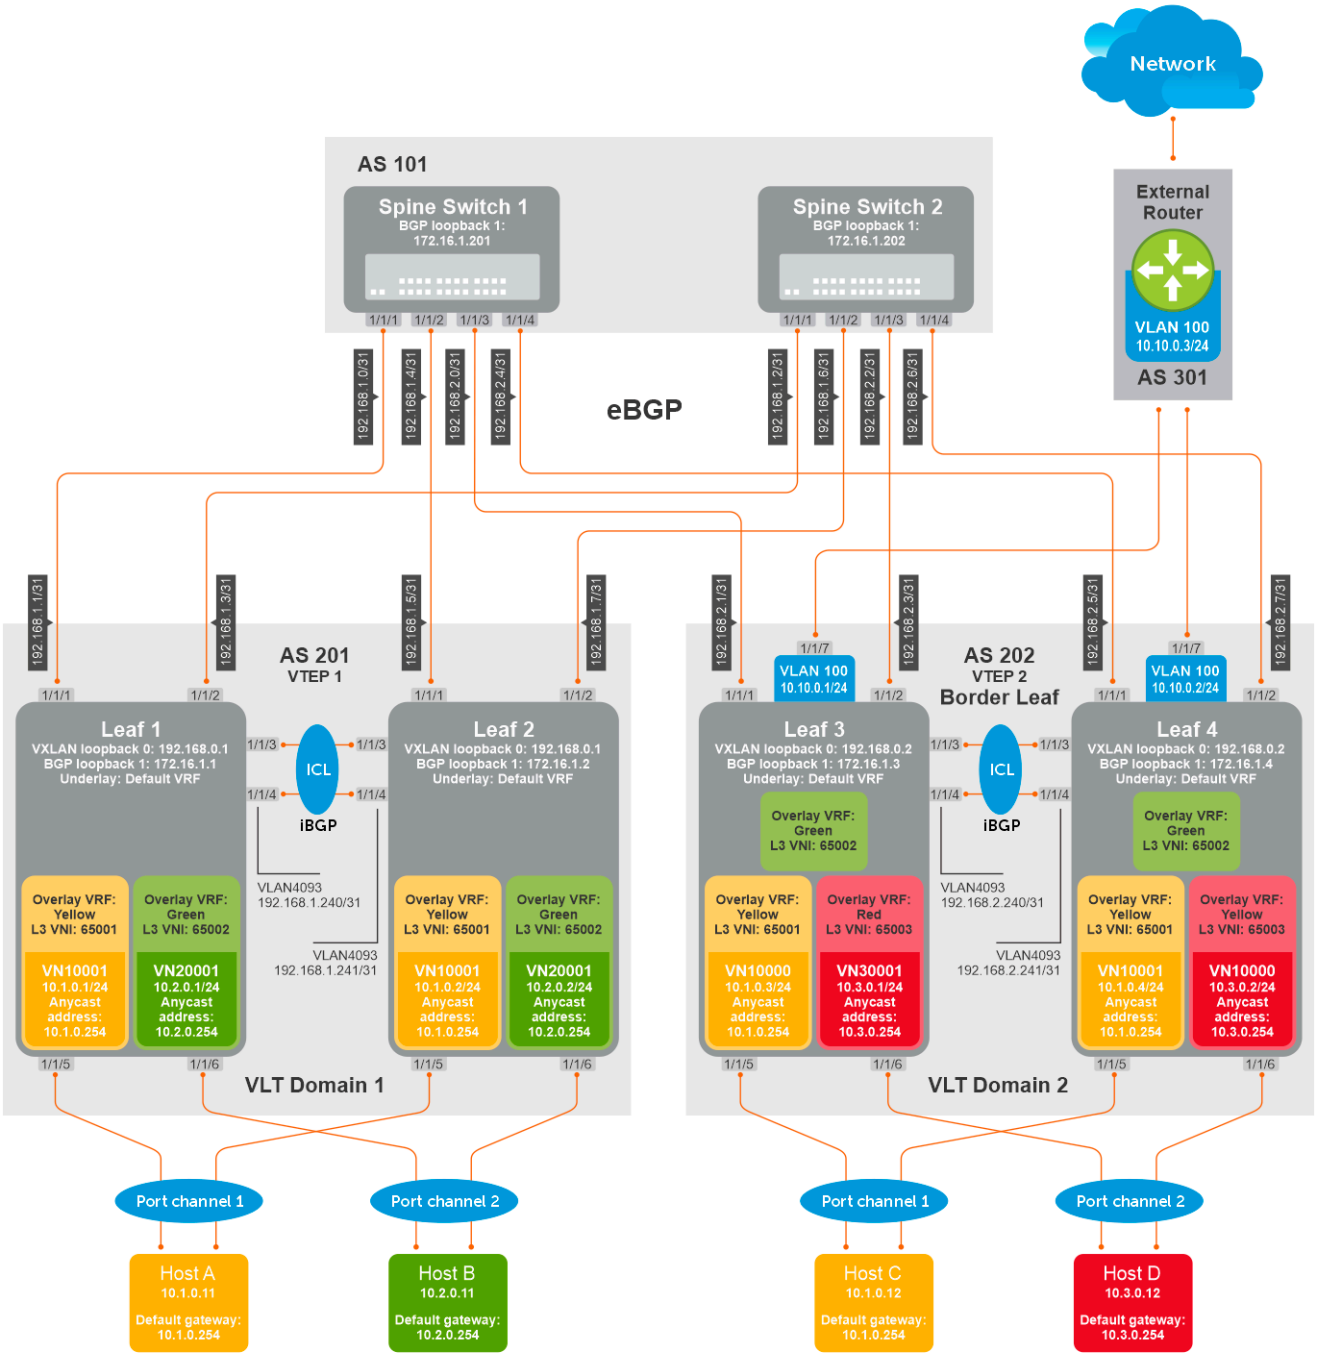
Example - Redistribute leaked IPv6 EVPN routes from one VRF instance to the BGP process of the default VRF instance

In the following example, a route map exports only the EVPN routes from `vrf1` and is received by `vrf2`.

```
OS10(config)# route-map export_EVPN
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map export_EVPN
OS10(conf-vrf)# ipv6 route-import 2:2
OS10(conf-vrf)# exit
OS10(config)# ipv6 route-import 1:1
OS10(config)# ipv6 route-export 2:2 route-map export_EVPN
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# address-family ipv6 unicast
OS10(configure-router-bgpv6-af)# redistribute l2vpn evpn
```

Example - Route leaking across VRFs in a VXLAN BGP EVPN symmetric IRB topology

The following VXLAN with BGP EVPN example uses a Clos leaf-spine topology to show how to set up route leaking across VRF in a symmetric IRB topology.



The following explains how the network is configured:

- All VTEPs perform symmetric IRB routing. In this example, all spine nodes are in one autonomous system and each VTEP in the leaf network belongs to a different autonomous system. Spine switch 1 is in AS 101. Spine switch 2 is in AS 101. For leaf nodes, VLT domain 1 is in AS 201; VLT domain 2 is in AS 202. VLT domain 2 is a border leaf VTEP.
- The individual switch configuration shows how to configure VRFs in the VTEPs and configure route leaking between VRFs. For other VXLAN and BGP EVPN configuration, see other examples and the VXLAN section.
- Route leaking is performed on the Border Leaf VTEP.
- There are three nondefault VRFs present in the network – Yellow, Green, and Red.

- Route leaking is done between:
  - VRF-Yellow and VRF-Green.
  - VRF-Yellow and VRF-Red.
  - VRF-Yellow and VRF-default (underlay with external router)

  NOTE: Route leaking is not performed between VRF-Green and VRF-Red.
- On VTEPs 1 and 2, two VRFs are present – VRF-Yellow and VRF-Green. VN10001 is part of VRF-Yellow and VN20001 is part of VRF-Green.
- On VTEPs 3 and 4, three VRFs are present – VRF-Yellow, VRF-Green and VRF-Red. VN10001 is part of VRF-Yellow and VN30001 is part of VRF-Red. VRF-Green does not have local VNs.
- On all VTEPs, symmetric IRB is configured in EVPN mode using a unique, dedicated VXLAN VNI, and Auto RD/RT values for each tenant VRF.
- On all VTEPs, the `disable-rt-asn` command is used to autoderive the RT that does not include the ASN in the RT value. This allows auto RT to be used even if there are separate ASNs for each leaf node.
- A VLAN to an external network is configured on VTEPs 3 and 4 in the VLT domain that serves as the border-leaf gateway.

Leaf 1 configuration

1. Configure VRFs Yellow and Green.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.1/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip vrf forwarding Green
OS10(conf-if-vn-20001)# ip address 10.2.0.1/24
OS10(conf-if-vn-20001)# ip virtual-router address 10.2.0.254
```

   NOTE: For creating the virtual-networks with access ports, check the relevant sections.

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# router-mac de:11:de:11:00:01
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
```

Leaf 2 configuration

1. Configure VRFs Yellow and Green.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
```

```
OS10(conf-if-vn-10001)# ip address 10.1.0.2/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip vrf forwarding Green
OS10(conf-if-vn-20001)# ip address 10.2.0.2/24
OS10(conf-if-vn-20001)# ip virtual-router address 10.2.0.254
```

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# router-mac de:11:de:11:00:02
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
```

Leaf3 configuration:

1. Configure VRFs Yellow, Green, and Red.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.3/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip vrf forwarding Red
OS10(conf-if-vn-30001)# ip address 10.3.0.1/24
OS10(conf-if-vn-30001)# ip virtual-router address 10.3.0.254
```

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# router-mac de:11:de:11:00:02
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
OS10(config-evpn)# vrf Red
OS10(config-evpn-vrf-Red)# vni 65003
OS10(config-evpn-vrf-Red)# route-target auto
OS10(config-evpn-vrf-Red)# advertise ipv4 connected
OS10(config-evpn-vrf-Red)# exit
```

4. Configure the border-leaf to advertise the default route into the EVPN in each VRF. From the other VTEPs, any traffic to an external network and also to networks which are not within the local VRF reaches the Border Leaf router using this default route.
   a. **If the border-leaf is already getting a default route from an external router for each VRF**: Advertise the BGP route using the `advertise ipv4 bgp` command for each VRF in the EVPN.

```
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 bgp
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 bgp
OS10(config-evpn-vrf-Green)# exit
```

   b. **If the border-leaf does not get a default route from an external router**: Configure a static null default route in each VRF and advertise it using `advertise ipv4 static` command for each VRF in the EVPN.

```
OS10(config)# ip route vrf Yellow 0.0.0.0/0 interface null 0
OS10(config)# ip route vrf Green 0.0.0.0/0 interface null 0
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 static
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 static
OS10(config-evpn-vrf-Green)# exit
```

5. (Optional) Configure route-maps with a prefix-list to leak selective routes from each VRF.

```
OS10(config)# ip prefix-list PrefixList_DefaultVrf_Export permit 10.10.0.0/24
OS10(config)# ip prefix-list PrefixList_YellowVrf_Export permit 10.1.0.0/24 le 32
OS10(config)# ip prefix-list PrefixList_GreenVrf_Export permit 10.2.0.0/24
OS10(config)# ip prefix-list PrefixList_RedVrf_Export permit 10.3.0.0/24
OS10(config)# route-map RouteMap_DefaultVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_DefaultVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_YellowVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_YellowVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_GreenVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_GreenVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_RedVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_RedVrf_Export
OS10(config-route-map)# exit
```

   NOTE: While leaking EVPN routes, only the subnet routes must be leaked. Host routes (/32) need not be leaked and could be blocked using route-maps. But, if you have certain VNs stretched on the border-leaf as well (like in Yellow VRF), you must leak the host routes as well.

6. Configure route leaking between:
   - `Yellow` VRF and `default` VRF.
   - `Yellow` VRF and `Green` VRF.
   - `Yellow` VRF and `Red` VRF.

```
OS10(config)# ip vrf default
OS10(conf-vrf)# ip route-export 0:0 route-map RouteMap_DefaultVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip route-export 1:1 route-map RouteMap_YellowVrf_Export
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# ip route-import 3:3
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip route-export 2:2 route-map RouteMap_GreenVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
```

```
OS10(conf-vrf)# ip route-export 3:3 route-map RouteMap_RedVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
```

7. (Optional) For advertising leaked routes from `Yellow` VRF only to an external router on the `default` VRF and not to an underlay network, use route-maps on spine-facing eBGP neighbors and also on the iBGP neighbor between the VLT peers.

```
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes deny 10.1.0.0/24 le
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes permit 0.0.0.0/0 le 32
OS10(config)#
OS10(config)# route-map RouteMap_Deny_YellowVrfRoutes
OS10(config-route-map)# match ip address prefix-list PrefixList_Deny_YellowVrfRoutes
OS10(config-route-map)#
OS10(config-route-map)# router bgp 202
OS10(config-router-bgp-202)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.0
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.2
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.241
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 10.10.0.3
OS10(config-router-neighbor)# remote-as 301
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

Leaf 4 configuration

1. Configure VRFs Yellow, Green, and Red.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.4/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip vrf forwarding Red
OS10(conf-if-vn-30001)# ip address 10.3.0.2/24
OS10(conf-if-vn-30001)# ip virtual-router address 10.3.0.254
```

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
```

```
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
OS10(config-evpn)# vrf Red
OS10(config-evpn-vrf-Red)# vni 65003
OS10(config-evpn-vrf-Red)# route-target auto
OS10(config-evpn-vrf-Red)# advertise ipv4 connected
OS10(config-evpn-vrf-Red)# exit
```

4. Configure a border-leaf to advertise the default route into the EVPN in each VRF. From the other VTEPs, any traffic to external network and also to networks which are not within the local VRF reaches the Border-Leaf router using this default route.
   a. **If the border-leaf is already getting a default route from an external router for each VRF**: Advertise the BGP route using the `advertise ipv4 bgp` command for each VRF in the EVPN.

```
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 bgp
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 bgp
OS10(config-evpn-vrf-Green)# exit
```

   b. **If the border-leaf does not get a default route from an external router**: Configure a static null default route in each VRF and advertise it using the `advertise ipv4 static` command for each VRF in the EVPN.

```
OS10(config)# ip route vrf Yellow 0.0.0.0/0 interface null 0
OS10(config)# ip route vrf Green 0.0.0.0/0 interface null 0
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 static
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 static
OS10(config-evpn-vrf-Green)# exit
```

5. (Optional) Configure route-maps with a prefix-list to leak selective routes from each VRF.

```
OS10(config)# ip prefix-list PrefixList_DefaultVrf_Export permit 10.10.0.0/24
OS10(config)# ip prefix-list PrefixList_YellowVrf_Export permit 10.1.0.0/24 le 32
OS10(config)# ip prefix-list PrefixList_GreenVrf_Export permit 10.2.0.0/24
OS10(config)# ip prefix-list PrefixList_RedVrf_Export permit 10.3.0.0/24
OS10(config)#
OS10(config)# route-map RouteMap_DefaultVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_DefaultVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_YellowVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_YellowVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_GreenVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_GreenVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_RedVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_RedVrf_Export
OS10(config-route-map)# exit
```

   NOTE: While leaking EVPN routes, only the subnet routes must be leaked. Host routes (/32) need not be leaked and could be blocked using route-maps. But, if you have certain VNs stretched on border leaf as well (like in Yellow VRF), you must leak the host routes as well.

6. Configure route leaking between:
   - `Yellow` VRF and `default` VRF.
   - `Yellow` VRF and `Green` VRF.
   - `Yellow` VRF and `Red` VRF.

```
OS10(config)# ip vrf default
OS10(conf-vrf)# ip route-export 0:0 route-map RouteMap_DefaultVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
```

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip route-export 1:1 route-map RouteMap_YellowVrf_Export
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# ip route-import 3:3
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip route-export 2:2 route-map RouteMap_GreenVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip route-export 3:3 route-map RouteMap_RedVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
```

7. (Optional) For advertising leaked routes from the `Yellow` VRF only to an external router in the default VRF and not to an underlay network, use route-maps on spine facing eBGP neighbors and also on the iBGP neighbor between the VLT peers.

```
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes deny 10.1.0.0/24 le 32
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes permit 0.0.0.0/0 le 32
OS10(config)#
OS10(config)# route-map RouteMap_Deny_YellowVrfRoutes
OS10(config-route-map)# match ip address prefix-list PrefixList_Deny_YellowVrfRoutes
OS10(config-route-map)#
OS10(config-route-map)# router bgp 202
OS10(config-router-bgp-202)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.4
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.5
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.240
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 10.10.0.3
OS10(config-router-neighbor)# remote-as 301
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

Verify leaked routes using show outputs on the the Border-Leaf switch:

```
OS10# show ip route vrf Yellow
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP, EV - EVPN BGP

```

Administrative distance for leaked routes

Routers use administrative distance (AD) to determine the best path between two or more routes to reach the same destination. AD indicates the reliability of the route; the lower the administrative distance, the more reliable the route.

If a local route exists in the destination VRF where route is being leaked, the local route is chosen as the best route. You can use the `set distance` command to configure AD for routes when they are exported from one VRF to another using a route-map. This command allows you to set AD of leaked routes to be of lower value so that the leaked routes are chosen over the local routes.

Restrictions and limitations

- The `set distance` command is effective in setting the administrative distance only when used with route-map while exporting routes.
- The `set distance` command does not take effect in the following scenarios:
  - When used with route-map while importing routes.
  - When redistributing routes using the `redistribute` or `network` command.

- When used as part of BGP neighbor-level route-map.
- If static route and dynamic protocol route are configured to have the same AD, both the routes will be active.

Configure administrative distance for leaked routes

1. Enter the VRF from which you want to leak routes in CONFIGURATION mode.

```
ip vrf source-vrf-name
```

2. Export all routes that belong to one VRF instance in VRF-CONFIGURATION mode.

   IPv4:

```
ip route-export route-target route-map route-map-name
```

   IPv6:

```
ipv6 route-export route-target route-map route-map-name
```

3. Create a route-map.

```
route-map rmap-name
```

4. Change the administrative distance for leaked routes in ROUTE-MAP mode.

```
set distance value
```

The following example shows configuration of administrative distance for routes that are exported from one VRF to another using a route-map:

```
OS10# configure terminal
OS10(config)# ip vrf vrf1
OS10(conf-vrf)# ipv6 route-export 1:1 route-map ExportOSPFBGProutes
OS10(conf-vrf)#exit
OS10(config)# route-map ExportOSPFBGProutes
OS10(config-route-map)# set distance 100
```

VRF commands

interface management

Adds a management interface to the management VRF instance.

Syntax	`interface management`
Parameters	None
Default	Not configured
Command Mode	VRF CONFIGURATION
Usage Information	The `no` version of this command removes the management interface from the management VRF instance.
Example	`OS10(config)# ip vrf management` `OS10(conf-vrf)# interface management`
Supported Releases	10.4.0E(R1) or later

ip domain-list vrf

Configures a domain list for the management VRF instance or any non-default VRF instance that you create.

Syntax `ip domain-list vrf {management | vrf-name} domain-names`

Parameters

- `management`—Enter the keyword `management` to configure a domain list for the management VRF instance.
- *`vrf-name`*—Enter the name of the non-default VRF instance to configure a domain list for that non-default VRF instance.
- *`domain-names`*—Enter the list of domain names.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the domain list configuration from the management or the non-default VRF instance.

Example

```
OS10(config)# ip domain-list vrf management dns1 dell.com
or
OS10(config)# ip domain-list vrf blue dns1 dell.com
```

Supported Releases 10.4.0E(R1) or later

ip domain-name vrf

Configures a domain name for the management VRF instance or any non-default VRF instance that you create.

Syntax `ip domain–name vrf {management | vrf-name} domain-name`

Parameters

- `management`—Enter the keyword `management` to configure a domain name for the management VRF instance.
- *`vrf-name`*—Enter the name of the non-default VRF instance to configure a domain name for that VRF instance.
- *`domain-name`*—Enter the domain name.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the domain name from the management or non-default VRF instance.

Example

```
OS10(config)# ip domain-name vrf management dell.com
or
OS10(config)# ip domain-name vrf blue dell.com
```

Supported Releases 10.4.0E(R1) or later

ip vrf

Create a non-default VRF instance.

Syntax `ip vrf vrf-name`

Parameters

- *`vrf-name`*—Enter the name of the non-default VRF that you want to create. Enter a VRF name that is not greater than 32 characters in length.

Default Not configured

Command Mode CONFIGURATION

Usage Information	Enter the `ip vrf vrf-name` command only in non-transaction-based configuration mode. Do not use transaction-based mode. You can create up to a maximum of 128 non-default VRF instances. The `no ip vrf vrf-name` command removes the non-default VRF instance that you specify.
Example	`OS10(config)# ip vrf vrf-test` `OS10(conf-vrf-test)#`
Supported Releases	10.4.1.0 or later

ip ftp vrf

Configures an FTP client for the management or non-default VRF instance.

Syntax	`ip ftp vrf {management | vrf vrf-name}`
Parameters	• `management` — Enter the keyword to configure an FTP client on the management VRF instance. • `vrf vrf-name` — Enter the keyword then the name of the VRF to configure an FTP client on that non-default VRF instance.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the management VRF instance configuration from the FTP client.
Example	`OS10(config)# ip ftp vrf management` `OS10(config)# ip ftp vrf vrf-blue`
Supported Releases	10.4.0E(R1) or later

ip host vrf

Configures a hostname for the management VRF instance or a non-default VRF instance and maps the hostname to an IPv4 or IPv6 address.

Syntax	`ip host vrf {management | vrf-name} hostname {IP-address | Ipv6-address}`
Parameters	• `management`—Enter the keyword `management` to configure a hostname for the management VRF instance. • *`vrf-name`*—Enter the name of the non-default VRF instance to configure a hostname for that VRF instance. • *`hostname`*—Enter the hostname. • *`IP-address | Ipv6-address`*—Enter the host IPv4 or IPv6 address.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the hostname from the management or non-default VRF instance.

Example	`OS10(config)# ip host vrf management dell 10.1.1.1`
	`or`
	`OS10(config)# ip host vrf blue dell 10.1.1.1`

Supported Releases	10.4.0E(R1) or later

ip http vrf

Configures an HTTP client for the management or non-default VRF instance.

Syntax `ip http vrf {management | vrf vrf-name}`

Parameters
- `management` — Enter the keyword to configure an HTTP client for the management VRF instance.
- `vrf vrf-name` — Enter the keyword then the name of the VRF to configure an HTTP client for that non-default VRF instance.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the management VRF instance configuration from the HTTP client.

Example

```
OS10(config)# ip http vrf management
OS10(config)# ip http vrf vrf-blue
```

Supported Releases 10.4.0E(R1) or later

ip name-server vrf

Configures a DNS name server for the management VRF instance or a non-default VRF instance.

Syntax `ip name-server vrf {management | vrf-name}`

Parameters
- `management`—Enter the keyword `management` to configure a DNS name server for the management VRF instance.
- *`vrf-name`*—Enter the name of the non-default VRF instance to configure a DNS name server for that VRF instance.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the name server from the management or non-default VRF instance.

Example

```
OS10(config)# ip name-server vrf management
or
OS10(config)# ip name-server vrf blue
```

Supported Releases 10.4.0E(R1) or later

ip route-import

Imports an IPv4 static route into a VRF instance from another VRF instance.

Syntax `[no] ip route-import route-target [route-map route-map-name]`

Parameters
- *`route-target`*—Enter the `route-target` of the nondefault VRF instance, from 1 to 65535.
- `route-map` *`route-map-name`*—Enter the name of the route map to filter IPv4 routes imported from a VRF.

Default Not configured

Command Mode VRF CONFIG

Usage Information You can import routes corresponding only to a nondefault or a default VRF instance. You cannot import routes that belong to a management VRF instance into another VRF instance.

To filter IPv4 routes imported from across VRFs, use a route map.

Use the `no` form of this command to remove the imported routes.

Example

```
OS10(conf-vrf)# ip route-import 1:1 ==> No route-map attached
```

```
OS10(conf-vrf)# ip route-import 1:1 route-map importOSPFBGProutes
```

Supported Releases 10.4.3.0 or later

ip route-export

Exports an IPv4 static route from one VRF instance to another.

Syntax `[no] ip route-export` *`route-target`* `[route-map` *`route-map-name`*`]`

Parameters

- *`route-target`*—Enter the `route-target` of the VRF instance.
- `route-map` *`route-map-name`*—(Optional) Enter the route-map name to specify the route-map.

Default Not configured

Command Mode VRF CONFIG

Usage Information You can export routes corresponding only to a nondefault or a default VRF instance. You cannot export routes that belong to a management VRF instance.

This command exports all routes from static, connected, BGP, OSPF, and EVPN routes in a VRF to another VRF. To export only a set of routes from a specific routing protocol, use the `match source-protocol` command.

Use the `no` form of this command to undo the configuration.

Example

```
OS10(config-vrf)# ip route-export 1:1 ==> No route-map attached
OS10(config-vrf)# ip route-export 1:1 route-map abc ==> Route-map abc
attached to filter export routes
```

```
OS10(conf-vrf)# ip route-export 1:1 route-map exportBGPEVPNroutes
OS10(config-vrf)# exit
OS10(config)# route-map exportBGPEVPNroutes
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config-route-map)# match source-protocol static
```

Supported Releases 10.4.3.0 or later

ipv6 route-import

Imports an IPv6 static route into a VRF instance from another VRF instance.

Syntax `[no] ipv6 route-import` *`route-target`* `[route-map` *`route-map-name`*`]`

Parameters

- *`route-target`*—Enter the `route-target` of the VRF instance.
- `route-map` *`route-map-name`*—Enter the name of the route map to filter IPv6 routes imported from a VRF.

Default Not configured

Command Mode VRF CONFIG

Usage Information You can import IPv6 routes corresponding only to a nondefault or a default VRF instance. You cannot import IPv6 routes that belong to a management VRF instance into another VRF instance.

To filter IPv6 routes imported from across VRFs, use a route map.

Use the `no` form of this command to remove the imported routes.

Example

```
OS10(conf-vrf)# ipv6 route-import 1:1 ==> No route-map attached
```

```
OS10(conf-vrf)# ipv6 route-import 1:1 route-map importOSPFBGProutes
```

Supported Releases 10.4.3.0 or later

ipv6 route-export

Exports an IPv6 static route from a VRF instance to another VRF instance.

Syntax `[no] ipv6 route-export route-target [route-map route-map-name]`

Parameters

- *route-target*—Enter the `route-target` of the VRF instance.
- `route-map` *route-map-name*—(Optional) Enter the route-map name to specify the route-map.

Default Not configured

Command Mode VRF CONFIG

Usage Information

You can export IPv6 routes corresponding only to a nondefault or a default VRF instance. You cannot export IPv6 routes that belong to a management VRF instance into another VRF instance.

This command exports all routes from static, connected, BGP, OSPF, and EVPN routes in a VRF to another VRF. To export only a set of routes from a specific routing protocol, use the `match source-protocol` command.

Use the `no` form of this command to undo the configuration.

Example

```
OS10(conf-vrf)# ipv6 route-export 1:1 ==> No route-map attached
OS10(conf-vrf)# ipv6 route-export 1:1 route-map abc ==> Route-map abc
attached to filter export routes
```

```
OS10(conf-vrf)# ipv6 route-export 1:1 route-map exportBGPEVPNroutes
OS10(config-vrf)# exit
OS10(config)# route-map exportBGPEVPNroutes
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config-route-map)# match source-protocol static
```

Supported Releases 10.4.3.0 or later

ip scp vrf

Configures an SCP connection for the management or non-default VRF instance.

Syntax `ip scp vrf {management | vrf vrf-name}`

Parameters

- `management` — Enter the keyword to configure an SCP connection for the management VRF instance.
- `vrf` *vrf-name* — Enter the keyword then the name of the VRF to configure an SCP connection for that VRF instance.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the management VRF instance configuration from the SCP client.

Example

```
OS10(config)# ip scp vrf management
OS10(config)# ip scp vrf vrf-blue
```

Supported Releases 10.4.0E(R1) or later

ip sftp vrf

Configures an SFTP client for the management or non-default VRF instance.

Syntax `ip sftp vrf {management | vrf vrf-name}`

Parameters

- `management` — Enter the keyword to configure an SFTP client for a management VRF instance.
- `vrf vrf-name` — Enter the keyword then the name of the VRF to configure an SFTP client for that non-default VRF instance.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the management VRF instance configuration from the SFTP client.

Example

```
OS10(config)# ip sftp vrf management
OS10(config)# ip sftp vrf vrf-blue
```

Supported Releases 10.4.0E(R1) or later

ip tftp vrf

Configures a TFTP client for the management or non-default VRF instance.

Syntax `ip tftp vrf {management | vrf vrf-name}`

Parameters

- `management` — Enter the keyword to configure a TFTP client for the management VRF instance.
- `vrf vrf-name` — Enter the keyword then the name of the VRF to configure a TFTP client for that non-default VRF instance.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the management VRF instance configuration from the TFTP client.

Example

```
OS10(config)# ip tftp vrf management
OS10(config)# ip tftp vrf vrf-blue
```

Supported Releases 10.4.0E(R1) or later

ip vrf management

Configures the management VRF instance.

Syntax `ip vrf management`

Parameters None

Default Not configured

Command Mode CONFIGURATION

Usage Information

Enter the `ip vrf management` command only in non-transaction-based configuration mode. Do not use transaction-based mode. The `no` version of this command removes the management VRF instance configuration.

Example

```
OS10(config)# ip vrf management
OS10(conf-vrf)#
```

Supported Releases

10.4.0E(R1) or later

match source-protocol

Matches the source routing protocol in a route map.

Syntax

```
match source-protocol {bgp {ebgp | evpn | ibgp} | connected | ospf |
static}
```

Parameters

- `bgp {ebgp | evpn | ibgp}`—Enter the BGP variant.
  - `ebgp`—Filters external BGP routes.
  - `evpn`—Filters EVPN BGP routes.
  - `ebgp`—Filters internal BGP routes.
- `connected`—Filters the connected routes.
- `ospf`—Filters OSPF routes.
- `static`—Filters static routes.

Default

None

Command Mode

ROUTE-MAP

Usage Information

Use this command to export only a set of routes from a specific routing protocol.

The `no` version of this command deletes a match.

Example

Route Map Configuration for BGP routes

```
OS10(config)# route-map match_protocol_bgp_all
OS10(config-route-map)# match source-protocol bgp evpn
OS10(config-route-map)# match source-protocol bgp ibgp
OS10(config-route-map)# match source-protocol bgp ebgp
```

Route Map Configuration for static routes

```
OS10(config)# route-map match_static_routes
OS10(config-route-map)# match source-protocol static
```

Route Map Configuration for connected routes

```
OS10(config)# route-map match_connected_routes
OS10(config-route-map)# match source-protocol connected
```

Route Map Configuration for OSPF routes

```
OS10(config)# route-map match_ospf_routes
OS10(config-route-map)# match source-protocol ospf
```

Supported Releases

10.5.2.0 or later

redistribute imported-bgp-routes

Redistributes leaked eBGP and iBGP routes from a VRF domain into the BGP session of another VRF domain.

Syntax `redistribute imported-bgp-routes vrf vrf-name [route-map route-map-name]`

Parameters
- `vrf vrf-name`—Enter the VRF instance from which to import routes.
- `route-map route-map-name`—Enter the route map name to filter the leaked BGP routes.

Defaults None

Command Mode BGP-AF

Usage Information Use this command with optional route maps to redistribute leaked BGP routes from one VRF to another VRF.

Examples

Redistribute leaked BGP IPv4 routes from VRF RED to VRF BLUE

```
OS10(config)# router bgp 65000
OS10(config-router-bgp-65000)# vrf BLUE
OS10(config-router-bgp-65000-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute imported-bgp-routes
vrf RED
```

Redistribute leaked eBGP IPv4 routes from VRF RED to VRF BLUE using a route map

```
OS10(config)# route-map match_source_bgp_ebgp
OS10(config-route-map)# match source-protocol bgp ebgp
OS10(config)# router bgp 65000
OS10(config-router-bgp-65000)# vrf BLUE
OS10(config-router-bgp-65000-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute imported-bgp-routes
vrf RED route-map match_source_bgp_ebgp
```

Redistribute leaked BGP IPv6 routes from VRF RED to VRF BLUE

```

OS10(configure-router-bgpv6-vrf-af)# redistribute imported-bgp-routes
vrf RED route-map match_source_bgp_ibgp
```

Supported Releases 10.5.2.0 or later

redistribute imported-ospf-routes

Redistributes leaked OSPF routes from all VRF domains into the OSPF session of another VRF domain.

Syntax `redistribute imported-ospf-routes [route-map route-map-name]`

Parameters
- `route-map route-map-name`—Enter the route map name to filter the leaked OSPF routes.

Defaults None

Command Mode OSPF-ROUTER

Usage Information

Redistribute leaked routes from all imported VRFs to another VRF with additional filtering using a route map.

There is no option to redistribute a specific leaked OSPF routes of a VRF.

Examples

Redistribute leaked OSPF IPv4 routes

```
OS10(config-router-ospf-1)# redistribute imported-ospf-routes
```

Redistribute leaked OSPF IPv4 external Type 2 routes using a route map

```
OS10(config)# route-map match_ospf_route_type
OS10(config-route-map)# match route-type external type-2
OS10(config-router-ospf-1)# redistribute imported-ospf-routes route-map
match_ospf_route_type
```

Redistribute leaked OSPF IPv6 routes

```
OS10(config-router-ospfv3-3)# redistribute imported-ospf-routes
```

Redistribute leaked OSPF IPv6 external Type 2 routes using a route map

```
OS10(config)# route-map match_ospf_route_type
OS10(config-route-map)# match route-type external type-2
OS10(config-router-ospfv3-3)# redistribute imported-ospf-routes route-
map match_ospf_route_type
```

Supported Releases

10.5.2.0 or later

redistribute l2vpn evpn

Redistributes L2VPN EVPN routes into BGP and OSPF IPv4/IPv6 routes.

Syntax

```
redistribute l2vpn evpn [route-map map name]
```

Parameters

- `route-map map-name` — (Optional) Filter the L2VPN EVPN routes that are redistributed in BGP and OSPF.

Default

None

Command Mode

ROUTER-BGPv4-AF, ROUTER-BGPv6-AF, ROUTER-OSPF, or ROUTER-OSPFv6

Usage Information

Use the `redistribute l2vpn evpn` command to redistribute the L2VPN EVPN routes learned in non-default tenant VRFs for BGP and or OSPF IPv4/IPv6 routing.

Example

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# vrf blue
OS10(conf-router-bgp-101-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
```

```
OS10(config)# router ospf 1 vrf GREEN
OS10(config-router-ospf-1)# redistribute l2vpn evpn

OS10(config)# router ospfv3 2 vrf GREEN
OS10(config-router-ospfv3-2)# redistribute l2vpn evpn
```

Supported Releases

10.5.1 or later

set distance

Sets the administrative distance (AD) for the routes, which are exported from one VRF to another using a route-map.

Syntax `[no] set distance value`

Parameters *value*—Enter a number to assign to routes, from 1 to 255.

Default None

Command Mode ROUTE-MAP

Security and Access netadmin, sysadmin, and secadmin

Usage Information Use this command when exporting routes from one VRF to another.

The `no` version of this command deletes the AD configuration.

Example

Setting AD for IPv4 routes

```
OS10(conf-vrf)# ip route-export 1:1 route-map ExportOSPFBGProutes
OS10(config)# route-map ExportOSPFBGProutes
OS10(config-route-map)# set distance 100
```

Setting AD for IPv6 routes

```
OS10(conf-vrf)# ipv6 route-export 1:1 route-map ExportOSPFBGProutes
OS10(config)# route-map ExportOSPFBGProutes
OS10(config-route-map)# set distance 100
```

Supported Releases 10.5.2.3 or later

show hosts vrf

Displays the host table in the management or non-default VRF instance.

Syntax `show hosts vrf {management | vrf-name}`

Parameters

- `management`—Enter the keyword management to display the host table in the management VRF instance.
- *vrf-name*—Enter the name of the non-default VRF instance to display the host table in that VRF instance.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show hosts vrf management
Default Domain Name : dell.com
Domain List : abc.com xyz.net
Name Servers : 10.16.126.1
================================================
       Static Host to IP mapping Table
================================================
Host                                  IP-Address
------------------------------------------------
google.com                        172.217.160.142
yahoo.com                          98.139.180.180
```

Supported Releases 10.4.0E(R1) or later

show ip vrf

Displays the VRF instance information.

Syntax

```
show ip vrf [management | vrf-name]
```

Parameters

- `management`—Enter the keyword `management` to display information corresponding to the management VRF instance.
- *`vrf-name`*—Enter the name of the non-default VRF instance to display information corresponding to that VRF instance.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip vrf
VRF-Name            Interfaces
default             Mgmt1/1/1
                    Eth1/1/1-1/1/2
                    Vlan1

management
```

```
OS10# show ip vrf management
VRF-Name            Interfaces
management
```

Supported Releases 10.4.0E(R1) or later

update-source-ip

Configures a source IP interface for any leaked route in a VRF instance.

Syntax

```
update-source-ip interface interface-id
```

To undo this configuration, use the `no update-source-ip` command.

Parameters

- `interface` *`interface-id`* — Enter the loopback interface identifier. The range is from 0 to 16383.

Default Not configured

Command Mode VRF CONFIGURATION

Example

```
OS10(conf-vrf)# update-source-ip loopback 1
```

Supported Releases 10.4.2E or later.

Bidirectional Forwarding Detection

The Bidirectional Forwarding Detection (BFD) protocol rapidly detects communication failures between two adjacent routers. BFD replaces link-state detection mechanisms in existing routing protocols. It also provides a failure detection solution for links with no routing protocols.

BFD provides forwarding-path failure detection in milliseconds instead of seconds. Because BFD is independent of routing protocols, it provides consistent network failure detection. BFD eliminates multiple protocol-dependent timers and methods. Networks converge is faster because BFD triggers link-state changes in the routing protocol sooner and more consistently.

BFD is a simple hello mechanism. Two neighboring routers running BFD establish a session using a three-way handshake. After the session is established, the routers exchange periodic control packets at subsecond intervals. If a router does not receive a hello packet within the specified time, routing protocols are notified that the forwarding path is down.

In addition, BFD sends a control packet when there is a state change or change in a session parameter. These control packets are sent without regard to transmit and receive intervals in a routing protocol.

BFD is an independent and generic protocol, which all media, topologies, and routing protocols can support using any encapsulation. OS10 implements BFD at Layer 3 (L3) and with User Datagram Protocol (UDP) encapsulation. BFD is supported on static and dynamic routing protocols, such as static route, OSPF, OSPFv3, and BGP.

The system displays BFD state change notifications.

NOTE:

- When you update the BFD interval from a dynamic protocol in shared session (for example, combination of RTM and OSPF or RTM and BGP), and then delete the same dynamic client or neighbor instance that is involved in the shared BFD session (BGP, OSPFv2, and OSPFv3), the last committed BFD timer from the dynamic protocol for the BFD session is retained.
- In an admin DOWN scenario between two BFD peers, BFD routes are not removed.

BFD session states

To establish a BFD session between two routers, enable BFD on both sides of the link. BFD routers can operate in both active and passive roles.

- The active router starts the BFD session. Both routers can be active in the same session.
- The passive router does not start a session. It only responds to a request for session initialization from the active router.

A BFD session can occur in Asynchronous and Demand modes. However, OS10 BFD supports only Asynchronous mode.

- In Asynchronous mode, both systems send periodic control messages at a specified interval to indicate that their session status is `Up`.
- In Demand mode, if one router requests Demand mode, the other router stops sending periodic control packets; it only sends a response to status inquiries from the Demand mode initiator. Either peer router, but not both, can request Demand mode at any time.

A BFD session can have four states: `Administratively Down`, `Down`, `Init`, and `Up`. The default BFD session state is `Down`.

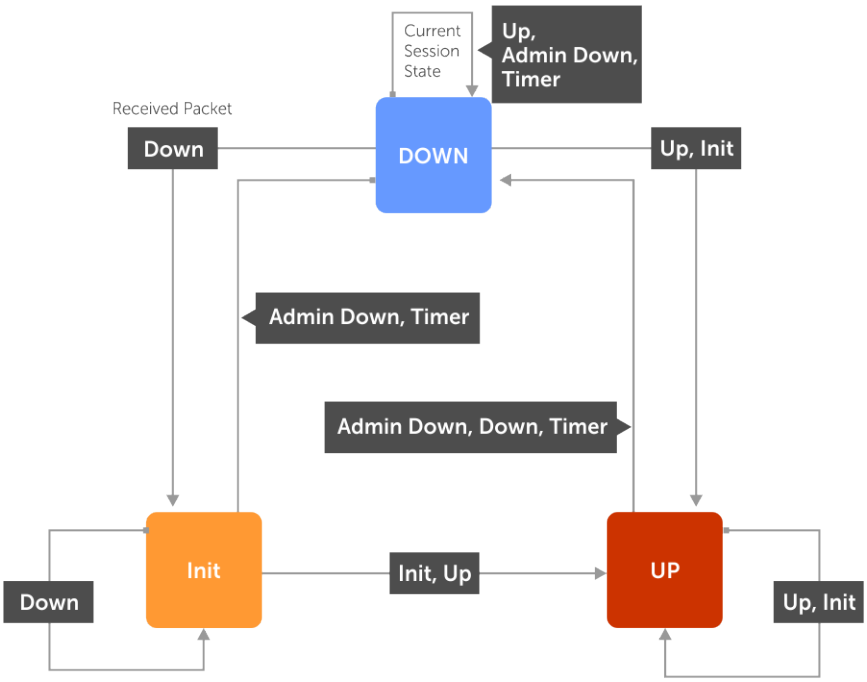
- `Administratively Down` — The local BFD router does not participate in the session.
- `Down` — The remote BFD router is not sending control packets or does not send them within the detection time for the session.
- `Init` — The local BFD outer is communicating to the remote router in the session.
- `Up` — Both BFD routers are sending control packets.

A BFD session's state changes to `Down` if:

- A control packet is not received within the detection time.
- Demand mode is active and a control packet is not received in response to a poll packet.

BFD session state changes example

The session state on a router changes according to the status notification it receives from the peer router. For example, if the current session state is `Down` and the router receives a `Down` status notification from the remote router, the session state on the local router changes to `Init`.



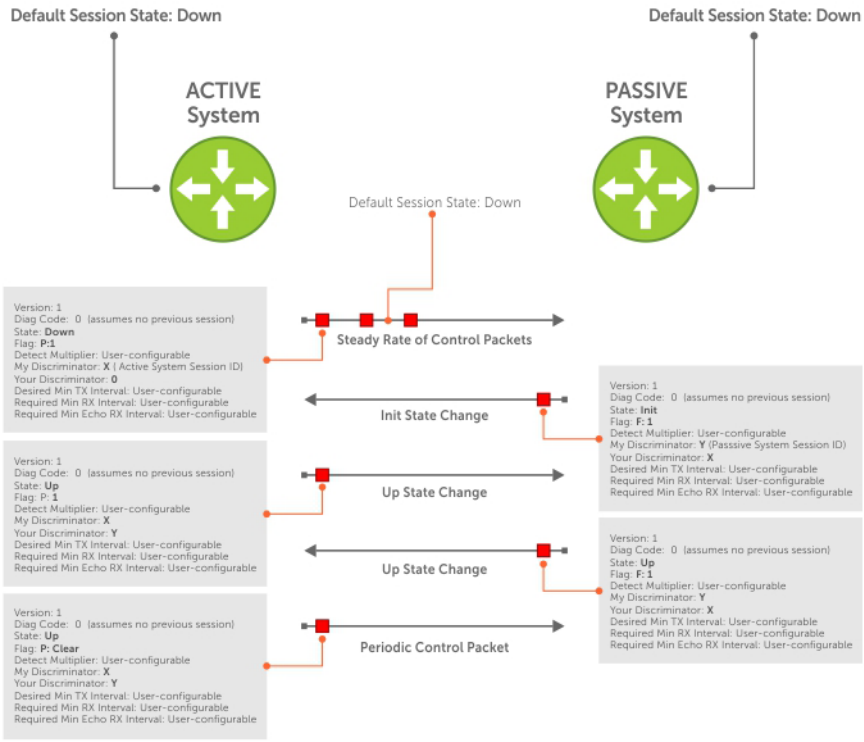
NOTE: BFD sessions flap when the node has multiple unresolved IPv6 PTP slaves and hence Dell Technologies recommends running one of the protocols in the node. This issue exists only with the IPv6 slaves.

BFD three-way handshake

A BFD session requires a three-way handshake between neighboring routers. In the following example, the handshake assumes:

- One router is active, and the other router is passive.
- This is the first session established on this link.
- The default session state on both ports is `Down`.

1. The active system sends a steady stream of control packets to indicate that its session state is `Down` until the passive system responds. These packets are sent at the desired transmit interval of the Active system. The `Your Discriminator` field is set to zero.
2. When the passive system receives a control packet, it changes its session state to `Init` and sends a response to indicate its state change. The response includes its session ID in the `My Discriminator` field and the session ID of the remote system in the `Your Discriminator` field.
3. The active system receives the response from the passive system and changes its session state to `Up`. It then sends a control packet to indicate this state change. Discriminator values exchange, and transmit intervals negotiate.
4. The passive system receives the control packet and changes its state to `Up`. Both systems agree that a session is established. However, because both members must send a control packet, which requires a response, whenever there is a state change or change in a session parameter, the passive system sends a final response indicating the state change. After this, periodic control packets exchange.



BFD configuration

Before you configure BFD for a routing protocol, first enable BFD globally on both routers in the link. BFD is disabled by default.

- OS10 does not support Demand mode, authentication, and Echo function.
- OS10 does not support BFD on multihop and virtual links.
- OS10 supports protocol liveness only for routing protocols.
- OS10 BFD is supported in default and nondefault VRF for the following protocols: Static route (v4 and v6), OSPFv2, OSPFv3, BGPv4, and BGPv6.

NOTE: Dell Technologies recommends that:

- For the S4100-ON series platform, you configure a BFD interval of 500 milliseconds with multiplier of 3 or higher for multidimensional scaled configurations.
- For other series switches, you configure a BFD interval of 200 milliseconds with a multiplier of 4 or higher for multidimensional scaled configurations.

Configure BFD globally

Before you configure BFD for static routing or a routing protocol, configure BFD globally on each router, including the global BFD session settings. BFD is disabled by default.

1. Configure the global BFD session parameters in CONFIGURATION mode.

```
bfd interval milliseconds min_rx milliseconds multiplier number role {active |
passive}
```

- `interval milliseconds` — Enter the time interval for sending control packets to BFD peers, from 50 to 1000. The default is 200. Dell Technologies recommends using more than 100 milliseconds.
- `min_rx milliseconds` — Enter the maximum waiting time for receiving control packets from BFD peers, from 50 to 1000. The default is 200. Dell Technologies recommends using more than 100 milliseconds.

- `multiplier number` — Enter the number of consecutive packets that must not be received from a BFD peer before the session state changes to `Down`, from 3 to 50. The default is 3.
- `role {active | passive}` — Enter `active` if the router initiates BFD sessions. Both BFD peers can be active at the same time. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session. The default is `active`.

2. Enable BFD globally in CONFIGURATION mode.

```
bfd enable
```

To verify that BFD is globally enabled, use the `show running-config bfd` command.

BFD global configuration

```
OS10(config)# bfd interval 250 min_rx 300 multiplier 4 role passive
OS10(config)# bfd enable
OS10(config)# do show running-config bfd
!
bfd enable
bfd interval 250 min_rx 300 multiplier 4 role passive
```

View information about active BFD neighbors

```
OS10#show bfd neighbors active

```

BFD for BGP

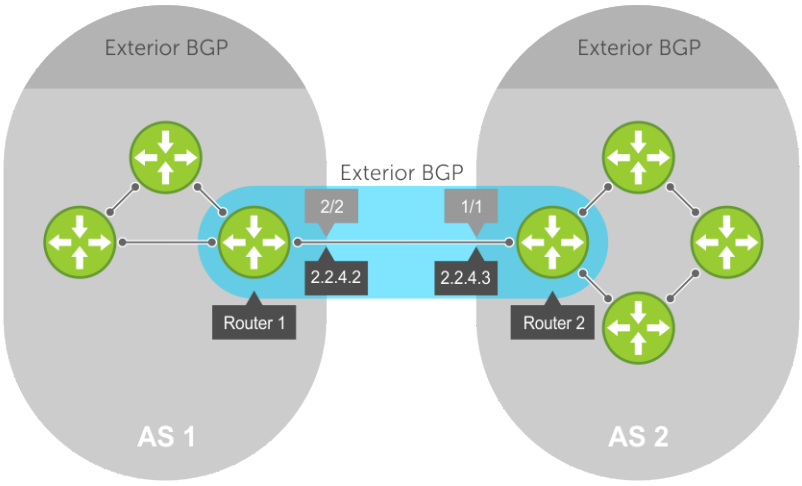
In a BGP core network, BFD enables faster network reconvergence. BFD rapidly detects communication failures in BGP fast-forwarding paths between internal BGP (iBGP) and external BGP (eBGP) peers. BFD for BGP is supported on physical, port-channel, and VLAN interfaces. BFD for BGP does not support the BGP multihop feature.

Before configuring BFD for BGP, first configure BGP on the interconnecting routers. For more information, see Border Gateway Protocol.

NOTE: When you clear the BGP instance or flaps VLT interconnect (VLTi) interface, the BFD sessions goes down and comes back up. This happens when the default timer is set to 200ms and multiplier as 3. You can avoid this by customizing the timer to 200ms and multiplier as 6.

BFD for BGP example

In this BFD for BGP configuration example, Router 1 and Router 2 use eBGP in a transit network to interconnect AS1 and AS2. The eBGP routers exchange information with each other and with iBGP routers to maintain connectivity and accessibility within each autonomous system.



When you configure a BFD session with a BGP neighbor, you can:

- Establish a BFD session with a specified BGP neighbor using the `neighbor` *`ip-address`* and `bfd` commands.
- Establish BFD sessions with all neighbors discovered by BGP using the `bfd all-neighbors` command.

For example:

Router 1

```
OS10(conf)# bfd enable
OS10(conf)# router bgp 1
OS10(config-router-bgp-1)# neighbor 2.2.4.3
OS10(config-router-neighbor)# bfd
OS10(config-router-neighbor)# no shutdown
OR
OS10(conf)# bfd enable
OS10(conf)# router bgp 1
OS10(config-router-bgp-1)# bfd all-neighbors interval 200 min_rx 200 multiplier 6 role
active
```

Router 2

```
OS10(conf)# bfd enable
OS10(conf)# router bgp 2
OS10(config-router-bgp-2)# neighbor 2.2.4.2
OS10(config-router-neighbor)# bfd
OS10(config-router-neighbor)# no shutdown
OR
OS10(conf)# bfd enable
OS10(conf)# router bgp 2
OS10(conf-router-bgp-2)# bfd all-neighbors interval 200 min_rx 200 multiplier 6 role
active
```

BFD packets originating from a router are assigned to the highest priority egress queue to minimize transmission delays. Incoming BFD control packets received from the BGP neighbor are assigned to the highest priority queue within the control plane policing (CoPP) framework to avoid BFD packets drops due to queue congestion.

BFD notifies BGP of any failure conditions that it detects on the link. BGP initiates recovery actions.

BFD for BGP is supported only on directly connected BGP neighbors and in both BGP IPv4 and IPV6 networks. A maximum of 100 simultaneous BFD sessions are supported.

If each BFD for BGP neighbor receives a BFD control packet within the configured BFD interval for failure detection, the BFD session remains up and BGP maintains its adjacencies. If a BFD for BGP neighbor does not receive a control packet within the detection interval, the router informs any clients of the BFD session, and other routing protocols, about the failure. It then depends on the routing protocol that uses the BGP link to determine the appropriate response to the failure condition. The normal response is to terminate the peering session for the routing protocol and reconverge by bypassing the failed neighboring router. A log message generates whenever BFD detects a failure condition.

Configure BFD for BGP

OS10 supports BFD sessions with IPv4 or IPv6 BGP neighbors using the default and nondefault VRF. When you configure BFD for BGP, you can enable BFD sessions with all BGP neighbors that BGP discovered or with a specified neighbor.

1. Configure BFD session parameters and enable BFD globally on all interfaces in CONFIGURATION mode as described in Configure BFD globally.

   ```
   bfd interval milliseconds min_rx milliseconds multiplier number role {active |
   passive}
   bfd enable
   ```

2. Enter the AS number of a remote BFD peer in CONFIGURATION mode, from 1 to 65535 for a 2-byte AS number and from 1 to 4294967295 for a 4-byte AS number. Only one AS number is supported per system. If you enter a 4-byte AS number, 4-byte AS support enables automatically.

   ```
   router bgp as-number
   ```

3. Enter the IP address of a BFD peer in ROUTER-BGP mode. Enable a BFD session and the BGP link in ROUTER-NEIGHBOR mode. The global BFD session parameters that are configured in Step 1 are used.

   ```
   neighbor ip-address
     bfd
     no shutdown
   ```

   OR

   Configure BFD sessions with all neighbors discovered by the BGP in ROUTER-BGP mode. The BFD session parameters that you configure override the global session parameters configured in Step 1.

   ```
   bfd all-neighbors [interval milliseconds min_rx milliseconds multiplier number role
   {active | passive}]
   ```

   - `interval milliseconds`—Enter the time interval for sending control packets to BFD peers, from 100 to 1000; default 200. Dell Technologies recommends using more than 100 milliseconds.
   - `min_rx milliseconds`—Enter the maximum waiting time for receiving control packets from BFD peers, from 100 to 1000; default 200. Dell Technologies recommends using more than 100 milliseconds.
   - `multiplier number`—Enter the maximum number of consecutive packets that are not received from a BFD peer before the session state changes to `Down`, from 3 to 50; default 3.
   - `role {active | passive}`—Enter `active` if the router initiates BFD sessions. Both BFD peers can be active simultaneously. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session. The default is `active`.

   To ignore the configured `bfd all-neighbors` settings for a specified neighbor, enter the `bfd disable` command in ROUTER-NEIGHBOR mode.

   OR

   Enter a BGP template with neighborhood name in ROUTER-BGP mode. Configure BFD sessions with all neighbors which inherit the template in ROUTER-TEMPLATE mode. For more information about how to use BGP templates, see Peer templates. The global BFD session parameters that are configured in Step 1 are used.

   ```
   template template-name
     bfd
     no shutdown
   ```

4. Verify the BFD for BGP configuration in EXEC mode.

   ```
   show bfd neighbors [detail]
   ```

BFD for BGP all-neighbors configuration

```
OS10(conf)# bfd interval 200 min_rx 200 multiplier 6 role active
OS10(conf)# bfd enable
OS10(conf)# router bgp 4
```

```
OS10(config-router-bgp-4)# bfd all-neighbors interval 200 min_rx 200 multiplier 6 role
active
```

BFD for BGP single-neighbor configuration

```
OS10(conf)# bfd interval 200 min_rx 200 multiplier 6 role active
OS10(conf)# bfd enable
OS10(conf)# router bgp 1
OS10(config-router-bgp-1)# neighbor 150.150.1.1
OS10(config-router-neighbor)# bfd
OS10(config-router-neighbor)# no shutdown
```

BFD for BGP template configuration

```
OS10(config)# router bgp 300
OS10(config-router-bgp-300)# template ebgppg
OS10(config-router-template)# bfd
OS10(config-router-template)# exit
OS10(config-router-bgp-300)# neighbor 3.1.1.1
OS10(config-router-neighbor)# inherit template ebgppg
OS10(config-router-neighbor)# no shutdown
```

Display BFD operation

```

```

BFD for OSPF

You can configure BFD to monitor and notify reachability status between OSPF neighbors. When you use BFD with OSPF, BFD sessions are established between all neighboring interfaces participating with OSPF full state. If a neighboring interface fails, BFD notifies OSPF protocol that a link state change has occurred.

To configure BFD for OSPF:

1. Enable BFD Globally.
2. Configure OSPF on the interconnecting routers. For more information, see Open Shortest Path First (OSPFv2 and OSPFv3).

Enable BFD Globally

To enable BFD globally:

Enable BFD globally.

```
bfd enable
```

CONFIGURATION Mode

Establishing BFD sessions with OSPFv2 neighbors

You can establish BFD sessions with all OSPF neighbors at one go. Alternatively, you can also establish BFD sessions with OSPF neighbors corresponding to a single OSPF interface.

To establish BFD sessions with OSPFv2 neighbors:

1. Enable BFD globally

   ```
   bfd enable
   ```

CONFIGURATION Mode

2. Enter ROUTER-OSPF mode
   `router ospf ospf-instance`
   CONFIGURATION Mode
3. Establish sessions with all OSPFv2 neighbors.
   `bfd all-neighbors`
   ROUTER-OSPF Mode
4. Enter INTERFAC E CONFIGURATION mode.
   `interface interface-name`
   CONFIGURATION Mode
5. Establish BFD sessions with OSPFv2 neighbors corresponding to a single OSPF interface.
   `ip ospf bfd all-neighbors`
   INTERFACE CONFIGURATION Mode

Establishing BFD sessions with OSPFv2 neighbors in a non-default VRF instance

To establish BFD sessions with OSPFv2 neighbors in a non-default VRF instance:

1. Enable BFD globally
   `bfd enable`
   CONFIGURATION Mode
2. Enter INTERFACE CONFIGURATION mode
   `interface interface-name`
   CONFIGURATION Mode
3. Associate a non-default VRF with the interface you have entered.
   `ip vrf forwarding vrf1`
   INTERFACE CONFIGURATION Mode
4. Assign an IP address to the VRF.
   `ip address ip-address`
   VRF CONFIGURATION Mode
5. Attach the interface to an OSPF area.
   `ip ospf ospf-instance area area-address`
   VRF CONFIGURATION Mode
6. Establish BFD session with OSPFv2 neighbors in a single OSPF interface in a non-default VRF instance.
   `ip ospf bfd all-neoghbors`
   VRF CONFIGURATION Mode
7. Enter ROUTER-OSPF mode in a non-default VRF instance.
   `router ospf ospf-instance vrf vrf-name`
8. Establish BFD sessions with all OSPFv2 instances in a non-default VRF.
   `bfd all-neighbors`

```
OS10# show running-configuration ospf
!
interface vlan200
 no shutdown
 ip vrf forwarding red
 ip address 20.1.1.1/24
 ip ospf 200 area 0.0.0.0
 ip ospf bfd all-neighbors disable
!
interface vlan300
 no shutdown
```

```
 ip vrf forwarding red
 ip address 30.1.1.1/24
 ip ospf 200 area 0.0.0.0
!
router ospf 200 vrf red
 bfd all-neighbors
 log-adjacency-changes
 router-id 2.3.3.1
!
```

In this example OSPF is enabled in non-default VRF red. BFD is enabled globally at the router OSPF level and all the interfaces associated with this VRF OSPF instance inherit the global BFD configuration. However, this global BFD configuration does not apply to interfaces in which the interface level BFD configuration is already present. Also, VLAN 200 takes the interface level BFD configuration as interface-level BFD configuration takes precedent over the global OSPF-level BFD configuration.

Changing OSPFv2 BFD session parameters

Configure BFD sessions with default intervals and a default role.

The parameters that you can configure are: desired tx interval, required min rx interval, detection multiplier, and system role. Configure these parameters for all OSPF sessions or all OSPF sessions on a particular interface. If you change a parameter globally, the change affects all OSPF neighbors sessions. If you change a parameter at the interface level, the change affects all OSPF sessions on that interface.

NOTE: By default, OSPF uses the following BFD parameters for it's neighbors: min_tx = 200 msec, min_rx = 200 msec, multiplier = 3, role = active. If BFD is configured under interface context, that will be given high priority.

To change parameters for all OSPFv2 sessions or for OSPF sessions on a single interface, use the following commands:

1. Change parameters for OSPF sessions.

   ```
   bfd all-neighbors interval milliseconds min_rx milliseconds multiplier value role [active | passive]
   ```

   ROUTER-OSPF Mode
2. Change parameters for all OSPF sessions on an interface.

   ```
   ip ospf bfd all-neighbors interval milliseconds min_rx milliseconds multiplier value role [active | passive]
   ```

   INTERFACE CONFIGURATION Mode

Disabling BFD for OSPFv2

If you disable BFD globally, all sessions are torn down and sessions on the remote system are placed in a Down state. If you disable BFD on an interface, sessions on the interface are torn down and sessions on the remote system are placed in a Down state. Disabling BFD does not trigger a change in BFD clients; a final Admin Down packet is sent before the session is terminated.

To disable BFD sessions, use the following commands:

1. Disable BFD sessions with all OSPF neighbors.

   ```
   no bfd all-neighbors
   ```

   ROUTER-OSPF Mode
2. Disable OSPFv2 at interface level using the following command:

   ```
   ip ospf bfd all-neighbors disable
   ```

   INTERFACE CONFIGURATION Mode

To re-enable BFD, disabled the interface alone using the following commands:

- `no ip ospf bfd all-neighbors command`
- `ip ospf bfd all-neighbors`

Configure BFD for OSPFv3

BFD for OSPFv3 provides support for IPv6:

1. Enable BFD Globally.
2. Establish sessions with OSPFv3 neighbors.

Establishing BFD sessions with OSPFv3 neighbors

To establish BFD sessions with OSPFv3 neighbors:

1. Enable BFD globally
   `bfd enable`
   CONFIGURATION Mode
2. Enter ROUTER-OSPF mode
   `router ospfv3 ospfv3-instance`
   CONFIGURATION
3. Establish sessions with all OSPFv3 neighbors.
   `bfd all-neighbors`
   ROUTER-OSPFv3 Mode
4. Enter INTERFAC E CONFIGURATION mode.
   `interface interface-name`
   CONFIGURATION Mode
5. Establish BFD sessions with OSPFv3 neighbors corresponding to a single OSPF interface.
   `ipv6 ospf bfd all-neighbors`
   INTERFACE CONFIGURATION Mode

Establishing BFD sessions with OSPFv3 neighbors in a non-default VRF instance

To establish BFD sessions with OSPFv3 neighbors in a non-default VRF instance:

1. Enable BFD globally
   `bfd enable`
   CONFIGURATION Mode
2. Enter INTERFACE CONFIGURATION mode
   `interface interface-name`
   CONFIGURATION Mode
3. Associate a non-default VRF with the interface you have entered.
   `ip vrf forwarding vrf1`
   INTERFACE CONFIGURATION Mode
4. Assign an IP address to the VRF.
   `ip address ip-address`
   VRF CONFIGURATION Mode
5. Attach the interface to an OSPF area.
   `ipv6 ospf ospf-instance area area-address`
   VRF CONFIGURATION Mode
6. Establish BFD session with OSPFv3 neighbors in a single OSPF interface in a non-default VRF instance.
   `ipv6 ospf bfd all-neoghbors`
   VRF CONFIGURATION Mode
7. Enter ROUTER-OSPF mode in a non-default VRF instance.
   `router ospf ospf-instance vrf vrf-name`
   CONFIGURATION Mode
8. Establish BFD sessions with all OSPFv2 instances in a non-default VRF.
   `bfd all-neighbors`

Changing OSPFv3 session parameters

Configure BFD sessions with default intervals and a default role.

The parameters that you can configure are: desired tx interval, required min rx interval, detection multiplier, and system role. Configure these parameters for all OSPFv3 sessions or all OSPFv3 sessions on a particular interface. If you change a parameter globally, the change affects all OSPFv3 neighbors sessions. If you change a parameter at the interface level, the change affects all OSPF sessions on that interface.

NOTE: By default, OSPF uses the following BFD parameters for it's neighbors: min_tx = 200 msec, min_rx = 200 msec, multiplier = 3, role = active. If BFD is configured under interface context, that will be given high priority.

To change parameters for all OSPFv3 sessions or for OSPF sessions on a single interface, use the following commands:

1. Change parameters for OSPF sessions.

   ```
   bfd all-neighbors interval milliseconds min_rx milliseconds multiplier value role [active | passive]
   ```

   ROUTER-OSPFv3 Mode
2. Change parameters for all OSPF sessions on an interface.

   ```
   ipv6 ospf bfd all-neighbors interval milliseconds min_rx milliseconds multiplier value role [active | passive]
   ```

   INTERFACE CONFIGURATION Mode

Disabling BFD for OSPFv3

If you disable BFD globally, all sessions are torn down and sessions on the remote system are placed in a Down state. If you disable BFD on an interface, sessions on the interface are torn down and sessions on the remote system are placed in a Down state. Disabling BFD does not trigger a change in BFD clients; a final Admin Down packet is sent before the session is terminated.

To disable BFD sessions, use the following commands:

1. Disable BFD sessions with all OSPF neighbors.

   ```
   no bfd all-neighbors
   ```

   ROUTER-OSPFv3 Mode
2. Disable BFD sessions with all OSPF neighbors on an interface.

   ```
   ipv6 ospf bfd all-neighbors disable
   ```

   INTERFACE CONFIGURATION Mode

To re-enable BFD, disabled the interface alone using the following commands:

- `no ipv6 ospf bfd all-neighbors command`
- `ipv6 ospf bfd all-neighbors`

BFD for Static routes

The static route BFD feature enables association of static routes with a BFD session to monitor the static route reachability. Depending on the status of the BFD session, the static routes are added to or deleted from the Routing Information Base (RIB). When you configure BFD, next-hop reachability depends on the BFD state of the BFD session corresponding to the specified next hop. If the BFD session of the configured next hop is down, the static route is not installed in the RIB.

The BFD session must be up for the static route. You must configure BFD on both the peers pointing to its neighbor as the next hop. There is no dependency on the configuration order of the static route and BFD configuration. You can configure BFD for all static routes or for specific static routes. OS10 supports BFD for both IPv4 and IPv6 static routes.

Enable BFD for all static routes

Configuring BFD for static routes is a three-step process:

1. Enable BFD globally.
2. Configure static routes on both routers on the system (either local or remote). Configure the static route in such a way that the next-hop interfaces point to each other.

3. Configure BFD for static route using the `ip route bfd` command.

Establishing BFD Sessions for IPv4 Static Routes

Sessions are established for all neighbors that are the next hop of a static route.

To establish a BFD session, use the following command.

Establish BFD sessions for all neighbors that are the next hop of a static route.

`ip route bfd [interval interval min_rx min_rx multiplier value role {active | passive}]`

CONFIGURATION Mode

Enter the time interval for sending and receiving BFD control packets from 50 to 1000.

Establishing BFD Sessions for IPv4 Static Routes in a non-default VRF instance

To establish a BFD session for IPv4 static routes in a non-default VRF instance, use the following command.

Establish BFD sessions for all neighbors that are the next hop of a static route.

`ip route bfd [vrf vrf-name] [interval interval min_rx min_rx multiplier value role {active | passive}]`

CONFIGURATION Mode

Enter the time interval for sending and receiving BFD control packets from 50 to 1000.

Changing IPv4 static route session parameters

Configure BFD sessions with default intervals and a default role.

Configure the following for all static routes:

- Desired TX Interval
- Required Min RX Interval
- Detection Multiplier
- system role

These parameters are configured for all static routes. If you change a parameter, the change affects all sessions for static routes. To change parameters for static route sessions, use the following command.

- Change the parameters for all static route sessions in CONFIGURATION mode.

  `ip route bfd interval milliseconds min_rx milliseconds multiplier value role [active | passive]`

  Enter the time interval for sending and receiving BFD control packets; from 50 to 1000.

  NOTE: By default, OSPF uses the following BFD parameters for its neighbors: min_tx = 200 msec, min_rx = 200 msec, multiplier = 3, role = active.

Disabling BFD for IPv4 Static Routes

If you disable BFD, all static route BFD sessions are torn down.

A final Admin Down packet is sent to all neighbors on the remote systems, and those neighbors change to the Down state. To disable BFD for IPv4 static routes, use the following command.

Disable BFD for static routes.

`no ip route bfd`

CONFIGURATION Mode

Establishing BFD Sessions for IPv6 Static Routes

To establish a BFD session for IPv6 static routes, use the following command.

Establish BFD sessions for all neighbors that are the next hop of a static route.

```
ipv6 route bfd [interval interval min_rx min_rx multiplier value role {active | passive}]
```

CONFIGURATION Mode

Enter the time interval for sending and receiving BFD control packets from 50 to 1000.

NOTE: By default, OSPF uses the following BFD parameters for it's neighbors: min_tx = 200 msec, min_rx = 200 msec, multiplier = 3, role = active. The values are configured in milliseconds

Establishing BFD Sessions for IPv6 Static Routes in a non-default VRF instance

To establish a BFD session for IPv6 static routes in a non-default VRF instance, use the following command.

Establish BFD sessions for all neighbors that are the next hop of a static route.

```
ipv6 route bfd [vrf vrf-name] [interval interval min_rx min_rx multiplier value role
{active | passive}]
```

CONFIGURATION Mode

Enter the time interval for sending and receiving BFD control packets from 50 to 1000.

NOTE: By default, OSPF uses the following BFD parameters for it's neighbors: min_tx = 200 msec, min_rx = 200 msec, multiplier = 3, role = active. The values are configured in milliseconds

Changing IPv6 static route session parameters

To change parameters for IPv6 static route sessions:

- Change the parameters for all static route sessions in CONFIGURATION mode.

  ```
  ipv6 route bfd interval milliseconds min_rx milliseconds multiplier value role [active |
  passive]
  ```

  Enter the time interval for sending and receiving BFD control packets; from 50 to 1000.

  NOTE: By default, OSPF uses the following BFD parameters for its neighbors: min_tx = 200 msec, min_rx = 200 msec, multiplier = 3, role = active.

Enable BFD for specific static routes

To enable BFD for specific static routes:

- Configure static routes on both local and remote routers. Configure static route in such a way that the next-hop interfaces point to each other.
- Configure BFD for a specific IPv4 static route using the following command in CONFIGURATION mode:

  ```
  ip route [vrf vrf-name] dest-ip-prefix mask {next-hop [interface interface-type]
  [route-preference]} bfd
  ```

- Configure BFD for a specific IPv6 static route using the following command in CONFIGURATION mode:

  ```
  ipv6 route [vrf vrf-name] dest-ipv6-prefix mask {next-hop [interface interface-type]
  [route-preference]}  bfd
  ```

The following is an example configuration for enabling BFD for specific static routes on the default VRF:

```
OS10(config)#ip route 10.2.2.0/24 10.1.1.1 bfd
```

The following example enables BFD for specific static routes on a nondefault VRF:

```
OS10(config)#ip route vrf LAN2 10.2.2.0/24 10.1.1.1 bfd
```

The following example enables BFD for specific IPv6 static routes on the default VRF:

```
OS10(config)# ipv6 route 2111:dddd:0eee::22/128 2001:db86:0fff::2 bfd
```

The following example enables BFD for specific IPv6 static routes on a nondefault VRF:

```
OS10(config)# ipv6 route vrf LAN2 2111:dddd:0eee::22/128 2001:db86:0fff::2 bfd
```

Change the BFD session parameters for static routes

To change BFD session parameters for IPv4 or IPv6 static routes, use the following command in CONFIGURATION mode:

```
bfd interval milliseconds min_rx milliseconds multiplier number role {active | passive}
```

The following example changes the BFD session parameters for static routes:

```
OS10(config)# bfd interval 250 min_rx 300 multiplier 4 role passive
```

Disabling BFD for IPv6 Static Routes

To disable BFD for IPv6 static routes, use the following command.

Disable BFD for static routes.

`no ipv6 route bfd`

CONFIGURATION Mode

BFD commands

bfd

Enables BFD sessions with specified neighbors.

Syntax	`bfd`
Parameters	None
Default	Not configured
Command Mode	ROUTER-NEIGHBOR ROUTER-TEMPLATE
Usage Information	• Use the `bfd` command to configure BFD sessions with a specified neighbor or neighbors which inherit a BGP template. Use the `neighbor {ip-address | ipv6-address}` command in ROUTER-BGP mode to specify the neighbor. Use the `template template-name` command in ROUTER-BGP mode to specify a BGP template. Use the `no bfd` command in ROUTER-NEIGHBOR mode to disable BFD sessions with a neighbor. • Use the `bfd all-neighbors` command to configure L3 protocol-specific BFD parameters for all BFD sessions between discovered neighbors. The BFD parameters you configure override the global session parameters configured with the `bfd interval` command.
Example	`OS10(conf)# router bgp 1` `OS10(config-router-bgp-1)# neighbor 10.1.1.1`

```
OS10(config-router-neighbor)# bfd
OS10(config-router-neighbor)# no shutdown
```

```
OS10(config)# router bgp 300
OS10(config-router-bgp-300)# template ebgppg
OS10(config-router-template)# bfd
OS10(config-router-template)# exit
OS10(config-router-bgp-300)# neighbor 3.1.1.1
OS10(config-router-neighbor)# inherit template ebgppg
OS10(config-router-neighbor)# no shutdown
```

Supported releases 10.4.1.0 or later

bfd all-neighbors

Configures parameters of BFD sessions that are established between neighbors discovered by an L3 protocol.

Syntax `bfd all-neighbors [interval` *`milliseconds`* `min_rx` *`milliseconds`* `multiplier` *`number`* `role {active | passive}]`

Parameters

- `interval` *`milliseconds`*—Enter the time interval for sending control packets to BFD peers; from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `min_rx` *`milliseconds`*—Enter the maximum waiting time for receiving control packets from BFD peers; from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `multiplier` *`number`*—Enter the maximum number of consecutive packets that must not be received from a BFD peer before the session state changes to `Down`; from 3 to 50.
- `role {active | passive}`—Enter `active` if the router initiates BFD sessions. Both BFD peers can be active at the same time. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session.

Default

The time interval for sending control packets to BFD peers is 200 milliseconds.

The maximum waiting time for receiving control packets from BFD peers is 200 milliseconds.

The number of consecutive packets that must be received from a BFD peer before BFD considers it as down is 3.

The BFD role is `active`.

Command Mode

- ROUTER-BGP
- ROUTER-OSPF
- ROUTER-OSPFv3

Usage Information

- Use this command to configure BFD sessions between discovered neighbors. The BFD session parameters you configure override the global session parameters configured with the `bfd interval` command. To disable BFD and ignore the configured `bfd all-neighbors` settings for a specified neighbor, use the `bfd disable` command in ROUTER-NEIGHBOR mode.
- To remove the configured all-neighbors settings for all BGP neighbors, enter the `no` version of the command. To return to the default values, use the `bfd all-neighbors` command.

Example

```
OS10(conf-router-bgp)# bfd all-neighbors interval 250 min_rx 300
multiplier 4 role passive
```

Supported releases 10.4.1.0 or later

bfd disable

Ignores the configured `bfd all-neighbors` settings and disables BFD for a specified neighbor.

Syntax `bfd disable`

Parameters	None
Default	Not configured
Command Mode	ROUTER-NEIGHBOR
Usage Information	Use the `neighbor ip-address` command in ROUTER-BGP mode to specify a neighbor. Use the `bfd disable` command to disable BFD sessions with the neighbor.

Example	`OS10(conf)# router bgp 1`
	`OS10(config-router-bgp-1)# neighbor 10.1.1.1`
	`OS10(config-router-neighbor)# bfd disable`

Supported releases	10.4.1.0 or later

bfd enable

Enables BFD on all interfaces on the switch.

Syntax	`bfd enable`
Parameters	None
Default	BFD is disabled.
Command Mode	CONFIGURATION
Usage Information	Before you configure BFD for static routing or a routing protocol, enable BFD globally on each router in a BFD session. To globally disable BFD on all interfaces, enter the `no bfd enable` command.
Example	`OS10(config)# bfd enable`
Supported releases	10.4.1.0 or later

bfd interval

Configures parameters for all BFD sessions on the switch.

Syntax	`bfd interval milliseconds min_rx milliseconds multiplier number role {active | passive}`
Parameters	• `interval milliseconds` — Enter the time interval for sending control packets to BFD peers; from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds. • `min_rx milliseconds` — Enter the maximum waiting time for receiving control packets from BFD peers, from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds. • `multiplier number` — Enter the number of consecutive packets that can be missed from a BFD peer before the session state changes to `Down`, from 3 to 50. • `role {active | passive}` — Enter `active` if the router initiates BFD sessions. Both BFD peers can be active at the same time. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session.
Default	The time interval for sending control packets to BFD peers is 200 milliseconds. The maximum waiting time for receiving control packets from BFD peers is 200 milliseconds. The number of consecutive packets that must be received from a BFD peer is 3. The BFD role is `active`.
Command Mode	CONFIGURATION
Usage Information	Use this command to configure global BFD session settings. To configure the BFD parameters used in sessions established with neighbors discovered by an L3 protocol, use the `bfd all-neighbors`

command. The no version of this command deletes the configured global settings and returns to the default values.

If you enable BFD on a specific static route, use the `bfd interval` command to configure the BFD parameters for that specific static route.

Example

```
OS10(config)# bfd interval 250 min_rx 300 multiplier 4 role passive
```

Supported releases 10.4.1.0 or later

ip ospf bfd all-neighbors

Enables and configures the default BFD parameters for all OSPFv2 neighbors in this interface.

Syntax `ip ospf bfd all-neighbors [disable|[interval` *millisec* `min_rx` *min_rx* `multiplier role {active | passive}]]`

Parameters

- `disable`—Disables the BFD session on an interface alone.
- `interval` *milliseconds*—Enter the time interval for sending control packets to BFD peers, from 100 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `min_rx` *milliseconds*—Enter the maximum waiting time for receiving control packets from BFD peers, from 100 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `multiplier` *number*—Enter the maximum number of consecutive packets that must not be received from a BFD peer before the session state changes to `Down`, from 3 to 50.
- `role {active | passive}`—Enter `active` if the router initiates BFD sessions. Both BFD peers can be active at the same time. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session.

Default The time interval for sending control packets to BFD peers is 200 milliseconds.

The maximum waiting time for receiving control packets from BFD peers is 200 milliseconds.

The number of consecutive packets that must be received from a BFD peer is 3.

The BFD role is `active`.

Command Mode CONFIG-INTERFACE

Usage Information This command can be used to enable or disable BFD for an interface associated with OSPFv2. Interface level BFD configuration takes precedent over the OSPF global level BFD configuration. If there is no BFD configuration present at the interface level global OSPF BFD configuration will be inherited.

Example

```
(conf-if-eth1/1/1)#ip ospf bfd all-neighbors
```

Supported releases 10.4.2E or later

ipv6 ospf bfd all-neighbors

Enables and configures the default BFD parameters for all OSPFv3 neighbors in this interface.

Syntax `ipv6 ospf bfd all-neighbors [disable|[interval` *millisec* `min_rx` *min_rx* `multiplier role {active | passive}]]`

Parameters

- `disable`—Disables the BFD session on an interface alone.
- `interval` *milliseconds*—Enter the time interval for sending control packets to BFD peers, from 100 to 1000. You cannot configure a value that is less than 100 milliseconds.
- `min_rx` *milliseconds*—Enter the maximum waiting time for receiving control packets from BFD peers, from 100 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `multiplier` *number*—Enter the maximum number of consecutive packets that must not be received from a BFD peer before the session state changes to `Down`, from 3 to 50.

- `role {active | passive}`—Enter `active` if the router initiates BFD sessions. Both BFD peers can be active at the same time. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session.

Default

The time interval for sending control packets to BFD peers is 200 milliseconds.

The maximum waiting time for receiving control packets from BFD peers is 200 milliseconds.

The number of consecutive packets that must be received from a BFD peer is 3.

The BFD role is `active`.

Command Mode

INTERFACE

Usage Information

This command is used to enable or disable BFD for an interface associated with OSPFv3. Interface level BFD configuration takes precedent over the OSPF global level BFD configuration. If there is no BFD configuration present at the interface level, global OSPF BFD configuration is inherited. All types of interfaces are supported. To disable default BFD parameters for all OSPFv3 neighbors, use the `no ipv6 ospf bfd all-neighbors` command.

Example

```
OS10(config)# interface ethernet 1/1/1
(conf-if-eth1/1/1)#ipv6 ospf bfd all-neighbors
```

Supported releases

10.4.2E or later

ip route bfd

Enables or disables BFD on static routes.

Syntax

`ip route[vrf` *`vrf-name`*`] bfd [interval` *`interval`* `min_rx` *`wait-time`* `multiplier` *`number`* `role {active | passive}]`

Parameters

- `vrf` *`vrf-name`*—Enter `vrf` and then the name of the VRF to configure static route in that VRF.
- `interval` *`milliseconds`*—Enter the time interval for sending control packets to BFD peers; from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `min_rx` *`milliseconds`*—Enter the minimum waiting time for receiving control packets from BFD peers, from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `multiplier` *`number`*—Enter the maximum number of consecutive packets that must not be received from a BFD peer before the session state changes to `Down`; from 3 to 50.
- `role {active | passive}`—Enter `active` if the router initiates BFD sessions. Both BFD peers can be active simultaneously. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session.

Default

The time interval for sending control packets to BFD peers is 200 milliseconds.

The maximum waiting time for receiving control packets from BFD peers is 200 milliseconds.

The number of consecutive packets that must be received from a BFD peer is 3.

The BFD role is `active`

Command Mode

CONFIGURATION

Usage Information

Use this command to enable or disable BFD for all the configured IPv4 static routes for the specified VRF. If you do not specify a VRF name, the command is applicable for the default VRF. The `no` version of this command disables BFD on a static route.

Example

```
OS10(config)# ip route bfd interval 250 min_rx 250 multiplier 4 role
active
```

Supported releases

10.4.2E or later

ipv6 route bfd

Enables or disables BFD on IPv6 static routes.

Syntax

```
ipv6 route [vrf vrf-name] bfd [interval millisec min_rx min_rx multiplier
role {active | passive}]
```

Parameters

- `vrf vrf-name`—Enter the keyword VRF and then the name of the VRF to configure static route in that VRF.
- `interval milliseconds`—Enter the time interval for sending control packets to BFD peers, from 50 to 1000.
- `min_rx milliseconds`—Enter the maximum waiting time for receiving control packets from BFD peers, from 50 to 1000. Dell Technologies recommends using more than 100 milliseconds.
- `multiplier number`—Enter the maximum number of consecutive packets that must not be received from a BFD peer before the session state changes to `Down`, from 3 to 50.
- `role {active | passive}`—Enter `active` if the router initiates BFD sessions. Both BFD peers can be active simultaneously. Enter `passive` if the router does not initiate BFD sessions, and only responds to a request from an active BFD to initialize a session.

Default

The time interval for sending control packets to BFD peers is 200 milliseconds.

The maximum waiting time for receiving control packets from BFD peers is 200 milliseconds.

The number of consecutive packets that must be received from a BFD peer is 3.

The BFD role is `active`.

Command Mode

CONFIGURATION

Usage Information

Use this command to enable or disable BFD for all the configured IPv6 static routes for the specified VRF. If you do not specify a VRF name, the command is applicable for the default VRF. The `no` version of this command disables BFD on an IPv6 static route.

Example

```
OS10(config)# ipv6 route bfd interval 250 min_rx 250 multiplier 4 role
active
```

Supported releases

10.4.2E or later

show bfd neighbors

Displays information about BFD neighbors from all interfaces using the default VRF.

Syntax

```
show bfd neighbors [active | detail | interface]
```

Parameters

- `detail`—(Optional) View detailed information about BFD neighbors.
- `active`—(Optional) View information about the active BFD neighbors whose state is up.
- `interface interface-type`—(Optional) Enter one of the following interface types:
  - `ethernet node/slot/port[:subport]`—Displays Ethernet interface information.
  - `port-channel id-number`—Display port channel interface IDs, from 1 to 999 or 1001 to 2000.
  - `vlan vlan-id`—Displays the VLAN interface number, from 1 to 4093.

Default

Not configured

Command Mode

EXEC

Usage Information

Use this command to verify that a BFD session between neighbors is up using the default VRF instance. Use the `de` parameter to view the BFD session parameters.

Example

```
OS10# show bfd neighbors
* - Active session role

Supported releases 10.4.1.0 or later

Border Gateway Protocol

Border Gateway Protocol (BGP) is an interautonomous system routing protocol that transmits interdomain routing information within and between autonomous systems (AS). BGP exchanges network reachability information with other BGP systems. BGP

adds reliability to network connections by using multiple paths from one router to another. Unlike most routing protocols, BGP uses TCP as its transport protocol.

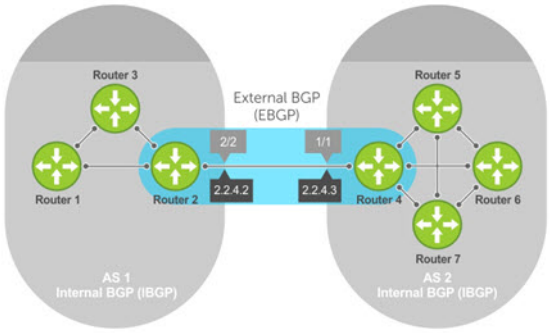
Autonomous systems

BGP autonomous systems are a collection of nodes under a single administration with shared network routing policies. Each AS has a number, which an Internet authority assigns—you do not assign the BGP number.

The Internet Assigned Numbers Authority (IANA) identifies each network with a unique AS number (ASN). AS numbers 64512 through 65534 are reserved for private purposes. AS numbers 0 and 65535 cannot be used in a live environment. IANA assigns valid AS numbers in the range of 1 to 64511.

Multihomed AS	Maintains connections to more than one other AS. This group allows the AS to remain connected to the Internet if a complete failure occurs to one of their connections. This type of AS does not allow traffic from one AS to pass through on its way to another AS.
Stub AS	Connected to only one AS.
Transit AS	Provides connections through itself to separate networks. For example, Router 1 uses Router 2—the transit AS, to connect to Router 4. Internet service providers (ISPs) are always a transit AS because they provide connections from one network to another. An ISP uses a transit AS to sell transit service to a customer network.

When BGP operates inside an AS - AS1 **or** AS2, it functions as an Internal Border Gateway Protocol (IBGP). When BGP operates between AS endpoints - AS1 **and** AS2, it functions as an External Border Gateway Protocol (EBGP). IBGP provides routers inside the AS with the path to reach a router external to the AS. EBGP routers exchange information with other EBGP routers and IBGP routers to maintain connectivity and accessibility.



Classless interdomain routing

BGPv4 supports classless interdomain routing (CIDR) with aggregate routes and AS paths. CIDR defines a network using a prefix consisting of an IP address and mask, resulting in efficient use of the IPv4 address space. Using aggregate routes reduces the size of routing tables.

Path-vector routing

BGP uses a path-vector protocol that maintains dynamically updated path information. Path information updates which return to the originating node are detected and discarded. BGP does not use a traditional Internal Gateway Protocol (IGP) matrix but makes routing decisions based on path, network policies, and/or rule sets.

Full-mesh topology

In an AS, a BGP network must be in `full mesh` for routes received from an internal BGP peer to send to another IBGP peer. Each BGP router talks to all other BGP routers in a session. For example, in an AS with four BGP routers, each router has three peers; in an AS with six routers, each router has five peers.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

- If you use eBGP to exchange routes with switches in an SFS environment, the router must directly connect to the switch or switches present. You must use the interface IP to set up BGP peering.

  NOTE: This behavior is applicable only to the S4100-ON series of switches.
- By default, routes that are learned on multiple paths to eBGP peers are advertised to IBGP peers with the next-hop local IP address. This behavior allows for local repair of atomic failure of any external peers.
- Fast external failover is enabled by default. To disable or re-enable fast external failover, use the `[no] fast-externalfallover` command. For the `fast-external-fallover` command to take effect on an established BGP

session, you must reset the session using the `clear ip bgp {* | peer-ipv4-address | peer-ipv6-address}` command.

- Enabling the BGP add-paths globally for all BGP neighbors is not supported (the `add-path` command in ROUTER-BGPv4-AF or ROUTER-BGPv6-AF mode). To enable the BGP add-path for one neighbor, use the `add-path` command in ROUTERBGP-NEIGHBOR-AF mode.
- When you redistribute OSPFv3 routes to BGP, including External Type-2 routes, the multi-exit discriminator (MED) attribute is set to the OSPF route metric plus one instead of the OSPF route metric value.
- When you configure the `bgp bestpath router-id ignore` command, for non-best paths, the `show ip bgp` output displays Inactive reason: Router ID.
- Do not configure the IP address of the router as a BGP neighbor. This action causes the address being accepted as an invalid neighbor address.
- SNMP support is not available for BGP in nondefault VRF.

Sessions and peers

A BGP session starts with two routers communicating using the BGP. The two end-points of the session are called *peers*. A peer is also called a *neighbor*. Events and timers determine the information exchange between peers. BGP focuses on traffic routing policies.

Sessions

In operations with other BGP peers, a BGP process uses a simple finite state machine consisting of six states—`Idle`, `Connect`, `Active`, `OpenSent`, `OpenConfirm`, and `Established`. For each peer-to-peer session, a BGP implementation tracks the state of the session. The BGP defines the messages that each peer exchanges to change the session from one state to another.

Idle	BGP initializes all resources, refuses all inbound BGP connection attempts, and starts a TCP connection to the peer.
Connect	Router waits for the TCP connection to complete and transitions to the `OpenSent` state if successful. If that transition is not successful, BGP resets the `ConnectRetry` timer and transitions to the `Active` state when the timer expires.
Active	Router resets the `ConnectRetry` timer to zero and returns to the `Connect` state.
OpenSent	Router sends an `Open` message and waits for one in return after a successful `OpenSent` transition.
OpenConfirm	Neighbor relation establishes and is in the `OpenConfirm` state after the Open message parameters are agreed on between peers. The router then receives and checks for agreement on the parameters of the open messages to establish a session.
Established	Keepalive messages exchange, and after a successful receipt, the router is in the `Established` state. Keepalive messages continue to send at regular periods. The keepalive timer establishes the state to verify connections.

After the connection is established, the router sends and receives keepalive, update, and notification messages to and from its peer.

Peer templates

Peer templates allow BGP neighbors to inherit the same outbound policies. Instead of manually configuring each neighbor with the same policy, you can create a peer group with a shared policy that applies to individual peers. A peer template provides efficient update calculation with a simplified configuration.

Peer templates also aid in convergence speed. When a BGP process sends the same information to many peers, a long output queue may be set up to distribute the information. For peers that are members of a peer template, the information is sent to one place then passed on to the peers within the template.

Martian addresses

Martian addresses are invalid networks on the Internet.

Martian addresses are special IPv4 and IPv6 addresses which are not routed by routing devices on the Internet. OS10 considers the following as Martian prefixes:

- 0.0.0.0/8

- 127.0.0.0/8
- 224.0.0.0/4
- :: / 128
- FF00::/8

  FE80::/16
- ::0002-::FFFF- all prefixes

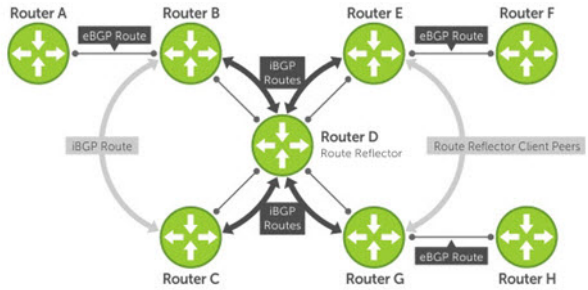
Route reflectors

Route reflectors (RRs) reorganize the IBGP core into a hierarchy and allow route advertisement rules. Route reflection divides IBGP peers into two groups — client peers and nonclient peers.

- If a route is received from a nonclient peer, it reflects the route to all client peers
- If a route is received from a client peer, it reflects the route to all nonclient and client peers

An RR and its client peers form a *route reflection cluster*. BGP speakers announce only the best route for a given prefix. RR rules apply after the router makes its best path decision.

NOTE: Do not use RRs in forwarding paths — hierarchal RRs that maintain forwarding plane RRs could create route loops.



Routers B, C, D, E, and G are members of the same AS—AS100. These routers are also in the same route reflection cluster, where Router D is the route reflector. Routers E and G are client peers of Router D, and Routers B and C and nonclient peers of Router D.

1. Router B receives an advertisement from Router A through EBGP. Because the route is learned through EBGP, Router B advertises it to all its IBGP peers — Routers C and D.
2. Router C receives the advertisement but does not advertise it to any peer because its only other peer is Router D (an IBGP peer) and Router D has already learned it through IBGP from Router B.
3. Router D does not advertise the route to Router C because Router C is a nonclient peer. The route advertisement came from Router B which is also a nonclient peer.
4. Router D does reflect the advertisement to Routers E and G because they are client peers of Router D.
5. Routers E and G advertise this IBGP learned route to their EBGP peers — Routers F and H.

Multiprotocol BGP

Multiprotocol BGP (MBGP) is an extension to BGP that supports multiple address families—IPv4 and IPv6. MBGP carries multiple sets of unicast and multicast routes depending on the address family.

You can enable the MBGP feature on a per router, per template, and/or a per peer basis. The default is the IPv4 unicast routes.

BGP session supports multiple address family interface (AFI) and sub address family interface (SAFI) combinations, BGP uses OPEN message to convey this information to the peers. As a result, the IPv6 routing information is exchanged over the IPv4 peers and vice versa.

BGP routers that support IPv6 can set up BGP sessions using IPv6 peers. If the existing BGP-v4 session is capable of exchanging ipv6 prefixes, the same is used to carry ipv4 as well as ipv6 prefixes. If the BGP-v4 neighbor goes down, it also impacts the IPv6 route exchange. If BGP-v6 session exists, it continues to operate independently from BGP-v4.

Multiprotocol BGPv6 supports many of the same features and functionality as BGPv4. IPv6 enhancements to MBGP include support for an IPv6 address family and Network Layer Reachability Information (NLRI) and next hop attributes that use the IPv6 addresses.

Attributes

Routes learned using BGP have associated properties that are used to determine the best route to a destination when multiple paths exist to a particular destination. These properties are called *BGP attributes* which influence route selection for designing robust networks. There are no hard coded limits on the number of supported BGP attributes.

BGP attributes for route selection:

- Weight
- Local preference
- Multiexit discriminators
- Origin
- AS path
- Next-hop

Communities

BGP communities are sets of routes with one or more common attributes. Communities assign common attributes to multiple routes simultaneously. Duplicate communities are not rejected.

Disable announcement of ASN values

Modify the AS_PATH attribute of the received routes.

- Disable prepending the local AS number in CONFIG-ROUTER-NEIGHBOR mode.

```
local-as as-number no-prepend
```

- Disable prepending the globally-configured AS number in CONFIG-ROUTER-NEIGHBOR mode.

```
local-as as-number no-prepend replace-as
```

Selection criteria

Best path selection criteria for BGP attributes:

1. Prefer the path with the largest WEIGHT attribute, and prefer the path with the largest LOCAL_PREF attribute.
2. Prefer the path that is locally originated using the `network` command, `redistribute` command, or `aggregate-address` command. Routes originated using a `network` or `redistribute` command are preferred over routes that originate with the `aggregate-address` command.
3. (Optional) If you configure the `bgp bestpath as-path ignore` command, skip this step because AS_PATH is not considered. Prefer the path with the shortest AS_PATH:
   - An AS_SET has a path length of 1 no matter how many are in the set
   - A path with no AS_PATH configured has a path length of 0
   - AS_CONFED_SET is not included in the AS_PATH length
   - AS_CONFED_SEQUENCE has a path length of 1 no matter how many ASs are in the AS_CONFED_SEQUENCE
4. Prefer the path with the lowest ORIGIN type—IGP is lower than EGP and EGP is lower than INCOMPLETE.
5. Prefer the path with the lowest multiexit discriminator (MED) attribute:
   - This comparison is only done if the first neighboring AS is the same in the two paths. The MEDs compare only if the first AS in the AS_SEQUENCE is the same for both paths.
   - Configure the `bgp always-compare-med` command to compare MEDs for all paths.
   - Paths with no MED are treated as “worst” and assigned a MED of 4294967295.
6. Prefer external (EBGP) to internal (IBGP) paths or confederation EBGP paths, and prefer the path with the lowest IGP metric to the BGP next-hop.
7. The system deems the paths as equal and only performs the following steps if the criteria are not met:

- Configure the IBGP multipath or EBGP multipath using the `maximum-path` command.
- The paths being compared were received from the same AS with the same number of AS in the AS Path but with different next-hops.
- The paths were received from IBGP or EBGP neighbor, respectively.

8. If you enable the `bgp bestpath router-id ignore` command and:
   - If the Router-ID is the same for multiple paths because the routes were received from the same route—skip this step.
   - If the Router-ID is **not** the same for multiple paths, prefer the path that was first received as the Best Path. The path selection algorithm returns without performing any of the checks detailed.
9. Prefer the external path originated from the BGP router with the lowest router ID. If both paths are external, prefer the oldest path—first received path. For paths containing an RR attribute, the originator ID is substituted for the router ID. If two paths have the same router ID, prefer the path with the lowest cluster ID length. Paths without a cluster ID length are set to a 0 cluster ID length.
10. Prefer the path originated from the neighbor with the lowest address. The neighbor address is used in the BGP neighbor configuration and corresponds to the remote peer used in the TCP connection with the local router.

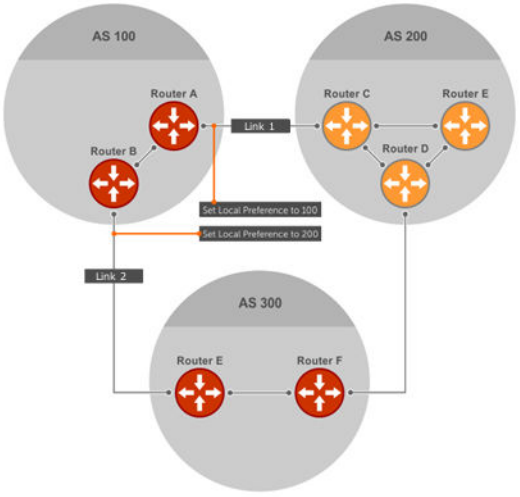
In Non-Deterministic mode, the `bgp non-deterministic-med` command applies. Paths compare in the order they arrive. This method leads to system selection of different best paths from a set of paths. Depending on the order they were received from the neighbors, MED may or may not get compared between the adjacent paths. In Deterministic mode, the system compares MED. MED is compared between the adjacent paths within an AS group because all paths in the AS group are from the same AS.

Weight and local preference

The weight attribute is local to the router and does not advertise to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred. The route with the highest weight is installed in the IP routing table.

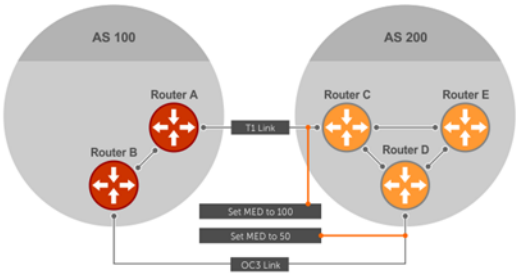
The local preference — LOCAL_PREF represents the degree of preference within the entire AS. The higher the number, the greater the preference for the route.

LOCAL_PREF is one of the criteria that determines the best path — other criteria may impact selection, see Best path selection. Assume that LOCAL_PREF is the only attribute applied and AS 100 has two possible paths to AS 200. Although the path through Router A is shorter, the LOCAL_PREF settings have the preferred path going through Router B and AS 300. This advertises to all routers within AS 100, causing all BGP speakers to prefer the path through Router B.



Multiexit discriminators

If two autonomous systems connect in more than one place, use a multiexit discriminator (MED) to assign a preference to a preferred path. MED is one of the criteria used to determine best path—other criteria may also impact selection.



One AS assigns the MED a value. Other AS uses that value to decide the preferred path. Assume that the MED is the only attribute applied and there are two connections between AS 100 and AS 200. Each connection is a BGP session. AS 200 sets the MED for its Link 1 exit point to 100 and the MED for its Link 2 exit point to 50. This sets up a path preference through Link 2. The MEDs advertise to AS 100 routers so they know which is the preferred path.

MEDs are nontransitive attributes. If AS 100 sends the MED to AS 200, AS 200 does not pass it on to AS 300 or AS 400. The MED is a locally relevant attribute to the two participating AS — AS 100 and AS 200. The MEDs advertise across both links—if a link goes down, AS 100 has connectivity to AS 300 and AS 400.

Origin

The origin indicates how the prefix came into BGP. There are three origin codes—IGP, EGP, and INCOMPLETE.

IGP	Prefix originated from information learned through an IGP.
EGP	Prefix originated from information learned from an EGP, which Next Generation Protocol (NGP) replaced.
INCOMPLETE	Prefix originated from an unknown source.

An IGP indicator means that the route was derived inside the originating AS. EGP means that a route was learned from an external gateway protocol. An INCOMPLETE origin code results from aggregation, redistribution, or other indirect ways of installing routes into BGP.

The question mark (?) indicates an origin code of INCOMPLETE, and the lower case letter (i) indicates an origin code of IGP.

Origin configuration

```
OS10# show ip bgp
BGP local RIB : Routes to be Added , Replaced , Withdrawn
BGP local router ID is 30.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Path source: I - internal, a - aggregate, c - confed-external, r - redistributed
n - network S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
          Network       Next Hop  Metric LocPrf Weight Path
*>I       1.1.1.0/24    17.1.1.2  0      0      0      i
*>I       2.2.2.0/24    17.1.1.2  0      0      0      ?
*>I       3.3.3.0/24    17.1.1.2  0      0      0      e
```

AS path and next-hop

The AS path is the AS list that all the prefixes that are listed in the update have passed through. The BGP speaker adds the local AS number when advertising to an EBGP neighbor. Any update that contains the AS path number 0 is valid.

The next-hop is the IP address that is used to reach the advertising router:

- For EBGP neighbors, the next-hop address is the IP address of the connection between neighbors.
- For IBGP neighbors, the EBGP next-hop address is carried into the local AS. A next hop attribute sets when a BGP speaker advertises itself to another BGP speaker outside the local AS and when advertising routes within an AS.

For EBGP neighbors, the next-hop address corresponding to a BGP route does not resolve if the next-hop address is not the same as the neighbor IP address. The next-hop attribute also serves as a way to direct traffic to another BGP speaker, instead of waiting for a speaker to advertise. When a next-hop BGP neighbor is unreachable, the connection to that BGP neighbor goes down after the hold-down timer expires.

When you enable `fast-external-fallover` and if the router has learned the routes from the BGP neighbor, the BGP session terminates immediately if the next-hop becomes unreachable, without waiting for the hold-down time.

Best path selection

Best path selection selects the best route out of all paths available for each destination, and records each selected route in the IP routing table for traffic forwarding. Only valid routes are considered for best path selection. BGP compares all paths, in the order in which they arrive, and selects the best paths. Paths for active routes are grouped in ascending order according to their neighboring external AS number.

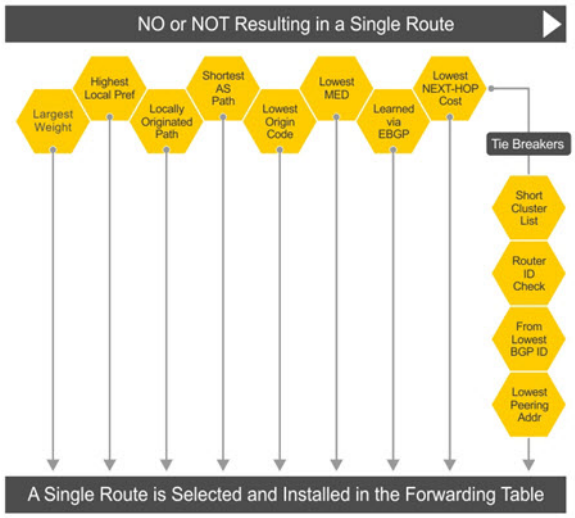
OS10 follows *deterministic* MED to select different best paths from a set of paths. This may depend on the order the different best paths are received from the neighbors — MED may or may not get compared between adjacent paths. BGP best path selection is deterministic by default.

The best path in each group is selected based on specific criteria—only one best path is selected at a time. If BGP receives more than one best path, it moves on to the next list of valid paths, and continues until it reaches the end of the list.

When you configure the `non-deterministic-med` command, paths are compared in the order they arrive. OS10 follows this method to select different best paths from a set of paths, depending on the order they were received from the neighbors—MED may or may not get compared between the adjacent paths.

By default, the `bestpath as-path multipath-relax` command is disabled. This prevents BGP from load-balancing a learned route across two or more EBGP peers. To enable load-balancing across different EBGP peers, enter the `bestpath as-path multipath-relax` command.

If you configure the `bgp bestpath as-path ignore` command and the `bestpath as-path multipath-relax` command simultaneously, an error message displays—only enable one command at a time.



More path support

More path (Add-Path) reduces convergence times by advertising multiple paths to its peers for the same address prefix without replacing existing paths with new ones. By default, a BGP speaker advertises only the best path to its peers for a given address prefix.

If the best path becomes unavailable, the BGP speaker withdraws its path from its local router information base (RIB) and recalculates a new best path. This situation requires both IGP and BGP convergence and is a lengthy process. BGP add-path also helps switch over to the next new best path when the current best path is unavailable.

The Add-Path capability to advertise more paths is supported only on IBGP peers—it is not supported on EBGP peers or BGP peer groups.

Ignore router ID calculations

Avoid unnecessary BGP best path transitions between external paths under certain conditions. The `bestpath router-id ignore` command reduces network disruption that is caused by routing and forwarding plane changes and allows for faster convergence.

Advertise cost

As the default process for redistributed routes, OS10 supports IGP cost as MED. Both autosummarization and synchronization are disabled by default.

BGPv4 and BGPv6 support

- Deterministic MED, default
- A path with a missing MED is treated as worst path and assigned an `0xffffffff` MED value.
- Delayed configuration at system boot—OS10 reads the entire configuration file BEFORE sending messages to start BGP peer sessions.

4-Byte AS numbers

OS10 supports 4-byte AS number configurations by default. The 4-byte support is advertised as a new BGP capability - `4-BYTE-AS`, in the OPEN message. A BGP speaker that advertises 4-Byte-AS capability to a peer, and receives the same from that peer must encode AS numbers as 4-octet entities in all messages.

If the AS number of the peer is different, the 4-byte speaker brings up the neighbor session using a reserved 2-byte ASN, 23456 called *AS_TRANS*. The AS_TRANS is used to interop between a 2-byte and 4-byte AS number.

Where the 2-byte format is 1 to 65535, the 4-byte format is 1 to 4294967295. You can also enter AS numbers using the dotted decimal format. For example, you can enter 0.123.

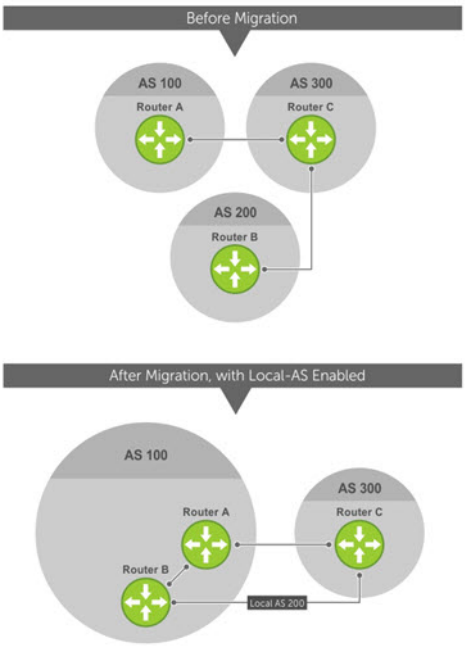
AS number migration

You can transparently change the AS number of an entire BGP network. Changing the AS number ensures that the routes propagate throughout the network while migration is in progress. When migrating one AS to another and combining multiple AS, an external BGP (eBGP) network may lose its routing to an internal BGP (iBGP) if the AS number changes.

Migration is difficult as all iBGP and eBGP peers of the migrating network must be updated to maintain network reachability. Local-AS allows the BGP speaker to operate as if it belongs to a virtual AS network besides its physical AS network.

NOTE: The `local-as` command is supported only for eBGP autonomous system migration, and it is not supported for iBGP autonomous system migration.

Disable the `local-as` command after migration. Failure to disable the `local-as` command after migration causes the `local-as` command to replace the original AS number of the system. Reconfigure the system with a new AS number.



Router A, Router B, and Router C belong to AS 100, 200, and 300, respectively. Router A acquired Router B — Router B has Router C as its client. When Router B is migrating to Router A, it must maintain the connection with Router C without immediately updating Router C's configuration. Local-AS allows Router B to appear as if it still belongs to Router B's old network, AS 200, to communicate with Router C.

The Local-AS does not prepend the updates with the AS number received from the EBGP peer if you use the `no prepend` command. If you do not select `no prepend`, the default, the Local-AS adds to the first AS segment in the AS-PATH. If you use an inbound route-map to prepend the AS-PATH to the update from the peer, the Local-AS adds first.

If Router B has an inbound route-map applied on Router C to prepend *65001 65002* to the AS-PATH, these events take place on Router B:

- Receive and validate the update.
- Prepend local-as 200 to AS-PATH.
- Prepend *65001 65002* to AS-PATH.

Local-AS prepends before the route map to give the appearance that the update passed through a router in AS 200 before it reaches Router B.

Graceful restart

OS10 offers graceful restart capability for BGP in helper mode only.

A BGP router whose neighbor is restarting is called a "helper."

If graceful restart is enabled on the restarting router, during restart, the helper maintains the routes that it has learned from its neighbor.

After the switch over, the graceful restart operation begins. Both routers reestablish their neighbor relationship and exchange their BGP routes again. The helper continues to forward prefixes pointing to the restarting peer, and the restarting router continues to forward traffic to its peers even though those neighbor relationships are restarting. When the restarting router receives all route updates from all BGP peers that are graceful restart capable, the graceful restart is complete. BGP sessions become operational again.

Configure Border Gateway Protocol

BGP is disabled by default. To enable the BGP process and start to exchange information, assign an AS number and use commands in ROUTER-BGP mode to configure a BGP neighbor.

BGP neighbor adjacency changes	All BGP neighbor changes are logged
Fast external fallover	Enabled
Graceful restart	Disabled
Local preference	100
4-byte AS	Enabled
MED	0
Route flap dampening parameters	• half-life = 15 minutes • max-suppress-time = 60 minutes • reuse = 750 • suppress = 2000
Timers	• keepalive = 60 seconds • holdtime = 180 seconds
Add-path	Disabled

Enable BGP

Before enabling BGP, assign a BGP router ID to the switch using the following command:

- In the ROUTER BGP mode, enter the `router-id` *ip-address* command. Where in, `ip-address` is the IP address corresponding to a configured L3 interface (physical, loopback, or port-channel).

BGP is disabled by default. The system supports one AS number — you must assign an AS number to your device. To establish BGP sessions and route traffic, configure at least one BGP neighbor or peer. In BGP, routers with an established TCP connection are called *neighbors* or *peers*. After a connection establishes, the neighbors exchange full BGP routing tables with incremental updates afterward. Neighbors also exchange the KEEPALIVE messages to maintain the connection.

You can classify BGP neighbor routers or peers as internal or external. Connect EBGP peers directly, unless you enable EBGP multihop — IBGP peers do not need direct connection. The IP address of an EBGP neighbor is usually the IP address of the interface directly connected to the router. The BGP process first determines if all internal BGP peers are reachable, then it determines which peers outside the AS are reachable.

1. Assign an AS number, and enter ROUTER-BGP mode from CONFIGURATION mode, from 1 to 65535 for 2-byte, 1 to 4294967295 for 4-byte. Only one AS number is supported per system. If you enter a 4-byte AS number, 4-byte AS support is enabled automatically.

   ```
   router bgp as-number
   ```

2. Enter a neighbor in ROUTER-BGP mode.

   ```
   neighbor ip-address
   ```

3. Add a remote AS in ROUTER-NEIGHBOR mode, from 1 to 65535 for 2-byte or 1 to 4294967295 for 4-byte.

   ```
   remote-as as-number
   ```

4. Enable the BGP neighbor in ROUTER-NEIGHBOR mode.

   ```
   no shutdown
   ```

5. (Optional) Add a description text for the neighbor in ROUTER-NEIGHBOR mode.

   ```
   description text
   ```

To reset the configuration when you change the configuration of a BGP neighbor, use the `clear ip bgp *` command. To view the BGP status, use the `show ip bgp summary` command.

Configure BGP

```
OS10# configure terminal
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 5.1.1.1
OS10(config-router-neighbor)# remote-as 1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# description  n1_abcd
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# template t1
OS10(config-router-template)# description peer_template_1_abcd
```

View BGP summary with 2-byte AS number

```
OS10# show ip bgp summary

BGP router identifier 202.236.164.86 local AS number 64901
Neighbor AS MsgRcvd MsgSent Up/Down State/Pfx
120.10.1.1 64701 664 662 04:47:52 established 12000
```

View BGP summary with 4-byte AS number

```
OS10# show ip bgp summary
BGP router identifier 11.1.1.1, local AS number 4294967295
BGP local RIB : Routes to be Added 0, Replaced 0, Withdrawn 0
1 neighbor(s) using 8192 bytes of memory
```

```
Neighbor AS MsgRcvd MsgSent TblVer InQ OutQ Up/Down State/Pfx
5.1.1.2 4294967295 0 0 0 0 0 00:00:00 Active
```

For the router ID, the system selects the first configured IP address or a random number. To view the status of BGP neighbors, use the `show ip bgp neighbors` command. For BGP neighbor configuration information, use the `show running-config bgp` command.

The example shows two neighbors — one is an external BGP neighbor; and the other is an internal BGP neighbor. The first line of the output for each neighbor displays the AS number and states if the link is external or internal.

The third line of the `show ip bgp neighbors` output contains the BGP state. If anything other than *established* displays, the neighbor is not exchanging information and routes. For more information, see IPv6 commands.

View BGP neighbors

```
OS10# show ip bgp neighbors
BGP neighbor is 5.1.1.1, remote AS 1, internal link
BGP version 4, remote router ID 6.1.1.1

Configuring BGP in a non-default VRF instance

To configure BGP in a non-default VRF instance.

1. Assign an AS number, and enter ROUTER-BGP mode from CONFIGURATION mode (1 to 65535 for 2-byte, 1 to 4294967295 for 4-byte). Only one AS number is supported per system. If you enter a 4-byte AS number, 4-byte AS support is enabled automatically.

   ```
   router bgp as-number
   ```

2. Enter ROUTER-BGP-VRF mode to configure BGP in a non-default VRF instance.

   ```
   vrf vrf-name
   ```

3. Enter a neighbor in CONFIG-ROUTER-VRF mode.

   ```
   neighbor ip-address
   ```

4. Add a remote AS in ROUTER-NEIGHBOR mode, from 1 to 65535 for 2-byte or 1 to 4294967295 for 4-byte.

```
remote-as as-number
```

5. Enable the BGP neighbor in ROUTER-NEIGHBOR mode.

```
no shutdown
```

6. (Optional) Add a description text for the neighbor in ROUTER-NEIGHBOR mode.

```
description text
```

To reset the configuration when you change the configuration of a BGP neighbor, use the `clear ip bgp *` command. To view the BGP status, use the `show ip bgp summary` command.

Configure BGP

```
OS10# configure terminal
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf blue
OS10(config-router-vrf)# neighbor 5.1.1.1
OS10(config-router-neighbor)# remote-as 1
OS10(config-router-neighbor)# description  n1_abcd
OS10(config-router-neighbor)# exit
OS10(config-router-vrf)# template t1
OS10(config-router-template)# description peer_template_1_abcd
```

BGP unnumbered

The BGP unnumbered feature supports route exchange for advertising IPv4 NLRI with IPv6 next-hop.

Dell Technologies recommends populating the next hop field as follows:

- The IPv6 address of the next hop is followed by the link-local IPv6 address of the next hop. This field is constructed following recommendations that are described in Constructing the Next Hop field.

NOTE: The BGP unnumbered feature is compliant with RFC5549.

In SmartFabric OS10 implementations enter the global IPv6 address in the Next Hop field, if it is configured in the peer interface; otherwise, enter the default IPv6 address in the Next Hop field. The IPv6 address is followed by the link-local address.

After receiving route-updates from an unnumbered peer with link-local address entered in both fields of Next Hop, SmartFabric OS10 brings down the unnumbered session that is formed with the FRR-based switch. All outgoing route updates are sent with the global IPv6 address followed by the link-local address in the Next hop field of the BGP UPDATE message. This is the default behavior of route exchange between unnumbered peers that are established with FRR vendors.

This feature introduces the `link-local-only-nexthop` command, to enable interoperability with such nonstandard implementations. You can configure the `link-local-only-nexthop` command at the following three levels: ROUTER BGP, BGP neighbor, and BGP template. When you enable this feature, route-updates are accepted when both fields of the Next Hop are filled with link-local addresses. This feature also enables route updates to be sent with link-local addresses entered in both fields of Next Hop.

Recommended and limitations

The following restrictions and limitations apply to the BGP unnumbered feature:

- This feature is applicable only for unnumbered peers.
- This feature is not applicable for EVPN routes.

Impact on software upgrade and downgrade

This section describes the impact of the BGP unnumbered feature on software upgrade and downgrade.

As the BGP unnumbered interop with FRR vendor feature is not enabled by default, no issues are seen during software upgrade.

You must undo or remove this configuration under ROUTER BGP before downgrading to a version lower than 10.5.3.

Constructing the Next Hop field

A BGP speaker advertises to its peers the global IPv6 address of the Next Hop present in the network address of the Next Hop field.

This global IPv6 address is followed by the link-local IPv6 address of the Next Hop.

The length of the Next Hop network address field on a `MP_REACH_NLRI` attribute is set to 16 when only a global address is present. The length of this field is set to 32 if a link-local address is also included in the Next Hop field.

The link-local address is included in the Next Hop field only if the BGP speaker shares a common subnet with the entity that is identified by the global IPv6 address that is carried in the network address of the Next Hop field and also the peer to which the route is being advertised to.

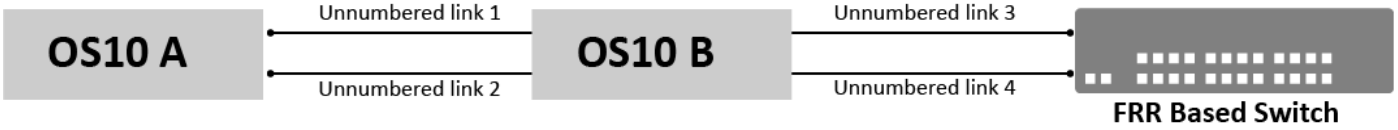
Link-local-only-nexthop command at ROUTER BGP level

This section provides information about the behavior of the `link-local-only-nexthop` command at the ROUTER BGP level.

The following behavior occurs when you configure this feature at the ROUTER BGP level:

- When you configure the `link-local-only-nexthop` command at the ROUTER BGP level, the incoming route updates are accepted when the Next Hop fields have link local addresses in both address fields.
- All outgoing route updates are sent with the link-local address that is entered in both fields of the Next Hop.
- When enabled globally at the ROUTER BGP level, this behavior is applicable for all unnumbered peers present in all VRF instances.
- Configuration and removal of this feature does not impact route exchange between numbered peers that are formed with other vendors based on the FRR stack.
- Route updates exchanged before you configure this feature follow the existing behavior.
- All other updates after you configure this feature follows the new behavior for interop with the FRR vendors.
- All unnumbered neighbors in all VRFs display the global configuration status in the `show ip bgp neighbors` command output.
- Before removing the BGP unnumbered with FRR interop feature by running the `no link-local-only-nexthop` command, clear all unnumbered neighbors to restore default behavior for route exchange.
- During configuration flow, you need not clear all unnumbered neighbors as the session is already in IDLE state after receiving updates with the link-local address in both fields of Next Hop.
- The new configuration at the global level impacts all unnumbered sessions. Use the neighbor or template level `link-local-only-nexthop` command to disable this feature and avoid this impact.

Consider the following topology where the BGP unnumbered with FRR vendor feature interoperates with FRR-based vendors:



Configuration steps on SmartFabric OS10 switches are as follows:

OS10-B configuration:

To configure OS10-B:

1. Create a BGP instance with ASN 100.

```
OS10-B(config)# router bgp 100
```

2. Enable the support of link local Next Hop in both fields for unnumbered peers to internetwork with a FRR-based switch.

```
OS10-B(config-router-bgp-100)#link-local-only-nexthop
```

3. Create a BGP unnumbered neighbor with the FRR switch.

```
OS10-B(config-router-bgp-100)# neighbor interface ethernet 1/1/5
OS10-B(config-router-neighbor)# no shutdown
```

4. Create a BGP unnumbered neighbor with OS10-A. The neighbor level command `link-local-only-nexthop disable` disables the link-local address in both Next Hop fields for the unnumbered peer on interface Ethernet 1/1/6. This ensures legacy behavior for the route exchange.

```
OS10-B(config-router-bgp-100)# neighbor interface ethernet 1/1/6
OS10-B(config-router-neighbor)# no shutdown
OS10-B(config-router-neighbor)link-local-only-nexthop disable
```

OS10-A configuration:

To configure OS10-A:

1. Create a BGP instance with ASN 200.

```
OS10-A(config)# router bgp 200
```

2. Create a BGP unnumbered neighbor with OS10-B.

```
OS10-A(config-router-bgp-200)# neighbor interface ethernet 1/1/6
OS10-A(config-router-neighbor)# no shutdown
```

Run the `link-local-only-nexthop` command in OS10-B connecting to the FRR-based switch at the ROUTER BGP level. After you configure this feature in OS10-B, all outgoing route updates are sent with two Next hops as link-local addresses for all unnumbered peers in all VRFs.

To restore the legacy (default) behavior for unnumbered sessions in OS10-B connecting to other SmartFabric OS10 switches, where the BGP unnumbered feature is not supported, use the `link-local-only-nexthop disable` command at the BGP neighbor or template level to restore the legacy behavior. Otherwise, route updates with two link-local Next hops are dropped in OS10-A and the session terminates.

Link-local-only-nexthop command at the BGP neighbor or template level

The `link-local-only-nexthop` command is also supported at the BGP neighbor and template level with the disable option.

Use this command to enable or disable link-local addresses that are entered in both fields of Next Hop for a particular unnumbered peer or unnumbered peers belonging to a peer-group. By default, this feature is not enabled for the unnumbered neighbor.

When you enable this feature globally and disabled it Neighbor level, precedence is given to the neighbor configuration. As a result, this feature is disabled for that unnumbered peer. Between neighbor and template configurations for this feature, precedence is given to the neighbor configuration.

When the neighbor configuration is in Default state , configuration at the template level, if any, applies. When both neighbor and template configurations are at the default state for this feature, the global configuration of the BGP unnumbered feature applies for all unnumbered peers present in all VRF instances.

The following table describes the BGP unnumbered configuration and its use cases:

Table 61. BGP unnumbered configuration

Steps	Feature configuration	System behavior	Use case
1	Globally enabled and not configured at the neighbor or template level.	The `link-local-only-nexthop` command is enabled for all unnumbered peers in all VRFs.	Use scenarios where all unnumbered sessions are with FRR-based implementations.
2	Globally enabled and disabled at the neighbor or template level.	The `link-local-only-nexthop` command is enabled for all unnumbered peers in all VRFs except the unnumbered neighbors in a disabled configuration.	Use where a few of the unnumbered sessions are with legacy SmartFabric OS10 implementation and this feature is not supported.
3	Globally disabled and enabled at neighbor or the template level.	The feature is enabled only for unnumbered neighbors with enabled configuration.	Use where only few unnumbered sessions are formed with the FRR implementation and other unnumbered sessions follow

Table 61. BGP unnumbered configuration (continued)

Steps	Feature configuration	System behavior	Use case
			a legacy SmartFabric OS10 implementation.
4	Enabled at both the global and neighbor or template level.	The `link-local-only-nexthop` command is enabled for all unnumbered peers in all VRFs.	Use where all unnumbered sessions are with a FRR-based implementation.

Behavior of iBGP unnumbered with cumulus

By default, SmartFabric OS10 has next-hop-self configuration enabled for unnumbered peers under both IPv4 and IPv6 address-families.

Routes that are sent to an iBGP unnumbered peer have Next Hop resolved with Next Hop length as 32. In Cumulus, IPv4 NLRI is advertised with link-local Next Hop and Next Hop length as 16. IPv6 NLRI is advertised with Next Hop unchanged if you do not configure next-hop-self; otherwise, with next-hop-self configured with link-local address the Next hop length as 16.

IPv4 NLRI with Next Hop length as 16 is accepted only if you enable the `link-local-only-nexthop` command for that unnumbered peer. Otherwise, this results in an update error.

IPv6 NLRI with link-local address as Next Hop and length as 16 is accepted only if you enable the `link-local-only-nexthop` command for that unnumbered peer. Otherwise, this results in an update error.

BGP over unnumbered interfaces

As BGP relies on TCP for connection between peers, the interface that connects to the peer requires a unique IP address.

Assigning an IP address to every interface may exhaust the available pool of IP addresses and is error prone. Unnumbered interfaces are the interfaces without unique IP addresses. BGP unnumbered interfaces use the extended Next Hop encoding (ENHE) feature, which is defined by RFC 5549. BGP unnumbered interfaces advertise IPv4 routes with an IPv6 Next Hop.

As IPv6 link-local addresses automatically configure on connected interfaces, BGP uses these link-local addresses to form neighborship. Unnumbered interfaces use IPv6 router advertisements to identify the address of the peer.

Restrictions

- You cannot configure VRRP for IPv6 on an unnumbered interface. This configuration causes BGP session failure.
- You cannot use the default VLAN as the unnumbered VLAN.
- Route reflectors are not supported with unnumbered peers.
- Confederations are not supported with unnumbered peers.
- Dampening is not supported with unnumbered peers.

Configure an unnumbered neighbor

1. Create an interface, if required, in CONFIGURATION mode.

   ```
   interface interface-type
   ```

   `interface interface-type`—(Optional) Enter one of the following interface types:
   - `ethernet node/slot/port[:subport]`—Display Ethernet interface information.
   - `port-channel id-number`—Display port channel interface IDs, from 1 to 999 or 1001 to 2000.
   - `vlan vlan-id`—Display the VLAN interface number, from 1 to 4093.
2. Enable RAs on the interface in INTERFACE mode.

   ```
   ipv6 nd send-ra
   ```
3. Configure minimum and maximum RA intervals in INTERFACE mode.

   ```
   ipv6 nd min-ra-interval 3
   ipv6 nd max-ra-interval 4
   ```

4. Enable BGP on the device.

```
router bgp as-number
```

5. Enter an unnumbered neighbor in ROUTER-BGP mode.

```
neighbor interface interface-type
```

`interface interface-type`—(Optional) Enter one of the following interface types:

- `ethernet node/slot/port[:subport]`—Display Ethernet interface information.
- `port-channel id-number`—Display port channel interface IDs, from 1 to 999 or 1001 to 2000.
- `vlan vlan-id`—Display the VLAN interface number, from 1 to 4093.

6. Enable the BGP neighbor in ROUTER-NEIGHBOR mode.

```
no shutdown
```

Example for configuring an unnumbered neighbor

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# exit
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor interface ethernet 1/1/1
OS10(config-router-neighbor)# no shutdown
```

Example outputs for viewing unnumbered BGP interfaces

```
OS10# show ip bgp

Auto-unnumbered interfaces for BGP

Although the BGP unnumbered feature provides an easier way of configuring BGP, you can use the BGP auto-unnumbered feature to reduce configuration overhead.

The BGP auto-unnumbered feature works similar to the BGP unnumbered feature. However, with the BGP auto-unnumbered feature configured, the switch automatically establishes BGP sessions on interfaces that learn the link-local addresses of peer devices.

Restrictions

All restrictions that are applicable for the BGP unnumbered feature are also applicable for the BGP auto-unnumbered feature.

Prerequisites

- Enable RA advertisement on the required interfaces by using the `ipv6 nd send-ra` command.
- If you configure RA timers globally and on individual interfaces, interface level RA timers take precedence. In the absence of interface level RA, global RA timers are applied to all interfaces.
- Configure the global RA timers. Dell Technologies recommends that you configure three seconds for the minimum and four seconds for the maximum RA timer.
- Configure the physical and port channel interfaces to operate in Layer 3 mode by using the `no switchport` command. VLAN interfaces do not require this configuration.
- Configure the `ipv6 bgp unnumbered {ebgp-template | ibgp-template}` command on the required interfaces. For the BGP auto-unnumbered feature to work, you must specify the type of the template.
- While forming BGP neighborship on an interface, the system uses the corresponding template that is configured under the ROUTER-BGP-NEIGHBOR mode.
- Template configuration is optional. If there is no template configured, neighborship comes up with default parameters.
- The template type configuration is only used when there is a valid inherit template configuration on the neighbor with the auto-unnumbered configuration. For example, the `ipv6 bgp unnumbered ebgp-template` configuration requires the corresponding `inherit ebgp-template` configuration.
- An explicit BGP unnumbered configuration using the `neighbor interface` command brings down any BGP sessions that are formed using the auto-unnumbered configuration on that interface. The system brings a new session with new configured parameters.
- If you delete the explicit neighbor configuration which is already configured, the BGP sessions are brought down. If there is an interface-level auto-unnumbered configuration, the system tries to bring up the BGP session with the unnumbered-auto neighbor configuration.

Software behavior

- If you delete an interface that is configured as a BGP auto-unnumbered interface which is already in established state, the established state is brought down.
- If you configure the `default interface` command on an interface that is configured as a BGP auto-unnumbered interface which is already in established state, the established state is brought down.

Configure an auto-unnumbered neighbor

To configure an auto-unnumbered neighbor:

1. Configure minimum and maximum RA intervals in CONFIGURATION mode.

```
ipv6 nd min-ra-interval interval
ipv6 nd max-ra-interval interval
```

2. Configure physical or port-channel interfaces as Layer 3 interfaces in INTERFACE mode.

```
interface range ethernet 1/1/1-1/1/4
no shutdown
no switchport
```

3. Enable RAs on the interfaces in INTERFACE mode.

```
ipv6 nd send-ra
```

4. Configure the interfaces as BGP auto-unnumbered interfaces in INTERFACE mode.

```
ipv6 bgp unnumbered {ebgp-template | ibgp-template}
```

5. Enable BGP on the device in CONFIGURATION mode.

```
router bgp as-number
```

6. Create a template, and assign parameters to the template in ROUTER-BGP mode.

```
template template-name
timers keepalive holdtime
```

7. Create a BGP auto unnumbered neighbor in ROUTER-BGP mode.

```
neighbor unnumbered-auto
no shutdown
```

8. Configure the peer group template that the neighbors use to inherit peer-group configuration in ROUTER-NEIGHBOR mode. This template is applied only to the auto-unnumbered interfaces configured with the `ipv6 bgp unnumbered` command.

```
inherit {ebgp-template | ibgp-template} template-name
```

NOTE: The `inherit ebgp-template` and `inherit ibgp-template` commands apply the template configurations to all auto-unnumbered interfaces that are configured with the `ipv6 bgp unnumbered ebgp-template` command.

9. Enable the IPv6 address family to advertise IPv6 routes in ROUTER-NEIGHBOR mode. IPv4 address family is activated by default.

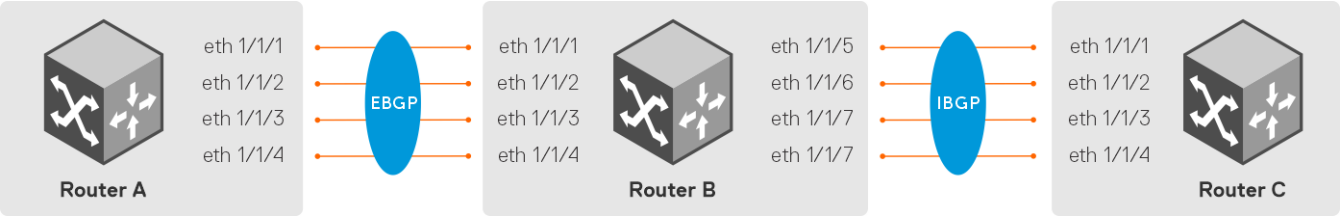
```
address-family ipv6 unicast
activate
```

10. Enable EVPN address family to advertise EVPN routes in ROUTER-NEIGHBOR mode.

```
address-family l2vpn evpn
activate
```

Example auto-unnumbered BGP configuration

In the following figure, Router A and Router B share eBGP routes. Router B and Router C share iBGP routes. This section provides a sample configuration for this topology.



Router A configuration

1. Configure recommended RA timers globally for fast convergence in CONFIGURATION mode.

```
OS10-A(config)# ipv6 nd min-ra-interval 3
OS10-A(config)# ipv6 nd max-ra-interval 4
```

2. Make the required interfaces in CONFIGURATION mode and convert them to Layer 3 routing interfaces.

```
OS10-A(config)# interface range ethernet 1/1/1-1/1/4
OS10-A(conf-range-eth1/1/1-1/1/4)# no shutdown
OS10-A(conf-range-eth1/1/1-1/1/4)# no switchport
```

3. Enable RA transmission on all the interfaces in the range in INTERFACE mode.

```
OS10-A(conf-range-eth1/1/1-1/1/4)# ipv6 nd send-ra
```

4. Configure the interfaces as BGP auto-unnumbered interfaces in INTERFACE mode.

```
OS10-A(conf-range-eth1/1/1-1/1/4)# ipv6 bgp unnumbered ebgp-template
```

5. Create BGP instance in CONFIGURATION mode.

```
OS10-A(config)# router bgp 100
```

6. Create a template and assign necessary parameters in ROUTER-BGP mode.

```
OS10-A(config-router-bgp-100)# template ext-bgp
OS10-A(config-router-template)# timers 120 360
```

7. Enable the BGP auto-unnumbered neighbor feature in ROUTER-BGP mode.

```
OS10-A(config-router-bgp-100)# neighbor unnumbered-auto
OS10-A(config-router-neighbor)# no shutdown
```

8. Configure the peer group template that the neighbors use to inherit peer-group configuration in ROUTER-NEIGHBOR mode. This template is applied only to the auto-unnumbered interfaces configured with the `ipv6 bgp unnumbered` command.

```
OS10-A(config-router-neighbor)# inherit ebgp-template ext-bgp
```

9. Enable IPv6 address family to advertise IPv6 routes in ROUTER-NEIGHBOR mode.

```
OS10-A(config-router-neighbor)# address-family ipv6 unicast
OS10-A(config-router-bgp-neighbor-af)# activate
```

10. Enables EVPN address family to advertise EVPN routes in ROUTER-NEIGHBOR mode.

```
OS10-A(config-router-neighbor)# address-family l2vpn evpn
OS10-A(config-router-bgp-neighbor-af)# activate
```

Router B configuration

1. Configure recommended RA timers globally for fast convergence in CONFIGURATION mode.

```
OS10-B(config)# ipv6 nd min-ra-interval 3
OS10-B(config)# ipv6 nd max-ra-interval 4
```

2. Make the required interfaces in CONFIGURATION mode and convert them to Layer 3 routing interfaces.

```
OS10-B(config)# interface range ethernet 1/1/1-1/1/8
OS10-B(conf-range-eth1/1/1-1/1/8)# no shutdown
OS10-B(conf-range-eth1/1/1-1/1/8)# no switchport
```

3. Enable RA transmission on all the interfaces in the range in INTERFACE mode.

```
OS10-B(conf-range-eth1/1/1-1/1/8)# ipv6 nd send-ra
```

4. Configure the interfaces as BGP auto-unnumbered interfaces in INTERFACE mode.

```
OS10-B(conf-range-eth1/1/1-1/1/4)# ipv6 bgp unnumbered ebgp-template
OS10-B(conf-range-eth1/1/5-1/1/8)# ipv6 bgp unnumbered ibpg-template
```

5. Create BGP instance in CONFIGURATION mode.

```
OS10-B(config)# router bgp 100
```

6. Create a template and assign necessary parameters in ROUTER-BGP mode.

```
OS10-B(config-router-bgp-100)# template ext-bgp
OS10-B(config-router-template)# timers 120 360
```

7. Enable the BGP auto-unnumbered neighbor feature in ROUTER-BGP mode.

```
OS10-B(config-router-bgp-100)# neighbor unnumbered-auto
OS10-B(config-router-neighbor)# no shutdown
```

8. Configure the peer group template that the neighbors use to inherit peer-group configuration in ROUTER-NEIGHBOR mode. This template is applied only to the auto-unnumbered interfaces configured with the `ipv6 bgp unnumbered` command.

```
OS10-B(config-router-neighbor)# inherit ebgp-template ext-bgp
```

9. Enable IPv6 address family to advertise IPv6 routes in ROUTER-NEIGHBOR mode.

```
OS10-B(config-router-neighbor)# address-family ipv6 unicast
OS10-B(config-router-bgp-neighbor-af)# activate
```

10. Enables EVPN address family to advertise EVPN routes in ROUTER-NEIGHBOR mode.

```
OS10-B(config-router-neighbor)# address-family l2vpn evpn
OS10-B(config-router-bgp-neighbor-af)# activate
```

Router C configuration

1. Configure recommended RA timers globally for fast convergence in CONFIGURATION mode.

```
OS10-C(config)# ipv6 nd min-ra-interval 3
OS10-C(config)# ipv6 nd max-ra-interval 4
```

2. Make the required interfaces in CONFIGURATION mode and convert them to Layer 3 routing interfaces.

```
OS10-C(config)# interface range ethernet 1/1/1-1/1/4
OS10-C(conf-range-eth1/1/1-1/1/4)# no shutdown
OS10-C(conf-range-eth1/1/1-1/1/4)# no switchport
```

3. Enable RA transmission on all the interfaces in the range in INTERFACE mode.

```
OS10-C(conf-range-eth1/1/1-1/1/4)# ipv6 nd send-ra
```

4. Configure the interfaces as BGP auto-unnumbered interfaces in INTERFACE mode.

```
OS10-C(conf-range-eth1/1/1-1/1/4)# ipv6 bgp unnumbered ibgp-template
```

5. Create BGP instance in CONFIGURATION mode.

```
OS10-C(config)# router bgp 100
```

6. Create a template and assign necessary parameters in ROUTER-BGP mode.

```
OS10-C(config-router-bgp-100)# template int-bgp
OS10-C(config-router-template)# weight 100
```

7. Configure the BGP auto-unnumbered neighbor in ROUTER-BGP mode.

```
OS10-C(config-router-bgp-100)# neighbor unnumbered-auto
OS10-C(config-router-neighbor)# no shutdown
```

8. Configure the peer group template that the neighbors use to inherit peer-group configuration in ROUTER-NEIGHBOR mode. This template is applied only to the auto-unnumbered interfaces configured with the `ipv6 bgp unnumbered` command.

```
OS10-C(config-router-neighbor)# inherit ibgp-template int-bgp
```

9. Enable IPv6 address family to advertise IPv6 routes in ROUTER-NEIGHBOR mode.

```
OS10-C(config-router-neighbor)# address-family ipv6 unicast
OS10-C(config-router-bgp-neighbor-af)# activate
```

10. Enables EVPN address family to advertise EVPN routes in ROUTER-NEIGHBOR mode.

```
OS10-C(config-router-neighbor)# address-family l2vpn evpn
OS10-C(config-router-bgp-neighbor-af)# activate
```

Configure Dual Stack

OS10 supports dual stack for BGPv4 and BGPv6. Dual stack BGP allows simultaneous exchange of the same IPv4 or IPv6 prefixes through different IPv4 and IPv6 peers. You can enable dual stack using the `activate` command in the corresponding address-family mode. By default, `activate` command is enabled for the IPv4 address family for all the neighbors.

If a BGP-v4 neighbor wants to carry ipv6 prefix information, it activates the IPv6 address-family. For a BGP-v6 neighbor to carry ipv4 prefix, it activates the IPv4 address-family.

1. Enable support for the IPv6 unicast family in CONFIG-ROUTER-BGP mode.

```
address family ipv6 unicast
```

2. Enable IPv6 unicast support on a BGP neighbor/template in CONFIG-ROUTER-BGP-AF mode.

```
activate
```

Configure administrative distance

Routers use administrative distance to determine the best path between two or more routes to reach the same destination. Administrative distance indicates the reliability of the route; the lower the administrative distance, the more reliable the route. If the routing table manager (RTM) receives route updates from one or more routing protocols for a single destination, it chooses the best route based on the administrative distance.

You can assign an administrative distance for the following BGP routes using the `distance bgp` command:

- External BGP (eBGP) routes
- Internal BGP (iBGP) routes
- Local routes

If you do not configure the administrative distance for BGP routes, the following default values are used:

- eBGP—20
- iBGP—200
- local routes—200

To change the administrative distance for BGP, use the following command:

`distance bgp` *`external-distance internal-distance local-distance`*

Configure administrative distance

1. Enable BGP and assign the AS number in CONFIGURATION mode, from 0.1 to 65535.65535 or 1 to 4294967295.

```
OS10# configure terminal
OS10(config)# router bgp 100
```

2. Use one of the following commands to enter the respective ADDRESS-FAMILY mode from ROUTER-BGP mode:

   IPv4:

   ```
   address-family ipv4 unicast
   ```

   IPv6:

   ```
   address-family ipv6 unicast
   ```

3. Change the administrative distance for BGP from the respective ADDRESS-FAMILY mode.

   IPv4:

   ```
   distance bgp 21 200 200
   ```

   IPv6:

   ```
   distance bgp 21 201 250
   ```

The following example provides the configuration for nondefault VRF:

OS10# configure terminal OS10(config)# router bgp 100

```
OS10(config-router-bgp-100)# vrf blue
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# distance bgp 21 200 200
OS10(config-router-bgp-100-vrf)# address-family ipv6 unicast
OS10(configure-router-bgpv6-vrf-af)# distance bgp 21 201 250
```

Peer templates

To configure multiple BGP neighbors at one time, create and populate a BGP peer template. An advantage of configuring peer templates is that members of a peer template inherit the configuration properties of the template and share the update policy. Always create a peer template and assign a name to it before adding members to the peer template. Create a peer template before configuring any route policies for the template.

1. Enable BGP, and assign the AS number to the local BGP speaker in CONFIGURATION mode, from 1 to 65535 for 2 bytes, 1 to 4294967295 | 0.1 to 65535.65535 for 4 bytes, or 0.1 to 65535.65535, in dotted format.

   ```
   router bgp as-number
   ```

2. Create a peer template by assigning a neighborhood name to it in ROUTER-BGP mode.

   ```
   template template-name
   ```

3. (Optional) Add a text description for the template in ROUTER-TEMPLATE mode.

   ```
   description text
   ```

4. Enter Address Family mode in ROUTER-NEIGHBOR mode.

   ```
   address-family {[ipv4 | ipv6] [unicast]}
   ```

5. Filter networks in routing updates, create a route-map, and assign a filtering criteria in ROUTER-BGP-NEIGHBOR-AF mode.

   ```
   distribute-list prefix-list-name {in | out}
   ```

   ```
   route-map map-name {in | out}
   ```

6. Add a neighbor as a remote AS in ROUTER-TEMPLATE mode, from 1 to 65535 for 2 bytes, 1 to 4294967295 | 0.1 to 65535.65535 for 4 byte, or 0.1 to 65535.65535, in dotted format.

   ```
   neighbor ip-address
   ```

7. (Optional) Add a remote neighbor, and enter the AS number in ROUTER-TEMPLATE mode.

```
remote-as as-number
```

- To add an EBGP neighbor, configure the `as-number` parameter with a number different from the BGP as-number configured in the `router bgp as-number` command.
- To add an IBGP neighbor, configure the `as-number` parameter with the same BGP as-number configured in the `router bgp as-number` command.

NOTE: When you configure an unnumbered interface, do not configure the remote AS number.

8. Assign a peer-template with a peer-group name from which to inherit to the neighbor in ROUTER-NEIGHBOR mode.
   - For peers with an IP address:

     ```
     inherit template template-name
     ```

   - For peers with unnumbered interfaces:

     ```
     inherit template template-name inherit-type {ebgp | ibgp}
     ```

9. Enable the neighbor in ROUTER-BGP mode.

```
no shutdown
```

A neighbor may keep its configuration after it is added to a peer group if the neighbor configuration is more specific than the peer group and if the neighbor configuration does not affect outgoing updates.

To display the peer-group configuration assigned to a BGP neighbor, use the `show ip bgp peer-group peer-group-name` command. The `show ip bgp neighbor` command output does not display peer-group configurations.

The following example shows a sample configuration:

Configure peer templates

```
OS10# configure terminal
OS10(config)# router bgp 64601
OS10(config-router-bgp-64601)# template leaf_v4
OS10(config-router-template)# description peer_template_1_abcd
OS10(config-router-template)# address-family ipv4 unicast
OS10(config-router-bgp-template-af)# distribute-list leaf_v4_in in
OS10(config-router-bgp-template-af)# distribute-list leaf_v4_out out
OS10(config-router-bgp-template-af)# route-map set_aspath_prepend in
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# exit
OS10(config-router-bgp-64601)# neighbor 100.5.1.1
OS10(config-router-neighbor)# inherit template leaf_v4
OS10(config-router-neighbor)# remote-as 64802
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-64601)# neighbor 100.6.1.1
OS10(config-router-neighbor)# inherit template leaf_v4
OS10(config-router-neighbor)# remote-as 64802
OS10(config-router-neighbor)# no shutdown
```

View peer group status

```
OS10# show ip bgp peer-group leaf_v4
Peer-group leaf_v4, remote AS 0
  BGP version 4
  Minimum time between advertisement runs is 30 seconds
  Description: peer_template_1_abcd
  For address family:  Unicast
  BGP neighbor is leaf_v4, peer-group external
  Update packing has 4_OCTET_AS support enabled

  Number of peers in this group 2
  Peer-group members:
```

```
    100.5.1.1
    100.6.1.1
```

```
OS10# show ip bgp peer-group bg1
    Peer-group bg1, remote AS 0
    BGP version 4
    Minimum time between advertisement runs is 30 seconds

    For address family: Unicast
    BGP neighbor is bg1, peer-group external
    Update packing has 4_OCTET_AS support enabled

    Number of peers in this group 2
    Peer-group members:
    40.1.1.2

    ethernet 1/1/1
```

```
OS10# show ip bgp peer-group leaf_v4 summary
BGP router identifier 100.0.0.8 local AS number 64601

```

Peer templates for a nondefault VRF instance

You can create peer templates to add multiple neighbors at a time to the nondefault VRF instance that you create.

1. Enable BGP, and assign the AS number to the local BGP speaker in CONFIGURATION mode, from 1 to 65535 for 2 bytes, 1 to 4294967295 | 0.1 to 65535.65535 for 4 bytes, or 0.1 to 65535.65535, in dotted format.

   ```
   router bgp as-number
   ```

2. Enter CONFIG-ROUTER-VRF mode to create a peer template for the nondefault VRF instance that you create.

   ```
   vrf vrf-name
   ```

3. Create a peer template by assigning a neighborhood name to it in CONFIG-ROUTER-VRF mode.

   ```
   template template-name
   ```

4. Add a neighbor as a remote AS in ROUTER-TEMPLATE mode, from 1 to 65535 for 2 bytes, 1 to 4294967295 | 0.1 to 65535.65535 for 4 bytes, or 0.1 to 65535.65535, in dotted format.

   ```
   neighbor ip-address
   ```

5. Add a remote neighbor, and enter the AS number in ROUTER-TEMPLATE mode.

   ```
   remote-as as-number
   ```

   - To add an EBGP neighbor, configure the `as-number` parameter with a number different from the BGP as-number configured in the `router bgp as-number` command.
   - To add an IBGP neighbor, configure the `as-number` parameter with the same BGP as-number configured in the `router bgp as-number` command.

6. (Optional) Add a text description for the template in ROUTER-TEMPLATE mode.

   ```
   description text
   ```

7. Assign a peer-template with a peer-group name from which to inherit to the neighbor in ROUTER-NEIGHBOR mode.
   - For peers with an IP address:

     ```
     inherit template template-name
     ```

   - For peers with unnumbered interfaces:

     ```
     inherit template template-name inherit-type {ebgp | ibgp}
     ```

8. Enable the neighbor in ROUTER-BGP mode.

   ```
   neighbor ip-address
   ```

9. Enable the peer-group in ROUTER-NEIGHBOR mode.

   ```
   no shutdown
   ```

A neighbor may keep its configuration after it is added to a peer group if the neighbor configuration is more specific than the peer group and if the neighbor configuration does not affect outgoing updates.

To display the peer-group configuration that is assigned to a BGP neighbor, use the `show ip bgp peer-group peer-group-name` command. The `show ip bgp neighbor` command output does not display peer-group configurations.

Configure peer templates

```
OS10(config)# router bgp 300
OS10(config-router-bgp-300) vrf blue
OS10(config-router-vrf)# template ebgppg
OS10(config-router-template)# remote-as 100
OS10(config-router-template)# description peer_template_1_abcd
OS10(config-router-template)# exit
OS10(config-router-vrf)# neighbor 3.1.1.1
OS10(config-router-neighbor)# inherit template ebgppg
OS10(config-router-neighbor)# no shutdown
```

Neighbor fall-over

The BGP neighbor fall-over feature reduces the convergence time while maintaining stability. When you enable fall-over, BGP tracks IP reachability to the peer remote address and the peer local address.

When remote or peer local addresses become unreachable, BGP brings the session down with the peer. For example, if no active route exists in the routing table for peer IPv6 destinations/local address, BGP brings the session down.

By default, the hold time governs a BGP session. Configure BGP fast fall-over on a per-neighbor or peer-group basis. BGP routers typically carry large routing tables as frequent session resets are not desirable. If you enable fail-over, the connection to an internal BGP peer is immediately reset if the host route added to reach the internal peer fails.

1. Enter the neighbor IP address in ROUTER-BGP mode.

   ```
   neighbor ip-address
   ```

2. Disable fast fall-over in ROUTER-NEIGHBOR mode.

   ```
   no fall-over
   ```

3. Enter the neighbor IP address in ROUTER-BGP mode.

   ```
   neighbor ip-address
   ```

4. Enable BGP fast fall-Over in ROUTER-NEIGHBOR mode.

   ```
   fall-over
   ```

Configure neighbor fall-over

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 3.1.1.1
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# fall-over
OS10(config-router-neighbor)# no shutdown
```

Verify neighbor fall-over on neighbor

```
OS10(config-router-neighbor)# do show ip bgp neighbors 3.1.1.1
BGP neighbor is 3.1.1.1, remote AS 100, local AS 100  internal link

  BGP version 4, remote router ID 3.3.3.33
  BGP state ESTABLISHED, in this state for 00:17:17
  Last read 00:27:54 seconds
  Hold time is 180, keepalive interval is 60 seconds
  Configured hold time is 180, keepalive interval is 60 seconds
  Fall-over enabled

  fall-over
  remote-as 102
!
```

Configure password

You can enable message digest 5 (MD5) authentication with a password on the TCP connection between two BGP neighbors.

Configure the same password on both BGP peers. When you configure MD5 authentication between two BGP peers, each segment of the TCP connection is verified and the MD5 digest is checked on every segment sent on the TCP connection. Configuring a password for a neighbor establishes a new connection.

NOTE: You can secure the VTEP neighbor communications as well using the MD5 authentication.

Configure password

- Configure the password in both the BGP peers in ROUTER-NEIGHBOR CONFIGURATION or ROUTER-TEMPLATE CONFIGURATION mode. The password provided in ROUTER-NEIGHBOR mode takes preference over the password in ROUTER-TEMPLATE mode. Enter the password either as plain text or in encrypted format.
  - `password {9 encrypted password-string|password-string}`

View password configuration

- `show configuration`

Peer 1 in ROUTER-NEIGHBOR mode

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/5

  remote-as 20
  no shutdown
```

Fast external fallover

Fast external fallover terminates EBGP sessions of any directly adjacent peer if the link used to reach the peer goes down. BGP does not wait for the hold-down timer to expire.

Fast external fallover is enabled by default. To disable or re-enable it, use the `[no] fast-external-fallover` command. For the `fast-external-fallover` command to take effect on an established BGP session, you must reset the session using the `clear ip bgp {* | peer-ipv4-address | peer-ipv6-address}` command.

View fast external fallover configuration

Passive peering

When you enable a peer-template, the system sends an OPEN message to initiate a TCP connection. If you enable passive peering for the peer template, the system does not send an OPEN message but responds to an OPEN message.

When a BGP neighbor connection with authentication rejects a passive peer-template, the system prevents another passive peer-template on the same subnet from connecting with the BGP neighbor. To work around this constraint, change the BGP configuration or change the order of the peer template configuration.

You can restrict the number of passive sessions the neighbor accepts using the `limit` command.

1. Enable BGP and assign the AS number to the local BGP speaker in CONFIGURATION mode (1 to 65535 for 2-byte, 1 to 4294967295 for 4-byte).

   ```
   router bgp as-number
   ```

2. Configure a template that does not initiate TCP connections with other peers in ROUTER-BGP mode. A maximum of 16 characters.

   ```
   template template-name
   ```

3. Create and enter the AS number for the remote neighbor in ROUTER-BGP-TEMPLATE mode (1 to 4294967295).

   ```
   remote-as as-number
   ```

4. Enable peer listening and enter the maximum dynamic peers count in ROUTER-BGP-TEMPLATE mode (1 to 4294967295).

   ```
   listen neighbor ip-address limit
   ```

Only after the peer template responds to an OPEN message sent on the subnet does the state of its BGP change to ESTABLISHED. After the peer template is ESTABLISHED, the peer template is the same as any other peer template, see Peer templates.

If you do not configure a BGP device in Peer-Listening mode, a session with a dynamic peer comes up. Passwords are not supported on BGPv4/v6 dynamic peers.

Configure passive peering

```
OS10(config)# router bgp 10
OS10(conf-router-bgp-10)# template bgppg
```

```
OS10(conf-router-template)# remote-as 100
OS10(conf-router-template)# listen 32.1.0.0/8 limit 10
```

Local AS

During BGP network migration, you can maintain existing AS numbers. Reconfigure your routers with the new information to disable after the migration. Network migration is not supported on passive peer templates. You must configure Peer templates before assigning it to an AS.

The following options are available with the `local-as` command:

To append the `global-as` and `local-as` in the outbound AS_PATH for the neighbor, use:

```
local-as as-number
```

To not add the `local-as` to prefixes received from the BGP neighbor, use:

```
local-as as-number no-prepend
```

To not add the `global AS number` in the outbound AS_PATH for that neighbor, use:

```
local-as as-number no-prepend replace-as
```

1. Enter a neighbor IP address, A.B.C.D, in ROUTER-BGP mode.

   ```
   neighbor ip-address
   ```

2. Enter a local-as number for the peer, and the AS values not prepended to announcements from the neighbors in ROUTER-NEIGHBOR mode (1 to 4294967295).

   ```
   local-as as number [no prepend]
   ```

3. Return to ROUTER-BGP mode.

   ```
   exit
   ```

4. Enter a template name to assign to the peer-groups in ROUTER-BGP mode. A maximum of 16 characters.

   ```
   template template-name
   ```

5. Enter a local-as number for the peer in ROUTER-TEMPLATE mode.

   ```
   local-as as number [no prepend]
   ```

6. Add a remote AS in ROUTER-TEMPLATE mode (1 to 65535 for 2 bytes, 1 to 4294967295 for 4 bytes).

   ```
   remote-as as-number
   ```

Allow external routes from neighbor

```
OS10(config)# router bgp 10
OS10(conf-router-bgp-10)# neighbor 32.1.1.2
OS10(conf-router-neighbor)# local-as 50
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-10)# template bgppg1
OS10(conf-router-template)# fall-over
OS10(conf-router-template)# local-as 400
OS10(conf-router-template)# remote-as 102
```

Local AS number disabled

```
OS10(config)# router bgp 102
OS10(conf-router-bgp-102)# neighbor 32.1.1.2
OS10(conf-router-neighbor)# no local-as 100
```

AS number limit

Sets the number of times an AS number occurs in an AS path. The `allow-as` parameter permits a BGP speaker to allow the AS number for a configured number of times in the updates received from the peer.

The AS-PATH loop is detected if the local AS number is present more than the number of times in the command.

1. Enter the neighbor IP address to use the AS path in ROUTER-BGP mode.

   ```
   neighbor ip address
   ```

2. Enter Address Family mode in ROUTER-NEIGHBOR mode.

   ```
   address-family {{ipv4 | ipv6} unicast | l2vpn evpn}
   ```

3. Allow the neighbor IP address to use the AS path the specified number of times in ROUTER-BGP-NEIGHBOR-AF mode (1 to 10).

   ```
   allowas-in number
   ```

Configure AS number appearance

```
OS10(config)# router bgp 10
OS10(conf-router-bgp-10)# neighbor 1.1.1.2
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# allowas-in 5
```

View AS numbers in AS paths

```
OS10# show running-configuration bgp
!
router bgp 101
 no fast-external-fallover

i
```

Additional paths

The `add-path` command is disabled by default.

1. Assign an AS number in CONFIGURATION mode.

   ```
   router bgp as-number
   ```

2. Enter a neighbor and IP address (A.B.C.D) in ROUTER-BGP mode.

   ```
   neighbor ip-address
   ```

3. Enter Address Family mode in ROUTER-NEIGHBOR mode.

   ```
   address-family {[ipv4 | ipv6] [unicast])
   ```

4. Allow the specified neighbor to send or receive multiple path advertisements in ROUTER-BGP mode. The *count* parameter controls the number of paths that are advertised — not the number of paths received.

   ```
   add-path [both | received | send] count
   ```

Enable additional paths

```
OS10(config)# router bgp 102
OS10(conf-router-bgp-102)# neighbor 32.1.1.2
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# add-path both 3
```

Redistribute routes

Add routes from other routing instances or protocols to the BGP process. You can include OSPF, static, or directly connected routes in the BGP process with the `redistribute` command.

- Include directly connected or user-configured (static) routes in ROUTER-BGP-AF mode.

  ```
  redistribute {connected | static}
  ```

- Include specific OSPF routes in IS-IS in ROUTER-BGP-AF mode (1 to 65535).

  ```
  redistribute ospf process-id
  ```

Disable redistributed routes

```
OS10(conf-router-bgp-af)# no redistribute ospf route-map ospf-to-bgp
```

All the paths that an OS10 device learns; for example, static route, connected routes, and redistributed routes from different protocols, are valid. However, the system maintains only the route that has the shortest administrative distance from the source as the active route path. The system marks other valid paths as inactive routes in the routing table. When an active path is removed, the next best valid path based on the shortest administrative distance becomes the active route path. The order of preference based on the protocol source is:

1. Connected
2. Static
3. EBGP
4. OSPF

5. IBGP

Before Release 10.5.2.0, the `redistribute` command redistributed active and inactive route paths. By default, from Release 10.5.2.0 and beyond, this command redistributes only active route paths. If you have configured route redistribution, when you upgrade to Release 10.5.2.0 or later, the inactive route paths are no longer redistributed.

To redistribute both active and inactive routes, you must configure a route map with the `inactive-path-additive` rule and apply the route map to the `redistribute` command.

To redistribute active and inactive IPv4/IPv6 routes from other unicast protocols into BGP:

1. Configure a route-map to match the inactive-path-additive rule.

```
route-map route-map-name
match inactive-path-additive
```

2. Apply the route-map to the `redistribute` command.

```
redistribute {connected [route-map map-name] | imported-bgp-routes {vrf vrf-name}
[route-map map-name] | ospf process-id [route-map map-name] | static [route-map map-
name] | l2vpn evpn [route-map map-name]}
```

Redistribute active routes

```
OS10(config)# router bgp 102
OS10(config-router-bgp-102)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute ospf 12
```

Redistribute active and inactive IPv4 OSPF routes into BGP

```
OS10# configure terminal
OS10(config)# route-map redis-inactive-routes
OS10(config-route-map)# match inactive-path-additive
OS10(config-route-map)# exit

OS10(config)# router bgp 100
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute ospf 10 route-map redis-inactive-r
outes
```

Redistribute active and inactive IPv6 L2 VPN EVPN routes into BGP

```
OS10# configure terminal
OS10(config)# route-map redis-inactive-routes
OS10(config-route-map)# match inactive-path-additive
OS10(config-route-map)# exit

OS10(config)# router bgp 100
OS10(config-router-bgp-100)# address-family ipv6 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn route-map redis-inactive-r
outes
```

MED attributes

OS10 uses the MULTI_EXIT_DISC or MED attribute when comparing EBGP paths from the same AS. MED comparison is not performed in paths from neighbors with different AS numbers.

1. Enable MED comparison in the paths from neighbors with different AS in ROUTER-BGP mode.

```
always-compare-med
```

2. Change the best path MED selection in ROUTER-BGP mode.

```
bestpath med {confed | missing-as-best}
```

- `confed`—Selects the best path MED comparison of paths learned from BGP confederations.
- `missing-as-best`—Treats a path missing an MED as the most preferred one.
- `missing-as-worst`—Treats a path missing an MED as the least preferred one.

Modify MED attributes

```
OS10(config)# router bgp 100
OS10(conf-router-bgp-100)# always-compare-med
OS10(conf-router-bgp-100)# bestpath med confed
```

Local preference attribute

You can change the value of the LOCAL_PREFERENCE attributes for all routes the router receives. To change the LOCAL_PREF value in ROUTER-BGP mode from 0 to 4294967295 with default 100, use the `default local preference value` command.

To view the BGP configuration, use the `show running-configuration` command. A more flexible method for manipulating the LOCAL_PREF attribute value is to use a route-map.

1. Assign a name to a route map in CONFIGURATION mode.

   ```
   route-map map-name {permit | deny | sequence-number}
   ```

2. Change the LOCAL_PREF value for routes meeting the criteria of this route map in ROUTE-MAP mode, then return to CONFIGURATION mode.

   ```
   set local-preference value
   exit
   ```

3. Enter ROUTER-BGP mode.

   ```
   router bgp as-number
   ```

4. Enter the neighbor to apply the route map configuration in ROUTER-BGP mode.

   ```
   neighbor {ip-address}
   ```

5. Apply the route map to the neighbor's incoming or outgoing routes in ROUTER-BGP-NEIGHBOR-AF mode.

   ```
   route-map map-name {in | out)
   ```

6. Enter the peer group to apply the route map configuration in ROUTER-BGP mode.

   ```
   template template-name
   ```

7. Apply the route map to the peer group's incoming or outgoing routes in CONFIG-ROUTER-TEMPLATE-AF mode.

   ```
   route-map map-name {in | out}
   ```

Configure and view local preference attribute

```
OS10(config)# route-map bgproutemap 1
OS10(conf-route-map)# set local-preference 500
OS10(conf-route-map)# exit
OS10(config)# router bgp 10
OS10(conf-router-bgp-10)# neighbor 10.1.1.4
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# route-map bgproutemap in
```

```
OS10 configure terminal
OS10(config)# route-map bgproutemap 1
OS10(conf-route-map)# set local-preference 500
OS10(conf-route-map)# exit
OS10(config)# router bgp 64601
OS10(conf-router-bgp-64601)# template bgppg
OS10(conf-router-template)# address-family ipv4 unicast
OS10(conf-router-bgp-template-af)# route-map bgproutemap in
```

View route-map

```
OS10(conf-route-map)# do show route-map
route-map bgproutemap, permit, sequence 1
  Match clauses:
  Set clauses:
    local-preference 500
    metric 400
    origin incomplete
```

Weight attribute

You can influence the BGP routing based on the weight value. Routes with a higher weight value have preference when multiple routes to the same destination exist.

1. Assign a weight to the neighbor connection in ROUTER-BGP mode.

   ```
   neighbor {ip-address}
   ```

2. Set a weight value for the route in ROUTER-NEIGHBOR mode (1 to 4294967295, default 0).

   ```
   weight weight
   ```

3. Return to ROUTER-BGP mode.

   ```
   exit
   ```

4. Assign a weight value to the peer-group in ROUTER-BGP mode.

   ```
   template template name
   ```

5. Set a weight value for the route in ROUTER-TEMPLATE mode.

   ```
   weight weight
   ```

Modify weight attribute

```
OS10(config)# router bgp 10
OS10(config-router-bgp-10)# neighbor 10.1.1.4
OS10(config-router-neighbor)# weight 400
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-10)# template zanzibar
OS10(config-router-template)# weight 200
```

Enable multipath

You can have one path to a destination by default, and enable multipath to allow up to 64 parallel paths to a destination. The `show ip bgp network` command includes multipath information for that network.

- Configure the number of ECMP groups in CONFIGURATION.

  ```
  ip ecmp-group maximum-paths number
  ```

- Enable multiple parallel paths in ROUTER-BGP mode.

  ```
  maximum-paths {ebgp | ibgp} number
  ```

Enable multipath

```
OS10(config)#  ip ecmp-group maximum-paths 12
OS10(config)# router bgp 10
OS10(conf-router-bgp-10)# maximum-paths ebgp 10
```

Route-map filters

Filtering routes allows you to implement BGP policies. Use route-maps to control which routes the BGP neighbor or peer group accepts and advertises.

1. Enter the neighbor IP address to filter routes in ROUTER-BGP mode.

```
neighbor ipv4-address
```

2. Enter Address Family mode in ROUTER-NEIGHBOR mode.

```
address-family {[ipv4 | ipv6] [unicast]}
```

3. Create a route-map and assign a filtering criteria in ROUTER-BGP-NEIGHBOR-AF mode, then return to CONFIG-ROUTER-BGP mode.

```
route-map map-name {in | out}
exit
```

   - `in`—Enter a filter for incoming routing updates.
   - `out`—Enter a filter for outgoing routing updates.

4. Enter a peer template name in ROUTER-BGP mode.

```
template template-name
```

5. Enter Address Family mode.

```
address-family {[ipv4 | ipv6] [unicast]}
```

6. Create a route-map, and assign a filtering criteria in ROUTER-BGP-TEMPLATE-AF mode.

```
route-map map-name {in | out}
```

Filter BGP route

```
OS10(config)# router bgp 102
OS10(conf-router-bgp-102)# neighbor 40.1.1.2
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# route-map metro in
OS10(conf-router-bgp-neighbor-af)# exit
OS10(conf-router-bgp-102)# template ebgp
OS10(conf-router-template)# address-family ipv4 unicast
OS10(conf-router-bgp-template-af)# route-map metro in
```

Route reflector clusters

BGP route reflectors are intended for ASs with a large mesh. They reduce the amount of BGP control traffic. With route reflection configured properly, IBGP routers are not fully meshed within a cluster but all receive routing information.

Configure clusters of routers where one router is a concentration router and the others are clients who receive their updates from the concentration router.

1. Assign an ID to a router reflector cluster in ROUTER-BGP mode. You can have multiple clusters in an AS.

```
cluster-id cluster-id
```

2. Assign a neighbor to the router reflector cluster in ROUTER-BGP mode.

```
neighbor {ip-address}
```

3. Configure the neighbor as a route-reflector client in ROUTER-NEIGHBOR mode, then return to ROUTER-BGP mode.

```
route-reflector-client
exit
```

4. Assign a peer group template as part of the route-reflector cluster in ROUTER-BGP mode.

```
template template-name
```

5. Configure the template as the route-reflector client in ROUTER-TEMPLATE mode.

```
route-reflector-client
```

When you enable a route reflector, the system automatically enables route reflection to all clients. To disable route reflection between all clients in this reflector, use the `no bgp client-to-client reflection` command in ROUTER-BGP mode. You must fully mesh all the clients before you disable route reflection.

Configure BGP route reflector

```
OS10(config)# router bgp 102
OS10(conf-router-bgp-102)# cluster-id 4294967295
OS10(conf-router-bgp-102)# neighbor 32.1.1.2
OS10(conf-router-neighbor)# route-reflector-client
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-102)# template zanzibar
OS10(conf-router-template)# route-reflector-client
```

Aggregate routes

OS10 provides multiple ways to aggregate routes in the BGP routing table. At least one route of the aggregate must be in the routing table for the configured aggregate route to become active. AS_SET includes AS_PATH and community information from the routes that are included in the aggregated route.

1. Assign an AS number in CONFIGURATION mode.

```
router bgp as-number
```

2. Enter Address Family mode in ROUTER-BGP mode.

```
address-family {[ipv4 | ipv6] [unicast]}
```

3. Aggregate address in ROUTER-BGPv4-AF mode.

```
aggregate-address ip-address/mask
```

Configure aggregate routes

```
OS10(config)# router bgp 105
OS10(conf-router-bgp-105)# address-family ipv4 unicast
OS10(conf-router-bgpv4-af)# aggregate-address 3.3.0.0/16
```

View running configuration

```
OS10(conf-router-bgpv4-af)# do show running-configuration bgp
! Version
! Last configuration change at Jul  27 06:51:17 2016
!
!
router bgp 105
 !
 address-family ipv4 unicast
  aggregate-address 3.3.0.0/16
 !

neighbor 32.1.1.2
  remote-as 104
  no shutdown
  !
  address-family ipv4 unicast
```

Confederations

Another way to organize routers within an AS and reduce the mesh for IBGP peers is to configure BGP confederations. As with route reflectors, Dell Technologies recommends BGP confederations only for IBGP peering involving many IBGP peering sessions per router.

When you configure BGP confederations, you break the AS into smaller sub-ASs. To devices outside your network, the confederations appear as one AS. Within the confederation sub-AS, the IBGP neighbors are fully meshed and the MED, NEXT_HOP, and LOCAL_PREF attributes maintain between confederations.

1. Enter the confederation ID AS number in ROUTER-BGP mode (1 to 65535 for 2–byte, 1 to 4294967295 for 4–byte).

```
confederation identifier as-number
```

2. Enter which confederation sub-AS are peers in ROUTER-BGP mode, from 1 to 65535 for 2–byte, 1 to 4294967295 for 4–byte. All Confederation routers must be either 4 bytes or 2 bytes. You cannot have a mix of router ASN support.

```
confederation peers as-number [... as-number]
```

Configure BGP confederations

```
OS10(config)# router bgp 65501
OS10(conf-router-bgp-65501)# confederation identifier 100
OS10(conf-router-bgp-65501)# confederation peers 65502 65503 65504
OS10(conf-router-bgp-65501)# neighbor 1.1.1.2
OS10(conf-router-neighbor)# remote-as 65502
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-65501)# neighbor 2.1.1.2
OS10(conf-router-neighbor)# remote-as 65503
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-65501)# neighbor 3.1.1.2
OS10(conf-router-neighbor)# remote-as 65504
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-65501)# end
OS10# show running-configuration bgp
!
router bgp 65501
 confederation identifier 100
 confederation peers 65502 65503 65504
 !
 neighbor 1.1.1.2
  remote-as 65502
  no shutdown
 !
 neighbor 2.1.1.2
  remote-as 65503
  no shutdown
 !
 neighbor 3.1.1.2
  remote-as 65504
  no shutdown
```

Route dampening

When EBGP routes become unavailable, they “flap” and the router issues both WITHDRAWN and UPDATE notices. A flap occurs when a route is withdrawn, readvertised after being withdrawn, or has an attribute change.

The constant router reaction to the WITHDRAWN and UPDATE notices causes instability in the BGP process. To minimize this instability, configure penalties (a numeric value) for routes that flap. When that penalty value reaches a configured limit, the route is not advertised, even if the route is up, the penalty value is 1024.

As time passes and the route does not flap, the penalty value decrements or decays. If the route flaps again, it is assigned another penalty. The penalty value is cumulative and adds underwithdraw, readvertise, or attribute change.

When dampening applies to a route, its path is described by:

History entry	Entry that stores information about a downed route.
Dampened path	Path that is no longer advertised.
Penalized path	Path that is assigned a penalty.

1. Enable route dampening in ROUTER-BGP mode.

```
dampening [half-life | reuse | max-suppress-time]
```

- *half-life* — Number of minutes after which the penalty decreases (1 to 45, default 15). After the router assigns a penalty of 1024 to a route, the penalty decreases by half after the half-life period expires.
- *reuse* — Number compares to the flapping route's penalty value. If the penalty value is less than the reuse value, the flapping route again advertises or is no longer suppressed (1 to 20000, default 750). Withdrawn routes are deleted from the history state.
- *suppress* — Number compares to the flapping route's penalty value. If the penalty value is greater than the suppress value, the flapping route no longer advertises and is suppressed (1 to 20000, default 2000).
- *max-suppress-time* — Maximum number of minutes a route is suppressed (1 to 255, default is four times the half-life value or 60 minutes).

2. View all flap statistics or for specific routes meeting the criteria in EXEC mode.

```
show ip bgp flap-statistics [ip-address [mask]]
```

- *ip-address [mask]* — Enter the IP address and mask.
- filter-list *as-path-name* — Enter the name of an AS-PATH ACL.
- regexp *regular-expression* — Enter a regular express to match on.

When you change the best path selection method, path selections for the existing paths remain unchanged until you reset it by using the `clear ip bgp` command in EXEC mode.

Configure values to reuse or restart route

```
OS10(config)# router bgp 102
OS10(conf-router-bgp-102)# address-family ipv4 unicast
OS10(conf-router-bgpv4-af)# dampening 2 2000 3000 10
```

View dampened (nonactive) routes

```
OS10# show ip bgp flap-statistics

BGP local router ID is 13.176.123.28
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Origin codes: i - IGP, e - EGP, ? - incomplete
          Network                                    From
             Reuse          Path
Total number of prefixes: 0
```

View dampened paths

```
OS10# show ip bgp dampened-paths

BGP local router ID is 80.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, > best
Origin codes: i - IGP, e - EGP, ? - incomplete
      Network        From       Reuse       Path
d*    3.1.2.0/24     80.1.1.2   00:00:12    800 9 8 i
d*    3.1.3.0/24     80.1.1.2   00:00:12    800 9 8 i

d*    3.1.6.0/24     80.1.1.2   00:00:12    800 9 8 i
Total number of prefixes: 5
```

Timers

To adjust the routing timers for all neighbors, configure the timer values using the `timers` command. If both the peers negotiate with different keepalive and hold time values, the final hold time value is the lowest values received. The new keepalive value is one-third of the accepted hold time value.

- Configure timer values for all neighbors in ROUTER-NEIGHBOR mode.

```
timers keepalive holdtime
```

  - *keepalive* — Time interval in seconds, between keepalive messages sent to the neighbor routers (1 to 65535, default 60).
  - *holdtime* — Time interval in seconds, between the last keepalive message and declaring the router dead (3 to 65535, default 180).

Changing timers example

```
OS10(config)# router bgp 102
OS10(config-router-bgp-102)# neighbor 10.5.2.3
OS10(config-router-neighbor)# timers 120 200
```

View nondefault values

```
OS10# show running-configuration
...
 neighbor 32.1.1.2
 remote-as 103
  timers 120 200
  no shutdown
```

Neighbor soft-reconfiguration

BGP soft-reconfiguration allows for fast route changes. Changing routing policies requires a reset of BGP sessions or the TCP connection, for the policies to take effect.

Resets cause undue interruption to traffic due to the hard reset of the BGP cache, and the time it takes to reestablish the session. BGP soft-reconfiguration allows for policies to apply to a session without clearing the BGP session. You can perform a soft-reconfiguration on a per-neighbor basis, either inbound or outbound. BGP soft-reconfiguration clears the policies without resetting the TCP connection. After configuring soft-reconfiguration, use the `clear ip bgp` command to make the neighbor use soft reconfiguration.

When you enable soft-reconfiguration for a neighbor and you run the `clear ip bgp soft in` command, the update database that is stored in the router replays and updates are reevaluated. With this command, the replay and update process trigger only if a route-refresh request is not negotiated with the peer. If the request is negotiated after using the `clear ip bgp soft in` command, BGP sends a route-refresh request to the neighbor and receives all the updates of the peer.

To use soft reconfiguration, or soft reset without preconfiguration, both BGP peers must support soft route refresh. The soft route refresh advertises in the OPEN message sent when the peers establish a TCP session. To determine whether a BGP router supports this capability, use the `show ip bgp neighbors` command. If a router supports the route refresh capability, the `Received route refresh capability from peer` message displays.

1. Enable soft-reconfiguration for the BGP neighbor and BGP template in ROUTER-BGP mode. BGP stores all the updates that the neighbor receives but does not reset the peer-session. Using this command starts the storage of updates, which is required for inbound soft reconfiguration.

```
neighbor {ip-address} soft-reconfiguration inbound
```

2. Enter Address Family mode in ROUTER-NEIGHBOR mode.

```
address-family {[ipv4 | ipv6] [unicast]}
```

3. Configure soft-configuration for the neighbors belonging to the template.

```
soft-reconfiguration inbound
```

4. Clear all information or only specific details in EXEC mode.

```
clear ip bgp {neighbor-address | * | interface interface-type} [soft in]
```

- `*` — Clears all peers.
- `neighbor-address`— Clears the neighbor with this IP address.
- `interface interface-type`— Clears an unnumbered neighbor.

Soft-reconfiguration of IPv4 neighbor

```
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# soft-reconfiguration inbound
OS10(conf-router-bgp-neighbor-af)# end
OS10# clear ip bgp 10.2.1.2
```

Soft-reconfiguration of IPv6 neighbor

```
OS10(conf-router-neighbor)# address-family ipv6 unicast
OS10(conf-router-bgp-neighbor-af)# soft-reconfiguration inbound
OS10(conf-router-bgp-neighbor-af)# end
OS10# clear ip bgp 2001:0000:3221:DFE8:63::FEAB
```

Redistribute iBGP route to OSPF

When you configure the system to redistribute BGP routes to OSPF, by default, the system redistributes only the external BGP (eBGP) routes. Use the `[no] bgp redistribute-internal` command under BGP to allow or block the redistribution of IPv4 or IPv6 internal BGP ((iBGP) routes to OSPF in a default or nondefault VRF instance.

Configure redistribution of iBGP routes into OSPF

To enable the system to allow the redistribution of iBGP routes into OSPF, follow these steps:

1. Enter ROUTER-BGP mode with an AS number in CONFIGURATION mode.

```
router bgp as-number
```

2. Create a nondefault VRF instance in ROUTER-BGP mode. You can skip this step to enable redistribution of iBGP routes in the default VRF.

```
vrf vrf-name
```

3. Enter IPv4 or IPV6 address-family configuration mode from ROUTER-BGP mode.

```
address-family ipv4 unicast
```

```
address-family ipv6 unicast
```

4. Enable redistribution of internal BGP routes.

```
bgp redistribute-internal
```

5. Enter ROUTER-OSPF mode in a default or nondefault VRF instance.

```
router ospf instance-number [vrf vrf-name]
```

6. Configure redistribution the BGP routes in OSPF in ROUTER-OSPF mode.

```
redistribute bgp as-number
```

Example: Configure redistribution of IPv4 iBGP routes in a nondefault VRF to OSPF

```
OS10# configure terminal
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf dell
```

```
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# bgp redistribute-internal
OS10(config)# router ospf 20 vrf dell
OS10(config-router-ospf-20)# redistribute bgp 100
```

View BGP routes information

Use the following commands to view all BGP routes that match any of the community filters for a default or nondefault VRF instance.

- View BGP routes that match a standard community number.

```
show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [community community-number |
{internet | local-AS | no-advertise | no-export}]
```

- View BGP routes that match any of the standard community numbers from a standard community list.

```
show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [community-list community-list-
name]
```

- View BGP routes that match any of the extended community attributes from an extended community list.

```
show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [extcommunity-list extcommunity-
list-name]
```

- View BGP routes that match any of the AS-path regular expression attributes from the given AS-path list.

```
show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [filter-list as-path-list-name
```

Debug BGP

Use the following procedure to debug BGP.

- To debug BGP:

```
debug ip bgp
```

Configuring BGP template

Configure the BGP templates to support the following attributes in IPv4 and IPv6 address family level: next-hop-self, oft-reconfiguration inbound, maximum-prefix, and add-path.

To configure BGP template:

1. Configure peer-group under BGP.

```
OS10(config)# router bgp 100
   OS10(config-router-bgp-100)# template abc
```

2. Configure maximum-prefix in IPV4 AFI, where maximum-prefix is 10, threshold is 50, and warning is enabled.

```
OS10(config-router-template)# address-family ipv4 unicast
   OS10(config-router-bgp-template-af)# maximum-prefix 10 50 warning-only
```

3. Configure add-path capability in IPv4 AFI, with add-path on both directions with count as 4.

```
OS10(config-router-template)# address-family ipv4 unicast
   OS10(config-router-bgp-template-af)# add-path both 4
```

4. Configure soft-reconfiguration inbound for IPv6 AFI.

```
OS10(config-router-template)# address-family ipv6 unicast
   OS10(config-router-bgp-template-af)# soft-reconfiguration inbound
```

5. Configure next-hop-self for IPv6 AFI.

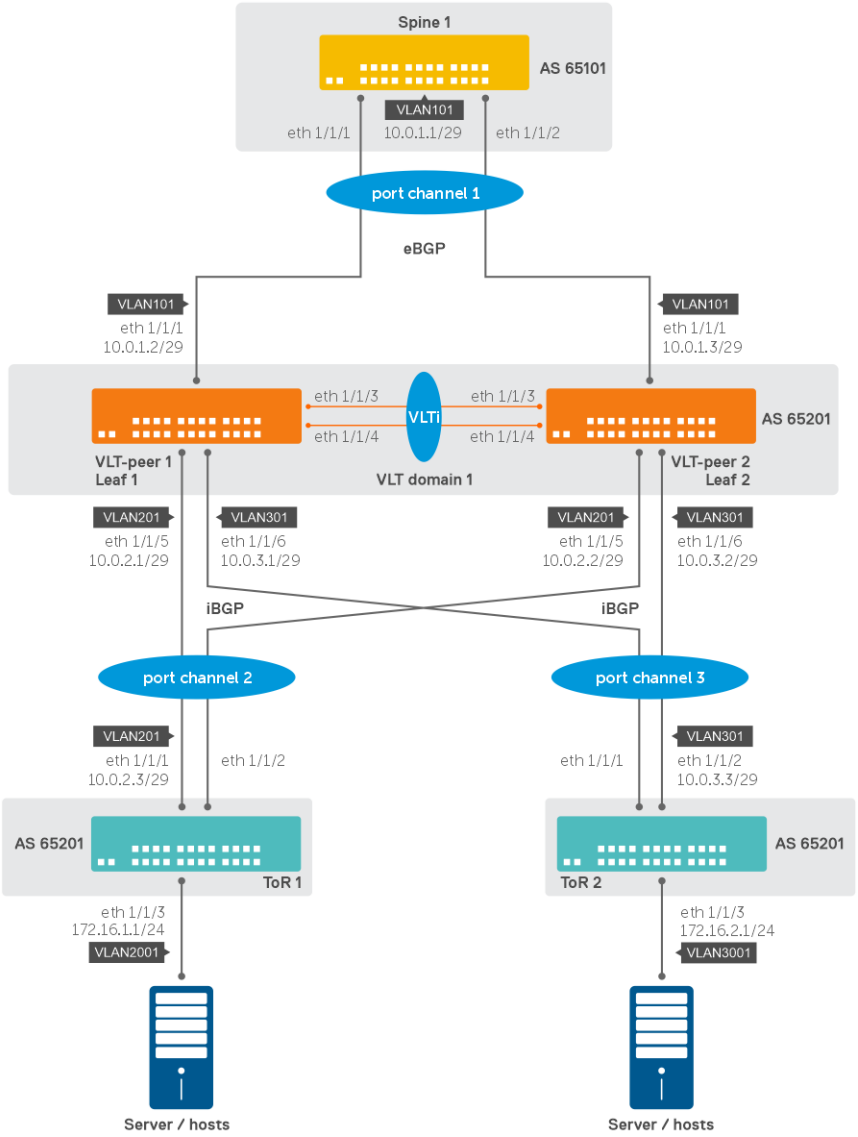
```
OS10(config-router-template)# address-family ipv6 unicast
   OS10(config-router-bgp-template-af)# next-hop-self
```

6. Apply the template to the BGP peers.

```
OS10(config-router-bgp-100)# neighbor 1.1.1.2
   OS10(config-router-neighbor)# inherit template abc
```

Example - BGP in a VLT topology

The following spine-leaf VLT topology runs BGP for Layer 3 communication.



Spine 1 configuration

1. Configure a VLAN interface on which the BGP session has to be formed with VLT peers.

```
Spine1(config)# interface vlan101
Spine1(conf-if-vl-101)# ip address 10.0.1.1/29
Spine1(conf-if-vl-101)# mtu 9216
Spine1(conf-if-vl-101)# exit
```

2. Configure port channel interfaces between Spine and VLT peers. Add it as part of the created VLAN.

```
Spine1(config)# interface port-channel1
Spine1(conf-if-po-1)# mtu 9216
Spine1(conf-if-po-1)# switchport mode trunk
Spine1(conf-if-po-1)# switchport trunk allowed vlan 101
Spine1(conf-if-po-1)# exit
Spine1(config)# interface ethernet1/1/1
Spine1(conf-if-eth1/1/1)# channel-group 1 mode active
Spine1(conf-if-eth1/1/1)# exit
Spine1(config)# interface ethernet1/1/2
Spine1(conf-if-eth1/1/2)# channel-group 1 mode active
Spine1(conf-if-eth1/1/2)# exit
```

3. Configure eBGP neighbor with VLT peer1 and VLT peer2.

```
Spine1(config)# router bgp 65101
Spine1(config-router-bgp-65101)# router-id 10.1.1.1
Spine1(config-router-bgp-65101)# neighbor 10.0.1.2
Spine1(config-router-neighbor)# remote-as 65201
Spine1(config-router-neighbor)# no shutdown
Spine1(config-router-neighbor)# exit
Spine1(config-router-bgp-65101)# neighbor 10.0.1.3
Spine1(config-router-neighbor)# remote-as 65201
Spine1(config-router-neighbor)# no shutdown
Spine1(config-router-neighbor)# exit
```

Leaf 1 configuration

1. Configure VLT peering between VLT peer 1 and VLT peer 2.

```
Leaf1(config)# interface range ethernet1/1/3-1/1/4
Leaf1(conf-range-eth1/1/3-1/1/4)# no switchport
Leaf1(conf-range-eth1/1/3-1/1/4)# exit
Leaf1(config)# vlt-domain 1
Leaf1(conf-vlt-1)# backup destination 192.168.1.2
Leaf1(conf-vlt-1)# discovery-interface ethernet1/1/3-1/1/4
Leaf1(conf-vlt-1)# primary-priority 1
Leaf1(conf-vlt-1)# vlt-mac de:11:de:11:de:11
Leaf1(conf-vlt-1)# peer-routing
Leaf1(conf-vlt-1)# exit
```

2. Configure VLAN interfaces on which BGP sessions has to be formed with Spine and ToR switches.

```
Leaf1(config)# interface vlan101
Leaf1(conf-if-vl-101)# ip address 10.0.1.2/29
Leaf1(conf-if-vl-101)# mtu 9216
Leaf1(conf-if-vl-101)# exit
Leaf1(config)# interface vlan201
Leaf1(conf-if-vl-201)# ip address 10.0.2.1/29
Leaf1(conf-if-vl-201)# mtu 9216
Leaf1(conf-if-vl-201)# exit
Leaf1(config)# interface vlan301
Leaf1(conf-if-vl-301)# ip address 10.0.3.1/29
Leaf1(conf-if-vl-301)# mtu 9216
Leaf1(conf-if-vl-301)# exit
```

3. Configure VLT port-channel with Spine 1.

```
Leaf1(config)# interface port-channel1
Leaf1(conf-if-po-1)# mtu 9216
Leaf1(conf-if-po-1)# switchport mode trunk
Leaf1(conf-if-po-1)# switchport trunk allowed vlan 101
Leaf1(conf-if-po-1)# vlt-port-channel 1
Leaf1(conf-if-po-1)# exit
```

```
Leaf1(config)# interface ethernet1/1/1
Leaf1(conf-if-eth1/1/1)# channel-group 1 mode active
Leaf1(conf-if-eth1/1/1)# exit
```

4. Configure VLT port-channels with ToR 1 and ToR 2.

```
Leaf1(config)# interface port-channel2
Leaf1(conf-if-po-2)# mtu 9216
Leaf1(conf-if-po-2)# switchport mode trunk
Leaf1(conf-if-po-2)# switchport trunk allowed vlan 201
Leaf1(conf-if-po-2)# vlt-port-channel 2
Leaf1(conf-if-po-2)# exit
Leaf1(config)# interface ethernet1/1/5
Leaf1(conf-if-eth1/1/5)# channel-group 2 mode active
Leaf1(conf-if-eth1/1/5)# exit
Leaf1(config)# interface port-channel3
Leaf1(conf-if-po-3)# mtu 9216
Leaf1(conf-if-po-3)# switchport mode trunk
Leaf1(conf-if-po-3)# switchport trunk allowed vlan 301
Leaf1(conf-if-po-3)# vlt-port-channel 3
Leaf1(conf-if-po-3)# exit
Leaf1(config)# interface ethernet1/1/6
Leaf1(conf-if-eth1/1/6)# channel-group 3 mode active
Leaf1(conf-if-eth1/1/6)# exit
```

5. Configure the eBGP neighbor with Spine 1 and iBGP neighbor with ToR 1 and ToR 2.

```
Leaf1(config)# router bgp 65201
Leaf1(config-router-bgp-65201)# router-id 10.2.1.1
Leaf1(config-router-bgp-65201)# neighbor 10.0.1.1
Leaf1(config-router-neighbor)# remote-as 65101
Leaf1(config-router-neighbor)# no shutdown
Leaf1(config-router-neighbor)# exit
Leaf1(config-router-bgp-65201)# neighbor 10.0.2.3
Leaf1(config-router-neighbor)# remote-as 65201
Leaf1(config-router-neighbor)# route-reflector-client
Leaf1(config-router-neighbor)# no shutdown
Leaf1(config-router-neighbor)# address-family ipv4 unicast
Leaf1(config-router-bgp-neighbor-af)# next-hop-self
Leaf1(config-router-bgp-neighbor-af)# exit
Leaf1(config-router-neighbor)# exit
Leaf1(config-router-bgp-65201)# neighbor 10.0.3.3
Leaf1(config-router-neighbor)# remote-as 65201
Leaf1(config-router-neighbor)# route-reflector-client
Leaf1(config-router-neighbor)# no shutdown
Leaf1(config-router-neighbor)# address-family ipv4 unicast
Leaf1(config-router-bgp-neighbor-af)# next-hop-self
Leaf1(config-router-bgp-neighbor-af)# exit
Leaf1(config-router-neighbor)# exit
```

Leaf 2 configuration

1. Configure VLT peering between VLT peer 1 and VLT peer 2.

```
Leaf2(config)# interface range ethernet1/1/3-1/1/4
Leaf2(conf-range-eth1/1/3-1/1/4)# no switchport
Leaf2(conf-range-eth1/1/3-1/1/4)# exit
Leaf2(config)# vlt-domain 1
Leaf2(conf-vlt-1)# backup destination 192.168.1.1
Leaf2(conf-vlt-1)# discovery-interface ethernet1/1/3-1/1/4
Leaf2(conf-vlt-1)# primary-priority 65535
Leaf2(conf-vlt-1)# vlt-mac de:11:de:11:de:11
Leaf2(conf-vlt-1)# peer-routing
Leaf2(conf-vlt-1)# exit
```

2. Configure VLAN interfaces on which BGP sessions has to be formed with Spine and ToR switches.

```
Leaf2(config)# interface vlan101
Leaf2(conf-if-vl-101)# ip address 10.0.1.3/29
Leaf2(conf-if-vl-101)# mtu 9216
Leaf2(conf-if-vl-101)# exit
Leaf2(config)# interface vlan201
Leaf2(conf-if-vl-201)# ip address 10.0.2.2/29
```

```
Leaf2(conf-if-vl-201)# mtu 9216
Leaf2(conf-if-vl-201)# exit
Leaf2(config)# interface vlan301
Leaf2(conf-if-vl-301)# ip address 10.0.3.2/29
Leaf2(conf-if-vl-301)# mtu 9216
Leaf2(conf-if-vl-301)# exit
```

3. Configure VLT port-channel with Spine 1.

```
Leaf2(config)# interface port-channel1
Leaf2(conf-if-po-1)# mtu 9216
Leaf2(conf-if-po-1)# switchport mode trunk
Leaf2(conf-if-po-1)# switchport trunk allowed vlan 101
Leaf2(conf-if-po-1)# vlt-port-channel 1
Leaf2(conf-if-po-1)# exit
Leaf2(config)# interface ethernet1/1/1
Leaf2(conf-if-eth1/1/1)# channel-group 1 mode active
Leaf2(conf-if-eth1/1/1)# exit
```

4. Configure VLT port-channels with ToR 1 and ToR 2.

```
Leaf2(config)# interface port-channel2
Leaf2(conf-if-po-2)# mtu 9216
Leaf2(conf-if-po-2)# switchport mode trunk
Leaf2(conf-if-po-2)# switchport trunk allowed vlan 201
Leaf2(conf-if-po-2)# vlt-port-channel 2
Leaf2(conf-if-po-2)# exit
Leaf2(config)# interface ethernet1/1/5
Leaf2(conf-if-eth1/1/5)# channel-group 2 mode active
Leaf2(conf-if-eth1/1/5)# exit
Leaf2(config)# interface port-channel3
Leaf2(conf-if-po-3)# mtu 9216
Leaf2(conf-if-po-3)# switchport mode trunk
Leaf2(conf-if-po-3)# switchport trunk allowed vlan 301
Leaf2(conf-if-po-3)# vlt-port-channel 3
Leaf2(conf-if-po-3)# exit
Leaf2(config)# interface ethernet1/1/6
Leaf2(conf-if-eth1/1/6)# channel-group 3 mode active
Leaf2(conf-if-eth1/1/6)# exit
```

5. Configure the eBGP neighbor with Spine 1 and iBGP neighbor with ToR 1 and ToR 2.

```
Leaf2(config)# router bgp 65201
Leaf2(config-router-bgp-65201)# router-id 10.2.1.2
Leaf2(config-router-bgp-65201)# neighbor 10.0.1.1
Leaf2(config-router-neighbor)# remote-as 65101
Leaf2(config-router-neighbor)# no shutdown
Leaf2(config-router-neighbor)# exit
Leaf2(config-router-bgp-65201)# neighbor 10.0.2.3
Leaf2(config-router-neighbor)# remote-as 65201
Leaf2(config-router-neighbor)# route-reflector-client
Leaf2(config-router-neighbor)# no shutdown
Leaf2(config-router-neighbor)# address-family ipv4 unicast
Leaf2(config-router-bgp-neighbor-af)# next-hop-self
Leaf2(config-router-bgp-neighbor-af)# exit
Leaf2(config-router-neighbor)# exit
Leaf2(config-router-bgp-65201)# neighbor 10.0.3.3
Leaf2(config-router-neighbor)# remote-as 65201
Leaf2(config-router-neighbor)# route-reflector-client
Leaf2(config-router-neighbor)# no shutdown
Leaf2(config-router-neighbor)# address-family ipv4 unicast
Leaf2(config-router-bgp-neighbor-af)# next-hop-self
Leaf2(config-router-bgp-neighbor-af)# exit
Leaf2(config-router-neighbor)# exit
```

ToR 1 configuration

1. Configure VLAN interface on which the BGP session has to be formed with VLT peers.

```
ToR1(config)# interface vlan201
ToR1(conf-if-vl-201)# ip address 10.0.2.3/29
```

```
ToR1(conf-if-vl-201)# mtu 9216
ToR1(conf-if-vl-201)# exit
```

2. Configure a port channel interface between ToR1 and VLT peers. Add it as part of the above created VLAN.

```
ToR1(config)# interface port-channel2
ToR1(conf-if-po-1)# mtu 9216
ToR1(conf-if-po-1)# switchport mode trunk
ToR1(conf-if-po-1)# switchport trunk allowed vlan 201
ToR1(conf-if-po-1)# exit
ToR1(config)# interface ethernet1/1/1
ToR1(conf-if-eth1/1/1)# channel-group 2 mode active
ToR1(conf-if-eth1/1/1)# exit
ToR1(config)# interface ethernet1/1/2
ToR1(conf-if-eth1/1/2)# channel-group 2 mode active
ToR1(conf-if-eth1/1/2)# exit
```

3. Configure the host facing VLAN and add host connected interfaces to it.

```
ToR1(config)# interface vlan2001
ToR1(conf-if-vl-2001)# ip address 172.16.1.1/24
ToR1(conf-if-vl-2001)# mtu 9216
ToR1(conf-if-vl-2001)# exit
ToR1(config)# interface ethernet1/1/3
ToR1(conf-if-eth1/1/3)# mtu 9216
ToR1(conf-if-eth1/1/3)# switchport mode trunk
ToR1(conf-if-eth1/1/3)# switchport trunk allowed vlan 2001
ToR1(conf-if-eth1/1/3)# exit
```

4. Configure the iBGP neighbor with VLT peers and advertise the host subnet.

```
ToR1(config)# router bgp 65201
ToR1(config-router-bgp-65201)# router-id 10.3.1.1
ToR1(config-router-bgp-65201)# address-family ipv4 unicast
ToR1(configure-router-bgpv4-af)# network 172.16.1.0/24
ToR1(configure-router-bgpv4-af)# exit
ToR1(config-router-bgp-65201)# neighbor 10.0.2.1
ToR1(config-router-neighbor)# remote-as 65201
ToR1(config-router-neighbor)# no shutdown
ToR1(config-router-neighbor)# exit
ToR1(config-router-bgp-65201)# neighbor 10.0.2.2
ToR1(config-router-neighbor)# remote-as 65201
ToR1(config-router-neighbor)# no shutdown
ToR1(config-router-neighbor)# exit
```

ToR 2 configuration

1. Configure a VLAN interface on which the BGP session has to be formed with VLT peers.

```
ToR2(config)# interface vlan301
ToR2(conf-if-vl-201)# mtu 9216
ToR2(conf-if-vl-201)# ip address 10.0.3.3/29
ToR2(conf-if-vl-201)# exit
```

2. Configure a port channel interface between ToR2 and VLT peers. Add it as part of the above created VLAN.

```
ToR2(config)# interface port-channel3
ToR2(conf-if-po-1)# mtu 9216
ToR2(conf-if-po-1)# switchport mode trunk
ToR2(conf-if-po-1)# switchport trunk allowed vlan 301
ToR2(conf-if-po-1)# exit
ToR2(config)# interface ethernet1/1/1
ToR2(conf-if-eth1/1/1)# channel-group 3 mode active
ToR2(conf-if-eth1/1/1)# exit
ToR2(config)# interface ethernet1/1/2
ToR2(conf-if-eth1/1/2)# channel-group 3 mode active
ToR2(conf-if-eth1/1/2)# exit
```

3. Configure the host facing VLAN and add host connected interfaces to it.

```
ToR2(config)# interface vlan3001
ToR2(conf-if-vl-2001)# mtu 9216
```

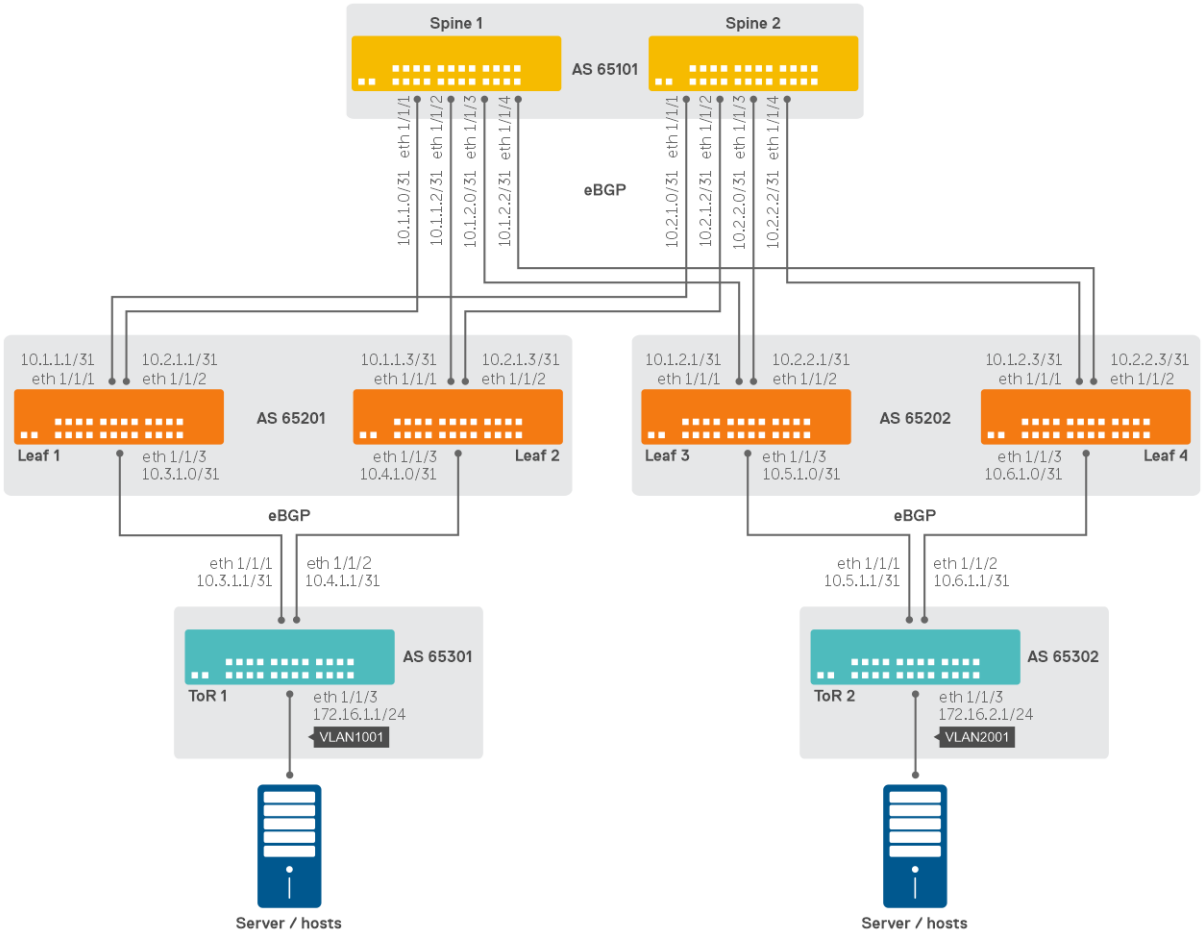
```
ToR2(conf-if-vl-2001)# ip address 172.16.2.1/24
ToR2(conf-if-vl-2001)# exit
ToR2(config)# interface ethernet1/1/3
ToR2(conf-if-eth1/1/3)# mtu 9216
ToR2(conf-if-eth1/1/3)# switchport mode trunk
ToR2(conf-if-eth1/1/3)# switchport trunk allowed vlan 3001
ToR2(conf-if-eth1/1/3)# exit
```

4. Configure the iBGP neighbor with VLT peers and advertise the host subnet.

```
ToR2(config)# router bgp 65201
ToR2(config-router-bgp-65201)# router-id 10.3.1.2
ToR2(config-router-bgp-65201)# address-family ipv4 unicast
ToR2(configure-router-bgpv4-af)# network 172.16.2.0/24
ToR2(configure-router-bgpv4-af)# exit
ToR2(config-router-bgp-65201)# neighbor 10.0.2.1
ToR2(config-router-neighbor)# remote-as 65201
ToR2(config-router-neighbor)# no shutdown
ToR2(config-router-neighbor)# exit
ToR2(config-router-bgp-65201)# neighbor 10.0.2.2
ToR2(config-router-neighbor)# remote-as 65201
ToR2(config-router-neighbor)# no shutdown
ToR2(config-router-neighbor)# exit
```

Example - Three-tier CLOS topology with eBGP

This section provides a sample three-tier topology with external BGP.



Spine 1 configuration

1. Configure an IP address on leaf-facing interfaces.

```
Spine1(config)# interface ethernet1/1/1
Spine1(conf-if-eth1/1/1)# description Spine1-Leaf1
Spine1(conf-if-eth1/1/1)# no switchport
Spine1(conf-if-eth1/1/1)# mtu 9216
Spine1(conf-if-eth1/1/1)# ip address 10.1.1.0/31
Spine1(conf-if-eth1/1/1)# exit
Spine1(config)# interface ethernet1/1/2
Spine1(conf-if-eth1/1/2)# description Spine1-Leaf2
Spine1(conf-if-eth1/1/2)# no switchport
Spine1(conf-if-eth1/1/2)# mtu 9216
Spine1(conf-if-eth1/1/2)# ip address 10.1.1.2/31
Spine1(conf-if-eth1/1/2)# exit
Spine1(config)# interface ethernet1/1/3
Spine1(conf-if-eth1/1/3)# description Spine1-Leaf3
Spine1(conf-if-eth1/1/3)# no switchport
Spine1(conf-if-eth1/1/3)# mtu 9216
Spine1(conf-if-eth1/1/3)# ip address 10.1.2.0/31
Spine1(conf-if-eth1/1/3)# exit
Spine1(config)# interface ethernet1/1/4
Spine1(conf-if-eth1/1/4)# description Spine1-Leaf4
Spine1(conf-if-eth1/1/4)# no switchport
Spine1(conf-if-eth1/1/4)# mtu 9216
Spine1(conf-if-eth1/1/4)# ip address 10.1.2.2/31
Spine1(conf-if-eth1/1/4)# exit
```

2. Configure BGP neighbors. This example uses passive peering which simplifies neighbor configuration.

```
Spine1(config)# router bgp 65101
Spine1(config-router-bgp-65101)# router-id 10.0.0.1
Spine1(config-router-bgp-65101)# template passive_v4_pod1
Spine1(config-router-template)# remote-as 65201
Spine1(config-router-template)# listen 10.1.1.0/24
Spine1(config-router-template)# exit
Spine1(config-router-bgp-65101)# template passive_v4_pod2
Spine1(config-router-template)# remote-as 65202
Spine1(config-router-template)# listen 10.1.2.0/24
Spine1(config-router-template)# exit
```

Spine 2 configuration

1. Configure an IP address on leaf-facing interfaces.

```
Spine2(config)# interface ethernet1/1/1
Spine2(conf-if-eth1/1/1)# description Spine2-Leaf1
Spine2(conf-if-eth1/1/1)# no switchport
Spine2(conf-if-eth1/1/1)# mtu 9216
Spine2(conf-if-eth1/1/1)# ip address 10.2.1.0/31
Spine2(conf-if-eth1/1/1)# exit
Spine2(config)# interface ethernet1/1/2
Spine2(conf-if-eth1/1/2)# description Spine2-Leaf2
Spine2(conf-if-eth1/1/2)# no switchport
Spine2(conf-if-eth1/1/2)# mtu 9216
Spine2(conf-if-eth1/1/2)# ip address 10.2.1.2/31
Spine2(conf-if-eth1/1/2)# exit
Spine2(config)# interface ethernet1/1/3
Spine2(conf-if-eth1/1/3)# description Spine2-Leaf3
Spine2(conf-if-eth1/1/3)# no switchport
Spine2(conf-if-eth1/1/3)# mtu 9216
Spine2(conf-if-eth1/1/3)# ip address 10.2.2.0/31
Spine2(conf-if-eth1/1/3)# exit
Spine2(config)# interface ethernet1/1/4
Spine2(conf-if-eth1/1/4)# description Spine2-Leaf4
Spine2(conf-if-eth1/1/4)# no switchport
Spine2(conf-if-eth1/1/4)# mtu 9216
Spine2(conf-if-eth1/1/4)# ip address 10.2.2.2/31
Spine2(conf-if-eth1/1/4)# exit
```

2. Configure BGP neighbors. This example uses passive peering which simplifies neighbor configuration.

```
Spine2(config)# router bgp 65101
Spine2(config-router-bgp-65101)# router-id 10.0.0.2
Spine2(config-router-bgp-65101)# template passive_v4_pod1
Spine2(config-router-template)# remote-as 65201
Spine2(config-router-template)# listen 10.2.1.0/24
Spine2(config-router-template)# exit
Spine2(config-router-bgp-65101)# template passive_v4_pod2
Spine2(config-router-template)# remote-as 65202
Spine2(config-router-template)# listen 10.2.2.0/24
Spine2(config-router-template)# exit
```

Leaf 1 configuration

1. Configure an IP address on spine-facing interfaces.

```
Leaf1(config)# interface ethernet1/1/1
Leaf1(conf-if-eth1/1/1)# description Leaf1-Spine1
Leaf1(conf-if-eth1/1/1)# no switchport
Leaf1(conf-if-eth1/1/1)# mtu 9216
Leaf1(conf-if-eth1/1/1)# ip address 10.1.1.1/31
Leaf1(conf-if-eth1/1/1)# exit
Leaf1(config)# interface ethernet1/1/2
Leaf1(conf-if-eth1/1/2)# description Leaf1-Spine2
Leaf1(conf-if-eth1/1/2)# no switchport
Leaf1(conf-if-eth1/1/2)# mtu 9216
Leaf1(conf-if-eth1/1/2)# ip address 10.2.1.1/31
Leaf1(conf-if-eth1/1/2)# exit
```

2. Configure an IP address on ToR facing interfaces.

```
Leaf1(config)# interface ethernet1/1/3
Leaf1(conf-if-eth1/1/1)# description Leaf1-ToR1
Leaf1(conf-if-eth1/1/1)# no switchport
Leaf1(conf-if-eth1/1/1)# mtu 9216
Leaf1(conf-if-eth1/1/1)# ip address 10.3.1.0/31
Leaf1(conf-if-eth1/1/1)# exit
```

3. Configure BGP neighbors.

```
Leaf1(config)# router bgp 65201
Leaf1(config-router-bgp-65201)# router-id 10.0.1.1
Leaf1(config-router-bgp-65201)# neighbor 10.1.1.0
Leaf1(config-router-neighbor)# remote-as 65101
Leaf1(config-router-neighbor)# no shutdown
Leaf1(config-router-neighbor)# exit
Leaf1(config-router-bgp-65201)# neighbor 10.2.1.0
Leaf1(config-router-neighbor)# remote-as 65101
Leaf1(config-router-neighbor)# no shutdown
Leaf1(config-router-neighbor)# exit
Leaf1(config-router-bgp-65201)# neighbor 10.3.1.1
Leaf1(config-router-neighbor)# remote-as 65301
Leaf1(config-router-neighbor)# no shutdown
Leaf1(config-router-neighbor)# exit
```

Leaf 2 configuration

1. Configure an IP address on spine-facing interfaces.

```
Leaf2(config)# interface ethernet1/1/1
Leaf2(conf-if-eth1/1/1)# description Leaf2-Spine1
Leaf2(conf-if-eth1/1/1)# no switchport
Leaf2(conf-if-eth1/1/1)# mtu 9216
Leaf2(conf-if-eth1/1/1)# ip address 10.1.1.3/31
Leaf2(conf-if-eth1/1/1)# exit
Leaf2(config)# interface ethernet1/1/2
Leaf2(conf-if-eth1/1/2)# description Leaf2-Spine2
Leaf2(conf-if-eth1/1/2)# no switchport
Leaf2(conf-if-eth1/1/2)# mtu 9216
Leaf2(conf-if-eth1/1/2)# ip address 10.2.1.3/31
Leaf2(conf-if-eth1/1/2)# exit
```

2. Configure an IP address on ToR-facing interfaces.

```
Leaf2(config)# interface ethernet1/1/3
Leaf2(conf-if-eth1/1/1)# description Leaf2-ToR1
Leaf2(conf-if-eth1/1/1)# no switchport
Leaf2(conf-if-eth1/1/1)# mtu 9216
Leaf2(conf-if-eth1/1/1)# ip address 10.4.1.0/31
Leaf2(conf-if-eth1/1/1)# exit
```

3. Configure BGP neighbors.

```
Leaf2(config)# router bgp 65201
Leaf2(config-router-bgp-65201)# router-id 10.0.1.2
Leaf2(config-router-bgp-65201)# neighbor 10.1.1.2
Leaf2(config-router-neighbor)# remote-as 65101
Leaf2(config-router-neighbor)# no shutdown
Leaf2(config-router-neighbor)# exit
Leaf2(config-router-bgp-65201)# neighbor 10.2.1.2
Leaf2(config-router-neighbor)# remote-as 65101
Leaf2(config-router-neighbor)# no shutdown
Leaf2(config-router-neighbor)# exit
Leaf2(config-router-bgp-65201)# neighbor 10.4.1.1
Leaf2(config-router-neighbor)# remote-as 65301
Leaf2(config-router-neighbor)# no shutdown
Leaf2(config-router-neighbor)# exit
```

Leaf 3 configuration

1. Configure an IP address on spine-facing interfaces.

```
Leaf3(config)# interface ethernet1/1/1
Leaf3(conf-if-eth1/1/1)# description Leaf3-Spine1
Leaf3(conf-if-eth1/1/1)# no switchport
Leaf3(conf-if-eth1/1/1)# mtu 9216
Leaf3(conf-if-eth1/1/1)# ip address 10.1.2.1/31
Leaf3(conf-if-eth1/1/1)# exit
Leaf3(config)# interface ethernet1/1/2
Leaf3(conf-if-eth1/1/2)# description Leaf3-Spine2
Leaf3(conf-if-eth1/1/2)# no switchport
Leaf3(conf-if-eth1/1/2)# mtu 9216
Leaf3(conf-if-eth1/1/2)# ip address 10.2.2.1/31
Leaf3(conf-if-eth1/1/2)# exit
```

2. Configure an IP address on ToR-facing interfaces.

```
Leaf3(config)# interface ethernet1/1/3
Leaf3(conf-if-eth1/1/3)# description Leaf3-ToR2
Leaf3(conf-if-eth1/1/3)# no switchport
Leaf3(conf-if-eth1/1/3)# mtu 9216
Leaf3(conf-if-eth1/1/3)# ip address 10.5.1.0/31
Leaf3(conf-if-eth1/1/3)# exit
```

3. Configure BGP neighbors.

```
Leaf3(config)# router bgp 65202
Leaf3(config-router-bgp-65202)# router-id 10.0.1.3
Leaf3(config-router-bgp-65202)# neighbor 10.1.2.0
Leaf3(config-router-neighbor)# remote-as 65101
Leaf3(config-router-neighbor)# no shutdown
Leaf3(config-router-neighbor)# exit
Leaf3(config-router-bgp-65202)# neighbor 10.2.2.0
Leaf3(config-router-neighbor)# remote-as 65101
Leaf3(config-router-neighbor)# no shutdown
Leaf3(config-router-neighbor)# exit
Leaf3(config-router-bgp-65202)# neighbor 10.5.1.1
Leaf3(config-router-neighbor)# remote-as 65302
Leaf3(config-router-neighbor)# no shutdown
Leaf3(config-router-neighbor)# exit
```

Leaf 4 configuration

1. Configure an IP address on spine-facing interfaces.

```
Leaf4(config)# interface ethernet1/1/1
Leaf4(conf-if-eth1/1/1)# description Leaf4-Spine1
Leaf4(conf-if-eth1/1/1)# no switchport
Leaf4(conf-if-eth1/1/1)# mtu 9216
Leaf4(conf-if-eth1/1/1)# ip address 10.1.2.3/31
Leaf4(conf-if-eth1/1/1)# exit
Leaf4(config)# interface ethernet1/1/2
Leaf4(conf-if-eth1/1/2)# description Leaf4-Spine2
Leaf4(conf-if-eth1/1/2)# no switchport
Leaf4(conf-if-eth1/1/2)# mtu 9216
Leaf4(conf-if-eth1/1/2)# ip address 10.2.2.3/31
Leaf4(conf-if-eth1/1/2)# exit
```

2. Configure an IP address on ToR-facing interfaces.

```
Leaf4(config)# interface ethernet1/1/3
Leaf4(conf-if-eth1/1/3)# description Leaf4-ToR2
Leaf4(conf-if-eth1/1/3)# no switchport
Leaf4(conf-if-eth1/1/3)# mtu 9216
Leaf4(conf-if-eth1/1/3)# ip address 10.6.1.0/31
Leaf4(conf-if-eth1/1/3)# exit
```

3. Configure BGP neighbors.

```
Leaf4(config)# router bgp 65202
Leaf4(config-router-bgp-65202)# router-id 10.0.1.4
Leaf4(config-router-bgp-65202)# neighbor 10.1.2.2
Leaf4(config-router-neighbor)# remote-as 65101
Leaf4(config-router-neighbor)# no shutdown
Leaf4(config-router-neighbor)# exit
Leaf4(config-router-bgp-65202)# neighbor 10.2.2.2
Leaf4(config-router-neighbor)# remote-as 65101
Leaf4(config-router-neighbor)# no shutdown
Leaf4(config-router-neighbor)# exit
Leaf4(config-router-bgp-65202)# neighbor 10.6.1.1
Leaf4(config-router-neighbor)# remote-as 65302
Leaf4(config-router-neighbor)# no shutdown
Leaf4(config-router-neighbor)# exit
```

ToR 1 configuration

1. Configure an IP address on leaf-facing interfaces.

```
ToR1(config)# interface ethernet1/1/1
ToR1(conf-if-eth1/1/1)# description ToR1-Leaf1
ToR1(conf-if-eth1/1/1)# no switchport
ToR1(conf-if-eth1/1/1)# mtu 9216
ToR1(conf-if-eth1/1/1)# ip address 10.3.1.1/31
ToR1(conf-if-eth1/1/1)# exit
ToR1(config)# interface ethernet1/1/2
ToR1(conf-if-eth1/1/2)# description ToR1-Leaf2
ToR1(conf-if-eth1/1/2)# no switchport
ToR1(conf-if-eth1/1/2)# mtu 9216
ToR1(conf-if-eth1/1/2)# ip address 10.4.1.1/31
ToR1(conf-if-eth1/1/2)# exit
```

2. Configure a VLAN interface and a VLAN member for the end hosts.

```
ToR1(config)# interface vlan 1001
ToR1(conf-if-vl-1001)# ip address 172.16.1.1/24
ToR1(conf-if-vl-1001)# mtu 9216
ToR1(conf-if-vl-1001)# exit
ToR1(config)# interface ethernet1/1/3
ToR1(conf-if-eth1/1/3)# description ToR1-Hosts
ToR1(conf-if-eth1/1/3)# mtu 9216
ToR1(conf-if-eth1/1/3)# switchport mode trunk
ToR1(conf-if-eth1/1/3)# switchport trunk allowed vlan 1001
ToR1(conf-if-eth1/1/3)# exit
```

3. Configure BGP neighbors, and advertise the host subnet.

```
ToR1(config)# router bgp 65301
ToR1(config-router-bgp-65301)# router-id 10.0.2.1
ToR1(config-router-bgp-65301)# address-family ipv4 unicast
ToR1(configure-router-bgpv4-af)# network 172.16.1.0/24
ToR1(configure-router-bgpv4-af)# exit
ToR1(config-router-bgp-65301)# neighbor 10.3.1.0
ToR1(config-router-neighbor)# remote-as 65201
ToR1(config-router-neighbor)# no shutdown
ToR1(config-router-neighbor)# exit
ToR1(config-router-bgp-65301)# neighbor 10.4.1.0
ToR1(config-router-neighbor)# remote-as 65201
ToR1(config-router-neighbor)# no shutdown
ToR1(config-router-neighbor)# exit
```

ToR 2 configuration

1. Configure an IP address on leaf-facing interfaces.

```
ToR2(config)# interface ethernet1/1/1
ToR2(conf-if-eth1/1/1)# description ToR2-Leaf3
ToR2(conf-if-eth1/1/1)# no switchport
ToR2(conf-if-eth1/1/1)# mtu 9216
ToR2(conf-if-eth1/1/1)# ip address 10.5.1.1/31
ToR2(conf-if-eth1/1/1)# exit
ToR2(config)# interface ethernet1/1/2
ToR2(conf-if-eth1/1/2)# description ToR2-Leaf4
ToR2(conf-if-eth1/1/2)# no switchport
ToR2(conf-if-eth1/1/2)# mtu 9216
ToR2(conf-if-eth1/1/2)# ip address 10.6.1.1/31
ToR2(conf-if-eth1/1/2)# exit
```

2. Configure a VLAN interface and a VLAN member for end devices.

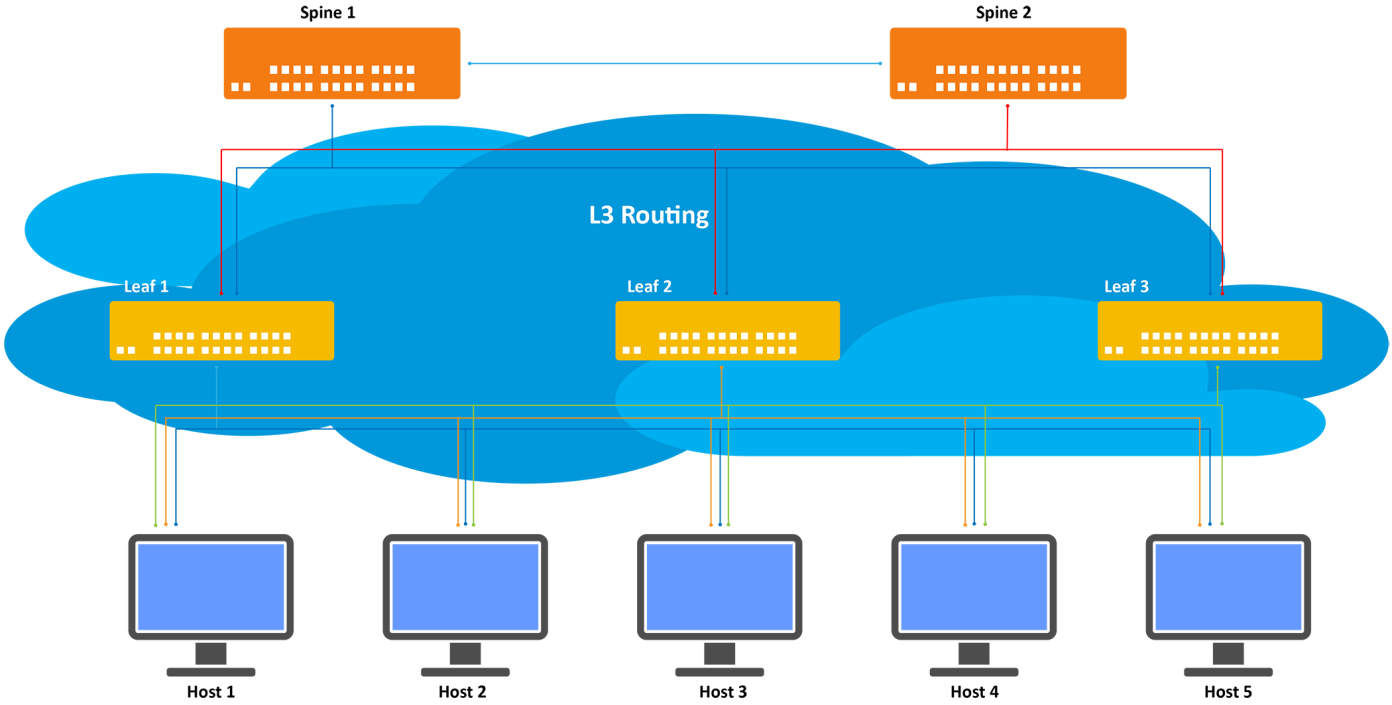
```
ToR2(config)# interface vlan 2001
ToR2(conf-if-vl-2001)# ip address 172.16.2.1/24
ToR2(conf-if-vl-2001)# mtu 9216
ToR2(conf-if-vl-2001)# exit
ToR2(config)# interface ethernet1/1/3
ToR2(conf-if-eth1/1/3)# description ToR2-Hosts
ToR2(conf-if-eth1/1/3)# mtu 9216
ToR2(conf-if-eth1/1/3)# switchport mode trunk
ToR2(conf-if-eth1/1/3)# switchport trunk allowed vlan 2001
ToR2(conf-if-eth1/1/3)# exit
```

3. Configure BGP neighbors, and advertise the host subnet.

```
ToR2(config)# router bgp 65302
ToR2(config-router-bgp-65302)# router-id 10.0.2.2
ToR2(config-router-bgp-65302)# address-family ipv4 unicast
ToR2(configure-router-bgpv4-af)# network 172.16.2.0/24
ToR2(configure-router-bgpv4-af)# exit
ToR2(config-router-bgp-65302)# neighbor 10.5.1.0
ToR2(config-router-neighbor)# remote-as 65202
ToR2(config-router-neighbor)# no shutdown
ToR2(config-router-neighbor)# exit
ToR2(config-router-bgp-65302)# neighbor 10.6.1.0
ToR2(config-router-neighbor)# remote-as 65202
ToR2(config-router-neighbor)# no shutdown
ToR2(config-router-neighbor)# exit
```

Example - Routing on the host with BGP

In the following spine-leaf VLT topology, hosts and servers attach to the top-of-rack (ToR) switches with point-to-point Layer 3 interfaces. BGP with Bidirectional Forwarding Detection (BFD) is configured between the servers and ToR switches.



Routing on the host with BGP allows the host to advertise single-host IPv4 addresses (/32 IP address) directly into the routing domain. If a server or host must be relocated, its IP address moves along with it and the route to that IP address is maintained at its new physical location.

The scalability requirement for this topology is as follows: a maximum of 128 BGP peers with 128 BFD sessions with BFD timers of 200 millisecond x 3 on the ToR switches (128; includes the sessions towards the spine and the servers).

BGP commands

activate

Enables the neighbor or peer group to be the current address-family identifier (AFI).

Syntax	`activate`
Parameters	None
Default	Not configured
Command Mode	ROUTER-BGP-NEIGHBOR-AF
Usage Information	This command exchanges IPv4 or IPv6 address family information with an IPv4, IPv6, and L2VPN neighbor. IPv4 unicast Address family is enabled by default. To activate IPv6 address family for IPv6 neighbor, use the `activate` command. To deactivate IPv4 address family for IPv6 neighbor, use the `no` activate command.
Example	`OS10(conf-router-neighbor)# address-family ipv4 unicast` `OS10(conf-router-bgp-neighbor-af)# activate`
Supported Releases	10.2.0E or later

add-path

Adds path-configuration support in peer-group level templates. This support applies for both IPv4 and IPv6 address families.

Syntax `add-path {both 2-64 | receive | send 2-64}`

Parameters

- `both`-Receives and sends multiple paths from peers.
- `receive`-Receives multiple paths from peers.
- `send`-Sends multiple paths to peers.

Default Not configured

Command Mode TEMPLATE ADDRESS FAMILY LEVEL

Usage Information Configures the number of paths to be advertised or received for a specific template. This configuration is applied to all BGP peers when inheriting this template.

NOTE: Only the system administers (sysadmin) role is allowed to manage this configuration.

NOTE: The add-path configuration is not supported on the unnumbered peers when applied through the template.

Example

```
MAA-S4048T-X01-7445(config-router-template)# address-family ipv4 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# add-path both 4

MAA-S4048T-X01-7445(config-router-template)# address-family ipv6 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# add-path send 4

MAA-S4048T-X01-7445(config-router-template)# address-family ipv4 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# add-path receive

For BGP Unnumbered peers,

MAA-S4048T-X01-7445(config-router-bgp-200)# template abc
MAA-S4048T-X01-7445(config-router-template)# address-family ipv4 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# add-path both 4

MAA-S4048T-X01-7445(config-router-bgp-200)# neighbor interface ethernet
1/1/20

MAA-S4048T-X01-7445(config-router-neighbor)#inherit template abc inherit-
type ibgp

% Error: Add-path not supported over unnumbered peer
```

Supported Releases 10.5.2.1 or Later

add-path

Allows the system to advertise multiple paths for the same destination without replacing previous paths with new ones.

Syntax `add-path {both path count | receive | send path count}`

Parameters	• `both` *`path count`* — Enter the number of paths to advertise to the peer, from 2 to 64. • `receive` — Receive multiple paths from the peer. • `send` *`path count`* — Enter the number of multiple paths to send multiple to the peer, from 2 to 64.
Default	Not configured
Command Mode	ROUTER-BGP-NEIGHBOR-AF
Usage Information	Advertising multiple paths to peers for the same address prefix without replacing the existing path with a new path reduces convergence times. The `no` version of this command disables the multiple path advertisements for the same destination.
Example (IPv4)	`OS10(conf-router-bgp-af)# add-path both 64`
Example (IPv6)	`OS10(conf-router-bgpv6-af)# add-path both 64`
Example (Receive)	`OS10(conf-router-bgpv6-af)# add-path receive`
Supported Releases	10.2.0E or later

address-family

Enters Global Address Family Configuration mode for the IP address family.

Syntax	`address-family {[ipv4 | ipv6] unicast}`
Parameters	• `ipv4 unicast` — Enter an IPv4 unicast address family. • `ipv6 unicast` — Enter an IPv6 unicast address family.
Default	None
Command Mode	ROUTER-BGP
Usage Information	This command applies to all IPv4 or IPv6 peers belonging to the template or neighbors only. The `no` version of this command deletes the subsequent address-family configuration.

Example (IPv4 Unicast)	`OS10(config)# router bgp 3`
	`OS10(conf-router-bgp-3)# address-family ipv4 unicast`
	`OS10(conf-router-bgpv4-af)#`

Example (IPv6 Unicast)	`OS10(config)# router bgp 4`
	`OS10(conf-router-bgp-4)# address-family ipv6 unicast`
	`OS10(conf-router-bgpv6-af)#`

Supported Releases	10.3.0E or later

advertisement-interval

Sets the minimum time interval for advertisement between the BGP neighbors or within a BGP peer group.

Syntax	`advertisement-interval` *`seconds`*
Parameters	*`seconds`*—Enter the time interval value in seconds between BGP advertisements, from 1 to 600.
Default	EBGP 30 seconds, IBGP 5 seconds
Command Mode	ROUTER-NEIGHBOR
Usage Information	The time interval applies to all peer group members of the template in ROUTER-TEMPLATE mode. The `no` version of this command resets the advertisement-interval value to the default.

Example

```
OS10(conf-router-neighbor)# advertisement-interval 50
```

Supported Releases 10.3.0E or later

advertisement-start

Delays initiating the OPEN message for the specified time.

Syntax `advertisement-start seconds`

Parameters *seconds*—Enter the time interval value, in seconds, before starting to send the BGP OPEN message, from 0 to 240.

Default Not configured

Command Mode ROUTER-NEIGHBOR

Usage Information The time interval applies to all the peer group members of the template in ROUTER-TEMPLATE mode. The `no` version of this command disables the advertisement-start time interval.

Example

```
OS10(conf-router-neighbor)# advertisement-start 30
```

Supported Releases 10.3.0E or later

aggregate-address

Summarizes a range of prefixes to minimize the number of entries in the routing table.

Syntax `aggregate-address address/mask [as-set] [summary-only] [advertise-map map-name] {attribute-map route-map-name] [suppress-map route-map-name]`

Parameters

- *address/mask* — Enter the IP address and mask.
- `as-set` — (Optional) Generates AS set-path information.
- `summary-only` — (Optional) Filters more specific routes from updates.
- `advertise-map map-name` — (Optional) Enter the map name to advertise.
- `attribute-map route-map-name` — (Optional) Enter the route-map name to set aggregate attributes.
- `suppress-map route-map-name` — (Optional) Enter the route-map name to conditionally filter specific routes from updates.

Default None

Command Mode ROUTER-BGPv4-AF

Usage Information At least one of the routes that is included in the aggregate address must be in the BGP routing table for the configured aggregate to become active. If routes within the aggregate are constantly changing, do not add the `as-set` parameter to the aggregate because the aggregate flaps to track changes in the AS_PATH. The `no` version of this command disables the aggregate-address configuration.

Example

```
OS10(conf-router-bgpv4-af)# aggregate-address 6.1.0.0/16 summary-only
```

Supported Releases 10.3.0E or later

allowas-in

Configures the number of times the local AS number can appear in the BGP AS_PATH path attribute before the switch rejects the route.

Syntax `allowas-in as-number`

Parameters *as-number*—Enter the number of occurrences for a local AS number, from 1 to 10.

Default Disabled

Command Mode ROUTER-BPG-NEIGHBOR-AF

Usage Information Use this command to enable the BGP speaker to accept a route with the local AS number in updates received from a peer for the specified number of times. The `no` version of this command resets the value to the default.

Example (IPv4)

```
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# allowas-in 5
```

Example (IPv6)

```
OS10(conf-router-template)# address-family ipv6 unicast
OS10(conf-router-bgp-template-af)# allowas-in 5
```

Example (l2vpn)

```
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# allowas-in 3
```

Supported Releases 10.3.0E or later

always-compare-med

Compares MULTI_EXIT_DISC (MED) attributes in the paths that are received from different neighbors.

Syntax `always-compare-med`

Parameters None

Default Disabled

Command Mode ROUTER-BGP

Usage Information After you use this command, use the `clear ip bgp *` and `clear ip bgp vrf vrf-name` commands to recompute the best path for default and nondefault VRF BGP instances, respectively. The `no` version of this command resets the value to the default.

NOTE: To configure these settings for a nondefault VRF instance, first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp as-number` command.
2. From the ROUTER BGP mode, enter ROUTER BGP VRF mode using the `vrf vrf-name` command.

Example

```
OS10(conf-router-bgp-10)# always-compare-med
```

Supported Releases 10.2.0E or later

as-notation

Changes the AS number notation format and requires four-octet-as support.

Syntax `as-notation {asdot | asdot+ | asplain}`

Parameters
- `asdot` — Specify the AS number notation in asdot format.
- `asdot+` — Specify the AS number notation in asdot+ format.
- `asplain` — Specify the AS number notation in asplain format.

Defaults `asplain`

Command Modes ROUTER-BGP

Usage Information

NOTE: To configure these settings for a non-default VRF instance, first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example - asdot format

```
OS10(conf-router-bgp-100)# as-notation asdot
OS10(conf-router-bgp-100)# show configuration
!
router bgp 100
as-notation asdot
```

Example - asdot+ format

```
OS10(conf-router-bgp-100)# as-notation asdot+
OS10(conf-router-bgp-100)# show configuration
!
router bgp 0.100
as-notation asdot+
```

Example - asplain format

```
OS10(conf-router-bgp-100)# as-notation asplain
OS10(conf-router-bgp-100)# show configuration
!
router bgp 100
```

Supported Releases 10.1.0E or later

bestpath as-path

Configures the AS path selection criteria for best path computation.

Syntax `bestpath as-path {ignore | mutlipath-relax}`

Parameters
- `ignore` — Enter to ignore the AS PATH in BGP best path calculations.
- `mutlipath-relax` — Enter to include prefixes received from different AS paths during multipath calculation.

Default Enabled

Command Mode ROUTER-BGP

Usage Information To enable load-balancing across different EBGP peers, configure the `mutlipath-relax` option. If you configure both `ignore` or `multipath-relax` options simultaneously, a system-generated error message appears. The `no` version of this command disables configuration.

NOTE: To configure these settings for a nondefault VRF instance, first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example

```
OS10(conf-router-bgp-10)# bestpath as-path multipath-relax
```

Supported Releases	10.3.0E or later

bestpath med

Changes the best path MED attributes during MED comparison for path selection.

Syntax	`bestpath med {confed | missing-as-worst}`
Parameters	• `confed` — Compare MED among BGP confederation paths. • `missing-as-worst` — Treat missing MED as the least preferred path.
Default	Disabled
Command Mode	ROUTER-BGP
Usage Information	Before you apply this command, use the `always-compare-med` command. The `no` version of this command resets the MED comparison influence. **NOTE:** To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands: 1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command. 2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.
Example	`OS10(conf-router-bgp-2)# bestpath med confed`
Supported Releases	10.3.0E or later

bestpath router-id

Ignores comparing router-id information for external paths during best-path selection.

Syntax	`bestpath router-id {ignore}`
Parameters	`ignore` — Enter to ignore AS path for best-path computation.
Default	Enabled
Command Mode	ROUTER-BGP
Usage Information	If you do not receive the same router ID for multiple paths, select the path that you received first. If you received the same router ID for multiple paths, ignore the path information. The `no` version of this command resets the value to the default. **NOTE:** To configure these settings for a nondefault VRF instance, first enter the ROUTER-CONFIG-VRF sub mode using the following commands: 1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command. 2. From the ROUTER BGP mode, enter ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.
Example	`OS10(conf-router-bgp-2)# bestpath router-id ignore`
Supported Releases	10.3.0E or later

bgp dampening

Enables BGP route-flap dampening and configures the dampening parameters.

Syntax

```
bgp dampening [half-life | reuse-limit | suppress-limit | max-suppress-time | route-map-name]
```

Parameters

- *half-life* — (Optional) Enter the half-life time, in minutes, after which the penalty decreases. After the router assigns a penalty of 1024 to a route, the penalty decreases by half after the half-life period expires, from 1 to 45.
- *reuse-limit* — (Optional) Enter a reuse-limit value, which compares to the flapping route's penalty value. If the penalty value is less than the reuse value, the flapping route advertises again and is not suppressed, from 1 to 20000.
- *suppress-limit* — (Optional) Enter a suppress-limit value, which compares to the flapping route's penalty value. If the penalty value is greater than the suppress value, the flapping route is no longer advertised, from 1 to 20000.
- *max-suppress-time* — (Optional) Enter the maximum number of minutes a route is suppressed, from 1 to 255.
- *route-map-name* — (Optional) Enter the name of the route-map.

Defaults

`half-life` 15; `reuse-limit` 750; `suppress-limit` 2000; `max-suppress-time` 60

Command Mode

ROUTER-BGP-AF

Usage Information

To reduce the instability of the BGP process, setup route flap dampening parameters. After setting up the dampening parameters, clear information about route dampening and return the suppressed routes to the `Active` state. You can also view statistics on route flapping or change the path selection from Default Deterministic mode to Non-Deterministic mode. The `no` version of this command resets the value to the default.

Example

```
OS10(conf-router-bgpv4-af)# dampening 2 751 2001 51 map1
```

Supported Releases

10.3.0E or later

bgp redistribute-internal

Allows the redistribution of internal BGP (iBGP) routes for an address family in a default or nondefault VRF.

Syntax

```
[no] bgp redistribute-internal
```

Parameters

None

Default

Not configured

Command Mode

ROUTER-BGP

Usage Information

When an IGP protocol such as OSPF is configured to redistribute BGP, by default, only the eBGP routes are redistributed. You can use this command to enable redistribution of iBGP routes in addition to external BGP (eBGP) routes. This configuration is applicable only for IPv4 unicast and IPv6 unicast address family modes, and it is not applicable for L2 VPN EVPN address family.

The `no` version of this command disables iBGP redistribution.

Example - Enable redistribution of IPv4 iBGP routes in default VRF

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# bgp redistribute-internal
```

Example - Enable redistribution of IPv6 iBGP routes in VRF "dell"

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf dell
OS10(config-router-bgp-100-vrf)# address-family ipv6 unicast
OS10(configure-router-bgpv6-vrf-af)# bgp redistribute-internal
```

Supported Releases	10.5.2.1 or later

clear ip bgp

Resets BGP IPv4 or IPv6 neighbor sessions.

Syntax

```
clear ip bgp [unnumbered-peers] [vrf vrf-name] {ipv4-address | ipv6-address | * | interface interface-type} [ ipv4 | ipv6 | soft in]
```

Parameters

- `unnumbered-peers`—(OPTIONAL) Resets unnumbered sessions for all VRFs.
- `vrf vrf-name`—(OPTIONAL) Enter `vrf` then the name of the VRF to clear IPv4 or IPv6 BGP neighbor sessions corresponding to that VRF.
- *IPv4-address*—Enter an IPv4 address to clear a BGP neighbor configuration.
- *IPv6-address*—Enter an IPv6 address to clear a BGP neighbor configuration.
- `*`—Clears all BGP sessions.
- `interface interface-type`—Clears BGP information that is learned through an unnumbered neighbor. Enter one of the following interface types:
  - `ethernet node/slot/port[:subport]`—Display Ethernet interface information.
  - `port-channel id-number`—Display port channel interface IDs, from 1 to 999 or 1001 to 2000.
  - `vlan vlan-id`—Display the VLAN interface number, from 1 to 4093.
- `soft`—(Optional) Enter to configure and activate policies without resetting the BGP TCP session—BGP soft reconfiguration.
- `in`—(Optional) Enter to activate only ingress (inbound) policies.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# clear ip bgp 1.1.15.4
```

The following is an example to clear BGP information learned through an unnumbered neighbor:

```
OS10# clear ip bgp interface ethernet 1/1/1
```

Supported Releases 10.3.0E or later

clear ip bgp *

Resets BGP sessions. The soft parameter, BGP soft reconfiguration, clears policies without resetting the TCP connection.

Syntax

```
clear ip bgp * [soft in]
```

Parameters

- `*` — Enter to clear all BGP sessions.
- `soft` — (Optional) Enter to configure and activate policies without resetting the BGP TCP session — BGP soft reconfiguration.
- `in` — (Optional) Enter to activate only ingress (inbound) policies.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# clear ip bgp *
```

Supported Releases	10.3.0E or later

clear ip bgp dampening

Clears the path information of the dampened and undampened prefixes.

Syntax	`clear ip bgp dampening [vrf vrf-name] [ipv4-prefix | ipv6-prefix]`
Parameters	• `vrf vrf-name` — (OPTIONAL) Enter `vrf` then the name of the VRF to clear dampened paths information. • *ipv4-prefix* — (Optional) Enter an IPv4 prefix of the dampened path. • *ipv6-prefix* — (Optional) Enter an IPv6 prefix of the dampened path.
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	`OS10# clear ip bgp dampening 1.1.15.5`
Supported Releases	10.3.0E or later

clear ip bgp flap-statistics

Clears all or specific IPv4 or IPv6 flap counts of prefixes.

Syntax	`clear ip bgp [vrf vrf-name] [ipv4-address | ipv6-address] flap-statistics [ipv4-prefix | ipv6-prefix]`
Parameters	• `vrf vrf-name` — (OPTIONAL) Enter `vrf` then the name of the VRF to clear flap statistics information. • *ipv4-address* — (Optional) Enter an IPv4 address to clear the flap counts of the prefixes learned from the given peer. • *ipv6-address* — (Optional) Enter an IPv6 address to clear the flap counts. • *ipv4-prefix* — (Optional) Enter an IPv4 prefix to clear the flap counts of the given prefix. • *ipv6-prefix* — (Optional) Enter an IPv6 prefix to clear the flap counts of the given prefix.
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example (All Prefixes)	`OS10# clear ip bgp flap-statistics`
Example (IPv4)	`OS10# clear ip bgp 1.1.15.4 flap-statistics`
Example (Given Prefix)	`OS10# clear ip bgp flap-statistics 1.1.15.0/24`
Supported Releases	10.3.0E or later

connection-retry-timer

Configures the timer to retry the connection to BGP neighbor or peer group.

Syntax `connection-retry-timer retry-timer-value`

Parameters *retry-timer-value* — Enter the time interval in seconds, ranging from 10 to 65535.

Defaults 60 seconds

Command Modes CONFIG-ROUTER-NEIGHBOR

CONFIG-ROUTER-TEMPLATE

Usage Information The `no` version of this command resets the timer to default value..

Example

```
OS10(config-router-neighbor)# connection-retry-timer 1000
OS10(config-router-template)# connection-retry-timer 100
```

Supported Releases 10.3.0E or later

confederation

Configures an identifier for a BGP confederation.

Syntax `confederation {identifier as-num | peers as-number}`

Parameters

- `identifier` *as-num* —Enter an AS number, from 0 to 65535 for 2 bytes, 1 to 4294967295 for 4 bytes, or 0.1 to 65535.65535 for dotted format.
- `peers` *as-number*—Enter an AS number for peers in the BGP confederation, from 1 to 4294967295.

Default Not configured

Command Mode ROUTER-BGP

Usage Information Configure your system to accept 4-byte formats before entering a 4-byte AS number. All routers in the Confederation must be 4-byte or 2-byte identified routers. You cannot have a mix of 2-byte and 4-byte identified routers. The autonomous system number that you configure in this command is visible to the EBGP neighbors. Each autonomous system is fully meshed and contains a few connections to other autonomous systems. The next-hop (MED) and local preference information is preserved throughout the confederation. The system accepts confederation EBGP peers without a LOCAL_PREF attribute. OS10 sends AS_CONFED_SET and accepts AS_CONFED_SET and AS_CONF_SEQ. The `no` version of this command deletes the confederation configuration.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *as-number* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *vrf-name* command.

Example (Identifier)

```
OS10(conf-router-bgp-2)# confederation identifier 1
```

Example (Peers)

```
OS10(conf-router-bgp-2)# confederation peers 2
```

Supported Releases 10.3.0E or later

client-to-client

Enables route reflection between clients in a cluster.

Syntax `client-to-client {reflection}`

Parameters `reflection` — Enter to enable reflection of routes allowed in a cluster.

Default Enabled

Command Mode ROUTER-BGP

Usage Information Configure the route reflector to enable route reflection between all clients. You must fully mesh all clients before you disable route reflection. The `no` version of this command disables route reflection in a cluster.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example

```
OS10(conf-router-bgp-2)# client-to-client reflection
```

Supported Releases 10.2.0E or later

cluster-id

Assigns a cluster ID to a BGP cluster with multiple route reflectors.

Syntax `cluster-id {`*`number`* `|` *`ip-address`*`}`

Parameters

- *`number`*—Enter a route reflector cluster ID as a 32-bit number, from 1 to 4294967295.
- *`ip-address`*—Enter an IP address as the route-reflector cluster ID.

Default Router ID

Command Mode ROUTER-BGP

Usage Information If a cluster contains only one route reflector, the cluster ID is the route reflector's router ID. For redundancy, a BGP cluster may contain two or more route reflectors. Without a cluster ID, the route reflector cannot recognize route updates from the other route reflectors within the cluster. The default format to display the cluster ID is A.B.C.D format. If you enter the cluster ID as an integer, an integer displays. The `no` version of this command resets the value to the default.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example

```
OS10(conf-router-bgp-10)# cluster-id 3.3.3.3
```

Supported Releases 10.3.0E or later

debug ip bgp

Enables Border Gateway Protocol (BGP) debugging and displays messages related to processing of BGP.

Syntax `debug ip bgp`

Parameters None

Defaults	None
Command Modes	EXEC
Usage Information	The `debug ip bgp` command does not display the logs on the console because they are saved in the journal log. The `no debug ip bgp` command stops displaying messages related to processing of BGP.
Example	`OS10# debug ip bgp`
Supported Releases	OS10 legacy command.

description

Configures a description for the BGP neighbor or for peer template.

Syntax	`description` *text*
Parameters	*text* — Enter a description for the BGP neighbor or peer template.
Default	None
Command Mode	ROUTER-BGP-NEIGHBOR ROUTER-BGP-TEMPLATE
Usage Information	• To use special characters as a part of the description string, enclose the string in double quotes. • To use comma as a part of the description string add double back slash before the comma. • The `no` version of this command removes the description.

Example	`OS10# configure terminal`
	`OS10(config)# router bgp 100`
	`OS10(config-router-bgp-100)# neighbor 8.8.8.8`
	`OS10(config-router-neighbor)# description  n1_abcd`
	`OS10(config-router-neighbor)# exit`
	`OS10(config-router-bgp-100)# template t1`
	`OS10(config-router-template)# description peer_template_1_abcd`

Supported Releases	10.4.1.0 or later

default-metric

Assigns a default-metric of redistributed routes to locally originated routes.

Syntax	`default-metric` *number*
Parameters	*number* — Enter a number as the metric to assign to routes from other protocols, from 1 to 4294967295.
Default	Disabled
Command Mode	ROUTER-BGP
Usage Information	Assigns a metric for locally-originated routes such as redistributed routes. After you redistribute routes in BGP, use this command to reset the metric value — the new metric does not immediately take effect. The new metric takes effect only after you disable and re-enable route redistribution for a specified protocol. To re-enable route distribution use the `redistribute {connected [route-map` *map-name*`] | ospf` *process-id* `| static [route-map` *map-name*`]}` command, or use the `clear ip bgp *` command after you reset BGP. The `no` version of this command removes the default metric value.

Example (IPv4)

```
OS10(conf-router-bgpv4-af)# default-metric 60
```

Example (IPv6)

```
OS10(conf-router-bgpv6-af)# default-metric 60
```

Supported Releases 10.3.0E or later

default-originate

Configures the default route to a BGP peer or neighbor.

Syntax `default—originate [route-map route-map-name]`

Parameters `route-map route-map-name`—(Optional) Enter a route-map name. A maximum of 140 characters.

Default Enabled

Command Mode ROUTER-BGP-NEIGHBOR-AF

ROUTER-TEMPLATE-AF

Usage Information The `no` version of this command removes the default route.

Example

```
OS10(conf-router-bgp-10)# template lunar
OS10(conf-router-bgp-template)# address-family ipv6 unicast
OS10(conf-router-template-af)# default-originate route-map rmap-bgp
```

Supported Releases 10.4.1.0 or later

distance bgp

Sets the administrative distance for BGP routes.

Syntax `distance bgp external-distance internal-distance local-distance`

Parameters

- *external-distance*—Enter a number to assign to routes learned from a neighbor external to the AS, from 1 to 255.
- *internal-distance*—Enter a number to assign to routes learned from a router within the AS, from 1 to 255.
- *local-distance*—Enter a number to assign to routes learned from networks listed in the `network` command, from 1 to 255.

Defaults

- *external-distance*—20
- *internal-distance*—200
- *local-distance*—200

Command Modes

- CONFIG-ROUTER-BGP-ADDRESS-FAMILY
- CONFIG-ROUTER-BGP-VRF-ADDRESS-FAMILY

Usage Information This command is used to configure administrative distance for eBGP route, iBGP route, and local BGP route. Administrative distance indicates the reliability of the route; the lower the administrative distance, the more reliable the route is. Routes that are assigned an administrative distance of 255 are not installed in the routing table. Routes from confederations are treated as iBGP routes.

Examples Default VRF:

IPv4

```
OS10# configure terminal
OS10(config)# router bgp 100
```

```
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# distance bgp 10 200 210
```

IPv6

```
OS10# configure terminal
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# address-family ipv6 unicast
OS10(configure-router-bgpv6-af)# distance bgp 10 200 210
```

Non-default VRF

```
OS10(config-router-bgp-100)# vrf blue
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# distance bgp 21 200 200
OS10(config-router-bgp-100-vrf)# address-family ipv6 unicast
OS10(configure-router-bgpv6-vrf-af)# distance bgp 21 201 250
```

Supported Releases 10.4.2.0 or later

distribute-list

Distributes BGP information through an established prefix list.

Syntax `distribute-list prefix-list-name {in | out}`

Parameters

- *prefix-list-name*—Enter the name of established prefix list.
- `in`—Enter to distribute inbound traffic.
- `out`—Enter to distribute outbound traffic.

Defaults None

Command Modes ROUTER-BGP-NEIGHBOR-AF

ROUTER-TEMPLATE-AF

Usage Information The `no` version of this command removes the `route-map`.

Example

```
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# distribute-list inbgg in
```

```
OS10(conf-router-template)# address-family ipv4 unicast
OS10(conf-router-bgp-template-af)# distribute-list outbgg out
```

Supported Releases 10.4.1.0 or later

bgp default local-preference

Changes the default local preference value for routes exchanged between internal BGP peers.

Syntax `default local-preference number`

Parameters *number* — Enter a number to assign to routes as the degree of preference for those routes. When routes compare, the route with the higher degree of preference or the local preference value is most preferred, from 1 to 4294967295.

Default 100

Command Mode ROUTER-BGP

Usage Information	All routers apply this command setting within the AS. The `no` version of this command deletes local preference value.
Example	`OS10(conf-router-bgp-1)# default local-preference 200`
Supported Releases	10.3.0E or later

ebgp-multihop

Allows eBGP neighbors on indirectly connected networks.

Syntax	`ebgp-multihop` *`hop count`*
Parameters	*`hop count`* — Enter a value for the number of hops, from 1 to 255.
Default	1 for eBGP. 255 for iBGP.
Command Mode	ROUTER-NEIGHBOR
Usage Information	This command avoids installation of default multihop peer routes to prevent loops and creates neighbor relationships between peers. Networks indirectly connected are not valid for best path selection. The `no` version of this command removes multihop session.
Example	`OS10(conf-router-neighbor)# ebgp-multihop 2`
Supported Releases	10.3.0E or later

enforce-first-as

Enforces the first AS in the AS path of the route received from an EBGP peer to be the same as the configured remote AS.

Syntax	`enforce-first-as`
Parameters	None
Default	Enabled
Command Mode	ROUTER-BGP
Usage Information	To verify statistics of routes rejected, use the `show ip bgp neighbors` command. If routes are rejected, the session is reset. In the event of a failure, the existing BGP sessions flap. For updates received from EBGP peers, BGP ensures that the first AS of the first AS segment is always the AS of the peer, otherwise the update drops and the counter increments. The `no` version of this command turns off the default. **NOTE:** To configure these settings for a non default VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands: 1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command. 2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.
Example	`OS10(conf-router-bgp-1)# enforce-first-as`
Supported Releases	10.3.0E or later

fall-over

Enables or disables BGP session fast fall-over for BGP neighbors.

Syntax	`fall-over`
Parameters	None
Default	Disabled
Command Mode	ROUTER-NEIGHBOR
Usage Information	Configure the BGP fast fall-over on a per-neighbor or peer-group basis. When you enable this command on a template, it simultaneously enables on all peers that inherit the peer group template. When you enable fall-over, BGP tracks IP reachability to the peer remote address and the peer local address. Whenever either address becomes unreachable — no active route exists in the routing table for peer IPv6 destinations or local address — BGP brings down the session with the peer. The `no` version of this command disables fall-over.
Example	`OS10(conf-router-neighbor)# fall-over`
Supported Releases	10.3.0E or later

fast-external-fallover

Resets BGP sessions immediately when a link to a directly connected external peer fails.

Syntax	`fast-external-fallover`
Parameters	None
Default	Not configured
Command Mode	ROUTER-BGP
Usage Information	Fast external fall-over terminates the EBGP session immediately after the IP unreachability or link failure is detected. This only applies after you manually reset all existing BGP sessions. For the configuration to take effect, use the `clear ip bgp` command. The `no` version of this command disables fast external fallover. **NOTE:** To configure these settings for a non default VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands: 1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command. 2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.
Example	`OS10(conf-router-bgp-10)# fast-external-fallover`
Supported Releases	10.3.0E or later

graceful-restart

Enables graceful or hitless restart and configures the required parameters for the restart process.

Syntax	`graceful-restart role receiver-only`
Parameters	• `role` — Sets the restart role of the local router • `receiver-only` — Local router supports graceful restart as a receiver only
Defaults	Disabled
Command Mode	ROUTER BGP

Usage Information	When you enable graceful restart on a node, its BGP neighbor acts as a helper by not dropping the sessions and maintaining the route information so that the traffic is not disturbed. The `no` version of this command disables graceful-restart helper mode. **NOTE:** To configure these settings for a non-default VRF instance, you must first enter ROUTER-CONFIG-VRF sub mode using the following commands: 1. Enter the ROUTER BGP mode using the `router bgp` *as-number* command. 2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *vrf-name* command.
Example	`OS10(conf-router-bgp-10)# graceful-restart role receiver-only`
Supported Releases	10.3.0E or later

ibgp-ecmp-next-hop-self

Configures the ECMP routes to be advertised to an iBGP peer with next-hop-self.

Syntax	`[no] ibgp-ecmp-next-hop-self`
Parameters	None
Default	None
Command Mode	ROUTER-BGP
Security and Access	netadmin, sysadmin, and secadmin
Usage Information	By default, the next-hop is set to next-hop-self while advertising an ECMP route to an iBGP peer. Use the `no` version of this command to advertise ECMP routes to iBGP neighbors with the lowest next-hop IP address. To verify the configuration, use the `show ip bgp neighbors` command. This command is applicable for IPv4 unicast and IPv6 unicast address family modes.
Example (Default VRF)	`OS10(config)# router bgp 100` `OS10(config-router-bgp-100)# no ibgp-ecmp-next-hop-self`

Example (Nondefault VRF)	`OS10(config)# router bgp 100`
	`OS10(config-router-bgp-100)# vrf red`
	`OS10(config-router-bgp-100-vrf)# no ibgp-ecmp-next-hop-self`

Supported Releases	10.5.2.3 or later

inherit

Configures a peer group template name that the auto-unnumbered interfaces use to inherit peer-group configuration.

Syntax	`inherit {ibgp-template | ebgp-template}` *template-name*
Parameters	• `ebgp-template`—Enter an external BGP template to establish a BGP neighborship through this interface. • `ebgp-template`—Enter an internal BGP template to establish a BGP neighborship through this interface. • *template-name*—Enter the name of the template.
Default	Not configured
Command Mode	ROUTER-NEIGHBOR

Usage Information This command is available only if you use the `neighbor unnumbered-auto` command.

Example

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# template int-bgp
OS10(config-router-template)# timers 30 90
OS10(config-router-template)# exit
OS10(config-router-bgp-100)# template ext-bgp
OS10(config-router-template)# timers 40 120
OS10(config-router-template)# exit
OS10(config-router-bgp-100)# neighbor unnumbered-auto
OS10(config-router-neighbor)# inherit ibgp-template int-bgp
OS10(config-router-neighbor)# inherit ebgp-template ext-bgp
OS10(config-router-neighbor)# no shutdown
```

Supported Releases 10.5.2.0 or later

inherit template

Configures a peer group template name that the neighbors use to inherit peer-group configuration.

Syntax `inherit template` *`template-name`* `[inherit-type {ibgp | ebgp}]`

Parameters

- *`template-name`* — Enter a template name. A maximum of 16 characters.
- `inherit-type {ibgp | ebgp}` —To associate a template to an unnumbered peer, specify the inherit-type. The options are `ibgp` and `ebgp`.

Default Not configured

Command Mode ROUTER-NEIGHBOR

Usage Information When network neighbors inherit a template, all that are enabled on the template are also supported on the neighbors. The `no` version of this command disables the peer group template configuration.

Example

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# template Group
OS10(config-router-template)# weight 100
OS10(config-router-template)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# exit
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor interface ethernet 1/1/1
OS10(config-router-neighbor)# inherit template Group inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
```

Supported Releases 10.2.0E or later

ipv6 bgp unnumbered

Configures an interface to be a BGP auto-unnumbered interface.

Syntax `ipv6 bgp unnumbered {ebgp-template | ibgp-template}`

Parameters

- `ebgp-template`—Indicates to inherit an eBGP template for this auto-unnumbered interface using the `inherit ebgp-template` command. If there is no configuration under unnumbered-auto neighbor, the system does not inheit any templates from this neighbor.
- `ibgp-template`—Indicates to inherit an iBGP template for this auto-unnumbered interface using the `inherit ibgp-template` command. If there is no configuration under the auto-unnumbered neighbor, the system does not inherit any templates from this neighbor.

Defaults None

Command Modes
- INTERFACE
- INTERFACE-RANGE

Usage Information

Use the `ipv6 bgp unnumbered` command on interfaces that must be discovered as auto-unnumbered interfaces using RA messages.

Use this command on a Layer 3 interface.

You can use this command on the following interface types:

- Physical interfaces
- Port channel interfaces
- VLAN interfaces

Example

```
OS10# configure terminal
OS10(config)# ipv6 nd max-ra-interval 4
OS10(config)# ipv6 nd min-ra-interval 3
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)#ipv6 bgp unnumbered ebgp-template
```

Supported Releases

10.5.2.0 or later

link-local-only-nexthop (Global level)

Configures link-local-only-nexthop under BGP.

Syntax

`[no] link-local-only-nexthop`

Parameters

None.

Default

Disabled

Command Mode

ROUTER-BGP

Security and access

This command is restricted to the `netadmin`, `sysadmin`, and `secadmin` user roles.

Usage Information

Supports link-local in both Next Hop fields for route exchange with unnumbered neighbors.

The `no link-local-only-nexthop` command removes the BGP unnumbered interop with FRR vendor feature.

Configure this command globally under router BGP. This configuration is applicable for all VRFs. This command is not applicable for numbered peers. Use this command when the BGP unnumbered sessions are established with other vendors based on FRR stacks.

Example

```
OS10(config-router-bgp-200)# link-local-only-nexthop

OS10(config-router-bgp-200)# show configuration

!
router bgp 200
no enforce-first-as
link-local-only-nexthop
!
```

Supported Releases

10.5.3 or later

link-local-only-nexthop (BGP neighbor level)

Configures link-local-only-nexthop at the BGP neighbor level.

Syntax `[no] link-local-only-nexthop [disable]`

Parameters `disable` - (Optional) Disable link local in both Next Hop fields for route exchange with unnumbered neighbors.

Default Disabled

Command Mode ROUTER-BGP

Security and access This command is restricted to the `netadmin`, `sysadmin`, and `secadmin` user roles.

Usage Information

Support for link local in both Next Hop fields for route exchange with unnumbered neighbors.

Use this command to enable or disable link-local only Next Hop support at the neighbor level for unnumbered peers.

The neighbor level configuration takes precedence over ROUTER BGP (Global) and template level.

This command is not applicable for numbered peers.

Example

```
OS10(config-router-neighbor)# link-local-only-nexthop

OS10(config-router-bgp-100)# show configuration

!
router bgp 100
 no enforce-first-as
 !
 neighbor interface ethernet1/1/3
 no shutdown
 link-local-only-nexthop
 !
!

OS10(config-router-neighbor)# link-local-only-nexthop disable

OS10(config-router-bgp-100)# show configuration

!
router bgp 100
 no enforce-first-as
 !
 neighbor interface ethernet1/1/3
 no shutdown
 link-local-only-nexthop disable
 !

OS10(config-router-bgp-100)# neighbor 120.1.1.2
OS10(config-router-neighbor)# link-local-only-nexthop
% Error: Link-local nexthop configuration is applicable only for
unnumbered peers.
OS10(config-router-neighbor)# show configuration
!
neighbor 120.1.1.2
!

OS10(config-router-bgp-100-vrf)# neighbor 120::2
OS10(config-router-vrf-neighbor)# link-local-only-nexthop disable
% Error: Link-local nexthop configuration is applicable only for
unnumbered peers.
OS10(config-router-vrf-neighbor)#

!
neighbor 120::2
```

Supported Releases	10.5.3 or later

link-local-only-nexthop (BGP template level)

Configures link-local-only-nexthop at the BGP template level.

Syntax	`[no] link-local-only-nexthop [disable]`
Parameters	`disable`—(Optional) Disable link local in both Next Hop fields for route exchange with unnumbered neighbors.
Default	Disabled
Command Mode	BGP-TEMPLATE
Security and access	This command is restricted to the `netadmin`, `sysadmin`, and `secadmin` user roles.
Usage Information	Support for link local in both Next Hop fields for route exchange with unnumbered neighbors. Use this command to enable or disable link-local only Next Hop support at the BGP template level for unnumbered peers. The template level configuration takes precedence over ROUTER BGP (Global) level. This command is not applicable for numbered peers.
Example	See below

```
OS10(config-router-template)# link-local-only-nexthop

OS10(config-router-bgp-100)# show configuration

!
router bgp 100
  no enforce-first-as
  !
  template pg1
    link-local-only-nexthop
    !
OS10(config-router-template)# link-local-only-nexthop disable

OS10(config-router-bgp-100)# show configuration

!
router bgp 100
  no enforce-first-as
  !
  template pg1
    link-local-only-nexthop disable
    !
```

Supported Releases	10.5.3.0 or later

listen

Enables peer listening and sets the prefix range for dynamic peers.

Syntax	`listen` *`ip-address`* `[limit` *`count`*`]`
Parameters	• *`ip-address`*—Enter the BGP neighbor IP address. • `limit` *`count`*—(Optional) Enter a maximum dynamic peer count, from 1 to 4294967295.
Default	Not configured
Command Mode	ROUTER-TEMPLATE

Usage Information	Enables a passive peering session for listening. The `no` version of this command disables a passive peering session.
Example	`OS10(conf-router-template)# listen 1.1.0.0/16 limit 4`
Supported Releases	10.2.0E or later

local-as

Configures a local AS number for a peer.

Syntax	`local-as` *`as-number`* `[no-prepend] [replace-as]`
Parameters	• *`as-number`*—Enter the local AS number, from 1 to 4294967295. • `no-prepend`—(Optional) Enter so that local AS values are not prepended to the AS_PATH attribute. • `replace-as`—(Optional) Enter so that globally configured AS values are not prepended to the AS_PATH attribute.
Default	Disabled
Command Mode	ROUTER-NEIGHBOR or ROUTER-TEMPLATE
Usage Information	Facilitates the BGP network migration operation and allows you to maintain existing AS numbers. The `no` version of this command resets the value to the default. This command is supported only for external BGP (eBGP) autonomous system migration, and it is not supported for internal BGP (iBGP) autonomous system migration. After configuring the `replace-as` option, clear the BGP session. The `no local-as` command deletes the local-as configuration. The `no local-as no-prepend` command removes both local and globally-configured AS numbers from the AS_PATH attribute and leaves the `local-as` *`local-as`* configuration intact.
Example (Neighbor)	`OS10(conf-router-bgp-10)# neighbor lunar` `OS10(conf-router-neighbor)# local-as 20`
Example (Template)	`OS10(conf-router-bgp-10)# template solar` `OS10(conf-router-template)# local-as 20`
Example (Replace AS)	`OS10(conf-router-bgp-10)# neighbor SJC` `OS10(conf-router-template)# local-as 20 no-prepend replace-as`
Supported Releases	10.3.0E or later

log-neighbor-changes

Enables logging for changes in neighbor status.

Syntax	`log-neighbor-changes`
Parameters	None
Default	Enabled
Command Mode	ROUTER-BGP
Usage Information	OS10 saves logs which includes the neighbor operational status and reset reasons. To view the logs, use the `show bgp config` command. The `no` version of this command disables the feature.

NOTE: To configure these settings for a non default VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp as-number` command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf vrf-name` command.

Example

```
OS10(conf-router-bgp-10)# log-neighbor-changes
```

Supported Releases 10.3.0E or later

maximum-paths

Configures the maximum number of equal-cost paths for load sharing.

Syntax `maximum-paths [ebgp number | ibgp number] maxpaths`

Parameters

- `ebgp`—Enable multipath support for external BGP routes.
- `ibgp`—Enable multipath support for internal BGP routes.
- *number*—Enter the number of parallel paths, from 1 to 64.

Default 64 paths

Command Mode ROUTER-BGP

Usage Information Dell Technologies recommends not using multipath and add path simultaneously in a route reflector. To recompute the best path, use the `clear ip bgp *` command. The `no` version of this command resets the value to the default

NOTE: To configure these settings for a non default VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp as-number` command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf vrf-name` command.

Example (EBGP)

```
OS10(conf-router-bgp-2)# maximum-paths ebgp 2 maxpaths
```

Example (IBGP)

```
OS10(conf-router-bgp-2)# maximum-paths ibgp 4 maxpaths
```

Supported Releases 10.3.0E or later

maximum-prefix

Configures maximum-prefix support in peer-group level templates. This support applies for both IPv4 and IPv6 address families.

Syntax `maximum-prefix 1-4294967295 {1-100 | warning-only}`

Parameters

- *1-4294967295* - Maximum number of prefix limit.
- *1-100* - Percentage threshold value at which to generate an warning message. The default value is 75.
- `warning-only` - Specify warning-only to generate a warning message when limit is exceeded.

Default None.

Command Mode TEMPLATE ADDRESS FAMILY LEVEL

Usage Information Configures maximum prefix for a specific template. This configuration is applied to all BGP peers when inheriting this template.

NOTE: Only the system administer (sysadmin) role is allowed to manage this configuration.

Example

```
MAA-S4048T-X01-7445(config-router-template)# address-family ipv4 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# maximum-prefix 10 50
warning-only

MAA-S4048T-X01-7445(config-router-template)# address-family ipv6 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# maximum-prefix 20 100
```

Supported Releases 10.5.2.1 or Later

neighbor

Creates a remote IP or unnumbered peer and enters Neighbor Configuration mode.

Syntax `neighbor {ip-address | interface interface-type | unnumbered-auto}`

Parameters

- *ip-address*—Enter the IPv4 or IPv6 address of the neighbor.
- `interface` *interface-type*—Enter the interface that connects to an unnumbered neighbor.
- `unnumbered-auto`—Configure one or more BGP auto unnumbered neighbors.

Default Not configured

Command Mode CONFIG-ROUTER-BGP

Usage Information

Create a remote peer with the BGP neighbor.

If you configure an unnumbered interface using the `interface`, or `unnumbered-auto` options, ensure that the interface is in Layer 3 mode. Also, enable Router Advertisement globally or on required interfaces using the `ipv6 nd send-ra` command. If you do not enable Router Advertisement, the BGP neighborship does not form. Dell Technologies recommends configuring the minimum and maximum advertisement intervals as 3 s and 4 s, respectively.

NOTE: You cannot configure the default VLAN as the connecting interface for an unnumbered neighbor.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *as-number* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *vrf-name* command.

The `no` version of this command disables the BGP neighbor configuration.

Example

The following is an example for configuring an unnumbered BGP neighbor:

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ipv6 nd max-ra-interval 4
OS10(conf-if-vl-100)# ipv6 nd min-ra-interval 3
OS10(conf-if-vl-100)# ipv6 nd send-ra
OS10(conf-if-vl-100)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# switchport mode trunk
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 100
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor interface vlan 100
OS10(config-router-neighbor)# no shutdown
```

The following is an example for configuring an auto unnumbered BGP neighbor:

```
OS10# configure terminal
OS10(config)# ipv6 nd max-ra-interval 4
OS10(config)# ipv6 nd min-ra-interval 3
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)#ipv6 bgp unnumbered ebgp-template
OS10(conf-if-eth1/1/1)#exit
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor unnumbered-auto
OS10(config-router-neighbor)# no shutdown
```

Supported Releases 10.3.0E or later

network

Configures a network as local to this AS and adds it to the BGP routing table.

Syntax `network ip-address/prefix [route-map map-name]`

Parameters

- *ip-address/prefix*—Enter the IPv4 or IPv6 address and the prefix number to the network.
- `route-map` *map-name*—(Optional) Enter the name of an established route-map.

Defaults None

Command Modes ROUTER-AF

Usage Information The `no` version of this command removes the network.

Example

```
OS10(conf-router-bgpv4-af)#
OS10(config-router-bgp-64601)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# network 192.168.1.0/24
OS10(configure-router-bgpv4-af)# do commit
```

Supported Releases 10.3.0E or later

next-hop-self

Configures the next-hop-self support for the peer-group level. This support applies for both IPv4 and IPv6 address families.

Syntax `next-hop-self`

Parameters None.

Default Not configured

Command Mode TEMPLATE ADDRESS FAMILY LEVEL

Usage Information Configures the next-hop-self for a specific template. This configuration is applied to all BGP peers when inheriting this template.

The next-hop-self configuration is enabled by default on the unnumbered peers. When the next-hop-self configuration is removed, there is no impact on the unnumbered peers.

NOTE: Only the system administers (sysadmin) role is allowed to manage this configuration.

Example

```
MAA-S4048T-X01-7445(config-router-template)# address-family ipv4 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# next-hop-self
```

```
MAA-S4048T-X01-7445(config-router-template)# address-family ipv6 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# no next-hop-self
```

Supported Releases 10.5.2.1 or Later

non-deterministic-med

Compares paths in the order they arrive.

Syntax `non-deterministic-med`

Parameters None

Default Disabled

Command Mode ROUTER-BGP

Usage Information Paths compare in the order they arrive. OS10 uses this method to choose different best paths from a set of paths, depending on the order they are received from the neighbors. MED may or may not be compared between adjacent paths. When you change the path selection from deterministic to nondeterministic, the path selection for the existing paths remains deterministic until you use the `clear ip bgp` command to clear the existing paths. The `no` version of this command configures BGP bestpath selection as non-deterministic.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example

```
OS10(conf-router-bgp-10)# non-deterministic-med
```

Supported Releases 10.2.0E or later

outbound-optimization

Enables outbound optimization for IBGP peer-group members.

Syntax `outbound-optimization`

Parameters None

Default Not configured

Command Mode ROUTER-BGP

Usage Information Enable or disable outbound optimization dynamically to reset all neighbor sessions. When you enable outbound optimization, all peers receive the same update packets. The next-hop address chosen as one of the addresses of neighbor's reachable interfaces is also the same for the peers. The `no` version of this command disables outbound optimization.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example

```
OS10(conf-router-bgp-10)# outbound-optimization
```

Supported Releases	10.3.0E or later

password

Configures a password for message digest 5 (MD5) authentication on the TCP connection between two neighbors.

Syntax	`password {9 encrypted password-string| password-string}`
Parameters	• `9 encrypted password-string`—Enter 9 then the encrypted password. • `password-string`—Enter a password for authentication. A maximum of 128 characters.
Default	Disabled
Command Mode	ROUTER-NEIGHBOR ROUTER-TEMPLATE
Usage Information	You can enter the password either as plain text or in encrypted format. The password that is provided in ROUTER-NEIGHBOR mode takes preference over the password in ROUTER-TEMPLATE mode. The `no` version of this command disables authentication.

Example	`OS10(conf-router-neighbor)# password abcdell`
	
	`OS10(conf-router-neighbor)# password 9 f785498c228f365898c0efdc2f476b4b27c47d972c3cd8cd9b91f518c14ee42d`

Supported Releases	10.3.0E or later

redistribute

Redistributes connected, static, and OSPF routes in BGP.

Syntax	`redistribute {connected [route-map map name] | imported-bgp-routes {vrf vrf-name} [route-map map-name] | ospf process-id [route-map map name] | static [route-map map name]}`
Parameters	• `connected` — Enter to redistribute routes from physically connected interfaces. • `imported-bgp-routes {vrf vrf-name} [route-map map-name]` — Enter to redistribute leaked BGPv4 routes. • `route-map map name` — (Optional) Enter the name of a configured route-map. • `ospf process-id` — Enter a number for the OSPF process (1 to 65535). • `static` — Enter to redistribute manually configured routes.
Default	Disabled
Command Mode	ROUTER-BGPv4-AF or ROUTER-BGPv6-AF
Usage Information	Static routes are treated as incomplete routes. When you use the `redistribute ospf process-id` command without other parameters, the system redistributes all OSPF internal routes, external type 1 routes, and external type 2 routes. The `no` version of this command resets the value to the default.
Example (Connected)	`OS10(conf-router-bgp-102)# address-family ipv4 unicast` `OS10(conf-router-bgpv4-af)# redistribute connected route-map mapbgp1`
Example (Static — IPv4)	`OS10(conf-router-bgp-102)# address-family ipv4 unicast` `OS10(conf-router-bgpv4-af)# redistribute static route-map mapbgp2`

Example (Static — IPv6)

```
OS10(conf-router-bgp-102)# address-family ipv6 unicast
OS10(conf-router-bgpv6-af)# redistribute static
```

Example (OSPF — IPv4)

```
OS10(conf-router-bgp-102)# address-family ipv4 unicast
OS10(conf-router-bgpv4-af)# redistribute ospf 1
```

Example (OSPF — IPv6)

```
OS10(conf-router-bgp-102)# address-family ipv6 unicast
OS10(conf-router-bgpv6-af)# redistribute ospf 1
```

Supported Releases 10.2.0E or later

remote-as

Adds a remote AS to the specified BGP neighbor or peer group.

Syntax `remote-as as-number`

Parameters *as-number* — Specify AS number ranging from 1 to 65535 for 2 byte or 1 to 4294967295 for 4 byte.

Defaults None

Command Modes CONFIG-ROUTER-NEIGHBOR

CONFIG-ROUTER-TEMPLATE

Usage Information The `no` version of this command deletes the remote AS.

Example

```
OS10(config)# router bgp 300
OS10(config-router-bgp-300)# template ebgppg
OS10(config-router-template)# remote-as 100
```

Supported Releases 10.4.1.0 or later

remove-private-as

Removes private AS numbers from receiving outgoing updates.

Syntax `remove-private-as`

Parameters None

Defaults Disabled

Command Mode CONFIG-ROUTER-NEIGHBOR

CONFIG-ROUTER-TEMPLATE

Usage Information None

Example

```
OS10(config)# router bgp 300
OS10(config-router-bgp-300)# template ebgppg
OS10(config-router-template)# remove-private-as
```

Supported Releases 10.4.1.0 or later

route-map

Applies an established route-map to either incoming or outbound routes of a BGP neighbor or peer group.

Syntax `route-map route-map-name {in | out}`

Parameters
- *route-map-name* — Enter the name of the configured route-map.
- `in` — attaches the route-map as the inbound policy
- `out` — attaches the route-map as the outbound policy

Defaults None

Command Modes ROUTER-BGP-TEMPLATE-AF

Usage Information The `no` version of this command deletes the `route-map`.

Example

```
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# route-map bgproutemap in
```

```
OS10(conf-router-template)# address-family ipv4 unicast
OS10(conf-router-bgp-template-af)# route-map bgproutemap in
```

Supported Releases 10.4.1.0 or later

route-reflector-client

Configures a neighbor as a member of a route-reflector cluster.

Syntax `route-reflector-client`

Parameters None

Default Not configured

Command Mode ROUTER-TEMPLATE

Usage Information The device configures as a route reflector, and the BGP neighbors configure as clients in the route-reflector cluster. The `no` version of this command deletes all clients of a route reflector—the router no longer functions as a route reflector.

Example

```
OS10(conf-router-template)# route-reflector-client
```

Supported Releases 10.3.0E or later

router bgp

Enables BGP and assigns an AS number to the local BGP speaker.

Syntax `router bgp as-number`

Parameters *as-number*—Enter the AS number range.
- 1 to 65535 in 2 byte
- 1 to 4294967295 in 4 byte

Default None

Command Mode CONFIGURATION

Usage Information The AS number can be a 16-bit integer. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# router bgp 3
OS10(conf-router-bgp-3)#
```

Supported Releases 10.3.0E or later

router-id

Assigns a user-given ID to a BGP router.

Syntax `router-id ip-address`

Parameters *ip-address* — Enter an IP address in dotted decimal format.

Default First configured IP address or random number

Command Mode ROUTER-BGP

Usage Information Change the router ID of a BGP router to reset peer-sessions. The `no` version of this command resets the value to the default.

By default, OS10 sets a loopback IP address as the router ID. If there is no loopback address, the software chooses the highest IP address that is configured to a physical interface.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *as-number* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *vrf-name* command.

Example

```
OS10(conf-router-bgp-10)# router-id 10.10.10.40
```

Supported Releases 10.3.0E or later

send-community

Sends a community attribute to a BGP neighbor or peer group.

Syntax `send-community {extended | standard}`

Parameters

- `extended` — Enter an extended community attribute.
- `standard` — Enter a started community attribute.

Default Not configured

Command Mode ROUTER-NEIGHBOR

Usage Information A community attribute indicates that all routes with the same attributes belong to the same community grouping. All neighbors belonging to the template inherit the feature when configured for a template. The `no` version of this command disables sending a community attribute to a BGP neighbor or peer group.

Example

```
OS10(conf-router-neighbor)# send-community extended
```

Supported Releases 10.3.0E or later

sender-side-loop-detection

Enables the sender-side loop detection process for a BGP neighbor.

Syntax `sender-side-loop-detection`

Parameters None

Default Enabled

Command Mode ROUTER-BGP-NEIGHBOR-AF

Usage Information This command helps detect routing loops, based on the AS path before it starts advertising routes. To configure a neighbor to accept routes use the `neighbor allowas-in` command. The `no` version of this command disables sender-side loop detection for that neighbor.

Example (IPv4)

```
OS10(conf-router-bgp-102)# neighbor 3.3.3.1
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# sender-side-loop-detection
```

Example (IPv6)

```
OS10(conf-router-bgp-102)# neighbor 32::1
OS10(conf-router-neighbor)# address-family ipv6 unicast
OS10(conf-router-bgp-neighbor-af)# no sender-side-loop-detection
```

Supported Releases 10.3.0E or later

show ip bgp

Displays information that BGP neighbors exchange.

Syntax `show ip bgp [vrf vrf-name] ip-address/mask`

Parameters

- `vrf vrf-name` — (OPTIONAL) Enter `vrf` and then the name of the VRF to view route information corresponding to that VRF.
- *`ip-address/mask`* — Enter the IP address and mask in A.B.C.D/x format.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip bgp 1.1.1.0/24
BGP routing table entry for 1.1.1.0/24
Paths: (1 available, table Default-IP-Routing-Table.)

Received from :
3.1.1.1(3.3.3.33) Best

AS_PATH : 100
Next-Hop : 3.1.1.1, Cost : 0

Origin INCOMPLETE, Metric 0, LocalPref 100, Weight  0, confed-external
Route-reflector origin : 0.0.0.0
```

The following displays the next hop as an unnumbered neighbor with `ethernet1/1/1` as the connected interface.

```
OS10# show ip bgp 31.1.1.0/24
BGP routing table entry for 31.1.1.0/24
Paths: (1 available, table Default-IP-Routing-Table.)

Received from :
fe80::3617:ebff:fef1:dc5e via ethernet1/1/1 (1.1.1.1) Best
```

```
AS_PATH :
Next-Hop :ethernet 1/1/1 , Cost : 0

Origin INCOMPLETE, Metric 0, LocalPref 100, Weight 32768,
Route-reflector origin : 0.0.0.0
```

The following displays the next hop as an unnumbered neighbor with `ethernet1/1/1` as the connected interface.

```
OS10# show ip bgp
BGP local RIB : Routes to be Added , Replaced , Withdrawn
BGP local router ID is 14.233.209.106
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed/network, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
       Network            Next Hop           Metric       LocPrf
Weight           Path
*>r    31.1.1.0/24        0.0.0.0               0           100
32768            ?

*>     41.1.1.0/24      ethernet 1/1/1          0           100
32768            ?
```

When you filter routes by IP addresses, if the system does not find a match, it displays the following error message:

```
OS10# show ip bgp 40.40.40.0/24
%Error: Prefix does not exist.
```

Supported Releases 10.3.0E or later

show ip bgp community

Displays the BGP routes that match a standard community number.

Syntax `show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [community community-number | {internet | local-AS | no-advertise | no-export}]`

Parameters

- `vrf vrf-name`—(Optional) Enter the name of the VRF to view information either on all routes with community attributes or specific BGP community routes corresponding to that VRF.
- `ipv4 unicast`—(Optional) Displays information that is related only to IPv4 unicast routes.
- `ipv6 unicast`—(Optional) Displays information that is related only to IPv6 unicast routes.
- `community community-number`—Enter the community number in AA:NN format where AA is the AS number (2 bytes) and NN is a value specific to that autonomous system.
- `internet`—Displays all routes that are part of the well-known community INTERNET.
- `local-AS`—Displays routes that are advertised only to local peers.
- `no-advertise`—Displays routes that are not advertised to any peer.
- `no-export`—Displays routes that are advertised only within BGP AS boundary.

Default None

Command Mode EXEC

Security and Access `Netadmin`, `sysadmin`, `secadmin`, and `netoperator`

Usage Information This command is used to display BGP routes that match the given community number.

Example

```
OS10# show ip bgp community 11:22
BGP local RIB : Routes to be Added , Replaced , Withdrawn
```

```
BGP local router ID is 10.1.1.2
Status codes:s suppressed,S stale,d dampened,h history,* valid,> best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed/network, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
      Network       Next Hop  Metric  LocPrf  Weight   Path
*>r   10.1.1.0/24   0.0.0.0     0       100    32768    ?
*>r   30.1.1.0/24   0.0.0.0     0       100    32768    ?
```

Supported Releases 10.5.2.1 or later

show ip bgp community-list

Displays the BGP routes that match any of the standard community numbers from a standard community list.

Syntax `show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [community-list community-list-name]`

Parameters

- `vrf vrf-name`—(Optional) Enter the name of the VRF to view routes that are related to a specific community list corresponding to that VRF.
- `ipv4 unicast`—Displays information that is related to IPv4 unicast routes.
- `ipv4 unicast`—Displays information that is related to IPv6 unicast routes.
- `community-list community-list-name`—Enter the name of a configured IP community list (maximum 140 characters).

Default None

Command Mode EXEC

Security and Access `Netadmin`, `sysadmin`, `secadmin`, and `netoperator`

Usage Information This command is used to display BGP routes that match any standard community number from the given standard community list.

Example

```
OS10# show ip bgp ipv6 unicast community-list std-com
BGP local RIB : Routes to be Added , Replaced , Withdrawn
BGP local router ID is 10.1.1.2
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed/network, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
      Network              Next Hop     Metric    LocPrf     Weight
Path
*>r   100::1/128              ::          0         100      32768      ?
*>r   2001:100:1:1::/64       ::          0         100      32768      ?
```

Supported Releases 10.5.2.1 or later

show ip bgp dampened-paths

Displays BGP routes that are dampened or nonactive.

Syntax `show ip bgp [vrf vrf-name] dampened-paths`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information

- `vrf vrf-name` — (OPTIONAL) Enter `vrf` and then the name of the VRF to view routes that are affected by a specific community list corresponding to that VRF.

- `Network` — Displays the network ID where the route is dampened.
- `From` — Displays the IP address of the neighbor advertising the dampened route.
- `Reuse` — Displays the HH:MM:SS until the dampened route is available.
- `Path` — Lists all AS the dampened route that is passed through to reach the destination network.

Example

```
OS10# show ip bgp dampened-paths

BGP local router ID is 80.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Origin codes: i - IGP, e - EGP, ? - incomplete
          Network         From            Reuse           Path
d*        3.1.2.0/24      80.1.1.2        00:00:12        800 9 8 i
d*        3.1.3.0/24      80.1.1.2        00:00:12        800 9 8 i
d*        3.1.4.0/24      80.1.1.2        00:00:12        800 9 8 i
d*        3.1.5.0/24      80.1.1.2        00:00:12        800 9 8 i
d*        3.1.6.0/24      80.1.1.2        00:00:12        800 9 8 i
Total number of prefixes: 5
```

Supported Releases 10.3.0E or later

show ip bgp extcommunity-list

Displays BGP routes that match any of the extended community attributes from an extended community list.

Syntax `show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [extcommunity-list extcommunity-list-name]`

Parameters

- `vrf vrf-name`—Enter the name of the VRF to view information about all routes with extended community attributes corresponding to that VRF.
- `ipv4 unicast`—Displays information that is related to IPv4 unicast routes.
- `ipv6 unicast`—Displays information that is related to IPv6 unicast routes.
- `extcommunity-list extcommunity-list-name`—Enter the extended community list name (maximum of 140 characters).

Default None

Command Mode EXEC

Security and Access `Netadmin`, `sysadmin`, `secadmin`, and `netoperator`

Usage Information This command is used to display BGP routes that match any extended community attribute from the given extended community list.

Example

```
OS10# show ip bgp ipv6 unicast extcommunity-list ext-com
BGP local RIB : Routes to be Added , Replaced , Withdrawn
BGP local router ID is 10.1.1.2
Status codes:s suppressed,S stale,d dampened,h history,* valid,> best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed/network, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
      Network             Next Hop    Metric    LocPrf    Weight    Path
*>r   100::1/128             ::          0        100     32768      ?
*>r   2001:100:1:1::/64      ::          0        100     32768      ?
```

Supported Releases 10.5.2.1 or later

show ip bgp filter-list

Displays the BGP routes that match any of the AS-path regular expressions from the AS-path list.

Syntax

```
show ip bgp [vrf vrf-name] [{ipv4 | ipv6} unicast] [filter-list as-path-list-name]
```

Parameters

- `vrf vrf-name`—(Optional) Enter the keyword `vrf` and then the name of the VRF to view route information that matches the filter lists corresponding to that VRF. If the VRF name is not specified, this command displays BGP routes for default VRF.
- `ipv4 unicast`—(Optional) Displays information that is related only to IPv4 unicast routes.
- `ipv6 unicast`—(Optional) Displays information that is related only to IPv6 unicast routes.
- *`as-path-name`*—(Optional) Enter an AS-PATH access list name that is configured using the using `ip as-path access-list` command.

Default None

Command Mode EXEC

Security and Access `Netadmin`, `sysadmin`, `secadmin`, and `netoperator`

Usage Information This command is used to display BGP routes that match any of the AS-path regular expression attributes from the given AS-path list.

Example

```
OS10# show ip bgp filter-list as-list
BGP local RIB : Routes to be Added , Replaced , Withdrawn
BGP local router ID is 10.1.1.2
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Path source: I - internal, a - aggregate, c - confed-external,
r - redistributed/network, S - stale
Origin codes: i - IGP, e - EGP, ? - incomplete
     Network        Next Hop   Metric   LocPrf   Weight   Path
*>   10.1.1.10/32   10.1.1.1     0       100       200     ?
*>   20.1.1.10/32   10.1.1.1     0       100       200     ?
```

Supported Releases 10.5.2.3 or later

show ip bgp flap-statistics

Displays BGP flap statistics on BGP routes.

Syntax

```
show ip bgp [vrf vrf-name] flap-statistics
```

Parameters None

Default Not configured

Command Mode EXEC

Usage Information

- `vrf vrf-name` — (OPTIONAL) Enter `vrf` and then the name of the VRF to view flap statistics on BGP routes corresponding to that VRF.
- `Network` — Displays the network ID where the route is flapping.
- `From` — Displays the IP address of the neighbor advertising the flapping route.
- `Duration` — Displays the HH:MM:SS after the route first flapped.
- `Flaps` — Displays the number of times the route flapped.
- `Reuse` — Displays the HH:MM:SS until the flapped route is available.
- `Path` — Lists all AS the flapping route passed through to reach the destination network.

Example

```
OS10# show ip bgp flap-statistics
BGP local router ID is 80.1.1.1
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
```

```
Origin codes: i - IGP, e - EGP, ? - incomplete
     Network      From       Flaps  Duration  Reuse      Path
*>   3.1.2.0/24   80.1.1.2   1      00:00:11  00:00:00   800 9 8 i
*>   3.1.3.0/24   80.1.1.2   1      00:00:11  00:00:00   800 9 8 i
*>   3.1.4.0/24   80.1.1.2   1      00:00:11  00:00:00   800 9 8 i
*>   3.1.5.0/24   80.1.1.2   1      00:00:11  00:00:00   800 9 8 i
*>   3.1.6.0/24   80.1.1.2   1      00:00:11  00:00:00   800 9 8 i
Total number of prefixes: 5
```

Supported Releases 10.3.0E or later

show ip bgp ipv4 unicast

Displays route information for BGP IPv4 routes.

Syntax `show ip bgp [vrf vrf-name] ipv4 unicast [summary | neighbors [ip-address | interface interface-type] [advertised-routes | dampened-paths | flap-statistics | denied-routes | routes]]]`

Parameters

- `vrf vrf-name` — (OPTIONAL) Enter `vrf` then the name of the VRF to view IPv4 unicast summary information corresponding to that VRF.
- `summary` — Displays IPv4 unicast summary information.
- `neighbors` — Displays information about neighbors.
- **`ip-address`** — Displays information about a specific neighbor.
- `interface interface-type` — Displays BGP information that is learned through an unnumbered neighbor.
- `advertised-routes` — Displays the routes that are advertised to a neighbor.
- `dampened-paths` — Displays the suppressed routes that are received from a neighbor.
- `flap-statistics` — Displays the flap statistics of the route that are received from a neighbor.
- `received-routes` — Displays the routes that are received from a neighbor.
- `denied-routes` — Displays the routes that are denied by a neighbor.
- `routes` — Displays routes learned from a neighbor.

Default Not configured

Command Mode EXEC

Usage Information This command displays locally advertised BGPv4 routes configured using the `network` command. These routes show as `r` for redistributed/network-learned routes.

Example

```
OS10# show ip bgp ipv4 unicast summary
BGP router identifier 80.1.1.1 local AS number 102
Neighbor    AS    MsgRcvd  MsgSent Up/Down   State/Pfx
80.1.1.2    800   8        4       00:01:10  5
```

```
OS10# show ip bgp ipv4 unicast neighbors interface ethernet 1/1/1
advertised-routes
BGP local router ID is 40.1.1.2
Status codes: s suppressed, S stale, d dampened, h history, * valid, >
best
Origin codes: i - IGP, e - EGP, ? - incomplete
    Network             Next Hop                       Metric
LocPrf        Weight     Path
*>  41.1.1.0/24      fe80::3617:ebff:fef1:dc5e            0           0
          0        10
```

```
OS10# show ip bgp ipv4 unicast neighbors interface ethernet 1/1/1 routes
BGP local router ID is 40.1.1.2
Status codes: s

suppressed, S stale, d dampened, h history, * valid, > best
Origin codes: i - IGP, e - EGP, ? - incomplete
```

```
    Network              Next Hop                          Metric

*>     41.1.1.0/24      ethernet 1/1/1          0           100
32768           ?
```

Supported Releases 10.3.0E or later

show ip bgp ipv6 unicast

Displays route information for BGP IPv6 routes.

Syntax `show ip bgp [vrf vrf-name] ipv6 unicast [summary | neighbors [ip-address | interface interface-type] [advertised-routes | dampened-paths | flap-statistics | denied-routes | routes]]]`

Parameters

- `vrf vrf-name` — (OPTIONAL) Enter `vrf` then the name of the VRF to view IPv6 unicast information corresponding to that VRF.
- `neighbors` — Displays IPv6 neighbor information.

- **ip-address** — Displays information about a specific neighbor.
- `interface` *interface-type* — Displays BGP information that is learned through an unnumbered neighbor.
- `summary` — Displays IPv6 unicast summary information.
- `advertised-routes` — Displays the routes that are advertised to a neighbor.
- `dampened-paths` — Displays the suppressed routes that are received from a neighbor.
- `flap-statistics` — Displays the flap statistics of the route that are received from a neighbor.
- `received-routes` — Displays the routes that are received from a neighbor.
- `denied-routes` — Displays the routes that are denied by a neighbor.
- `routes` — Displays routes learned from a neighbor.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip bgp ipv6 unicast summary
BGP router identifier 80.1.1.1 local AS number 102
Neighbor   AS   MsgRcvd  MsgSent Up/Down    State/Pfx
80.1.1.2   800  8        4       00:01:10   5
```

```
OS10# show ip bgp ipv6 unicast neighbors interface ethernet 1/1/1

32768           ?
```

Supported Releases 10.3.0E or later

show ip bgp neighbors

Displays information that BGP neighbors exchange.

Syntax

```
show ip bgp [vrf vrf-name] neighbors [ip-address | interface interface-type] [advertised-routes | dampened-routes | flap-statistics | denied-routes | routes]
```

Parameters

- `vrf vrf-name` — Enter `vrf` and then the name of the VRF to view information that is exchanged between BGP neighbors corresponding to that VRF.
- *ip-address* — Enter the IPv4 of IPv6 address of a specific neighbor.
- `interface interface-type` — Displays BGP information that is learned through an unnumbered neighbor.
- `denied-routes` — Displays the list of routes that are denied by policy.
- `advertised-routes`—Displays the routes that are advertised to a neighbor.
- `dampened-routes`—Displays the suppressed routes that are received from a neighbor.
- `flap-statistics`—Displays the flap statistics of routes that are received from a neighbor.
- `received-routes`—Displays the routes that are received from a neighbor.
- `routes`—Displays routes learned from a neighbor.

Default Not configured

Command Mode EXEC

Usage Information

- `BGP neighbor` — Displays the BGP neighbor address and its AS number. The last phrase in the line indicates whether the link between the BGP router and its neighbor is an external or internal one. If they are located in the same AS, the link is internal; otherwise the link is external.
- `BGP version` — Displays the BGP version, always version 4, and the remote router ID.
- `BGP state` — Displays the BGP state of the neighbor and the amount of time in hours:minutes: seconds it has been in that state.
- `Last read` — Displays the information in the last read:
  - Last read is the time in hours:minutes:seconds that the router read a message from its neighbor.
  - Hold time is the number of seconds configured between messages from its neighbor.
  - Keepalive interval is the number of seconds between keepalive messages to help ensure that the TCP session is still alive.
- `Received messages` — Displays the number of BGP messages received, the number of notifications or error messages, and the number of messages waiting in a queue for processing.

- `Sent messages` — Displays the number of BGP messages sent, the number of notifications or error messages, and the number of messages waiting in a queue for processing.
- `Description` — Displays the descriptive name that is configured for the BGP neighbor. This field is displayed only when the description is configured.
- `Local host` — Displays the peering address of the local router and the TCP port number.
- `Foreign host` — Displays the peering address of the neighbor and the TCP port number.

Although the status codes for routes that are received from a BGP neighbor may not display in the `show ip bgp neighbors` *`ip-address`* `received-routes` output, they display correctly in the `show ip bgp` output.

This command displays the route-maps for incoming and outgoing traffic.

When you enable link-local-only-nexthop globally at the router BGP level or enabled at the neighbor or template level, the link-local address as both Next Hops enabled for unnumbered neighbors, the logs display along with the other configuration data for the unnumbered peer.

This log does not display for numbered peers even if you enable the feature globally. The system administrator (`sysdmin` role) is allowed to view this configuration.

Example

```
MAA-S4048T-X01-7445(config-router-bgp-neighbor-af)# do show ip bgp
neighbors 1.1
.1.2
BGP neighbor is 1.1.1.2, remote AS 65536, local AS 100 external link
Member of peer-group max for session parameters

Supported Releases 10.3.0E or later

show ip bgp peer-group

Displays information about BGP peers in a peer-group.

Syntax `show ip bgp [vrf vrf-name] peer-group peer-group-name`

Parameters

- `vrf vrf-name` — (OPTIONAL) Enter `vrf` to view information about BGP peers in a peer group corresponding to that VRF.
- *`peer-group-name`* — (Optional) Enter the peer group name to view information about that peer-group only.

Default Not configured

Command Mode EXEC

Usage Information

- `Peer-group` — Displays the peer group name. Minimum time displays the time interval between BGP advertisements.
- `Administratively shut` — Displays the status of the peer group if you do not enable the peer group. If you enable the peer group, this line does not display.
- `BGP version` — Displays the BGP version supported.
- `Description` — Displays the descriptive name that is configured for the BGP peer template. This field displays only when you configure the description.
- `For address family` — Displays IPv4 unicast as the address family.
- `BGP neighbor` — Displays the name of the BGP neighbor.
- Number of peers—Displays the number of peers that are configured for this peer group.
- `Peer-group members` — Lists the IP addresses of the peers in the peer group. If the address is outbound optimized, an * displays next to the IP address.

Example

```
MAA-S4048T-X01-7445(config)# do show ip bgp peer-group
Peer-group abc, remote AS 0
BGP version 4
Minimum time between advertisement runs is 30 seconds

For address family: IPv4 Unicast

BGP neighbor is abc, peer-group internal

Soft-reconfiguration inbound configured

Update packing has 4_OCTET_AS support enabled

Next hop set to self

Max prefix set to 20 with threshold 10 warning only

For address family: IPv6 Unicast

BGP neighbor is abc, peer-group internal

Soft-reconfiguration inbound configured

Update packing has 4_OCTET_AS support enabled
```

```
Next hop set to self

Max prefix set to 20 with threshold 10 warning

Number of peers in this group 0
Peer-group members:
```

Example (Summary)

```
OS10# show ip bgp peer-group ebgp summary
BGP router identifier 32.1.1.1  local AS number 6
Neighbor      AS    MsgRcvd   MsgSent   Up/Down   State/Pfx
17.1.1.2      7     7         6         00:01:54  5
```

```
OS10# show ip bgp peer-group bg1
    Peer-group bg1, remote AS 0
    BGP version 4
    Minimum time between advertisement runs is 30 seconds

    For address family: Unicast
    BGP neighbor is bg1, peer-group external
    Update packing has 4_OCTET_AS support enabled

    Number of peers in this group 2
    Peer-group members:
    40.1.1.2

    ethernet 1/1/1
```

```
OS10# show ip bgp peer-group bg1 summary
BGP router identifier 14.233.209.106 local AS number 10
Neighbor            AS       MsgRcvd        MsgSent          Up/Down
  State/Pfx
40.1.1.2            20          15             19            00:00:32
     0

ethernet 1/1/1      20          15             19            00:00:32
     0
```

Supported Releases 10.2.0E or later

show ip bgp summary

Displays the status of all BGP connections.

Syntax `show ip bgp [vrf vrf-name] summary`

Parameters `vrf vrf-name` — (OPTIONAL) Enter `vrf` then the name of the VRF to view the status of all BGP connections corresponding to that VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `Neighbor`—Displays the BGP neighbor address.
- `AS`—Displays the AS number of the neighbor
- `MsgRcvd`—Displays the number of BGP messages that the neighbor received.
- `MsgSent`—Displays the number of BGP messages that the neighbor sent.
- `Up/Down`—Displays the amount of time that the neighbor is in the `Established` stage. If the neighbor has never moved into the `Established` stage, the word never displays. The output format is:

```
1 day = 00:12:23 (hours:minutes:seconds), 1 week = 1d21h (DaysHours),
1 week + 11w2d (WeeksDays)
```

- `State/Pfxrcd`—If the neighbor is in the `Established` stage, this is the number of network prefixes received. If you configured a maximum limit using the `neighbor maximum-prefix` command, `prfxd` appears in this column. If the neighbor is not in the `Established` stage, the current stage - `Idle`, `Connect`, `Active`, `OpenSent`, `OpenConfirm` displays. When the peer is transitioning between states and clearing the routes received, the phrase `Purging` may appear in this column. If the neighbor is disabled, the phrase `Admin shut` appears in this column.

The suppressed status of aggregate routes may not display in the command output.

Example

```
OS10# show ip bgp summary
BGP router identifier 80.1.1.1 local AS number 102
Neighbor    AS    MsgRcvd  MsgSent  Up/Down    State/Pfx
80.1.1.2    800   24       23       00:09:15   5
```

Example for unnumbered peer:

```
OS10# show ip bgp summary
BGP router identifier 89.101.17.125 local AS number 100
Neighbor                                        AS            MsgRcvd
    MsgSent       Up/Down             State/Pfx
ethernet1/1/1                                  200             19
     19          00:15:34               0
```

Supported Releases 10.2.0E or later

show ip route

Displays information about IPv4 BGP routing table entries.

Syntax `show ip route [vrf vrf-name] bgp`

Parameters

- `vrf vrf-name` — Enter `vrf` and then the name of the VRF to view information that is exchanged between BGP neighbors corresponding to that VRF

Default Not configured

Command Mode EXEC

Usage Information This command displays information about IPv4 BGP routing table entries.

Example

```
OS10# show ip route
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, * - candidate default,
       + - summary route, > - non-active route
Gateway of last resort is not set
  Destination        Gateway                    Dist/Metric Last Change
-------------------------------------------------------------------------
  C     10.1.1.0/24  via 10.1.1.1  ethernet1/1/17  0/0       01:18:34
  B  IN 100.1.1.0/24 via 10.1.1.2                  200/0     00:03:46
  B  IN 101.1.1.0/24 via 10.1.1.2                  200/0     00:03:46
  B  IN 102.1.1.0/24 via 10.1.1.2                  200/0     00:03:46
  B  IN 103.1.1.0/24 via 10.1.1.2                  200/0     00:03:46
  B  IN 104.1.1.0/24 via 10.1.1.2                  200/0     00:03:46
```

```
OS10# show ip route bgp
Codes: C - connected
S - static
B - BGP, IN - internal BGP, EX - external BGP
O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
```

```
E2 - OSPF external type 2, * - candidate default,
+ - summary route, > - non-active route
Gateway of last resort is not set
Destination     Gateway                 Dist/Metric Last Change
------------------------------------------------------------
B IN 1.1.1.0/24 via 169.254.0.1 vlan100 200/0       00:17:34
```

Supported Releases 10.4.2.0 or later

show ipv6 route

Displays information about IPv6 BGP routing table entries.

Syntax `show ipv6 route [vrf vrf-name] bgp`

Parameters

- `vrf vrf-name` — Enter `vrf` and then the name of the VRF to view information that is exchanged between BGP neighbors corresponding to that VRF

Default Not configured

Command Mode EXEC

Usage Information This command displays information about IPv6 BGP routing table entries.

Example

```
OS10# show ipv6 route
```

```
OS10# show ipv6 route bgp
Codes: C - connected
S - static
B - BGP, IN - internal BGP, EX - external BGP
O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
E2 - OSPF external type 2, * - candidate default,
+ - summary route, > - non-active route
Gateway of last resort is not set
Destination        Gateway                                  Dist/Metric   Last Change
-------------------------------------------------------------------------------------
B IN 1::/64   via fe80::250:56ff:fe80:1815   vlan100    200/0         00:17:28
```

Supported Releases 10.4.2.0 or later

soft-reconfiguration inbound

Enables soft-reconfiguration for a neighbor.

Syntax `soft-reconfiguration inbound`

Parameters None

Default Not configured

Command Modes ROUTER-BGP-NEIGHBOR-AF

Usage Information This command is not supported on a peer-group level. To enable soft-reconfiguration for peers in a peer-group, you must enable this command at a per-peer level. With soft-reconfiguration inbound, all updates that are received from this neighbor are stored unmodified, regardless of the inbound policy. When inbound soft-reconfiguration is performed later, the stored information generates a new set of inbound updates. The `no` version of this command disables soft-reconfiguration inbound for a BGP neighbor.

Example (IPv4)

```
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-bgp-neighbor-af)# soft-reconfiguration inbound
```

Example (IPv6)

```
OS10(conf-router-neighbor)# address-family ipv6 unicast
OS10(conf-router-bgp-neighbor-af)# soft-reconfiguration inbound
```

Supported Releases 10.3.0E or later

soft-reconfiguration inbound

Configures the soft-reconfiguration support for the peer-group level. This support applies for both IPv4 and IPv6 address families.

Syntax `soft-reconfiguration inbound`

Parameters None.

Default Not configured

Command Mode TEMPLATE ADDRESS FAMILY LEVEL

Usage Information This configuration allows soft-reconfiguration for a specific template. This configuration is applied to all BGP peers when inheriting this template.

NOTE: Only the system administers (sysadmin) role is allowed to manage this configuration.

NOTE: Before applying the soft-reconfiguration, you must clear all the BGP configurations at the VRF level. You must also clear the BGP configurations at template level using the `clear ip bgp template` command.

Example

```
MAA-S4048T-X01-7445(config-router-template)# address-family ipv6 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# soft-reconfiguration
inbound

MAA-S4048T-X01-7445(config-router-template)# address-family ipv4 unicast
MAA-S4048T-X01-7445(config-router-bgp-template-af)# no soft-
reconfiguration inbound
```

Supported Releases 10.5.2.1 or Later

template

Creates a peer-group template to assign it to BGP neighbors.

Syntax `template` *`template-name`*

Parameters *`template-name`* — Enter a peer-group template name. A maximum of 16 characters.

Default Not configured

Command Mode CONFIG-ROUTER-BGP

Usage Information Members of a peer-group template inherit the configuration properties of the template and share the same update policy. The `no` version of this command deletes a peer-template configuration.

NOTE: To configure these settings for a nondefault VRF instance, you must first enter the ROUTER-CONFIG-VRF sub mode using the following commands:

1. Enter the ROUTER BGP mode using the `router bgp` *`as-number`* command.
2. From the ROUTER BGP mode, enter the ROUTER BGP VRF mode using the `vrf` *`vrf-name`* command.

Example

```
OS10(conf-router-bgp-10)# template solar
OS10(conf-router-bgp-template)#
```

Supported Releases 10.3.0E or later

timers

Adjusts BGP keepalive and holdtime timers.

Syntax `timers keepalive holdtime`

Parameters

- *keepalive*—Enter the time interval, in seconds, between keepalive messages sent to the neighbor routers, from 1 to 65535.
- *holdtime*—Enter the time interval, in seconds, between the last keepalive message and declaring a router dead, from 3 to 65535.

Default `keepalive` 60 seconds; `holdtime` 180 seconds

Command Mode ROUTER-BGP

Usage Information The configured timer value becomes effective after a BGP hard reset. The timer values negotiate from peers. The `no` version of this command resets the value to the default.

Example

```
OS10(conf-router-bgp)# timers 30 90
```

Supported Releases 10.3.0E or later

update-source

Enables using Loopback interfaces for TCP connections to stabilize BGP sessions.

Syntax `update–source loopback interface-id`

Parameters `loopback interface-id` — Specify a Loopback interface ID, from 0 to 16383.

Defaults None

Command Modes

- CONFIG-ROUTER-NEIGHBOR
- CONFIG-ROUTER-TEMPLATE

Usage Information When you configure the `update–source loopback` command for a template, all the neighbors belonging to the template inherit the feature.

Example

```
OS10(config)# router bgp 10
OS10(conf-router-bgp-10)# neighbor
OS10(conf-router-bgp-10)# neighbor 1.1.15.4
OS10(conf-router-neighbor)# update-source Loopback 1
```

Supported Releases 10.3.0E or later

vrf

Enters the CONFIG-ROUTER-VRF command mode.

Syntax `vrf vrf-name`

Parameters None

Default None

Command Mode	ROUTER-BGP
Usage Information	This mode allows you to apply BGP configurations to nondefault VRFs.

Example	`OS10(config)#router bgp 100`
	`OS10(config-router-bgp-100)#`
	`OS10(config-router-bgp-100)#vrf vrf_test1`
	
	`OS10(config-router-bgp-100-vrf)#`

Supported Releases	10.3.0E or later

weight

Assigns a default weight for routes from the neighbor interfaces.

Syntax	`weight` *number*
Parameters	*number*—Enter a number as the weight for routes, from 1 to 4294967295.
Default	0
Command Mode	ROUTER-BGP-NEIGHBOR
Usage Information	The path with the highest weight value is preferred in the best-path selection process. The `no` version of this command resets the value to the default.
Example	`OS10(conf-router-bgp-neighbor)# weight 4096`
Supported Releases	10.3.0E or later

Equal cost multi-path
