ECMP is a routing technique where next-hop packet forwarding to a single destination occurs over multiple best paths. When you enable ECMP, OS10 uses a hash algorithm to determine the next-hop. The hash algorithm makes hashing decisions based on values in various packet fields and internal values.

Configure the hash algorithm in CONFIGURATION mode.

```
hash-algorithm ecmp {crc | crc16cc | crc32LSB | crc32MSB | xor | xor1 | xor2 | xor4 |
xor8 | random}
```

Change hash algorithm

```
OS10(config)# hash-algorithm ecmp crc
```

Restrictions on ECMP Static Routes

When you configure static route leaking, all the Equal-cost multipath (ECMP) static routes from the source do not leak to the destination VRF instance. Only a single ECMP route, normally the best ECMP route, leaks to the destination VRF instance.

Load balancing

To increase bandwidth, traffic is balanced across member links. RTAG7 is a hash algorithm that load balances traffic within a trunk group in a controlled manner. RTAG7 balances traffic to more effectively use member links as traffic gets more diverse.

RTAG7 generates a hash that consists of two parts:

- The first part generates from packet headers to identify micro-flows in traffic. By default, all listed parameters are enabled for load balancing except the ingress port.

```
OS10# show load-balance

Load-Balancing Configuration For LAG and ECMP:
-----------------------------------------------
IPV4 Load Balancing         : Enabled
IPV6 Load Balancing         : Enabled
MAC Load Balancing          : Enabled
TCP-UDP Load Balancing      : Enabled
Ingress Port Load Balancing : Disabled
IPV4 FIELDS    : source-ip destination-ip protocol vlan-id l4-destination-port l4-
source-port
IPV6 FIELDS    : source-ip destination-ip protocol vlan-id l4-destination-port l4-
source-port
MAC FIELDS     : source-mac destination-mac  ethertype  vlan-id
TCP-UDP FIELDS: l4-destination-port  l4-source-port
```

- The second part generates from the static physical configuration such as the ingress and egress port numbers.

To generate load balancing based on any parameters, change the hash field using the `load-balance` command. The example shows how to enable the ingress port to generate load balancing based on the ingress parameter.

```
OS10(config)# load-balancing ingress-port enable
OS10(config)# do show load-balance
Load-Balancing Configuration For LAG and ECMP:
-----------------------------------------------
IPV4 Load Balancing         : Enabled
IPV6 Load Balancing         : Enabled
MAC Load Balancing          : Enabled
TCP-UDP Load Balancing      : Enabled
Ingress Port Load Balancing : Enabled
IPV4 FIELDS    : source-ip destination-ip protocol vlan-id l4-destination-port l4-source-
port
IPV6 FIELDS    : source-ip destination-ip protocol vlan-id l4-destination-port l4-source-
port
MAC FIELDS     : source-mac destination-mac ethertype vlan-id
TCP-UDP FIELDS: l4-destination-port  l4-source-port
```

Configuration notes

Dell PowerSwitch S4200–ON Series:

The `load-balancing` command does not work with the `tcp-udp-selection` parameter.

Resilient hashing

To increase bandwidth and for load balancing, traffic distributes across the next hops of an ECMP group or member ports of a port channel. OS10 uses a hash algorithm to determine a hash key. The egress port in a port channel or the next hop in an ECMP group is selected based on the hash key modulo the number of ports in a port channel or next hops in an ECMP group, respectively. When a member link goes down or a new member link is added, the traffic flows remap based on the new hash result.

In this section, the term, "member link" refers to either a member physical port, in the case of port channels or next hop in the case of ECMP groups.

With resilient hashing, when a member link goes down, the existing flows are not affected; they do not remap. Resilient hashing reassigns the traffic from the failed link to another member link without remapping the other existing flows. However, minimal re-mapping occurs when a new member link is added.

Resilient hashing is supported both for Port Channels and Equal Cost MultiPath Groups (ECMP). Resilient hashing is a global configuration. You can configure resilient hashing for both port channels and ECMP independently.

NOTE:

- Resilient hashing is not supported on the S4200-ON and Z9332F-ON platforms.
- The flow-map table always has an even number of entries.

To enable resilient hashing for Port Channels or ECMP groups, use the following commands in CONFIGURATION mode:

```
OS10(config)# enhanced-hashing resilient-hashing ecmp
```

```
OS10(config)# enhanced-hashing resilient-hashing lag
```

Supported platforms

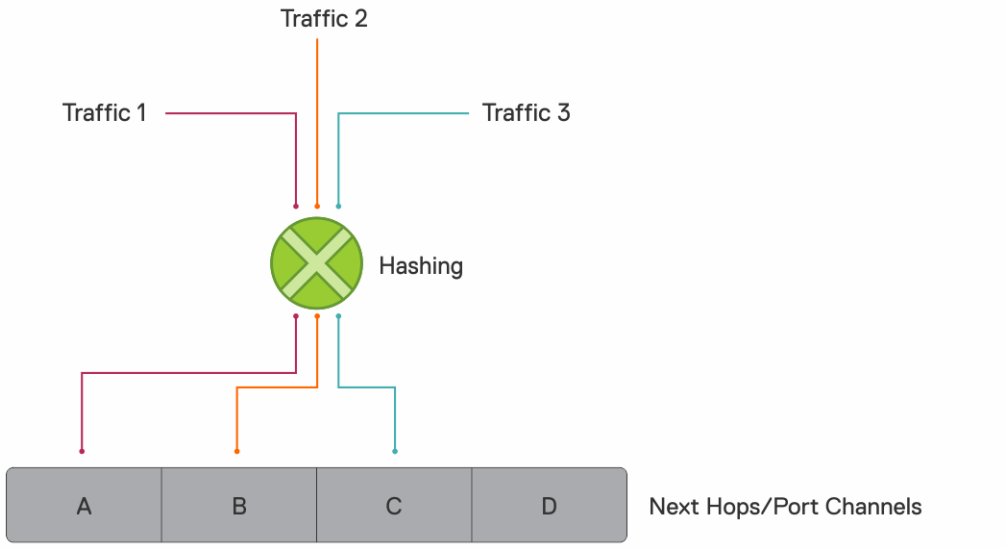
The following table lists the platforms that support resilient hashing.

Table 62. Supported platforms for resilient hashing feature

Platform	Resilient hashing on ECMP	Resilient hashing on Port Channels
S6000-ON, S6010-ON, S4048T-ON, S4100-ON Series, S5200F-ON Series	Y	Y
Z9100-ON Series, Z9200-ON Series	Y	N
S3000-ON, S4200-ON Series	N	N

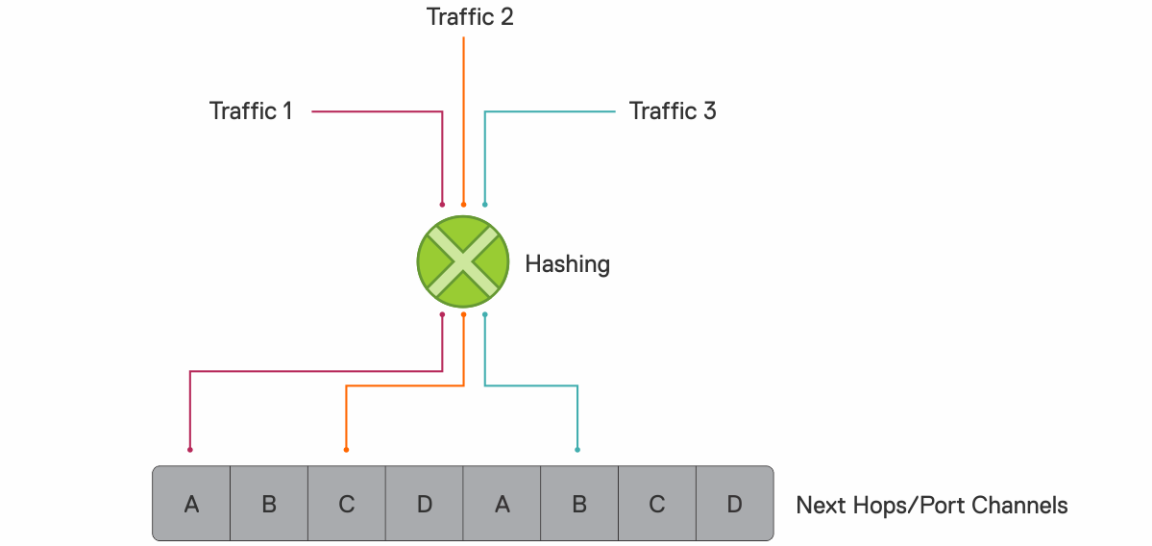
Examples

Normal traffic flow without resilient hashing



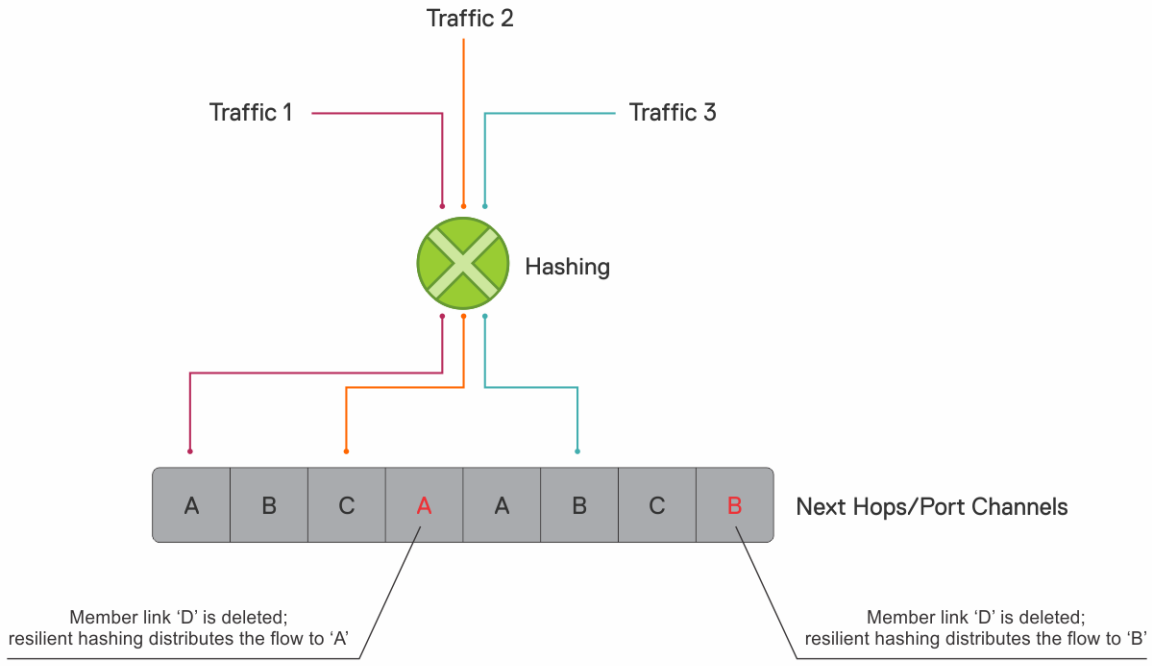
Traffic flow with resilient hashing enabled

When you enable resilient hashing for ECMP groups, the flow-map table is created with 64 paths (the OS10 default maximum number of ECMP paths) and traffic is equally distributed. In the following example, traffic 1 maps to next hop 'A'; traffic 2 maps to next hop 'C'; and traffic 3 maps to next hop 'B.'



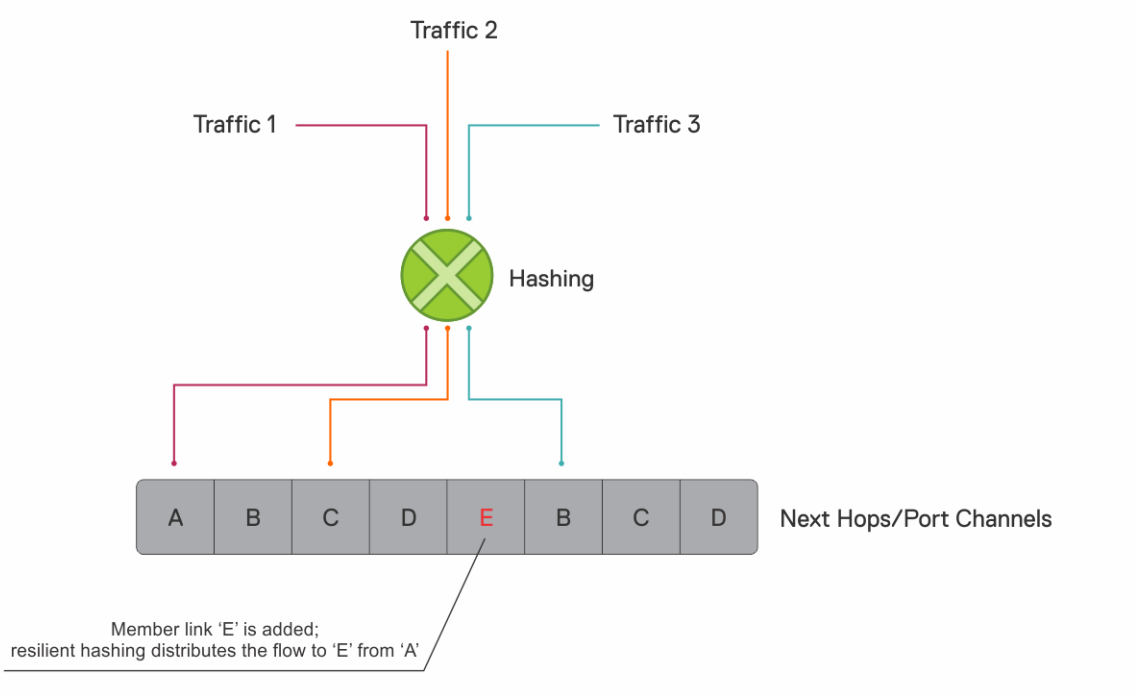
Member link goes down

In the following example, if member link D goes down, resilient hashing distributes the traffic intended for member link D to A and B. The existing 1, 2, and 3 traffic is not disturbed.



Member link is added

However, when a new member link is added, resilient hashing completes minimal remapping for better load balancing, as shown:



Important notes

- Resilient hashing on port channels applies only for unicast traffic.
- For resilient hashing on ECMP groups, the ECMP path must be in multiples of 64. Before you enable resilient hashing, ensure that the maximum ECMP path is set to a multiple of 64. You can configure this value using the `ip ecmp-group maximum-paths` command.

Symmetric hashing

For effective traffic monitoring on a port channel or ECMP interface, both forward and reverse traffic must flow through the same physical port. When hashing occurs, the forward and reverse traffic may flow through different physical interfaces. However, enabling symmetric hashing on the port channel or ECMP forces the bi-directional traffic flows to take the same physical ports.

When you enable symmetric hashing, the parameters that are used for hashing normalize before it enters into the hashing algorithm. The normalization process ensures that when parameters reverse, the hash output is same. The following parameters are used in calculating symmetric hashing:

- Source IPv4 or IPv6 address
- Destination IPv4 or IPv6 address
- Source IPv4 or IPv6 port
- Destination IPv4 or IPv6 port

To enable symmetric hashing for port channels or ECMP groups, use the following commands in CONFIGURATION mode:

```
OS10(config)# enhanced-hashing symmetric-hashing ecmp
```

```
OS10(config)# enhanced-hashing symmetric-hashing lag
```

Supported platforms

OS10 supports symmetric hashing only on the following platforms:

- S5212F-ON

- S5224F-ON
- S5232F-ON
- S5248F-ON
- S5296F-ON

Maximum ECMP groups and paths

The maximum number of ECMP groups supported on the switch depends on the maximum ECMP paths configured on the switch. To view the maximum number of ECMP groups and paths, use the `show ip ecmp-group details` command.

```
OS10# show ip ecmp-group details
Maximum Number of ECMP Groups : 256
Maximum ECMP Path per Group : 64
Next boot configured Maximum ECMP Path per Group : 64
```

The default value for the maximum number of ECMP paths per group is 64. This value is configurable and you can configure a maximum of up to 128 ECMP paths per group.

The `Maximum ECMP Path per Group` is the current value configured in the hardware. The `Next boot configured Maximum ECMP Path per Group` is the value that is configured for maximum ECMP path and will take effect after the next reboot.

You can increase or decrease the maximum number of ECMP groups using the `ip ecmp-group maximum-paths` *number* command. The number of ECMP groups is inversely proportional to the number of ECMP paths.

To configure maximum paths per ECMP route:

```
OS10# configure terminal
OS10(config)# ip ecmp-group maximum-paths 10
OS10(config)# exit
OS10# write memory
OS10# reload
```

ECMP commands

enhanced-hashing resilient-hashing

Ensures that existing traffic flows are not remapped when a member link goes down.

Syntax `enhanced-hashing resilient-hashing {lag | ecmp}`

Parameters

- `resilient-hashing`—Enter the keyword to enable enhanced-hashing.
- `{ecmp | lag}`—Enter the keyword to enable resilient hashing for a port channel or ECMP group.

Defaults Disabled

Command Mode CONFIGURATION

Usage Information The `no` version of this command disables resilient hashing. For supported platforms, see Supported platforms.

Example

```
OS10(config)# enhanced-hashing resilient-hashing ecmp
```

```
OS10(config)# enhanced-hashing resilient-hashing lag
```

Supported Releases 10.4.3.0 or later

enhanced-hashing symmetric-hashing

Ensures that the bi-directional traffic flows through the same physical port.

Syntax `enhanced-hashing symmetric-hashing {lag | ecmp}`

Parameters

- `symmetric-hashing`—Enter the keyword to enable symmetric hashing.
- `ecmp | lag`—Enter the keyword to enable symmetric hashing for a port channel or ECMP group.

Defaults Disabled

Command Mode CONFIGURATION

Usage Information The `no` version of this command disables symmetric hashing. The symmetric hashing feature is supported only on the S5212F-ON, S5224F-ON, S5232F-ON, S5248F-ON, S5296F-ON platforms.

Example

```
OS10(config)# enhanced-hashing symmetric-hashing ecmp
```

```
OS10(config)# enhanced-hashing symmetric-hashing lag
```

Supported Releases 10.5.3.0 or later

hash-algorithm

Changes the hash algorithm that distributes traffic flows across ECMP paths and the port channel.

Syntax `hash-algorithm {ecmp | lag | seed {seed-value}} {crc | crc16cc | crc32LSB | crc32MSB | xor | xor1 | xor2 | xor4 | xor8 | random}`

Parameters

- `ecmp`—Enables the ECMP hash configuration.
- `lag`—Enables the port channel hash configuration for Layer 2 (L2) only.
- `seed`—Changes the hash algorithm seed value to get a better hash value.
- *`seed-value`*—Enter a hash algorithm seed value, from 0 to 4294967295.
- `crc`—Enables the cyclic redundancy check (CRC) polynomial for hash computation.
- `crc16cc`—16 bit CRC16 using CRC16-CCITT polynomial
- `crc32LSB`—LSB 16 bits of computed CRC32(default)
- `crc32MSB`—MSB 16 bits of computed CRC32
- `xor` — Enables upper 8 bits of CRC and lower 8 bits of XOR value for computation.
- `xor1`—Enables upper 8 bits of CRC16-BISYNC and lower 8 bits of xor1
- `xor2`—Enables upper 8 bits of CRC16-BISYNC and lower 8 bits of xor2
- `xor4`—Enables upper 8 bits of CRC16-BISYNC and lower 8 bits of xor4
- `xor8`—Enables upper 8 bits of CRC16-BISYNC and lower 8 bits of xor8
- `random` — Enables a hash algorithm random seed value for ECMP or port channel hash computation.

Default `crc`

Command Mode CONFIGURATION

Usage Information The hash value calculated with this command is unique to the entire system. Different hash algorithms are based on the number of port-channel members and packet values. The default hash algorithm yields the most balanced results in various test scenarios, but if the default algorithm does not provide a satisfactory distribution of traffic, use this command to designate another algorithm.

When a port-channel member leaves or is added to the port-channel, the hash algorithm recalculates to balance traffic across the members. The `no` version of this command returns the value to the default.

Example

```
OS10(config)# hash-algorithm lag crc
```

Supported Releases	10.3.0E or later

ip ecmp-group maximum-paths

Configures the maximum number of ECMP paths per route.

Syntax	`ip ecmp-group maximum-paths` *number*
Parameters	*number* — Enter the maximum number of ECMP paths, from 2 to 128.
Default	64
Command Mode	CONFIGURATION
Usage Information	To save the new ECMP settings, use the `write memory` command, then reload the system for the new settings to take effect. The `no` version of this command returns the value to the default.

Example	`OS10# configure terminal`
	`OS10(config)# ip ecmp-group maximum-paths 2`
	`OS10(config)# exit`
	`OS10# write memory`
	`OS10# reload`

Supported Releases	10.4.3.0 or later

link-bundle-utilization trigger-threshold

Configures a threshold value to trigger traffic monitoring distribution on an ECMP link bundle.

Syntax	`link-bundle-utilization trigger-threshold` *value*
Parameters	*value* — Enter a link bundle trigger threshold value, from 0 to 100.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the configuration.
Example	`OS10(config)# link-bundle-utilization trigger-threshold 80`
Supported Releases	10.2.0E or later

load-balancing

Distributes or load balances incoming traffic using the default parameters in the hash algorithm.

Syntax	`load-balancing {ingress-port` *enable* `|` `[tcp-udp-selection` *l4-destination-port* `|` *l4-source-port*`]` `|` `[ip-selection` *destination-ip* `|` *source-ip* `|` *protocol* `|` *vlan-id* `|` *l4-destination-port* `|` *l4-source-port*`]` `|` `[ipv6-selection` *destination-ip* `|` *source-ip* `|` *protocol* `|` *vlan-id* `|` *l4-destination-port* `|` *l4-source-port*`]` `|` `[mac-selection` *destination-mac* `|` *source-mac* `|` *ethertype* `|` *vlan-id*`]}`
Parameters	• `ingress-port enable` — Enables load-balancing on ingress ports. • `tcp-udp-selection` — Enables the TCP UDP port for the load-balancing configuration. • `ip-selection` — Enables IPv4 key parameters to use in the hash computation. • `ipv6-selection` — Enables IPV6 key parameters to use in hash computation.

- `destination-ip` — Enables the destination IP address in the hash calculation.
- `source-ip` — Enables the source IP address in the hash calculation.
- `protocol` — Enables protocol information in the hash calculation.
- `vlan-id` — Enables VLAN ID information in the hash calculation.
- `l4-destination-port` — Enables Layer 4 (L4) destination port information in the hash calculation.
- `l4-source-port` — Enables L4 source port information in the hash calculation.
- `mac-selection` — Enables MAC load-balancing configurations.
- `destination-mac`— Enables destination MAC information in the hash calculation.
- `source-mac`— Enables source MAC information in the hash calculation.
- `ethertype` — Enables Ethernet type information in the hash calculation.

Default
- `ip-selelection—source—ip dest-ip vlan-id l4-source-port l4-dest-port ipv4 protocol`
- `ipv6-selection—source—ipv6 dest-ipv6 vlan—id l4-source-port l4-dest-port ipv6 protocol`
- `mac-selection—source—mac destination—mac vlan-id ethertype`
- `tcp-udp-selection—l4-source-port l4-dest-port`

Command Mode CONFIGURATION

Usage Information
- IPv4– selection: `source-ip destination-ip protocol vlan-id l4-destination-port l4-source-port`
- IPv6 destination address: `source-ip destination-ip protocol vlan-id l4-destination-port l4-source-port`
- MAC parameters: `source-mac destination-mac ethertype vlan-id`
- TCP/UDP parameters: `l4-destination-port l4-source-port`

The `no` version of this command resets the value to the default.

Example (Ingress)
```
OS10(config)# load-balancing ingress-port enable
```

Example (IP Selection)
```
OS10(config)# load-balancing ip-selection destination-ip source-ip
```

Supported Releases 10.2.0E or later

show enhanced-hashing resilient-hashing

Displays the status of the `enhanced-hashing` command.

Syntax
```
show enhanced-hashing resilient-hashing {lag | ecmp}
```

Parameters `lag | ecmp`—Enter the keyword to view enhanced-hashing for a port channel or ECMP group.

Default Disabled

Command Mode EXEC

Usage Information None

Example
```
OS10# show enhanced-hashing resilient-hashing lag
Resilient Hashing Configuration For LAG:
---------------------------------------
LAG Resilient hashing : Disabled
```

```
OS10# show enhanced-hashing resilient-hashing ECMP
Resilient Hashing Configuration For ECMP:
```

```
-------------------------------------------
ECMP Resilient hashing : Disabled
```

Supported Releases 10.4.3.0 or later

show enhanced-hashing symmetric-hashing

Displays the status of the `enhanced-hashing symmetric-hashing` command.

Syntax `show enhanced-hashing symmetric-hashing [lag | ecmp]`

Parameters `lag | ecmp`—Enter the keyword to view symmetric hashing for a port channel or ECMP group.

Default Disabled

Command Mode EXEC

Usage Information None

Example

```
OS10# show enhanced-hashing symmetric-hashing
LAG Symmetric hashing : Disabled
ECMP Symmetric hashing : Enabled
```

```
OS10# show enhanced-hashing symmetric-hashing lag
Symmetric Hashing Configuration For LAG:
----------------------------------------
LAG Symmetric hashing : Disabled
```

```
OS10# show enhanced-hashing symmetric-hashing ECMP
Symmetric Hashing Configuration For ECMP:
-----------------------------------------
ECMP Symmetric hashing : Enabled
```

Supported Releases 10.5.3.0 or later

show hash-algorithm

Displays hash-algorithm information.

Syntax `show hash-algorithm`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show hash-algorithm
   EcmpAlgo - crc LabAlgo - crc
```

Supported Releases 10.3.0E or later

show ip ecmp-group details

Displays the number of ECMP groups and paths.

Syntax `show ip ecmp-group details`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip ecmp-group details
Maximum Number of ECMP Groups : 256
Maximum ECMP Path per Group : 64
Next boot configured Maximum ECMP Path per Group : 64
```

Supported Releases 10.4.3.0 or later

show load-balance

Displays the global traffic load-balance configuration.

Syntax `show load-balance`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show load-balance

Load-Balancing Configuration For LAG & ECMP:
-------------------------------------------
IPV4 Load Balancing Enabled
IPV4 FIELDS : source-ipv4 dest-ipv4 vlan protocol L4-source-port L4-dest-
port

IPV6 Load Balancing Enabled
IPV6 FIELDS : source-ipv6 dest-ipv6 vlan protocol L4-source-port L4-dest-
port

Mac Load Balancing Enabled
MAC FIELDS : source-mac dest-mac vlan ethertype

mac-in-mac header based hashing is disabled
TcpUdp Load Balancing Enabled
```

Supported Releases 10.3.0E or later

IPv4 routing

OS10 supports IPv4 addressing including variable-length subnetting mask (VLSM), Address Resolution Protocol (ARP), static routing, and routing protocols. With VLSM, you can configure one network with different masks. You can also use supernetting, which increases the number of subnets. You can add a mask to the IP address to separate the network and host portions of the IP address to add a subnet.

You need to configure IPv4 routing for IP hosts to communicate with one another in the same network, or in different networks.

Assign interface IP address

You can assign primary and secondary IP addresses to a physical or logical interface to enable IP communication between the system and hosts connected to a specific interface. Assign one primary address and secondary IP addresses to each interface. By default, all ports are in the default VLAN—VLAN 1.

1. Enter the interface type information to assign an IP address in CONFIGURATION mode.

   ```
   interface interface
   ```

   - `ethernet`—Physical interface
   - `port-channel`—Port-channel ID number
   - `vlan`—VLAN ID number
   - `loopback`—Loopback interface ID
   - `mgmt`—Management interface
2. Enable the interface in INTERFACE mode.

   ```
   no shutdown
   ```
3. Remove the interface from the default VLAN in INTERFACE mode.

   ```
   no switchport
   ```
4. Configure a primary IP address and mask on the interface in INTERFACE mode.

   ```
   ip address ip-address mask [secondary]
   ```

   - *ip-address mask*—Enter the IP address in dotted decimal format—A.B.C.D. and mask in slash prefix-length format (/24).
   - `secondary`—Enter a secondary backup IP address for the interface.

Assign interface IP address to interface

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 10.10.1.4/8
```

View interface configuration

```
OS10# show interface ethernet 1/1/1
Ethernet 1/1/1 is up, line protocol is up
Hardware is Dell EMC Eth, address is 00:0c:29:98:1b:79
    Current address is 00:0c:29:98:1b:79
Pluggable media present, QSFP+ type is QSFP+ 40GBASE CR 1.0M
    Wavelength is 64
    SFP receive power reading is 0.0
Interface index is 16866084
Internet address is not set
Mode of IPv4 Address Assignment: not set
MTU 1532 bytes
LineSpeed 40G, Auto-Negotiation on
Flowcontrol rx off tx off
ARP type: ARPA, ARP Timeout: 60
Last clearing of "show interface" counters: 3 weeks 1 day 23:12:50
Queuing strategy: fifo
Input statistics:
     0 packets, 0 octets
     0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
     0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
     0 Multicasts, 0 Broadcasts, 0 Unicasts
     0 runts, 0 giants, 0 throttles
     0 CRC, 0 overrun, 0 discarded
Output statistics:
     0 packets, 0 octets
```

```
     0 64-byte pkts, 0 over 64-byte pkts, 0 over 127-byte pkts
     0 over 255-byte pkts, 0 over 511-byte pkts, 0 over 1023-byte pkts
     0 Multicasts, 0 Broadcasts, 0 Unicasts
     0 throttles, 0 discarded, 0 Collisions, 0 wreddrops
Rate Info(interval 299 seconds):
     Input 0 Mbits/sec, 0 packets/sec, 0% of line rate
     Output 0 Mbits/sec, 0 packets/sec, 0% of line rate
Time since last interface status change: 3 weeks 1 day 20:54:37
```

Configure static routing

You can configure a manual or static route for open shortest path first (OSPF).

- Configure a static route in CONFIGURATION mode.

```
ip route ip-prefix/mask {next-hop | interface interface [route-preference]}
```

  - *ip-prefix*—IPv4 address in dotted decimal in A.B.C.D format.
  - *mask*—Mask in slash prefix-length format (/X).
  - *next-hop*—Next-hop IP address in dotted decimal in A.B.C.D format.
  - *interface*—Interface type with the node/slot/portinformation
  - *route-preference*—(Optional) Route-preference range, from 1 to 255.

Configure static routes

```
OS10(config)# ip route 200.200.200.0/24 10.1.1.2
```

View configured static routes

```
OS10# show ip route static
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF,IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
Destination        Gateway                  Dist/Metric Last Change
-----------------------------------------------------------------
S  200.200.200.0/24 via 10.1.1.2 ethernet1/1/1  0/0      00:00:03
```

OS10 installs a static route if the next hop is on a directly connected subnet. A next-hop that is not on the directly connected subnet which recursively resolves to a next-hop on the interface's configured subnet also automatically configures. For example, if `interface ethernet 1/1/5` has IP address on subnet 100.0.0.0/8, and if 10.1.1.0/24 recursively resolves to 100.1.1.1, the system installs the static route:

- When the interface goes down, OS10 withdraws the route.
- When the interface comes up, OS10 reinstalls the route.
- When the recursive resolution is *broken*, OS10 withdraws the route.
- When the recursive resolution is satisfied, OS10 reinstalls the route.

NOTE: The recursive next-hop resolution does not work when the interface involved is null 0.

Address Resolution Protocol

Address Resolution Protocol (ARP) runs over Ethernet and enables end stations to learn the MAC addresses of neighbors on an IP network. Using ARP, OS10 automatically updates the *ARP cache* table that maps the MAC addresses to their corresponding IP addresses. The *ARP cache* enables dynamically learned addresses to be removed after a time period you configure.

Configure static ARP entries

You can manually configure static entries in the ARP mapping table. Dynamic ARP is vulnerable to spoofing. To avoid spoofing, configure static entries. Static entries take precedence over dynamic ARP entries.

NOTE: In the default forwarding-table mode, the maximum number of ARP entries that are learnt over Layer3 port-channels is limited to 32000. This restriction is applicable only to the Z9100 and S5200.

1. Configure an IP address and MAC address mapping for an interface in INTERFACE mode.

```
ip arp ip-address mac address
```

- *ip-address*—IP address in dotted decimal format in A.B.C.D format.
- *mac address*—MAC address in nnnn.nnnn.nnnn format

These entries do not age, and you can only remove them manually. To remove a static ARP entry, use the `no arp ip-address` command.

Configure static ARP entries

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# ip arp 10.1.1.5 08:00:20:b7:bd:32
```

View ARP entries

```
OS10# show ip arp interface ethernet 1/1/6
Address    Hardware address    Interface      Egress Interface
-------------------------------------------------------------
10.1.1.5   08:00:20:b7:bd:32   ethernet1/1/6  ethernet1/1/6
```

IPv4 routing commands

clear ip arp

Clears the dynamic ARP entries from a specific interface or optionally delete (no-refresh) ARP entries from the content addressable memory (CAM).

Syntax

`clear ip arp [vrf vrf-name] [interface interface | ip ip-address] [no-refresh]`

Parameters

- `vrf vrf-name`—(Optional) Enter `vrf` then the name of the VRF to clear ARP entries corresponding to that VRF.
- `interface interface`—(Optional) Specify an interface type:
  - `ethernet`—Enter the physical interface.
  - `port-channel`—Enter the port channel identifier number, from 1 to 999 or 1001 to 2000.
  - `vlan`—Enter the VLAN identifier.
  - `loopback`—Enter the Loopback interface identifier.
  - `virtual-network vn-id`—Enter the virtual network ID.
- `ip ip-address`—(Optional) Specify the IP address of the ARP entry to clear.
- `no-refresh`—(Optional) Delete the ARP entry from CAM. You can also use this option with *interface* or `ip ip-address` to specify which dynamic ARP entries to delete.

Default

Not configured

Command Mode

EXEC

Usage Information

Transit traffic may not forward during the period when deleted ARP entries resolve again and reinstall in CAM.

NOTE: Use this option with extreme caution.

You can use this command to clear the ARP entries of Layer 2 VXLAN bridges as well. All existing options of this command are supported for Layer 2 VXLAN bridges.

Example

```
OS10# clear ip arp interface ethernet 1/1/5
```

Example (ARP-suppression)

```
OS10# clear ip arp interface virtual-network 100

OS10# show ip arp interface virtual-network 100
Address Hardware address Interface Egress Interface
------------------------------------------------------------

OS10# show evpn mac-ip

Type -(lcl): Local (rmt): remote

EVI Mac-Address Type Seq-No Host-IP Interface/Next-Hop
```

Supported Releases 10.2.0E or later

clear ip route

Clears the specified routes from the IP routing table.

Syntax `clear ip route [vrf vrf-name] {* | A.B.C.D/mask}`

Parameters

- `vrf vrf-name` — (Optional) Enter the keyword `vrf` and then the name of the VRF to clear the routes corresponding to that VRF.
- `*`—Clear the entire IP routing table. This option refreshes all the routes in the routing table. Traffic flow is affected for all the routes in the switch.
- *A.B.C.D/mask* —Specify the IP route to remove from the IP routing table. This option refreshes all the routes in the routing table. Traffic flow is affected only for the specified route in the switch.

Default Not configured

Command Mode EXEC

Usage Information This command does not remove the static routes from the routing table.

Example

```
OS10# clear ipv6  route 10.1.1.0/24
```

Supported Releases 10.3.0E or later

ip address

Configure the IP address to an interface.

Syntax `ip address ip-address/mask`

Parameters *ip–address/mask* — Enter the IP address.

Defaults None

Command Mode INTERFACE

Usage Information The `no` version of this command removes the IP address set for the interface.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip address 10.1.1.0/24
```

Supported Releases 10.3.0E or later

ip address dhcp

Enables DHCP client operations on the interface.

Syntax `ip address dhcp`

Parameters None

Defaults None

Command Mode INTERFACE

Usage Information The `no` version of this command disables DHCP operations on the interface.

NOTE: After running the `no ip address dhcp` command the DHCP IP address is released; also, any active SSH or Telnet connections to the DHCP IP address are terminated immediately.

Example

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# ip address dhcp
```

Supported Releases 10.3.0E or later

ip arp

Configures static ARP and maps the IP address of the neighbor to a MAC address.

Syntax `ip arp` *mac-address*

Parameters *mac-address* — Enter the MAC address of the IP neighbor in A.B.C.D format.

Default Not configured

Command Mode INTERFACE

Usage Information Do not use Class D (multicast) or Class E (reserved) IP addresses. Zero MAC addresses (00:00:00:00:00:00) are invalid. The `no` version of this command disables the IP ARP configuration.

Example

```
OS10(conf-if-eth1/1/6)# ip arp 10.1.1.5 08:00:20:b7:bd:32
```

Supported Releases 10.2.0E or later

ip arp gratuitous

Enables an interface to receive or send gratuitous ARP requests and updates.

Syntax `ip arp gratuitous {update | request}`

Parameters

- `update` — Specify to enable or disable ARP cache updates for gratuitous ARP.
- `request` — Specify to enable or disable sending gratuitous ARP requests when duplicate address is detected.

Default Not configured

Command Mode CONFIG-INTERFACE

Usage Information When a reply to a gratuitous ARP request is received, it indicates an IP address conflict in the network. The `no` version of this command disables the ARP cache updates for gratuitous ARP.

Example

```
OS10(conf-if-eth1/1/6)# ip arp gratuitous update
OS10(conf-if-eth1/1/6)# ip arp gratuitous request
```

Supported Releases 10.2.0E or later

ip proxy-arp

Enables proxy ARP on an interface.

Syntax `ip proxy-arp enable`

Parameters `enable`—Enable proxy ARP.

Defaults Disabled

Command Mode INTERFACE

Usage Information OS10 does not support proxy ARP in a VLT setup.

The `no` version of this command resets the value to the default.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip proxy-arp
```

Supported Releases OS10 legacy command.

ip route

Assigns a static route on the network device.

Syntax `ip route [vrf` **`vrf-name`**`]` *`dest-ip-prefix mask {next-hop [ interface interface-type] [route-preference]} [bfd]`*

Parameters

- `vrf` *`vrf-name`* — (Optional) Enter `vrf` and then the name of the VRF to configure a static route corresponding to that VRF. Use this VRF option after the `ip route` keyword to configure a static route on that specific VRF.
- *`dest-ip-prefix`* — Enter the destination IP prefix in dotted decimal A.B.C.D format.
- *`mask`* — Enter the mask in slash prefix-length /x format.
- *`next-hop`* — Enter the next-hop IP address in dotted decimal A.B.C.D format.
- `interface` *`interface-type`* — Enter the interface type and interface information. The interface types supported are: Ethernet, port-channel, VLAN, and Null.
- *`route-preference`* — (Optional) Enter the range, from 1 to 255.
- *`bfd`* — (Optional) Enable BFD on a specific static route.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command deletes a static route configuration.

Use the `bfd` option to enable Bidirectional Forwarding detection (BFD) on a specific static route.

Example

```
OS10(config)# ip route 200.200.200.0/24 10.1.1.2
```

```
OS10(config)# ip route 200.200.200.0/24 interface null 0
```

The following is a sample configuration for enabling BFD on a specific static route:

```
OS10(config)# ip route 10.10.200.0/24 10.1.1.2 bfd
```

Supported Releases 10.2.0E or later

show evpn mac-ip

Displays the BGP EVPN Type 2 routes used for host MAC-IP address binding.

Syntax

```
show evpn mac-ip [count | evi evi [mac-address mac-address] | mac-address
mac-address | next-hop ip-address]
```

Parameters

- `count` — Displays the total number of MAC addresses in EVPN MAC-IP address binding.
- `evi evi` — Enter an EVPN instance ID, from 1 to 65535.
- `host ip-address` — Enter the IP address of a host that communicates through EVPN routes.
- `mac-address mac-address` — Enter the MAC address of a host that communicates through EVPN routes in the format `nn:nn:nn:nn:nn`.
- `next-hop ip-address` — Enter the IP address of a next-hop switch.

Default Not configured

Command mode EXEC

Usage information

Use this command to view the MAC-IP address binding for host communication in VXLAN tenant segments. The type 2 routes received from the remove VTEP displays only if there is a corresponding EVI configured locally.

Use this command to display the snooped MAC-IP binding (ARP entries) for Layer 2 VXLAN bridges. The functionality is extended to Layer 2 VXLAN bridges. Additionally, this command displays Layer 2 VXLAN related information also. Use this command to view snooped MAC-IP bindings of Layer 3 VXLAN bridges. All existing filters of this command are supported including VRF. The `show ip arp summary` command is supported for Layer 2 VXLAN.

Example

```
OS10# show evpn mac-ip

100  00:00:e7:dd:3b:a9 lcl 0 1.1.1.2 virtual-network100
```

Supported releases 10.4.3.0 or later

show ip arp

Displays the ARP table entries for a specific IP address or MAC address, static, dynamic, and a summary of all ARP entries.

Syntax `show ip arp [vrf vrf-name] [interface [ethernet | vlan | port-channel] | ip-address | mac-address | static | dynamic | summary]`

Parameters

- `vrf vrf-name`—Enter `vrf` then the name of the VRF to display ARP entries corresponding to that VRF.
- `interface`—(Optional) Enter the keyword and interface information:
  - *`ethernet`*—Enter the interface information.
  - *`vlan`*—Enter the VLAN ID number, from 1 to 4093.
  - *`port-channel`*—Enter the port channel ID number, from 1 to 999 or 1001 to 2000.
- *`ip-address`*—(Optional) Enter the IP address for the ARP entry in A.B.C.D format.
- *`mac-address`*—(Optional) Enter the MAC address in nn:nn:nn:nn:nn:nn format.
- `static`—(Optional) Enter the keyword to display static ARP entries.
- `dynamic`—(Optional) Enter the keyword to display dynamic ARP entries.
- `summary`—(Optional) Enter the keyword to display a summary of all ARP entries.

Default Not configured

Command Mode EXEC

Usage Information This command shows both static and dynamic ARP entries.

Use this command to display the snooped MAC-IP binding (ARP entries) for Layer 2 VXLAN bridges. The functionality is extended to Layer 2 VXLAN bridges. Additionally, this command displays Layer 2 VXLAN related information also. Use this command to view snooped MAC-IP bindings of Layer 3 VXLAN bridges. All existing filters of this command are supported including VRF. The `show ip arp summary` command is supported for Layer 2 VXLAN.

Example (Includes the PVLAN domain where the MAC is learned originally)

```
OS10# show ip arp
pv <vlan-id> - private vlan where the mac is originally learnt
Address   Hardware address    Interface  Egress Interface
-------------------------------------------------------------------
1.1.1.1   00:00:00:00:00:01   vlan100    ethernet1/1/11
1.1.1.2   00:00:00:00:00:02   vlan100    ethernet1/1/12    pv 10
1.1.1.3   00:00:00:00:00:03   vlan100    ethernet1/1/13    pv 20
1.1.1.5   00:00:00:00:00:05   vlan100    port-channel1000
1.1.1.6   00:00:00:00:00:06   vlan100    port-channel1000  pv 10
```

Example (IP address)

```
OS10# show ip arp 192.168.2.2
Address      Hardware address    Interface          Egress Interface
-------------------------------------------------------------------
192.168.2.2  90:b1:1c:f4:a6:e6   ethernet1/1/49:1   ethernet1/1/49:1
```

Example (static)

```
OS10# show ip arp summary
Total Entries       Static Entries      Dynamic Entries
-----------------------------------------------------
    3994                  0                 3994
```

```
OS10# show ip arp 192.168.2.2
Address      Hardware address    Interface          Egress Interface
-------------------------------------------------------------------
192.168.2.2  90:b1:1c:f4:a6:e6   ethernet1/1/49:1   ethernet1/1/49:1
```

```
OS10# show ip arp
Address        Hardware address    Interface            Egress Interface
-------------------------------------------------------------------------
192.168.2.2    90:b1:1c:f4:a6:e6   ethernet1/1/49:1     ethernet1/1/49:1
193.168.2.3    54:bf:64:e6:d4:c5   vlan4000             port-channel1000
```

Example (dynamic)

```
OS10# show ip arp dynamic
Address        Hardware address    Interface           Egress Interface
-------------------------------------------------------------------------
192.168.2.2    90:b1:1c:f4:a6:e6   ethernet1/1/49:1    ethernet1/1/49:1
193.168.2.3    54:bf:64:e6:d4:c5   vlan4000            port-channel1000
```

Example (ARP-suppression)

```
OS10# show ip arp interface virtual-network 100
Address Hardware address Interface Egress Interface
-----------------------------------------------------------
1.1.1.1 00:00:e7:dd:21:2c virtual-network100 ethernet1/1/2
1.1.1.2 00:00:e7:dd:3b:a9 virtual-network100 ethernet1/1/1
```

Supported Releases

10.2.0E or later

show ip route

Displays IP route information.

Syntax

```
show ip route [vrf vrf-name] [all | bgp | connected | ospf process-
id | static | ip-prefix[/mask]|summary] load-balancing {ingress-port
enable | [tcp-udp-selection l4-destination-port | l4-source-port] | [ip-
selection destination-ip | source-ip | protocol | vlan-id | l4-destination-
port | l4-source-port] | [ipv6-selection destination-ip | source-ip |
protocol | vlan-id | l4-destination-port | l4-source-port] | [mac-selection
destination-mac | source-mac | ethertype | vlan-id]}
```

Parameters

- `vrf vrf-name`—(Optional) Enter `vrf` and then the VRF name to list the routes in the route table of a specific VRF.
- `all`—(Optional) Displays both active and non-active IP routes.
- `bgp`—(Optional) Displays BGP route information.
- `connected`—(Optional) Displays only the directly connected routes.
- `ospf process-id`—(Optional) Displays route information for the OSPF process, from 1 to 65535.
- `static`—(Optional) Displays static route information.
- `ip-prefix[/mask]`—(Optional) Displays details of a particular IPv4 destination prefix from the IPv4 routing table matching the IPv4 destination address and mask. When the prefix alone is given, this command displays the IPv4 Longest Prefix Match (LPM) route, if it exists in the routing table.
- `summary`—(Optional) Displays an IP route summary.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip route
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF, IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
 Destination         Gateway             Dist/Metric  Last Change
-------------------------------------------------------------------
 C     10.1.1.0/24   via 10.1.1.1 vlan100   0/0        01:16:56
 B EX  10.1.2.0/24   via 10.1.2.1 vlan101   20/0       01:16:56
 O     10.1.3.0/24   via 10.1.3.1 vlan102   110/2      01:16:56
 B IN  10.1.4.0/24   via 10.1.4.1 vlan103   200/0      01:16:56

OS10(config)# do show ip route vrf VRF1
Codes: C - connected
S - static

```

Supported Releases 10.2.0E or later

IPv6 routing

OS10 supports IPv6 routing and addressing, including the Neighbor Discovery Protocol (NDP), stateless IPv6 address autoconfiguration, and stateful IPv6 address configuration. Configure IPv6 routing for IP hosts to communicate with one another in the same network, or in different networks.

NOTE: OS10 does not support Routing Information Protocol Next Generation (RIPNG).

Cofiguration notes

IPv6 processing is supported according to the OS10 interface type. The following interface-specific IPv6 settings apply:

- Physical port and port-channel interfaces are in L2 mode by default. IPv6 capability and forwarding are disabled in L2 mode. To enable IPv6 forwarding, set the interface in L3 mode using the no switchport and commit commands.
- VLAN and Loopback interfaces come up in L3 mode with IPv6 capability and forwarding enabled by default.
- On the management interface, IPv6 is enabled by default. IPv6 forwarding is disabled so that the interface operates in Host mode without routing traffic.
- IPv6 stateless auto-configuration is disabled by default, except on the management interface. To enable autoconfiguration, use the ipv6 address autoconfig command in Interface mode. Autoconfiguration acquires a global IPv6 address using the network prefix in Router Advertisements. When IPv6 auto-configuration is enabled, IPv6 forwarding is disabled on the interface.

To disable auto-configuration, use the no ipv6 address autoconfig command. IPv6 forwarding remains enabled.

Enable or disable IPv6

By default:

- IPv6 forwarding is enabled on physical Ethernet interfaces, VLANs, and port groups. IPv6 forwarding is disabled only when you enable IPv6 address autoconfiguration on an interface and set it in host mode using the `ipv6 address autoconfig` command.
- IPv6 forwarding is permanently disabled on the management Ethernet interface so that it remains in Host mode and does not operate as a router regardless of the `ipv6 address autoconfig` setting.

If necessary, you can manually disable IPv6 processing on an interface so that the configured IPv6 addresses do not take effect. The IPv6 addresses take effect again when you re-enable IPv6.

If you disable IPv6 and configure a Layer (L2) interface in Layer (L3) mode, IPv6 is not automatically re-enabled on the interface. You must manually re-enable it.

A link-local address automatically generates when you re-enable IPv6 on an interface with the `ipv6 enable` command.

Disable and enable IPv6

```
OS10(config)# interface ethernet 1/1/8
OS10(conf-if-eth1/1/8)# ipv6 address 2111:dddd:0eee::22/64
OS10(conf-if-eth1/1/8)# no ipv6 address autoconfig
OS10(conf-if-eth1/1/8)# no ipv6 enable
OS10(conf-if-eth1/1/8)# ipv6 enable
```

Display IPv6 status

```
OS10# show interface ethernet 1/1/20
Ethernet 1/1/20 is up, line protocol is up
Hardware is Dell EMC Eth, address is ec:f4:bb:fb:fa:30
    Current address is ec:f4:bb:fb:fa:30
Pluggable media present, QSFP+ type is QSFP+ 40GBASE CR 1.0M
    Wavelength is 850
    Receive power reading is 0.0
Interface index is 17305562
Internet address is 20.20.20.1/24
Mode of IPv4 Address Assignment: MANUAL
Interface IPv6 oper status: Enabled
Link local IPv6 address: fe80::eef4:bbff:fefb:fa30/64
```

```
Global IPv6 address: 2020::1/64
...
```

```
OS10# show ipv6 interface brief
Interface Name    admin/protocol  IPV6 Address/Link-Local Address  IPv6 Oper Status
==========================================================================================
Ethernet 1/1/1:1  up   / up       fe80::eef4:bbff:fefb:f9f0/64
                                  2017::1/64                      Enabled
Ethernet 1/1/20   up   / up       fe80::eef4:bbff:fefb:fa30/64
                                  2020::1/64                      Enabled
Management 1/1/1  up   / up       fe80::eef4:bbff:fefb:f9ef/64    Enabled
Vlan 1            up   / up       fe80::eef4:bbff:fefb:fa59/64    Enabled
```

IPv6 addresses

An IPv6 address consists of a 48-bit global routing prefix, optional 16-bit subnet ID, and a 64-bit interface identifier in the extended universal identifier (EUI)-64 format.

IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons: x:x:x:x:x:x:x:x.

```
2001:0db8:0000:0000:0000:0000:1428:57a
```

Leading zeros in each field are optional. You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only one time in each address:

```
2001:db8::1428:57ab
```

In the following example, all the addresses are valid and equivalent:

- `2001:0db8:0000:0000:0000:0000:1428:57ab`
- `2001:0db8:0000:0000:0000::1428:57ab`
- `2001:0db8:0:0:0:0:1428:57ab`
- `2001:0db8:0:0::1428:57ab`
- `2001:0db8::1428:57ab`
- `2001:db8::1428:57ab`

Write IPv6 networks using CIDR notation. An IPv6 network or subnet is a contiguous group of IPv6 addresses which must be a power of two. The initial bits of addresses, which are identical for all hosts in the network, are the network's prefix.

A network is denoted by the first address in the network and the size in bits of the prefix in decimal, separated with a slash. Because a single host is seen as a network with a 128-bit prefix, host addresses may be written with a following /128.

For example, `2001:0db8:1234::/48` stands for the network with addresses `2001:0db8:1234:0000:0000:0000:0000:0000` through `2001:0db8:1234:ffff:ffff:ffff:ffff:ffff`.

As soon as you assign an IPv6 address, IPv6 packet processing is enabled on an interface. You can manually disable and re-enable IPv6 processing on an interface configured with an IPv6 address using the `no ipv6 enable` and `ipv6 enable` commands.

To remove all IPv6 addresses from an interface, use the `no ipv6 address` command. To remove a specific IPv6 address, use the `ipv6 address` *`ipv6-address/mask`* command.

Link-local addresses

When an OS10 switch boots up, an IPv6 unicast link-local address automatically assigns to an interface using stateless configuration. A link-local address allows IPv6 devices on a local link to communicate without requiring a globally unique address. IPv6 reserves the address block FE80::/10 for link-local unicast addressing.

Global addresses

To enable stateless autoconfiguration of an IPv6 global address and set the interface to Host mode, use the `ipv6 address autoconfig` command. The router receives network prefixes in IPv6 router advertisements (RAs). An interface ID appends to the prefix. In Host mode, IPv6 forwarding is disabled.

The `no ipv6 address autoconfig` command disables IPv6 global address autoconfiguration, and sets the interface to Router mode with IPv6 forwarding enabled.

DHCP-assigned addresses

As an alternative to stateless autoconfiguration, you can enable a network host to obtain IPv6 addresses using a DHCP server via stateful autoconfiguration using the `ipv6 address dhcp` command. A DHCPv6 server uses a prefix pool to configure a network address on an interface. The interface ID automatically generates.

Manally configured addresses

An interface can have multiple IPv6 addresses. To configure an IPv6 address in addition to the link-local address, use the `ipv6 address` *`ipv6-address/mask`* command. Enter the full 128-bit IPv6 address, including the network prefix and a 64-bit interface ID.

NOTE: Dell Technologies does not recommend configuring both a static IPv6 address and DHCPv6 on the same interface.

You can also manually configure an IPv6 address by assigning:f

- A network prefix with the EUI-64 parameter using the `ipv6 address` *`ipv6-prefix`* `eui64` command. A 64-bit interface ID automatically generates based on the MAC address.
- A link-local address to use instead of the link-local address that automatically configures when you enable IPv6 using the `ipv6 address link-local` command.

Configure IPv6 address

```
OS10(config)# interface ethernet 1/1/8
OS10(conf-if-eth1/1/8)# ipv6 address 2001:dddd:0eee::4/64
```

Configure network prefix

```
OS10(config)# interface ethernet 1/1/8
OS10(conf-if-eth1/1/8)# ipv6 address 2001:FF21:1:1::/64 eui64
```

Configure link-local address

```
OS10(config)# interface ethernet 1/1/8
OS10(conf-if-eth1/1/8)# ipv6 address FE80::1/64 link-local
```

Stateless autoconfiguration

When an interface comes up, OS10 uses stateless autoconfiguration to generate a unique link-local IPv6 address with a FE80::/64 prefix and an interface ID generated from the MAC address. To use stateless autoconfiguration to assign a globally unique address using a prefix received in router advertisements, use the `ipv6 address autoconfig` command.

Stateless autoconfiguration sets an interface in Host mode, and allows the interface connected to an IPv6 network to autoconfigure IPv6 addresses and communicate with other IPv6 devices on local links. A DHCP server is not required for automatic IPv6 interface configuration. IPv6 devices on a local link send router advertisement (RA) messages in response to solicitation messages received at startup.

Perform stateless autoconfiguration of IPv6 addresses using:

Prefix advertisement	Routers use router advertisement messages to advertise the network prefix. Hosts append their interface-identifier MAC address to generate a valid IPv6 address.
Duplicate address detection	An IPv6 host node checks whether that address is used anywhere on the network using this mechanism before configuring its IPv6 address.
Prefix renumbering	Transparent renumbering of hosts in the network when an organization changes its service provider.

IPv6 provides the flexibility to add prefixes on RAs in response to a router solicitation (RS). By default, RA response messages are sent when an RS message is received. The system manipulation of IPv6 stateless autoconfiguration supports the router side only. Neighbor Discovery (ND) messages advertise so the neighbor can use the information to auto-configure its address. Received ND messages are not used to create an IPv6 address.

Inconsistencies in RA values between routers are logged. The values checked for consistency include:

- Current hop limit
- M and O flags
- Reachable time
- Retransmission timer

- MTU options
- Preferred and valid lifetime values for the same prefix

The router redirect functionality in the NDP is similar to IPv4 router redirect messages. NDP uses ICMPv6 redirect messages (Type 137) to inform nodes that a better router exists on the link.

Neighbor Discovery

The IPv6 NDP determines if neighboring IPv6 devices are reachable and receives the IPv6 addresses of IPv6 devices on local links. Using the link-layer and global prefixes of neighbor addresses, OS10 performs stateless autoconfiguration of IPv6 addresses on interfaces.

ICMPv6 RA messages advertise the IPv6 addresses of IPv6-enabled interfaces and allow a router to learn information corresponding to any address changes in IPv6 neighbors. By default, RAs are disabled on an interface.

ICMPv6 RA messages are sent on a maximum of 256 interfaces. If the interfaces exceed this limit, the following error message is thrown in the system log: `sendmsg: No buffer space available`. ICMPv6 RA messages are not sent beyond 256 interfaces.

Prerequisites

To enable RA messages, the switch must be in Router mode with IPv6 forwarding enabled and stateless autoconfiguration disabled using the `no ipv6 address autoconfig` command.

Enable router advertisement messages

1. Enable IPv6 neighbor discovery and sending ICMPv6 RA messages in Interface mode.

```
ipv6 nd send-ra
```

2. (Optional) Configure IPv6 neighbor discovery options in Interface mode.
   - `ipv6 nd hop-limit` *hops* — (Optional) Sets the hop limit advertised in RA messages and included in IPv6 data packets sent by the router, from 0 to 255; default 64. `0` indicates that no hop limit is specified by the router.
   - `ipv6 nd managed-config-flag` — (Optional) Sent in RA messages to tell hosts to use stateful address autoconfiguration, such as DHCPv6, to obtain IPv6 addresses.
   - `ipv6 nd max-ra-interval` *seconds* — (Optional) Sets the maximum time interval for sending RA messages, from 4 to 1800 seconds; default 600.
   - `ipv6 nd mtu` *number* — (Optional) Sets the maximum transmission unit (MTU) used in RA messages on the link, from 1280 to 65535 bytes; default 1500. By default, no MTU setting is included in RA messages.
   - `ipv6 nd other-config-flag` — (Optional) Tells hosts to use stateful autoconfiguration to obtain nonaddress-related information.
   - `ipv6 nd ra-lifetime` *seconds* — (Optional) Sets the lifetime of a default router in RA messages, from 0 to 9000 milliseconds; default 3 times the `max-ra-interval` setting. `0` indicates that this router is not used as a default router.
   - `ipv6 nd reachable-time` *milliseconds* — (Optional) Sets the advertised time the router sees that a neighbor is up after it receives neighbor reachability confirmation, from 0 to 3600000 milliseconds; default 0. `0` indicates that no reachable time is sent in RA messages.
   - `ipv6 nd retrans-timer` *seconds* — (Optional) Sets the time between retransmitting neighbor solicitation messages, from 100 to 4292967295 milliseconds. By default, no retransmit timer is configured.
3. Configure the IPv6 prefixes that are advertised by IPv6 neighbor discovery in Interface mode.

```
ipv6 nd prefix {ipv6-prefix | default} [no-advertise] [no-autoconfig] [no-rtr-
address]
[off-link] [lifetime {valid-lifetime seconds | infinite}
{preferred-lifetime seconds | infinite}]
```

   - `ipv6-prefix` — Enter an IPv6 prefix in *x:x::y/mask* format to include the prefix in RA mesages. Include prefixes that are not already in the subnets configured on the interface.
   - `default` — Configure the prefix parameters advertised in all subnets configured on the interface.
   - `no-advertise` — (Optional) Do not advertise the specified prefix. By default, all prefixes in configured subnets are advertised.
   - `no-autoconfig` — (Optional) Sets `AdvAutonomous` to `Off` for the specified prefix in the radvd.conf file. This setting tells hosts to not use this prefix for address autoconfiguration. By default, `AdvAutonomous` is `On`.
   - `no-rtr-address` — (Optional) Sets `AdvRouterAddr` to `Off` for the prefix in the radvd.conf file. The `Off` setting tells hosts to not use the advertising router address for on-link determination. By default, `AdvRouterAddr` is `On`.

- `off-link` — (Optional) Sets `AdvOnLink` to `Off` for the prefix in the radvd.conf file. The `Off` setting tells hosts to not use this prefix for on-link determination. By default, `AdvOnLink` is `On`.
- `lifetime {valid-lifetime` *`seconds`* `| infinite}` — (Optional) Sets `AdvValidLifetime` in seconds for the prefix in the radvd.conf file. The prefix is valid for on-link determination only for the specified lifetime. The default is 86400 seconds (1 day). The `infinite` setting allows the prefix to be valid for on-link determination with no time limit.
- `lifetime {preferred-lifetime` *`seconds`* `| infinite}` — (Optional) Sets `AdvPreferredLifetime` in seconds for the prefix in the radvd.conf file. IPv6 addresses generated from the prefix using stateless autoconfiguration remain preferred for the configured lifetime. The default is 14400 seconds (4 hours). The `infinite` setting allows addresses that are autoconfigured using the prefix to be preferred with no time limit.

By default, all prefixes configured in IPv6 addresses on an interface are advertised. To modify the default values advertised for interface subnet prefixes, use the `ipv6 nd prefix default` command and specify new default settings.

On-link determination is the process used to forward IPv6 packets to a destination IPv6 address.

Configure neighbor discovery

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 nd mtu 1500
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
```

Configure advertised IPv6 prefixes

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 nd prefix default lifetime infinite infinite
OS10(conf-if-eth1/1/1)# ipv6 nd prefix 2002::/64
```

Duplicate address discovery

To determine if an IPv6 unicast address is unique before assigning it to an interface, an OS10 switch sends a neighbor solicitation message. If the process of duplicate address discovery (DAD) detects a duplicate address in the network, the address does not configure on the interface. DAD is enabled by default.

By default, IPv6 is not disabled when a duplicate address is detected. Only the duplicate address is not applied. Other IPv6 addresses are still active on the interface.

To disable IPv6 on an interface when a duplicate link-local address is detected, use the `ipv6 nd dad disable-ipv6-on-failure` command. To re-enable IPv6 after you resolve a duplicate link-local address, enter `no ipv6 enable`, then the `ipv6 enable` command.

- Disable or re-enable IPv6 duplicate address discovery in Interface mode.

  ```
  ipv6 nd dad {disable | enable}
  ```

- Disable IPv6 on an interface if a duplicate link-local address is discovered in Interface mode.

  ```
  ipv6 nd dad disable-ipv6-on-dad-failure
  ```

Disable duplicate address discovery

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 nd dad disable
```

Disable IPv6 for duplicate link-local address

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 nd dad disable-ipv6-on-dad-failure
```

DNS Search List

Domain name system search list (DNSSL) is an IPv6 router advertisement (RA) option that allows IPv6 devices to advertise DNS configurations in networks where hosts are autoconfigured through IPv6 stateless address auto-configuration (SLAAC).

Configure DNS search list

To configure a domain name to advertise for an interface in RA messages:

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)#
```

2. Enter Interface Configuration mode.

```
OS10(config)# interface ethernet 1/1/11
```

3. Configure the interface as a Layer 3 routed interface and bring the interface administratively up.

```
OS10(conf-if-eth1/1/11)# no switchport
OS10(conf-if-eth1/1/11)# no shutdown
```

4. Configure the IPv6 prefix to advertise in router advertisement (RA) messages.

```
OS10(conf-if-eth1/1/11)# ipv6 nd prefix 150::1/64
```

5. Enable sending ICMPv6 RA messages.

```
OS10(conf-if-eth1/1/11)# ipv6 nd send-ra
```

6. Configure the DNS search list with domain name dell.com, sequence number 8, and the default lifetime.

```
OS10(conf-if-eth1/1/11)# ipv6 nd ra-dns search-list seq 8 dell.com
```

7. Verify the configuration.

```
OS10(conf-if-eth1/1/11)# show configuration
!
interface ethernet1/1/11
no shutdown
no switchport
ipv6 nd prefix 150::1/64
ipv6 nd ra-dns search-list seq 8 dell.com
ipv6 nd send-ra
flowcontrol receive on
```

To suppress advertising the configured DNS search list, use the `ipv6 nd ra-dns search-list suppress` command

Recursive DNS server addresses

Recursive DNS server (RDNSS) contains recursive DNS server addresses that help in DNS name resolution in IPv6 hosts. The devices advertise the configured recursive server addresses through IPv6 router advertisement (RA) messages.

Configure recursive DNS server lists

To configure a DNS server address to advertise for an interface in RA messages:

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)#
```

2. Enter Interface Configuration mode.

```
OS10(config)# interface ethernet 1/1/11
```

3. Configure the interface as a Layer 3 routed interface and bring the interface administratively up.

```
OS10(conf-if-eth1/1/11)# no switchport
OS10(conf-if-eth1/1/11)# no shutdown
```

4. Configure the IPv6 prefix to advertise in router advertisement (RA) messages.

```
OS10(conf-if-eth1/1/11)# ipv6 nd prefix 150::1/64
```

5. Enable sending ICMPv6 RA messages.

```
OS10(conf-if-eth1/1/11)# ipv6 nd send-ra
```

6. Configure the recursive DNS server with sequence number 1 and lifetime 2000.

```
OS10(conf-if-eth1/1/11)# ipv6 nd ra-dns server seq 1 2001:4860:4860::8888 2000
```

7. Configure the recursive DNS server with sequence number 1 and lifetime 2000.

```
OS10(conf-if-eth1/1/11)# show configuration
!
interface ethernet1/1/11
no shutdown
no switchport
ipv6 nd prefix 150::1/64
ipv6 nd ra-dns server seq 1 2001:4860:4860::8888 2000
ipv6 nd send-ra
flowcontrol receive on
```

To suppress advertising the configured recursive DNS server list, use the `ipv6 nd ra-dns server suppress` command.

Static IPv6 routing

To define an explicit route between two IPv6 networking devices, configure a static route on an interface. Static routing is useful for smaller networks with only one path to an outside network, or to provide security for certain traffic types in a larger network.

- Enter the static routing information including the IPv6 address and mask in x:x:x:x::x format in CONFIGURATION mode. The length is from 0 to 64.

```
ipv6 route ipv6-prefix/mask {next-hop | interface interface [route-preference]}
```

  - *next-hop* — Enter the next-hop IPv6 address in x:x:x:x::x format.
  - `interface` *interface* — Enter the interface type then the slot/port or number information.
  - *route-preference* — (Optional) Enter a route-preference range, from 1 to 255.

After you configure a static IPv6 route, configure the forwarding router's address on the interface. The IPv6 neighbor interface must have an IPv6 address configured.

Configure IPv6 static routing and view configuration

```
OS10(config)# ipv6 route 2111:dddd:0eee::22/128 2001:db86:0fff::2
OS10(config)# do show ipv6 route static
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF,IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
  Destination            Gateway                 Dist/Metric   Last Change
-------------------------------------------------------------------------
  S 2111:dddd:eee::22/12via 2001:db86:fff::2 ethernet1/1/1  1/1  00:01:24
```

IPv6 destination unreachable

By default, when no matching entry for an IPv6 route is found in the IPv6 routing table, a packet drops and no error message is sent. You can enable the capability to send an `IPv6 destination unreachable` error message to the source without dropping the packet.

Enable IPv6 unreachable destination messaging

```
OS10(config)# interface ethernet 1/1/8
OS10(conf-if-eth1/1/8)# ipv6 unreachables
```

IPv6 hop-by-hop options

A hop-by-hop header extension in an IPv6 packet contains options that are processed by all IPv6 routers in the packet's path. By default, hop-by-hop header options in an IPv6 packet do not process locally. To enable local processing of IPv6 hop-by-hop options on an interface, use the `ipv6 hop-by-hop` command.

Enable IPv6 hop-by-hop options forwarding

```
OS10(config)# interface ethernet 1/1/8
OS10(conf-if-eth1/1/8)# ipv6 hop-by-hop
```

IPv6 Routing Header Type 0

Routing header is an extension header that is defined in RFC 2460 for IPv6. A source uses routing header to list one or more intermediate nodes that a packet takes to reach its destination. Routing header is modeled similar to the IPv4 Loose Source and Route IP options. It consists of routing type field, which further identifies the extension.

The Type 0 routing header extension (RH0) is used for listing the addresses of the intermediate nodes for the packet to take to reach its destination. RH0 can also be used to perform denial of service attacks, bypassing filtering and firewall devices, and other kinds of security attacks. This extension is depreciated in RFC 5095. OS10 switches are compliant with RFC 5095. You can use the following command to drop all IPv6 packets with RH0 in case there is any noncompliant router or node in the network:

```
[no] ipv6 routing-header-type0 deny fast-path [slow-path]
```

Restrictions and Limitations

IPv6 RH0 packets are not dropped in hardware (fast-path) in the following scenarios:

- IPv6 RH0 packets for which Routing Header is present beyond first 128 bytes of the packet.
- IPv6 RH0 packets matching a Policy-Based Routing (PBR) entry is routed and not dropped.
- IPv6 RH0 packets with hop-by-hop header are not dropped when the `ipv6 hop-by-hop` CLI configuration is present. This restriction can be overcome using the `slow-path` parameter.
- This feature is not supported on the Z9664F-ON platform.

View IPv6 information

To view IPv6 configuration information, use the `show ipv6 route` command. To view IPv6 address information, use the `show address ipv6` command.

View IPv6 connected information

```
OS10# show ipv6 route connected
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF,IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
Destination       Gateway                  Dist/Metric  Last Change
----------------------------------------------------------------
C 2001:db86::/32  via 2001:db86:fff::1 ethernet1/1/1  0/0   00:03:24
```

View IPv6 static information

```
OS10# show ipv6 route static
Codes: C - connected
```

```
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF,IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
Destination         Gateway                 Dist/Metric  Last Change
------------------------------------------------------------------
S  2111:dddd:eee::22/12via 2001:db86:fff::2 ethernet1/1/1  1/1 00:01:24
```

IPv6 RA Guard

The IPv6 Router Advertisement (RA) guard feature prevents the OS10 switch from receiving unwanted and rouge RA messages from its neighbor devices. RA guard inspects and validates the RA messages against the policy that you configured. Depending on the validation result, RA guard forwards or drops the packets that match the policy conditions.

This feature is applicable only for an environment where all messages between IPv6 end devices traverse through an RA guard-enabled Layer 2 (L2) switch. This feature is not supported if the end devices communicate directly without an RA guard-capable L2 device.

Limitations

- RA guard validation is not applicable for IPv6-tunneled RA packets.
- This feature is supported only in the ingress direction and not supported at egress.
- OS10 does not validate IPv6 unicast RA packets that include extension headers and IPv6 unicast RA fragmented packets.

Configuration notes

- If you enable the IPv6 RA guard and port security feature on the same interface, ensure that you do not use the `flood` option.
- IPv6 RA guard policy takes precedence over the Access Control List (ACL) that is applied on the interface.

Configure IPv6 RA guard

This section describes how to configure IPv6 RA guard.

Enable the IPv6 RA guard feature globally. Create a policy and specify a list of parameters to validate against the contents of the RA guard packets. Apply the policy to the specific interfaces.

1. Enable IPv6 RA guard.

   ```
   OS10(config)# ipv6 nd ra-guard enable
   ```

2. Create an IPv6 RA guard policy.

   ```
   OS10(config)# ipv6 nd ra-guard policy ra-guard-test-policy
   ```

3. Configure the device role to apply the IPv6 RA guard policy to an interface.

   ```
   OS10(conf-ra_guard_policy_list)# device-role router
   ```

4. If this command is set to `off`, the system verifies the advertised managed configuration parameter is set to off in the RA packet and the other way round.

   If this flag is set to `off`, OS10 skips the validation process.

   ```
   OS10(conf-ra_guard_policy_list)# managed-config-flag on
   ```

5. (Optional) Create an IPv6 prefix, access, or MAC list. This list specifies the condition that is validated against the RA guard packet that is received. You can optionally use an existing IPv6 prefix, access, or MAC list.

```
OS10(config)# ipv6 prefix-list example_prefix_list deny 10::/64
```

```
OS10(config)# ipv6 access-list example-access-list
OS10(config-ipv6-acl)# permit udp any any capture session 1
OS10(config-ipv6-acl)# exit
```

```
OS10(config)# mac access-list example-maclist
OS10(config-mac-acl)# permit 00:00:00:00:11:11 00:00:11:11:11:11 any vlan 1
OS10(config-mac-acl)# permit 00:00:00:00:11:11 00:00:11:11:11:11 any cos 7
OS10(config-mac-acl)# exit
```

6. The system permits or denies the RA guard packets based on the results of the validation. Specify the prefix, access, or MAC list against which the RA guard packet is validated.

```
OS10(conf-ra_guard_policy_list)# match ra ipv6-prefix-list example_prefix_list
OS10(conf-ra_guard_policy_list)# exit
```

```
OS10(conf-ra_guard_policy_list)# match ra ipv6-access-list example-access-list
OS10(conf-ra_guard_policy_list)# exit
```

```
OS10(conf-ra_guard_policy_list)# match ra mac-access-list example-maclist
```

7. Specify the maximum transmission unit (MTU) against which the RA packet is validated.

```
OS10(conf-ra_guard_policy_list)# mtu 1280
```

8. If this command is set to `off`, the system verifies the advertised other configuration parameter is set to off in the RA packet and the other way round.

```
OS10(conf-ra_guard_policy_list)# other-config-flag on
```

9. Configure the reachability timer value.

```
OS10(conf-ra_guard_policy_list)# reachable-time 100
```

10. Configure the retransmission timer value.

```
OS10(conf-ra_guard_policy_list)# retrans-timer 100
```

11. Configure the router preference.

```
OS10(conf-ra_guard_policy_list)# router-preference maximum high
```

12. Configure the lifetime of the router.

```
OS10(conf-ra_guard_policy_list)# router-lifetime 100
```

13. Apply the policy to an interface.

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# ipv6 nd ra-guard attach-policy ra-guard-test-policy vlan 1
```

```
OS10# show ipv6 nd ra-guard ra-guard-test-policy
ipv6 nd ra-guard policy ra-guard-test-policy
device-role router
managed-config true
other-config true
mtu 1280
reachable time 100
retransmit-timer 100
router-life-time 100
router-preference maximum high
match ra ipv6-prefix-list example_prefix_list
```

```
Interfaces                Vlans
--------------------------------
ethernet1/1/6             vlan1
```

IPv6 RA guard commands

clear ipv6 nd ra-guard statistics

Clears the RA packet statistics from all the interfaces that have RA guard policy configured.

Syntax `clear ipv6 nd ra-guard statistics [interface {ethernet node/slot/port[:subport] | port-channel channel-id}]`

Parameters
- `ethernet node/slot/port[:subport]`—Enter the Ethernet interface information.
- `port-channel channel-id`—Enter the port channel ID, from 1 to 999 or 1001 to 2000.

Default None

Command Mode EXEC

Usage Information This command clears the RA packet statistics from all the interfaces that have RA guard policy configured.

Example

```
OS10# clear ipv6 nd ra-guard statistics interface port-channel 10
```

Supported Releases 10.5.2.0 or later

device-role

Configures the attached device as a host or a router.

Syntax `device-role {host | router}`

Parameters
- `host`—Enter `host` to specify the connected device as a host.
- `router`—Enter `router` to specify the connected device as a router.

Default None

Command Mode RA GUARD POLICY LIST CONFIGURATION

Usage Information This command specifies whether the device attached to the interface is a host or a router. When an RA packet arrives at the interface where this policy is configured:
- If you configure the device role as a host, OS10 drops all the RA packets.
- If you configure the device role as a router, OS10 examines all the RA packets against the other policy parameters.

The `no` form of this command removes the configuration.

Examples

```
OS10(conf-ra_guard_policy_list)# device-role router
```

```
OS10(conf-ra_guard_policy_list)# device-role host
```

Supported Releases 10.5.2.0 or later

ipv6 nd ra-guard attach-policy

Applies the RA guard policy to a specific interface.

Syntax `ipv6 nd ra-guard attach-policy policy-name vlan {all | vlan-id-1, vlan-id-2...vlan-id-n | vlan-id1-vlan-idn}`

Parameters	*policy-name*—Enter the RA guard policy name. A maximum of 140 characters.
Default	None
Command Mode	INTERFACE CONFIGURATION

Usage Information	**NOTE:** If you configure the BGP unnumbered feature on a VLAN, do not apply the RA guard policy for that VLAN.
	• This command is applicable for physical and port-channel interfaces.
	• You must associate the interface as a member port with the VLAN or VLANs that you specify in this command.
	• If you specify a VLAN ID that is not yet created in the system, the policy is applied when the VLAN is configured, becomes active, and is associated with this interface.
	• If you choose the `all` option:
	  ○ The system applies the RA guard policy to all the VLANs that are associated with this interface.
	  ○ The system applies the RA guard policy to any new VLANs that you associate with this interface in the future.
	• When you apply the RA guard policy to a primary VLAN, the primary VLAN works as a regular VLAN. The RA packets received on the promiscuous ports flood to all the member ports of the primary and secondary VLANs.
	• When you apply the policy to a secondary VLAN, the RA packets received on secondary ports are flooded to the member ports of the primary VLAN.
	NOTE: If the secondary ports are connected to host devices, ensure that you configure the device role as host using the `device-role` command.

Examples	`OS10(conf-if-eth1/1/1)#ipv6 nd ra-guard attach-policy test vlan all`
	`OS10(conf-if-eth1/1/1)#ipv6 nd ra-guard attach-policy test vlan 1,5`
	`OS10(conf-if-eth1/1/1)#ipv6 nd ra-guard attach-policy test vlan 1-5`

Supported Releases	10.5.2.0 or later

ipv6 nd ra-guard enable

Enables IPv6 RA guard.

Syntax	`ipv6 nd ra-guard enable`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	This command allows you to configure the IPv6 RA guard feature. The `no` form of this command disables IPv6 RA guard.
Example	`OS10(config)# ipv6 nd ra-guard enable`
Supported Releases	10.5.2.0 or later

ipv6 nd ra-guard logging enable

Enables console logging for RA guard violation.

Syntax	`ipv6 nd ra-guard logging enable`
Parameters	None

Default	Disabled
Command Mode	CONFIGURATION
Usage Information	By default, the system logs the first violating packet for a port-VLAN combination. You can control further console logging for RA guard violation using this command. The `no` form of this command disables console logging. The logs appear on the console as shown: `2020-01-03T12:44:23.225810+00:00 MAA-S6000-1235 dn_alm 1027 - - Node.1-Unit.1:PRI [event], Dell EMC (OS10) %RAGUARD_DENIED_RA_PACKET: RAGUARD: Denied RA Packet on Vlan : vlan100 Port : ethernet1/1/10:3`
Example	`OS10(config)# ipv6 nd ra-guard logging enable`
Supported Releases	10.5.2.0 or later

ipv6 nd ra-guard policy

Configures RA guard policy.

Syntax	`ipv6 nd ra-guard policy` *`policy-name`*
Parameters	*`policy-name`*—Enter the policy name. A maximum of 140 characters.
Default	None
Command Mode	CONFIGURATION
Usage Information	This command takes you to the RA guard policy list configuration submode. The `no` form of this command removes the RA guard only if the policy is not configured on any of the interfaces.
Example	`OS10(config)# ipv6 nd ra-guard policy ra-guard-policy`
Supported Releases	10.5.2.0 or later

mtu

Verifies the configured maximum transmission unit (MTU) value in the received RA packets.

Syntax	`mtu` *`value`*
Parameters	`value`—MTU value in bytes, from 1280 to 11982 bytes.
Default	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION
Usage Information	The `no` form of this command removes the configuration.
Example	`OS10(conf-ra_guard_policy_list)# mtu 1280`
Supported Releases	10.5.2.0 or later

managed-config-flag

Verifies the advertised managed configuration parameter.

Syntax `managed-config-flag {on | off}`

Parameters
- `on`—Specifies the managed configuration flag as `on`.
- `off`—Specifies the managed configuration flag as `off`.

Default None

Command Mode RA GUARD POLICY LIST CONFIGURATION

Usage Information If this command is set to `off`, the system verifies that the advertised managed configuration parameter is not set in the RA packet and the other way round.

Examples

```
OS10(conf-ra_guard_policy_list)# managed-config-flag on
```

```
OS10(conf-ra_guard_policy_list)# managed-config-flag off
```

Supported Releases 10.5.2.0 or later

match ra

Verifies the source IPv6 address, prefix address, and the source MAC address of the inspected messages.

Syntax `match ra {ipv6-access-list | ipv6-prefix-list | mac-access-list} name`

Parameters
- `ipv6-access-list` *name*—Enter `ipv6-access-list` and the name of the access list.
- `ipv6-prefix-list` *name*—Enter `ipv6-prefix-list` and the name of the prefix list.
- `mac-access-list` *name*—Enter `mac-access-list` and the name of the MAC access list.

Default None

Command Mode RA GUARD POLICY LIST CONFIGURATION

Usage Information
- If you do not configure this command, the system bypasses the verification process.
- If you configure all three access lists, OS10 matches the inspected packets against all the configured policies.
- For the IPv6 access list, the system verifies only the IPv6 source address. For the MAC access list, the system verifies only the source MAC address.

NOTE: If you have configured the policy using the `match ra` command, but not configured the access lists or ACLs, the system bypasses the verification process. Generic ACL behavior applies when the policy is attached to interface.

The `no` form of this command removes the configuration.

Example

```
OS10(conf-ra_guard_policy_list)# match ra ipv6-access-list
test_access_list
```

Supported Releases 10.5.2.0 or later

other-config-flag

Verifies other advertised configuration parameter.

Syntax `other-config-flag {on | off}`

Parameters
- `on`—Enables verification of the other advertised configuration parameter.
- `off`—Disables verification of the other advertised configuration parameter.

Default	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION
Usage Information	If you do not configure this command, the system bypasses the verification of the other configuration parameter. The `no` form of this command removes the configuration.
Example	`OS10(conf-ra_guard_policy_list)# other-config-flag on`
Supported Releases	10.5.2.0 or later

reachable-time

Verifies the configured reachability time in the received RA packets.

Syntax	`reachable-time` *value*
Parameters	`value`—Enter the advertised reachability time in milliseconds, from 0 to 3600000.
Default	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION
Usage Information	The `no` form of this command resets the advertised reachability time.
Example	`OS10(conf-ra_guard_policy_list)# reachable-time 100`
Supported Releases	10.5.2.0 or later

retrans-timer

Verifies the configured retransmission timer value in the received RA packets.

Syntax	`retrans-timer` *value*
Parameters	`value`—Enter the advertised retransmission time interval in milliseconds, from 100 to 4294967295.
Default	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION
Usage Information	The `no` form of this command removes the configuration.
Example	`OS10(conf-ra_guard_policy_list)# retrans-timer 100`
Supported Releases	10.5.2.0 or later

router-lifetime

Verifies the configured router lifetime value in the received RA packets.

Syntax	`router-lifetime` *value*
Parameters	`value`—Enter the router lifetime in seconds, from 0 to 9000.
Default	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION

Usage Information	The `no` form of this command removes the configuration.
Example	`OS10(conf-ra_guard_policy_list)# router-lifetime 100`
Supported Releases	10.5.2.0 or later

router-preference maximum

Verifies the advertised Default Router Preference (DRP) value.

Syntax	`router-preference maximum {high | low | medium}`
Parameters	• `high`—Enter `high` to set the DRP value as high. • `low`—Enter `low` to set the DRP value as low. • `medium`—Enter `medium` to set the DRP value as medium.
Default	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION
Usage Information	The DRP value is lower than or equal to the specified limit. If you do not configure this command, the system bypasses this verification. The `no` form of this command removes the configuration.
Example	`OS10(conf-ra_guard_policy_list)# router-preference maximum high`
Supported Releases	10.5.2.0 or later

show config

Displays the RA guard policy mode configurations.

Syntax	`show config`
Parameters	None
Command Mode	RA GUARD POLICY LIST CONFIGURATION
Usage Information	This command displays the following information about the applied RA guard policy: • Device role • Hop limit • MTU • Other configuration parameter flag • Reachability time • Retransmission timer value • Router preference value

Example	`OS10(conf-ra_guard_policy_list)# show config`
	`!`
	`ipv6 nd ra-guard policy test`
	`device-role router`
	`hop-limit maximum 254`
	`mtu 1280`
	`other-config-flag on`
	`reachable-time 100`
	`retrans-timer 100`
	`router-preference maximum medium`

Supported Releases	10.5.2.0 or later

show ipv6 nd ra-guard policy

Displays the configurations applied on all RA guard policies or a specific RA guard policy.

Syntax `show ipv6 nd ra-guard policy policy-name`

Parameters *policy-name*—Name of the policy.

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 nd ra-guard policy test
ipv6 nd ra-guard policy test
device-role router
hop-limit maximum 1
match ra ipv6-access-list access
other-config-flag on
router-preference maximum medium
Interfaces :
ethernet1/1/2
```

Supported Releases 10.5.2.0 or later

show ipv6 nd ra-guard statistics

Displays the statistics of all RA guard-enabled interfaces or a specific interface.

Syntax `show ipv6 nd ra-guard statistics [interface interface-name]`

Parameters *interface-name*—Enter the physical or port-channel interface name.

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 nd ra-guard statistics
Interface             Vlan             Pkts allowed        Pkts dropped
-------------------------------------------------------------------------
ethernet1/1/3    vlan10          0                           4095
ethernet1/1/4    vlan1           0                           0

OS10# show ipv6 nd ra-guard statistics interface ethernet 1/1/3
Interface            Vlan             Pkts allowed        Pkts dropped
-------------------------------------------------------------------------
ethernet1/1/3    vlan10          0                           4095
```

Supported Releases 10.5.2.0 or later

show ipv6 nd ra-guard violation-details

Displays the violation details of RA guard in the device.

Syntax `show ipv6 nd ra-guard violation-details`

Parameters None

Command Mode EXEC

Usage Information The system displays up to 50,000 packet violations. If the packet violation count is more than 50000, the details are overwritten.

Example

```
OS10# show ipv6 nd ra-guard violation-details
Vlan name Interface name Source address  Violation details Timestamp
------------------------------------------------------------------------------
vlan200   port-channel10 fe80::fee2 OTHER CONFIG FLAG Mon Jan 27 14:34:42 2020
vlan200   port-channel10 fe80::fee2 OTHER CONFIG FLAG Mon Jan 27 14:34:57 2020
```

Supported Releases 10.5.2.0 or later

show vlt mismatch

Displays the RA guard configuration mismatch between VLT peers.

Syntax `show vlt domain-id mismatch [ra-guard]`

Parameters *domain-id*—Enter the VLT domain ID.

Command Mode EXEC

Usage Information None

Example

```
OS10# show vlt 100 mismatch ra-guard
RA Guard Mismatch:
Global RA Guard Configuration Mismatch: No

Interface                 Vlan            Reason
------------------------------------------------------------------
port-channel100           -                Device Role
```

Supported Releases 10.5.2.0 or later

IPv6 commands

clear ipv6 neighbors

Deletes all entries in the IPv6 neighbor discovery cache or neighbors of a specific interface. Static entries are not removed.

Syntax `clear ipv6 neighbors [vrf vrf-name] [ipv6-address | interface | virtual-network vn-id | all]`

Parameters

- `vrf vrf-name` — (Optional) Enter `vrf` then the name of the VRF to clear the neighbor corresponding to that VRF. If you do not specify this option, the neighbors in the default VRF clear.
- `ipv6-address` — Enter the IPv6 address of the neighbor in the x:x:x:x::x format to remove a specific IPv6 neighbor. The :: notation specifies successive hexadecimal fields of zero.
- `interface interface` — To remove all neighbor entries learned on a specific interface, enter the keyword interface then the interface type and slot/port or number information of the interface:
  - For a 10-Gigabit Ethernet interface, enter `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter `fortyGigE` then the slot/port information.
  - For a port channel interface, enter `port-channel` then a number.
  - For a VLAN interface, enter `vlan` then a number from 1 to 4093.
  - `virtual-network vn-id` — For a virtual network, enter `virtual-network` then the ID of the network.

Defaults None.

Command Mode EXEC

Usage Information The `no` version of this command resets the value to the default.

Example

Supported Releases 10.4.1.0 or later or later

clear ipv6 route

Clears routes from the IPv6 routing table.

Syntax `clear ipv6 route [vrf vrf-name] {* | A::B/mask}`

Parameters

- `vrf vrf-name` — (Optional) Enter `vrf` then the name of the VRF to clear the IPv6 routes corresponding to that VRF.
- `*` — Clears all routes and refreshes the IPv6 routing table. Traffic flow for all the routes in the switch is affected.
- `A::B/mask` — Removes the IPv6 route and refreshes the IPv6 routing table. Traffic flow in the switch is affected only for the specified route.

Default Not configured

Command Mode EXEC

Usage Information This command does not remove the static routes from the routing table.

Example

```
OS10# clear ipv6  route *
```

Supported Releases 10.3.0E or later

ipv6 address

Configures a global unicast IPv6 address on an interface.

Syntax `ipv6 address ipv6-address/prefix-length`

Parameters *ipv6-address/prefix-length* — Enter a full 128-bit IPv6 address with the network prefix length, including the 64-bit interface identifier.

Defaults None

Command Mode INTERFACE

Usage Information An interface can have multiple IPv6 addresses. To configure an IPv6 address in addition to the link-local address, use the `ipv6 address ipv6-address/mask` command and specify the complete 128-bit IPv6 address. To configure a globally unique IPv6 address by entering only the network prefix and length, use the `ipv6 address ipv6-prefix/prefix-length eui-64` command.

The `no` version of this command removes the IPv6 address on the interface.

NOTE: Dell Technologies does not recommend configuring both a static IPv6 address and DHCPv6 on the same interface.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 address 2111:dddd:0eee::22/64
```

Supported Releases 10.3.0E or later

ipv6 address autoconfig

Acquires global IPv6 addresses by using the network prefix obtained from RAs.

Syntax	`ipv6 address autoconfig`
Parameters	None
Defaults	Disabled except on the management interface
Command Mode	INTERFACE
Usage Information	• This command sets an interface in Host mode to perform IPv6 stateless auto-configuration by discovering prefixes on local links, and adding an EUI-64 based interface identifier to generate each IPv6 address. The command disables IPv6 forwarding. Addresses are configured depending on the prefixes received in RA messages. • The `no` version of this command disables IPv6 address autoconfiguration, resets the interface in Router mode, and re-enables IPv6 forwarding.

Example	`OS10(config)# interface ethernet 1/1/1`
	`OS10(conf-if-eth1/1/1)# no switchport`
	`OS10(conf-if-eth1/1/1)# ipv6 address autoconfig`
	`OS10(conf-if-eth1/1/1)#`

Supported Releases	10.3.0E or later

ipv6 address dhcp

Enables DHCP client operations on the interface.

Syntax	`ipv6 address dhcp`
Parameters	None
Defaults	None
Command Mode	INTERFACE
Usage Information	The `no` version of this command disables DHCP operations on the interface. **NOTE:** Dell Technologies does not recommend configuring both a static IPv6 address and DHCPv6 on the same interface.
Example	`OS10(config)# interface mgmt 1/1/1` `OS10(conf-if-ma-1/1/1)# ipv6 address dhcp`
Supported Releases	10.3.0E or later

ipv6 enable

Enables and disables IPv6 forwarding on an interface configured with an IPv6 address.

Syntax	`ipv6 enable`
Parameters	None
Defaults	None
Command Mode	INTERFACE
Usage Information	Use this command to disable and re-enable IPv6 forwarding on an interface for security purposes or to recover from a duplicate address discovery (DAD) failure. The `no` version of this command disables IPv6 forwarding.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 address 2111:dddd:0eee::22/128
OS10(conf-if-eth1/1/1)# no ipv6 enable
OS10(conf-if-eth1/1/1)# ipv6 enable
```

Supported Releases 10.3.0E or later

ipv6 address eui-64

Configures a global IPv6 address on an interface by entering only the network prefix and length.

Syntax `ipv6 address ipv6-prefix/prefix-length eui-64`

Parameters *ipv6-prefix* — Enter an IPv6 prefix in *x:x::y/mask* format.

Defaults None

Command Mode INTERFACE

Usage Information Use this command to manually configure an IPv6 address in addition to the link-local address generated with stateless autoconfiguration. Specify only the network prefix and length. The 64-bit interface ID automatically computes from the MAC address. This command enables IPv6 processing on the interface. The `no` version of this command removes the IPv6 address configuration.

Example

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# ipv6 address 2111:dddd:0eee::/64 eui-64
```

Supported Releases 10.4.0E(R1) or later

ipv6 address link-local

Configures a link-local IPv6 address on the interface to use instead of the link-local address that is automatically configured with stateless autoconfiguration.

Syntax `ipv6 address ipv6-prefix link-local`

Parameters *ipv6-prefix* — Enter an IPv6 prefix in *x:x::y/mask* format.

Defaults None

Command Mode INTERFACE

Usage Information

- An interface can have only one link-local address. By default, an IPv6 link-local address automatically generates with a MAC-based EUI-64 interface ID when a router boots up and IPv6 is enabled. Use this command to manually configure a link-local address to replace the autoconfigured address. For example, to configure a more user-friendly link-local address, replace `fe80::eef4:bbff:fefb:fa30/64` with `fe80::1/64`.
- The `no` version of this command removes the specified link-local address.

Example

```
OS10(config)# interface mgmt 1/1/1
OS10(conf-if-ma-1/1/1)# ipv6 address 2111:dddd:0eee::22/64 link-local
```

Supported Releases 10.4.0E(R1) or later

ipv6 hop-by-hop

Enables and disables processing hop-by-hop options in IPv6 packet headers.

Syntax `ipv6 hop-by-hop`

Parameters	None
Defaults	Hop-by-hop header options in an IPv6 packet do not process on an interface.
Command Mode	INTERFACE
Usage Information	• Use this command to enable local processing of IPv6 packets with hop-by-hop options in conformance with the RFC 8200, IPv6 Specification. • The `no` version of this command disables IPv6 processing of hop-by-hop header options.
Example: Disable hop-by-hop option processing	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# no ipv6 hop-by-hop`
Supported Releases	10.4.0E(R1) or later

ipv6 nd dad

Disables or re-enables IPv6 duplicate address discovery (DAD).

Syntax	`ipv6 nd dad {disable | enable | disable-ipv6-on-dad-failure}`
Parameters	• `disable` — Disable duplicate address discovery on the interface. • `enable` — Re-enable IPv6 duplicate address discovery if you have disabled it. • `disable-ipv6-on-dad-failure` — Enable duplicate address discovery on the existing autoconfigured link-local address.
Defaults	Duplicate address discovery is enabled on an interface.
Command Mode	INTERFACE
Usage Information	• An OS10 switch sends a neighbor solicitation message to determine if an autoconfigured IPv6 unicast link-local address is unique before assigning it to an interface. If the process of duplicate address discovery (DAD) detects a duplicate address in the network, the link-local address does not configure. Other IPv6 addresses are still active on the interface. • By default, DAD does not disable IPv6 if a duplicate link-local address is detected in the network. To disable IPv6 on an interface when a duplicate link-local address is detected, use the `ipv6 nd dad disable-ipv6-on-failure` command.
Example: Disable DAD	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 nd dad disable`
Example: Enable DAD on link-local address	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 nd dad disable-ipv6-on-dad-failure`
Supported Releases	10.4.0E(R1) or later

ipv6 nd hop-limit

Sets the hop limit advertised in RA messages and included in IPv6 data packets sent by the router.

Syntax	`ipv6 nd hop-limit` *hops*
Parameters	• `hop-limit` *hops* — Enter the maximum number of hops allowed for RA messages, from 0 to 255.
Defaults	64 hops
Command Mode	INTERFACE
Usage Information	The configured hop limit is advertised in RA messages and included in IPv6 data packets sent by the router. `0` indicates that no hop limit is specified by the router.

Example

```
OS10(config)# interface ethernet 1/2/3
OS10(conf-if-eth1/2/3)# ipv6 nd hop-limit 100
```

Supported Releases 10.4.0E(R1) or later

ipv6 nd managed-config-flag

Sends RA messages that tell hosts to use stateful address autoconfiguration, such as DHCPv6, to obtain IPv6 addresses.

Syntax `ipv6 nd managed-config-flag`

Parameters None

Defaults Not configured

Command Mode INTERFACE

Usage Information The `no` version of this command disables the `managed-config-flag` option in RA messages.

Example

```
OS10(config)# interface ethernet 1/2/3
OS10(conf-if-eth1/2/3)# ipv6 nd managed-config-flag
```

Supported Releases 10.4.0E(R1) or later

ipv6 nd max-ra-interval

Sets the maximum time interval between sending RA messages.

Syntax `ipv6 nd max-ra-interval` *`seconds`*

Parameters

- `max-ra-interval` *`seconds`*—Enter a time interval in seconds, from 4 to 1800.

Defaults 600 seconds

Command Mode

- CONFIGURATION
- INTERFACE

Usage Information If you are configuring auto-unnumbered BGP neighbors, use this command in CONFIGURATION mode. Dell Technologies recommends that you configure the maximum RA timer to four seconds auto-unnumbered BGP neighbors.

If you configure this command both globally and on an interface, the configuration on the interface takes precedence.

The `no` version of this command restores the default time interval that is used to send RA messages.

Example

```
OS10(config)# interface ethernet 1/2/3
OS10(conf-if-eth1/2/3)# ipv6 nd max-ra-interval 300
```

```
OS10(config)# ipv6 nd max-ra-interval 4
```

Supported Releases 10.4.0E(R1) or later

ipv6 nd mtu

Sets the maximum transmission unit (MTU) used on a local link in RA messages.

Syntax `ipv6 nd mtu` *`number`*

Parameters	• `mtu number` — Enter the MTU size in bytes, from 1280 to 65535.
Defaults	1500 bytes
Command Mode	INTERFACE
Usage Information	The `no` version of this command restores the default MTU value advertised in RA messages.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 nd mtu 2500`
Supported Releases	10.4.0E(R1) or later

ipv6 nd other-config-flag

Sends RA messages that tell hosts to use stateful autoconfiguration to obtain nonaddress-related information.

Syntax	`ipv6 nd other-config-flag`
Parameters	None
Defaults	Not configured
Command Mode	INTERFACE
Usage Information	The `no` version of this command disables the `other-config-flag` option in RA messages.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 nd other-config-flag`
Supported Releases	10.4.0E(R1) or later

ipv6 nd prefix

Configures the IPv6 prefixes that are included in messages to neighboring IPv6 routers.

Syntax

```
ipv6 nd prefix {ipv6-prefix | default} [no-advertise] [no autoconfig]
[no-rtr-address] [off-link] [lifetime {valid-lifetime seconds | infinite}
{preferred-lifetime seconds | infinite}]
```

Parameters

- `ipv6-prefix` — Enter an IPv6 prefix in *x:x::y/mask* format to include the prefix in RA mesages. Include prefixes that are not already in the subnets on the interface.
- `default` — Configure the prefix parameters advertised in all subnets configured on the interface.
- `no-advertise` — (Optional) Do not advertise the specified prefix. By default, all prefixes in configured subnets advertise.
- `no-autoconfig` — (Optional) Sets `AdvAutonomous` to `Off` for the specified prefix in the radvd.conf file. This setting tells hosts to not use this prefix for address autoconfiguration. By default, `AdvAutonomous` is `On`.
- `no-rtr-address` — (Optional) Sets `AdvRouterAddr` to `Off` for the prefix in the radvd.conf file. The `Off` setting tells hosts to not use the advertising router's address for on-link determination. By default, `AdvRouterAddr` is `On`.
- `off-link` — (Optional) Sets `AdvOnLink` to `Off` for the prefix in the radvd.conf file. The `Off` setting tells hosts to not use this prefix for on-link determination. By default, `AdvOnLink` is `On`.
- `lifetime {valid-lifetime seconds | infinite}` — (Optional) Sets `AdvValidLifetime` in seconds for the prefix in the radvd.conf file. The prefix is valid for on-link determination only for the specified lifetime. The default is 86400 seconds (1 day). The `infinite` setting allows the prefix to be valid for on-link determination with no time limit.

- `lifetime {preferred-lifetime` *`seconds`* `| infinite}` — (Optional) Sets `AdvPreferredLifetime` in seconds for the prefix in the radvd.conf file. IPv6 addresses generated from the prefix using stateless autoconfiguration remain preferred for the configured lifetime. The default is 14400 seconds (4 hours). The `infinite` setting allows addresses that are autoconfigured using the prefix to be preferred with no time limit.

Defaults All prefixes in IPv6 subnets configured on an interface advertise.

Command Mode INTERFACE

Usage Information
- By default, all prefixes configured in IPv6 addresses on an interface advertise. To advertise all default parameters in the subnet prefixes on an interface, enter the `default` keyword.
- If you configure a prefix with valid or preferred lifetime values, the `ipv6 nd prefix default no autoconfig` command does not apply the default prefix values.
- On-link determination is used to forward IPv6 packets to a destination IPv6 address.

Examples

Enable router advertisements

```
OS10(conf-if-eth1/1/1)# ipv6 address 2001:0db8:2000::1/64
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
```

Change default settings for interface subnet prefixes

```
OS10(conf-if-eth1/1/1)# ipv6 nd prefix default lifetime infinite infinite
```

Disable advertising an interface subnet prefix

```
OS10(conf-if-eth1/1/1)# ipv6 nd prefix 2001:0db8:2000::/64 no-advertise
```

Advertise prefix for which there is no interface address

```
OS10(conf-if-eth1/1/1)# ipv6 nd prefix 2001:0db8:3000::/64 no-autoconfig
```

Supported Releases 10.4.0E(R1) or later

ipv6 nd ra-dns search-list

Configures the advertisement of the domain name system (DNS) suffix in IPv6 router advertisement (RA) messages.

Syntax

```
ipv6 nd ra-dns search-list seq sequence-num dnssl [dnssl-life-time]
no ipv6 nd ra-dns search-list [seq sequence-num]
```

Parameters
- *`sequence-num`*—Enter the sequence number from 1 to 8. The sequence number specifies the maximum number of configurations on an interface.
- *`dnssl`*—Enter the domain name of the DNS suffix. The maximum length of DNS suffix is 140 characters. The supported length of each label in a domain name is from 1 to 63 octets.
- *`dnssl-life-time`*—(Optional) Enter the maximum lifetime value for the specified DNSSL entry. The following values are supported:
  - 0—The configured DNS query is not used.
  - 1 to 4294967295—Specifies the lifetime period for this DNS entry in seconds.

  If you do not specify this parameter, the default lifetime period is configured on the interface. The default value is three times the maximum RA interval set by the `ipv6 nd max-ra-interval` command.

Defaults The DNS suffix is not advertised in IPv6 RA messages.

Command Mode INTERFACE

Security and Access `netadmin` and `sysadmin`

Usage Information	Use this command to advertise DNS search list (DNSSL) with the IPv6 RA message. The IPv6 hosts use DNSSL to perform DNS query searches for short and unqualified domain names. The `no` version of this command disables the advertisement of the DNS suffix in IPv6 RA messages.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 nd ra-dns search-list seq 8 dell.com 2000`
Supported Releases	10.5.3.0 or later

ipv6 nd ra-dns search-list suppress

Suppresses the advertisement of the configured DNS server list (DNSSL) in router advertisement (RA) messages on an interface.

Syntax	`[no] ipv6 nd ra-dns search-list suppress` `no ipv6 nd ra-dns search-list suppress`
Parameters	None
Defaults	RDNSS addresses are not suppressed.
Command Mode	INTERFACE
Security and Access	`netadmin` and `sysadmin`
Usage Information	You can configure suppressing advertisement before configuring DNSSL and remove suppressing advertisement to send DNSSL in single RA message. The `no` version of this command disables suppression of the DNSSL option in RA messages.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 nd ra-dns search-list suppress`
Supported Releases	10.5.3.0 or later

ipv6 nd ra-dns server

Configures the IPv6 address of a recursive DNS server (RDNSS) to include in IPv6 router advertisement (RA) messages.

Syntax	`ipv6 nd ra-dns server seq` *`sequence-num ipv6-addr`* `[`*`rdnss-life-time`*`]` `no ipv6 nd ra-dns server [seq` *`sequence-num`*`]`

Parameters	• *`sequence-num`*—Enter the sequence number from 1 to 8. The sequence number specifies the maximum number of configurations on an interface.
	• *`ipv6-addr`*—Enter the address of RDNSS to advertise in IPv6 RA messages.
	• *`rdnss-life-time`*—(Optional) Enter the maximum lifetime value for the specified RDNSS entry. The following values are supported:
	  ○ 0—The configured DNS server is not used.
	  ○ 1 to 4294967295—Specifies the lifetime period for this DNS server in seconds.
	If you do not specify this parameter, the default lifetime period is configured on the interface. The default value is three times the maximum RA interval set by the `ipv6 nd max-ra-interval` command.

Defaults	Not configured
Command Mode	INTERFACE
Security and Access	`netadmin` and `sysadmin`

Usage Information	Use this command to advertise DNS server with the IPv6 RA messages. The `no` version of this command removes the configured RDNSS address on the interface.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 nd ra-dns server seq 1 2001:db8:1::4 2000`
Supported Releases	10.5.3.0 or later

ipv6 nd ra-dns server suppress

Suppresses the advertisement of the configured RDNSS address in router advertisement (RA) messages on an interface.

Syntax	`[no] ipv6 nd ra-dns server suppress`
Parameters	None
Defaults	RDNSS addresses are not suppressed.
Command Mode	INTERFACE
Security and Access	`netadmin` and `sysadmin`
Usage Information	You can configure suppressing advertisement before configuring DNS server list (DNSSL) and remove suppressing advertisement to send DNS server list in a single RA message. The `no` version of this command disables suppression of IPv6 addresses in RA messages.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 nd ra-dns server suppress`
Supported Releases	10.5.3.0 or later

ipv6 nd ra-lifetime

Sets the lifetime of the default router in RA messages.

Syntax	`ipv6 nd ra-lifetime` *`seconds`*
Parameters	• `ra-lifetime` *`seconds`* — Enter a lifetime value in milliseconds, from 0 to 9000 milliseconds.
Defaults	Three times the `max-ra-interval` value
Command Mode	INTERFACE
Usage Information	The `no` version of this command restores the default lifetime value. `0` indicates that this router is not used as the default router.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 nd max-ra-interval 300`
Supported Releases	10.4.0E(R1) or later

ipv6 nd reachable-time

Sets the advertised time the router sees a neighbor to be up after it receives a reachability confirmation.

Syntax	`ipv6 nd reachable-time` *`milliseconds`*
Parameters	• `reachable-time` *`milliseconds`* — Enter the reachable time in milliseconds, from 0 to 3600000.
Defaults	0

Command Mode	INTERFACE
Usage Information	The `no` version of this command restores the default reachable time. `0` indicates that no reachable time is sent in RA messages.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 nd reachable-time 1000`
Supported Releases	10.4.0E(R1) or later

ipv6 nd retrans-timer

Sets the time between retransmitting neighbor solicitation messages.

Syntax	`ipv6 nd retrans-timer` *seconds*
Parameters	• `retrans-timer` *seconds* — Enter the retransmission time interval in milliseconds, from 100 to 4292967295.
Defaults	Not configured
Command Mode	INTERFACE
Usage Information	The `no` version of this command disables the configured retransmission timer.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 nd retrans-timer 1000`
Supported Releases	10.4.0E(R1) or later

ipv6 nd send-ra

Enables sending ICMPv6 RA messages.

Syntax	`ipv6 nd send-ra`
Parameters	None
Defaults	RA messages are disabled.
Command Mode	INTERFACE
Usage Information	• Using ICMPv6 RA messages, the Neighbor Discovery Protocol (NDP) advertises the IPv6 addresses of IPv6-enabled interfaces and learns of any address changes in IPv6 neighbors. Before you enable sending RA messages, the switch must be in Router mode with IPv6 forwarding enabled and stateless autoconfiguration disabled `no ipv6 address autoconfig` command. • The `no` version command disables RA messages.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 nd send-ra`
Supported Releases	10.4.0E(R1) or later

ipv6 route

Configures a static IPv6 static route.

Syntax	`ipv6 route [vrf` *vrf-name*`] dest-ipv6-prefix mask {next-hop | interface interface-type [route-preference]} [bfd]`

Parameters

- `vrf` *vrf-name* — (Optional) Enter `vrf` then the name of the VRF to install IPv6 routes in that VRF.
- *dest-ipv6-prefix* — Enter the destination IPv6 address in x:x:x:x::x format.
- *mask* — Enter the mask in slash prefix-length /x format.
- *next-hop* — Enter the next-hop IPv6 address in x:x:x:x::x format.
- `interface` *interface-type* — Enter the interface type then the slot/port or number information. The interface types supported are: Ethernet, port-channel, VLAN, and Null.
- *route-preference* — (Optional) Enter a route-preference range, from 1 to 255.
- *bfd* — (Optional) Enable BFD on a specific static route.

Default Not configured

Command Mode CONFIGURATION

Usage Information

When the interface fails, the system withdraws the route. The route reinstalls when the interface comes back up. When a recursive resolution breaks, the system withdraws the route. The route reinstalls when the recursive resolution is satisfied. After you create an IPv6 static route interface, if you do not assign an IP address to a peer interface, you must manually ping the peer to resolve the neighbor information.

The `no` version of this command deletes the IPv6 route configuration.

Use the `bfd` option to enable Bidirectional Forwarding detection (BFD) on a specific static route.

Example

```
OS10(config)# ipv6 route 2111:dddd:0eee::22/128 2001:db86:0fff::2
```

```
OS10(config)# ipv6 route 2111:dddd:0eee::22/128 interface null 0
```

The following is a sample configuration for enabling BFD on a specific IPv6 static route:

```
OS10(config)# ipv6 route 2111:dddd:0eee::22/128 2001:db86:0fff::2 bfd
```

Supported Releases 10.2.0E or later

ipv6 routing-header-type0 deny

Configures IPv6 routing header Type 0 packet handling in hardware (fast-path) and kernel (slow-path).

Syntax

```
[no] ipv6 routing-header-type0 deny fast-path [slow-path]
```

Parameters

- `fast-path`—Deny IPv6 routing header Type 0 packets in the hardware.
- `slow-path`—Deny IPv6 routing header Type 0 packets in hardware and kernel.

Defaults IPv6 routing header Type 0 packets in the hardware are denied.

Command Mode GLOBAL CONFIGURATION

Security and Access netadmin and sysadmin

Usage Information

Use the `no` version of this command to permit IPv6 routing header Type 0 packets. When configured to permit IPv6 routing header Type 0 packets, OS10 allows normal switching and routing of packets with IPv6 routing header Type 0. However, OS10 switches are compliant with RFC 5095 and drops any IPv6 routing header Type 0 packets that are destined to it.

Example: Configure IPv6 RH0 deny in hardware

```
OS10(config)# ipv6 routing-header-type0 deny fast-path
```

Example: Configure IPv6 RH0 deny in hardware and kernel

```
OS10(config)# ipv6 routing-header-type0 deny fast-path slow-path
```

Supported Releases	10.5.2.3 or later

ipv6 unreachables

Enables generating error messages on an interface for IPv6 packets with unreachable destinations.

Syntax	`ipv6 unreachables`
Parameters	None
Defaults	ICMPv6 unreachable messages are not sent.
Command Mode	INTERFACE
Usage Information	• By default, when no matching entry for an IPv6 route is found in the IPv6 routing table, the packet drops and no error message is sent. Use this command to enable sending an `IPv6 destination unreachable` error message to the source without dropping the packet. • The `no` version of this command disables generating unreachable destination messages.
Example	`OS10(config)# interface ethernet 1/2/3` `OS10(conf-if-eth1/2/3)# ipv6 unreachables`
Supported Releases	10.4.0E(R1) or later

show ipv6 interface brief

Displays IPv6 interface information.

Syntax	`show ipv6 interface brief`
Parameters	`brief` — Displays a brief summary of IPv6 interface information.
Defaults	None
Command Mode	EXEC
Usage Information	Use the `do show ipv6 interface brief` command to view IPv6 interface information in other modes.

Example (Brief)	`OS10# show ipv6 interface brief`
	
	`Interface  admin/  IPV6 Address/  IPv6 Oper`
	`Name  protocol  Link-Local Address  Status`
	`==========================================================`
	`Management 1/1/1 up/up  fe80::20c:29ff:fe54:c852/64  Enabled`
	`Vlan 1  up/up  fe80::20c:29ff:fe54:c8bc/64  Enabled`
	`Ethernet 1/1/2  up/up  fe80::20c:29ff:fe54:c853/64`
	`100::1/64`
	`1001:1:1:1:20c:29ff:fe54:c853/64  Enabled`
	`Ethernet 1/1/3  up/up  fe80::4/64`
	`3000::1/64`
	`4000::1/64  Disabled`
	`Ethernet 1/1/4  up/up  fe80::4/64`
	`4::1/64`
	`5::1/64  Enabled`

Supported Releases	10.2.0E or later or later

show ipv6 nd ra-dns search-list

Displays the details of DNS search list (DNSSL) configured on all the interfaces or on a specific interface.

Syntax `show ipv6 nd ra-dns search-list [interface interface-name]`

Parameters *interface-name*—Enter the name of the physical interface, port channel, virtual local area network (VLAN), private VLAN (PVLAN), or VXLAN network identifier (VNI).

Defaults None

Command Mode EXEC

Security and Access `netadmin, sysadmin,` and `netoperator`

Usage Information None

Example

```
OS10# show ipv6 nd ra-dns search-list
Interface       Seq no  Lifetime(sec)  State        DNS Suffix
-----------------------------------------------------------------
ethernet1/1/3   1       2000           Active       dell.com
ethernet1/1/4   1       0              In-active    com
ethernet1/1/5   1       4500           Suppress     us
ethernet1/1/6   1       4500           RA-disabled  ca
ethernet1/1/7   1       4500           Intf-down    au
```

Example (interface-level)

```
OS10# show ipv6 nd ra-dns seach-list interface ethernet 1/1/3
Interface       Seq no  Lifetime(sec)  State        DNS Suffix
-----------------------------------------------------------------
ethernet1/1/3   1       2000           Active       dell.com
```

Supported Releases 10.5.3.0 or later

show ipv6 nd ra-dns server

Displays the details of recursive DNS server (RDNSS) configured on all the interfaces or on a specific interface.

Syntax `show ipv6 nd ra-dns server [interface interface-name]`

Parameters *interface-name*—Enter the name of the physical interface, port channel, virtual local area network (VLAN), private VLAN (PVLAN), or VXLAN network identifier (VNI).

Defaults None

Command Mode EXEC

Security and Access `netadmin, sysadmin,` and `netoperator`

Usage Information None

Example

```
OS10# show ipv6 nd ra-dns server
Interface       Seq no  Lifetime(sec)  State        DNS Server
-----------------------------------------------------------------
ethernet1/1/3   1       2000           Active       2001:db8:1::4
ethernet1/1/4   1       0              In-active    2001:db8:2::5
ethernet1/1/5   1       4500           Suppress     2001:db8:3::5
ethernet1/1/6   1       4500           RA-disabled  2001:db8:4::5
ethernet1/1/7   1       4500           Intf-down    2001:db8:5::5
```

Example (interface-level)

```
OS10# show ipv6 nd ra-dns server interface ethernet 1/1/3
Interface       Seq no  Lifetime(sec)  State        DNS Server
```

```
-------------------------------------------------------------------
ethernet1/1/3   1       2000           Active       2001:db8:1::4
```

Supported Releases 10.5.3.0 or later

show ipv6 neighbors

Displays IPv6 discovery information. Entering the command without options shows all IPv6 neighbor addresses stored on the control processor (CP).

Syntax `show ipv6 neighbors [vrf vrf-name] [ipv6-address| interface interface]`

Parameters

- `vrf vrf-name` — (Optional) Enter `vrf` then the name of the VRF to display the neighbors corresponding to that VRF. If you do not specify this option, neighbors corresponding to the default VRF display.
- `ipv6-address` — Enter the IPv6 address of the neighbor in the x:x:x:x::x format. The :: notation specifies successive hexadecimal fields of zero.
- `interface interface` — Enter `interface` then the interface type and slot/port or number information:
  - For a 10-Gigabit Ethernet interface, enter `TenGigabitEthernet` then the slot/port/subport[/subport] information.
  - For a 40-Gigabit Ethernet interface, enter `fortyGigE` then the slot/port information.
  - For a port channel interface, enter `port-channel` then a number.
  - For a VLAN interface, enter `vlan` then a number from 1 to 4093.

Defaults None.

Command Mode EXEC

Usage Information The `no` version of this command resets the value to the default.

Example

```
OS10# show ipv6 neighbors
pv <vlan-id> - private vlan where the mac is originally learnt
IPv6 Address              Hardware Address  State     Interface Egress Int
-------------------------------------------------------------------------
1111::30                  14:18:77:09:e5:49 reachable vlan100   port-channel1000
fe80::1618:77ff:fe09:e549 14:18:77:09:e5:49 reachable vlan100   port-channel1000
fe80::1618:77ff:fe09:e549 14:18:77:09:e5:49 reachable vlan101   port-channel1000
```

Supported Releases 10.4.1.0 or later or later

show ipv6 route

Displays IPv6 routes.

Syntax `show ipv6 route [vrf vrf-name] [all | bgp | connected | static | A::B[/mask] | summary]`

Parameters

- `vrf vrf-name`—(Optional) Enter `vrf` then the name of the VRF to display IPv6 routes corresponding to that VRF. If you do not specify this option, routes corresponding to the default VRF display.
- `all`—(Optional) Displays all routes including nonactive routes.
- `bgp`—(Optional) Displays BGP route information.
- `connected`—(Optional) Displays only the directly connected routes.
- `static`—(Optional) Displays all static routes.
- `A::B[/mask]`—(Optional) Displays details of a particular IPv6 destination prefix from the IPv6 routing table matching the IPv6 destination address and mask. When the prefix alone is given, this command displays the IPv6 Longest Prefix Match (LPM) route, if it exists in the routing table.
- `summary`—(Optional) Displays the IPv6 route summary.

Default Not configured

Command Mode	EXEC
Usage Information	None

Example (All)

```
OS10# show ipv6 route all
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF,IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
  Destination     Gateway        Dist/Metric     Last Change
-----------------------------------------------------------
```

Example (Connected)

```
OS10# show ipv6 route connected
Codes: C - connected
       S - static
       B - BGP, IN - internal BGP, EX - external BGP
       O - OSPF,IA - OSPF inter area, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, E1 - OSPF external type 1,
       E2 - OSPF external type 2, > - non-active route
Gateway of last resort is not set
Destination          Gateway             Dist/Metric      Last Change
-------------------------------------------------------------------
C    2001:db86::/32 via 2001:db86:fff::1 ethernet1/1/1  0/0 00:03:24
```

Example (Summary)

```
OS10# show ipv6 route summary
Route Source         Active Routes  Non-Active Routes
Ospf                 0              0
Bgp                  0              0
Connected            0              0
Static               0              0
Ospf Inter-area      0              0
NSSA External-1      0              0
NSSA External-2      0              0
Ospf External-1      0              0
Ospf External-2      0              0
Bgp Internal         0              0
Bgp External         0              0
Ospf Intra-area      0              0
Total                0              0
```

Supported Releases	10.2.0E or later

Open shortest path first

OSPF routing is a link-state routing protocol that allows sending link-state advertisements (LSAs) to all other routers within the same autonomous system (AS) area. OSPF LSAs include information about attached interfaces, metrics used, and other attributes. OSPF routers accumulate link-state information, and use the shortest path first (SPF) algorithm to calculate the shortest path to each node.

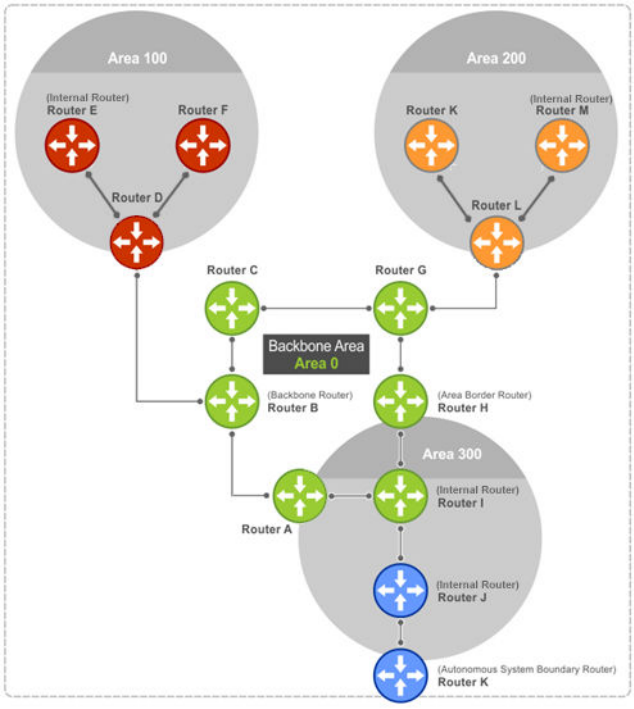
Autonomous system areas

OSPF operates in a hierarchy. The largest entity within the hierarchy is the autonomous system (AS). The AS is a collection of networks under a common administration that share a common routing strategy. OSPF is an intra-AS, Interior Gateway Routing Protocol (IGRP) that receives routes from and sends routes to other AS.

You can divide an AS into several areas, which are groups of contiguous networks and attached hosts administratively grouped. Routers with multiple interfaces can participate in multiple areas. These routers, called area border routers (ABRs), maintain

separate databases for each area. Areas are a logical grouping of OSPF routers that an integer or dotted-decimal number identifies.

Areas allow you to further organize routers within the AS with one or more areas within the AS. Areas allow subnetworks to *hide* within the AS—minimizing the size of the routing tables on all routers. An area within the AS may not see the details of another area's topology. An area number or the router's IP address identifies AS areas.



Areas, networks, and neighbors

The backbone of the network is Area 0, also called Area 0.0.0.0, the core of any AS. All other areas must connect to Area 0. An OSPF backbone distributes routing information between areas. It consists of all area border routers and networks not wholly contained in any area and their attached routers.

The backbone is the only area with a default area number. You configure all other areas Area ID. If you configure two nonbackbone areas, you must enable the B bit in OSPF. Routers, A, B, C, G, H, and I are the backbone, see Autonomous system areas.

- A stub area (SA) does not receive external route information, except for the default route. These areas do receive information from interarea (IA) routes.
- A not-so-stubby area (NSSA) can import AS external route information and send it to the backbone as type-7 LSA.
- Totally stubby areas are also known as no summary areas.

Configure all routers within an assigned stub area as stubby and do not generate LSAs that do not apply. For example, a Type 5 LSA is intended for external areas and the stubby area routers may not generate external LSAs. A virtual link cannot traverse stubby areas.

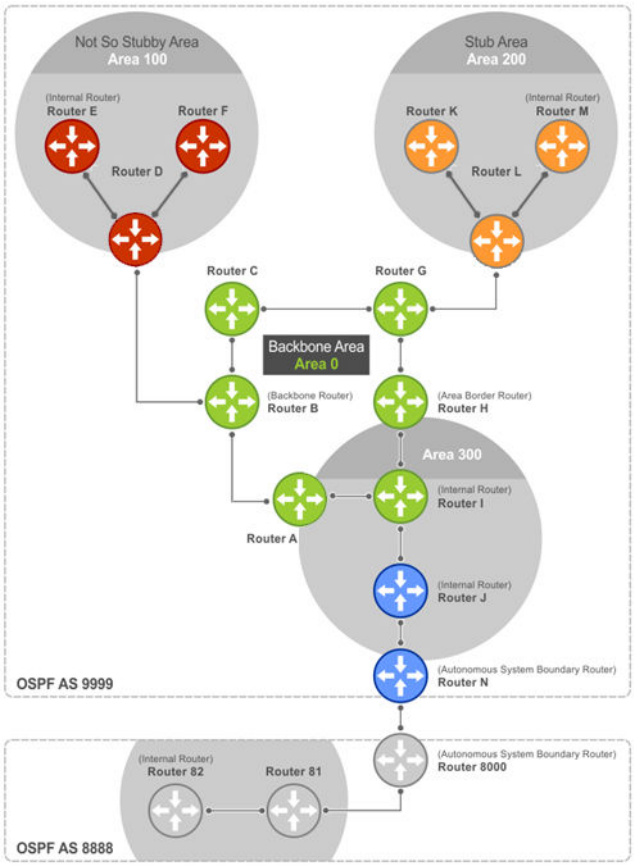
Networks and neighbors

As a link-state protocol, OSPF sends routing information to other OSPF routers concerning the state of the links between them. The Up or Down state of those links is important. Routers that share a link become neighbors on that segment. OSPF uses the `hello` protocol as a neighbor discovery and `keepalive` mechanism. After two routers are neighbors, they may proceed to exchange and synchronize their databases, which creates an adjacency.

Router types

Router types are attributes of the OSPF process—multiple OSPF processes may run on the same router. A router connected to more than one area, receiving routing from a BGP process connected to another AS, acts as both an area border router and an autonomous system border router.

Each router has a unique ID, written in decimal A.B.C.D format. You do not have to associate the router ID with a valid IP address. To make troubleshooting easier, ensure the router ID is identical to the router's IP address.



Backbone router	A backbone router (BR) is part of the OSPF Backbone, Area 0, and includes all ABRs. The BR includes routers connected only to the backbone and another ABR, but are only part of Area 0.
Area border router	Within an AS, an area border router (ABR) connects one or more areas to the backbone. The ABR keeps a copy of the link-state database for every area it connects to. It may keep multiple copies of the link state database. An ABR summarizes learned information from one of its attached areas before it is sent to other connected areas. An ABR can connect to many areas in an AS and is considered a member of each area it connects to—shown as Router H in the example.
Autonomous system border router	The autonomous system border router (ASBR) connects to more than one AS and exchanges information with the routers in other ASs. The ASBR connects to a non-IGP such as BGP or uses static routes—shown as Router N in the example.
Internal router	The internal router (IR) has adjacencies with ONLY routers in the same area—shown as Routers E, F, I, J, K, and M in the example.

Designated and backup designated routers

OSPF elects a designated router (DR) and a backup designated router (BDR). The DR generates LSAs for the entire multiaccess network. Designated routers allow a reduction in network traffic and in the size of the topological database.

Designated router	Maintains a complete topology table of the network and sends updates to the other routers via multicast. All routers in an area form a slave/master relationship with the DR. Every time a router sends an update, the router sends it to the DR and BDR. The DR sends the update to all other routers in the area.
Backup designated router	Router that takes over if the DR fails.

Each router exchanges information with the DR and BDR. The DR and BDR relay information to other routers. On broadcast network segments, the number of OSPF packets reduces by the DR sending OSPF updates to a multicast IP address that all OSPF routers on the network segment are listening on.

DRs and BDRs are configurable. If you do not define the DR or BDR, OS10 assigns them per the protocol. To determine which routers are the DR and BDR, OSPF looks at the priority of the routers on the segment. The default router priority is 1. The router with the highest priority is elected DR. If there is a tie, the router with the higher router ID takes precedence. After the DR is elected, the BDR is elected the same way. A router with a router priority set to zero cannot become a DR or BDR.

Link-state advertisements

A link-state advertisement (LSA) communicates the router's routing topology to all other routers in the network.

Type 1—Router LSA	Router lists links to other routers or networks in the same area. Type 1 LSAs flood across their own area only. The link-state ID of the Type 1 LSA is the originating router ID.
Type 2—Network LSA	DR in an area lists which routers are joined within the area. Type 2 LSAs flood across their own area only. The link-state ID of the Type 2 LSA is the IP interface address of the DR.
Type 3—Summary LSA (OSPFv2), Inter-Area Prefix LSA (OSPFv3)	ABR takes information it has learned on one of its attached areas and summarizes it before sending it out on other areas it connects to. The link-state ID of the Type 3 LSA is the destination network's IP address.
Type 4—AS Border Router Summary LSA (OSPFv2), Inter-Area-Router LSA (OSPFv3)	In some cases, Type 5 External LSAs flood to areas where the detailed next-hop information may not be available because it may be using a different routing protocol. The ABR floods the information for the router, the ASBR where the Type 5 originated. The link-state ID for Type 4 LSAs is the router ID of the described ASBR.
Type 5—AS-External LSA	LSAs contain information imported into OSPF from other routing processes. Type 5 LSAs flood to all areas except stub areas. The link-state ID of the Type 5 LSA is the external network number.
Type 7—NSSA-External LSA (OSPFv2), LSA (OSPFv3)	Routers in an NSSA do not receive external LSAs from ABRs but send external routing information for redistribution. They use Type 7 LSAs to tell the ABRs about these external routes, which the ABR then translates to Type 5 external LSAs and floods as normal to the rest of the OSPF network.
Type 8—Link LSA (OSPFv3)	Type 8 LSA carries the IPv6 address information of the local links.
Type 9—Link-Local Opaque LSA (OSPFv2), Intra-Area Prefix LSA (OSPFv3)	Link-local *opaque* LSA as defined by RFC2370 for OSPFv2. Intra-Area-Prefix LSA carries the IPv6 prefixes of the router and network links for OSPFv3.
Type 11—Grace LSA (OSPFv3)	Link-local *opaque* LSA for OSPFv3 only is sent during a graceful restart by an OSPFv3 router.

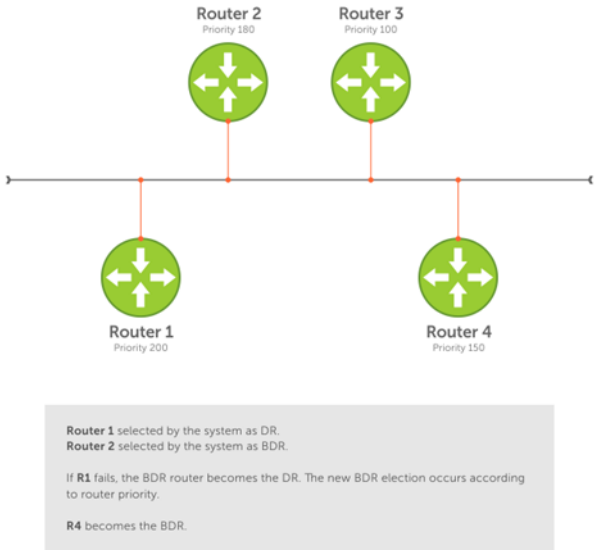
The LSA header is common to LSA types. Its size is 20 bytes. One of the fields of the LSA header is the link-state ID. Each router link is defined as one of four types—type 1, 2, 3, or 4. The LSA includes a link ID field that identifies the object this link connects to, by the network number and mask. Depending on the type, the link ID has different meanings.

1	Point-to-point connection to another router or neighboring router
2	Connection to a transit network IP address of the DR
3	Connection to a stub network IP network or subnet number
4	Virtual link neighboring router ID

Router priority

Router priority determines the designated router for the network. The default router priority is 1. When two routers attach to a network, both attempt to become the DR. The router with the higher router priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. A router with a router priority set to zero cannot become the DR or BDR.

If not assigned, the system selects the router with the highest priority as the DR. The second highest priority is the BDR. Priority rates from 0 to 255, with 255 as the highest number with the highest priority.



OSPF route limit

OS10 supports up to 16,000 OSPF routes. Within this range, the only restriction is on intra-area routes that scale only up to 1000 routes. Other OSPF routes can scale up to 16 K.

Shortest path first throttling

Use shortest path first (SPF) throttling to delay SPF calculations during periods of network instability. In an OSPF network, a topology change event triggers an SPF calculation that is performed after a start time. When the start timer finishes, a hold time can delay the next SPF calculation for an additional time.

When the hold timer is running:

- Each time a topology change occurs, the SPF calculation delays for double the configured hold time up to maximum wait time.
- If no topology change occurs, an SPF calculation is performed and the hold timer is reset to its configured value.

Set the start, hold, and wait timers according to the stability of the OSPF network topology. Enter the values in milliseconds (ms). If you do not specify a start-time, hold-time, or max-wait value, the default values are used.

OSPFv2 and OSPFv3 instances support SPF throttling. By default, SPF timers are disabled in an OSPF instance. Enter the `no` version of this command to remove the configured SPF timers and disable SPF throttling.

1. Configure an OSPF instance from CONFIGURATION mode, from 1 to 65535.

```
router {ospf | ospfv3} instance-number
```

2. Set OSPF throttling timers in OSPF INSTANCE mode.

```
timers spf [start-time [hold-time [max-wait]]]
```

- *start-time* — Configure the initial delay before performing an SPF calculation after a topology change, from 1 to 600000 milliseconds; default 1000.
- *hold-time* — Configure the additional delay before performing an SPF calculation when a new topology change occurs, from 1 to 600000 milliseconds; default 10000.
- *max-wait* — Configure the maximum amount of hold time that can delay an SPF calculation, from 1 to 600000 milliseconds; default 10000.

Enable SPF throttling (OSPFv2)

```
OS10(config)# router ospf 100
OS10(config-router-ospf-100)# timers spf 1200 2300 3400
```

Enable SPF throttling (OSPFv3)

```
OS10(config)# router ospfv3 10
OS10(config-router-ospf-10)# timers spf 2000 3000 4000
```

View OSPFv2 SPF throttling

```
OS10(config-router-ospf-100)# do show ip ospf

Routing Process ospf 100 with ID 12.1.1.1
Supports only single TOS (TOS0) routes

Area (0.0.0.1)
Number of interface in this area is 1
SPF algorithm executed 2 times
```

Redistribute routes

Add routes from other routing instances or protocols to the OSPFv2 process and include BGP, static, or connected routes in the OSPFv2 process. Do not route IBGP routes to OSPFv2 unless there are route-maps associated with the OSPFv2 redistribution.

When you configure the system to redistribute BGP routes to OSPF, by default, the system redistributes only the external BGP (eBGP) routes. Use the `[no] bgp redistribute-internal` command under BGP to allow or block the redistribution of IPv4 or IPv6 internal BGP ((iBGP) routes to OSPF in a default or nondefault VRF instance. To know more information, see Redistribute iBGP route to OSPF.

NOTE: With the `redistribute static` command in the running configuration, if a static route is configured which is also learned through OSPF, the static route is installed in the routing table even if the static route preference is higher than OSPF.

- Enter the routes that redistribute into the OSPFv2 process in ROUTER-OSPF mode.

  ```
  redistribute {bgp as-number| connected | static} [route-map map-name]
  ```

  - `bgp | connected | static`—Enter a keyword to redistribute those routes.
  - `route-map map-name`—Enter the name of a configured route map.

Configure redistribute routes

```
OS10(conf-router-ospf-10)# redistribute bgp 4 route-map aloha
OS10(conf-router-ospf-10)# redistribute connected route-map aloha
OS10(conf-router-ospf-10)# redistribute static route-map aloha
```

Before Release 10.5.2.0, the `redistribute` command redistributed active and inactive route paths. By default, from Release 10.5.2.0 and beyond, this command redistributes only active route paths. If you have configured route redistribution, when you upgrade to Release 10.5.2.0 or later, the inactive route paths are no longer redistributed.

To redistribute both active and inactive routes, you must configure a route map with the `inactive-path-additive` rule and apply the route map to the `redistribute` command.

Consider a case where two route paths, one learned from the OSPF peer and the other leaked from another VRF, having the same metric and cost are present. In this case, the routing table prioritizes the local route over the leaked route. If you have

chosen to redistribute the inactive OSPF routes, OSPF removes the route learned from the peer and retains only the leaked route.

To redistribute active and inactive IPv4/IPv6 routes from other unicast protocols into OSPF:

1. Configure a route-map to match the inactive-path-additive rule.

```
route-map route-map-name
match inactive-path-additive
```

2. Apply the route-map to the redistribute command.

```
redistribute {connected [route-map map-name] | imported-ospf-routes [route-map map-name] | bgp AS-number [route-map map-name] | static [route-map map-name]}
```

View OSPF configuration - redistribute active routes

```
OS10(conf-router-ospf-10)# do show running-configuration ospf
!
router ospf 10
 redistribute bgp 4 route-map aloha
 redistribute connected route-map aloha
 redistribute static route-map aloha
!
```

Redistribute active and inactive IPv4 BGP routes into OSPF

```
OS10# configure terminal
OS10(config)# route-map redis-inactive-routes
OS10(config-route-map)# match inactive-path-additive
OS10(config-route-map)# exit

OS10(config)# router ospf 10
OS10(config-router-ospf-10)# redistribute bgp 100 route-map redis-inactive-routes
```

Redistribute active and inactive IPv6 static routes into OSPF

```
OS10# configure terminal
OS10(config)# route-map redis-inactive-routes
OS10(config-route-map)# match inactive-path-additive
OS10(config-route-map)# exit

OS10(config)# router ospfv3 20
OS10(config-router-ospfv3-20)# redistribute static route-map redis-inactive-routes
```

OSPFv2

OSPFv2 supports IPv4 address families. OSPFv2 routers initially exchange `hello` messages to set up adjacencies with neighbor routers. The `hello` process establishes adjacencies between routers of the AS. It is not required that every router within the AS areas establish adjacencies. If two routers on the same subnet agree to become neighbors through this process, they begin to exchange network topology information in the form of LSAs.

In OSPFv2, neighbors on broadcast and non-broadcast multiple access (NBMA) network links are identified by their interface addresses, while neighbors on other types of links are identified by router-identifiers (RID).

Enable OSPFv2

OSPFv2 is disabled by default. Configure at least one interface as either Physical or Loopback and assign an IP address to the interface. You can assign any area besides area 0 a number ID. The OSPFv2 process starts automatically when you configure it globally and you can enable it for one or more interfaces.

1. Enable OSPF globally and configure an OSPF instance in CONFIGURATION mode.

```
router ospf instance-number
```

2. Enter the interface information to configure the interface for OSPF in INTERFACE mode.

```
interface ethernet node/slot/port[:subport]
```

3. Enable the interface in INTERFACE mode.

```
no shutdown
```

4. Disable the default switchport configuration and remove it from an interface or a port-channel in INTERFACE mode.

```
no switchport
```

5. Assign an IP address to the interface in INTERFACE mode.

```
ip address ip-address/mask
```

6. Enable OSPFv2 on an interface in INTERFACE mode.

```
ip ospf process-id area area-id
```

- *process-id*—Enter the OSPFv2 process ID for a specific OSPF process, from 1 to 65535.
- *area-id*—Enter the OSPFv2 area ID as an IP address (A.B.C.D) or number, from 1 to 65535.

Enable OSPFv2 configuration

```
OS10(config)# router ospf 100
OS10(conf-router-ospf-100)# exit
OS10(config)#  interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 11.1.1.1/24
OS10(conf-if-eth1/1/1)# ip ospf 100 area 0.0.0.0
```

View OSPFv2 configuration

```
OS10# show running-configuration ospf
!
interface ethernet1/1/1
 ip ospf 100 area 0.0.0.0
!
router ospf 100
...
```

Enable OSPFv2 in a non-default VRF instance

To enable OSPFv2 in a non-default VRF instance:

1. Create a non-default VRF instance in which you want to enable OSPFv2:

```
ip vrf vrf-name
```

2. Enable OSPF and configure an OSPF instance in VRF CONFIGURATION mode.

```
router ospf instance-number vrf vrf-name
```

3. Enter the interface information to configure the interface for OSPF in INTERFACE mode.

```
interface ethernet node/slot/port[:subport]
```

4. Enable the interface in INTERFACE mode.

```
no shutdown
```

5. Disable the default switchport configuration and remove it from an interface or a LAG in INTERFACE mode.

```
no switchport
```

6. Associate the interface with the non-default VRF instance that you created earlier.

```
ip vrf forwarding vrf-name
```

7. Assign an IP address to the interface.

```
ip address ip-address/mask
```

8. Enable OSPFv2 on the interface.

```
ip ospf process-id area area-id
```

- *process-id*—Enter the OSPFv2 process ID for a specific OSPF process, from 1 to 65535.
- *area-id*—Enter the OSPFv2 area ID as an IP address (A.B.C.D) or number, from 1 to 65535.

Enable OSPFv2 configuration

```
OS10(config)# ip vrf vrf-blue
OS10(config-vrf-blue)# router ospf 100 vrf vrf-blue
OS10(conf-router-ospf-100)# exit
OS10(config)#  interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip vrf forwarding vrf-blue
OS10(conf-if-eth1/1/1)# ip address 11.1.1.1/24
OS10(conf-if-eth1/1/1)# ip ospf 100 area 0.0.0.0
```

NOTE:

If you want to move an interface associated with one VRF instance to another default or non-default VRF instance, you must first remove the OSPF or Layer3 configurations that already exist on the interface. If you move the interface from one VRF instance to another without removing these existing Layer3 or OSPF configurations, these configurations do not take effect in the new VRF instance.

Consider a scenario where the OSPF instance 100 is configured on the default VRF instance and the OSPF instance 200 is configured on the non-default VRF instance named VRF-Red. The interface eth1/1/1 on the default VRF instance is attached to an OSPF process 100 area 1. In this scenario, if you want to move eth1/1/1 from the default VRF instance to VRF-Red, you must first remove the OSPF area configuration to which the interface eth1/1/1 is currently attached to.

Assign router identifier

For managing and troubleshooting purposes, you can assign a router ID for the OSPFv2 process. Use the router's IP address as the router ID.

- Assign the router ID for the OSPFv2 process in ROUTER-OSPF mode

```
router-id ip-address
```

Assign router ID

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# router-id 10.10.1.5
```

View OSPFv2 status

```
OS10# show ip ospf 10
Routing Process ospf 10 with ID 10.10.1.5
Supports only single TOS (TOS0) routes
It is an Autonomous System Boundary Router
It is Flooding according to RFC 2328
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
   Area (0.0.0.0)
       Number of interface in this area is 3
```

```
        SPF algorithm executed 38 times
        Area ranges are
```

Stub areas

Type 5 LSAs are not flooded into stub areas. The ABR advertises a default route into the stub area where it is attached. Stub area routers use the default route to reach external destinations.

1. Enable OSPF routing and enter ROUTER-OSPF mode, from 1 to 65535.

```
router ospf instance number
```

2. Configure an area as a stub area in ROUTER-OSPF mode.

```
area area-id stub [no-summary]
```

- *area-id*—Enter the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- no-summary—(Optional) Enter to prevent an ABR from sending summary LSA to the stub area.

Configure stub area

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# area 10.10.5.1 stub
```

View stub area configuration

```
OS10# show ip ospf
Routing Process ospf 10 with ID 130.6.196.14
Supports only single TOS (TOS0) routes
It is Flooding according to RFC 2328
SPF schedule delay 1000 msecs, Hold time between two SPFs 10000 msecs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 0 stub 1 nssa 0
   Area  (10.10.5.1)
        Number of interface in this area is 0
        SPF algorithm executed 1 times
        Area ranges are
```

```
OS10# show running-configuration ospf
!
router ospf 10
 area 10.10.5.1 stub
```

Passive interfaces

A passive interface does not send or receive routing information. Configuring an interface as a passive interface suppresses both receiving and sending routing updates.

Although the passive interface does not send or receive routing updates, the network on that interface is included in OSPF updates sent through other interfaces.

1. Enter an interface type in INTERFACE mode.

```
interface ethernet node/slot/port[:subport]
```

2. Configure the interface as a passive interface in INTERFACE mode.

```
ip ospf passive
```

Configure passive interfaces

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# ip ospf passive
```

View passive interfaces

```
OS10# show running-configuration
!!!
!!
interface ethernet1/1/6
 ip address 10.10.10.1/24
 no switchport
 no shutdown
 ip ospf 100 area 0.0.0.0
 ip ospf passive
!!
!
```

You can disable a passive interface using the `no ip ospf passive` command.

Fast convergence

Fast convergence sets the minimum origination and arrival LSA parameters to zero (0), allowing rapid route calculation. A higher convergence level can result in occasional loss of OSPF adjacency.

Convergence level 1 meets most convergence requirements. The higher the number, the faster the convergence, and the more frequent the route calculations and updates. This impacts CPU utilization and may impact adjacency stability in larger topologies.

NOTE: Select higher convergence levels only after checking with Dell Technical Support.

When you disable fast-convergence, origination and arrival LSA parameters are set to 0 msec and 1000 msec, respectively. Setting the convergence parameter from 1 to 4 indicates the actual convergence level. Each convergence setting adjusts the LSA parameters to zero, but the `convergence-level` parameter changes the convergence speed. The higher the number, the faster the convergence.

- Enable OSPFv2 fast-convergence and enter the convergence level in ROUTER-OSPF mode, from 1 to 4.

  ```
  fast-converge convergence-level
  ```

Configure fast convergence

```
OS10(config)# router ospf 65535
OS10(conf-router-ospf-65535)# fast-converge 1
```

View fast convergence

```
OS10(conf-router-ospf-65535)# do show ip ospf

Routing Process ospf 65535 with ID 99.99.99.99
Supports only single TOS (TOS0) routes
It is an Autonomous System Border Router
It is an Area Border Router
It is Flooding according to RFC 2328
Convergence Level 1
Min LSA origination 0 msec, Min LSA arrival 0 msec
Min LSA hold time 0 msec, Max LSA wait time 0 msec
Number of area in this router is 3, normal 1 stub 1 nssa 1
   Area BACKBONE (0)
       Number of interface in this area is 1
       SPF algorithm executed 28 times
       Area ranges are

   Area  (2)
       Number of interface in this area is 1

   Area  (3)
       Number of interface in this area is 1
       SPF algorithm executed 28 times
       Area ranges are
```

Disable fast convergence

```
OS10(conf-router-ospf-65535)# no fast-converge
```

Interface parameters

To avoid routing errors, interface parameter values must be consistent across all interfaces. For example, set the same time interval for the hello packets on all routers in the OSPF network to prevent misconfiguration of OSPF neighbors.

1. To change the OSPFv2 parameters in CONFIGURATION mode, enter the interface.

   ```
   interface interface-name
   ```

2. Change the cost associated with OSPF traffic on the interface in INTERFACE mode, from 1 to 65535. The default depends on the interface speed.

   ```
   ip ospf cost
   ```

3. Change the time interval, from 1 to 65535, that the router waits before declaring a neighbor dead in INTERFACE mode. The default time interval is 40. The dead interval must be four times the hello interval and must be the same on all routers in the OSPF network.

   ```
   ip ospf dead-interval seconds
   ```

4. Change the time interval between hello-packet transmission in INTERFACE mode, from 1 to 65535. The default time interval is 10. The hello interval must be the same on all routers in the OSPF network.

   ```
   ip ospf hello-interval seconds
   ```

   NOTE: When you copy and paste the `ip ospf dead-interval` and `ip ospf hello-interval` commands from the `show running configuration` output, the changes may not take effect if the configured dead interval is less than the default hello interval. This does not cause any issues while you save the configuration and reload the switch.

5. Change the priority of the interface, which determines the DR for the OSPF broadcast network in INTERFACE mode, from 0 to 255. The default priority of the interface is 1.

   ```
   ip ospf priority number
   ```

6. Change the retransmission interval time, in seconds, between LSAs in INTERFACE mode, from 1 to 3600. The default retransmission interval time is 5. The retransmit interval must be the same on all routers in the OSPF network.

   ```
   ip ospf retransmit-interval seconds
   ```

7. Change the wait period between link state update packets sent out the interface in INTERFACE mode, from 1 to 3600. The default wait period is 1. The transmit delay must be the same on all routers in the OSPF network.

   ```
   ip ospf transmit-delay seconds
   ```

Change parameters and view interface status

```
OS10(conf-if-eth1/1/1)# ip ospf hello-interval 5
OS10(conf-if-eth1/1/1)# ip ospf dead-interval 20
OS10(conf-if-eth1/1/1)# ip ospf retransmit-interval 30
OS10(conf-if-eth1/1/1)# ip ospf transmit-delay 200
```

View OSPF interface configuration

```
OS10(conf-if-eth1/1/1)# do show ip ospf interface

ethernet1/1/1 is up, line protocol is up
  Internet Address 11.1.1.1/24, Area 0.0.0.0
  Process ID 65535, Router ID 99.99.99.99, Network Type broadcast, Cost: 1
  Transmit Delay is 200 sec, State BDR, Priority 1
  Designated Router (ID) 150.1.1.1, Interface address 11.1.1.2
  Backup Designated router (ID) 99.99.99.99, Interface address 11.1.1.1
  Timer intervals configured, Hello 5, Dead 20, Wait 20, Retransmit 30
```

```
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 150.1.1.1(Designated Router)
```

Default route

You can generate an external default route and distribute the default information to the OSPFv2 routing domain.

- Generate the default route using the `default-information originate [always]` command in ROUTER-OSPF mode.

Configure default route

```
OS10(config)# router ospf 10
OS10(config-router-ospf-10)# default-information originate always
```

View default route configuration

```
OS10(config-router-ospf-10)# show configuration
!
router ospf 10
 default-information originate always
```

Summary address

You can configure a summary address for an ASBR to advertise one external route as an aggregate, for all redistributed routes that are covered by specified address range.

- Configure the summary address in ROUTER-OSPF mode.

  `summary-address` *`ip-address/mask`* `[not-advertise | tag` *`tag-value`*`]`

Configure summary address

```
OS10(config)# router ospf 100
OS10(config-router-ospf-100)# summary-address 10.0.0.0/8 not-advertise
```

View summary address

```
OS10(config-router-ospf-100)# show configuration
!
router ospf 100
  summary-address 10.0.0.0/8 not-advertise
```

Graceful restart

When a networking device restarts, the adjacent neighbors and peers detect the condition. During a graceful restart, the restarting device and neighbors continue to forward the packets without interrupting network performance. The neighbors that help in the restart process are called helper routers.

When you enable graceful restart, the restarting device retains the routes learned by OSPF in the forwarding table. To re-establish OSPF adjacencies with neighbors, the restart OSPF process sends a grace LSA to all neighbors. In response, the helper router enters Helper mode and sends an acknowledgement back to the restarting device.

OS10 supports graceful restart Helper mode. Use the `graceful-restart role helper-only` command to enable Helper mode in ROUTER OSPF mode.

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# graceful-restart role helper-only
```

Use the `no` version of the command to disable Helper mode.

OSPFv2 authentication

You can enable OSPF authentication either with clear text or MD5.

- Set a clear text authentication scheme on the interface in INTERFACE mode.
  `ip ospf authentication-key key`
- Set MD5 authentication in INTERFACE mode.
  `ip ospf message-digest-key keyid md5 key`

Configure text authentication

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip ospf authentication-key sample
```

View text authentication

```
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
 ip address 10.10.10.2/24
 no switchport
 no shutdown
 ip ospf 100 area 0.0.0.0
 ip ospf authentication-key sample
```

Configure MD5 authentication

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip ospf message-digest-key 2 md5 sample12345
```

View MD5 authentication

```
OS10(conf-if-eth1/1/1)# show configuration

!
interface ethernet1/1/1
 ip address 10.10.10.2/24
 no switchport
 no shutdown
 ip ospf 100 area 0.0.0.0
 ip ospf message-digest-key 2 md5 sample12345
```

Troubleshoot OSPFv2

You can troubleshoot OSPFv2 operations, and check questions for typical issues that interrupt a process.

- Is OSPF enabled globally?
- Is OSPF enabled on the interface?
- Are adjacencies established correctly?
- Are the interfaces configured for L3 correctly?
- Is the router in the correct area type?
- Are the OSPF routes included in the OSPF database?
- Are the OSPF routes included in the routing table in addition to the OSPF database?
- Are you able to ping the IPv4 address of adjacent router interface?

Troubleshooting OSPF with show commands

- View a summary of all OSPF process IDs enabled in EXEC mode.

  ```
  show running-configuration ospf
  ```

- View summary information of IP routes in EXEC mode.

  ```
  show ip route summary
  ```

- View summary information for the OSPF database in EXEC mode.

```
show ip ospf database
```

- View the configuration of OSPF neighbors connected to the local router in EXEC mode.

```
show ip ospf neighbor
```

- View routes that OSPF calculates in EXEC mode.

```
show ip ospf routes
```

View OSPF configuration

```
OS10# show running-configuration ospf
!
interface ethernet1/1/1
ip ospf 100 area 0.0.0.0
!
router ospf 100
log-adjacency-changes
```

Debug OSPF

Use the following procedures to debug OSPFv2 and OSPFv3.

- To debug OSPFv2:

```
debug ip ospfv2
```

- To debug OSPFv3:

```
debug ip ospfv3
```

OSPFv2 commands

area default-cost

Sets the metric for the summary default route generated by the ABR and sends it to the stub area.

Syntax	`area` *`area-id`* `default-cost` *`cost`*
Parameters	• *`area-id`* — Enter the OSPF area in dotted decimal A.B.C.D format or enter a number, from 0 to 65535. • *`cost`* — Enter a cost for the stub area's advertised external route metric, from 0 to 65535.
Default	Cost is 1
Command Mode	ROUTER-OSPF
Usage Information	The cost is also referred as *reference-bandwidth* or *bandwidth*. Use the `area default-cost` command on the border routers at the edge of a stub area. The `no` version of this command resets the value to the default.
Example	`OS10(conf-router-ospf-10)# area 10.10.1.5 default-cost 10`
Supported Releases	10.2.0E or later

area nssa

Defines an area as a NSSA.

Syntax

```
area area-id nssa [default-information-originate | no-redistribution | no-summary]
```

Parameters

- *area-id* — Enter the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- `no-redistribution` — (Optional) Prevents the `redistribute` command from distributing routes into the NSSA. Use `no-redistribution` command only in an NSSA ABR.
- `no-summary` — (Optional) Ensures that no summary LSAs are sent to the NSSA.

Default Not configured

Command Mode ROUTER-OSPF

Usage Information The `no` version of this command deletes an NSSA.

Example

```
OS10(conf-router-ospf-10)# area 10.10.1.5 nssa
```

Supported Releases 10.2.0E or later

area range

Summarizes routes matching an address/mask at an area in ABRs.

Syntax

```
area area-id range ip-address [no-advertise]
```

Parameters

- *area-id* — Set the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- *ip-address* — (Optional) Enter an IP address/mask in dotted decimal format.
- `no-advertise` — (Optional) Set the status to *Do Not Advertise*. The Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas.

Default Not configured

Command Mode ROUTER-OSPF

Usage Information You can use this command to summarize routes at ABR level. Summarized route must be installed in RTM and advertised over OSPFv3 neighbors at area border router level (ABR). The not-advertise option in the range command must suppress advertising of the specified summary route. Meaning, do not advertise the configured ABR summary route along with individual routes that fall under the summary route. Default behavior is advertise(set to TRUE. Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas). This command is restricted to the netadmin, sysadmin, and secadmin user roles. The `no` version of this command disables the route summarizations.

Example

```
OS10(conf-router-ospf-10)# area 0 range 10.1.1.4/8 no-advertise
OS10(config-router-ospfv3-10)# area 1.1.1.1 range 101::/16
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16

OS10(config-router-ospfv3-10)# area 1.1.1.1 range 101::/16
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16
OS10(config-router-ospfv3-10)# area 1.1.1.1 range 101::/16 not-advertise
Suppress route summarization.  Advertise individual routes that fall
under the summary route.

OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16 not-advertise
```

```
OS10(config-router-ospfv3-10)# no area 1.1.1.1 range 101::/16 not-
advertise
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16

"no area 1.1.1.1 range 101::/16 not-advertise" re-allows route
summarization to happen and only the summary route will be advertised.
```

Supported Releases 10.2.0E or later

area stub

Defines an area as the OSPF stub area.

Syntax `area area-id stub [no-summary]`

Parameters

- *area-id*—Set the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- `no-summary`—(Optional) Prevents an ABR from sending summary LAs into the stub area.

Default Not configured

Command Mode ROUTER-OSPF

Usage Information The `no` version of this command deletes a stub area.

Example

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# area 10.10.1.5 stub
```

Supported Releases 10.2.0E or later

auto-cost reference-bandwidth

Calculates default metrics for the interface based on the configured auto-cost reference bandwidth value.

Syntax `auto-cost reference-bandwidth value`

Parameters *value* — Enter the reference bandwidth value to calculate the OSPF interface cost in megabits per second, from 1 to 4294967.

Default 100000

Command Mode ROUTER-OSPF

Usage Information The value set by the `ip ospf cost` command in INTERFACE mode overrides the cost resulting from the `auto-cost` command. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# auto-cost reference-bandwidth 150
```

Supported Releases 10.2.0E or later

clear ip ospf process

Clears all OSPF routing tables.

Syntax `clear ip ospf {instance-number} [vrf vrf-name] process`

Parameters	• *instance-number* — Enter an OSPF instance number, from 1 to 65535. • vrf *vrf-name* — Enter the keyword vrf followed by the name of the VRF to reset the OSPF process configured in that VRF.
Default	Not configured
Command Mode	EXEC
Usage Information	This command clears all entries in the OSPF routing table.
Example	`OS10# clear ip ospf 3 vrf vrf-test process`
Supported Releases	10.2.0E or later

clear ip ospf statistics

Clears OSPF traffic statistics.

Syntax	`clear ip ospf [instance-number] [vrf vrf-name] statistics`
Parameters	• *instance-number* — (Optional) Enter an OSPF instance number, from 1 to 65535. • vrf vrf-name — (Optional) Enter the keyword vrf followed by the name of the VRF to clear OSPF traffic statistics in that configured VRF.
Default	Not configured
Command Mode	EXEC
Usage Information	This command clears the OSPF traffic statistics in a specified instance or in all the configured OSPF instances, and resets them to zero.
Example	`OS10# clear ip ospf 10 vrf vrf-test statistics`
Supported Releases	10.4.0E(R1) or later

debug ip ospfv2

Enables Open Shortest Path First version 2 (OSPFv2) debugging and displays messages related to processing of OSPFv2.

Syntax	`debug ip ospfv2`
Parameters	None
Defaults	None
Command Mode	EXEC
Usage Information	The `no debug ip ospfv2` command stops displaying messages related to processing of OSPFv2
Example	`debug ip ospfv2`
Supported Releases	OS10 legacy command.

default-information originate

Generates and distributes a default external route information to the OSPF routing domain.

Syntax	`default-information originate [always]`

Parameters	`always` — (Optional) Always advertise the default route.
Defaults	Disabled
Command Mode	ROUTER-OSPF
Usage Information	The `no` version of this command disables the distribution of default route.
Example	`OS10(config)# router ospf 10` `OS10(config-router-ospf-10)# default-information originate always`
Supported Releases	10.3.0E or later

default-metric

Assigns a metric value to redistributed routes for the OSPF process.

Syntax	`default-metric` *`number`*
Parameters	*`number`* — Enter a default-metric value, from 1 to 16777214.
Default	Not configured
Command Mode	ROUTER-OSPF
Usage Information	The `no` version of this command disables the default-metric configuration.
Example	`OS10(conf-router-ospf-10)# default-metric 2000`
Supported Releases	10.2.0E or later

fast-converge

Sets the minimum LSA origination and arrival times to zero (0) allowing more rapid route computation so convergence takes less time.

Syntax	`fast-converge` *`convergence-level`*
Parameters	*`convergence-level`*—Enter a desired convergence level value, from 1 to 4.
Default	Not configured
Command Mode	ROUTER-OSPF
Usage Information	Convergence level 1 (optimal) meets most convergence requirements. **NOTE:** Only select higher convergence levels following consultation with Dell Technical Support. The `no` version of this command disables the fast-convergence configuration.
Example	`OS10(conf-router-ospf-10)# fast-converge 3`
Supported Releases	10.2.0E or later

graceful-restart

Enables Helper mode during a graceful or hitless restart.

Syntax	`graceful-restart role helper-only`

Parameters	None
Defaults	Disabled
Command Mode	ROUTER-OSPF
Usage Information	The `no` version of this command disables Helper mode.
Example	`OS10(config)# router ospf 10` `OS10(conf-router-ospf-10)# graceful-restart role helper-only`
Supported Releases	10.3.0E or later

ip ospf area

Attaches an interface to an OSPF area.

Syntax	`ip ospf` *process-id* `area` *area-id*
Parameters	• *process-id* — Set an OSPF process ID for a specific OSPF process, from 1 to 65535. • `area` *area-id* — Enter the OSPF area ID in dotted decimal A.B.C.D format or enter an area ID number, from 1 to 65535.
Default	Not configured
Command Mode	INTERFACE
Usage Information	The `no` version of this command removes an interface from an OSPF area.
Example	`OS10(conf-if-vl-10)# ip ospf 10 area 5`
Supported Releases	10.2.0E or later

ip ospf authentication-key

Configures a text authentication key to enable OSPF traffic on an interface.

Syntax	`ip ospf authentication-key` *key*
Parameters	*key* — Enter an eight-character string for the authentication key.
Defaults	Not configured
Command Mode	INTERFACE
Usage Information	To exchange OSPF information, all neighboring routers in the same network must use the same authentication key. The `no` version of this command deletes the authentication key.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ip ospf authentication-key sample`
Supported Releases	10.3.0E or later

ip ospf cost

Changes the cost associated with the OSPF traffic on an interface.

Syntax	`ip ospf cost` *cost*

Parameters	*cost* — Enter a value as the OSPF cost for the interface, from 1 to 65335.
Default	Based on bandwidth reference
Command Mode	INTERFACE
Usage Information	if not configured, interface cost is based on the `auto-cost` command. This command configures OSPF over multiple vendors to ensure that all routers use the same cost. If you manually configure the cost, the calculated cost based on the reference bandwidth does not apply to the interface. The `no` version of this command removes the IP OSPF cost configuration.
Example	`OS10(config)# interface vlan 10` `OS10(conf-if-vl-1)# ip ospf cost 10`
Supported Releases	10.2.0E or later

ip ospf dead-interval

Sets the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

Syntax	`ip ospf dead-interval` *seconds*
Parameters	*seconds* — Enter the dead interval value in seconds, from 1 to 65535.
Default	40 seconds
Command Mode	INTERFACE
Usage Information	The dead interval is four times the default hello-interval by default. The `no` version of this command resets the value to the default.
Example	`OS10(conf-if-vl-10)# ip ospf dead-interval 10`
Supported Releases	10.2.0E or later

ip ospf hello-interval

Sets the time interval between the hello packets sent on the interface.

Syntax	`ip ospf hello-interval` *seconds*
Parameters	*seconds* — Enter the hello-interval value in seconds, from 1 to 65535.
Default	10 seconds
Command Mode	INTERFACE
Usage Information	All routers in a network must have the same hello time interval between the hello packets. The `no` version of the this command resets the value to the default. **NOTE:** When you configure hello-interval for OSPF, the OSPF dead-interval value is implicitly set to a value four times greater than the hello-interval value.
Example	`OS10(conf-if-vl-10)# ip ospf hello-interval 30`
Supported Releases	10.2.0E or later

ip ospf message-digest-key

Enables OSPF MD5 authentication and sends an OSPF message digest key on the interface.

Syntax `ip ospf message-digest-key keyid md5 key`

Parameters
- *keyid* — Enter an MD5 key ID for the interface, from 1 to 255.
- *key* — Enter a character string as the password. A maximum of 16 characters.

Defaults Not configured

Command Mode INTERFACE

Usage Information All neighboring routers in the same network must use the same key value to exchange OSPF information. The `no` version of this command deletes the authentication key.

Example

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip ospf message-digest-key 2 md5 sample12345
```

Supported Releases 10.3.0E or later

ip ospf mtu-ignore

Disables MTU size detection on received Database Descriptor (DBD) packets when forming OSPFv3 adjacency.

Syntax `ip ospf mtu-ignore`

Parameters None

Default Not configured

Command Mode INTERFACE

Usage Information If the MTU size of the peer interface is greater than the local interface, switches that run OSPF do not form adjacencies with neighbors. Use this command to override this behavior and form adjacency.

If you try to disable a neighborship using the `no ip ospf mtu-ignore` command after a neighborship is formed using the `ip ospf mtu-ignore` command, the neighborship still continues. To remove a neighborship after it is formed using the `ip ospf mtu-ignore` command, use the `clear ipv6 ospf process` command.

Example

```
OS10(conf-if-vl-10)# ip ospf mtu-ignore
```

Supported Releases 10.2.0E or later

ip ospf network

Sets the network type for the interface.

Syntax `ip ospf network {point-to-point | broadcast}`

Parameters
- `point-to-point` — Sets the interface as part of a point-to-point network.
- `broadcast` — Sets the interface as part of a broadcast network.

Default Broadcast

Command Mode INTERFACE

Usage Information The `no` version of this command resets the value to the default.

Example

```
OS10(conf-if-eth1/1/1)# ip ospf network broadcast
```

Supported Releases	10.2.0E or later

ip ospf passive

Configures an interface as a passive interface and suppresses both receiving and sending routing updates to the passive interface.

Syntax	`ip ospf passive`
Parameters	None
Default	Not configured
Command Mode	INTERFACE
Usage Information	You must configure the interface before setting the interface to Passive mode. The `no` version of the this command disables the passive interface configuration. **NOTE:** As loopback interfaces are implicitly passive, the configuration to suppress sending and receiving of OSPF routing updates does not take effect on the loopback interfaces. However, network information corresponding to these loopback interfaces is still announced in OSPF LSAs that are sent through other interfaces configured for OSPF.
Example	`OS10(conf-if-eth1/1/6)# ip ospf passive`
Supported Releases	10.2.0E or later

ip ospf priority

Sets the priority of the interface to determine the DR for the OSPF network.

Syntax	`ip ospf priority` *number*
Parameters	*number* — Enter a router priority number, from 0 to 255.
Default	1
Command Mode	INTERFACE
Usage Information	When two routers attached to a network attempt to become the DR, the one with the higher router priority takes precedence. The `no` version of this command resets the value to the default.
Example	`OS10(conf-if-eth1/1/6)# ip ospf priority 4`
Supported Releases	10.2.0E or later

ip ospf retransmit-interval

Sets the retransmission time between lost LSAs for adjacencies belonging to the interface.

Syntax	`ip ospf retransmit-interval` *seconds*
Parameters	*seconds* — Enter a value in seconds as the interval between retransmission, from 1 to 3600.
Default	5 seconds
Command Mode	INTERFACE
Usage Information	Set the time interval to a number large enough to avoid unnecessary retransmission. The `no` version of this command resets the value to the default.

Example	`OS10(conf-if-eth1/1/6)# ip ospf retransmit-interval 20`
Supported Releases	10.2.0E or later

ip ospf transmit-delay

Sets the estimated time required to send a link state update packet on the interface.

Syntax	`ip ospf transmit-delay` *seconds*
Parameters	*seconds* — Set the time in seconds required to send a link-state update, from 1 to 3600.
Default	1 second
Command Mode	INTERFACE
Usage Information	When you set the `ip ospf transmit-delay` value, take into account the transmission and propagation delays for the interface. The `no` version of this command resets the value to the default.
Example	`OS10(conf-if-eth1/1/4)# ip ospf transmit-delay 5`
Supported Releases	10.2.0E or later

log-adjacency-changes

Enables logging of syslog messages regarding changes in the OSPF adjacency state.

Syntax	`log-adjacency-changes`
Parameters	None
Default	Disabled
Command Mode	ROUTER-OSPF
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# router ospf 10` `OS10(conf-router-ospf-10)# log-adjacency-changes`
Supported Releases	10.2.0E or later

max-metric router-lsa

Configures OSPF to advertise a maximum metric on a router so that it is not desired as an intermediate hop from other routers.

Syntax	`max-metric router-lsa`
Parameters	None
Default	Not configured
Command Mode	ROUTER-OSPF
Usage Information	Routers in the network do not prefer other routers as the next intermediate hop after they calculate the shortest path. The `no` version of this command disables the maximum metric advertisement configuration.
Example	`OS10(conf-router-ospf-10)# max-metric router-lsa`

Supported Releases	10.2.0E or later

maximum-paths

Enables forwarding of packets over multiple paths.

Syntax	`maximum—paths` *number*
Parameters	*number* —Enter the number of paths for OSPF, from 1 to 128.
Default	64
Command Mode	ROUTER-OSPF
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# router ospf 10` `OS10(conf-router-ospf-10)# maximum-paths 1`
Supported Releases	10.2.0E or later

redistribute

Redistributes information from another routing protocol or routing instance to the OSPFv2 process.

Syntax	`redistribute {bgp` *as-number*`| imported-ospf-routes	connected	static} [route-map` *map-name*`]`
Parameters	• *as-number* — Enter an autonomous number to redistribute BGP routing information throughout the OSPF instance, from 1 to 4294967295 (4 Byte) or 0.1 to 65535.65535 (dotted format). • `connected` — Enter the information from the connected active routes on interfaces to redistribute. • `static` — Enter the information from static routes on interfaces to redistribute. • *route-map name* — Enter the name of a configured route-map.
Defaults	Not configured
Command Mode	ROUTER-OSPF
Usage Information	The `no` version of this command disables the redistribute configuration.
Example	`OS10(config)# router ospf 10` `OS10(conf-router-ospf-10)# redistribute bgp 4 route-map dell1`
Example (Connected)	`OS10(config)# router ospf 10` `OS10(conf-router-ospf-10)# redistribute connected route-map dell2`
Example (AS number notation in asdot+ format)	`OS10(config)# router ospf 1` `OS10(config-router-ospf-1)# redistribute bgp 0.100`
Supported Releases	10.2.0E or later

router-id

Configures a fixed router ID for the OSPF process.

Syntax	`router-id` *ip-address*

Parameters	*ip-address* — Enter the IP address of the router as the router ID.
Default	Not configured
Command Mode	ROUTER-OSPF
Usage Information	Configure an arbitrary value in the IP address format for each router. Each router ID must be unique. Use the fixed router ID for the active OSPF router process. Changing the router ID brings down the existing OSPF adjacency. The new router ID becomes effective immediately. The `no` version of this command disables the router ID configuration.
Example	`OS10(config)# router ospf 10` `OS10(conf-router-ospf-10)# router-id 10.10.1.5`
Supported Releases	10.2.0E or later

router ospf

Enters Router OSPF mode and configures an OSPF instance.

Syntax	`router ospf` *instance-number* `[vrf` *vrf-name*`]`
Parameters	• *instance-number*—Enter a router OSPF instance number, from 1 to 65535. • `vrf` *vrf-name* — Enter the keyword `vrf` followed by the name of the VRF to configure an OSPF instance in that VRF.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	Assign an IP address to an interface before using this command. The `no` version of this command deletes an OSPF instance.
Example	`OS10(config)# router ospf 10 vrf vrf-test`
Supported Releases	10.2.0E or later

show ip ospf

Displays OSPF instance configuration information.

Syntax	`show ip ospf [`*instance-number*`] [vrf` *vrf-name*`]`
Parameters	• *instance-number* — View OSPF information for a specified instance number from, 1 to 65535. • `vrf` *vrf-name* — Enter the keyword `vrf` followed by the name of the VRF to display OSPF configuration information corresponding to that VRF.
Default	Not configured
Command Mode	EXEC
Usage Information	None

Example	`OS10# show ip ospf 10`
	`Routing Process ospf 10 with ID 111.2.1.1`
	`Supports only single TOS (TOS0) routes`
	`It is an Autonomous System Boundary Router`
	`It is Flooding according to RFC 2328`
	`Convergence Level 0`
	`Min LSA origination 0 msec, Min LSA arrival 1000 msec`
	`Min LSA hold time 5000 msec, Max LSA wait time 5000 msec`
	`Number of area in this router is 1, normal 1 stub 0 nssa 0`
	`  Area (0.0.0.0)`

```
        Number of interface in this area is 3
        SPF algorithm executed 38 times
        Area ranges are
```

Supported Releases 10.2.0E or later

show ip ospf asbr

Displays all the ASBR visible to OSPF.

Syntax `show ip ospf [process-id] [vrf vrf-name] asbr`

Parameters

- *process-id*—(Optional) Displays information based on the process ID.
- `vrf` *vrf-name* — (Optional) Displays the ASBR router visible to the OSPF process configured in the specified VRF.

Default Not configured

Command Mode EXEC

Usage Information You can isolate problems with external routes. External OSPF routes are calculated by adding the LSA cost to the cost of reaching the ASBR router. If an external route does not have the correct cost, this command determines if the path to the originating router is correct. ASBRs that are not in directly connected areas display. You can determine if an ASBR is in a directly connected area by the flags. For ASBRs in a directly connected area, E flags are set.

Example

```
OS10# show ip ospf 10 asbr

RouterID          Flags    Cost   Nexthop         Interface    Area
112.2.1.1         E/-/-/   1      110.1.1.2       vlan3050    0.0.0.0
111.2.1.1         E/-/-/   0      0.0.0.0         -             -
```

Supported Releases 10.2.0E or later

show ip ospf database

Displays all LSA information. You must enable OSPF to generate output.

Syntax `show ip ospf [process-id] [vrf vrf-name] database`

Parameters

- *process-id* — (Optional) View LSA information for a specific OSPF process ID. If you do not enter a process ID, the command applies to all the configured OSPF processes.
- `vrf` *vrf-name* — (Optional) Enter the keyword `vrf` followed by the name of the VRF to display LSA information for the OSPF process corresponding to that VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `Link ID` — Identifies the router ID.
- `ADV Router` — Identifies the advertising router's ID.
- `Age` — Displays the LS age.
- `Seq#` — Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum` — Displays the Fletcher checksum of an LSA's complete contents.
- `Link count` — Displays the number of interfaces for that router.

Example

```
OS10# show ip ospf 10 database
OSPF Router with ID (111.2.1.1) (Process ID 10)

                Router (Area 0.0.0.0)

Link ID         ADV Router        Age     Seq#          Checksum    Link
```

```
count
111.2.1.1       111.2.1.1          1281    0x8000000d    0x9bf2          3
111.111.111.1   111.111.111.1      1430    0x8000021a    0x515a          1

112.1.1.1       112.2.1.1          1372    0x80000008    0x287c
112.2.1.1       112.2.1.1          1372    0x80000008    0x267c

                Summary Network (Area 0.0.0.0)
```

Supported Releases 10.2.0E or later

show ip ospf database asbr-summary

Displays information about AS boundary LSAs.

Syntax `show ip ospf [process-id] database asbr-summary`

Parameters

- *process-id*—(Optional) Displays the AS boundary LSA information for a specified OSPF process ID. If you do not enter a process ID, this applies only to the first OSPF process.
- `vrf` *vrf-name* — (Optional) Displays the AS boundary LSA information for a OSPF process ID corresponding to the specified VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `LS Age`—Displays the LS age.
- `Options`—Displays optional capabilities.
- `LS Type`—Displays the LS type.
- `Link State ID`—Identifies the router ID.
- `Advertising Router`—Identifies the advertising router's ID.
- `LS Seq Number`—Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum`—Displays the Fletcher checksum of an LSA's complete contents.
- `Length`—Displays the LSA length in bytes.
- `Network Mask`—Identifies the network mask implemented on the area.
- `TOS`—Displays the ToS options. The only option available is zero.
- `Metric`—Displays the LSA metric.

Example

```
OS10# show ip ospf 10 database asbr-summary

  OSPF Router with ID (1.1.1.1) (Process ID 100)

   Summary Asbr (Area 0.0.0.1)

LS age: 32
Options: (No TOS-Capability, No DC)
LS type: Summary Asbr
Link State ID: 8.1.1.1
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000001
Checksum: 0xB595
Length: 28
Network Mask: /0
    TOS: 0 Metric: 0
```

Supported Releases	10.2.0E or later

show ip ospf database external

Displays information about the AS external Type 5 LSAs.

Syntax `show ip ospf [process-id] [vrf vrf-name] database external`

Parameters

- *process-id*—(Optional) Displays AS external Type 5 LSA information for a specified OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf` *vrf-name* — (Optional) Displays AS external (Type 5) LSA information for a specified OSPF Process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `LS Age` — Displays the LS age.
- `Options` — Displays the optional capabilities available on the router.
- `LS Type` — Displays the LS type.
- `Link State ID` — Identifies the router ID.
- `Advertising Router` — Identifies the advertising router's ID.
- `LS Seq Number` — Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum` — Displays the Fletcher checksum of an LSA's complete contents.
- `Length` — Displays the LSA length in bytes.
- `Network Mask` — Identifies the network mask implemented on the area.
- `TOS` — Displays the ToS options. The only option available is zero.
- `Metric` — Displays the LSA metric.

Example

```
OS10# show ip ospf 10 database external

 OSPF Router with ID (111.2.1.1) (Process ID 10)

                Type-5 AS External

  LS age: 1424
  Options: (No TOS-capability, No DC, E)
  LS type: Type-5 AS External
  Link State ID: 110.1.1.0
  Advertising Router: 111.2.1.1
  LS Seq Number: 0x80000009
  Checksum: 0xc69a
  Length: 36
  Network Mask: /24
       Metric Type: 2
       TOS: 0
       Metric: 20
       Forward Address: 110.1.1.1
       External Route Tag: 0
```

Supported Releases	10.2.0E or later

show ip ospf database network

Displays information about network Type 2 LSA information.

Syntax `show ip ospf [process-id] [vrf vrf-name] database network`

Parameters

- *process-id* — (Optional) Displays network Type2 LSA information for a specified OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.

- `vrf vrf-name` — (Optional) Displays network Type2 LSA information for a specified OSPF process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information
- `LS Age`—Displays the LS age.
- `Options`—Displays optional capabilities.
- `LS Type`—Displays the LS type.
- `Link State ID`—Identifies the router ID.
- `Advertising Router`—Identifies the advertising router's ID.
- `LS Seq Number`—Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum`—Displays the Fletcher checksum of an LSA's complete contents.
- `Length`—Displays the LSA length in bytes.
- `Network Mask`—Identifies the network mask implemented on the area.
- `TOS`—Displays the ToS options. The only option available is zero..
- `Metric`—Displays the LSA metric.

Example

```
OS10# show ip ospf 10 database network
OSPF Router with ID (111.2.1.1) (Process ID 10)

                Network (Area 0.0.0.0)

  LS age: 1356
  Options: (No TOS-capability, No DC, E)
  LS type: Network
  Link State ID: 110.1.1.2
  Advertising Router: 112.2.1.1
  LS Seq Number: 0x80000008
  Checksum: 0xd2b1
  Length: 32
  Network Mask: /24
      Attached Router: 111.2.1.1
      Attached Router: 112.2.1.1
```

Supported Releases 10.2.0E or later

show ip ospf database nssa external

Displays information about the NSSA-External Type 7 LSA.

Syntax `show ip ospf [process-id] [vrf vrf-name] database nssa external`

Parameters
- *process-id* — (Optional) Displays NSSA-External Type7 LSA information for a specified OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf vrf-name` — (Optional) Displays NSSA-External Type7 LSA information for a specified OSPF process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information
- `LS Age` — Displays the LS age.
- `Options` — Displays the optional capabilities available on the router.
- `LS Type` — Displays the LS type.
- `Link State ID` — Identifies the router ID.
- `Advertising Router` — Identifies the advertising router's ID.
- `LS Seq Number` — Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum` — Displays the Fletcher checksum of an LSA's complete contents.
- `Length` — Displays the LSA length in bytes.

- `Network Mask`—Identifies the network mask implemented on the area.
- `TOS`—Displays the ToS options. The only option available is zero.
- `Metric`—Displays the LSA metric.

Example

```
OS10# show ip ospf database nssa external

       OSPF Router with ID (2.2.2.2) (Process ID 100)

          NSSA External (Area 0.0.0.1)

LS age: 98
Options: (No TOS-Capability, No DC, No Type 7/5 translation)
LS type: NSSA External
Link State ID: 0.0.0.0
Advertising Router: 1.1.1.1
LS Seq Number: 0x80000001
Checksum: 0x430C
Length: 36
Network Mask: /0
    Metric Type: 1
    TOS: 0
    Metric: 16777215
    Forward Address: 0.0.0.0
    External Route Tag: 0

LS age: 70
Options: (No TOS-Capability, No DC, No Type 7/5 translation)
LS type: NSSA External
Link State ID: 0.0.0.0
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000001
Checksum: 0x2526
Length: 36
Network Mask: /0
    Metric Type: 1
    TOS: 0
    Metric: 0
    Forward Address: 0.0.0.0
    External Route Tag: 0

LS age: 65
Options: (No TOS-Capability, No DC, No Type 7/5 translation)
LS type: NSSA External
Link State ID: 12.1.1.0
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000001
Checksum: 0xBDEA
Length: 36
Network Mask: /24
    Metric Type: 2
    TOS: 0
    Metric: 20
    Forward Address: 0.0.0.0
    External Route Tag: 0

LS age: 65
Options: (No TOS-Capability, No DC, No Type 7/5 translation)
LS type: NSSA External
Link State ID: 13.1.1.0
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000001
Checksum: 0xB0F6
Length: 36
Network Mask: /24
    Metric Type: 2
    TOS: 0
    Metric: 20
    Forward Address: 0.0.0.0
    External Route Tag: 0

LS age: 65
```

```
Options: (No TOS-Capability, No DC, No Type 7/5 translation)
LS type: NSSA External
Link State ID: 14.1.1.0
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000001
Checksum: 0xA303
Length: 36
Network Mask: /24
    Metric Type: 2
    TOS: 0
    Metric: 20
    Forward Address: 0.0.0.0
    External Route Tag: 0
```

Supported Releases 10.2.0E or later

show ip ospf database opaque-area

Displays information about the opaque-area Type 10 LSA.

Syntax `show ip ospf [process-id] [vrf vrf-name] database opaque-area`

Parameters

- *process-id* — (Optional) Displays the opaque-area Type 10 information for an OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf vrf-name` — (Optional) Displays the opaque-area Type 10 information for an OSPF process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `LS Age` — Displays the LS age.
- `Options` — Displays the optional capabilities available on the router.
- `LS Type` — Displays the LS type.
- `Link State ID` — Identifies the router ID.
- `Advertising Router` — Identifies the advertising router's ID.
- `LS Seq Number` — Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum` — Displays the Fletcher checksum of an LSA's complete contents.
- `Length` — Displays the LSA length in bytes.
- `Opaque Type` — Identifies the Opaque type field, the first 8 bits of the LS ID.
- `Opaque ID` — Identifies the Opaque type-specific ID, the remaining 24 bits of the LS ID.

Example

```
OS10# show ip ospf database opague-area
       OSPF Router with ID (1.1.1.1) (Process ID 100)

          Type-10 Area Local Opaque (Area 0.0.0.1)

LS age: 3600
Options: (No TOS-Capability, No DC)
LS type: Type-10 Area Local Opaque
Link State ID: 8.1.1.2
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000008
Checksum: 0x83B8
Length: 28
Opaque Type: 8
Opaque ID: 65794
!!
!
```

Supported Releases 10.2.0E or later

show ip ospf database opaque-as

Displays information about the opaque-as Type 11 LSAs.

Syntax `show ip ospf [process-id] opaque–as`

Parameters *process-id* — (Optional) Displays opaque-as Type 11 LSA information for a specified OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.

Default Not configured

Command Mode EXEC

Usage Information

- `LS Age` — Displays the LS age.
- `Options` — Displays the optional capabilities available on the router.
- `LS Type` — Displays the LS type.
- `Link State ID` — Identifies the router ID.
- `Advertising Router` — Identifies the advertising router's ID.
- `LS Seq Number` — Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum` — Displays the Fletcher checksum of an LSA's complete contents.
- `Length` — Displays the LSA length in bytes.
- `Opaque Type` — Identifies the Opaque type field, the first 8 bits of the LS ID.
- `Opaque ID` — Identifies the Opaque type-specific ID, the remaining 24 bits of the LS ID.

Example

```
OS10# show ip ospf 100 database opaque-as

  OSPF Router with ID (1.1.1.1) (Process ID 100)

          Type-11 AS Opaque

LS age: 3600
Options: (No TOS-Capability, No DC)
LS type: Type-11 AS Opaque
Link State ID: 8.1.1.3
Advertising Router: 2.2.2.2
LS Seq Number: 0x8000000D
Checksum: 0x61D3
Length: 36
Opaque Type: 8
Opaque ID: 65795
```

Supported Releases 10.2.0E or later

show ip ospf database opaque-link

Displays information about the opaque-link Type 9 LSA.

Syntax `show ip ospf [process-id] [vrf vrf-name] database opaque-link`

Parameters

- *process-id* — (Optional) Displays the opaque-link Type 9 LSA information for an OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf` *vrf-name* — (Optional) Displays the opaque-link Type 9 LSA information for an OSPF process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `LS Age` — Displays the LS age.
- `Options` — Displays the optional capabilities available on the router.
- `LS Type` — Displays the LS type.
- `Link State ID` — Identifies the router ID.
- `Advertising Router` — Identifies the advertising router's ID.

- `LS Seq Number` — Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum` — Displays the Fletcher checksum of an LSA's complete contents.
- `Length` — Displays the LSA length in bytes.
- `Opaque Type` — Identifies the Opaque type field, the first 8 bits of the LS ID.
- `Opaque ID` — Identifies the Opaque type-specific ID, the remaining 24 bits of the LS ID.

Example

```
OS10# show ip ospf 100 database opaque-link
       OSPF Router with ID (1.1.1.1) (Process ID 100)

          Type-9 Link Local Opaque (Area 0.0.0.1)

LS age: 3600
Options: (No TOS-Capability, No DC)
LS type: Type-9 Link Local Opaque
Link State ID: 8.1.1.1
Advertising Router: 2.2.2.2
LS Seq Number: 0x80000007
Checksum: 0x9DA1
Length: 28
Opaque Type: 8
Opaque ID: 65793
```

Supported Releases 10.2.0E or later

show ip ospf database router

Displays information about the router Type 1 LSA.

Syntax `show ip ospf process-id [vrf vrf-name] database router`

Parameters

- *process-id* — (Optional) Displays the router Type 1 LSA for an OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf` *vrf-name* — (Optional) Displays the router Type 1 LSA for an OSPF process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information Output:

- `LS age`—Displays the LS age.
- `Options`—Displays optional capabilities.
- `LS Type`—Displays the LS type.
- `Link State ID`—Identifies the router ID.
- `Advertising Router`—Identifies the advertising router's ID.
- `LS Seq Number`—Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum`—Displays the Fletcher checksum of an LSA's complete contents.
- `Length`—Displays the LSA length in bytes.
- `TOS`—Displays the ToS options. The only option available is zero.
- `Metric`—Displays the LSA metric.

Example

```
OS10# show ip ospf 10 database router

       OSPF Router with ID (111.2.1.1) (Process ID 10)

                Router (Area 0.0.0.0)

  LS age: 1419
  Options: (No TOS-capability, No DC, E)
  LS type: Router
  Link State ID: 111.2.1.1
  Advertising Router: 111.2.1.1
```

```
  LS Seq Number: 0x8000000d
  Checksum: 0x9bf2
  Length: 60
  AS Boundary Router
   Number of Links: 3

    Link connected to: a Transit Network
     (Link ID) Designated Router address: 110.1.1.2
     (Link Data) Router Interface address: 110.1.1.1
     Number of TOS metric: 0
      TOS 0 Metric: 1

    Link connected to: a Transit Network
     (Link ID) Designated Router address: 111.1.1.1
     (Link Data) Router Interface address: 111.1.1.1
     Number of TOS metric: 0
      TOS 0 Metric: 1

    Link connected to: a Transit Network
     (Link ID) Designated Router address: 111.2.1.1
     (Link Data) Router Interface address: 111.2.1.1
     Number of TOS metric: 0
      TOS 0 Metric: 1
```

Supported Releases 10.2.0E or later

show ip ospf database summary

Displays the network summary Type 3 LSA routing information.

Syntax `show ip ospf [process-id] [vrf vrf-name] database summary`

Parameters

- *process-id*—(Optional) Displays LSA information for a specific OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf` *vrf-name* — (Optional) Displays LSA information for a specified OSPF process ID corresponding to a VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `LS Age`—Displays the LS age.
- `Options`—Displays the optional capabilities available on the router.
- `LS Type`—Displays the LS type.
- `Link State ID`—Identifies the router ID.
- `Advertising Router`—Identifies the advertising router's ID.
- `LS Seq Number`—Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum`—Displays the Fletcher checksum of an LSA's complete contents.
- `Length`—Displays the LSA length in bytes.
- `Network Mask`—Identifies the network mask implemented on the area.
- `TOS`—Displays the ToS options. The only option available is zero.
- `Metric`—Displays the LSA metric.

Example

```
OS10# show ip ospf 10 database summary
     OSPF Router with ID (111.2.1.1) (Process ID 10)

                 Summary Network (Area 0.0.0.0)

  LS age: 623
  Options: (No TOS-capability, No DC)
  C: Summary Network
  Link State ID: 115.1.1.0
  Advertising Router: 111.111.111.1
  LS Seq Number: 0x800001e8
```

```
  Checksum: 0x4a67
  Length: 28
  Network Mask: /24
       TOS: 0 Metric: 0
```

Supported Releases 10.2.0E or later

show ip ospf interface

Displays the configured OSPF interfaces. You must enable OSPF to display output.

Syntax `show ip ospf interface [process-id] [vrf vrf-name] interface` or `show ip ospf [process-id] [vrf vrf-name] interface [interface]`

Parameters

- *process-id*—(Optional) Displays information for an OSPF process ID. If you do not enter a process ID, this command applies only to the first OSPF process.
- `vrf` *vrf-name*—(Optional) Displays information for an OSPF instance corresponding to a VRF.
- *interface*—(Optional) Enter the interface information:
  - `ethernet`—Enter the Ethernet interface information, from 1 to 48.
  - `port channel`—Enter the port-channel interface number, from 1 to 999 or 1001 to 2000.
  - `vlan`—Enter the VLAN interface number, from 1 to 4093.

Default Not configured

Command Mode EXEC

Example

```
OS10# show ip ospf 10 interface
ethernet1/1/1 is up, line protocol is up
  Internet Address 110.1.1.1/24, Area 0.0.0.0
  Process ID 10, Router ID 1.1.1.1, Network Type broadcast, Cost: 10
  Transmit Delay is 1 sec, State WAIT, Priority 1
  BFD enabled(Interface level) Interval 300 Min_rx 300 Multiplier 3 Role
Active
  Designated Router (ID) , Interface address 0.0.0.0
  Backup Designated router (ID) , Interface address 0.0.0.0
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Neighbor Count is 0, Adjacent neighbor count is 0
```

Supported Releases 10.2.0E or later

show ip ospf routes

Displays OSPF routes received from neighbors along with parameters such as cost, next-hop, area, interface, and type of route.

Syntax `show ip ospf [process-id] [vrf vrf-name] routes [prefix IP-prefix]`

Parameters

- *process-id* — (Optional) Enter OSPFv2 process ID to view information specific to the ID.
- `vrf` *vrf-name* — (Optional) Enter the keyword vrf followed by the name of the VRF to display the routes calculated by OSPF in the configured VRF.
- *IP-prefix* — (Optional) Specify an IP address to view information specific to the IP address.

Default None

Command Mode EXEC

Usage Information Displays the cost metric for each neighbor and interfaces.

Example

```
OS10# show ip ospf 10 routes
Prefix      Cost  Nexthop    Interface    Area     Type
110.1.1.0   1     0.0.0.0    vlan3050   0.0.0.0  intra-area
```

```
111.1.1.0    1      0.0.0.0    vlan3051    0.0.0.0   intra-area
111.2.1.0    1      0.0.0.0    vlan3053    0.0.0.0   intra-area
```

Supported Releases 10.2.0E or later

show ip ospf statistics

Displays OSPF traffic statistics.

Syntax

- `show ip ospf [instance-number] [vrf vrf-name] statistics [interface interface]`

Parameters

- *instance-number*—(Optional) Enter an OSPF instance number, from 1 to 65535.
- `vrf` *vrf-name*—(Optional) Enter the keyword `vrf` followed by the name of the VRF to display OSPF traffic statistics corresponding to that VRF.
- `interface` *interface*—(Optional) Enter the interface information:
  - `ethernet` *node/slot/port[:subport]*—Enter an Ethernet port interface.
  - `port-channel` *number*—Enter the port channel interface number, from 1 to 999 or 1001 to 2000.
  - `vlan` *vlan-id*—Enter the VLAN ID number, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information This command displays OSPFv2 traffic statistics for a specified instance or interface, or for all OSPFv2 instances and interfaces.

Example

```
OS10# show ip ospf 10 statistics
Interface vlan3050
  Receive Statistics
     rx-invalid          0    rx-invalid-bytes     0
     rx-hello            0    rx-hello-bytes       0
     rx-db-des           0    rx-db-des-bytes      0
     rx-ls-req           0    rx-ls-req-bytes      0
     rx-ls-upd           0    rx-ls-upd-bytes      0
     rx-ls-ack           0    rx-ls-ack-bytes      0
  Transmit Statistics
     tx-failed           0    tx-failed-bytes      0
     tx-hello            0    tx-hello-bytes       0
     tx-db-des           0    tx-db-des-bytes      0
     tx-ls-req           0    tx-ls-req-bytes      0
     tx-ls-upd           0    tx-ls-upd-bytes      0
     tx-ls-ack           0    tx-ls-ack-bytes      0
  Error packets (Receive statistics)
     bad-src             0   dupe-id               0   hello-err
  0
     mtu-mismatch        0   nbr-ignored           0   wrong-proto
  0
     resource-err        0   bad-lsa-len           0   lsa-bad-type
  0
     lsa-bad-len         0   lsa-bad-cksum         0   auth-fail
  0
     netmask-mismatch    0   hello-tmr-mismatch    0   dead-ivl-mismatch
  0
     options-mismatch    0   nbr-admin-down        0   own-hello-drop
  0
     self-orig             0   wrong-length        0   checksum-error
  0
     version-mismatch      0   area-mismatch       0
```

Supported Releases 10.2.0E or later

show ip ospf topology

Displays routers that directly connect to OSPF areas.

Syntax `show ip ospf [process-id] [vrf vrf-name] topology`

Parameters
- *process-id* — (Optional) Displays OSPF process information. If you do not enter a process ID, this applies only to the first OSPF process.
- `vrf` *vrf-name* — (Optional) Displays the routers in the directly connected OSPF areas in the configured VRF.

Default Not configured

Command Mode EXEC

Usage Information The “E” flag output indicates the router listed is an ASBR. The “B” flag indicates that the router listed is an ABR. If the Flag field shows both E and B, it indicates that the listed router is both an ASBR and an ABR.

Example

```
OS10# show ip ospf 10 topology

 Router ID       Flags   Cost  Nexthop     Interface  Area
111.111.111.1    -/B/-/   1    111.1.1.2   Vl 3051    0
111.111.111.2    -/B/-/   1    111.2.1.2   Vl 3053    0
112.2.1.1        E/-/-/   1    110.1.1.2   Vl 3050    0
112.112.112.1    -/B/-/   2    110.1.1.2   Vl 3050    0
112.112.112.2    -/B/-/   2    110.1.1.2   Vl 3050    0
```

Supported Releases 10.2.0E or later

summary-address

Configures a summary address for an ASBR to advertise one external route as an aggregate for all redistributed routes covered by a specified address range.

Syntax `summary-address` *ip-address/mask* `[not-advertise | tag` *tag-value*`]`

Parameters
- *ip-address/mask*—Enter the IP address to summarize along with the mask.
- *not-advertise*—(Optional) Suppresses IP addresses that do not match the network prefix/mask.
- *tag-value*—(Optional) Enter a value to match the routes redistributed through a route map, from 1 to 65535.

Default) Not configured

Command Mode ROUTER-OSPF

Usage Information The `no` version of this command disables the summary address.

Example

```
OS10(config)# router ospf 100
OS10(config-router-ospf-100)# summary-address 10.0.0.0/8 not-advertise
```

Supported Releases 10.3.0E or later

timers lsa arrival

Configures the LSA acceptance intervals.

Syntax `timers lsa arrival` *arrival-time*

Parameters *arrival-time* — Set the interval between receiving the LSA in milliseconds, from 0 to 600,000.

Default 1000 milliseconds

Command Mode ROUTER-OSPF

Usage Information Setting the LSA arrival time between receiving the LSA repeatedly ensures that the system gets enough time to accept the LSA. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# timers lsa arrival 2000
```

Supported Releases 10.2.0E or later

timers spf

Enables shortest path first (SPF) throttling to delay an SPF calculation when a topology change occurs.

Syntax `timers spf [start-time [hold-time [max-wait]]]`

Parameters

- *start-time* — Sets the initial SPF delay in milliseconds, from 1 to 600000; default 1000.
- *hold-time* — Sets the additional hold time between two SPF calculations in milliseconds, from 1 to 600000; default 10000.
- *max-wait* — Sets the maximum wait time between two SPF calculations in milliseconds, from 1 to 600000; default 10000.

Default

- *start-time* — 1000 milliseconds
- *hold-time* — 10000 milliseconds
- *max-wait* — 10000 milliseconds

Command Mode ROUTER-OSPF

Usage Information By default, SPF timers are disabled in an OSPF instance.

Use SPF throttling to delay SPF calculations during periods of network instability. In an OSPF network, a topology change event triggers an SPF calculation after a start time. When the start timer finishes, a hold time may delay the next SPF calculation for an additional time. When the hold timer is running:

- Each time a topology change occurs, the SPF calculation delays for double the configured hold time up to maximum wait time.
- If no topology change occurs, an SPF calculation performs and the hold timer is reset to its configured value.

If you do not specify a start-time, hold-time, or max-wait value, the default values are used. The `no` version of this command removes the configured SPF timers and disables SPF throttling in an OSPF instance.

Example

```
OS10(config)# router ospf 100
OS10(config-router-ospf-100)# timers spf 1200 2300 3400
OS10(config-router-ospf-100)# do show ip ospf

Routing Process ospf 100 with ID 12.1.1.1
Supports only single TOS (TOS0) routes
It is Flooding according to RFC 2328
SPF schedule delay 1200 msecs, Hold time between two SPFs 2300 msecs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
Area (0.0.0.1)
Number of interface in this area is 1
SPF algorithm executed 1 times
```

Supported Releases 10.4.0E(R1) or later

timers throttle lsa all

Configures the LSA transmit intervals.

Syntax `timers lsa all [start-interval | hold-interval | max-interval]`

Parameters

- *start-interval* — Sets the minimum interval between initial sending and re-sending the same LSA in milliseconds, from 0 to 600,000.
- *hold-interval* — Sets the next interval to send the same LSA in milliseconds. This is the time between sending the same LSA after the start-interval is attempted, from 1 to 600,000.
- *max-interval* — Sets the maximum amount of time the system waits before sending the LSA in milliseconds, from 1 to 600,000.

.

Default

- start-interval — 0 milliseconds
- hold-interval — 5000 milliseconds
- max-interval — 5000 milliseconds

Command Mode ROUTER-OSPF

Usage Information The `no` version of this command removes the LSA transmit timer.

Example

```
OS10(config)# router ospf 10
OS10(conf-router-ospf-10)# timers throttle lsa all 100 300 1000
```

Supported Releases 10.2.0E or later

OSPFv3

OSPFv3 is an IPv6 link-state routing protocol that supports IPv6 unicast address families (AFs). OSPFv3 is disabled by default. You must configure at least one interface, either physical or Loopback. The OSPF process automatically starts when OSPFv3 is enabled for one or more interfaces. Any area besides *area 0* can have any number ID assigned to it.

Enable OSPFv3

1. Enable OSPFv3 globally and configure an OSPFv3 instance in CONFIGURATION mode.

   ```
   router ospfv3 instance-number
   ```

2. Enter the interface information to configure the interface for OSPFv3 in INTERFACE mode.

   ```
   interface ethernet node/slot/port[:subport]
   ```

3. Enable the interface in INTERFACE mode.

   ```
   no shutdown
   ```

4. Disable the default switchport configuration and remove it from an interface or a port-channel in INTERFACE mode.

   ```
   no switchport
   ```

5. Enable the OSPFv3 on an interface in INTERFACE mode.

   ```
   ipv6 ospf process-id area area-id
   ```

   - *process-id* — Enter the OSPFv3 process ID for a specific OSPFv3 process, from 1 to 65535.
   - *area-id* — Enter the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.

Enable OSPFv3

```
OS10(config)# router ospfv3 100
OS10(config-router-ospfv3-100)# exit
OS10(config)#  interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ipv6 ospf 300 area 0.0.0.0
```

Enable OSPFv3 in a non-default VRF instance

1. Create the non-default VRF instance in which you want to enable OSPFv3:

   `ip vrf vrf-name`

   CONFIGURATION Mode
2. Enable OSPFv3 in the non-default VRF instance that you created earlier and configure an OSPFv3 instance in VRF CONFIGURATION mode.

   ```
   router ospfv3 instance-number vrf vrf-name
   ```
3. Enter the interface information to configure the interface for OSPFv3 in INTERFACE mode.

   ```
   interface ethernet node/slot/port[:subport]
   ```
4. Enable the interface in INTERFACE mode.

   ```
   no shutdown
   ```
5. Disable the default switchport configuration and remove it from an interface or a port-channel in INTERFACE mode.

   ```
   no switchport
   ```
6. Associate the interface with the non-default VRF instance that you created earlier.

   ```
   ip vrf forwarding vrf-name
   ```
7. Enable the OSPFv3 on an interface.

   ```
   ipv6 ospf process-id area area-id
   ```

   - *process-id* — Enter the OSPFv3 process ID for a specific OSPFv3 process, from 1 to 65535.
   - *area-id* — Enter the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.

Enable OSPFv3

```
OS10(config)# ip vrf vrf-blue
OS10(config-vrf-blue)# router ospfv3 100 vrf vrf-blue
OS10(config-router-ospfv3-100)# exit
OS10(config)#  interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip vrf forwarding vrf-blue
OS10(conf-if-eth1/1/1)# ipv6 ospf 300 area 0.0.0.0
```

NOTE:

If you want to move an interface associated with one VRF instance to another default or non-default VRF instance, you must first remove the OSPF or Layer3 configurations that already exist on the interface. If you move the interface from one VRF instance to another without removing these existing Layer3 or OSPF configurations, these configurations do not take effect in the new VRF instance.

Consider a scenario where the OSPF instance 100 is configured on the default VRF instance and the OSPF instance 200 is configured on the non-default VRF instance named VRF-Red. The interface eth1/1/1 on the default VRF instance is attached to an OSPF process 100 area 1. In this scenario, if you want to move eth1/1/1 from the default VRF instance to VRF-Red, you must first remove the OSPF area configuration to which the interface eth1/1/1 is currently attached to.

Assign Router ID

You can assign a router ID for the OSPFv3 process. Configure an arbitrary value in the IP address format for each router. Each router ID must be unique. Use the fixed router ID for the active OSPFv3 router process. Changing the router ID brings down the existing OSPFv3 adjacency. The new router ID becomes effective immediately.

- Assign the router ID for the OSPFv3 process in ROUTER-OSPFv3 mode.

```
router-id ip-address
```

Assign router ID

```
OS10(config)# router ospfv3 100
OS10(config-router-ospfv3-100)# router-id 10.10.1.5
```

View OSPFv3 Status

```
OS10# show ipv6 ospf
Routing Process ospfv3 100 with ID 10.10.1.5
It is an Area Border Router
Min LSA origination 5000 msec, Min LSA arrival 1000 msec
Min LSA hold time 0 msec, Max LSA wait time 0 msec
Number of area in this router is 2, normal 2 stub 0 nssa
   Area  (0.0.0.0)
       Number of interface in this area is 1
       SPF algorithm executed 42 times
   Area  (0.0.0.1)
       Number of interface in this area is 1
       SPF algorithm executed 42 times
```

Configure Stub Areas

Type 5 LSAs are not flooded into stub areas. The ABR advertises a default route into the stub area where it is attached. Stub area routers use the default route to reach external destinations.

1. Enable OSPFv3 routing and enter ROUTER-OSPFv3 mode, from 1 to 65535.

```
router ospfv3 instance number
```

2. Configure an area as a stub area in ROUTER-OSPFv3 mode.

```
area area-id stub [no-summary]
```

- *area-id* — Enter the OSPFv3 area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- no-summary — (Optional) Enter to prevent an ABR from sending summary LSAs into the stub area.

Configure Stub Area

```
OS10(config)# router ospfv3 10
OS10(conf-router-ospf-10)# area 10.10.5.1 stub no-summary
```

View Stub Area Configuration

```
OS10# show running-configuration ospfv3
!
interface ethernet1/1/3
ipv6 ospf 65 area 0.0.0.2
!
router ospfv3 65
area 0.0.0.2 stub no-summary

Enable Passive Interfaces

A passive interface is one that does not send or receive routing information. Configuring an interface as a passive interface suppresses both the receiving and sending routing updates.

Although the passive interface does not send or receive routing updates, the network on that interface is included in OSPF updates sent through other interfaces. You can remove an interface from passive interfaces using the `no ipv6 ospf passive` command.

1. Enter an interface type in INTERFACE mode.

```
interface ethernet node/slot/port[:subport]
```

2. Configure the interface as a passive interface in INTERFACE mode.

```
ipv6 ospf passive
```

Configure Passive Interfaces

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# ipv6 ospf passive
```

View Passive Interfaces

```
OS10# show running-configuraiton
!!!
!!
interface ethernet1/1/1
 ip address 10.10.10.1/24
 no switchport
 no shutdown
 ipv6 ospf 100 area 0
 ipv6 ospf passive
!!
!
```

Interface OSPFv3 Parameters

To avoid routing errors, interface parameter values must be consistent across all interfaces. For example, set the same time interval for the hello packets on all routers in the OSPF network to prevent misconfiguration of OSPF neighbors.

1. Enter the interface to change the OSPFv3 parameters in CONFIGURATION mode.

   ```
   interface interface-name
   ```

2. Change the cost associated with OSPFv3 traffic on the interface in INTERFACE mode, from 1 to 65535. The default depends on the interface speed.

   ```
   ipv6 ospf cost
   ```

3. Change the time interval the router waits before declaring a neighbor dead in INTERFACE mode, from 1 to 65535. The default is 40. The dead interval must be four times the hello interval. The dead interval must be the same on all routers in the OSPFv3 network.

   ```
   ipv6 ospf dead-interval seconds
   ```

4. Change the time interval in seconds between hello-packet transmission in INTERFACE mode, from 1 to 65535. The default is 10. The hello interval must be the same on all routers in the OSPFv3 network.

   ```
   ipv6 ospf hello-interval seconds
   ```

   NOTE: When you copy and paste the `ip ospf dead-interval` and `ip ospf hello-interval` commands from the `show running configuration` output, the changes may not take effect if the configured dead interval is less than the default hello interval. This does not cause any issues while you save the configuration and reload the switch.

5. Change the priority of the interface, which determines the DR for the OSPFv3 broadcast network in INTERFACE mode, from 0 to 255. The default is 1.

   ```
   ipv6 ospf priority number
   ```

6. Change the default setting to ignore the MTU mismatch with the peer, when the MTU size of the peer interface is higher than the local MTU size.

   ```
   ipv6 ospf mtu-ignore
   ```

Change the OSPFv3 interface parameters

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ipv6 ospf hello-interval 5
OS10(conf-if-eth1/1/1)# ipv6 ospf dead-interval 20
OS10(conf-if-eth1/1/1)# ipv6 ospf priority 4
OS10(conf-if-eth1/1/1)# ipv6 ospf mtu-ignore
```

View the OSPFv3 interface parameters

```
OS10# show ipv6 ospf interface
ethernet1/1/1 is up, line protocol is up
  Link Local Address fe80::20c:29ff:fe0a:d59/64, Interface ID 5
  Area 0.0.0.0, Process ID 200, Instance ID 0, Router ID 10.0.0.2
  Network Type broadcast, Cost: 1
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router on this network is 2.2.2.2
  Backup Designated router on this network is 10.0.0.2 (local)
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Neighbor Count is 1, Adjacent neighbor count is 1
    Adjacent with neighbor 2.2.2.2(Designated Router)
OS10# do show running-configuration ospfv3
!
interface ethernet1/1/9
ipv6 ospf 1 area 0.0.0.0
ipv6 ospf dead-interval 20
ipv6 ospf hello-interval 5
ipv6 ospf mtu-ignore
```

Default route

You can generate an external default route and distribute the default information to the OSPFv3 routing domain.

- Generate the default route, using the `default-information originate [always]` command in ROUTER-OSPFv3 mode.

Configure default route

```
OS10(config)# router ospfv3 100
OS10(config-router-ospf-100)# default-information originate always
```

View default route configuration

```

OSPFv3 IPsec authentication and encryption

Unlike OSPFv2, OSPFv3 does not have authentication fields in its protocol header to provide security. To provide authentication and confidentiality, OSPFv3 uses IP Security (IPsec) — a collection of security protocols for authenticating and encrypting data packets. OS10 OSPFv3 supports IPsec using the IPv6 authentication header (AH) or IPv6 encapsulating security payload (ESP).

- AH authentication verifies that data is not altered during transmission and ensures that users are communicating with the intended individual or organization. The authentication header is inserted after the IP header with a value of 51. MD5 and SHA1 authentication types are supported; encrypted and unencrypted keys are supported.
- ESP encryption encapsulates data, enabling data protection that follows in the datagram. The ESP extension header is inserted after the IP header and before the next layer protocol header. 3DES, DES, AES-CBC, and NULL encryption algorithms are supported; encrypted and unencrypted keys are supported.

Apply IPsec authentication or encryption on a physical, port-channel, or VLAN interface or in an OSPFv3 area. Each configuration consists of a security policy index (SPI) and the OSPFv3 packets validation key. After you configure an IPsec protocol for OSPFv3, IPsec operation is invisible to the user.

You can only enable one authentication or encryption security protocol at a time on an interface or for an area. Enable IPsec AH using the `ipv6 ospf authentication` command; enable IPsec ESP with the `ipv6 ospf encryption` command.

- A security policy configured for an area is inherited on all interfaces in the area by default.
- A security policy configured on an interface overrides any area-level configured security for the area where the interface is assigned.
- The configured authentication or encryption policy applies to all OSPFv3 packets transmitted on the interface or in the area. The IPsec security associations are the same on inbound and outbound traffic on an OSPFv3 interface.
- There is no maximum AH or ESP header length because the headers have fields with variable lengths.

Configure IPsec authentication on interfaces

Prerequisite: Before you enable IPsec authentication on an OSPFv3 interface, first enable IPv6 unicast routing globally, then enable OSPFv3 on the interface, and assign it to an area.

The SPI value must be unique to one IPsec authentication or encryption security policy on the router. You cannot configure the same SPI value on another interface even if it uses the same authentication or encryption algorithm.

You cannot use an IPsec MD5 or SHA-1 authentication type and the `null` setting at same time on an interface. These settings are mutually exclusive.

- Enable IPsec authentication for OSPFv3 packets in Interface mode.

  ```
  ipv6 ospf authentication {null | ipsec spi number {MD5 | SHA1} key}
  ```

  - `null` — Prevent an authentication policy configured for the area to be inherited on the interface. Only use this parameter if you configure IPsec area authentication.
  - `ipsec spi number` — Enter a unique security policy index (SPI) value, from 256 to 4294967295.
  - `md5` — Enable message digest 5 (MD5) authentication.
  - `sha1` — Enable secure hash algorithm 1 (SHA-1) authentication.

- *key* — Enter the text string used in the authentication type. All neighboring OSPFv3 routers must share the key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA-1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

To delete an IPsec authentication policy, use the `no ipv6 ospf authentication ipsec spi number` or `no ipv6 ospf authentication null` command.

Configure IPsec authentication on interface

```
OS10(conf-if-eth1/1/1)# ipv6 ospf authentication ipsec spi 400 md5
12345678123456781234567812345678
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
ipv6 ospf authentication ipsec spi 400 md5 12345678123456781234567812345678
no switchport
no shutdown
ipv6 address 1::1/64
```

IPsec encryption on interfaces

Prerequisite: Before you enable IPsec encryption on an OSPFv3 interface, enable IPv6 unicast routing globally, enable OSPFv3 on the interface, and assign it to an area.

When you configure encryption on an interface, both IPsec encryption and authentication are enabled. You cannot configure encryption if you have already configured an interface for IPsec authentication using the `ipv6 ospf authentication ipsec` command. To configure encryption, you must first delete the authentication policy.

- Enable IPsec encryption for OSPFv3 packets in Interface mode.

```
ipv6 ospf encryption ipsec spi number esp encryption-type
key authentication-type key
```

  - `ipsec spi number` — Enter a unique security policy index (SPI) value, from 256 to 4294967295.
  - `esp encryption-type key` — Enter the encryption algorithm used with ESP (3DES, DES, AES-CBC, or NULL). For AES-CBC, only the AES-128 and AES-192 ciphers are supported.
  - *key* — Enter the text string used in the encryption algorithm. All neighboring OSPFv3 routers must share the key to decrypt information. Only a non-encrypted key is supported. Required lengths of the non-encrypted key are: 3DES — 48 hex digits; DES — 16 hex digits; AES-CBC — 32 hex digits for AES-128 and 48 hex digits for AES-192.
  - *authentication-type key* — Enter the encryption authentication MD5 or SHA1 algorithm to use.
  - *key* — Enter the text string used in the authentication algorithm. All neighboring OSPFv3 routers must share the key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

To delete an IPsec encryption policy, use the `no ipv6 ospf encryption ipsec spi number` or `no ipv6 ospf encryption null` command.

Configure IPsec encryption on interface

```
OS10(conf-if-eth1/1/1)# ipv6 ospf encryption ipsec spi 500 esp des 1234567812345678 md5
12345678123456781234567812345678
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
ipv6 ospf encryption ipsec spi 500 esp des 1234567812345678 md5
12345678123456781234567812345678
no switchport
no shutdown
ipv6 address 1::1/64
```

Configure IPsec authentication for OSPFv3 area

Prerequisite: Before you enable IPsec authentication for an OSPFv3 area, enable OSPFv3 globally on the router.

- Enable IPsec authentication for OSPFv3 packets in an area in Router-OSPFv3 mode.

```
area area-id  authentication ipsec spi number {MD5 | SHA1} key
```

  - `area area-id` — Enter an area ID as a number or IPv6 prefix.
  - `ipsec spi number` — Enter a unique security policy index (SPI) value, from 256 to 4294967295.
  - `md5` — Enable message digest 5 (MD5) authentication.
  - `sha1` — Enable secure hash algorithm 1 (SHA1) authentication.
  - `key` — Enter the text string used in the authentication type. All OSPFv3 routers in the area share the key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

To delete an IPsec area authentication policy, use the `no area area-id authentication ipsec spi number` command.

Configure IPsec authentication for an OSPfv3 area

```
OS10(config-router-ospfv3-100)# area 1 authentication ipsec spi 400 md5
12345678123456781234567812345678
OS10(config-router-ospfv3-100)# show configuration
!
router ospfv3 100
area 0.0.0.1 authentication ipsec spi 400 md5 12345678123456781234567812345678
```

IPsec encryption for OSPV3 area

Prerequisite: Before you enable IPsec encryption for an OSPFv3 area, first enable OSPFv3 globally on the router.

When you configure encryption at the area level, both IPsec encryption and authentication are enabled. You cannot configure encryption if you have already configured an IPsec area authentication using the `area ospf authentication ipsec` command. To configure encryption, you must first delete the authentication policy.

- Enable IPsec encryption for OSPFv3 packets in an area in Router-OSPFv3 mode.

```
area area-id  encryption ipsec spi number esp encryption-type key
authentication-type key
```

  - `area area-id` — Enter an area ID as a number or IPv6 prefix.
  - `ipsec spi number` — Enter a unique security policy index (SPI) value, from 256 to 4294967295.
  - `esp encryption-type` — Enter the encryption algorithm used with ESP (3DES, DES, AES-CBC, or NULL). For AES-CBC, only the AES-128 and AES-192 ciphers are supported.
  - `key` — Enter the text string used in the encryption algorithm. All neighboring OSPFv3 routers must share the key to decrypt information. Only a non-encrypted key is supported. Required lengths of the non-encrypted key are: 3DES — 48 hex digits; DES — 16 hex digits; AES-CBC — 32 hex digits for AES-128 and 48 hex digits for AES-192.
  - `authentication-type` — Enter the encryption authentication MD5 or SHA1 algorithm to use.
  - `key` — Enter the text string used in the authentication algorithm. All neighboring OSPFv3 routers must share the key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

To delete an IPsec encryption policy, use the `no area area-id encryption ipsec spi number` command.

Configure IPsec encryption for OSPFv3 area

```
OS10(config-router-ospfv3-100)# area 1 encryption ipsec spi 401 esp des 1234567812345678
md5
12345678123456781234567812345678
OS10(config-router-ospfv3-100)# show configuration
!
router ospfv3 100
area 0.0.0.1 encryption ipsec spi 401 esp des 1234567812345678 md5
12345678123456781234567812345678
```

Support for OSPFv3 route summarization

This feature allows administrators to summarize OSPFv3 routes at the autonomous system boundary router (ASBR) level - summary-address and at the area boundary router (ABR) level - area range.

Route summarization helps reduce the size of the routing tables and also the number of link state advertisements (LSAs) that advertise.

This feature also summarizes a specific set of routes and advertises only the summary route to peer device.

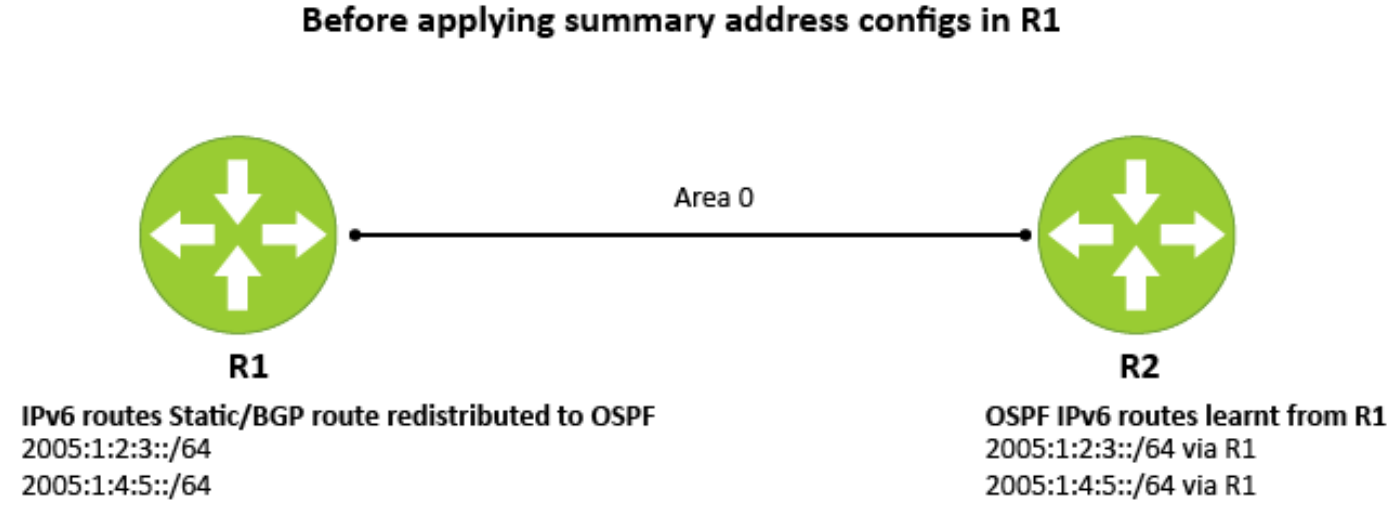
Route summarization is a key feature that helps scaling the OSPFv3 network. You must apply the area range on ABRs while summarizing routes between OSPFv3 areas using Type3 LSAs. You must also apply the summary-address on ASBRs while summarizing externally redistributed routes from another protocol domain, such as BGP or static, using Type5 or Type7 LSAs.

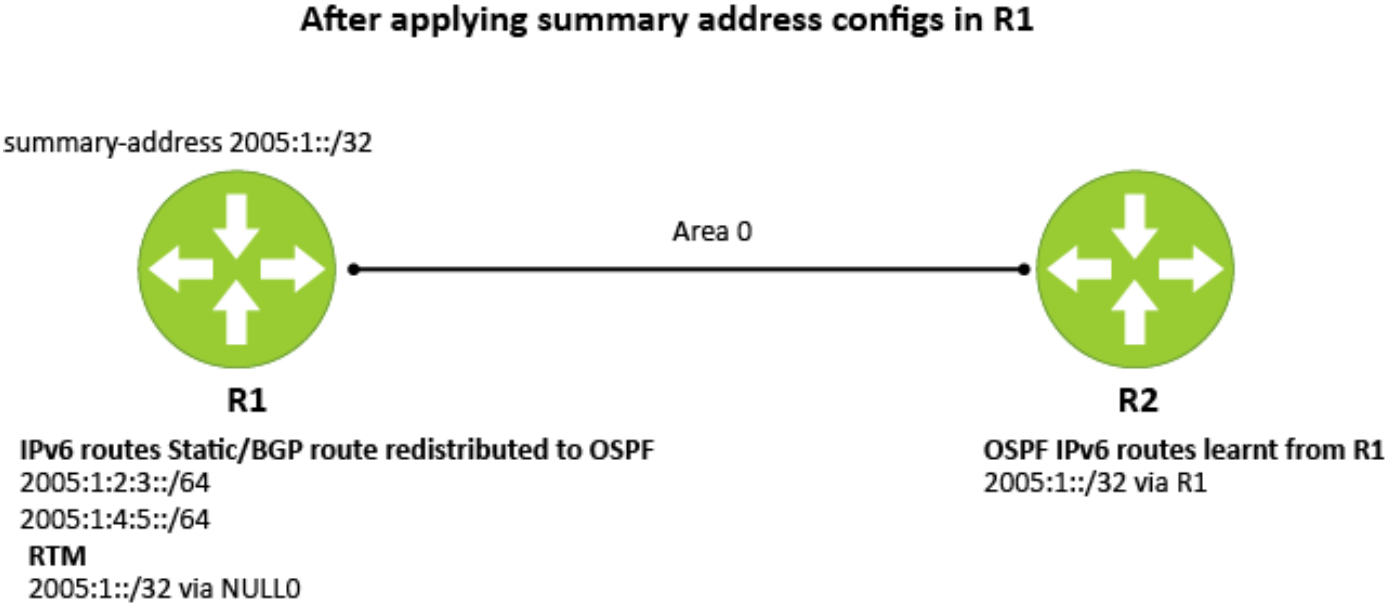
During route summarization the following interactions occur between the subsystems:

- Routing - Routes are summarized at the ASBR level using the `summary-address` command and at the ABR level using the `area range` command.
- VRF - Configuration of summary addresses and area ranges are supported for all VRF instances.

Use case 1 - Route summarization at the ASBR router

This use case describes route summarization at the ASBR router using summary address configuration.





Before applying the `summary-address` command, individual routes (2005:1:2:3::/64 and 2005:1:4::/64) were advertised from Router R1 to R2.

After you apply route summarization, a single summarized route 2005:1::/32 is advertised to R2.

After you apply route summarization, summary route with special next hop `NULL0` is installed in the RTM, Linux, and the NPU to block the summary route for the summary prefix.

Configuration on router R1

- Without summary address configuration:

```
!
router ospfv3 10
redistribute static
```

- After configuring summary address configuration:

```
!
router ospfv3 10
```

```
summary-address 2005:1::/32
redistribute static
```

- Summary address with tag option:

```
!
router ospfv3 10
summary-address 2005:1::/32 tag 300
redistribute static
```

- Summary address with "not-advertise" option:

```
!
router ospfv3 10
summary-address 2005:1::/32 not-advertise
redistribute static
```

- No form of not-advertise option:

```
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
summary-address 2005:1::/32 not-advertise
redistribute static
OS10(config-router-ospfv3-10)# no summary-address 2005:1::/32 not-advertise

OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
summary-address 2005:1::/32
redistribute static

No form of "summary address <prefix> not-advertise" is equivalent to "summary address
<prefix>"
```

RTM routes at router R1

- ```
  OS10# show ipv6 route

  ```

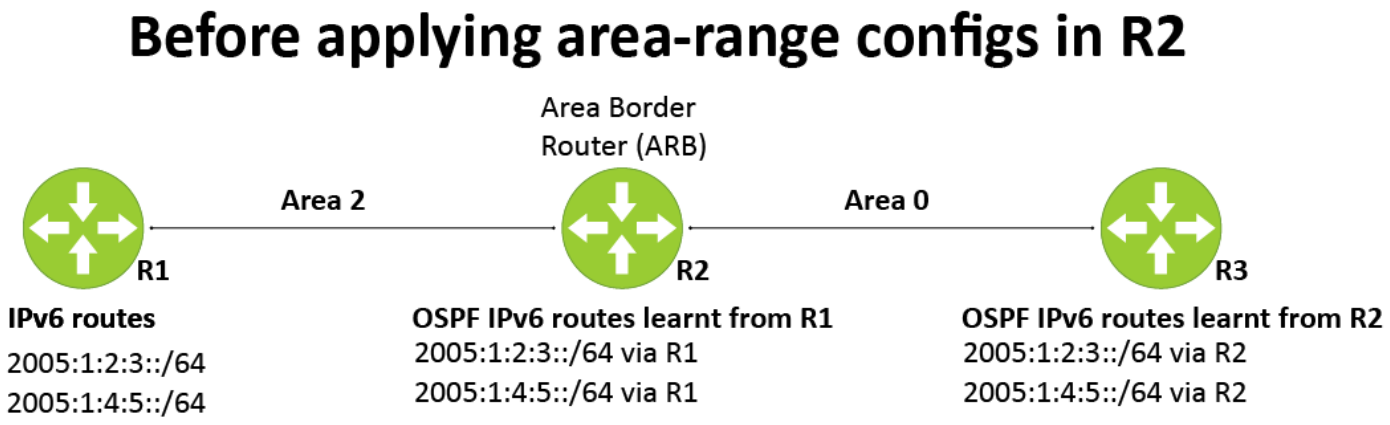
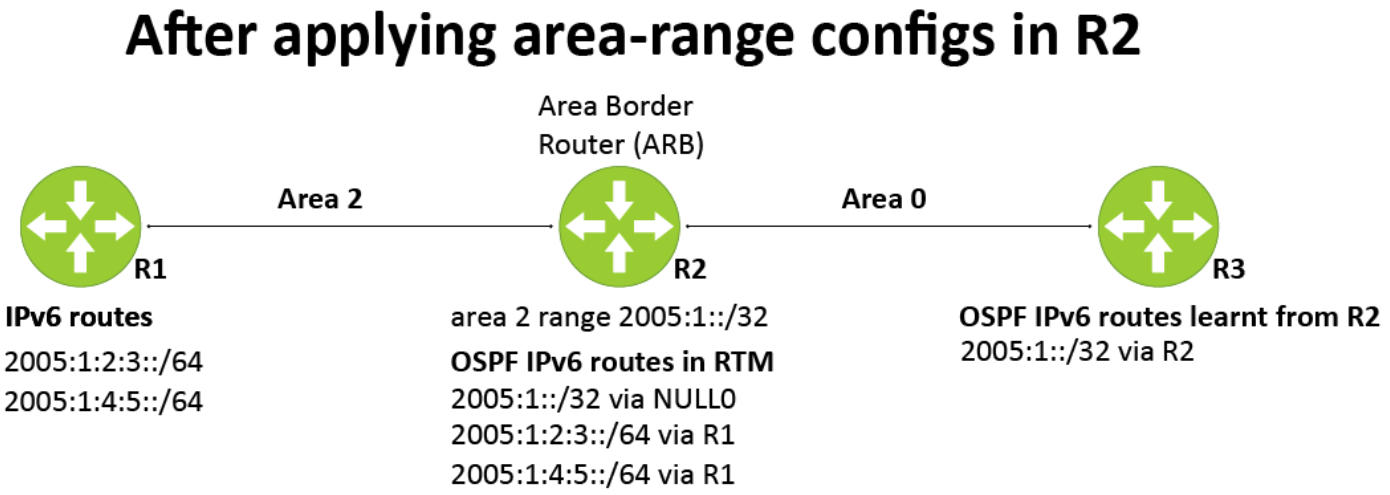
Use case 2 - Route summarization at the ABR router

This use case describes route summarization at the ABR router using the area range configuration.





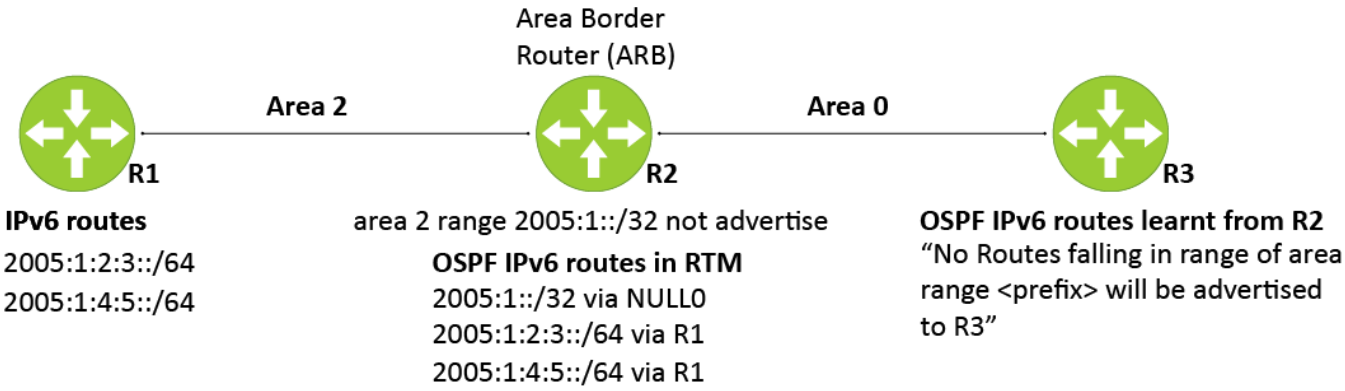
After configuring the `area range` command on Router R2 all the interarea routes are summarized.

In the previous configuration without an area range, interarea routes 2005:1:2:3::/64 and 2005:1:4:5::/64 are advertised from R2 to R3.

After configuring the `area range` command, only the summarized route (2005:1::/32) is advertised from R2 to R3.

The following depicts the `no` form of the `not-advertise` option:
  ```

After applying area-range not advertise configs in R2



Configuration on router R2

- Without area range configuration:

```
!
router ospfv3 10
```

- After configuring area range configuration

```
!
router ospfv3 10
area 1.1.1.1 range 2005:1::/32
```

- area range with `not-advertise` option

```
OS10(config-router-ospfv3-10)# area 1.1.1.1 range

2005:1::/32 not-advertise
!
router ospfv3 10
area 1.1.1.1 range 2005:1::/32 not-advertise
```

- No form of `not-advertise` option

```
OS10(config-router-ospfv3-10)# no area 1.1.1.1
range 2005:1::/32 not-advertise
OS10(config-router-ospfv3-10)# show
configuration
!
router ospfv3 10
area 1.1.1.1 range 2005:1::/32
No form of "area <area-id> <prefix>
 not-advertise" is equivalent
 to "area <area-id> <prefix>"
```

RTM routes at router R2

Troubleshoot OSPFv3

You can troubleshoot OSPFv3 operations and check questions for typical issues that interrupt a process.

- Is OSPFv3 enabled globally?
- Is OSPFv3 enabled on the interface?
- Are adjacencies established correctly?
- Are the interfaces configured for L3 correctly?
- Is the router in the correct area type?
- Are the OSPF routes included in the OSPF database?
- Are the OSPF routes included in the routing table in addition to the OSPF database?
- Are you able to ping the link-local IPv6 address of adjacent router interface?

Troubleshooting OSPFv3 with show Commands

- View a summary of all OSPF process IDs enabled in EXEC mode.

  ```
  show running-configuration ospfv3
  ```

- View summary information of IP routes in EXEC mode.

  ```
  show ipv6 route summary
  ```

- View summary information for the OSPF database in EXEC mode.

```
show ipv6 ospf database
```

- View the configuration of OSPF neighbors connected to the local router in EXEC mode.

```
show ipv6 ospf neighbor
```

View OSPF Configuration

```
OS10# show running-configuration ospfv3
!
interface ethernet1/1/1
ip ospf 100 area 0.0.0.0
!
router ospf 100
log-adjacency-changes
```

OSPFv3 Commands

area authentication

Configures authentication for an OSPFv3 area.

Syntax `area area-id authentication ipsec spi number {MD5 | SHA1} key`

Parameters

- `area area-id` — Enter an area ID as a number or IPv6 prefix.
- `ipsec spi number` — Enter a unique security policy index (SPI) value, from 256 to 4294967295.
- `md5` — Enable MD5 authentication.
- `sha1` — Enable SHA1 authentication.
- `key` — Enter the text string used in the authentication type.

Default OSPFv3 area authentication is not configured.

Command Mode ROUTER-OSPFv3

Usage Information

- Before you enable IPsec authentication for an OSPFv3 area, you must enable OSPFv3 globally on each router.
- All OSPFv3 routers in the area must share the same authentication key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

Example

```
OS10(config-router-ospfv3-100)# area 1 authentication ipsec spi 400 md5
12345678123456781234567812345678
```

Supported Releases 10.4.0E(R1) or later

area encryption

Configures encryption for an OSPFv3 area.

Syntax `area area-id encryption ipsec spi number esp encryption-type key authentication-type key`

Parameters

- `area area-id` — Enter an area ID as a number or IPv6 prefix.
- `ipsec spi number` — Enter a unique security policy index number, from 256 to 4294967295.
- `esp encryption-type` — Enter the encryption algorithm used with ESP (3DES, DES, AES-CBC, or NULL). For AES-CBC, only the AES-128 and AES-192 ciphers are supported.
- `key` — Enter the text string used in the encryption algorithm.
- `authentication-type` — Enter the encryption authentication MD5 or SHA1 algorithm to use.

- *key* — Enter the text string used in the authentication algorithm.

Default OSPFv3 area encryption is not configured.

Command Mode ROUTER-OSPFv3

Usage Information
- Before you enable IPsec encryption for an OSPFv3 area, you must enable OSPFv3 globally on each router.
- When you configure encryption at the area level, both IPsec encryption and authentication are enabled. You cannot configure encryption if you have already configured an IPsec area authentication using the `area ospf authentication ipsec` command. To configure encryption, you must first delete the authentication policy.
- All OSPFv3 routers in the area must share the same encryption key to decrypt information. Only a non-encrypted key is supported. Required lengths of the non-encrypted key are: 3DES — 48 hex digits; DES — 16 hex digits; AES-CBC — 32 hex digits for AES-128 and 48 hex digits for AES-192.
- All OSPFv3 routers in the area must share the same authentication key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

Example

```
OS10(config-router-ospfv3-100)# area 1 encryption ipsec spi 401 esp des
1234567812345678 md5
12345678123456781234567812345678
```

Supported Releases 10.4.0E(R1) or later

area range

Summarizes routes matching an IPv6 address and mask at an area in ABRs.

Syntax `area area-id range A::B/mask [no-advertise]`

Parameters
- *area-id*—Set the OSPF area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- *A::B/mask*—Enter an IPv6 address and mask in dotted decimal format.
- `no-advertise`—(Optional) Set the status to *Do Not Advertise*. The Type 3 summary-LSA is suppressed, and the component networks remain hidden from other areas.

Default Not configured

Security and Access `netadmin`, `sysadmin`, and `secadmin`

Command Mode OSPFv3-CONFIGURATION-MODE

Usage Information You can use this command to summarize routes at the ABR level. Summarized route must be installed in the RTM and advertised over OSPFv3 neighbors at the area border router level (ABR). The `not-advertise` option in the `range` command must suppress advertising of the specified summary route. It does not advertise the configured ABR summary route along with individual routes that fall under the summary route. Default behavior is advertise (set to TRUE. Type 3 summary-LSA is suppressed, and the component networks remain hidden from other areas). The `no` version of this command disables route summarizations.

Example

```
OS10(config-router-ospfv3-10)# area 1.1.1.1 range 101::/16
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16

OS10(config-router-ospfv3-10)# area 1.1.1.1 range 101::/16 not-advertise
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16 not-advertise

OS10(config-router-ospfv3-10)# no area 1.1.1.1 range 101::/16 not-
```

```
advertise
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
area 1.1.1.1 range 101::/16
```

Supported Releases 10.5.3.0 or later

area stub

Defines an area as the OSPF stub area.

Syntax `area area-id stub [no-summary]`

Parameters

- *area-id*—Set the OSPFv3 area ID as an IP address in A.B.C.D format or number, from 1 to 65535.
- `no-summary`—(Optional) Prevents an ABR from sending summary LAs into the stub area.

Default Not configured

Command Mode ROUTER-OSPFv3

Usage Information The `no` version of this command deletes a stub area.

Example

```
OS10(config)# router ospfv3 10
OS10(conf-router-ospfv3-10)# area 10.10.1.5 stub
```

Supported Releases 10.3.0E or later

auto-cost reference-bandwidth

Calculates default metrics for the interface based on the configured auto-cost reference bandwidth value.

Syntax `auto-cost reference-bandwidth value`

Parameters *value* — Enter the reference bandwidth value to calculate the OSPFv3 interface cost in megabits per second, from 1 to 4294967.

Default 100000

Command Mode ROUTER-OSPFv3

Usage Information The value set by the `ipv6 ospf cost` command in INTERFACE mode overrides the cost resulting from the `auto-cost` command. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# router ospfv3 100
OS10(config-router-ospfv3-100)# auto-cost reference-bandwidth 150
```

Supported Releases 10.3.0E or later

clear ipv6 ospf process

Clears all OSPFv3 routing tables.

Syntax `clear ipv6 ospf {instance-number} [vrf vrf-name] process`

Parameters

- *instance-number* — Enter an OSPFv3 instance number, from 1 to 65535.
- `vrf` *vrf-name* — (Optional) Enter the keyword `vrf` followed by the name of the VRF to clear OSPFv3 processes in that VRF.

Default Not configured

Command Mode	EXEC
Usage Information	None
Example	`OS10# clear ipv6 ospf 3 process`
Supported Releases	10.3.0E or later

clear ipv6 ospf statistics

Clears OSPFv3 traffic statistics.

Syntax	`clear ipv6 ospf [instance-number] [vrf vrf-name] statistics`
Parameters	• *instance-number* — (Optional) Enter an OSPFv3 instance number, from 1 to 65535. • `vrf` *vrf-name* — (Optional) Enter the keyword vrf followed by the name of the VRF to clear OSPFv3 statistics in that VRF.
Default	Not configured
Command Mode	EXEC
Usage Information	This command clears the OSPFv3 traffic statistics in a specified instance or in all the configured OSPFv3 instances, and resets them to zero.
Example	`OS10# clear ipv6 ospf 100 statistics`
Supported Releases	10.4.0E(R1) or later

debug ip ospfv3

Enables Open Shortest Path First version 3(OSPFv3) debugging and displays messages related to processing of OSPFv3.

Syntax	`debug ip ospfv3`
Parameters	None
Defaults	None
Command Mode	EXEC
Usage Information	The `no debug ip ospfv3` command stops displaying messages related to processing of OSPFv3.
Example	`debug ip ospfv3`
Supported Releases	OS10 legacy command.

default-information originate

Generates and distributes a default external route information to the OSPFv3 routing domain.

Syntax	`default-information originate [always]`
Parameters	`always` — (Optional) Always advertise the default route.
Defaults	Disabled
Command Mode	ROUTER-OSPFv3

Usage Information	The `no` version of this command disables the distribution of default route.
Example	`OS10(config)# router ospfv3 100` `OS10(config-router-ospfv3-100)# default-information originate always`
Supported Releases	10.3.0E or later

ipv6 ospf area

Attaches an interface to an OSPF area.

Syntax	`ipv6 ospf` *process-id* `area` *area-id*
Parameters	• *process-id*—Enter an OSPFv3 process ID for a specific OSPFv3 process, from 1 to 65535. • `area-id`—Enter the OSPFv3 area ID in dotted decimal A.B.C.D format or enter an area ID number, from 1 to 65535.
Default	Not configured
Command Mode	INTERFACE
Usage Information	The `no` version of this command removes an interface from an OSPFv3 area.
Example	`OS10(config)# interface vlan 10` `OS10(conf-if-vl-10)# ipv6 ospf 10 area 1`
Supported Releases	10.3.0E or later

ipv6 ospf authentication

Configures OSPFv3 authentication on an IPv6 interface.

Syntax	`ipv6 ospf authentication {null | ipsec spi` *number* `{MD5 | SHA1}` *key*`}`
Parameters	• `null` — Prevents area authentication from being inherited on the interface. • `ipsec spi` *number* — Enter a unique security policy index number, from 256 to 4294967295. • `md5` — Enable MD5 authentication. • `sha1` — Enable SHA1 authentication. • *key* — Enter the text string used by the authentication type.
Default	IPv6 OSPF authentication is not configured on an interface.
Command Mode	INTERFACE
Usage Information	• Before you enable IPsec authentication on an OSPFv3 interface, you must enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign it to an area. • The SPI value must be unique to one IPsec authentication or encryption security policy on the router. You cannot configure the same SPI value on another interface even if it uses the same authentication or encryption algorithm. • You cannot use an IPsec MD5 or SHA1 authentication type and the `null` setting at same time on an interface. These settings are mutually exclusive. • All neighboring OSPFv3 routers must share the key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

Example

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# ipv6 ospf authentication ipsec spi 400 md5
12345678123456781234567812345678
```

Supported Releases 10.4.0E(R1) or later

ipv6 ospf cost

Changes the cost associated with the OSPFv3 traffic on an interface

Syntax `ipv6 ospf cost cost`

Parameters *cost* — Enter a value as the OSPFv3 cost for the interface, from 1 to 65335.

Default Based on bandwidth reference

Command Mode INTERFACE

Usage Information If not configured, the interface cost is based on the `auto-cost` command. This command configures OSPFv3 over multiple vendors to ensure that all routers use the same cost value. The `no` version of this command removes the IPv6 OSPF cost configuration.

Example

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# ipv6 ospf cost 10
```

Supported Releases 10.3.0E or later

ipv6 ospf dead-interval

Sets the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

Syntax `ipv6 ospf dead-interval seconds`

Parameters *seconds* — Enter the dead interval value in seconds, from 1 to 65535.

Default 40 seconds

Command Mode INTERFACE

Usage Information The dead interval is four times the default hello-interval by default. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# ipv6 ospf dead-interval 10
```

Supported Releases 10.3.0E or later

ipv6 ospf encryption

Configures OSPFv3 encryption on an IPv6 interface.

Syntax `ipv6 ospf encryption {ipsec spi number esp encryption-type key authentication-type key | null}`

Parameters

- `ipsec spi number` — Enter a unique security policy index number, from 256 to 4294967295.
- `esp encryption-type` — Enter the encryption algorithm used with ESP (3DES, DES, AES-CBC, or NULL). For AES-CBC, only the AES-128 and AES-192 ciphers are supported.
- *key* — Enter the text string used in the encryption algorithm.

- *authentication-type* — Enter the encryption MD5 or SHA1 authentication algorithm to use.
- *key* — Enter the text string used in the authentication algorithm.
- null — Enter the keyword to not use the IPsec encryption.

Default IPv6 OSPF encryption is not configured on an interface.

Command Mode INTERFACE

Usage Information
- Before you enable IPsec authentication on an OSPFv3 interface, you must enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign it to an area.
- When you configure encryption on an interface, both IPsec encryption and authentication are enabled. You cannot configure encryption if you have already configured an interface for IPsec authentication using the `ipv6 ospf authentication ipsec` command. To configure encryption, you must first delete the authentication policy.
- All neighboring OSPFv3 routers must share the same encryption key to decrypt information. Only a non-encrypted key is supported. Required lengths of the non-encrypted key are: 3DES — 48 hex digits; DES — 16 hex digits; AES-CBC — 32 hex digits for AES-128 and 48 hex digits for AES-192.
- All neighboring OSPFv3 routers must share the same authentication key to exchange information. Only a non-encrypted key is supported. For MD5 authentication, the non-encrypted key must be 32 plain hex digits. For SHA1 authentication, the non-encrypted key must be 40 hex digits. An encrypted key is not supported.

Example

```
OS10(config)# interface ethernet 1/1/6
OS10(conf-if-eth1/1/6)# ipv6 ospf encryption ipsec spi 500 esp des
1234567812345678 md5 12345678123456781234567812345678
```

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# ipv6 ospf encryption null
```

Supported Releases 10.4.0E(R1) or later

ipv6 ospf hello-interval

Sets the time interval between hello packets sent on an interface.

Syntax `ipv6 ospf hello-interval seconds`

Parameters *seconds* — Enter the hello-interval value in seconds, from 1 to 65535.

Default 10 seconds

Command Mode INTERFACE

Usage Information All routers in a network must have the same hello time interval between the hello packets. The `no` version of the this command resets the value to the default.

Example

```
OS10(config)# interface vlan 10
OS10(conf-if-vl-10)# ipv6 ospf hello-interval 30
```

Supported Releases 10.3.0E or later

ipv6 ospf mtu-ignore

Disables MTU size detection on received Database Descriptor (DBD) packets when forming OSPFv3 adjacency.

Syntax `ipv6 ospf mtu-ignore`

Parameters None

Default Not configured

Command Mode INTERFACE

Usage Information	If the MTU size of the peer interface is greater than the local interface, switches that run OSPFv3 do not form adjacencies with neighbors. Use this command to override this behavior and form adjacency. If you try to disable a neighborship using the `no ipv6 ospf mtu-ignore` command after a neighborship is formed using the `ipv6 ospf mtu-ignore` command, the neighborship still continues. To remove a neighborship after it is formed using the `ipv6 ospf mtu-ignore` command, use the `clear ipv6 ospf process` command.
Example	`OS10(conf-if-eth1/1/17)# ipv6 ospf mtu-ignore`
Supported Releases	10.5.1.0 or later

ipv6 ospf network

Sets the network type for the interface.

Syntax	`ipv6 ospf network {point-to-point | broadcast}`
Parameters	• `point-to-point` — Sets the interface as part of a point-to-point network. • `broadcast` — Sets the interface as part of a broadcast network.
Default	Broadcast
Command Mode	INTERFACE
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ipv6 ospf network broadcast`
Supported Releases	10.3.0E or later

ipv6 ospf passive

Configures an interface as a passive interface and suppresses both receiving and sending routing updates to the passive interface.

Syntax	`ipv6 ospf passive`
Parameters	None
Default	Not configured
Command Mode	INTERFACE
Usage Information	You must configure the interface before setting the interface to passive mode. The `no` version of the this command disables Passive interface configuration. **NOTE:** As loopback interfaces are implicitly passive, the configuration to suppress sending and receiving of OSPF routing updates does not take effect on the loopback interfaces. However, network information corresponding to these loopback interfaces is still announced in OSPF LSAs that are sent through other interfaces configured for OSPF.
Example	`OS10(config)# interface ethernet 1/1/6` `OS10(conf-if-eth1/1/6)# ipv6 ospf passive`
Supported Releases	10.3.0E or later

ipv6 ospf priority

Sets the priority of the interface to determine the DR for the OSPFv3 network.

Syntax	`ipv6 ospf priority number`
Parameters	*number* — Enter a router priority number, from 0 to 255.
Default	1
Command Mode	INTERFACE
Usage Information	When two routers attached to a network attempt to become the DR, the one with the higher router priority takes precedence. The `no` version of this command resets the value to the default.
Example	`OS10(config)# interface ethernet 1/1/6` `OS10(conf-if-eth1/1/6)# ipv6 ospf priority 4`
Supported Releases	10.3.0E or later

log-adjacency-changes

Enables logging of syslog messages about changes in the OSPFv3 adjacency state.

Syntax	`log-adjacency-changes`
Parameters	None
Default	Disabled
Command Mode	ROUTER-OSPFv3
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# router ospfv3 100` `OS10(config-router-ospfv3-100)# log-adjacency-changes`
Supported Releases	10.3.0E or later

maximum-paths

Enables forwarding of packets over multiple paths.

Syntax	`maximum–paths number`
Parameters	*number* —Enter the number of paths for OSPFv3, from 1 to 128.
Default	Disabled
Command Mode	ROUTER-OSPFv3
Usage Information	The `no` version of this command resets the value to the default.
Example	`OS10(config)# router ospfv3` `OS10(config-router-ospfv3-100)# maximum-paths 1`
Supported Releases	10.3.0E or later

redistribute

Redistributes information from another routing protocol or routing instance to the OSPFv3 process.

Syntax

```
redistribute {bgp as-number | connected | static} [route-map route-map name]
```

Parameters

- *as-number* — Enter an autonomous number to redistribute BGP routing information throughout the OSPFv3 instance, from 1 to 4294967295 (4 Byte) or 0.1 to 65535.65535 (dotted format).
- *route-map name* — Enter the name of a configured route-map.
- connected — Enter the information from the connected active routes on interfaces to redistribute.
- static — Enter the information from static routes on interfaces redistribute.

Defaults

Not configured

Command Mode

ROUTER-OSPFv3

Usage Information

The no version of this command disables the redistribute configuration.

Example

```
OS10(config)# router ospfv3 100
OS10(config-router-ospfv3-100)# redistribute bgp 4 route-map dell1
```

Example (Connected)

```
OS10((config-router-ospfv3-100)# redistribute connected route-map dell2
```

Example (AS number notation in asdot+ format)

```
OS10(config)# router ospfv3 100
OS10(config-router-ospfv3-100)# redistribute bgp 0.100
```

Supported Releases

10.3.0E or later

router-id

Configures a fixed router ID for the OSPFv3 process.

Syntax

```
router-id ip-address
```

Parameters

ip-address — Enter the IP address of the router as the router ID.

Default

Not configured

Command Mode

ROUTER-OSPFv3

Usage Information

Configure an arbitrary value in the IP address format for each router. Each router ID must be unique. Use the fixed router ID for the active OSPFv3 router process. Changing the router ID brings down the existing OSPFv3 adjacency. The new router ID becomes effective immediatley. The no version of this command disables the router ID configuration.

Example

```
OS10(config)# router ospfv3 10
OS10(config-router-ospfv3-100)# router-id 10.10.1.5
```

Supported Releases

10.3.0E or later

router ospfv3

Enters Router OSPFv3 mode and configures an OSPFv3 instance.

Syntax

```
router ospfv3 instance-number [vrf vrf-name]
```

Parameters

- *instance-number*—Enter a router OSPFv3 instance number, from 1 to 65535.

- `vrf vrf-name` — Enter the keyword `vrf` followed by the name of the VRF to configure an OSPFv3 instance in that VRF.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command deletes an OSPFv3 instance.

Example

```
OS10(config)# router ospfv3 10 vrf vrf-test
```

Supported Releases 10.3.0E or later

show ipv6 ospf

Displays OSPFv3 instance configuration information.

Syntax `show ipv6 ospf [instance-number]`

Parameters *instance-number* — (Optional) View OSPFv3 information for a specified instance number, from 1 to 65535.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 ospf
Routing Process ospfv3 200 with ID 1.1.1.1
It is an Area Border Router
Min LSA origination 5000 msec, Min LSA arrival 1000 msec
Min LSA hold time 0 msec, Max LSA wait time 0 msec
Number of area in this router is 2, normal 2 stub 0 nssa
   Area  (0.0.0.0)
       Number of interface in this area is 1
       SPF algorithm executed 42 times
   Area  (0.0.0.1)
       Number of interface in this area is 1
       SPF algorithm executed 42 times
OS10# show ipv6 ospf 200
Routing Process ospfv3 200 with ID 10.0.0.2
Min LSA origination 5000 msec, Min LSA arrival 1000 msec
Min LSA hold time 0 msec, Max LSA wait time 0 msec
Number of area in this router is 1, normal 1 stub 0 nssa
   Area  (0.0.0.0)
       Number of interface in this area is 1
       SPF algorithm executed 3 times
```

```
OS10(config)# do show ipv6 ospf
Routing Process ospfv3 10 with ID 11.1.1.1
SPF schedule delay 1000 msecs, Hold time between two SPFs 10000 msecs
It is an Autonomous System Boundary Router
Min LSA origination 5000 msec, Min LSA arrival 1000 msec
Min LSA hold time 0 msec, Max LSA wait time 0 msec
Number of area in this router is 2, normal 2 stub 0 nssa
Area (0.0.0.0)
Number of interface in this area is 1
SPF algorithm executed 148 times
Area ranges are
10::/64
```

Supported Releases 10.3.0E or later

show ipv6 ospf database

Displays all LSA information. You must enable OSPFv3 to generate output.

Syntax

```
show ipv6 ospf process-id [vrf vrf-name] database
```

Parameters

- *process-id* — Enter the OSPFv3 process ID to view a specific process. If you do not enter a process ID, the command applies to all the configured OSPFv3 processes.
- `vrf` *vrf-name* — Enter `vrf` then the name of the VRF to display LSA information for that VRF.

Default

Not configured

Command Mode

EXEC

Usage Information

- `Link ID`—Identifies the router ID.
- `ADV Router`—Identifies the advertising router ID.
- `Age`—Displays the LS age.
- `Seq#`—Identifies the LS sequence number. This identifies old or duplicate LSAs.
- `Checksum`—Displays the Fletcher checksum of an LSA contents.
- `Link count`—Displays the number of interfaces for that router.
- `Rtr Count`—Displays the router count.
- `Dest RtrID`—Displays the destination router ID.
- `Interface`—Displays the interface type.
- `Prefix`—Displays the prefix details.

Example

```
OS10# show ipv6 ospf database
       OSPF Router with ID (10.0.0.2) (Process ID 200)
Router Link States (Area 0.0.0.0)
ADV Router      Age       Seq#        Fragment ID Link count Bits

         Tag

-------------------------------------------------------------------------
           11.1.1.1      436              0x8000008E    100:1:2::/64
     100
```

Supported Releases

10.3.0E or later

show ipv6 ospf interface

Displays the configured OSPFv3 interfaces. You must enable OSPFv3 to display the output.

Syntax `show ipv6 ospf interface interface [vrf vrf-name]`

Parameters

- *interface*—(Optional) Enter the interface information:
  - `ethernet`—Physical interface, from 1 to 48.
  - `port-channel`—Port-channel interface, from 1 to 999 or 1001 to 2000.
  - `vlan`—VLAN interface, from 1 to 4093.
- `vrf vrf-name`—(Optional) Enter the keyword `vrf` followed by the name of the VRF to display the configured OSPFv3 enabled interfaces in that VRF.

Default Not configured

Command Mode EXEC

Example

```
OS10# show ipv6 ospf interface
ethernet1/1/1 is up, line protocol is up
  Link Local Address fe80::20c:29ff:fe0a:d59/64, Interface ID 5
  Area 0.0.0.0, Process ID 200, Instance ID 0, Router ID 10.0.0.2
  Network Type broadcast, Cost: 1
  Transmit Delay is 1 sec, State BDR, Priority 1
  BFD enabled(Interface level) Interval 300 Min_rx 300 Multiplier 3 Role
Active
  Designated Router on this network is 2.2.2.2
  Backup Designated router on this network is 10.0.0.2 (local)
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
  Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 2.2.2.2(Designated Router)
```

Supported Releases 10.3.0E or later

show ipv6 ospf neighbor

Displays a list of OSPFv3 neighbors connected to the local router.

Syntax `show ipv6 ospf [vrf vrf-name] neighbor`

Parameters

- `vrf vrf-name` — Enter the keyword `vrf` followed by the name of the VRF to display a list of OSPFv3 neighbors in that VRF.

Default Not configured

Command Mode EXEC

Usage Information

- `Neighbor ID`—Displays the neighbor router ID.
- `Pri`—Displays the priority assigned neighbor.
- `State`—Displays the OSPF state of the neighbor.
- `Dead Time`—Displays the expected time until the system declares the neighbor dead.
- `Interface ID`—Displays the neighbor interface ID
- `Interface`—Displays the interface type, node/slot/port or number information.

Example

```
OS10(conf-if-eth1/1/1)# show ipv6 ospf neighbor
Neighbor ID    Pri     State     Dead Time    Interface ID  Interface
-------------------------------------------------------------------
2.2.2.2        1       Full/DR   00:00:30     5             ethernet1/1/1
```

Supported Releases 10.3.0E or later

show ipv6 ospf statistics

Displays OSPFv3 traffic statistics.

Syntax `show ipv6 ospf [instance-number] statistics [interface interface]`

Parameters

- *instance-number*—(Optional) Enter an OSPFv3 instance number, from 1 to 65535.
- `interface` *interface*—(Optional) Enter the interface information:
  - `ethernet` *node/slot/port[:subport]*—Enter an Ethernet port interface.
  - `port-channel` *number*—Enter the port channel interface number, from 1 to 999 or 1001 to 2000.
  - `vlan` *vlan-id*—Enter the VLAN ID number, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information This command displays OSPFv3 traffic statistics for a specified instance or interface, or for all OSPFv3 instances and interfaces.

Example

```
OS10# show ipv6 ospf interface ethernet 1/1/1

Interface ethernet1/1/1
  Receive Statistics
    rx-invalid 0 rx-invalid-bytes 0
    rx-hello 0 rx-hello-bytes 0
    rx-db-des 0 rx-db-des-bytes 0
    rx-ls-req 0 rx-ls-req-bytes 0
    rx-ls-upd 0 rx-ls-upd-bytes 0
    rx-ls-ack 0 rx-ls-ack-bytes 0
  Transmit Statistics
    tx-hello 1054 tx-hello-bytes 37944
    tx-db-des 0 tx-db-des-bytes 0
    tx-ls-req 0 tx-ls-req-bytes 0
    tx-ls-upd 0 tx-ls-upd-bytes 0
    tx-ls-ack 0 tx-ls-ack-bytes 0
  Error packets (Receive statistics)
    bad-src 0 dupe-id 0 hello-err 0
    mtu-mismatch 0 nbr-ignored 0
    resource-err 0 bad-lsa-len 0 lsa-bad-type 0
    lsa-bad-len 0 lsa-bad-cksum 0
    hello-tmr-mismatch 0 dead-ivl-mismatch 0
    options-mismatch 0 nbr-admin-down 0 own-hello-drop 0
    self-orig 0 wrong-length 0
    version-mismatch 0 area-mismatch 0
```

Supported Releases 10.4.0E(R1) or later

summary-address

Summarizes routes at the autonomous system border router (ASBR).

Syntax `summary-address` *A::B/mask* `[not-advertise | tag` *tag-value*`]`

Parameters

- *A::B/mask*—Enter an IPv6 address and mask in dotted decimal format to summarize routes at the ASBR.
- *not-advertize*—Specify this option to suppress advertising of the specified summary route along with individual routes that fall under the summary route. The advertise flag is set to TRUE by default.
- *tag-value*—This value sets as the OSPF tag to the summarized route. The default value is 0, the value range is from 0-4294967295.

Default None.

Security and Access `netadmin`, `sysadmin`, and `secadmin`

Command Mode ROUTER-OSPFv3

Usage Information

Summarized route are installed in the route table manager (RTM) and advertised over OSPFv3 neighbors. The `no` version of this command disables the summary address.

Example (summary address with not-advertise option)

```
OS10(config-router-ospfv3-10)# summary-address 2001:DB8::/32 not-
advertise
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
summary-address 2001:DB8::/32 not-advertise
```

Example (summary address with tag option)

```
OS10(config-router-ospfv3-10)# summary-address 2001:DB8::/32 tag 200
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
summary-address 2001:DB8::/32 tag 200
```

Example (no summary address with not-advertise option)

```
OS10(config-router-ospfv3-10)# no summary-address 10::/64 not-advertise
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
summary-address 10::/64
```

Example (no summary address with tag option)

```
OS10(config-router-ospfv3-10)# no summary-address 10::/64 tag 200
OS10(config-router-ospfv3-10)# show configuration
!
router ospfv3 10
summary-address 10::/64
```

Supported Releases

10.5.3.0 or later

timers spf (OSPFv3)

Enables shortest path first (SPF) throttling to delay an SPF calculation when a topology change occurs.

Syntax

```
timers spf [start-time [hold-time [max-wait]]]
```

Parameters

- *start-time* — Sets the initial SPF delay in milliseconds, from 1 to 600000; default 1000.
- *hold-time* — Sets the additional hold time between two SPF calculations in milliseconds, from 1 to 600000; default 10000.
- *max-wait* — Sets the maximum wait time between two SPF calculations in milliseconds, from 1 to 600000; default 10000.

Default

- *start-time* — 1000 milliseconds
- *hold-time* — 10000 milliseconds
- *max-wait* — 10000 milliseconds

Command Mode

ROUTER-OSPFv3

Usage Information

OSPFv2 and OSPFv3 support SPF throttling. By default, SPF timers are disabled in an OSPF instance.

Use SPF throttling to delay SPF calculations during periods of network instability. In an OSPF network, a topology change event triggers an SPF calculation after a specified start time. When the start timer finishes, a hold time may delay the next SPF calculation for an additional time. When the hold timer is running:

- Each time a topology change occurs, the SPF calculation delays for double the configured hold time up to maximum wait time.
- If no topology change occur, an SPF calculation performs and the hold timer resets to its configured value.

If you do not specify a start-time, hold-time, or max-wait value, the default values are used. The `no` version of this command removes the configured SPF timers and disables SPF throttling in an OSPF instance.

Example

```
OS10(config)# router ospfv3 100
OS10(config-router-ospfv3-100)# timers spf 1345 2324 9234

OS10(config-router-ospfv3-100)# do show ipv6 ospf
Routing Process ospfv3 100 with ID 129.240.244.107
SPF schedule delay 1345 msecs, Hold time between two SPFs 2324 msecs
Min LSA origination 5000 msec, Min LSA arrival 1000 msec
Min LSA hold time 0 msec, Max LSA wait time 0 msec
Number of area in this router is 1, normal 1 stub 0 nssa
Area (0.0.0.1)
Number of interface in this area is 1
SPF algorithm executed 2 times
```

Supported Releases 10.4.0E(R1) or later

Object tracking manager

OTM allows you to track the link status of Layer 2 (L2) interfaces, and the reachability of IPv4 and IPv6 hosts. You can increase the availability of the network and shorten recovery time if an object state goes Down.

Object tracking monitors the status of tracked objects and communicates any changes made to interested client applications. OTM client applications are virtual router redundancy protocol (VRRP) and policy-based routing (PBR). Each tracked object has a unique identifying number that clients use to configure the action to take when a tracked object changes state. You can also optionally specify a time delay before changes in a tracked object's state report to a client application.

VRRP subscribes to a track object which tracks the interface line protocol state. It uses the tracked object status to determine the priority of the VRRP router in a VRRP group. If a tracked state or interface goes down, VRRP updates the priority based on how you configure the new priority for the tracked state. When the tracked state comes up, VRRP restores the original priority for the virtual router group.

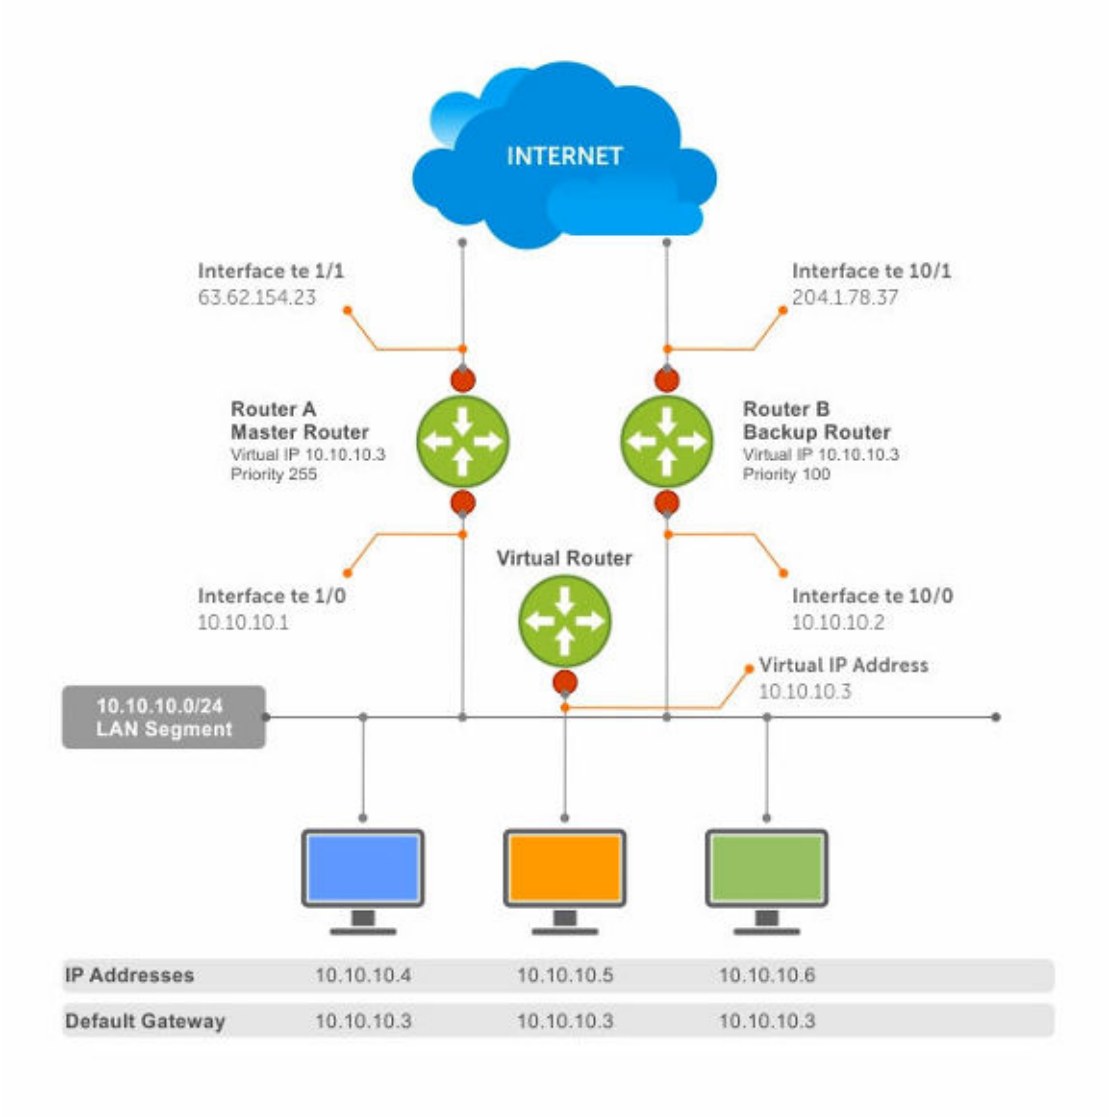

Figure 6. Object tracking

Interface tracking

You can create an object that tracks the line-protocol state of an L2 interface, and monitors its operational up or down status. You can configure up to 500 objects. Each object is assigned a unique ID.

When the link-level status goes down, the tracked resource status is also considered Down. If the link-level status goes up, the tracked resource status is also considered Up. For logical interfaces such as port-channels or VLANs, the link-protocol status is considered Up if any physical interface under the logical interface is Up.

The list of available interfaces include:

- `ethernet` — Physical interface
- `port-channel` — Port-channel identifier
- `VLAN` — Virtual local area network (VLAN) identifer
- `Loopback` — Loopback interface identifier
- `mgmt` — Management interface

1. Configure object tracking in CONFIGURATION mode, from 1 to 500.

```
track object-id
```

2. (Optional) Enter interface object tracking on the line-protocol state of an L2 interface in OBJECT TRACKING mode.

```
interface interface line-protocol
```

3. (Optional) Configure the time delay used before communicating a change to the status of a tracked interface in OBJECT TRACKING mode, from 0 to 80 seconds; default 0.

```
delay [up seconds] [down seconds]
```

4. (Optional) View the tracked object information in EXEC mode.

```
show track object-id
```

5. (Optional) View all interface object information in EXEC mode.

```
show track interface
```

6. (Optional) View all IPv4 or IPv6 next-hop object information in EXEC mode.

```
show track [ip | ipv6]
```

7. (Optional) View brief status of object information in EXEC mode.

```
show track brief
```

Configure object tracking

```
OS10(config)# track 1
OS10(conf-track-1)# interface ethernet 1/1/1 line-protocol
OS10(conf-track-1)# delay up 20
OS10(conf-track-1)# delay down 10
OS10(conf-track-1)# do show track 1
Interface ethernet1/1/1 line-protocol
Line protocol is UP
1 changes, Last change 2017-04-26T06:41:36Z
```

Host tracking

If you configure an IP host as a tracked object, the entry or next-hop address in the ARP cache determines the Up or Down state of the route.

A tracked host is reachable if there is an ARP cache entry for the router's next-hop address. An attempt to regenerate the ARP cache entry occurs if the next-hop address appears before considering the route Down.

1. Configure object tracking in CONFIGURATION mode.

```
track object-id
```

2. Enter the host IP address for reachability of an IPv4 or IPv6 route in OBJECT TRACKING mode.

```
[ip | ipv6] host-ip-address reachability
```

3. Configure the time delay used before communicating a change in the status of a tracked route in OBJECT TRACKING mode.

```
delay [up seconds] [down seconds]
```

4. Track the host by checking the reachability periodically in OBJECT TRACKING mode.

```
reachability-refresh interval
```

5. View the tracking configuration and the tracked object status in EXEC mode.

```
show track object-id
```

Configure IPv4 host tracking

```
OS10 (conf-track-1)# track 2
OS10 (conf-track-2)# ip 1.1.1.1 reachability
```

```
OS10 (conf-track-2)# do show track 2
IP Host 1.1.1.1 reachability
Reachability is DOWN
1 changes, Last change 2017-04-26T06:45:31Z
OS10 (conf-track-2)#
```

Configure IPv6 host tracking

```
OS10 (conf-track-2)# track 3
OS10 (conf-track-3)# ipv6 20::20 reachability
OS10 (conf-track-3)# delay up 20
OS10 (conf-track-3)# do show track 3
IP Host 20::20 reachability
Reachability is DOWN
1 changes, Last change 2017-04-26T06:47:04Z
OS10 (conf-track-3)#
```

Set tracking delays

You can configure an optional Up or Down timer for each tracked object. The timer allows you to set the time delay before a change in the state of a tracked object communicates to the clients. The time delay starts when the state changes from Up to Down or from Down to Up.

If the state of an object changes back to its former Up or Down state before the timer expires, the timer is canceled without notifying the client. If the timer expires and an object's state has changed, a notification is sent to the client. For example, if the Down timer is running and an interface goes down then comes back up, the Down timer is canceled. The client is not notified of the event.

If you do not configure a delay, a notification is sent when a change in the state of a tracked object is detected. The time delay in communicating a state change is specified in seconds.

Object tracking

As a client, VRRP can track up to 20 interface objects plus 12 tracked interfaces supported for each VRRP group. You can assign a unique priority-cost value, from 1 to 254, to each tracked VRRP object or group interface.

If a tracked VRRP object is in a Down state, the priority cost is subtracted from the VRRP group priority. If a VRRP group router acts as owner-master, the run-time VRRP group priority remains fixed at 255. Changes in the state of a tracked object have no effect.

In VRRP object tracking, the sum of the priority costs for all tracked objects and interfaces cannot equal or exceed the priority of the VRRP group.

View tracked objects

You can view the status of currently tracked L2 or L3 interfaces, or the IPv4 or IPv6 hosts.

View brief object tracking information

```
OS10# show track brief
TrackID   Resource               Parameter           Status        LastChange
-------------------------------------------------------------------------------
1         line-protocol          ethernet1/1/1       DOWN
2017-02-03T08:41:25Z1
2         ipv4-reachablity       1.1.1.1             DOWN
2017-02-03T08:41:43Z1
3         ipv6-reachablity       10::10              DOWN           2017-02-03T08:41:55Z1

OTM commands

delay

Configures the delay timers.

Syntax	`delay {up | down} seconds`
Parameters	*seconds* — Enter the delay time in seconds. A maximum of 180 characters.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(conf-track-100)# delay up 200 down 100`
Supported Releases	10.3.0E or later

interface line-protocol

Configures an object to track a specific interface's line-protocol status.

Syntax	`interface interface line-protocol`
Parameters	*interface*—Enter the interface information: • `ethernet`—Physical interface. • `port-channel`—Enter the port channel identifier, from 1 to 999 or 1001 to 2000. • `vlan`—Enter the VLAN identifier.

- `loopback`—Enter the Loopback interface identifier.
- `mgmt`—Enter the Management interface.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(conf-track-100)# interface ethernet line-protocol
```

Supported Releases 10.3.0E or later

ip reachability

Configures an object to track a specific next-hop host's reachability.

Syntax `ip host-ip-address reachability`

Parameters *host-ip-address* — Enter the IPv4 host address.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(config)# track 100
OS10(conf-track-100)# ip 10.10.10.1 reachability
```

Supported Releases 10.3.0E or later

ipv6 reachability

Configures an object to track a specific next-hop host's reachability.

Syntax `ipv6 host-ip-address reachability`

Parameters *host-ip-address* — Enter the IPv6 host address.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(config)# track 200
OS10(conf-track-200)# ipv6 10::1 reachability
```

Supported Releases 10.3.0E or later

reachability-refresh

Configures a polling interval for reachability tracking.

Syntax `reachability-refresh interval`

Parameters *interval* — Enter the polling interval value. A maximum of 3600 seconds.

Defaults 0 seconds

Command Mode CONFIGURATION

Usage Information Set the interval to 0 to disable the refresh.

Example

```
OS10(conf-track-100)# reachability-refresh 600
```

Supported Releases 10.3.0E or later

show track

Displays tracked object information.

Syntax `show track [brief] [object-id] [interface] [ip | ipv6]`

Parameters

- *brief* — (Optional) Displays brief tracked object information.
- *object-id* — (Optional) Displays tracked object information for a specific object ID.
- interface — (Optional) Displays all interface object information.
- ip — (Optional) Displays all IPv4 next-hop object information.
- ipv6 — (Optional) Displays all IPv6 next-hop object information.

Defaults None

Command Mode CONFIGURATION

Usage Information None

Example (Brief)

```
OS10# show track brief
TrackID  Resource             Parameter       Status  LastChange
------------------------------------------------------------------------------
1        line-protocol       ethernet1/1/1   DOWN
2017-02-03T08:41:25Z1
2        ipv4-reachablity    1.1.1.1         DOWN
2017-02-03T08:41:43Z1
3        ipv6-reachablity    10::10          DOWN    2017-02-03T08:41:55Z1
```

Supported Releases 10.3.0E or later

track

Configures and manages tracked objects.

Syntax `track object-id`

Parameters *object-id* — Enter the object ID to track. A maximum of 500.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The no version of this command deletes the tracked object from an interface.

Example

```
OS10# track 100
```

Supported Releases 10.3.0E or later

Policy-based routing

PBR provides a mechanism to redirect IPv4 and IPv6 data packets based on the policies defined to override the switch's forwarding decisions based on the routing table.

Policy-based route-maps

A route-map is an ordered set of rules that controls the redistribution of IP routes into a protocol domain. When you enable PBR on an interface, all IPv4 or IPv6 data packets process based on the policies that you define in the route-maps. The rules defined in route-maps are based on access control lists (ACLs) and next-hop addresses, and only apply to ACLs used in policy-based routing.

You can create a route-map that specifies the match criteria and resulting action if all the match clauses are met. After you create the route-map, you can enable PBR for that route-map on a specific interface. Route-maps contain `match` and `set` statements that you can mark as *permit*.

Access-list to match route-map

You can assign an IPv4 or IPv6 access-list to match a route-map. The IP access list contains the criteria to match the traffic content based on the header field, such as the destination IP or source IP.

When `permit` or `deny` is present in the `access-list`, it is omitted and the action present in the `route-map` command is used for policy-based routing. The `permit` keyword in the route-map statement indicates policy-based routing. The `deny` keyword in the route-map statement indicates a switch-based forwarding decision, a PBR exception. Only use access list for the packet match criteria in policy-based routing.

1. Assign an access-list to match the route-map in CONFIGURATION mode.

```
ip access-list access-list-name
```

2. Set the IP address to match the access-list in IP-ACL mode.

```
permit ip ip-address
```

Configure IPv4 access-list to match route-map

```
OS10(config)# ip access-list acl5
OS10(conf-ipv4-acl)# permit ip 10.10.10.0/24 any
```

Configure IPv6 access-list to match route-map

```
OS10(config)# ipv6 access-list acl8
OS10(conf-ipv6-acl)# permit ipv6 10::10 any
```

Set address to match route-map

You can set an IPv4 or IPv6 address to match a route-map.

1. Enter the IPv4 or IPv6 address to match and specify the access-list name in Route-Map mode.

```
match {ip | ipv6} address access-list-name
```

2. Set the next-hop IP address in Route-Map mode.

```
set {ip | ipv6} next-hop ip-address
```

Apply match and set parameters to IPv4 route-map

```
OS10(conf-route-map)# route-map map1
OS10(conf-route-map)# match ip address acl5
OS10(conf-route-map)# set ip next-hop 10.10.10.10
```

Apply match and set parameters to IPv6 route-map

```
OS10(conf-route-map)# route-map map1
OS10(conf-route-map)# match ipv6 address acl8
OS10(conf-route-map)# set ipv6 next-hop 20::20
```

Assign route-map to interface

You can assign a route-map to an interface for IPv4 or IPv6 policy-based routing to an interface.

- Assign the IPv4 or IPv6 policy-based route-map to an interface in INTERFACE mode.

  ```
  {ip | ipv6} policy route-map map-name
  ```

Assign route-map to an IPv4 interface

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# ip policy route-map map1
```

Assign route-map to an IPv6 interface

```
OS10(conf-if-eth1/1/5)# ipv6 policy route-map map2
```

View PBR information

Display PBR information to verify IPv4 or IPv6 configuration and view statistics.

1. View IPv4 or IPv6 PBR policy information in EXEC mode.

   ```
   show {ip | ipv6} policy name
   ```

2. View current PBR statistics in EXEC mode.

   ```
   show route-map map-name pbr-statistics
   ```

3. Clear all policy statistics information in EXEC mode.

   ```
   clear route-map map-name pbr-statistics
   ```

Verify IPv4 PBR configuration

```
OS10# show ip policy abc
Interface      Route-map
-----------------------
ethernet1/1/1  abc
ethernet1/1/3  abc
vlan100        abc
```

Verify IPv6 PBR configuration

```
OS10# show ipv6 policy abc
Interface       Route-map
-------------------------
ethernet1/1/1   abc
ethernet1/1/3   abc
vlan100         abc
```

View current PBR statistics

```
show route-map pbr-sample pbr-statistics
route-map pbr-sample, permit, sequence 10

Policy routing matches: 84 packets
```

Policy-based routing per VRF

Configure PBR per VRF instance for both IPv4 and IPv6 traffic flows.

Policy-based routing (PBR) enables packets with certain match criteria, such as packets from specific source and destination addresses, to be re-directed to a different next-hop.

You can also use PBR to re-direct packets arriving on a VRF instance to a next-hop that is reachable through a different VRF instance. You can re-direct packets arriving on any VRF instance to the default VRF instance or any other non-default VRF instance.

NOTE: PBR is supported on the default and non-default VRF instances; however, PBR is not supported on the management VRF instance.

Configuring PBR per VRF

For traffic arriving on a VRF instance, you can re-direct this traffic to a next-hop on another VRF instance using route-maps. In the route-map, set the next-hop IP address that is reachable through a different VRF instance. When traffic that matches certain criteria arrives on a VRF instance, the route-map configuration enables packets to be re-directed to a next-hop that is reachable over another VRF instance. To configure PBR per VRF:

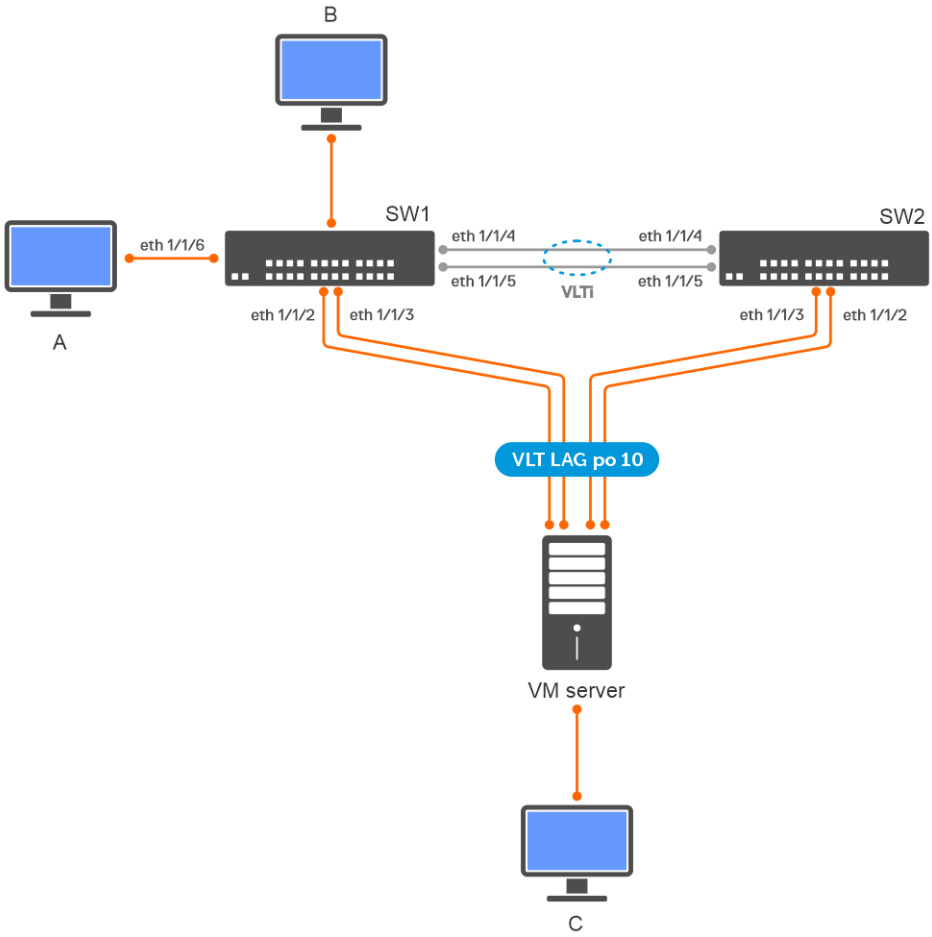
1. Create the match ACL rule for IPv4 or IPv6 traffic.
   `{ip | ipv6} access-list access-list-name`
2. Permit or deny IPv4 or IPv6 traffic from any source with a specific destination.
   `permit {ip | ipv6} any ip-address`
   or
   `deny {ip | ipv6} any ip-address`
3. Configure a route-map to re-direct traffic arriving on a specific VRF instance.
   `route-map route-map-name`
4. Enter the IPv4 or IPv6 address to match and specify the access-list name.
   `match {ip | ipv6} address access-list-name`
5. In the route-map, set the IPv4 or IPv6 next-hop to be reached through a different VRF instance.
   `set {ip | ipv6} vrf vrf-name next-hop next-hop-ipv4address`
   This next-hop-address is reachable through a different VRF instance.
   NOTE: If the next-hop is reachable on the specified VRF instance, the packet is redirected; otherwise, the packet follows the regular routing flow.
6. Apply the route-map to the interface.
   `interface interface-type`
   `{ip | ipv6} policy route-map route-map-name`
7. View the route-map information.
   `show route-map`

```
OS10(conf-if-vl-40)# do show route-map
route-map test, permit, sequence 10
Match clauses:
ip address (access-lists): acl1
Set clauses:
ip vrf red next-hop 1.1.1.1 track-id 200
```

PBR and VLT

When you configure PBR in a VLT setup, configure the same PBR rules on both VLT peers.

In the following example, traffic originates from A and is destined to B. The traffic is redirected to C using a PBR rule through the VLT port channel. When the VLT port channel interface goes down, the traffic still reaches C through VLTi.



SW1

VLAN configuration

- Create a VLAN and assign an IP address to it which acts as the gateway for the hosts in the VM.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
OS10(conf-if-vl-100)# ip address 10.1.1.1/24
OS10(conf-if-vl-100)# exit
```

- Create another VLAN, and assign an IP address to it.

```
OS10# configure terminal
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# no shutdown
OS10(conf-if-vl-200)# ip address 10.2.1.1/24
OS10(conf-if-vl-200)# exit
```

VLT configuration

1. Create a VLT domain, and configure VLTi.

```
OS10(config)# interface range ethernet 1/1/4-1/1/5
OS10(conf-range-eth1/1/4-1/1/5)# no switchport
OS10(conf-range-eth1/1/4-1/1/5)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/4-1/1/5
```

2. Configure a VLT MAC address.

```
OS10(conf-vlt-1)# vlt-mac 12:5e:23:2d:76:3e
```

3. Specify the management IP address of the VLT peer as a backup link.

```
OS10(conf-vlt-1)# backup destination 10.10.10.2
```

4. Configure VLT port channels.

   SW1-to-VM VLT port channel configuration

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description SW1ToVM
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100,200
OS10(conf-if-po-10)# exit
OS10(config)# interface range ethernet 1/1/2-1/1/3
OS10(conf-if-eth1/1/2-1/1/3)# no shutdown
OS10(conf-if-eth1/1/2-1/1/3)# channel-group 10
```

   SW1-to-server configuration

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# description SW1ToServer
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport trunk allowed vlan 100,200
OS10(conf-if-po-20)# exit
OS10(config)# interface range ethernet 1/1/1,1/1/6
OS10(conf-if-eth1/1/1,1/1/6)# no shutdown
OS10(conf-if-eth1/1/1,1/1/6)# channel-group 20
```

(Optional) Peer routing configuration

- Configure peer routing.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# peer-routing
```

PBR configuration

Apply the policy on the traffic ingress interface and the VLTi interfaces of both VLT peers.

```
OS10(config)# ip access-list PBR-A2C
OS10(conf-ipv4-acl)# permit ip 10.10.10.0/24 any
OS10(config-ipv4-acl)# exit
OS10(config)# route-map Map1
OS10(conf-route-map)# match ip address PBR-A2C
OS10(conf-route-map)# set ip next-hop 10.10.20.10
OS10(conf-route-map)# exit
OS10(config)# interface range ethernet 1/1/4-1/1/6
OS10(conf-if-eth1/1/4-1/1/6)# ip policy route-map Map1
```

SW2

VLAN configuration

- Create a VLAN and assign an IP address to it which acts as the gateway for the hosts in the VM.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no shutdown
OS10(conf-if-vl-100)# ip address
OS10(conf-if-vl-100)# ip address 10.1.1.2/24
OS10(conf-if-vl-100)# exit
```

- Create another VLAN, and assign an IP address to it.

```
OS10# configure terminal
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# no shutdown
OS10(conf-if-vl-200)# ip address
```

```
OS10(conf-if-vl-200)# ip address 10.2.1.3/24
OS10(conf-if-vl-200)# exit
```

VLT configuration

1. Create a VLT domain, and configure VLTi.

```
OS10(config)# interface range ethernet 1/1/4-1/1/5
OS10(conf-range-eth1/1/4-1/1/5)# no switchport
OS10(conf-range-eth1/1/4-1/1/5)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/4-1/1/5
```

2. Configure a VLT MAC address.

```
OS10(conf-vlt-1)# vlt-mac 12:5e:23:f4:23:54
```

3. Specify the management IP address of the VLT peer as a backup link.

```
OS10(conf-vlt-1)# backup destination 10.10.10.1
```

4. Configure VLT port channels.

   SW2-to-VM VLT port channel configuration

```
OS10(config)# interface port-channel 10
OS10(conf-if-po-10)# description SW2ToVM
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100,200
OS10(conf-if-po-10)# exit
OS10(config)# interface range ethernet 1/1/2-1/1/3
OS10(conf-if-eth1/1/2-1/1/3)# no shutdown
OS10(conf-if-eth1/1/2-1/1/3)# channel-group 10
```

(Optional) Peer routing configuration

- Configure peer routing.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# peer-routing
```

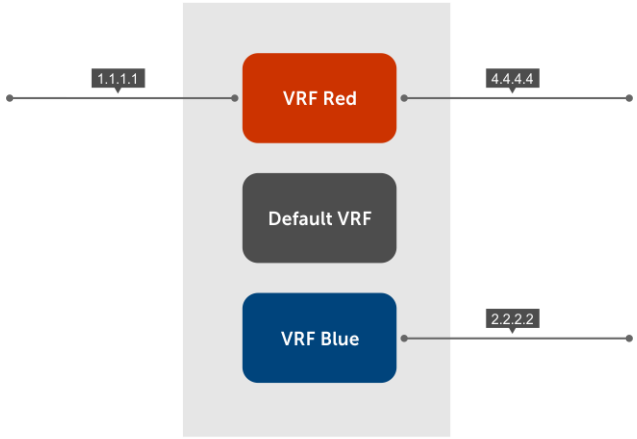
PBR configuration

Apply the policy on the VLTi interfaces of both VLT peers.

```
OS10(config)# ip access-list PBR-A2C
OS10(conf-ipv4-acl)# permit ip 10.10.10.0/24 any
OS10(conf-route-map)# route-map Map1
OS10(conf-route-map)# match ip address PBR-A2C
OS10(conf-route-map)# set ip next-hop 10.10.20.10
OS10(conf-route-map)# exit
OS10(config)# interface ethernet 1/1/4-1/1/6
OS10(conf-if-eth1/1/4-1/1/6)# ip policy route-map Map1
```

Sample configuration

Consider a scenario where traffic from source IP address 1.1.1.1 ingresses through VLAN40 that is part of VRF RED. The egress interface for this traffic is also on the same VRF RED with IP address 4.4.4.4, as shown.



Using the following PBR configuration, you can re-direct traffic ingresssing to VRF RED to a destination that is reachable through the next-hop IP address `2.2.2.2` in VRF BLUE:

1. Create a route-map.

```
OS10(config)# route-map test
```

2. Enter the IP address to match the specified access list.

```
OS10(config-route-map)# match ip 4.4.4.4 acl1
```

3. Set the next-hop address to `2.2.2.2`, which is reachable through VRF BLUE.

```
OS10(config-route-map)#
  OS10(config-route-map)# set ip vrf BLUE next-hop 2.2.2.2
OS10(config-route-map)# exit
```

4. Apply this rule to the interface where the traffic ingresses, in this case VLAN40.

```
OS10(config)# interface vlan 40
OS10(conf-if-vl-40)#
OS10(conf-if-vl-40)# ip policy route-map test
```

5. (Optional) View the PBR configuration on the interface.

```
OS10(conf-if-vl-40)# show configuration
 !
  interface vlan40
  no shutdown
  ip policy route-map test
 !
```

Track route reachability

Track IPv4 or IPv6 reachablility using object tracking. To configure tracking over the routes that are reachable through a VRF instance:

1. Configure object tracking.

   `track track-id`

```
OS10(config)# track 200
```

2. Configure reachability of the next-hop address through the VRF instance.

```
ip ip-address reachablility vrf vrf-name
```

```
OS10(conf-track-200)#
OS10(conf-track-200)# ip 1.1.1.1 reachability vrf red
OS10(conf-track-200)#exit
```

3. Configure the route-map.

```
route-map route-map-name
```

```
OS10(config-route-map)#
OS10(config-route-map)# match ip address acl1
```

4. Set the track ID configured in step 1 to the route-map.

```
set ip vrf vrf-name nexy-hop next-hop-address track-id track-id-number
```

```
OS10(config-route-map)# set ip vrf red next-hop 1.1.1.1 track-id 200
```

5. Apply the route-map to the interface where traffic is ingressing on the VRF instance.

```
interface interface-type
ip policy route-map route-map-name
```

```
OS10(config)# interface vlan 40
OS10(conf-if-vl-40)#
OS10(conf-if-vl-40)# ip policy route-map test
OS10(conf-if-vl-40)# show configuration
!
```

NOTE: Ensure you configure next-hop IP address tracking and PBR next-hop with the same VRF instance. For next-hop reachability in the same VRF instance, you must configure both PBR per VRF and object tracking. Missing either the next-hop IP address tracking or PBR next-hop configuration in a VRF instance results in an erroneous configuration. However, the system does not display an error message indicating problems in the configuration.

Use PBR to permit and block specific traffic

This section explains how to permit specific traffic through an interface using PBR.

Configure the interface

1. Create a VLAN interface.

```
OS10(Config)# interface vlan999
```

2. Enable the interface.

```
OS10(Conf-if-999)# no shutdown
```

3. Enter an IP address to the interface.

```
OS10(Conf-if-999)# ip address 10.99.0.251/16
```

Define the PBR parameters

- Create an ACL and define what should be enabled for PBR processing.

```
ip access-list TEST-ACL
seq 10 permit tcp any any eq 80
seq 20 permit tcp any any eq 443
seq 30 permit tcp any any eq 21
seq 40 permit icmp any any
```

- Create an ACL and define what should be excluded from PBR processing.

```
ip access-list TEST-ACL-DENY
seq 10 permit tcp 10.99.0.0/16 10.0.0.0/8 eq 80
seq 20 permit tcp 10.99.0.0/16 10.0.0.0/8 eq 443
```

```
seq 30 permit tcp 10.99.0.0/16 10.0.0.0/8 eq 21
seq 40 permit icmp 10.99.0.0/16 10.0.0.0/8
```

- Create a route-map to block specific traffic from PBR processing.

```
route-map TEST-RM deny 5
match ip address TEST-ACL-DENY
```

- Create a route-map to permit traffic for PBR processing.

```
route-map TEST-RM permit 10
match ip address TEST-ACL
set ip next-hop 10.0.40.235
```

- Apply the policy to the previously created interface.

```
ip policy route-map TEST-RM
```

NOTE: In PBR, the `permit` or `deny` action specified in the access list does not determine whether the traffic is forwarded or dropped. The `permit` or `deny` action specified in the route-map configuration determines the results of PBR processing.

In this configuration, the `route-map TEST-RM deny 5` configuration blocks traffic that matches the `TEST-ACL-DENY` ACL from further PBR processing. This traffic is routed using the routing table. The `route-map TEST-RM permit 10` configuration sends traffic that matches the `TEST-ACL` ACL for PBR processing. Any packet that matches the `TEST-ACL` ACL is forwarded to 10.0.40.235.

View PBR configuration

Use the `show configuration` command to view the configuration of the interface.

```
OS10(conf-if-vl-40)# show configuration
!
interface vlan40
no shutdown
ip policy route-map test
```

Use the `show route-map` command to view the route-map configuration.

```
OS10(config)# do show route-map
 route-map map1, permit, sequence 10
 Match clauses:
    ipv6 address (access-lists): acl1
 Set clauses:
    ipv6 vrf {vrf-name} next-hop 5555::5556

OS10(conf-if-vl-40)# do show route-map
route-map test, permit, sequence 10
Match clauses:
ip address (access-lists): acl1
Set clauses:
ip next-hop 1.1.1.1 track-id 200

OS10(conf-if-vl-40)# do show route-map test
route-map test, permit, sequence 10
Match clauses:
ip address (access-lists): acl1
Set clauses:
ip vrf red next-hop 1.1.1.1 track-id 200
!
```

PBR commands

clear route-map pbr-statistics

Clears all PBR counters.

Syntax	`clear route-map [map-name] pbr-statistics`
Parameters	*map-name*—Enter the name of a configured route-map. A maximum of 140 characters.
Defaults	None
Command Mode	EXEC
Usage Information	None
Example	`OS10# clear route-map map1 pbr-statistics`
Supported Releases	10.3.0E or later

match address

Matches the access-list to the route-map.

Syntax	`match {ip | ipv6} address [name]`
Parameters	*name*—Enter the name of an access-list. A maximum of 140 characters.
Defaults	Not configured
Command Mode	ROUTE-MAP
Usage Information	None
Example	`OS10(conf-route-map)# match ip address acl1`
Supported Releases	10.3.0E or later

policy route-map

Assigns a route-map for IPv4 or IPV6 policy-based routing to the interface.

Syntax	`{ip | ipv6} policy route-map [map-name]`
Parameters	*map-name*—Enter the name of a configured route-map. A maximum of 140 characters.
Defaults	Not configured
Command Mode	INTERFACE
Usage Information	None
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# ip policy route-map map1`
Supported Releases	10.3.0E or later

route-map pbr-statistics

Enables counters for PBR statistics.

Syntax `route-map [map-name] pbr-statistics`

Parameters *map-name*—Enter the name of a configured route-map. A maximum of 140 characters.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(config)# route-map map1 pbr-statistics
```

Supported Releases 10.3.0E or later

set next-hop

Sets an IPv4 or IPv6 next-hop address for policy-based routing.

Syntax `set {ip | ipv6} vrf [vrf-name] next-hop address`

Parameters

- `vrf vrf-name` — Enter the keyword then the name of the VRF to make the next-hop reachable over that VRF.
- *address* — Enter the next-hop IPv4 or IPv6 address.

Defaults Not configured

Command Mode ROUTE-MAP

Usage Information You must configure next-hop IP address tracking and PBR next-hop with the same VRF instance. For next-hop reachability in the same VRF instance, you must configure both PBR per VRF and object tracking. Missing either the next-hop IP address tracking or PBR next-hop configuration in a VRF instance results in an erroneous configuration. However, the system does not display an error message indicating problems in the configuration.

The `set {ip | ipv6} next-hop` command supports multiple next-hop addresses for PBR route-map configuration. If you enter multiple next-hop entries for BGP route-map configuration or RTM route redistribution, the system uses only the first entry and ignores the rest of the entries.

Example

```
OS10(conf-route-map)# set ip next-hop 10.10.10.10
*Sets the next-hop IP address.
OS10(conf-route-map)#set ip vrf red next-hop 2.2.2.2
*The next-hop 2.2.2.2 should be reachable via interface over VRF "red".
```

Supported Releases 10.3.0E or later

set next-hop track

Tracks the next-hop IPv4 or IPv6 address object.

Syntax `set {ip | ipv6} vrf [vrf-name] next-hop address track track-id`

Parameters

- *address*—Enter an IPv4 or IPv6 address.
- `vrf vrf-name` — Enter the keyword then the name of the VRF to track the next-hop reachable through that VRF.
- *track-id*—(Optional) Enter the track ID of the PBR object.

Defaults Not configured

Command Mode	ROUTE-MAP
Usage Information	You must configure next-hop IP address tracking and PBR next-hop with the same VRF instance. For next-hop reachability in the same VRF instance, you must configure both PBR per VRF and object tracking. Missing either the next-hop IP address tracking or PBR next-hop configuration in a VRF instance results in an erroneous configuration. However, the system does not display an error message indicating problems in the configuration.

Example	`OS10(conf-route-map)# set ip next-hop 10.10.10.10 track-id 12`
	`*Set the track ID configured to the route-map.`
	`OS10(conf-route-map)# set ip vrf red next-hop 1.1.1.1 track-id 200`
	`*Sets the track ID configured to track the next-hop reachable through the VRF specified.`

Supported Releases	10.3.0E or later

show policy

Displays policy information.

Syntax	`show {ip | ipv6} policy [map-name]`
Parameters	*map-name* — (Optional) Enter the name of a configured route map. A maximum of 140 characters.
Defaults	None
Command Mode	EXEC
Usage Information	None
Example	`OS10# show ip policy map-name`
Supported Releases	10.3.0E or later

show route-map pbr-statistics

Displays the current PBR statistics.

Syntax	`show route-map [map-name] pbr-statistics`
Parameters	*map-name* — (Optional) Enter the name of a configured route map. A maximum of 140 characters.
Defaults	None
Command Mode	EXEC
Usage Information	None
Example	`OS10# show route-map map1 pbr-statistics`
Supported Releases	10.3.0E or later

Virtual Router Redundancy Protocol

VRRP allows you to form virtual routers from groups of physical routers on your local area network (LAN). These virtual routing platforms—master and backup pairs—provide redundancy during hardware failure. VRRP also allows you to easily configure a virtual router as the default gateway to all your hosts. It also avoids the single point of failure of a physical router.

VRRP:

- Provides a virtual default routing platform
- Provides load balancing
- Supports multiple logical IP subnets on a single LAN segment
- Enables simple traffic routing without the single point of failure of a static default route
- Avoids issues with dynamic routing and discovery protocols
- Takes over a failed default router:
  - Within a few seconds
  - With a minimum of VRRP traffic
  - Without any interaction from hosts

NOTE:

- The default behavior of VRRP is active-active. If you do not want the VRRP backup gateway to forward traffic on behalf of the active VRRP gateway in a non-VLT deployment, use the `no vrrp mode active-active` command to disable the VRRP active-active feature.
- In a VLT deployment, OS10 supports VRRP in an active-standby mode as well. However, it is recommended that you use the default VRRP active-active mode in a VLT deployment.

NOTE: When an IPv6 VRRP group and OSPFv3 are configured on the same interface, OSPFv3 does not converge on that interface. For OSPFv3 convergence to happen on that interface, configure a static IPv6 neighbor entry on the VLAN interface with the peer link-local IPv6 address and MAC address. To configure a static IPv6 neighbor entry with the peer link-local IPv6 address and MAC address, use the ipv6 neighbor command.

VRRP provides interoperability for VRRPv3 IPv4 groups between OS10 and any other VRRP solutions that do not include a pseudo header in the VRRP checksum calculation. The OS10 VRRP solution automatically detects whether a pseudo header is used or not, and adjusts the checksum algorithm to match the peer. This allows full interoperability with any other router or switch that uses the checksum approach.

NOTE: VRRP works only when all the other VRRP peers in the VRRP group are using the same checksum algorithm.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

Priority 255 is not supported.

BFD tracking support in VRRP groups

VRRP supports tracking BFD session objects in addition to tracking interface state objects.

The VRRP module supports BFD session tracking with configurable priority cost value using object tracking. When a BFD session goes DOWN, VRRP reduces the priority of the configured priority cost value, and the reduced priority value is used for any further advertisements. Similarly, when a BFD session is UP, the VRRP restores the priority value by adding the priority cost value to the current priority.

In conjunction with VRRP priority decrement using object tracking, priority decrement to value zero is supported. This behavior ensures VRRP to advertise priority zero packets to trigger immediate failover.

VRRP supports omitting skew time from the `master_down_interval` calculation formula as defined in RFC5798.

Skew time is the time to skew `master_down_interval` in seconds. Skew time is calculated using the following simple formula:

```
For VRRPv2:       (256 - Priority) / 256 )
For VRRPv3:       (((256 - priority) * Master_Adver_Interval) / 256)
```

You can reduce the time that is required to transition from the Standby state to the Active state by disabling the skew timer.

Restrictions and limitations

Following are the restrictions and limitations for BFD tracking support:

- You can track a maximum of four BFD sessions in a VRRP group.
- A maximum of 256 VRRP groups (IPv4 and IPv6 groups combined) are supported with advertisement interval of three seconds.
- A maximum of 200 VRRP groups (IPv4 and IPv6 groups combined) are supported with an advertisement interval of 25 centiseconds.

UDS (common scale for all platforms):

- 256 BFD sessions are supported with 200 milliseconds and a multiplier of three.
- 128 BFD sessions are supported with 100 milliseconds and a multiplier of three.
- 64 BFD sessions are supported with 50 milliseconds and a multiplier of three.

Following is the maximum number of sessions that are supported in MDS cases in platforms such as the S5200-ON Series, Z9254F-ON, and Z9332F-ON:

- Session count - 128
- Timer - 200 milliseconds
- Multiplier - 3

Following is the maximum number of BFD sessions that are supported in platforms such as the S4100-ON Series:

- Session count - 32
- Timer - 200 milliseconds
- Multiplier - 3

NOTE: BFD is not supported on the S4100-ON Series and S5212-ON platforms.

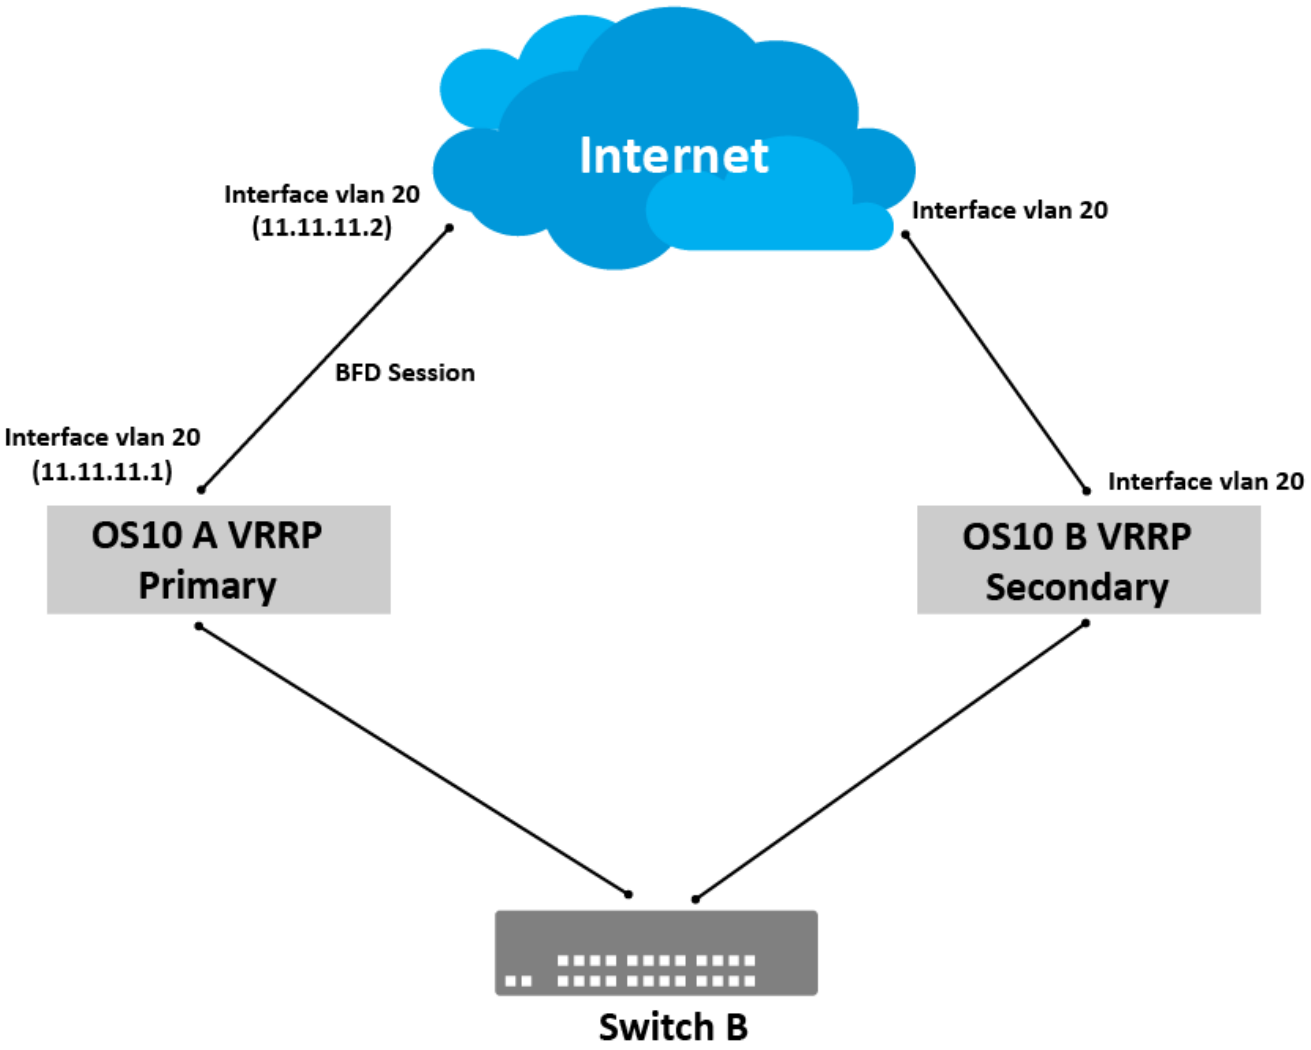
VRRP groups are supported for each of the following interface types:

- Ethernet
- VLAN
- Port channel

NOTE: The minimum advertisement interval for BFD tracking is 25 centiseconds.

Configuring BFD session tracking under VRRP group

Consider the following topology:



Following are the configuration steps for topology in the above figure:

OS10A - VRRP Primary configuration

1. Create a track object and configure a BFD session.

```
OS10-A(config)# track 1
OS10-A(conf-track-1)#bfd interface vlan 20 vrf default source-ip-address 11.11.11.1
neighbor-ip-address 11.11.11.2 interval
50 min_rx 50 multiplier 5 role active
```

2. Create a VLAN and a VRRP group under the VLAN. Then, configure a priority value and a track object with a priority cost.

```
OS10-A(config)# interface vlan 20
OS10-A(conf-if-vl-20)# vrrp-group 1
OS10-A(conf-vlan20-vrid-1)#priority 120
OS10-A(conf-vlan20-vrid-1)# track 1 priority-cost 20
```

3. Configure track objects under a VRRP group. You can configure a maximum of four track objects under a VRRP group.

```
OS10-A(conf-vlan20-vrid-1)# track 2 priority-cost 30
OS10-A(conf-vlan20-vrid-1)# track 3 priority-cost 25
OS10-A(conf-vlan20-vrid-1)# track 4 priority-cost 40
OS10-A(conf-vlan20-vrid-1)# track 5 priority-cost 25
```

4. Configure a priority cost value that is less than the configured VRRP group priority value.

```
OS10-A(conf-vlan20-vrid-1)# track 2 priority-cost 254
```

If you change the VRRP group priority value to a value that is less than or equal to the priority cost value at a later point of time, the following error message displays: `% Error: VRRP group priority cost cannot be greater than oper priority.`

```
OS10-A(conf-vlan20-vrid-1)# priority 200
OS10-A(conf-vlan20-vrid-1)# track 2 priority-cost 190
OS10-A(conf-vlan20-vrid-1)# priority 110
```

5. Unconfigure the `track1` object from the VRRP group and its BFD session.

```
OS10-A(conf-vlan20-vrid-1)#no track 1
OS10-A(conf-vlan20-vrid-1)# no bfd interface vlan 20 vrf default source-ip-address
11.11.11.1 neighbor-ip-address 11.11.11.2
OS10-A(conf-vlan20-vrid-1)#no track 1
```

NOTE: OS10 VRRP implementation supports a maximum of four tracking objects inside a VRRP group. These tracking objects can be either an interface or a BFD tracking object, or both. If you try to configure more than four tracking objects, the following error message displays: `% Error: max-elements exceeded`.

OS10 - VRRP secondary configuration

1. Create a track object and configure a BFD session.

```
OS10-B(config)# track 1
OS10-B(conf-track-1)#bfd interface vlan 20 vrf default source-ip-address 12.12.12.1
neighbor-ip-address 12.12.12.2
interval 50 min_rx 50 multiplier 5 role active
```

2. Create a VLAN and a VRRP group under the VLAN. Then, configure a priority value and a track object with a priority cost.

```
OS10-A(config)# interface vlan 20
OS10-A(conf-if-vl-20)# vrrp-group 1
OS10-A(conf-vlan20-vrid-1)#priority 110
OS10-A(conf-vlan20-vrid-1)# track 1 priority-cost 20
```

Triggering immediate failover with priority zero packets

When a VRRP priority decrement occurs and it results in a VRRP priority is less than 1, VRRP advertisements with zero priority packets are sent. This activity triggers immediate failover. Immediate failover is faster when compared to the earlier method, where the VRRP backup node has to wait for the time duration of `master_down_interval`.

Omitting Skew time from master_down_interval calculation formula as defined in RFC5798

You are provided with an option to omit the skew time from the `master_down_interval` calculation. This option configures a lesser value for the `master_down_interval` and results in faster failover.

Global configuration

```
DELL(conf)#vrrp omit-skew-time
```

VRRP group level configuration

```
OS10(config)#vrrp-group 1
OS10(vrrp-group-1)#omit-skew-time
OS10(vrrp-group-1)#omit-skew-time disable
```

Following are the unconfigure commands:

```
OS10(vrrp-group-1)#no omit-skew-time
OS10(vrrp-group-1)#no omit-skew-time disable
```

By default, `omit-skew-time` is disabled both at the Global and VRRP group level.

When you configure group level `omit-skew-time` this configuration takes precedence over the Global level configuration.

Table 63. VRRP secondary configuration

Global level configuration	VRRP group level configuration	Expected behavior for this VRRP group
Default configuration or omit skew time disabled	Default configuration	Omit skew time is disabled.
Default configuration or omit skew time disabled	`omit-skew-time`	Omit skew time is enabled.
Default configuration or omit skew time disabled	`omit-skew-time` disable	Omit skew time is disabled.
VRRP `omit-skew-time`	Default configuration	Omit skew time is enabled.
VRRP `omit-skew-time`	`omit-skew-time`	Omit skew time is enabled.
VRRP `omit-skew-time`	`omit-skew-time` disable	Omit skew time is enabled.

When you enable `omit-skew-time` globally, it is applicable for all the VRRP groups. You can disable `omit-skew-time` for a subset of VRRP groups alone, by disabling it at the VRRP group level.

You can enable `omit-skew-time` only for a few VRRP groups, so that you can enable it at the VRRP group level. These VRRP groups are disabled at the Global level configuration.

Enabling omit-skew-time only for two VRRP groups

To enable `omit-skew-time` for only two VRRP groups:

1. Enable `omit-skew-time` for VRRP group1 at the group level.

```
OS10(config)#vrrp-group 1
OS10(vrrp-group-1)#omit-skew-time
```

2. Enable `omit-skew-time` for VRRP group2 at the group level.

```
OS10(config)#vrrp-group 2
OS10(vrrp-group-2)#omit-skew-time
```

Now `omit-skew-time` is enabled only in VRRP group 1 and 2. For other VRRP groups, `omit-skew-time` is not enabled.

Disabling omit-skew-time only for two VRRP groups

To disable `omit-skew-time` for only two VRRP groups:

1. Enable `omit-skew-time` globally.

```
OS10(conf)#vrrp omit-skew-time
```

2. Disable `omit-skew-time` for VRRP group1 at the group level.

```
OS10(config)#vrrp-group 1
OS10(vrrp-group-1)#omit-skew-time disable
```

3. Disable `omit-skew-time` for VRRP group2 at the group level.

```
OS10(config)#vrrp-group 2
OS10(vrrp-group-2)#omit-skew-time disable
```

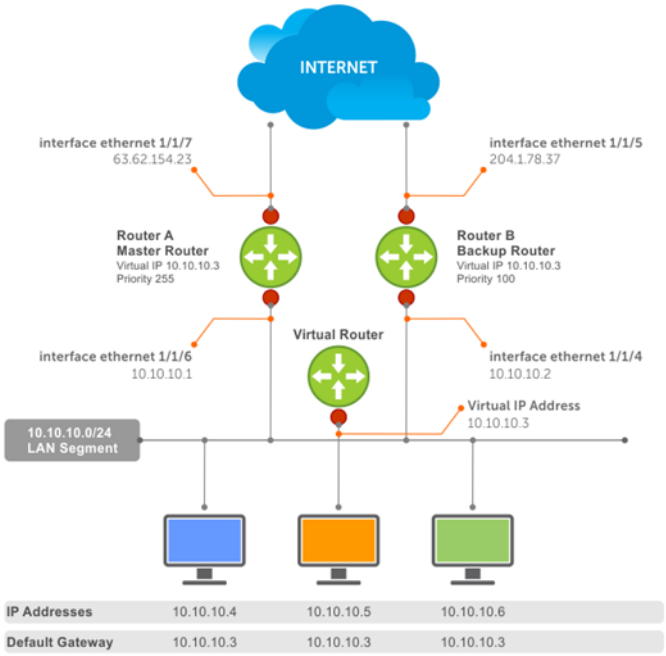
Now `omit-skew-time` is enabled at the global level and disabled only in VRRP groups 1 and 2. For other VRRP groups, `omit-skew-time` is enabled per the global configuration.

Configuration

VRRP specifies a master, or active, router that owns the next-hop IP and MAC address for end stations on a LAN. The master router is chosen from the virtual routers by an election process and forwards packets sent to the next-hop IP address. If the master router fails, VRRP begins the election process to choose a new master router which continues routing traffic.

VRRP packets transmit with the virtual router MAC address as the source MAC address. The virtual router MAC address associated with a virtual router is in 00:00:5E:00:01:{VRID} format for IPv4 and 00:00:5E:00:02:{VRID} format for IPv6. The VRID is the virtual router identifier that allows up to 255 IPv4 and IPv6 VRRP routers on a network. The first four octets are unquenchable, the last two octets are 01:{VRID} for IPv4 and 02:{VRID} for IPv6. The final octet changes depending on the VRRP virtual router identifier.

Basic VRRP Configuration



The example shows a typical network configuration using VRRP. Instead of configuring the hosts on network 10.10.10.0 with the IP address of either Router A or Router B as the default router, the default router of all hosts is set to the IP address of the virtual router. When any host on the LAN segment requests Internet access, it sends packets to the IP address of the virtual router.

Router A is configured as the master router with the virtual router IP address and sends any packets addressed to the virtual router to the Internet. Router B is the backup router and is also configured with the virtual router IP address.

If Router A, the master router, becomes unavailable (the connection between the LAN segment and Router A on ethernet 1/1/6 goes down), Router B, the backup router, automatically becomes the master router and responds to packets sent to the virtual IP address. All workstations continue to use the IP address of the virtual router to transmit packets destined to the Internet. Router B receives and forwards packets on `interface ethernet 1/1/5`. Until Router A resumes operation, VRRP allows Router B to provide uninterrupted service to the users on the LAN segment accessing the Internet.

When the interface that Router A uses to provide gateway services (ethernet 1/1/7) goes down, Router B does not take over automatically. For Router B to become the master router, you must configure interface tracking. When you configure tracking on the interface and the interface goes down, the VRRP group's priority decreases. The lowered priority of the VRRP group triggers an election and Router B becomes the master router. See Interface/object tracking for more information.

Create virtual router

VRRP uses the VRID to identify each virtual router configured. Before using VRRP, you must configure the interface with the primary IP address and enable it.

- Create a virtual router for the interface with the VRRP identifier in INTERFACE mode, from 1 to 255.

```
vrrp-group vrrp-id
```

- Delete a VRRP group in INTERFACE mode.

```
no vrrp-group vrrp-id
```

Configure VRRP

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# vrrp-group 254
```

Verify VRRP

```
OS10(conf-eth1/1/5-vrid-254)# do show running-configuration
...
!
interface ethernet 1/1/5
ip address 10.10.10.1/24
!
vrrp-group 254
no shutdown
...
```

Group version

Configure a VRRP version for the system. Define either VRRPv2 — `vrrp version 2` or VRRPv3 — `vrrp version 3`.

- Configure the VRRP version for IPv4 in INTERFACE mode.

```
vrrp version
```

Configure VRRP version 3

```
OS10(config)# vrrp version 3
```

1. Set the switch with the lowest priority to `vrrp version 2`.
2. Set the switch with the highest priority to `vrrp version 3`.
3. Set all switches from `vrrp version 2` to `vrrp version 3`.

Migrate IPv4 group from VRRPv2 to VRRPv3

```
OS10_backup_switch1(config)# vrrp version 2
OS10_backup_switch2(config)# vrrp version 2
```

Set master switch to VRRPv3

```
OS10_master_switch(config)# vrrp version 3
```

Set backup switches to VRRPv3

```
OS10_backup_switch1(config)# vrrp version 3
OS10_backup_switch2(config)# vrrp version 3
```

Virtual IP addresses

Virtual routers contain virtual IP addresses configured for that VRRP group (VRID). A VRRP group does not transmit VRRP packets until you assign the virtual IP address to the VRRP group.

To activate a VRRP group on an interface, configure at least one virtual IP address for a VRRP group. The virtual IP address is the IP address of the virtual router and does not require an IP address mask. You can configure up to 10 virtual IP addresses on a single VRRP group (VRID).

These rules apply to virtual IP addresses:

- The virtual IP addresses must be in the same subnet as the primary or secondary IP addresses configured on the interface. Though a single VRRP group can contain virtual IP addresses belonging to multiple IP subnets configured on the interface,

Dell Technologies recommends configuring virtual IP addresses belonging to the same IP subnet for any one VRRP group. An interface on which you enable VRRP contains a primary IP address of 50.1.1.1/24 and a secondary IP address of 60.1.1.1/24. The VRRP group (VRID 1) must contain virtual addresses belonging to subnet 50.1.1.0/24 or subnet 60.1.1.0/24.

- If you configure multiple VRRP groups on an interface, only one of the VRRP groups can contain the interface primary or secondary IP address.

NOTE: OS10 does not support configuring the virtual IP address to be the same as the primary or secondary IP address of the interface. Priority 255 is not supported.

Configure virtual IP address

Configure the virtual IP address — the primary IP address and the virtual IP addresses must be on the same subnet.

1. Configure a VRRP group in INTERFACE mode, from 1 to 255.

```
vrrp-group vrrp-id
```

2. Configure virtual IP addresses for this VRRP ID in INTERFACE-VRRP mode. A maximum of 10 IP addresses.

```
virtual-address ip-address1 [...ip-address10]
```

Configure virtual IP address

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 10.1.1.1/24
OS10(conf-if-eth1/1/1)# vrrp-group 10
OS10(conf-eth1/1/1-vrid-10)# virtual-address 10.1.1.8
```

Verify virtual IP address

```
OS10# show running-configuration
! Version 10.1.9999P.2281
! Last configuration change at Jul  26 12:01:58 2016
!
aaa authentication system:local
!
interface ethernet1/1/1
 ip address 10.1.1.1/24
 no switchport
 no shutdown
 !
 vrrp-group 10
  virtual-address 10.1.1.8
!
interface ethernet1/1/2
 switchport access vlan 1
 no shutdown
!
interface ethernet1/1/3
 switchport access vlan 1
 no shutdown
!
interface ethernet1/1/4
 switchport access vlan 1
--more--
```

View VRRP information

When the VRRP process completes initialization, the State field contains either `master` or `backup`.

```
OS10# show vrrp brief
Interface      Group   Priority  Preemption  State Master-addr  Virtual addr(s)
-------------------------------------------------------------------------------
ethernet1/1/1  IPv4 10 100       true       master 10.1.1.8    10.1.1.8
```

View VRRP group 1

```
OS10# show vrrp 1
Interface : ethernet1/1/1    IPv4 VRID : 1
Primary IP Address : 10.1.1.1    State : master-state
Virtual MAC Address : 00:00:5e:00:01:01
Version : version-3    Priority : 100
Preempt :     Hold-time :
Authentication : no-authentication
Virtual IP address :
10.1.1.1
master-transitions : 1    advertise-rcvd : 0
advertise-interval-errors : 0    ip-ttl-errors : 0
priority-zero-pkts-rcvd : 0    priority-zero-pkts-sent : 0
invalid-type-pkts-rcvd : 0    address-list-errors : 0
pkt-length-errors : 0
```

Configure virtual IP address in a VRF

You can configure a VRRP group in a non-default VRF instance and assign a virtual address to this group.

To configure VRRP under a specific VRF:

1. Create the non-default VRF in which you want to configure VRRP.

   `ip vrf vrf-name`

   CONFIGURATION Mode
2. In the VRF Configuration mode, enter the desired interface.

   `interface interface-id`

   VRF CONFIGURATION Mode
3. Remove the interface from L2 switching mode.

   `no switchport`

   INTERFACE CONFIGURATION Mode
4. Assign the interface to the non-default VRF that you have created.

   `ip vrf forwarding vrf-name`

   INTERFACE CONFIGURATION Mode
5. Assign an IP address to the interface.

   `ip address ip-address`

   INTERFACE CONFIGURATION Mode
6. Configure a VRRP group.

   `vrrp-group group-id`

   INTERFACE CONFIGURATION Mode
7. Configure virtual IP address for the VRRP ID.

   `virtual-address ip-address`

   INTERFACE VRRP Mode

```
OS10(config)# ip vrf vrf-test
OS10(config-vrf)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip vrf forwarding vrf-test
OS10(conf-if-eth1/1/1)# ip address 10.1.1.1/24
OS10(conf-if-eth1/1/1)# vrrp-group 10
OS10(conf-eth1/1/1-vrid-10)# virtual-address 10.1.1.8
```

Before removing an interface from a VRF, delete the configured VRRP groups from the interface associated with the VRF. If you do not delete the configured VRRP groups, these groups remain active on the default VRF resulting in duplicate virtual IP address configurations.

Set group priority

The router that has the highest primary IP address of the interface becomes the *master*. The default priority for a virtual router is 100. If the master router fails, VRRP begins the election process to choose a new master router based on the next-highest priority. The virtual router priority is automatically set to 255, if any of the configured virtual IP addresses matches the interface IP address.

1. Create a virtual router for the interface with the VRRP identifier in INTERFACE mode, from 1 to 255.

```
vrrp-group vrrp-id
```

2. Configure the priority number for the VRRP group in INTERFACE-VRRP mode, from 1 to 254, default 100.

```
priority number
```

Set VRRP group priority

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# vrrp-group 254
OS10(conf-eth1/1/5-vrid-254)# priority 200
```

Verify VRRP group priority

```
OS10(conf-eth1/1/5-vrid-254)# do show vrrp 254

Interface : ethernet1/1/5    IPv4 VRID : 254
Primary IP Address : 10.1.1.1    State : master-state
Virtual MAC Address : 00:00:5e:00:01:01
Version : version-3    Priority : 200
Preempt :     Hold-time :
Authentication : no-authentication
Virtual IP address :
10.1.1.1
master-transitions : 1    advertise-rcvd : 0
advertise-interval-errors : 0    ip-ttl-errors : 0
priority-zero-pkts-rcvd : 0    priority-zero-pkts-sent : 0
invalid-type-pkts-rcvd : 0    address-list-errors : 0
pkt-length-errors : 0
```

Authentication

Simple authentication of VRRP packets ensures that only trusted routers participate in VRRP processes. When you enable authentication, OS10 includes the password in its VRRP transmission. The receiving router uses that password to verify the transmission.

You must configure all virtual routers in the VRRP group with the same password. You must enable authentication with the same password or authentication is disabled. Authentication for VRRPv3 is not supported.

1. Create a virtual router for the interface with the VRRP identifier in INTERFACE mode, from 1 to 255.

```
vrrp-group vrrp-id
```

2. Configure a simple text password in INTERFACE-VRRP mode.

```
authentication-type simple—text text
```

`simple—text text` — Enter the keyword and a simple text password.

NOTE: The system does not support a simple text password that begins with the ! or # character. Ensure that the password does not begin with either of these characters.

Configure VRRP authentication

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# vrrp-group 250
OS10(conf-eth1/1/5-vrid-250)# authentication simple-text eureka
```

Verify VRRP authentication configuration

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# vrrp-group 1
OS10(conf-eth1/1/1-vrid-1)# authentication simple-text dell
```

Disable preempt

Prevent the Backup router with the higher priority from becoming the master router by disabling the preemption process. The `preempt` command is enabled by default. The command forces the system to change the master router if another router with a higher priority comes online.

You must configure all virtual routers in the VRRP group with the same settings. Configure all routers with preempt enabled or configure all with preempt disabled.

1. Create a virtual router for the interface with the VRRP identifier in INTERFACE mode, from 1 to 255.

   ```
   vrrp-group vrrp-id
   ```

2. Prevent any backup router with a higher priority from becoming the Master router in INTERFACE-VRRP mode.

   ```
   no preempt
   ```

Disable preempt

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# vrrp-group 254
OS10(conf-eth1/1/5-vrid-254)# no preempt
```

View running configuration

```
OS10(conf-eth1/1/5-vrid-254)# do show running-configuration

!
```

Advertisement interval

By default, the master router transmits a VRRP advertisement to all members of the VRRP group every one second, indicating it is operational and is the master router.

If the VRRP group misses three consecutive advertisements, the election process begins and the backup virtual router with the highest priority transitions to master. To avoid throttling VRRP advertisement packets, Dell Technologies recommends increasing the VRRP advertisement interval to a value higher than the default value of one second. If you change the time interval between VRRP advertisements on one router, change it on all participating routers.

If you configure VRRP version 2, you must configure the timer values in multiple of whole seconds. For example, a timer value of 3 seconds or 300 centisecs is valid and equivalent. A time value of 50 centisecs is invalid because it not a multiple of 1 second. If you are using VRRP version 3, you must configure the timer values in multiples of 25 centisecs. A centisecs is 1/100 of a second.

- Create a virtual router for the interface with the VRRP identifier in INTERFACE mode, from 1 to 255.

```
vrrp-group vrrp-id
```

- For VRRPv2, change the advertisement interval setting in seconds in INTERFACE-VRRP mode, from 1 to 255, default 1.

```
advertise-interval seconds
```

- For VRRPv3, change the advertisement centisecs interval setting INTERFACE-VRRP mode, from 25 to 4075, default 100.

```
advertise-interval centisecs centisecs
```

Change advertisement interval

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# vrrp-group 1
OS10(conf-eth1/1/1-vrid-1)# advertise-interval centisecs 200
```

```

Interface/object tracking

You can monitor the state of any interface according to the virtual group. OS10 supports a maximum of 10 track groups and each track group can track only one interface.

If the tracked interface goes down, the VRRP group's priority decreases by a default value of 10 — also known as *cost*. If the tracked interface's state goes up, the VRRP group's priority increases by the priority cost.

The lowered priority of the VRRP group may trigger an election. As the master/backup VRRP routers are selected based on the VRRP group's priority, tracking features ensure that the best VRRP router is the master for that group. The priority cost of the tracking group must be less than the configured priority of the VRRP group. If you configure the VRRP group as the owner router with a priority 255, tracking for that group is disabled, regardless of the state of the tracked interfaces. The priority of the owner group always remains 255.

For a virtual group, track the line-protocol state of any interface using the `interface` command. Enter an interface type and `node/slot/port[:subport]` information, or VLAN number:

- `ethernet` — Physical interface, from 1 to 48
- `vlan` — VLAN interface, from 1 to 4093

For a virtual group, track the status of a configured object using the `track` command and the object number. You can also configure a tracked object for a VRRP group with this command before you create the tracked object. No changes in the VRRP group's priority occur until the tracked object is determined to be down.

Configure tracking

To track the object in a VRRP group, use the following commands:

1. Assign an object tracking unique ID number in CONFIGURATION mode, from 1 to 500.

```
track track-id
```

2. Monitor an interface in Track CONFIGURATION mode.

```
interface ethernet node/slot/port[:subport]
```

Configure interface tracking

```
OS10(config)# track 10
OS10(conf-track-10)# interface ethernet 1/1/7 line-protocol
```

View running configuration

```
OS10(conf-track-10)# do show running-configuration

! Version 10.1.9999P.2281
! Last configuration change at Jul  27 03:24:01 2016
!
aaa authentication system:local

```

To associate a track object with a VRRP group, use the `track` command inside VRRP GROUP CONFIGURATION mode.

VRRP commands

advertise-interval

Sets the time interval between VRRP advertisements.

Syntax `advertise-interval [seconds | centisecs centisecs]`

Parameters
- *seconds*—Set the advertise interval in seconds, from 1 to 255.
- `centisecs` *centisecs*—(Optional) Enter a value in multiples of 25, from 25 to 4075.

Default 1 second or 100 centisecs

Command Mode INTERFACE-VRRP

Usage Information Dell Technologies recommends keeping the default setting for this command. If you change the time interval between VRRP advertisements on one router, change it on all routers. The `no` version of this command sets the VRRP advertisements timer interval back to its default value, 1 second or 100 centisecs.

Example

```
OS10(conf-eth1/1/6-vrid-250)# advertise-interval 120 centisecs 100
```

Supported Releases 10.2.0E or later

authentication-type

Enables authentication of VRRP data exchanges.

Syntax `authentication-type simple-text password`

Parameters `simple-text password` — Enter a simple text password.

Default Disabled

Command Mode INTERFACE-VRRP

Usage Information With authentication enabled, OS10 ensures that only trusted routers participate in routing in an autonomous network. The `no` version of this command disables authentication of VRRP data exchanges.

Example

```
OS10(conf-ethernet1/1/6-vrid-250)# authentication simple-text eureka
```

Supported Releases 10.2.0E or later

bfd interface

Configure BFD parameters under the track object configuration.

Syntax `[no] bfd interface interface name vrf vrf name source-ip-address source-ip-address neighbor-ip-address neighbor-ip-address [interval interval min_rx min_rx multiplier value role {active | passive}]`

Parameters
- `interface` *interface-name*—Enter the name of the interface for which the BFD session object is created and tracked. It can be any of the following interface types: Ethernet, VLAN, or port channel.
- `vrf` *vrf-name*—Enter the name of the VRF.
- `source-ip-address` *source-ip-address*—Enter the source IP address (IPv4 or IPv6) configured in the interface.
- `neighbor-ip-address` *neighbor-ip-address*—Enter the IP address (IPv4 or IPv6) of the remote interface that is connected to this interface.

- `interval interval`—Enter the transit interval between BFD packets in milliseconds. Default value is 200 milliseconds. Range is from 50 and 1000 milliseconds.
- `min_rx min_rx`—Enter the minimum receive interval capability. Default value is 200 milliseconds. Range is from 50 to 1000.
- `multiplier value`—Enter the multiplier value used to compute hold down. Default value is 3. Range is from 3 to 50. Detect multiplier value.
- `role {active | passive}`—Enter the role to be assigned by the BFD session. Enter `active` to assign an active role to the BFD session. Enter `passive` to assign a passive role to the BFD session.

Default Not configured

Security and access `sysadmin, secadmin, netadmin,` and `netoperator`

Command Mode CONFIGURATION-TRACK

Usage Information None.

Example

```
OS10(config)# track 1
OS10(conf-track-1)# bfd interface ethernet 1/1/7:1 vrf red source-ip-
address 1.1.1.1 neighbor-ip-address 1.1.1.2 interval
50 min_rx 50 multiplier 5 role active

OS10(config)# track 2
OS10(conf-track-2)# bfd interface ethernet 1/1/7:2 vrf red source-ip-
address 20.20.20.20  neighbor-ip-address 20.20.20.30

OS10(config)# track 3
OS10(conf-track-3)# bfd interface vlan300 vrf red source-ip-address
100.100.100.100  neighbor-ip-address 100.100.100.200
```

Supported Releases 10.5.3.0 or later

omit-skew-time

Configure omit skew time at VRRP group level. You can enable or disable skew time.

Syntax `[no] omit-skew-time [disable]`

Parameters

- *omit-skew-time*—Omits the skew time in the calculation of `master_down_interval`.
- `disable`—Disables the omit sew time.

Default Disabled

Security and access `sysadmin, secadmin, netadmin,` and `netoperator`

Command Mode CONFIGURATION

Usage Information None

Example

```
OS10(config)# vrrp-group 1
OS10(vrrp-group-1)# omit-skew-time

OS10(config)# vrrp-group 3
OS10(vrrp-group-3)# omit-skew-time disable
```

Supported Releases 10.5.3.0 or later

preempt

Permits or preempts a backup router with a higher priority value to become the master router.

Syntax	`preempt`
Parameters	None
Default	Enabled
Command Mode	INTERFACE-VRRP
Usage Information	VRRP uses preempt to determine what happens after a VRRP backup router becomes the master. With preempt enabled by default, VRRP switches to a backup if that backup router comes online with a priority higher than the new master router. If you disable preempt, VRRP switches only if the master fails. The `no` version of this command disables preemption.
Example	`OS10(conf-eth1/1/5-vrid-254)# preempt`
Supported Releases	10.2.0E or later

priority

Assigns a VRRP priority value for the VRRP group. The VRRP uses this value during the master election process.

Syntax	`priority` *`number`*
Parameters	*`number`* — Enter a priority value, from 1 to 254.
Default	100
Command Mode	INTERFACE-VRRP
Usage Information	To guarantee that a VRRP group becomes master, configure the priority of the VRRP group to the 254, which is the highest priority. OS10 does not support priority 255. The `no` version of this command resets the value to the default of 100.
Example	`OS10(conf-eth1/1/5-vrid-254)# priority 200`
Supported Releases	10.2.0E or later

show track brief

Displays the BFD track objects.

Syntax	`show track brief`
Parameters	None.
Default	None.
Security and access	`sysadmin`, `secadmin`, `netadmin`, and `netoperator`
Command Mode	EXEC Privilege
Usage Information	None

Example	`OS10# show track brief`
	`TrackID Resource Parameter Status`
	`----------`
	`400 BFD session vlan3998:default UP`
	`2021-08-25T12:59:16Z5`

```
                        src-ip 1111:2222:3333:4444:5555:6666:7777:8889
                        neighbor-ip 1111:2222:3333:4444:5555:6666:7777:8888
498     line-protocol   loopback1                                          UP
2021-08-25T10:47:47Z3
499     BFD session     vlan3999:default                                   UP
2021-08-25T12:59:16Z5
                        src-ip 39:39:39::2
                        neighbor-ip 39:39:39::1
500     BFD session     vlan3999:default                                   UP
2021-08-25T12:59:27Z5
                        src-ip 39.39.39.2
                        neighbor-ip 39.39.39.1
```

Supported Releases 10.5.3.0 or later

show track bfd

Displays the dump of all BFD track objects.

Syntax `show track bfd`

Parameters None.

Default None.

Security and access `sysadmin`, `secadmin`, `netadmin`, and `netoperator`

Command Mode EXEC Privilege

Usage Information None

Example

```
OS10# show track bfd

TrackID Resource     Parameter                                                 Status  I
-------------------------------------------------------------------------------------
400     BFD session  vlan3998:default                                          UP      2

                     src-ip 1111:2222:3333:4444:5555:6666:7777:8889
                     neighbor-ip 1111:2222:3333:4444:5555:6666:7777:8888
499     BFD session  vlan3999:default                                          UP      2

                      src-ip 39:39:39::2
                      neighbor-ip 39:39:39::1
500     BFD session  vlan3999:default                                          UP      2

                      src-ip 39.39.39.2
                      neighbor-ip 39.39.39.1
```

Supported Releases 10.5.3.0 or later

show vrrp

Displays VRRP group information.

Syntax `show vrrp [vrf vrf-name] {brief | vrrp-id | ipv6 group-id}`

Parameters

- `vrf vrf-name`—Displays the VRRP group information corresponding to the specified VRF.
- `brief`—Displays the configuration information for all VRRP instances in the system.
- *`vrrp-id`*—Enter a VRRP group ID number to view the VRRP IPv4 group operational status information, from 1 to 255.
- `ipv6 group-id`—(Optional) Enter a VRRP group ID number to view the specific IPv6 group operational status information, from 1 to 255.

Default All IPv4 VRRP group configuration

Command Mode EXEC

Usage Information Displays all active VRRP groups. If no VRRP groups are active, the system displays `No Active VRRP group`.

Example

```
OS10 # show vrrp ipv6 1
Interface : ethernet1/1/1    IPv6 VRID : 1
Primary IP Address : 10::1    State : master-state
Virtual MAC Address : 00:00:5e:00:02:01
Version : version-3    Priority : 200

```

Supported Releases	10.2.0E or later

track

Assigns a unique identifier to track an object.

Syntax	`track` *`track-id`* `[priority cost [value]]`
Parameters	• *`track-id`* — Enter the object tracking resource ID number, from 1 to 500. • `priority cost` *`value`* — (Optional) Enter a cost value to subtract from the priority value, from 1 to 254.
Default	10
Command Mode	INTERFACE-VRRP
Usage Information	If you disable the interface, the cost value subtracts from the priority value and forces a new master election. This election process is applicable when the priority value is lower than the priority value in the backup virtual router. You can associate only one track object with a VRRP group. The `no` version of this command resets the value to the default.
Example	`OS10(conf-eth1/1/5-vrid-254)# track 400`
Example (Priority Cost)	`OS10(conf-eth1/1/5-vrid-254)# track 400 priority-cost 20`
Supported Releases	10.2.0E or later

track interface

Monitors an interface and lowers the priority value of the VRRP group on that interface, if disabled.

Syntax	`interface {ethernet` *`node/slot/port[:subport]`*`} [line-protocol]`
Parameters	• `ethernet` *`node/slot/port[:subport]`* — (Optional) Enter the keyword and the interface information to track. • `line-protocol` — (Optional) Tracks the interface line-protocol operational status.
Default	Disabled
Command Mode	EXEC
Usage Information	Assign an object tracking unique ID number before tracking the interface. Use the `line-protocol` parameter to track for interface operational status information. The `no` version of this command resets the value to the default.
Example	`OS10(config)# track 10` `OS10(conf-track-10)# interface ethernet 1/1/5 line-protocol`
Supported Releases	10.2.0E or later

virtual-address

Configures up to 10 virtual router IP addresses in the VRRP group. Set at least one virtual IP address for the VRRP group to start sending VRRP packets.

Syntax	`virtual-address` *`ip-address1 [ip-address2...ip-address10]`*

Parameters	• *ip-address1* — Enter the IP address of a virtual router in A.B.C.D format. The IP address must be on the same subnet as the interface's primary IP address. • *ip-address2...ip-address10* — (Optional) Enter up to nine additional IP addresses of virtual routers, separated by a space. The IP addresses must be on the same subnet as the interface's primary IP address.
Default	Enabled
Command Mode	INTERFACE-VRRP
Usage Information	The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets. You can ping the virtual addresses configured in all VRRP groups. The `no` version of this command deletes one or more virtual-addresses configured in the system.
Example	`OS10(conf-eth1/1/5-vrid-254)# virtual address 10.1.1.15`
Supported Releases	10.2.0E or later

vrrp omit-skew-time

Configure omit skew time at the Global level. You can enable or disable skew time for all the configured VRRP groups in the router.

Syntax	`[no] vrrp` *omit-skew-time*
Parameters	*omit-skew-time*—Omits the skew time in the calculation of the `master_down_interval`.
Default	Disabled
Security and access	`sysadmin`, `secadmin`, `netadmin`, and `netoperator`
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# vrrp omit-skew-time`
Supported Releases	10.5.3.0 or later

vrrp delay reload

Sets the delay time for VRRP initialization after a system reboot.

Syntax	`vrrp delay reload` *seconds*
Parameters	*seconds* — Enter the number of seconds for the VRRP reload time, from 0 to 900.
Default	0
Command Mode	CONFIGURATION
Usage Information	VRRP delay reload time of zero seconds indicates no delays. This command configuration applies to all the VRRP configured interfaces. The `no` version of this command resets the value to the default.
Example	`OS10(config)# vrrp delay reload 5`
Supported Releases	10.4.0E(R1) or later

vrrp-group

Assigns a VRRP group identification number to an IPv4 interface or VLAN

Syntax	`vrrp-group vrrp-id`
Parameters	*vrrp-id* — Enter a VRRP group identification number, from 1 to 255.
Default	Not configured
Command Mode	INTERFACE-VRRP
Usage Information	The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets. The `no` version of this command removes the `vrrp-group` configuration.
Example	`OS10(conf-if-eth1/1/5)# vrrp-group 254`
Example (VLAN)	`OS10(conf-if-vl-10)# vrrp-group 5`
Supported Releases	10.2.0E or later

vrrp-ipv6-group

Assigns a VRRP group identification number to an IPv6 interface.

Syntax	`vrrp-ipv6-group vrrp-id`
Parameters	*vrrp-id* — Enter a VRRP group identification number, from 1 to 255.
Default	Not configured
Command Mode	INTERFACE-VRRP
Usage Information	The VRRP group only becomes active and sends VRRP packets when you configure a virtual IP address. When you delete the virtual address, the VRRP group stops sending VRRP packets. The `no` version of this command removes the `vrrp-ipv6-group` configuration.
Example	`OS10(conf-if-eth1/1/7)# vrrp-ipv6-group 250`
Supported Releases	10.2.0E or later

vrrp version

Sets the VRRP version for the IPv4 group.

Syntax	`vrrp version {2 | 3}`
Parameters	• `2` — Set to VRRP version 2. • `3` — Set to VRRP version 3.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the VRRP version for the IPv4 group.
Example	`OS10(config)# vrrp version 2`
Supported Releases	10.2.0E or later

13

Multicast

Multicast is a technique that allows networking devices to send data to a group of interested receivers in a single transmission. For instance, this technique is widely used for streaming videos. Multicast allows you to more efficiently use network resources, specifically for bandwidth-consuming services such as audio and video transmission.

OS10 supports the multicast feature in IPv4 networks and uses the following protocols for multicast distribution:

- **Internet Group Management Protocol (IGMP)**—IGMP is a communications protocol that establishes multicast group memberships using IPv4 networks. OS10 supports IGMPv1, IGMPv2, and IGMPv3 to manage the multicast group memberships on IPv4 networks.
- **Protocol Independent Multicast (PIM)**—PIM is a group of multicast routing protocols that provides one-to-many and many-to-many transmission of information. PIM uses routing information from other routing protocols and does not depend on any specific unicast routing protocol. PIM uses any unicast routing protocol that is deployed in the network.

Configuration notes

When there is an exclude join, the `show {ip | ipv6} {igmp | mld} snooping groups detail` command lists the member port under both the wild-card (--) source, and sources that are listed in the report. The member port listed under the wild-card (--) source has the expiry timer running and indicates that the multicast data packets that do not match the excluded sources for this member port are forwarded to that port.

For example, the member port ethernet1/1/36, is listed under both the wildcard source (--) and the source (15.1.1.1) in the following show command output.

```
OS10# show ip igmp snooping groups detail
Interface vlan10
Group 234.1.1.1
Source List
--
Member Port Mode Uptime
Expires
ethernet1/1/36 Exclude 00:01:33
00:01:59
ethernet1/1/38 Exclude 00:01:33
00:01:54
15.1.1.1
Member Port Mode Uptime
Expires
ethernet1/1/36 Exclude 00:01:33
Never
21.1.1.1
Member Port Mode Uptime
Expires
ethernet1/1/38 Exclude 00:01:33 Never
```

Important notes

- OS10 supports IGMP, IPv4 PIM, and IPv6 PIM for multicast routing.
- OS10 supports PIM and IGMP on default and non-default VRFs.
- OS10 does not support multicast routing on S3048-ON platforms.
- Multicast flood control is not supported on S4248FB-ON and S4248FBL-ON platforms.
- OS10 supports MLD snooping for L2 IPv6 multicast.

OS10 does not support the following:

- Fast leave support with a prefix list
- IGMPv2 SSM mapping
- Static multicast group configuration

- Simple Network Management Protocol (SNMP) MIB for Internet Group Management Protocol (IGMP) or Protocol Independent Multicast (PIM)

NOTE: Layer 3 (L3) PIM and IGMP multicast is not supported on the S3048-ON switch. IGMP and Multicast Listener Discovery (MLD) snooping is supported on all switches.

Configure multicast routing

Multicast routing protocol is used for communication between multicast routers and enables the multicast routers to calculate the multicast distribution tree of the receiving hosts.

Configuring multicast routing is a two-step process that involves configuring multicast routing and enabling PIM sparse mode (PIM-SM) on a Layer 3 (L3) interface. The following procedure describes how to configure multicast routing.

For more information about IGMP and PIM feature configurations, see Internet Group Management Protocol and Protocol Independent Multicast.

NOTE:

Multicast flood restrict feature is enabled by default. To ensure that no traffic drops occur, Dell Technologies recommends that you do one of the following:

- Disable IGMP snooping on the VLAN between two PIM routers that do not have IGMP receivers on that VLAN.
- Configure the interface between the PIM routers as static mrouter port.

1. Enable multicast routing for IPv4 networks.

```
OS10# configure terminal
OS10(config)# ip multicast-routing
```

2. Configure an IP address to a VLAN interface.

```
OS10(config)# interface vlan 2
OS10(conf-if-vl-2)# ip address 1.1.1.2/24
```

3. Enable PIM sparse mode on an L3 interface.

```
OS10(config)# interface vlan 2
OS10(conf-if-vl-2) ip pim sparse-mode
```

4. From CONFIGURATION mode, configure the rendezvous point (RP) IP address statically and specify the multicast group address range. The RP IP address should be reachable across the PIM domain.

```
OS10(config)# ip pim rp-address 171.1.1.1 group-address 225.1.1.3/32
```

5. Configure the RP address and multicast group address on all nodes in your network.

Multicast route optimization

This feature supports 8000 audio streams and 600 video streams that are identified by the multicast group addresses in SmartFabric OS10 network switches.

The total routes including (star, g) and (S,G) together are 8,600 multicast route entries. In a VLT environment with support for 8,600 multicast routes, this feature introduces optimizations to improve route convergence time. However, there is no change in the functional behavior corresponding to multicast routes, while these optimizations are implemented to improve route convergence time.

This feature also optimizes spanned VLAN message exchange between VLT peers.

Supported platforms

The following platforms are supported: S5232-ON, S5296-ON, S5248-ON, S5448F-ON, Z9264F-ON, Z9332F-ON, and Z9432F-ON.

Multicast Commands

ip multicast-routing

Enables IP multicast forwarding.

Syntax	`ip multicast-routing [vrf vrf-name]`
Parameters	`vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
Default	None
Command Mode	CONFIGURATION
Usage Information	After you enable IP multicast, enable IGMP and PIM on an interface. To do this, use the `ip pim sparse-mode` command in INTERFACE mode. The `no` form of the command disables IP multicast forwarding.
Example	`OS10# configure terminal` `OS10(config)# ip multicast-routing`
Supported Releases	10.4.3.0 or later

IPv4 multicast routing

Internet Group Management Protocol

Internet Group Management Protocol (IGMP) is a communications protocol that establishes multicast group memberships using IPv4 networks. OS10 supports IGMPv1, IGMPv2, and IGMPv3 to manage the multicast group memberships on IPv4 networks.

The IGMP querier periodically (by default, every 60 seconds) sends out a membership query to all the hosts. The hosts, in response to the query, send a response back to the querier to report their multicast group memberships. The switch makes an entry to identify the corresponding port as a member of the particular multicast group..

NOTE: A multicast router is a Layer 3 router or switch that has multicast features enabled.

When a host wants to join a multicast group, it sends an IGMP message to the multicast router.

Each network segment has an IGMP querier, which is a multicast router. The multicast router periodically sends IGMP queries to learn which multicast groups are active and have members on the network.

Multicast routers send the following types of queries:

- General query—To learn about listeners for multicast groups.
- Multicast address-specific query—To learn if a particular multicast address has listeners.
- Multicast address-and-source-specific query—To learn if any of the sources from the specified list for a multicast source has any listeners.

The hosts send the following messages to multicast routers:

- Version 1: Membership report
- Version 2:
  - Version 1 membership report for backward compatibility with version 1
  - Version 2 membership report
  - Leave group message
- Version 3:
  - Version 1 membership report for backward compatibility with version 1
  - Version 2 membership report for backward compatibility with version 2

- Version 3 membership report
- Version 2 leave group message

Version 3 provides support for source filtering. The system reports interest in receiving packets only from specific source addresses, or from all the sources except some specific source addresses, sent to a particular multicast address.

Standards compliance

- OS10 complies to the RFCs 1112, 2236, and 3376 for IGMP versions 1, 2, and 3, respectively.
- OS10 uses version 3 as the default IGMP version. Version 3 is backwards compatible with versions 1 and 2.

Important notes

- OS10 systems cannot serve as an IGMP host or an IGMP version 1 querier.
- OS10 automatically enables IGMP on interfaces where you enable PIM sparse mode.

Supported IGMP versions

IGMP has three versions. Version 3 obsoletes and is backwards-compatible with version 2; version 2 obsoletes version 1.

OS10 supports the following IGMP versions:

- Router—IGMP versions 2 and 3. The default is version 3.
- Host—IGMP versions 1, 2, and 3.

In IGMP version 2, the host expresses interest in a particular group membership (*, G). In IGMP version 3, the host expresses interest in a particular group membership, and specifies the source from which it wants the multicast traffic (S, G).

Query interval

The IGMP querier periodically sends a general query to discover which multicast groups are active. A group must have at least one host to be active. By default, the periodic query messages are sent every 60 seconds. You can configure this value using the `ip igmp query-interval` command.

To configure a query interval:

```
OS10# configure terminal
OS10# interface vlan120
OS10(conf-if-vl-120)# ip igmp query-interval 60
```

Last member query interval

When the IGMP querier receives a leave message, it sends a group-specific query message to ensure if any other host in the network is interested in the multicast flow. By default, the group-specific query messages are sent every 1000 milliseconds. You can configure this value using the `ip igmp last-member-query-interval` command.

To configure last member query interval:

```
OS10# configure terminal
OS10# interface vlan120
OS10(conf-if-vl-120)# ip igmp last-member-query-interval 200
```

Maximum response time

The maximum response time is the amount of time that the querier waits for a response to a query before taking action.

When a host receives a query, it does not respond immediately, but rather starts a delay timer. The delay time is set to a random value between 0 and the maximum response time. The host sends a response when the timer expires; in IGMP version 2, if another host responds before the timer expires, the timer nullifies, and no response is sent.

The querier advertises the maximum response time in the query. Lowering this value decreases leave latency but increases response burstiness because all host membership reports are sent before the maximum response time expires. Inversely, increasing this value decreases burstiness, but increases leave latency.

To configure maximum response time:

```
OS10# configure terminal
OS10# interface vlan120
OS10(conf-if-vl-120)# ip igmp query-max-resp-time 20
```

IGMP immediate leave

If the IGMP querier does not receive a response to a group-specific or group-and-source query, it sends another query based on the configured querier robustness value. This value determines the number of times the querier sends the message. If the querier does not receive a response, it removes the group from the outgoing interface for the subnet.

IGMP immediate leave reduces leave latency by enabling a router to immediately delete the group membership on an interface after receiving a *leave* message. Immediate leave does not send group-specific or group-and-source queries before deleting the entry.

To configure IGMP immediate leave:

```
OS10# configure terminal
OS10# interface vlan14
OS10(conf-if-vl-14)# ip igmp immediate-leave
```

Select an IGMP version

OS10 enables IGMP version 3 by default.

If hosts require an IGMP version other than 3, use the following to select a different IGMP version:

```
OS10# configure terminal
OS10# interface vlan12
OS10(conf-if-vl-12)# ip igmp version 3
```

IGMP commands

clear ip igmp groups

Clears entries from the group cache table.

Syntax	`clear ip igmp [vrf vrf-name] groups`
Parameters	`vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
Default	None
Command Mode	EXEC
Usage Information	None
Example	`OS10# clear ip igmp groups`
Supported Releases	10.4.3.0 or later

ip igmp immediate-leave

Enables IGMP immediate leave.

Syntax	`ip igmp immediate-leave`
Parameters	None
Default	None
Command Mode	INTERFACE
Usage Information	The querier sends some group-specific queries when it receives a leave message before deleting the group from the membership database. If you need to immediately delete a group from the membership database, use the `ip igmp immediate-leave` command. The `no` version of this command disables IGMP immediate leave.

Example	`OS10# configure terminal`
	`OS10# interface vlan11`
	`OS10(conf-if-vl-11)# ip igmp immediate-leave`

Supported Releases	10.4.3.0 or later

ip igmp last-member-query-interval

Changes the last member query interval, which is the maximum response time included in the group-specific queries sent in response to leave group messages. This last-member-query-interval is the interval between group-specific query messages.

Syntax	`ip igmp last-member-query-interval` *milliseconds*
Parameters	*milliseconds*—Enter the amount of time in milliseconds to configure the time interval between group-specific query messages. The range is from 100 to 65535.
Default	1000 milliseconds
Command Mode	INTERFACE
Usage Information	None

Example	`OS10# configure terminal`
	`OS10# interface vlan11`
	`OS10(conf-if-vl-11)# ip igmp last-member-query-interval 200`

Supported Releases	10.4.3.0 or later

ip igmp query-interval

Changes the frequency of IGMP general queries sent by the querier.

Syntax	`ip igmp query-interval` *seconds*
Parameters	*seconds*—Enter the amount of time in seconds to configure the time interval for IGMP general queries. The range is from 1 to 18000.
Default	60 seconds
Command Mode	INTERFACE
Usage Information	None

Example

```
OS10# configure terminal
OS10# interface vlan12
OS10(conf-if-vl-12)# ip igmp query-interval 60
```

Supported Releases 10.4.3.0 or later

ip igmp query-max-resp-time

Configures the maximum query response time advertised in general queries.

Syntax `ip igmp query-max-resp-time seconds`

Parameters *seconds*—Enter the amount of time in seconds, from 1 to 25.

Default 10 seconds

Command Mode INTERFACE

Usage Information The IGMP query maximum response time value must be less than the IGMP query interval value. The `no` form of the command configures the default value.

Example

```
OS10# configure terminal
OS10# interface vlan14
OS10(conf-if-vl-14)# ip igmp query-max-resp-time 20
```

Supported Releases 10.4.3.0 or later

ip igmp snooping enable

Enables IGMP snooping globally.

Syntax `ip igmp snooping enable`

Parameters None

Default Enabled

Command Mode CONFIGURATION

Usage Information The `no` version of this command disables IGMP snooping.

Example

```
OS10(config)# ip igmp snooping enable
```

Supported Releases 10.4.0E(R1) or later

ip igmp snooping

Enables IGMP snooping on the specified VLAN interface.

Syntax `ip igmp snooping`

Parameters None

Default Depends on the global configuration.

Command Mode VLAN INTERFACE

Usage Information When you enable IGMP snooping globally, the configuration applies to all VLAN interfaces. You can disable IGMP snooping on specified VLAN interfaces. The `no` version of this command disables IGMP snooping on the specified VLAN interface.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# no ip igmp snooping
```

Supported Releases 10.4.0E(R1) or later

ip igmp snooping fast-leave

Enables fast leave in IGMP snooping for specified VLAN.

Syntax `ip igmp snooping fast-leave`

Parameters None

Default Disabled

Command Mode VLAN INTERFACE

Usage Information The fast leave option allows the IGMP snooping switch to remove an interface from the multicast group immediately on receiving the *leave* message. The `no` version of this command disables the fast leave functionality.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping fast-leave
```

Supported Releases 10.4.1.0 or later

ip igmp snooping last-member-query-interval

Configures the time interval between group-specific IGMP query messages.

Syntax `ip igmp snooping last-member-query-interval` *`query-interval-time`*

Parameters *`query-interval-time`*—Enter the query time interval in milliseconds, from 100 to 65535.

Default 1000 milliseconds

Command Mode VLAN INTERFACE

Usage Information The `no` version of this command resets the last member query interval time to the default value.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping last-member-query-interval 2500
```

Supported Releases 10.4.1.0 or later

ip igmp snooping mrouter

Configures the multicast router port on the specified VLAN interface.

Syntax `ip igmp snooping mrouter interface` *`interface-type`*

Parameters *`interface-type`*—Enter the interface type details. The interface must be a member of the VLAN. In a PVLAN domain, only the promiscuous port is supported. Secondary ports are not supported.

Default Not configured

Command Mode VLAN INTERFACE

Usage Information The `no` version of this command removes the multicast router configuration from the VLAN member port.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping mrouter interface ethernet 1/1/1
```

Supported Releases 10.4.0E(R1) or later

ip igmp snooping querier

Enables IGMP querier processing for the specified VLAN interface.

Syntax `ip igmp snooping querier`

Parameters None

Default Not configured

Command Mode VLAN INTERFACE

Usage Information The `no` version of this command disables IGMP querier on the VLAN interface..

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping querier
```

Supported Releases 10.4.0E(R1) or later

ip igmp snooping query-interval

Configures time interval for sending IGMP general queries.

Syntax `ip igmp snooping query-interval` *`query-interval-time`*

Parameters *`query-interval-time`*—Enter the interval time in seconds, from 2 to 18000.

Default 60 seconds

Command Mode VLAN INTERFACE

Usage Information The `no` version of this command resets the query interval to the default value.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping query-interval 120
```

Supported Releases 10.4.1.0 or later

ip igmp snooping query-max-resp-time

Configures the maximum time for responding to a query advertised in IGMP queries.

Syntax `ip igmp snooping query-max-resp-time` *`query-response-time`*

Parameters *`query-response-time`*—Enter the query response time in seconds, ranging from 1 to 25.

Default 10 seconds

Command Mode VLAN INTERFACE

Usage Information The `no` version of this command resets the query response time to default value.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping query-max-resp-time 15
```

Supported Releases 10.4.1.0 or later

ip igmp version

Configures IGMP version.

Syntax `ip igmp version version-number`

Parameters *version-number*—Enter the version number as 2 or 3.

Default 3

Command Mode VLAN INTERFACE

Usage Information The `no` version of this command resets the version number to the default value.

Example

```
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp version 2
```

Supported Releases 10.4.1.0 or later

show ip igmp groups

Displays the IGMP groups.

Syntax `show ip igmp [vrf vrf-name] groups [group-address [detail] | detail | interface-name [group-address [detail]]]`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *group-address*—Enter the group address in dotted decimal format to view specific group information.
- *interface-name*—Enter the interface name.

Default None

Command Mode EXEC

Usage Information The `show ip igmp groups` command displays the IGMP database, configured entries for all groups on all interfaces, all groups on specific interfaces, or specific groups on specific interfaces. This command displays the following:

- `Group address`—Lists the multicast address for the IGMP group.
- `Interface`—Lists the interface type, slot, and port number.
- `Mode`—Displays the IGMP version used.
- `Uptime`—Displays the amount of time the group has been operational.
- `Expires`—Displays the amount of time until the entry expires.
- `Last reporter`—Displays the IP address of the last host to be a member of the IGMP group.

Example

```
OS10# show ip igmp groups
Total Number of Groups: 100
IGMP Connected Group Membership
Group Address Interface     Mode           Uptime     Expires  Last
Reporter
225.1.1.1     vlan121    IGMPv2-Compat   12:39:00    00:01:58  121.1.1.10

```

Supported Releases 10.4.3.0 or later

show ip igmp interface

Displays information about all IGMP-enabled interfaces.

Syntax `show ip igmp [vrf vrf-name] interface name`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- `interface name`—Enter the keyword `interface`, then the interface name.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip igmp interface
Vlan103 is up, line protocol is up
Internet address is 2.1.1.2
IGMP is enabled on interface
IGMP version is 3
IGMP query interval is 60 seconds
IGMP querier timeout is 130 seconds
IGMP last member query response interval is 1000 ms
IGMP max response time is 10 seconds
IGMP immediate-leave is disabled on this interface
IGMP joins count: 0
IGMP querying router is 2.1.1.1

Vlan121 is up, line protocol is up
Internet address is 121.1.1.2
IGMP is enabled on interface
IGMP version is 3
IGMP query interval is 60 seconds
IGMP querier timeout is 130 seconds
IGMP last member query response interval is 1000 ms
IGMP max response time is 10 seconds
IGMP immediate-leave is disabled on this interface
IGMP joins count: 100
IGMP querying router is 121.1.1.2
```

Supported Releases 10.4.3.0 or later

show ip igmp snooping groups

Displays IGMP snooping group membership details.

Syntax `show ip igmp snooping groups [detail | [vlan vlan-id [detail | ip-address] | private-vlan pvlan-id]]`

Parameters

- `vlan-id`—(Optional) Enter the VLAN ID, from 1 to 4093.

- `detail`—(Optional) Enter `detail` to display the IGMPv3 source information.
- *`ip-address`*—(Optional) Enter the IP address of the multicast group.
- *`pvlan-id`*—(Optional) Enter the private VLAN id, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information The `show ip igmp snooping groups` command displays the primary VLAN information.

- Use the `private-vlan` keyword to view information about the secondary VLANs.
- Enter a primary VLAN ID to view IGMP snooping group membership information learned on that PVLAN domain, including primary and its associated secondary VLANs.
- Enter an isolated or community VLAN ID to view IGMP snooping group membership information learned on that isolated or community VLAN.

Example

```
OS10# show ip igmp snooping groups
Total Number of Groups: 480
IGMP Connected Group Membership
Group Address                 Interface           Mode
Expires

vlan100)
```

Supported Releases 10.4.0E(R1) or later

show ip igmp snooping groups detail

Displays the IGMP source information along with detailed member port information.

Syntax `show ip igmp snooping groups [vlan vlan-id [ip-address]]show ip igmp snooping groups [vlan vlan-id] [group ip-address] detail`

Parameters

- *vlan-id*—(Optional) Enter the VLAN ID, from 1 to 4093.
- *ip-address*—(Optional) Enter the IP address of the multicast group.

Default Not configured

Command Mode EXEC

Usage Information None

Example

Supported Releases 10.4.1.0 or later

show ip igmp snooping interface

Displays IGMP snooping interfaces details.

Syntax `show ip igmp snooping interface [vlan vlan-id]`

Parameters *vlan-id*—(Optional) Enter the VLAN ID, from 1 to 4093. For a PVLAN domain, enter the VLAN ID of the primary VLAN, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information The multicast flood control feature is not available on the S4248FB-ON and S4248FBL-ON devices.

Example

```
OS10# show ip igmp snooping interface
Vlan3031 is up, line protocol is up
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is enabled on this interface

Vlan3032 is up, line protocol is up
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is enabled on this interface

Vlan3033 is up, line protocol is up
IGMP version is 3
--more--
<<Output Truncated>>
```

```
OS10# show ip igmp snooping interface
Vlan2 is up, line protocol is up
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is disabled on this interface
Multicast snooping flood-restrict is enabled on this interface

Vlan3 is up, line protocol is up
IGMP version is 3
```

```
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is disabled on this interface
Multicast snooping flood-restrict is enabled on this interface
```

Example (with VLAN)

```
OS10# show ip igmp snooping interface vlan 3031
Vlan3031 is up, line protocol is up
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is enabled on this interface
```

```
OS10# show ip igmp snooping interface vlan 3031
Vlan3031 is up, line protocol is up
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is enabled on this interface
Multicast snooping flood-restrict is enabled on this interface
```

Example (with PVLAN)

```
OS10# show ip igmp snooping interface vlan 100
Vlan100 is up, line protocol is up
Isolated VLAN: 200
Community VLANs: 300, 350-355
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is enabled on this interface
Multicast snooping flood-restrict is enabled on this interface
```

Supported Releases 10.4.0E(R1) or later

show ip igmp snooping mrouter

Displays the multicast router ports details.

Syntax `show ip igmp snooping mrouter [vlan vlan-id]`

Parameters *vlan-id*—(Optional) Enter the VLAN ID, from 1 to 4093. For a PVLAN domain, enter the VLAN ID of the primary VLAN, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip igmp snooping mrouter
Interface   Router Ports
vlan3031    port-channel31
vlan3032    port-channel31
vlan3033    port-channel31
vlan3034    port-channel31
vlan3035    port-channel31
vlan3036    port-channel31
vlan3037    port-channel31
vlan3038    port-channel31
vlan3039    port-channel31
vlan3040    port-channel31
vlan3041    port-channel31
vlan3042    port-channel31
vlan3043    port-channel31
vlan3044    port-channel31
vlan3045    port-channel31
vlan3046    port-channel31
vlan3047    port-channel31
vlan3048    port-channel31
vlan3049    port-channel31
vlan3050    port-channel31
vlan3051    port-channel31
vlan3052    port-channel31
--more--

<<Output Truncated>>
```

Example (with VLAN)

```
OS10# show ip igmp snooping mrouter vlan 3031
Interface   Router Ports
vlan3031    port-channel31
```

Supported Releases 10.4.0E(R1) or later

show ip igmp snooping summary

Displays the number of IGMP-enabled snooping instances.

Syntax `show ip igmp snooping summary`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip igmp snooping summary
Maximum number of IGMP and MLD Instances: 1024
Total Number of enabled IGMP Instances: 512
```

Supported Releases 10.5.2.1 or later

Protocol Independent Multicast

Protocol independent multicast (PIM) is a group of multicast routing protocols that provides one-to-many and many-to-many transmission of information. PIM uses routing information from other routing protocols and does not depend on any specific unicast routing protocol. PIM uses any unicast routing protocol that is deployed in the network. OS10 supports the following PIM modes:

- PIM sparse mode (PIM-SM)

- PIM source specific multicast (PIM-SSM)

PIM terminology

Table 64. PIM terminology

Terminology	Definition
Rendezvous point (RP)	The RP is a single root node that the shared tree uses, called the rendezvous point.
(*, G)	(*, G) refers to an entry in the PIM table for a group.
(S, G)	(S, G) refers to an entry in the PIM table for a source and group on the RP tree (RPT).
(S, G, RPT)	(S, G, RPT) refers to an entry in the RP tree.
First hop router (FHR)	The FHR is the router that is directly connected to the multicast source.
Last hop router (LHR)	The LHR is the last router in the multicast path and is directly connected to the multicast receiver.
Intermediate router	A PIM router that is not an FHR, RP, or LHR.
Shared tree (RPT)	The RPT is an unidirectional multicast tree whose root node is the RP.
Shortest path tree (SPT)	The root node of the SPT is the multicast source. The multicast traffic routes to the receiver on the shortest path. This setup reduces network latency and traffic congestion at the RP.
Outgoing interface (OIF)	The OIF is the interface through which a multicast packet is sent out towards the receiver.
Incoming interface (IIF)	The IIF is the interface through which a multicast packet is received towards the source or the RP.
Reverse path forwarding (RPF)	The RPF is the path the router uses to reach the RP or the multicast source.

Standards compliance

OS10 complies to the following standards:

- RFC 4601 for PIM-SM
- RFC 3569 for PIM-SSM

PIM-SM

PIM sparse mode (PIM-SM) is a multicast routing protocol for networks with receivers that are sparsely distributed. Receivers have to explicitly send a *join* message to join particular groups or sources. PIM join and prune messages are used to join and leave multicast distribution trees.

PIM-SM uses shared trees with the root node being the rendezvous point (RP). All multicast sources use the RP to route the traffic to the receiver. The last hop router (LHR) sends an (*,G) join message towards the RP. The designated router connected to the first hop router (FHR) encapsulates multicast data that comes from the multicast source in PIM control messages and sends it via unicast to the RP as PIM register messages. The RP sends an (S, G) join towards the source. When the RP receives native data traffic from the source, it sends a register stop message to the FHR.

OS10 supports static and dynamic configuration of an RP address for a multicast group.

To keep the PIM-SM state alive, all PIM neighbors send periodic hello messages.

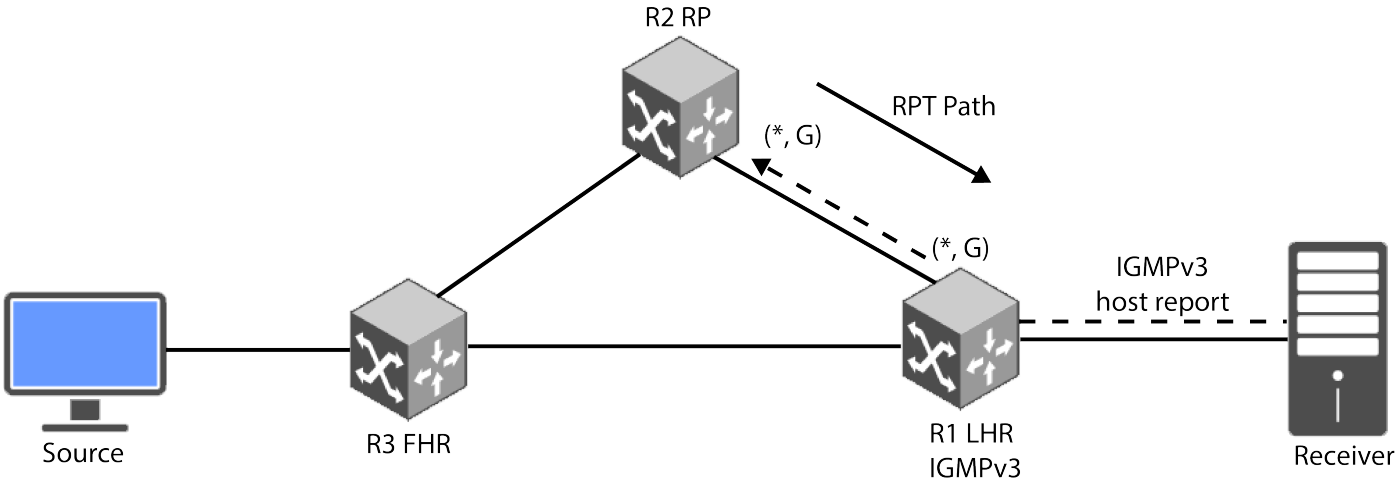
You must enable PIM-SM on each of the participating interfaces. Be sure to have multicast routing enabled on the system. To do this, use the `ip multicast-routing` command from CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip pim sparse-mode
```

Root Path Tree (RTP)

An RPT is the path between the RP and receivers (hosts) in a multicast group (see figure). The RPT is built by means of a PIM join message from a receiver DR.

- A receiver sends a request to join group (G) in an IGMP host membership report. A PIM sparse-mode router, the receiver DR, receives the report on a directly attached subnet and creates an RPT branch for the multicast group of interest.
- The receiver DR sends a PIM join message to its RPF neighbor, the next-hop address in the RPF table, or the unicast routing table.
- The PIM join message travels up the tree and each router in the tree finds its RPF neighbor by using either the RPF table or the unicast routing table. This is done until the message reaches the RP and forms the RPT. Routers along the path set up the multicast forwarding state to forward requested multicast traffic back down the RPT to the receiver.

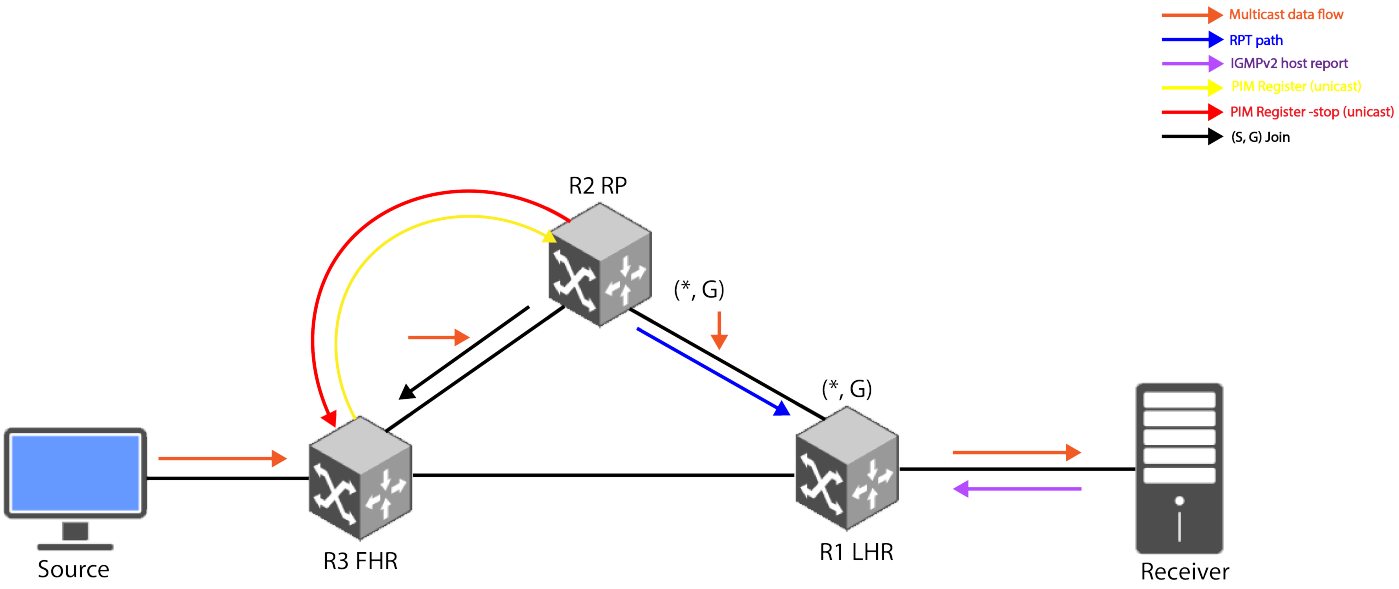


PIM-SM source registration

An RPT is a unidirectional tree, permitting traffic to flow down from the RP to the receiver in one direction. For multicast traffic to reach the receiver from the source, another branch of the distribution tree that is called the shortest-path tree, must be built from the source DR to the RP.

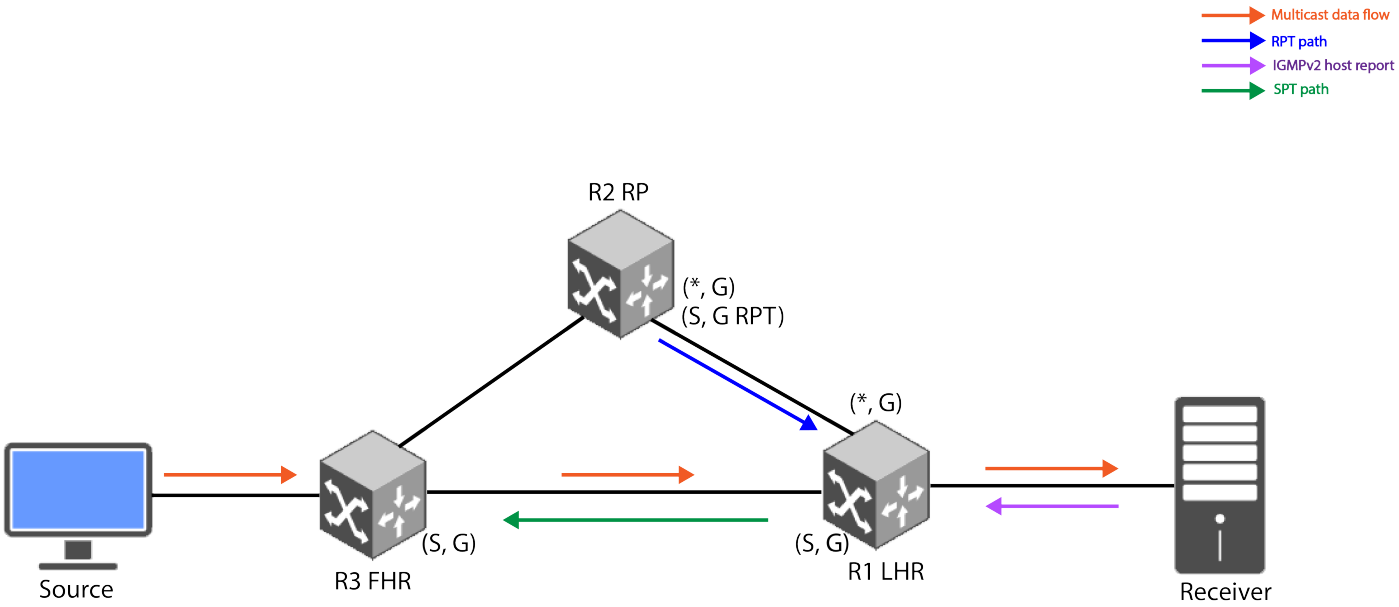
The shortest-path tree is created in the following way:

1. The source becomes active, sending out multicast packets on the LAN to which it is attached. The source DR receives the packets and encapsulates them in a PIM register message, which it sends to the RP router.
2. When the RP router receives the PIM register message from the source, it sends a PIM join message back to the source.
3. The source DR receives the PIM join message and begins sending traffic down the SPT toward the RP router.
4. Once the RP router receives traffic, it sends a register stop message to the source DR to stop the register process.
5. The RP router sends the multicast traffic down the RPT toward the receiver.



Instead of continuing to use the SPT to the RP and the RPT toward the receiver, a direct SPT is created between the source and the receiver in the following way:

1. Once the receiver DR receives the first multicast packet from the source, the DR sends a PIM join message to its RPF neighbor.
2. The source DR receives the PIM join message, and an additional (S, G) state is created to form the SPT.
3. Multicast packets from that particular source begin coming from the source DR and flowing down the new SPT to the receiver DR. The receiver DR is now receiving two copies of each multicast packet that is sent by the source - one from the RPT and one from the new SPT.
4. To stop duplicate multicast packets, the receiver DR sends a PIM prune message toward the RP router, letting it know that the multicast packets from this particular source coming in from the RPT are no longer needed.
5. The RP router receives the PIM prune message, and it stops sending multicast packets down to the receiver DR. The receiver DR is getting multicast packets only for this particular source over the new SPT. However, multicast packets from the source are still arriving from the source DR toward the RP router.
6. To stop the unneeded multicast packets from this particular source, the RP router sends a PIM prune message to the source DR.
7. The receiver DR now receives multicast packets only for the particular source from the SPT.



PIM-SM sample configuration

This section describes how to enable PIM-SM in the FHR, RP, and LHR nodes using the topology show in the following figure.

To enable PIM-SM, perform the following configurations on each of the nodes (FHR, RP, and LHR):

1. Enable multicast routing globally in CONFIGURATION mode.

```
ip multicast-routing
```

2. Enable PIM-SM on the required Layer 3 interfaces of the nodes in INTERFACE mode.

```
ip pim sparse-mode
```

3. Configure an RP address on every multicast-enabled node in CONFIGURATION mode.

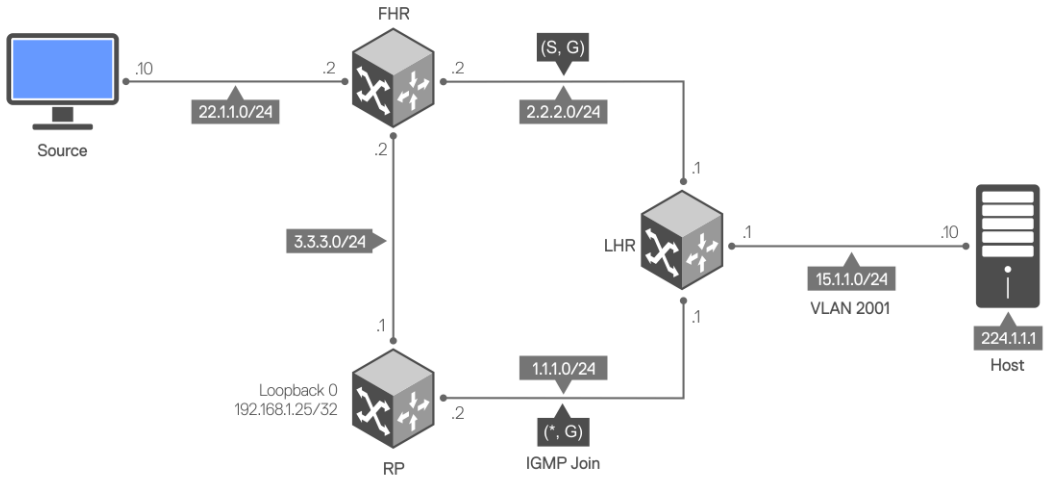
```
ip pim rp-address
```

4. Configure an IP address for each interface of the nodes in the PIM-SM topology in INTERFACE mode.

```
ip address A.B.C.D/prefix-length
```

5. Enable a routing protocol (OSPF) for route updates in INTERFACE mode.

```
ip ospf ospf-instance area area-address
```



Sample configuration in FHR node:

```
FHR# configure terminal
FHR(config)#
FHR(config)# ip multicast-routing
FHR(config)# interface ethernet 1/1/31
FHR(conf-if-eth1/1/31)# no switchport
FHR(conf-if-eth1/1/31)# ip address 3.3.3.2/24
FHR(conf-if-eth1/1/31)# ip pim sparse-mode
FHR(conf-if-eth1/1/31)# ip ospf 1 area 0
FHR(conf-if-eth1/1/31)# exit
FHR(config)#
FHR(config)# interface ethernet 1/1/17
FHR(conf-if-eth1/1/17)#
FHR(conf-if-eth1/1/17)# no switchport
FHR(conf-if-eth1/1/17)# ip address 2.2.2.2/24
FHR(conf-if-eth1/1/17)# ip pim sparse-mode
FHR(conf-if-eth1/1/17)# ip ospf 1 area 0
FHR(conf-if-eth1/1/17)# exit
FHR(config)# router ospf 1
FHR(config-router-ospf-1)# exit
FHR(config)# ip pim rp-address 192.168.1.25 group-address 224.0.0.0/4
FHR(config)#
FHR# configure terminal
FHR(config)# interface ethernet 1/1/48
```

```
FHR(conf-if-eth1/1/48)# no switchport
FHR(conf-if-eth1/1/48)# ip address 22.1.1.2/24
FHR(conf-if-eth1/1/48)# ip pim sparse-mode
FHR(conf-if-eth1/1/48)# ip ospf 1 area 0
FHR(conf-if-eth1/1/48)#
```

The `show ip pim interface` command displays the PIM-enabled interfaces in FHR.

```
FHR# show ip pim interface
Address       Interface           Ver/Mode      Nbr Count    Query Intvl      DR Prio      DR

```

The `show ip pim rp mapping` command displays the multicast groups to RP mapping and information about how RP is learned.

```
FHR# show ip pim rp mapping
Group(s) : 224.0.0.0/4,  Static
RP : 192.168.1.25, v2
```

Sample configuration in RP node:

```
RP# configure terminal
RP(config)# ip multicast-routing
RP(config)# interface ethernet 1/1/31
RP(conf-if-eth1/1/31)# no switchport
RP(conf-if-eth1/1/31)# ip address 3.3.3.1/24
RP(conf-if-eth1/1/31)# ip pim sparse-mode
RP(conf-if-eth1/1/31)# ip ospf 1 area 0
RP(conf-if-eth1/1/31)# exit
RP(config)#
RP(config)# interface ethernet 1/1/43
RP(conf-if-eth1/1/43)# no switchport
RP(conf-if-eth1/1/43)# ip address 1.1.1.2/24
RP(conf-if-eth1/1/43)# ip pim sparse-mode
RP(conf-if-eth1/1/43)# ip ospf 1 area 0

  Incoming interface : ethernet1/1/17
  Outgoing interface list :
   vlan2001
```

PIM-SSM

PIM-SSM uses source-based trees. A separate multicast distribution tree is built for each multicast source that sends data to a multicast group. Each multicast distribution tree has as its root node a router near the source. Sources send data directly to the root of the tree. PIM-SSM enables receivers to specify the source from which to receive data and the multicast group they want to join. The receiver identifies a multicast data stream using the source and group address pair (S, G) instead of the group address alone (*, G).

NOTE:

- PIM-SSM requires receivers to support IGMP version 3.
- The default PIM-SSM range is 232.0.0.0/8. The default range is always supported and the range can never be smaller than the default.
- If the PIM-SSM group range overlaps with the multicast group range that the candidate RP advertises, the router chooses the RP learned from the BSR and creates (*, G) entries instead of (S, G) entries.

Advantages of PIM-SSM

Advantages of PIM-SSM include the following:

- PIM-SSM forwards multicast traffic from a single source to a subnet. Other versions of PIM requires the receiver to subscribe to a group. The receiver receives traffic not just from the source that it is interested in, but from all the sources that send to that group. PIM-SSM requires the receiver to specify the sources in which they are interested in to avoid receiving unnecessary traffic.
- PIM-SSM is more efficient than PIM-SM because it immediately creates shortest path trees (SPT) to the source rather than using shared trees. PIM-SM requires a shared tree rooted at the RP because IGMPv2 receivers do not express the source information in their membership reports. Multicast traffic passes from the source to the receiver through the RP, until the last hop router (LHR) learns the source address, at which point it switches to the SPT.

- PIM-SSM uses IGMPv3 because receivers subscribe to a source and group, the RP and shared tree are unnecessary; only SPTs are used. On OS10 systems, it is possible to use PIM-SM with IGMPv3 to achieve the same result, but PIM-SSM eliminates the unnecessary protocol overhead.

Configure PIM-SSM

To configure a group range for PIM-SSM:

NOTE: The IP range, 232.0.0.0/8 is reserved for SSM. You do not have to explicitly configure this range.

1. Create an ACL rule to specify the range of addresses that should use SSM.

```
OS10# configure terminal
OS10(config)# ip access-list ssm-1
OS10(config-ipv4-acl)# permit ip any 236.0.0.0/8
OS10(config-ipv4-acl)# exit
```

2. Enable PIM-SSM for the range of addresses using the `ip pim ssm-range` command.

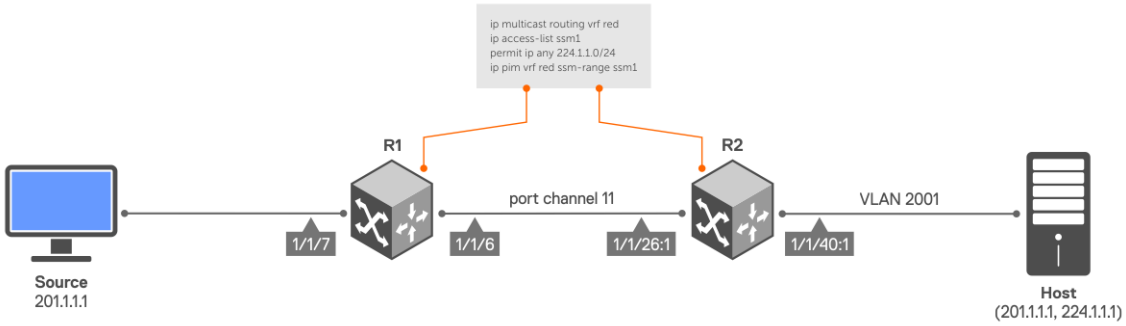
```
OS10(config)# ip pim ssm-range ssm-1
```

You can use the `show ip pim ssm-range` command to view the groups added in PIM-SSM configuration.

```
OS10# show ip pim ssm-range
Group Address    / MaskLen
236.0.0.0        / 8
```

PIM-SSM sample configuration

This section describes how to enable PIM-SSM using the topology show in the following illustration.



To enable PIM-SSM, perform the following configurations on R1 and R2:

Sample configuration on R1:

```
R1# configure terminal
R1(config)# ip vrf red
R1(conf-vrf)# end

R1# configure terminal
R1(config)# interface port-channel 11
R1(conf-if-po-11)# no switchport
R1(conf-if-po-11)# ip vrf forwarding red
R1(conf-if-po-11)# end

R1# configure terminal
R1(config)# interface ethernet 1/1/6
R1(conf-if-eth1/1/6)# no ip vrf forwarding
R1(conf-if-eth1/1/6)# no switchport
R1(conf-if-eth1/1/6)# channel-group 11
R1(conf-if-eth1/1/6)# end

R1# configure terminal
```

```
R1(config)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# no switchport
R1(conf-if-eth1/1/7)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# ip vrf forwarding red
R1(conf-if-eth1/1/7)# ip address 201.1.1.2/24
R1(conf-if-eth1/1/7)# ip pim sparse-mode
R1(conf-if-eth1/1/7)# no shutdown
R1(conf-if-eth1/1/7)# end

R1# configure terminal
R1(config)# interface port-channel 11
R1(conf-if-po-11)# no switchport
R1(conf-if-po-11)# interface port-channel 11
R1(conf-if-po-11)# ip vrf forwarding red
R1(conf-if-po-11)# ip address 193.1.1.1/24
R1(conf-if-po-11)# ip pim sparse-mode
R1(conf-if-po-11)# no shutdown
R1(conf-if-po-11)# end

R1# configure terminal
R1(config)# interface Lo0
R1(conf-if-lo-0)# ip vrf forwarding red
R1(conf-if-lo-0)# ip address 2.2.2.2/32
R1(conf-if-lo-0)# ip pim sparse-mode
R1(conf-if-lo-0)# no shutdown
R1(conf-if-lo-0)# end

R1# configure terminal
R1(config)# router ospf 100 vrf red
R1(config-router-ospf-100)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# ip ospf 100 area 0
R1(conf-if-eth1/1/7)# end

R1# configure terminal
R1(config)# router ospf 100 vrf red
R1(config-router-ospf-100)# interface port-channel 11
R1(conf-if-po-11)# ip ospf 100 area 0
R1(conf-if-po-11)# end

R1# configure terminal
R1(config)# ip multicast-routing vrf red
R1(config)# end

R1# configure terminal
R1(config)# ip access-list test
R1(config-ipv4-acl)# permit ip any 224.1.1.0/24
R1(config-ipv4-acl)# exit

R1(config)# ip pim vrf red ssm-range test
R1(config)# end
```

Sample configuration on R2:

```
R2# configure terminal
R2(config)# ip vrf red
R2(conf-vrf)# end

R2# configure terminal
R2(config)# interface vlan 2001
R2(conf-if-vl-2001)# ip vrf forwarding red
R2(conf-if-vl-2001)# end

R2# configure terminal
R2(config)# interface ethernet 1/1/40:1
R2(conf-if-eth1/1/40:1)# no ip vrf forwarding
R2(conf-if-eth1/1/40:1)# switchport mode trunk
R2(conf-if-eth1/1/40:1)# switchport trunk allowed vlan 2001
R2(conf-if-eth1/1/40:1)# end

R2# configure terminal
R2(config)# interface port-channel 11
R2(conf-if-po-11)# no switchport
R2(conf-if-po-11)# ip vrf forwarding red
```

```
R2(conf-if-po-11)# end

R2# configure terminal
R2(config)# interface ethernet 1/1/26:1
R2(conf-if-eth1/1/26:1)# no ip vrf forwarding
R2(conf-if-eth1/1/26:1)# no switchport
R2(conf-if-eth1/1/26:1)# channel-group 11
R2(conf-if-eth1/1/26:1)# end

R2# configure terminal
R2(config)# interface vlan 2001
R2(conf-if-vl-2001)# ip vrf forwarding red
R2(conf-if-vl-2001)# ip address 208.1.1.2/24
R2(conf-if-vl-2001)# ip pim sparse-mode
R2(conf-if-vl-2001)# no shutdown
R2(conf-if-vl-2001)# end

R2# configure terminal
R2(config)# interface port-channel 11
R2(conf-if-po-11)# no switchport
R2(conf-if-po-11)# interface port-channel 11
R2(conf-if-po-11)# ip vrf forwarding red
R2(conf-if-po-11)# ip address 193.1.1.2/24
R2(conf-if-po-11)# ip pim sparse-mode
R2(conf-if-po-11)# no shutdown
R2(conf-if-po-11)# end

R2# configure terminal
R2(config)# interface Lo0
R2(conf-if-lo-0)# ip vrf forwarding red
R2(conf-if-lo-0)# ip address 4.4.4.4/32
R2(conf-if-lo-0)# ip pim sparse-mode
R2(conf-if-lo-0)# no shutdown
R2(conf-if-lo-0)# end

R2# configure terminal
R2(config)# router ospf 100 vrf red
R2(config-router-ospf-100)# interface vlan 2001
R2(conf-if-vl-2001)# ip ospf 100 area 0
R2(conf-if-vl-2001)# end

R2# configure terminal
R2(config)# router ospf 100 vrf red
R2(config-router-ospf-100)# interface port-channel 11
R2(conf-if-po-11)# ip ospf 100 area 0
R2(conf-if-po-11)# end

R2# configure terminal
R2(config)# ip multicast-routing vrf red
R2(config)# end

R2# configure terminal
R2(config)# ip access-list test
R2(config-ipv4-acl)# permit ip any 224.1.1.0/24
R2(config-ipv4-acl)# exit
R2(config)# ip pim vrf red ssm-range test
R2(config)# end
```

Verify the configuration

To verify the configuration, use the following `show` commands on R1:

The `show ip pim vrf red neighbor` command displays the PIM neighbor of R1 and the interface through which the neighbor is reached.

```
R1# show ip pim vrf red neighbor
Neighbor Address Interface       Uptime/Expires     Ver  DR Priority / Mode
------------------------------------------------------------------------------
193.1.1.2        port-channel11  02:34:33/00:01:17   v2  1          / DR S
```

The `show ip pim vrf red ssm-range` command displays the specified multicast address range.

```
R1# show ip pim vrf red ssm-range
Group Address   / MaskLen
224.1.1.0       / 24
```

The `show ip pim vrf red tib` command output displays the PIM tree information base (TIB).

```
R1# show ip pim vrf red tib
PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(201.1.1.1, 224.1.1.1), uptime 00:19:42, expires 00:00:47, flags: T
  Incoming interface: ethernet1/1/7, RPF neighbor 0.0.0.0
  Outgoing interface list:
    port-channel11  Forward/Sparse  00:00:37/00:02:52
```

The `show ip pim vrf red mcache` command output displays multicast route entries.

```
R1# show ip pim vrf red mcache
PIM Multicast Routing Cache Table
(201.1.1.1, 224.1.1.1)
  Incoming interface : ethernet1/1/7
  Outgoing interface list :
   port-channel11
```

Use the following `show` commands on R2:

The `show ip igmp vrf red groups` command output displays the IGMP database.

```
R2# show ip igmp vrf red groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address   Interface   Mode     Uptime    Expires    Last Reporter
224.1.1.1       vlan2001    Include  00:00:03  Never      208.1.1.1
```

The `show ip pim vrf red tib` command output displays the PIM tree information base (TIB).

```
R2# show ip pim vrf red tib
PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(201.1.1.1, 224.1.1.1), uptime 00:00:06, expires 00:03:23, flags: CT
  Incoming interface: port-channel11, RPF neighbor 193.1.1.1
  Outgoing interface list:
    vlan2001  Forward/Sparse  00:00:06/Never
```

The `show ip pim vrf red neighbor` command displays the PIM neighbor of R2 and the interface through which the neighbor is reached.

```
R2# show ip pim vrf red neighbor
Neighbor Address  Interface      Uptime/Expires    Ver DR Priority / Mode
--------------------------------------------------------------------------
193.1.1.1         port-channel11 02:34:15/00:01:29 v2      1/ S
```

The `show ip pim vrf red ssm-range` command displays the specified multicast address range.

```
R2# show ip pim vrf red ssm-range
Group Address   / MaskLen
224.1.1.0       / 24
```

The `show ip pim vrf red mcache` command output displays multicast route entries.

```
R2# show ip pim vrf red mcache
PIM Multicast Routing Cache Table

(201.1.1.1, 224.1.1.1)
  Incoming interface : port-channel11
  Outgoing interface list :
   vlan2001
```

Configure expiry timers for S, G entries

You can configure expiry timers for S, G entries globally. The S, G entries expire in 210 seconds by default.

To configure the S, G expiry timer:

```
OS10# configure terminal
OS10(config)# ip pim sparse-mode sg-expiry-timer 500
```

Configure static rendezvous point

The rendezvous point (RP) is an interface on a router that acts as the root to a group-specific tree; every group must have an RP. You must configure the RP on all nodes in your network.

To configure a static RP:

```
OS10# configure terminal
OS10(config)# ip pim rp-address 171.1.1.1 group-address 225.1.1.3/32
```

Override bootstrap router updates

A bootstrap router (BSR) is a router in a PIM domain that helps to automatically discover the RP for a given multicast group in a multicast network. PIM routers use the BSR to obtain the RP IP address. You can also statically configure an IP address for the RP. If you configure a static RP for a group, to override BSR updates with the static RP configuration, use the `override` option in the `ip pim rp-address` command. If you do not explicitly use the `override` option and:

- The prefix length of the static RP is the same as the RP advertised in the BSR updates, the BSR RP takes precedence over the statically configured RP.
- If the prefix length of the static RP and the BSR RP does not match, OS10 selects the router having the longest-match prefix as the RP.

To override BSR updates:

```
OS10# configure terminal
OS10(config)# ip pim rp-address 20.1.1.1 255.1.2.3/24 override
```

NOTE: If you have enabled the `override` option, configuring static RP without using the `override` option does not remove the override configuration. You must delete the static RP configuration using the `override` option and then reconfigure static RP again.

To view the RP for a multicast group, use the `show ip pim rp` command.

```
OS10# show ip pim rp
Group                   RP
------------------------------
225.1.1.1           171.1.1.1
225.1.1.2           171.1.1.1
225.1.1.3           171.1.1.1
225.1.1.4           171.1.1.1
225.1.1.5           171.1.1.1
225.1.1.6           171.1.1.1
```

To view the RP for a multicast group range, use the `show ip pim rp mapping` command.

```
OS10# show ip pim rp mapping
PIM Group-to-RP Mappings
Group(s): 230.1.1.1/32
RP:14.1.1.1, v2
  Info source: 42.1.1.1, via bootstrap, priority 255
     expires: 00:01:53

Group(s): 231.1.1.1/32
RP: 9.1.1.1, v2
  Info source: 42.1.1.1, via bootstrap, priority 254
     expires: 00:01:54
```

Configure dynamic RP using the BSR mechanism

You can configure a subset of PIM routers within the domain as candidate BSRs (C-BSRs). The C-BSRs exchange bootstrap messages (BSM) to elect the BSR. The BSR informs its status to all the routers.

Every PIM router within a domain must map a particular multicast group address to the same RP. With BSR, group-to-RP mapping is dynamic. You can configure a subset of routers within a domain as C-RPs. Each PIM router selects an RP for a multicast group from the list of group-to-RP mappings learnt from the BSR messages.

The RP election process is:

1. The C-BSRs announce their candidacy throughout the domain in BSMs. Each BSM contains a BSR priority. The C-BSR with the highest priority becomes the BSR.
2. Each C-RP unicasts periodic candidate RP advertisements to the BSR. Each message contains an RP priority value and the multicast group ranges for which the router is a C-RP.
3. The BSR determines the most efficient and stable group-to-RP mapping, which is called the RP-set formation.
4. The BSR sends the group-to-RP mapping sets to all the multicast routers. To select an RP from a set of RPs, multicast routers use the algorithm that is specified in RFC 4601.
5. The BSR sends the group range-to-RP mappings to all the routers in the domain.

Configuration notes

- A PIM router supports only one candidate BSR per VRF instance.
- A PIM router supports only one candidate RP per VRF instance.
- You can configure a PIM BSR candidate and an RP candidate with Layer 3 (L3) VLAN, Loopback, physical, or port channel interface. The system derives the IP address from this interface to determine the BSR or RP address.
- PIM BSR and RP candidate configurations are not supported on VXLAN bridge interfaces.
- **Before you configure a candidate BSR:**
  - Enable multicast routing globally and establish PIM neighborship between routers. Ensure that the unicast routing table is populated.
  - Configure an IP address on the candidate BSR interface.
- **Before you configure a candidate RP:**
  - Enable multicast routing globally and establish PIM neighborship between routers. Ensure that the unicast routing table is populated.
  - Ensure that the candidate RP can reach all the nodes in your network.
  - (Optional) Configure an ACL with source as `any` and destination as a valid multicast group address. If you do not configure an ACL, the router advertises itself as the RP for the entire multicast range, which is 224.0.0.0/4.

    NOTE:
    - When you associate an ACL without any rules to an RP candidate, the system behaves differently depending on the order of the configuration:
      - If you create the ACL without any rules first and then associate it with the RP candidate, the router denies all multicast groups.
      - If you associate an ACL to an RP candidate that is not yet created in the system, and then configure the ACL without any rules, the router advertises itself as the RP for the entire multicast range, 224.0.0.0/4.
    - Do not use `deny` rules in the ACL that is used for RP candidate because it does not have any significance.

To configure dynamic RP using the BSR mechanism:

1. Configure a candidate BSR using the `ip pim bsr-candidate` command.

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/9
OS10(conf-if-eth1/1/9)# ip address 10.1.1.8/24
OS10(conf-if-eth1/1/9)# no shutdown
OS10(conf-if-eth1/1/9)# exit
OS10(config)# ip pim bsr-candidate ethernet 1/1/9 hash-mask-len 31 priority 255
```

   To view the PIM candidate and elected BSR:

```
OS10#  show ip pim bsr-router

This system is the Bootstrap Router (v2)
BSR address: 10.1.1.8
BSR Priority: 255, Hash mask length: 31
Next bootstrap message in 00:00:57
This system is a candidate BSR
Candidate BSR address: 11.1.1.8, priority: 255, hash mask length: 31
```

2. (Optional) Configure the BSR timer.

```
OS10(config)# ip pim bsr-candidate-timers ethernet 1/1/9 advt-interval 40
```

   To view the BSR timer value:

```
OS10# show ip pim bsr-router

This system is the Bootstrap Router (v2)
BSR address: 10.1.1.8
BSR Priority: 255, Hash mask length: 31
Next bootstrap message in 00:00:39
This system is a candidate BSR
Candidate BSR address: 11.1.1.8, priority: 255, hash mask length: 31
```

3. Configure candidate RP.

```
OS10# configure terminal
OS10(config)# interface loopback 10
OS10(conf-if-lo-10)# ip address 10.1.2.8/24
OS10(conf-if-lo-10)# no shutdown
OS10(conf-if-lo-10)# exit

OS10(config)# ip access-list acl-rp
OS10(config-ipv4-acl)# permit ip any 225.1.1.0/24

OS10(config)# ip pim rp-candidate loopback 10 priority 23 acl acl-rp
```

   NOTE: The system does not overwrite the candidate RP configuration. You must delete the entry and reconfigure it. For example, after you configure the candidate RP with priority and associate an ACL with it, to reset the priority and dissociate the ACL from the candidate RP, or to reset the candidate RP to the default values, you must use the `no ip pim rp-candidate` command and reconfigure the candidate RP.

   To view the candidate RP, candidate BSR, and elected BSR:

```
OS10# show ip pim bsr-router

This system is the Bootstrap Router (v2)
BSR address: 10.1.1.8
BSR Priority: 255, Hash mask length: 31
Next bootstrap message in 00:00:20
This system is a candidate BSR
Candidate BSR address: 10.1.1.8, priority: 255, hash mask length: 31
Next Cand_RP_advertisement in 00:00:50
RP: 10.1.2.8(loopback10)
```

To view RP-mapping details:

```
OS10# show ip pim rp mapping
Group(s) : 225.1.1.0/24
RP : 10.1.2.8, v2
Info source: 10.1.1.8, via bootstrap, priority 0
expires: 00:00:00
```

4. (Optional) Configure the RP timers.

```
OS10(config)# ip pim rp-candidate-timers loopback 10 advt-interval 10 hold-time 25
```

To view candidate RP details:

```
OS10# show ip pim bsr-router

This system is the Bootstrap Router (v2)
BSR address: 10.1.1.8
BSR Priority: 255, Hash mask length: 31
Next bootstrap message in 00:00:00
This system is a candidate BSR
Candidate BSR address: 10.1.1.8, priority: 255, hash mask length: 31
Next Cand_RP_advertisement in 00:00:09
RP: 10.1.2.8(loopback10)
```

To view RP-mapping details:

```
OS10# show ip pim rp mapping
Group(s) : 225.1.1.0/24
RP : 10.1.2.8, v2
Info source: 10.1.1.8, via bootstrap, priority 23
expires: 00:01:04
```

Configure designated router priority

Multiple PIM-SM routers can connect to a single local area network (LAN) segment. One of these routers is elected as the designated router (DR).

The DR is elected using hello messages. Each PIM router learns about its neighbors by periodically sending a hello message from each PIM-enabled interface. Hello messages contain the interface IP address from where it is sent and a DR priority value. The router with the highest priority value becomes the DR. If the priority value is the same for two routers, the router with the highest IP address is the DR. By default, the DR priority value is 1, so the IP address determines the DR.

To configure DR priority, use the following command:

```
OS10# configure terminal
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip pim dr-priority 200
```

Update RP mapping cache with new RP configuration

If you make changes to the RP configuration, the system continues to use the old RP until the next BSR advertisement arrives.

To clear the group-to-RP mapping entries from the RP mapping cache, use the `clear ip pim rp-mapping` command. This command removes only the group-to-RP mapping entries learned through the BSR updates. The system downloads the group-to-RP mapping entries at the next BSR update.

PIM join filters

The PIM join filter allows you to permit or deny PIM Join/Prune messages on an interface using an extended IP access list.

PIM router propagates (*, G) and (S,G) Join/Prune messages from its neighbors and creates multicast route to forward the traffic. This process can lead to PIM state explosion and high memory consumption when large numbers of PIM Join/Prune

messages are forwarded to each router on the rendezvous point tree (RPT). Use PIM join filters to prevent the PIM-enabled routers from creating a multicast state and to limit multicast traffic in the network.

When the join filter is applied on the downstream interface, the effect on the outgoing interface happens at the maximum of Join/Prune-HoldTime value.

To configure join filter for IPv4 PIM-enabled interface, use the following command:

```
ip pim join-filter <acl-name>
```

Configuration notes

- Dell Technologies recommends not using the `ip pim join-filter` command on an interface between a source and the RP router. Using this command in this scenario could cause problems with the PIM-SM source registration process resulting in excessive traffic being sent to the CPU of both the RP and PIM DR of the source.

  Excessive traffic generates when the join process from the RP back to the source is blocked due to a new source group being permitted in the join-filter. This results in the new source becoming stuck in registering on the DR and the continuous generation of UDP-encapsulated registration messages between the DR and RP routers which are sent to the CPU.
- Do not to configure a PIM join-filter on a source connected interface (IIF) on first hop router (FHR) node. Applying PIM join-filter with the rule, `deny ip any any` might block creation of the S,G entries.
- When you configure a join filter, it applies for both incoming and outgoing joins. There is no option to specify in or out parameters while configuring a join filter.

Configure PIM join filters

Before you configure a PIM join filter, enable multicast routing globally and establish PIM neighborship between routers. For more information, see the `ip multicast-routing` command.

To configure a join filter that applies an ACL to the interface:

1. Configure an ACL in CONFIGURATION mode. You can specify the ACL name up to 140 characters.

   ```
   OS10# configure terminal
   OS10(config)# ip access-list pim_joinfilter
   OS10(config-ipv4-acl)# permit ip 10.10.10.0/24 226.1.1.0/24
   OS10(config-ipv4-acl)# permit ip any 225.1.1.0/24
   ```

   PIM join filter uses both source and group information from the access-list for filtering joins. In this example, the first `permit ip` command is used to filter Join messages for an (S,G) pair. The second `permit ip` command is used to filter all join messages for a Group (G) irrespective of the sources.

2. Configure an Ethernet interface. This command enables INTERFACE configuration mode.

   ```
   OS10(config)# interface ethernet 1/1/1
   ```

3. Configure a join filter that applies the previously created ACL (`pim_joinfilter`) on the PIM interface.

   ```
   OS10(conf-if-eth1/1/1)# ip pim join-filter pim_joinfilter
   ```

PIM neighbor filters

The PIM neighbor filter allows you to control a PIM router from forming an adjacency with a neighbor router.

By default, PIM-enabled neighbor devices exchange Hello packets at regular intervals and through these message exchanges become PIM neighbors. You can use a neighbor filter ACL to ensure that the switch accepts only the appropriate PIM neighbors. The ACL is configured on a per-interface basis to filter PIM Hello packets from sources you want to deny or permit. If the access list is applied for the neighbor filter, then the destination prefix is ignored.

To use PIM neighbor filtering on an IPv4 PIM-enabled interface, use the following command:

```
ip pim neighbor-filter <acl-name>
```

NOTE: This feature does not filter Candidate-RP advertisements and is intended only to filter PIM Hello messages between PIM neighbors.

Configure PIM neighbor filter

Before you configure a PIM neighbor filter, enable multicast routing globally and PIM on the participating interfaces. For more information, see the `ip multicast-routing` and `ip pim sparse-mode` commands.

To configure a neighbor filter that applies an ACL to the interface:

1. Configure an ACL in CONFIGURATION mode. You can specify the ACL name up to 140 characters.

```
OS10# configure terminal
OS10(config)# ip access-list pim_nbr_filter
OS10(config-ipv4-acl)# permit ip 10.10.10.2/32 any
```

   The PIM neighbor filter uses only the source information from access-list for filtering neighbors.

2. Configure an Ethernet interface. This command enables INTERFACE configuration mode.

```
OS10(config)# interface ethernet 1/1/1
```

3. Configure a filter that applies the previously created ACL (`pim_nbr_filter`) to the PIM interface.

```
OS10(conf-if-eth1/1/1)# ip pim neighbor-filter pim_nbr_filter
```

PIM register filters

The PIM register filter prevents the PIM source Designated Router (DR) from sending register packets to a Rendezvous Point (RP) for the specified multicast source and group. When the register packets are blocked, the RP cannot learn (S,G) and therefore cannot pull the traffic from the source and forward it to downstream routers and receivers. Thus, the unauthorized groups and sources are prevented from registering with an RP router.

You can apply register message filters on an FHR (DR) to control outgoing register messages or apply them on an RP to control incoming register messages. When the register filter is applied on the FHR or RP node, it does not affect the Shortest Path Tree (SPT) created using the IGMPv3 joins.

To configure register filter for IPv4 PIM, use the following command:

```
ip pim [vrf <vrf-name>] register-filter <acl-name>
```

To view details of the configured PIM register filters, use the following command:

```
show ip pim [vrf <vrf-name>] register-filter <group address> <source address>
```

Configure PIM register filters

Before you configure a PIM register filter, enable multicast routing globally and establish PIM neighborship between routers.

To configure an ACL that is used for a register filter:

1. Configure an ACL in CONFIGURATION mode. You can specify the ACL name up to 140 characters.

```
OS10# configure terminal
OS10(config)# ip access-list pim_reg_filter
OS10(config-ipv4-acl)# permit ip 10.10.10.2/32 any
```

   The PIM register filter uses both source and group information from the access-list for filtering register messages.

2. Configure a register filter that applies the previously created ACL (`pim_reg_filter`) in the default or nondefault VRF.

```
OS10(config)# ip pim vrf vrf_dell register-filter pim_reg_filter
```

In this example, the register filter is configured in a nondefault VRF named `vrf_dell`.

PIM commands

clear ip pim rp-mapping

Clears group-to-RP mapping entries from the RP mapping cache.

Syntax `clear ip pim [vrf vrf-name] rp-mapping [ip-address]`

Parameters

- `vrf vrf-name`—Enter `vrf`, then the name of the VRF to clear the PIM RP mapping entries corresponding to that VRF.

  If you do not specify the VRF name, the system clears the entries from the default VRF.
- *ip-address*—IP address of the RP. The system clears the associated group-to-RP mapping entries for the specified RP.

  If you do not specify the RP IP address, the system clears all the group-to-RP mapping entries present in the VRF.

Default None

Command Mode EXEC

Usage Information This command removes only the group-to-RP mapping entries learned by a bootstrap router (BSR) from the RP mapping cache.

Example

```
OS10# clear ip pim rp-mapping
Clear PIM rp-mapping? [y/n]: y
```

Supported Releases 10.5.2.0 or later

clear ip pim tib

Clears PIM tree information from the PIM database.

Syntax `clear ip pim [vrf vrf-name] tib [ip-address]`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *ip-address*—Enter the IP address of the multicast group.

Default None

Command Mode EXEC PRIVILEGE

Usage Information When you run this command on a node, it deletes:

- All the multicast routes from the PIM tree information base (TIB)
- The entire multicast route table and all the entries in the data plane

With VLT multicast routing, when you run this command on a local VLT node, it deletes:

- All the multicast routes from the local PIM TIB
- All the local mroute entries in the data plane
- The synchronized mroute entries from the VLT peer node

Example

```
OS10# clear ip pim vrf vrf1 tib
Clear PIM tib? [y/n]:
```

Supported Releases 10.4.3.0 or later

ip multicast-routing

Enables IP multicast forwarding.

Syntax

```
ip multicast-routing [vrf vrf-name]
```

Parameters

`vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.

Default

None

Command Mode

CONFIGURATION

Usage Information

After you enable IP multicast, enable IGMP and PIM on an interface. To do this, use the `ip pim sparse-mode` command in INTERFACE mode. The `no` form of the command disables IP multicast forwarding.

Example

```
OS10# configure terminal
OS10(config)# ip multicast-routing
```

Supported Releases

10.4.3.0 or later

ip pim bsr-candidate

Configures the router as an IPv4 PIM BSR candidate.

Syntax

```
ip pim [vrf vrf-name] bsr-candidate {ethernet node/slot/port[:subport] |
loopback loopback-interface-number | vlan vlan-number | port-channel port-
channel-number} [hash-mask-len length] [priority priority-value]

no ip pim [vrf vrf-name] bsr-candidate
```

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *loopback-interface-number*—Enter a value from 0 to 16383.
- *vlan-number*—Enter a value from 1 to 4093.
- *port-channel-number*—Enter the port channel ID number, from 1 to 999 or 1001 to 2000.
- *length*—Enter a value from 0 to 32.
- *priority-value*—Enter a value from 0 to 255.

Default

- Hash mask length is 30.
- Priority is 64.

Command Mode

CONFIGURATION

Usage Information

The system advertises the IP address of the specified interface as the BSR IP address in BSR messages. The `no` form of the command removes the router from being the candidate BSR. Do not specify the parameters in the `no` form of the command.

Example

```
OS10# configure terminal
OS10(config)# ip pim vrf red bsr-candidate loopback 10 hash-mask-len 31
priority 11
```

Supported Releases

10.5.0 or later

ip pim bsr-candidate-timers

Configures the time interval between candidate BSR advertisements.

Syntax

```
ip pim [vrf vrf-name] bsr-candidate-timers {ethernet node/slot/
port[:subport] | loopback loopback-interface-number | vlan vlan-number |
port-channel port-channel-number} advt-interval interval-value
```

Parameters
- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF
- *loopback-interface-number*—Enter a value from 0 to 16383
- *vlan-number*—Enter a value from 1 to 4093
- *port-channel-number*—Enter the port channel ID number, from 1 to 999 or 1001 to 2000.
- *interval-value*—Enter a value from 1 to 2147483

Default
- Advertisement interval default is 60 s.

Command Mode CONFIGURATION

Usage Information Use this command to adjust the time interval between periodic BSR advertisements. The `no` form of the command resets the candidate BSR advertisement interval to the default value. Do not specify the parameters in the `no` form of the command.

Example
```
OS10(config)# ip pim vrf red bsr-candidate-timers loopback 10 advt-
interval 40
```

Supported Releases 10.5.0 or later

ip pim bsr-timeout

Configures the BSR timeout value.

Syntax
```
ip pim [vrf vrf-name] bsr-timeout value
```
```
no ip pim [vrf vrf-name] bsr-timeout
```

Parameters
- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF
- *value*—Enter a value from 0 to 2147483

Default 130 s

Command Mode CONFIGURATION

Usage Information The `no` form of the command resets the BSR timeout to its default value.

Example
```
OS10# configure terminal
OS10(config)# ip pim vrf red bsr-timeout 140
```

Supported Releases 10.5.0 or later

ip pim dr-priority

Changes the designated router (DR) priority for the interface.

Syntax
```
ip pim dr-priority priority-value
```

Parameters *priority-value*—Enter a number from 0 to 4294967295.

Default 1

Command Mode INTERFACE CONFIGURATION

Usage Information The router with the highest value assigned to an interface becomes the DR. If two interfaces have the same DR priority value, the interface with the highest IP address becomes the DR.

The `no` form of this command removes the DR priority value assigned to an interface.

Example
```
OS10# configure terminal
OS10(config)# interface vlan 1
OS10(conf-if-vl-1)# ip pim dr-priority 200
```

Supported Releases	10.4.3.0 or later

ip pim join-filter

Enables filtering of join and prune messages on an interface. This command prevents the PIM-SM router from creating a state based on a multicast source or group.

Syntax	`ip pim join-filter` *`access-list-name`*
Parameters	*`access-list-name`*—Enter the name of the access list. You can specify the ACL name up to 140 characters.
Default	Disabled
Command Mode	INTERFACE CONFIGURATION
Usage Information	Before you configure PIM join filter, ensure that: ● Multicast is enabled globally using the `ip multicast-routing` command. ● The interface is enabled. Use the `no shutdown` command to enable the interface. ● The interface is in Layer 3 mode. PIM-SM is enabled only on a Layer 3 interface. Before configuring PIM on the interface, use the `no switchport` command to change the interface from Layer 2 to Layer 3 mode. Use the access list to add a range of source and groups for which PIM (*, G) and (S, G) Join/Prune messages must be filtered. If an empty access list is associated with the filter, then all Join/Prune messages are permitted. Use the `no` form of this command to remove the access list.

Example	`OS10# configure terminal`
	`OS10(config)# ip access-list acl-join-filter`
	`OS10(config-ipv4-acl)# permit ip 10.10.10.0/24 226.1.1.0/24`
	`OS10(config-ipv4-acl)# permit ip any 225.1.1.0/24`
	`OS10(config-ipv4-acl)# exit`
	`OS10(config)# interface ethernet 1/1/1`
	`OS10(conf-if-eth1/1/1)# ip pim join-filter acl-join-filter`

Supported Releases	10.5.2.0 or later

ip pim neighbor-filter

Enables filtering of neighbors on an interface.

Syntax	`ip pim neighbor-filter` *`access-list-name`*
Parameters	*`access-list-name`*—Enter the name of the access list. You can specify the ACL name up to 140 characters.
Default	Disabled
Command Mode	INTERFACE CONFIGURATION
Usage Information	Before you configure PIM neighbor filter, ensure that: ● Multicast is enabled globally using the `ip multicast-routing` command. ● The interface is enabled. Use the `no shutdown` command to enable the interface. ● The interface is in Layer 3 mode. PIM-SM is enabled only on a Layer 3 interface. Before configuring PIM on the interface, use the `no switchport` command to change the interface from Layer 2 to Layer 3 mode. Use the access list to add a range of sources with which PIM neighbors must be filtered. If an empty access list is associated with the filter, then all neighbors are permitted. Use the `no` form of this command to remove the access list.

Example

```
OS10# configure terminal
OS10(config)# ip access-list acl-neighbor-filter
OS10(config-ipv4-acl)# permit ip 10.10.10.0/24 any
OS10(config-ipv4-acl)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip pim neighbor-filter acl-neighbor-filter
```

Supported Releases 10.5.2.0 or later

ip pim query-interval

Changes the frequency of PIM router query messages.

Syntax `ip pim query-interval seconds`

Parameters *seconds*—Enter the amount of time, in seconds, the router waits before sending a PIM hello packet out of each PIM-enabled interface, from 2 to 18000.

Default 30 seconds

Command Mode INTERFACE CONFIGURATION

Usage Information The `no` form of this command returns the frequency of PIM router query messages to the default value.

Example

```
OS10# configure terminal
OS10(config)# interface vlan 1
OS10(conf-if-vl-1)# ip pim query-interval 20
```

Supported Releases 10.4.3.0 or later

ip pim register-filter

Prevents a PIM source DR from sending register packets to an RP for the specified multicast source and group.

Syntax `ip pim [vrf vrf-name] register-filter access-list-name`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF. If you specify this option, this command applies the filter to specific VRF. Otherwise, it applies the filter to the default VRF.
- *access-list-name*—Enter the name of the access list. You can specify the ACL name up to 140 characters.

Default Disabled

Command Mode GLOBAL CONFIGURATION

Usage Information Before you configure a PIM register filter, ensure that Multicast is enabled globally using the `ip multicast-routing` command.

Use the access list to add a range of source and groups for which PIM register messages must be filtered. If an empty access list is associated with the register filter, then all PIM register messages are permitted.

Use the `no` form of this command to remove the access list.

Example

```
OS10# configure terminal
OS10(config)# ip access-list acl-register-filter
OS10(config-ipv4-acl)# permit ip 10.10.10.0/24 any
OS10(config-ipv4-acl)# exit
OS10(config)# ip pim vrf vrf_dell register-filter acl-register-filter
```

Supported Releases 10.5.2.0 or later

ip pim rp-address

Configures a static PIM RP address for a group.

Syntax

```
ip pim [vrf vrf-name] rp-address address {group-address group-address mask}
[override]
```

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- `rp-address address`—Enter the keyword `address`, then the RP address in dotted-decimal format (A.B.C.D).
- `group-address group-address mask`—Enter the keyword `group-address`, then the group-address mask in dotted-decimal format (`/xx`) to assign the group address to the RP.
- `[override]`—Overrides BSR updates with static RP for groups with the same prefix length.

Default

None

Command Mode

CONFIGURATION

Usage Information

First hop routers use this address to send register packets on behalf of the source multicast hosts. The RP addresses are stored in the order in which they are entered. The RP is chosen based on a longer prefix match for a group. You can specify the range of group addresses for which a given node is configured as an RP. The RP selection does not depend on static or dynamic RP assignments.

If you have configured a static RP for a group, use the `override` option to override BSR updates with static RP configuration.

If you do not explicitly use the `override` option and:

- The prefix length of the static RP is the same as the BSR RP, the BSR RP takes precedence over statically configured RP.
- If the prefix length of the static RP and the BSR RP does not match, OS10 selects the router having the longest-match prefix as the RP.

The `no` form of this command removes static RP configuration.

Example

```
OS10# configure terminal
OS10(config)# ip pim rp-address 171.1.1.1 group-address 225.1.1.3/32
override
```

Supported Releases

10.4.3.0 or later

ip pim rp-candidate

Configures the router as an IPv4 PIM RP candidate.

Syntax

```
ip pim [vrf vrf-name] rp-candidate {ethernet node/slot/port[:subport] |
loopback loopback-interface-number | vlan vlan-number | port-channel port-
channel-number} [priority priority-value] [acl acl-name]
```

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- `loopback-interface-number`—Enter a value from 0 to 16383.
- `vlan-number`—Enter a value from 1 to 4093.
- `port-channel-number`—Enter the port channel ID number, from 1 to 999 or 1001 to 2000.
- `priority-value`—Enter a value from 0 to 255.
- `acl-name`—Standard ACL name.

Default

Priority is 192.

Command Mode

CONFIGURATION

Usage Information

Specify the interface to obtain the candidate RP address. The access-list `acl-name` adds a range of group addresses that this candidate RP can serve.

If you do not specify an access list, the C-RP advertises itself to the entire multicast range, 224.0.0.0./4.

If you specify an access list, the C-RP advertises only the group range that the access list permits.

The `no` form of the command removes the router from being a C-RP. You must specify the parameters with the `no` form of this command.

Example

```
OS10# configure terminal
OS10(config)# ip pim vrf red rp-candidate loopback 10 priority 11 acl
rp-grp
```

Supported Releases 10.5.0 or later

ip pim rp-candidate-timers

Configures the time interval between periodic candidate RP advertisements.

Syntax

```
ip pim [vrf vrf-name] rp-candidate-timers {ethernet node/slot/
port[:subport] | loopback loopback-interface-number | vlan vlan-number |
port-channel port-channel-number} {advt-interval interval-value} [hold-time
hold-time-value]
```

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *`loopback-interface-number`*—Enter a value from 0 to 16383.
- *`vlan-number`*—Enter a value from 1 to 4093.
- *`port-channel-number`*—Enter the port channel ID number, from 1 to 999 or 1001 to 2000.
- *`interval-value`*—Enter a value from 1 to 26214.
- *`hold-time-value`*—Enter a value from 1 to 65535

  NOTE: The hold time must be greater than the advertisement interval.

Default

- Advertisement interval is 60 s.
- Hold time value is 150 s.

Command Mode CONFIGURATION

Usage Information Use this command to adjust the interval between candidate RP advertisements. The advertised RP entries remain in the node until the hold time value expires. Dell Technologies recommends configuring the hold time value to be 2.5 times the advertisement interval. The `no` form of the command resets the candidate RP timers to the default values.

Example

```
OS10# configure terminal
OS10(config)# ip pim vrf red rp-candidate-timers loopback 10 advt-
interval 30 hold-time 80
```

Supported Releases 10.5.0 or later

ip pim sparse-mode

Enables PIM sparse mode and IGMP on the interface.

Syntax

```
ip pim sparse-mode
```

Parameters None

Default Disabled

Command Mode INTERFACE CONFIGURATION

Usage Information Before you enable PIM sparse mode, ensure that:

- Multicast is enabled globally using the `ip multicast-routing` command.
- The interface is enabled. Use the `no shutdown` command to enable the interface.

- The interface is in Layer 3 mode. PIM-SM is enabled only on a Layer 3 interface. Before configuring PIM on the interface, use the `no switchport` command to change the interface from Layer 2 to Layer 3 mode.

Use the `no` form of the command to disable PIM sparse mode.

Example

```
OS10# configure terminal
OS10(config)# interface vlan 2
OS10(conf-if-vl-2)# ip address 1.1.1.2/24
OS10(conf-if-vl-2)# ip pim sparse-mode
```

Supported Releases 10.4.3.0 or later

ip pim sparse-mode sg-expiry-timer

Enables expiry timers globally for all sources.

Syntax `ip pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *`seconds`*—Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535 seconds.

Default 210 seconds

Command Mode CONFIGURATION

Usage Information This command configures the expiry timers for all S, G entries.

Example

```
OS10# configure terminal
OS10(config)# ip pim sparse-mode sg-expiry-timer 500
```

Supported Releases 10.4.3.0 or later

ip pim ssm-range

Specifies the SSM group range using an access list.

Syntax `ip pim [vrf vrf-name] ssm-range {access-list-name}`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *`access-list-name`*—Enter the name of the access list.

Default 232.0.0.0/8

Command Mode CONFIGURATION

Usage Information When ACL rules change, the ACL and PIM modules apply the new rules automatically. When you remove the SSM ACL, PIM-SSM is supported only for the default SSM range.

Example

```
OS10# configure terminal
OS10(config)# ip pim ssm-range ssm
```

Supported Releases 10.4.3.0 or later

show ip pim bsr-router

Displays information about the bootstrap router.

Syntax `show ip pim [vrf vrf-name] bsr-router`

Parameters `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip pim bsr-router

 PIMv2 Bootstrap information
    BSR address: 101.0.0.1
    BSR Priority: 199, Hash mask length: 31
    Expires: 00:00:24
    This system is a candidate BSR
    Candidate BSR address: 104.0.0.1, priority: 99, hash mask length: 31
    Next Cand_RP_advertisement in 00:00:15
    RP: 104.0.0.1(loopback101)
```

Supported Releases 10.5.0 or later

show ip pim interface

Displays information about IP PIM-enabled interfaces.

Syntax `show ip pim [vrf vrf-name] interface`

Parameters `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.

Default None

Command Mode EXEC

Usage Information The `show ip pim interface` command displays the following:

- `Address`—IP addresses of the IP PIM-enabled interfaces
- `Interface`—Interface type with slot/port information or VLAN/Port Channel ID
- `Version/Mode`—PIM version number and mode; `v2` for PIM version 2 and `S` for PIM sparse mode
- `Nbr Count`—Active neighbor count on the PIM-enabled interface
- `Query interval`—Query interval for router query messages on that interface
- `DR priority`—Designated router priority value configured on that interface
- `DR`—IP address of the DR for that interface

Example

```
OS10# show ip pim interface
Address   Interface Ver/Mode Nbr Count Query Intvl DR Prio  DR
------------------------------------------------------------------------
2.2.2.2   vlan103   v2/S      1         30          1       2.2.2.2
3.3.3.2   vlan105   v2/S      1         30          1       3.3.3.2
122.1.1.2 vlan121   v2/S      0         30          1       122.1.1.2
```

Supported Releases 10.4.3.0 or later

show ip pim mcache

Displays routes that are synchronized from VLT peer and local route information.

Syntax `show ip pim [vrf vrf-name] mcache [group-address [source-address]] [vlt]`

Parameters
- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *`group-address`*—Enter the multicast group address in dotted-decimal format (A.B.C.D).
- *`source-address`*—Enter the multicast source address in dotted-decimal format (A.B.C.D).

Default None

Command Mode EXEC

Usage Information This command provides details about the incoming and outgoing interfaces for multicast routes.

Examples

```
OS10# show ip pim mcache vlt
PIM Multicast Routing Cache Table

Flags: S - Synced

(*, 225.1.1.1), flags: S
  Incoming interface: Vlan 502
  outgoing interface list:
    Vlan 2002 (S)

(2.2.2.2, 225.1.1.1), flags: S
  Incoming interface: Vlan 501
  outgoing interface list:
    Vlan 1000, Vlan 2003 (S)
```

```
OS10# show ip pim mcache
PIM Multicast Routing Cache Table

(*, 225.1.1.1)
  Incoming interface : vlan105
  Outgoing interface list :
   vlan121

(101.1.1.10,225.1.1.1)
  Incoming interface : vlan103
  Outgoing interface list :
   vlan121
```

Supported Releases 10.4.3.0 or later

show ip pim neighbor

Displays PIM neighbors.

Syntax `show ip pim [vrf vrf-name] neighbor`

Parameters `vrf vrf-name`—Enter the keyword vrf, then the name of the VRF.

Default None

Command Mode EXEC

Usage Information This command displays the following:
- `Neighbor address`—IP addresses of the PIM neighbor
- `Interface`—Interface type with slot/port information or VLAN/Port Channel ID of the PIM neighbor
- `Uptime/expires`—Amount of time that the PIM neighbor has been up
- `Version`—PIM version number; `v2` for PIM version 2
- `DR priority/Mode`—Designated router priority value and mode. The default designated router priority is 1 and S for sparse mode

Example

```
OS10# show ip pim neighbor
Neighbor Address Interface  Uptime/Expires         Ver         DR Priority/Mode
---------------------------------------------------------------------------
```

```
2.1.1.1          vlan103    13:05:58/00:01:19        v2           1    / S
3.1.1.1          vlan105    13:05:58/00:01:17        v2           1    / S
```

Supported Releases 10.4.3.0 or later

show ip pim register-filter

Displays the details of the register filter.

Syntax `show ip pim [vrf vrf-name] register-filter group-address source-address`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- `group-address`—Enter the group address to which the multicast traffic is destined.
- `source-address`—Enter the source address from which the multicast traffic originates.

Default None

Command Mode EXEC

Usage Information This command displays access list information that helps to determine whether the (S, G) pair is included or excluded for the register filter.

Example

```
OS10# show ip pim register-filter 225.1.1.1 10.10.10.2
PIM Filters
Access List : acl-register-filter
VRF : default
Group Address : 225.1.1.1 Source Address : 10.10.10.2 Criteria : Deny
```

Supported Releases 10.5.2.0 or later

show ip pim rp

Displays brief information about all multicast group to RP mappings.

Syntax `show ip pim [vrf vrf-name] rp [mapping | group-address]`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- `mapping`—Enter the keyword `mapping` to display the multicast groups to RP mapping and information about how RP is learned.
- `group-address`—Enter the multicast group address mask in dotted-decimal format to view the RP for a specific group (A.B.C.D).

Default None

Command Mode EXEC

Usage Information None

Examples

```
OS10# show ip pim rp
Group           RP
--------------------------------
225.1.1.1       171.1.1.1
225.1.1.2       171.1.1.1
225.1.1.3       171.1.1.1
225.1.1.4       171.1.1.1
225.1.1.5       171.1.1.1
225.1.1.6       171.1.1.1
225.1.1.7       171.1.1.1
225.1.1.8       171.1.1.1
225.1.1.9       171.1.1.1
225.1.1.10      171.1.1.1
```

```
225.1.1.11      171.1.1.1
225.1.1.12      171.1.1.1
225.1.1.13      171.1.1.1
```

```
OS10# show ip pim rp mapping
PIM Group-to-RP Mappings

Group(s): 230.1.1.1/32
RP:14.1.1.1, v2
  Info source: 42.1.1.1, via bootstrap, priority 255
      expires: 00:01:53

Group(s): 231.1.1.1/32
RP: 9.1.1.1, v2
  Info source: 42.1.1.1, via bootstrap, priority 254
      expires: 00:01:54
```

Supported Releases 10.4.3.0 or later

show ip pim ssm-range

Displays the non-default groups added using the SSM range feature.

Syntax `show ip pim [vrf vrf-name] ssm-range`

Parameters `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ip pim ssm-range
Group Address   / MaskLen
224.1.1.1       / 32
```

Supported Releases 10.4.3.0 or later

show ip pim summary

Displays PIM summary.

Syntax `show ip pim [vrf vrf-name] summary`

Parameters `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.

Default None

Command Mode EXEC

Usage Information None

Examples

```
OS10# show ip pim summary

Entries in PIM-TIB/MFC : 250/150

Active Modes :
PIM-SM

TIB summary:
50/50 (*,G) entries in PIM-TIB/MFC
```

```
100/100 (S,G) entries in PIM-TIB/MFC
100/0 (S,G,Rpt) entries in PIM-TIB/MFC

Interface summary:

4 active PIM interfaces
1 active PIM neighbor

1 RPs
2 sources

Message summary:
150/50 Joins/Prunes sent/received
0/0 Candidate-RP advertisements sent/received
6/4 BSR messages sent/received
0 Null Register messages received
0/50 Register-stop messages sent/received

Data path event summary:
100 no-cache messages received
50 last-hop switchover messages received
0/0 pim-assert messages sent/received
0/0 register messages sent/received

VLT Multicast summary:
0(*,G) synced entries in MFC
281(S,G) synced entries in MFC
0(S,G,Rpt) synced entries in MFC
```

Supported Releases 10.4.3.0 or later

show ip pim tib

Displays the PIM tree information base (TIB).

Syntax `show ip pim [vrf vrf-name] tib [group-address [source-address]]`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- *`group-address`*—Enter the group address in dotted-decimal format (A.B.C.D).
- *`source-address`*—Enter the source address in dotted-decimal format (A.B.C.D).

Default None

Command Mode EXEC

Usage Information This command displays the following:

- `S, G`—Displays the entry in the multicast PIM database
- `uptime`—Displays the amount of time the entry has been in the PIM route table
- `expires`—Displays the amount of time until the entry expires and is removed from the database
- `RP`—Displays the IP address of the RP or source for the entry
- `Incoming interface`—Displays the reverse path forwarding (RPF) interface towards the RP/source
- `RPF neighbor`—Displays the next hop IP address from this interface towards the RP/source
- `Outgoing interface list`—Lists the interfaces that meet one of the following criteria:
  - a directly connected member of the group
  - a statically connected member of the group
  - received an (*, G) or (S, G) join message

Example

```
OS10# show ip pim tib

PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
```

```
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 13:08:24, expires 00:00:12, RP 171.1.1.1, flags:
SCJ
  Incoming interface: vlan105, RPF neighbor 3.1.1.1
  Outgoing interface list:
    vlan121  Forward/Sparse  13:07:53/Never

(101.1.1.10, 225.1.1.1), uptime 13:07:51, expires 00:06:09, flags: T
  Incoming interface: vlan103, RPF neighbor 2.1.1.1
  Outgoing interface list:
    vlan121  Forward/Sparse  13:07:50/Never
```

Supported Releases 10.4.3.0 or later

show ip rpf

Displays reverse path forwarding (RPF) information.

Syntax `show ip rpf [vrf vrf-name] [summary]`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF.
- `summary`—RPF summary.

Default None

Command Mode EXEC

Usage Information PIM uses unicast routing to check the multicast source reachability. PIM examines the distance of each route. The route with the shortest distance is the one that PIM selects for reachability.

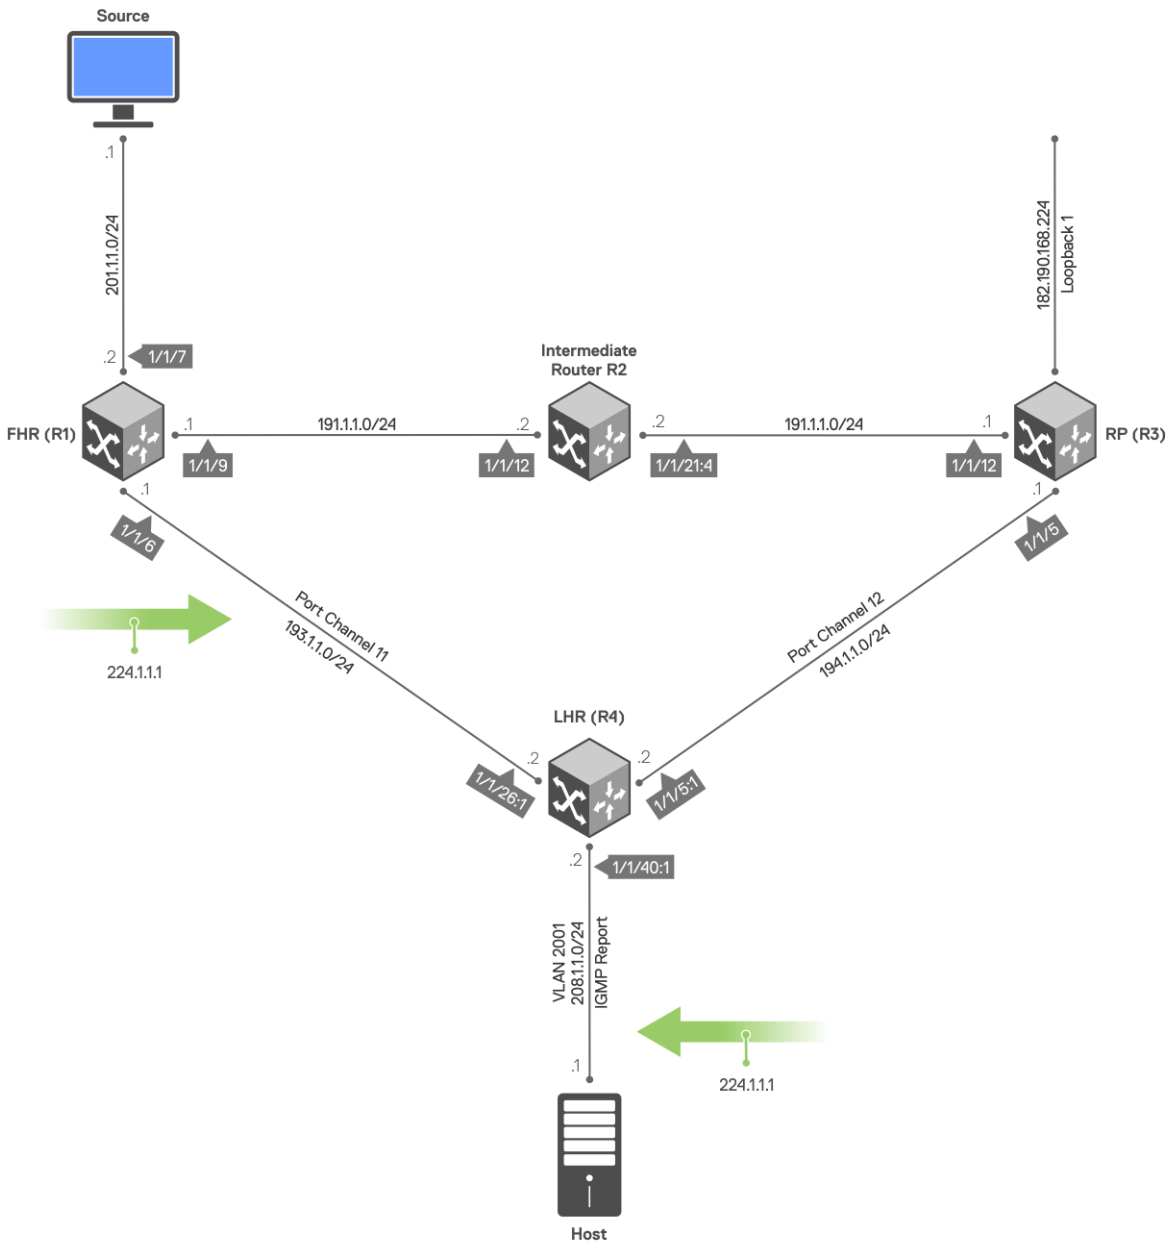
Example

```
OS10# show ip rpf
RPF information for 101.1.1.10
   RPF interface: vlan103
   RPF neighbor: 2.1.1.1
   RPF route/mask: 101.1.1.0/255.255.255.0
   RPF type: Unicast
RPF information for 171.1.1.1
   RPF interface: vlan105
   RPF neighbor: 3.1.1.1
   RPF route/mask: 171.1.1.0/255.255.255.0
   RPF type: Unicast
```

Supported Releases 10.4.3.0 or later

Sample configuration: Multicast VRF using PIM-SM

This section describes how to configure IPv4 multicast in a non-default VRF instance using the topology shown in the following illustration.



Perform the following configuration on each of the nodes, R1, R2, R3, and R4.

Sample configuration on R1:

```
R1# configure terminal
R1(config)# ip vrf red
R1(conf-vrf)# end

R1# configure terminal
R1(config)# interface port-channel 11
R1(conf-if-po-11)# no switchport
R1(conf-if-po-11)# ip vrf forwarding red
R1(conf-if-po-11)# end

R1# configure terminal
R1(config)# interface ethernet 1/1/6
```

```
R1(conf-if-eth1/1/6)# no ip vrf forwarding
R1(conf-if-eth1/1/6)# no switchport
R1(conf-if-eth1/1/6)# channel-group 11
R1(conf-if-eth1/1/6)# end

R1# configure terminal
R1(config)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# no switchport
R1(conf-if-eth1/1/7)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# ip vrf forwarding red
R1(conf-if-eth1/1/7)# ip address 201.1.1.2/24
R1(conf-if-eth1/1/7)# ip pim sparse-mode
R1(conf-if-eth1/1/7)# no shutdown
R1(conf-if-eth1/1/7)# end

R1# configure terminal
R1(config)# interface ethernet 1/1/9
R1(conf-if-eth1/1/9)# no switchport
R1(conf-if-eth1/1/9)# interface ethernet 1/1/9
R1(conf-if-eth1/1/9)# ip vrf forwarding red
R1(conf-if-eth1/1/9)# ip address 191.1.1.1/24
R1(conf-if-eth1/1/9)# ip pim sparse-mode
R1(conf-if-eth1/1/9)# no shutdown
R1(conf-if-eth1/1/9)# end

R1# configure terminal
R1(config)# interface port-channel 11
R1(conf-if-po-11)# no switchport
R1(conf-if-po-11)# interface port-channel 11
R1(conf-if-po-11)# ip vrf forwarding red
R1(conf-if-po-11)# ip address 193.1.1.1/24
R1(conf-if-po-11)# ip pim sparse-mode
R1(conf-if-po-11)# no shutdown
R1(conf-if-po-11)# end

R1# configure terminal
R1(config)# interface Lo0
R1(conf-if-lo-0)# ip vrf forwarding red
R1(conf-if-lo-0)# ip address 2.2.2.2/32
R1(conf-if-lo-0)# ip pim sparse-mode
R1(conf-if-lo-0)# no shutdown
R1(conf-if-lo-0)# end

R1# configure terminal
R1(config)# router ospf 100 vrf red
R1(config-router-ospf-100)# interface ethernet 1/1/7
R1(conf-if-eth1/1/7)# ip ospf 100 area 0
R1(conf-if-eth1/1/7)# end

R1# configure terminal
R1(config)# router ospf 100 vrf red
R1(config-router-ospf-100)# interface ethernet 1/1/9
R1(conf-if-eth1/1/9)# ip ospf 100 area 0
R1(conf-if-eth1/1/9)# end

R1# configure terminal
R1(config)# router ospf 100 vrf red
R1(config-router-ospf-100)# interface port-channel 11
R1(conf-if-po-11)# ip ospf 100 area 0
R1(conf-if-po-11)# end

R1# configure terminal
R1(config)# ip multicast-routing vrf red
R1(config)# end

R1# configure terminal
R1(config)# ip pim vrf red rp-address 182.190.168.224 group-address 224.0.0.0/4
R1(config)# end
```

Sample configuration on R2:

```
R2# configure terminal
R2(config)# ip vrf red
```

```
R2(conf-vrf)# end

R2# configure terminal
R2(config)# interface vlan 1001
R2(conf-if-vl-1001)# ip vrf forwarding red
R2(conf-if-vl-1001)# end

R2# configure terminal
R2(config)# interface ethernet 1/1/21:4
R2(conf-if-eth1/1/21:4)# switchport mode trunk
R2(conf-if-eth1/1/21:4)# switchport trunk allowed vlan 1001
R2(conf-if-eth1/1/21:4)# end

R2# configure terminal
R2(config)# interface ethernet 1/1/12:1
R2(conf-if-eth1/1/12:1)# no switchport
R2(conf-if-eth1/1/12:1)# ip vrf forwarding red
R2(conf-if-eth1/1/12:1)# ip address 191.1.1.2/24

Anycast RP using PIM

PIM Anycast RP provides load balancing and redundancy capabilities for Rendezvous Point (RP) routers in a multicast domain.

This feature allows you to configure two or more RPs with same IP address (RP address) in a multicast group. The shared RP address is advertised in Interior Gateway Protocol (IGP). The RP routers that share the same RP address form an Anycast RP set. Each router in the Anycast RP set is configured with two IP addresses: a shared RP address on the Loopback interface and a separate, unique IP address. The unique IP address is used for communication between the RPs. The Loopback address must be reachable to all PIM routers in the multicast domain. This configuration allows the RPs to share the load for source registration and to act as back-up routers for each other.

PIM enables multiple RPs to inform each other about active sources. When a source registers with an RP, that RP sends a PIM register message to all other members of the RP set informing that there is a new active source. Thus, each RP in the multicast domain knows about the active sources of the other RPs.

IGP protocols such as OSPF routes the sources and receivers to the RPs with the best route. Packets sent to the RP address are delivered to the nearest RP with this address. When an RP with the best route fails, IGP automatically recalculates the best

route and takes the sources and receivers to the closest operating RP. This failover mechanism ensures that connectivity is maintained, and traffic disruption is minimal.

NOTE: PIM Anycast RP is not supported on the S3048-ON switch.

Configure PIM Anycast RP

To configure PIM Anycast RP, enable PIM-SM and IGP on the participating Loopback interfaces. Also, configure Loopback interfaces with unique IP addresses on each of the RPs.

To configure static Anycast RP:

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)#
```

2. Configure the rendezvous point (RP) IP address statically and specify the multicast group address range. The RP address must be reachable across the PIM domain.

```
OS10(config)# ip pim rp-address 100.1.1.1 group-address 224.0.0.0/4
```

3. Configure PIM Anycast RP peer addresses for the specified Anycast-RP address.

```
OS10(config)# ip pim anycast-rp 100.1.1.1 192.10.1.1
OS10(config)# ip pim anycast-rp 100.1.1.1 192.10.2.2
OS10(config)# ip pim anycast-rp 100.1.1.1 192.10.3.3
```

4. Verify the configuration.

```
OS10# show ip pim rp mapping
Anycast-RP 100.1.1.1 members:
192.10.1.1* 192.10.2.2 192.10.3.3

PIM Group-to-RP Mappings

Group(s): 224.0.0.0/4, Static

RP: 100.1.1.1,v2
```

The asterisk (*) in the output denotes the local IP address.

Example configuration with PIM Bootstrap

The following example is a configuration of dynamic anycast RP address over a PIM bootstrap router. The RP shared address 100.1.1.1 is used in the multicast domain. IP addresses 192.10.1.1 and 192.10.2.2 are mapped to form the Anycast RP set.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# ip address 100.1.1.1/32
OS10(conf-if-lo-1)# ip ospf 10 area 0.0.0.0
OS10(config)#exit
OS10(config)# interface loopback2
OS10(conf-if-lo-1)# ip address 192.10.1.1/32
OS10(conf-if-lo-1)# ip ospf 10 area 0.0.0.0
OS10(config)#exit
OS10(config)# ip pim rp-candidate loopback1
OS10(config)# ip pim bsr-candidate loopback2
OS10(config)#ip pim anycast-rp 100.1.1.1 192.10.1.1
OS10(config)#ip pim anycast-rp 100.1.1.1 192.10.2.2
OS10(config)#exit
OS10# show ip pim rp mapping

Anycast-RP 1.1.1.1 members:
192.10.1.1* 192.10.2.2

Group(s) : 224.0.0.0/4
RP : 1.1.1.1, v2
```

```
Info source: 192.10.2.2, via bootstrap, priority 192
expires: 00:02:15
```

View mismatch of PIM Anycast RP on VLT nodes

To identify the configuration mismatch of PIM Anycast RP on VLT nodes, use the `show vlt mismatch` command.

The following example shows PIM Anycast RP mismatch information for a specific VLT domain.

```
OS10# show vlt 1 mismatch

<<Output truncated>>

PIM Anycast RP information mismatches:

```

PIM Anycast RP commands

ip pim anycast-rp

Configures an Anycast RP peer for the specified Anycast RP address.

Syntax `ip pim [vrf vrf-name] anycast-rp rp-address rp-set-address`

Parameters

- `vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF to configure anycast-RP on a specific VRF. If VRF is not specified, the Anycast RP configuration applies to the default VRF.
- *`rp-address`*—Enter the Loopback IP address that is shared between all routers within an RP set.
- *`rp-set-address`*—Enter the IP address of a peer in the Anycast RP set.

Default Disabled

Command Mode CONFIGURATION

Usage Information Use the `no` form of the command to remove the peer.

Example To configure a PIM Anycast-RP peer, enter the following command:

```
OS10# configure terminal
OS10(config)# ip pim anycast-rp 1.1.1.1 192.168.1.1
```

To remove a peer, enter the following command:

```
OS10# configure terminal
OS10(config)# no ip pim anycast-rp 1.1.1.1 192.168.1.1
```

Supported Releases 10.5.2.0 or later

show ip pim rp mapping

Displays the Anycast RP mapping information for a multicast group.

Syntax	`show ip pim [vrf vrf-name] rp mapping`
Parameters	`vrf vrf-name`—Enter the keyword `vrf`, then the name of the VRF to display Anycast RP information for a specific VRF. If VRF name is not specified, this command displays information for the default VRF.
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	

```
OS10# show ip pim rp mapping
Anycast-RP 100.1.1.1 members:
192.10.1.1* 192.10.2.2

Group(s) : 224.0.0.0/4
RP : 1.1.1.1, v2
Info source: 192.10.2.2, via bootstrap, priority 192
expires: 00:02:15
```

Supported Releases	10.5.2.0 or later

VLT multicast routing

OS10 supports multicast routing in a VLT domain for IPv4 networks. This feature provides resiliency to multicast-routed traffic when a VLT peer node or the VLTi link goes down.

Multicast routing table synchronization

Multicast routing protocols do not exchange multicast routes between peer VLT nodes. Each VLT node runs the PIM protocol independent of the peer VLT node. Hence, the PIM states do not synchronize between the nodes. However, OS10 synchronizes the multicast routing table with routes that the PIM learns on each of the nodes between the peer VLT nodes. Multicast routing table synchronization:

- Avoids unoptimized forwarding over VLTi links. Table synchronization allows the incoming traffic sent to the wrong peer to be routed locally within the device.
- Provides traffic resiliency in the event of a VLT node failure. The traffic is forwarded until the PIM protocol reconverges and builds a new tree.

IGMP message synchronization

VLT nodes use the VLTi link to synchronize IGMP messages across their peers. Any IGMP join message that is received on one of the VLT nodes synchronizes with the peer node. Therefore, the IGMP tables are identical in a VLT domain.

Egress mask

When multicast traffic from the source arrives at one of the VLT peer nodes, it is sent to the downstream receivers using local routing or switching and over the VLTi link. The port block at the VLTi link of the peer node drops the multicast traffic. This port block, also known as the egress mask, avoids duplicate traffic forwarding on the VLT port channel by both VLT nodes. However, if the receiver is connected to the peer node, the system forwards the multicast traffic to the receiver.

Spanned VLAN

Any VLAN configured on both the VLT peer nodes is known as a spanned VLAN. The VLT interconnect (VLTi) port is automatically added as a member of the spanned VLAN. Any adjacent router connected to at least one VLT node on a spanned VLAN subnet is directly reachable from both the VLT peer nodes at the L3 level.

- Spanned VLAN L3 interface: If you enable PIM on each of the spanned VLAN L3 interfaces on both VLT nodes, the interface is a spanned VLAN L3 interface.
  - Spanned VLT VLAN L3 interface: Includes all spanned L3 VLANs that have at least one VLT port that is configured as a port channel member.
  - Spanned non-VLT VLAN L3 interface: Includes all spanned VLANs that do not have VLT ports configured as port channel members.
- Nonspanned L3 interface: All point-to-point interfaces or L3 VLANs that do not have VLT ports configured as port channel members.

For more information, see Deployment considerations.

VLT multicast peer routing timer

If a VLT peer node fails, OS10 retains the synchronized multicast routes for the duration specified in the `multicast peer-routing-timeout` command. The VLT multicast peer-routing timer is enabled by default with a timeout value of 300s. When this timer expires, OS10 removes the routes that are not learned locally and routes that are not re-synchronized from the peer node.

NOTE: Dell Technologies recommends that you configure the multicast peer routing timer value to be 100 seconds greater than the VLT delay restore timer value. For more information, see Configure the delay restore timer.

The `show vlt` *`domain-id`* command displays the configured timer value. When the timer is in progress, this command displays the amount of time remaining until the timer expiration.

NOTE: This timer runs by default, regardless of whether you enable multicast routing or not.

Deployment considerations

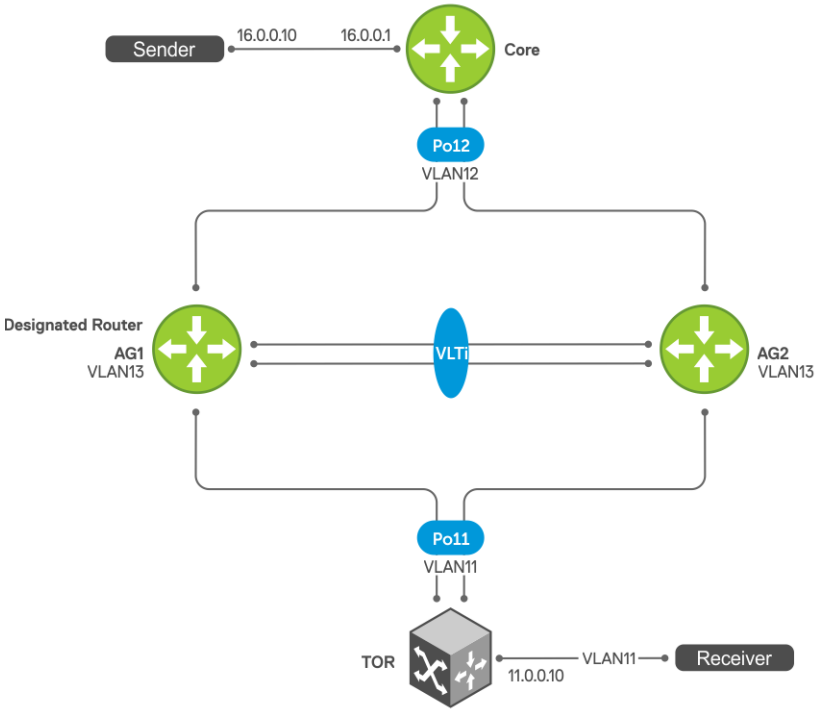
Dell Technologies recommends the following:

- In a VLT-enabled PIM router, multicast routing is not supported when there are multiple PIM spanned paths to reach the source or RP. Configure only one PIM spanned path to reach any PIM router in the aggregation or spine.
- If a source is connected to a nonspanned interface of the VLT peer nodes and the RP is reachable on a spanned interface from both the VLT nodes, the receiver might receive duplicate traffic. To avoid duplicate traffic, configure the source to be reachable on a spanned interface.
- For better convergence, the upstream incoming interface (IIF) and the downstream outgoing interface (OIF) must be a spanned VLAN.
- In VLT deployments, Dell Technologies recommends not to change the PIM designated router by configuring a non-default value using the `ip pim dr-priority` command.
- In large-scale multicast deployments, you might see frequent bursts of multicast control traffic. For such deployments, Dell Technologies recommends that you increase the burst size for queue 2 on all PIM routers using control-plane policing. For more information about how to configure a QoS policy to rate limit control-plane traffic, see Configure control-plane policing.

Example: Spanned L3 VLAN IIF using PIM-SM

This section describes how to configure VLT multicast routing in a four-node setup—core, AG1, AG2, and ToR—using the topology shown in the following figure:

- Core, AG1, and AG2 are multicast routers in a VLT domain.
- ToR is an IGMP-enabled L2 switch.
- OSPF is the unicast routing protocol.



Sample configuration on core:

```
core# configure terminal
core(config)# ip multicast-routing
core(config)# ip pim rp-address 103.0.0.3 group-address 224.0.0.0/4
core(config)# router ospf 100
core(config-router-ospf-100)# exit

core(config)# interface ethernet 1/1/32:1
core(conf-if-eth1/1/32:1)# no shutdown
core(conf-if-eth1/1/32:1)# no switchport
core(conf-if-eth1/1/32:1)# ip address 16.0.0.1/24
core(conf-if-eth1/1/32:1)# flowcontrol receive off
core(conf-if-eth1/1/32:1)# ip pim sparse-mode
core(conf-if-eth1/1/32:1)# ip ospf 100 area 0.0.0.0
core(conf-if-eth1/1/32:1)# exit

core(config)# interface vlan 12
core(conf-if-vl-12)# no shutdown
core(conf-if-vl-12)# ip address 12.0.0.3/24
core(conf-if-vl-12)# ip pim sparse-mode
core(conf-if-vl-12)# ip pim dr-priority 1000
core(conf-if-vl-12)# ip ospf 100 area 0.0.0.0
core(conf-if-vl-12)# exit

core(config)# interface loopback 103
core(conf-if-lo-103)# no shutdown
core(conf-if-lo-103)# ip address 103.0.0.3/32
core(conf-if-lo-103)# ip pim sparse-mode
core(conf-if-lo-103)# ip ospf 100 area 0.0.0.0
core(conf-if-lo-103)# exit
```

PIM neighbors of core and the interface to reach the neighbors

The `show ip pim neighbor` command displays the PIM neighbors of core and the interface to reach the neighbors.

```
core# show ip pim neighbor
Neighbor Address Interface Uptime/Expires      Ver   DR Priority / Mode
--------------------------------------------------------------------------
```

```
12.0.0.1          vlan12     00:01:06/00:01:43   v2   10          / S
12.0.0.2          vlan12     00:01:03/00:01:42   v2   10          / S
```

PIM states in core

The output of the `show ip pim tib` command.

```
core# show ip pim tib
PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 00:04:16, expires 00:00:00, RP 103.0.0.3, flags: S
  Incoming interface:  Null, RPF neighbor 0.0.0.0
  Outgoing interface list:
    vlan12  Forward/Sparse  00:04:16/00:03:13
```

The following `show` command output displays traffic after flow is initiated:

The `show ip pim tib` command output displays the PIM tree information base (TIB).

```
core# show ip pim tib
PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 00:09:54, expires 00:00:00, RP 103.0.0.3, flags: S
  Incoming interface:  Null, RPF neighbor 0.0.0.0
  Outgoing interface list:
    vlan12  Forward/Sparse  00:09:54/00:02:35

(16.0.0.10, 225.1.1.1), uptime 00:00:34, expires 00:02:55, flags: FT
  Incoming interface: ethernet1/1/32:1, RPF neighbor 0.0.0.0
  Outgoing interface list:
    vlan12  Forward/Sparse  00:00:34/00:02:55
```

The `show ip pim mcache` command output displays multicast route entries.

```
core# show ip pim mcache
PIM Multicast Routing Cache Table

(16.0.0.10, 225.1.1.1)
  Incoming interface : ethernet1/1/32:1
  Outgoing interface list :
   vlan12
```

Sample configuration on AG1:

```
AG1# configure terminal
AG1(config)# ip multicast-routing
AG1 (config)# ip pim rp-address 103.0.0.3 group-address 224.0.0.0/4
AG1(config)# router ospf 100
AG1(config-router-ospf-100)# exit

AG1(config)# vlt-domain 255
AG1(conf-vlt-255)# backup destination 10.16.132.147

```

IGMP and PIM states in AG2

The `show ip igmp groups` command output displays the IGMP database.

```
AG2# show ip igmp groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address                Interface          Mode                Uptime
 Expires             Last Reporter
225.1.1.1                    vlan11             Exclude             00:02:00
 00:01:47            0.0.0.0
```

The output of the `show ip pim tib` command.

```
AG2# show ip pim tib

PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 00:02:15, expires 00:00:00, RP 103.0.0.3, flags: SC
  Incoming interface: vlan12, RPF neighbor 12.0.0.3
```

```
  Outgoing interface list:
    vlan11  Forward/Sparse  00:02:15/Never
```

The `show ip pim mcache` command output displays multicast route entries.

```
AG2# show ip pim mcache
PIM Multicast Routing Cache Table

(*, 225.1.1.1)
  Incoming interface : vlan12
  Outgoing interface list :
   vlan11

AG2# show ip pim mcache vlt
PIM Multicast Routing Cache Table
Flags: S - Synced

(*, 225.1.1.1),flags: S
  Incoming interface : vlan12
  Outgoing interface list :
   vlan11 (S)
```

The following `show` command output displays the synchronized states after traffic flow is established:

```
AG2# show ip pim tib

PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
       R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
       K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, 225.1.1.1), uptime 00:10:30, expires 00:00:00, RP 103.0.0.3, flags: SC
  Incoming interface: vlan12, RPF neighbor 12.0.0.3
  Outgoing interface list:
    vlan11  Forward/Sparse  00:10:30/Never
```

```
AG2# show ip pim mcache
PIM Multicast Routing Cache Table

(*, 225.1.1.1)
  Incoming interface : vlan12
  Outgoing interface list :
   vlan11

(16.0.0.10, 225.1.1.1)
  Incoming interface : vlan12
  Outgoing interface list :
   vlan11
```

```
AG2# show ip pim mcache vlt
PIM Multicast Routing Cache Table
Flags: S - Synced

(*, 225.1.1.1),flags: S
  Incoming interface : vlan12
  Outgoing interface list :
   vlan11 (S)

(16.0.0.10, 225.1.1.1),flags: S
  Incoming interface : vlan12
  Outgoing interface list :
   vlan11 (S)
```

Sample configuration on TOR:

```
TOR# configure terminal
TOR(config)# ip igmp snooping enable

TOR(config)# interface vlan 11
TOR(conf-if-vlan-11)# no shutdown
TOR(conf-if-vlan-11)# exit

TOR(config)# interface port-channel 11
TOR(conf-if-po-11)# no shutdown
TOR(conf-if-po-11)# switchport mode trunk
TOR(conf-if-po-11)# switchport access vlan 1
TOR(conf-if-po-11)# switchport trunk allowed vlan 11
TOR(conf-if-po-11)# exit

TOR(config)# interface ethernet 1/1/32:1
TOR(conf-if-eth1/1/32:1)# no shutdown
TOR(conf-if-eth1/1/32:1)# switchport mode trunk
TOR(conf-if-eth1/1/32:1)# switchport access vlan 1
TOR(conf-if-eth1/1/32:1)# switchport trunk allowed vlan 11
TOR(conf-if-eth1/1/32:1)# flowcontrol receive off
TOR(conf-if-eth1/1/32:1)# exit
```

IGMP snooping information on TOR

The following command displays IGMP snooping groups membership details:

```
ToR# show ip igmp snooping groups
Total Number of Groups: 1
IGMP Connected Group Membership
Group Address                 Interface           Mode                Expires
225.1.1.1                     vlan11              IGMPv2-Compat       00:02:09
  Member-ports :ethernet1/1/32:1
```

VLT multicast routing commands

multicast peer-routing-timeout

Configures the time duration for a VLT node to retain synchronized multicast routes if there is a VLT peer node failure.

Syntax	`multicast peer-routing-timeout` *value*
Parameters	*value*—Enter the timeout value in seconds, from 1 to 1200.
Default	300 s
Command Mode	VLT-DOMAIN
Usage Information	If one of the VLT peer nodes goes down, the multicast peer-routing timer starts. When the multicast peer-routing timer expires, the system removes any stale routes that were retained at the time the peer went down, but were not converged. The routes that are not locally learned and the routes that are not resynchronized from the peer, or both, are removed. **NOTE:** Dell Technologies recommends that you configure the same timeout value on both the VLT peer nodes. The `no` form of this command resets the multicast peer-routing timer value to its default value of 300 s.
Example	`OS10(config)# vlt-domain 255` `OS10(conf-vlt-255)# multicast peer-routing-timeout 1200`
Supported Releases	10.5.2.0 or later

show vlt inconsistency ip mcache

Displays information about mismatched IIF routes between the local and peer VLT nodes.

Syntax `show vlt inconsistency ip mcache [vrf vrf-name]`

Parameters `vrf vrf-name`—(Optional) Enter the keyword then the name of the VRF to display information about mismatched IIF routes corresponding to that non-default VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show vlt inconsistency ip mcache

Spanned Multicast routing IIF inconsistency:
Multicast Route Local IIF Peer IIF
(22.22.22.200, 225.1.1.2) Vlan 5 Vlan6
(*, 225.1.1.2) Vlan 15 ethernet 1/1/1
```

Supported Releases 10.5.0 or later

show vlt mismatch

Displays configuration mismatch between VLT peers.

Syntax `show vlt {domain-id | all} mismatch`

Parameters `domain-id`—Enter a VLT domain ID, from 1 to 255.

Default None

Command Mode EXEC

Usage Information The `show vlt mismatch` command displays multicast configuration mismatches.

Example

```
OS10# show vlt all mismatch

Multicast routing mismatches:
Global status:
Parameter        VRF                                  Local     Peer
-------------------------------------------------------------------
V4 Multicast    default                              Enabled    Disabled

Vlan status          IPv4                   IPv6
VlanId         Local      Peer        Local       Peer
-----------------------------------------------------
Vlan 11       Enabled    Disabled    Disabled    Disabled
Vlan 12       Enabled    Disabled    Disabled    Disabled
Vlan 13       Enabled    Disabled    Disabled    Disabled
```

Supported Releases 10.5.0 or later

IPv6 multicast routing

OS10 supports the following Layer 3 IPv6 multicast features:

- **MLD**—An IPv6 multicast group is an arbitrary group of receivers that want to receive a particular data stream. This group has no physical or geographical boundaries, receivers can be located anywhere on the Internet. Receivers that are interested

in receiving data flowing to a particular group must join the group by signaling their local device. This signaling is achieved with the MLD protocol.

- **PIM Sparse Mode (PIM-SM)**—IPv6 multicast provides support for intradomain multicast routing using PIM sparse mode (PIM-SM). PIM-SM uses unicast routing to provide reverse-path information for multicast tree building.
- **PIM Source Specific Multicast (PIM-SSM)**—The PIM-SSM feature is an extension of IP multicast where datagram traffic is forwarded to receivers from only those multicast sources on which the receivers have explicitly joined.

Restrictions and limitations

The following table describes the platform-specific restrictions:

Table 65. Platform restrictions and limitations

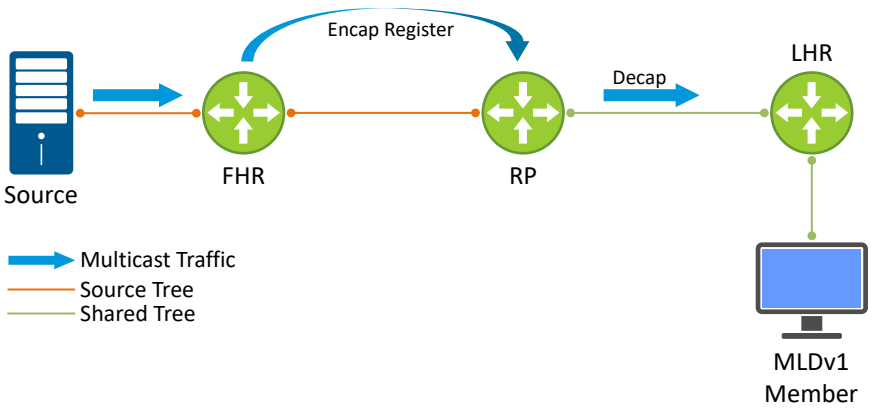
Platform	IGMP snooping	MLD snooping	IPv4 Multicast routes	IPv6 Multicast routes
S5200 Series, Z9264-ON, or Z9432-ON	2,000	1,000	4,000	2,000
N3248TE-ON	1,000	512	2,000	1,000

The following restrictions and limitations apply for the IPv6 multicast routing feature:

- Number of PIMv4 interfaces supported is 100.
- Number of PIMv6 interfaces supported is 100.
- All platforms except S3000-ON, S4200-ON, and S5100-ON support IPv6 multicast routing.

Example - Configuration IPv6 PIM with static RP

The following topology diagram describes the IPv6 PIM with static IP configuration:



Perform the following steps to configure IPv6 PIM with static RP:

- Enable IPv6 multicast forwarding and configure IPv6 PIM neighborship between routers (first hop router (FHR), rendezvous point (RP), and last hop router (LHR) nodes).
- Configure static RP address on the loopback interface.
- Configure unicast IPv6 route reachability using OSPFv3 for the static RP and multicast source addresses.
- Learn MLDv1 groups and multicast streams and verify RPT and SPT paths.

Establish IPv6 PIM neighbor-ship between routers (FHR, RP, and LHR nodes)

Enable IPv6 multicast forwarding and configured IPv6 PIM neighbor-ship between devices.

```
FHR# show ipv6 pim neighbor
Neighbor Address Interface         Uptime/Expires     Ver   DR Priority / Mode
--------------------------------------------------------------------------------------------
--------------------
20:1::2          ethernet1/1/27:1  00:01:09/00:01:36  v2    1 / DR S
FHR#
```

Following are the FHR device configurations:

```
FHR# configure terminal
FHR(config)# ipv6 multicast-routing
FHR(config)#
FHR(config)# interface ethernet 1/1/27:1
FHR(conf-if-eth1/1/27:1)# no switchport
FHR(conf-if-eth1/1/27:1)# ipv6 address 20:1::1/64
FHR(conf-if-eth1/1/27:1)# ipv6 pim sparse-mode
FHR(conf-if-eth1/1/27:1)# exit

FHR(config)#
FHR(config)# interface ethernet 1/1/18:1
FHR(conf-if-eth1/1/18:1)# no switchport
FHR(conf-if-eth1/1/18:1)# ipv6 address 50:1::1/64
FHR(conf-if-eth1/1/18:1)# ipv6 pim sparse-mode
FHR(conf-if-eth1/1/18:1)# end
FHR#
```

Following are the RP device configurations:

```
RP# configure terminal
RP(config)# ipv6 multicast-routing
RP(config)#
RP(config)# interface ethernet 1/1/27:1
RP(conf-if-eth1/1/27:1)# no switchport
RP(conf-if-eth1/1/27:1)# ipv6 address 20:1::2/64
RP(conf-if-eth1/1/27:1)# ipv6 pim sparse-mode
RP(conf-if-eth1/1/27:1)# exit

RP(config)# interface ethernet 1/1/26:1
RP(conf-if-eth1/1/26:1)# no switchport
RP(conf-if-eth1/1/26:1)# ipv6 address 21:1::2/64
RP(conf-if-eth1/1/26:1)# ipv6 pim sparse-mode
RP(conf-if-eth1/1/26:1)# exit
RP#
```

Following are LHR device configurations:

```
LHR# configure terminal
LHR(config)# ipv6 multicast-routing
LHR(config)# interface ethernet 1/1/26:1
LHR(conf-if-eth1/1/26:1)# no switchport
LHR(conf-if-eth1/1/26:1)# ipv6 address 21:1::1/64
LHR(conf-if-eth1/1/26:1)# ipv6 pim sparse-mode
LHR(conf-if-eth1/1/26:1)# exit

LHR(config)# interface ethernet 1/1/27:1
LHR(conf-if-eth1/1/27:1)# no switchport
LHR(conf-if-eth1/1/27:1)# ipv6 address 61:1::1/64
LHR(conf-if-eth1/1/27:1)# ipv6 pim sparse-mode
LHR(conf-if-eth1/1/27:1)# end
LHR#
```

Configure static RP address on the loopback interface

Configure static RP on FHR, RP, and LHR nodes.

```
FHR# show ipv6 pim rp mapping

Group(s) : ff00::/8, Static
RP : 11:1:1::1, v2
FHR#
```

Following are the RP device configurations:

```
RP(config)# interface loopback 0
RP(conf-if-lo-0)# ip address 1.1.1.1/32
RP(conf-if-lo-0)# ipv6 address 11:1:1::1/128
RP(conf-if-lo-0)# ipv6 ospf 1 area 0
RP(conf-if-lo-0)# exit
RP(config)# ipv6 pim rp-address 11:1:1::1 group-address ff00::/8
RP(config)#
```

Following are the LHR device configurations:

```
LHR# configure terminal
LHR(config)# ipv6 pim rp-address 11:1:1::1 group-address ff00::/8
LHR(config)#
```

Following are the FHR device configurations:

```
FHR# configure terminal
FHR(config)# ipv6 pim rp-address 11:1:1::1 group-address ff00::/8
FHR(config)#
```

Configure unicast IPv6 route reachability using OSPFv3 for the static RP and multicast source addresses

Configure OSPFv3 for IPv6 unicast route reachability and configure multicast sources on FHR and host-connected interfaces on LHR device.

Following are the FHR device configurations:

```
FHR# configure terminal
FHR(config)# interface ethernet 1/1/27:1
FHR(conf-if-eth1/1/27:1)# ipv6 ospf 1 area 0
FHR(conf-if-eth1/1/27:1)# exit
FHR#(config)# router ospfv3 1
FHR(config-router-ospfv3-1)# end
FHR#
FHR# configure terminal
FHR(config)# interface ethernet 1/1/18:1
FHR(conf-if-eth1/1/18:1)# ipv6 ospf 1 area 0
FHR(conf-if-eth1/1/18:1)# exit
FHR(config)# end
FHR#
```

Following are the RP device configurations:

```
RP# configure terminal
RP(config)# interface ethernet 1/1/27:1
RP(conf-if-eth1/1/27:1)# ipv6 ospf 1 area 0
RP(conf-if-eth1/1/27:1)# exit
RP#(config)# router ospfv3 1
RP(config-router-ospfv3-1)# end
RP#
RP# configure terminal
RP(config)# interface ethernet 1/1/26:1
RP(conf-if-eth1/1/26:1)# ipv6 ospf 1 area 0
RP(conf-if-eth1/1/26:1)# exit
```

```
RP(config)# end
RP#
```

Following are the LHR device configurations:

```
LHR# configure terminal
LHR(config)# interface ethernet 1/1/26:1
LHR(conf-if-eth1/1/26:1)# ipv6 ospf 1 area 0
LHR(conf-if-eth1/1/26:1)# exit
LHR#(config)# router ospfv3 1
LHR(config-router-ospfv3-1)# end
LHR#
LHR# configure terminal
LHR(config)# interface ethernet 1/1/27:1
LHR(conf-if-eth1/1/27:1)# ipv6 ospf 1 area 0
LHR(conf-if-eth1/1/27:1)# exit
LHR(config)# end
LHR#
```

Learn MLDv1 groups and multicast streams and verify RPT and SPT paths

Verify MLD group members, IPv6 PIM RPT and SPT entries.

Display the LHR device entries:

```
LHR#show ipv6 mld groups

Layer 3 IPv6 Multicast commands

clear ipv6 mld groups

Deletes MLD group cache entries.

Syntax `clear ipv6 mld [vrf vrf-name] groups`

Parameters `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to clear MLD group cache entries.

NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# clear ipv6 mld groups
```

Supported Releases 10.5.4.0 or later

clear ipv6 pim tib

Deletes PIM tree information from the PIM database.

Syntax `clear ipv6 pim [vrf vrf-name] tib group-address`

Parameters

- `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to clear PIM tree entries.

  NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.
- *group-address*—Enter the group address.

Default None

Command Mode EXEC

Usage Information If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. Local VLT node sends delete requests to locally learned routes. Both local and synced routes are removed from the local VLT node

multicast route table. The peer VLT node clears synced routes from the node. If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.

Example

```
OS10# clear ipv6 pim tib
```

Supported Releases 10.5.4.0 or later

ipv6 mld immediate-leave

Enables MLD immediate-leave.

Syntax `ipv6 mld immediate-leave`

Parameters None.

Default Disabled.

Command Mode INTERFACE CONFIGURATION

Usage Information When you enable MLD immediate-leave, the switch immediately removes a port from a multicast group when it detects an MLD Done message on that port. Use the immediate-leave option only when there is a single receiver present on every port in the VLAN. When there are multiple clients for a multicast group on the same port, you must not enable immediate-leave in a VLAN. Use the `no ipv6 mld immediate-leave` command to remove this configuration.

Example

```
OS10(conf-if-vl-2001)# ipv6 mld immediate-leave
```

Supported Releases 10.5.4.0 or later

ipv6 mld last-member-query-interval

Configures MLD last member query interval.

Syntax `ipv6 mld last-member-query-interval` *`interval-in-milliseconds`*

Parameters `last-member-query-interval` *`interval-in-milliseconds`*—Enter the last member query time interval value in milliseconds. The range is from100 to 65535.

Default 1000 milliseconds

Command Mode INTERFACE CONFIGURATION

Usage Information Use the `no ipv6 mld last-member-query-interval` command to remove this configuration.

Example

```
OS10(conf-if-vl-2001)# ipv6 mld last-member-query-interval 600
```

Supported Releases 10.5.4.0 or later

ipv6 mld query-interval

Configures MLD host query interval.

Syntax `ipv6 mld query-interval` *`query-interval-in-milliseconds`*

Parameters `query-interval` *`query-interval-in-milliseconds`*—Enter the host query time interval value in milliseconds. The range is from 2 to 18000.

Default 60 milliseconds

Command Mode	INTERFACE CONFIGURATION
Usage Information	Use the `no ipv6 mld query-interval` command to remove this configuration.
Example	`OS10(conf-if-vl-2001)# ipv6 mld query-interval 70`
Supported Releases	10.5.4.0 or later

ipv6 mld query-max-resp-time

Configures the MLD max query response value.

Syntax	`ipv6 mld query-max-resp-time` *query-response-value-in-seconds*
Parameters	`query-max-resp-time` *query-response-value-in-seconds*—Enter the maximum query response time interval value in seconds. The range is from1 to 25.
Default	10 seconds
Command Mode	INTERFACE CONFIGURATION
Usage Information	Use the `no ipv6 mld query-max-resp-time` command to remove the configuration.
Example	`OS10(conf-if-vl-2001)# ipv6 mld query-max-resp-time 11`
Supported Releases	10.5.4.0 or later

ipv6 multicast-routing

Enables IPv6 multicast forwarding.

Syntax	`ipv6 multicast-routing [vrf` *vrf-name*`]`
Parameters	• `vrf` *vrf-name*—Enter the keyword vrf followed by the name of the VRF to enable global ipv6 multicast routing on VRFs.
Default	Disabled.
Command Mode	CONFIGURATION
Usage Information	Use the `no ipv6 multicast-routing [vrf` *vrf-name*`]` command to disable IPv6 multicast forwarding.
Example	`OS10(config)# ipv6 multicast-routing`
Supported Releases	10.5.4.0 or later

ipv6 pim dr-priority

Enables the PIM sparse-mode operation.

Changes the designated router (DR) priority of the interface.

Syntax	`ipv6 pim dr-priority` *priority-value*
Parameters	`dr-priority` *priority-value*—Enter a priority number. Larger numbers are given preference over smaller numbers. The range is from 0 to 4294967295.
Default	1

Command Mode	INTERFACE CONFIGURATION
Usage Information	This command allows you to specify the DR priority of each interface on the LAN segment so that the interface with the highest priority is elected as the PIM DR. If all devices on the LAN segment have the same priority, and then the PIM device with the highest IPv6 address becomes the DR. Use the `no ipv6 pim dr-priority priority-value` command to remove this configuration.
Example	`OS10(conf-if-vl-2001)# ipv6 pim dr-priority 100`
Supported Releases	10.5.4.0 or later

ipv6 pim query-interval

Changes the frequency of the PIM router query messages.

Syntax	`ipv6 pim query-interval interval-in-seconds`
Parameters	• `query-interval interval-in-seconds`—Enter the time interval in seconds between router query messages. The range is from 2 to 18000.
Default	30.
Command Mode	INTERFACE CONFIGURATION
Usage Information	Use this command to control the transmission frequency of a PIM hello packet on a PIM enabled interface. Use the `no query-interval interval-in-seconds` command to remove this configuration.
Example	`dut(conf-if-vl-2001)# ipv6 pim query-interval 100`
Supported Releases	10.5.4.0 or later

ipv6 pim rp-address

Configures a static PIM rendezvous point (RP) address for the IPv6 address family.

Syntax	`ipv6 pim [vrf vrf-name] rp-address ipv6-address {group-address group-mask}`
Parameters	• `vrf vrf-name`—Enter the keyword vrf followed by the name of the VRF to configure static RP for a nondefault VRF. • `rp-address ipv6-address`—Enter the IPv6 address of the rendezvous-point for the group. • `group-address group-mask`—Enter the mask IPv6 address corresponding to the group.
Default	None.
Command Mode	CONFIGURATION
Usage Information	Use the `no ipv6 pim [vrf vrf-name] rp-address ipv6-address {group-address group-mask}` command to remove the static RP address configuration for the IPv6 address family.
Example	`OS10(config)# ipv6 pim rp-address 1234::1 group-address fffe:ffff:225::/64`
Supported Releases	10.5.4.0 or later

ipv6 pim sparse-mode

Enables the PIM sparse-mode operation.

Syntax	`ipv6 pim sparse-mode`
Parameters	None.
Default	Disabled.
Command Mode	INTERFACE CONFIGURATION
Usage Information	Use the `no ipv6 pim sparse-mode` command to remove this configuration.
Example	`OS10(conf-if-vl-2001)# ipv6 pim sparse-mode`
Supported Releases	10.5.4.0 or later

ipv6 pim sparse-mode sg-expiry-timer

Enables expiry timers globally for all sources. This is a PIM-SM specific configuration.

Syntax	`ipv6 pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds`
Parameters	• `vrf vrf-name`—Enter the keyword vrf followed by the name of the VRF to apply this configuration to a specific VRF if input is provided. • `sg-expiry-timer seconds`—Enter the expiry interval in seconds. The range is from 211 to 65535.
Default	210 seconds.
Command Mode	CONFIGURATION
Usage Information	Use the `no ipv6 pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds` command to disable the expiry timers globally for all sources.
Example	`OS10(config)# ipv6 pim sparse-mode sg-expiry-timer 300`
Supported Releases	10.5.4.0 or later

ipv6 pim ssm-range

Configures the SSM group range using an access list.

Syntax	`ipv6 pim [vrf vrf-name] ssm-range access-list-string`
Parameters	• `vrf vrf-name`—Enter the keyword vrf followed by the name of the VRF to apply this configuration to a specific VRF if input is provided. • `ssm-range access-list-string`—Enter the SSM group range access list string.
Default	The default SSM group range is ff3x::/32.
Command Mode	CONFIGURATION
Usage Information	Use the `no ipv6 pim [vrf vrf-name] ssm-range access-list string` command to remove this configuration.
Example	`OS10(config)# ipv6 pim ssm-range access-list-ssm`
Supported Releases	10.5.4.0 or later

show control-plane info

Displays MLD and IPv6 multicast data queue settings in addition to the control-plane information.

Syntax `show control-plane info`

Parameters None

Default None

Command Mode EXEC

Usage Information

NOTE: SmartFabric OS10 creates separate COPP queues for IPv6 control packets. The queue group corresponding to MLD control-plane is 27. Before upgrading to the SmartFabric OS10 10.5.4.0 release, if you have modified the MLD queue rate limit from the default value, you must manually configure the COPP queue limit to 27 after the upgrade is completed.

Example

```
OS10# show control-plane info
Queue  Min Rate Limit(in pps) Max Rate Limit(in pps) Protocols
0      600                    600                   ISCSI UNKNOWN
UNICAST
1      1000                   1000                  OPEN_FLOW SFLOW
2      400                    400                   IGMP PIM
3      600                    1000                  VLT NDS
4      500                    1000                  IPV6_ICMP IPV4_ICMP
5      500                    1000                  ICMPV6_RS ICMPV6_NS
ICMPV6_RA ICMPV6_NA
6      500                    1000                  ARP_REQ
SERVICEABILITY
7      500                    1000                  ARP_RESP
8      500                    500                   SSH TELNET TACACS
NTP FTP
9      600                    600                   FCOE
10     600                    1000                  LACP
11     400                    400                   RSTP PVST MSTP
12     500                    500                   DOT1X LLDP FEFD
13     600                    1000                  IPV6_OSPF IPV4_OSPF
14     600                    1000                  OSPF_HELLO
15     600                    1000                  BGP
16     500                    500                   IPV6_DHCP IPV4_DHCP
17     600                    1000                  VRRP
18     700                    700                   BFD
19     1400                   2000                  REMOTE CPS
20     300                    300                   MCAST DATA
21     100                    100                   ACL LOGGING
22     300                    300                   MCAST KNOWN DATA
23     1400                   4000                  PTP
24     100                    100                   PORT_SECURITY
25     300                    300                   MCAST V6 KNOWN DATA
26     300                    300                   MCAST V6 UNKNOWN
DATA
27     400                    400                   MLD PIMV6
```

Supported Releases 10.5.4.0 or later

show ipv6 mld groups

Displays MLD group membership information.

Syntax `show ipv6 mld [vrf vrf-name] groups {detail | [interface-name detail] | [group-address detail]}`

Parameters

- `vrf vrf-name`—Enter the keyword vrf followed by the name of the VRF to display MLD group membership information corresponding to that nondefault VRF.
- `interface [interface-name]`—Specify the interface type.
- `group-address`—Enter the IPv6 group multicast address.

- `detail`—Enter this keyword to display detailed information.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 mld groups
Total Number of Groups: 1
MLD Connected Group Membership
Group Address Interface Mode Uptime Expires Last Reporter
fffe:ffff:225:1::1 vlan2001 Exclude 01:22:34 00:02:03 ::
```

Supported Releases 10.5.4.0 or later

show ipv6 mld interface

Displays MLD interface information.

Syntax `show ipv6 mld [vrf vrf-name] interface interface-name`

Parameters

- `vrf vrf-name`—Enter the keyword vrf followed by the name of the VRF to display MLD interface information corresponding to that nondefault VRF.
- `interface interface-name`—Specify the interface type.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 mld interface
Vlan2001 is up, line protocol is up
Internet address is 20:1:1::1
MLD is enabled on interface
MLD version is 2
MLD query interval is 60 seconds
MLD querier timeout is 130 seconds
MLD last member query response interval is 1000 ms
MLD max response time is 10 seconds
MLD immediate-leave is enabled on this interface
MLD joins count: 1
MLD querying router is 20:1:1::1
```

Supported Releases 10.5.4.0 or later

show ipv6 pim interface

Displays the PIM interface information.

Syntax `show ipv6 pim vrf [vrf-name] interface`

Parameters `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display PIM interface information corresponding to that nondefault VRF.

NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 pim interface
Address Interface Ver/Mode Nbr Count Query Intvl DR Prio DR
--------------------------------------------------------------------------
fe80::3617:ebff:fe1f:6b82 vlan1001 v2/S 1 30 1 fe80::4e76:25ff:fee5:6744
```

Supported Releases 10.5.4.0 or later

show ipv6 pim mcache

Displays the PIM multicast-routing table information.

Syntax `show ipv6 pim [vrf vrf-name] mcache [group-address [source address]] [vlt]`

Parameters

- `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display PIM multicast-routing table information corresponding to that nondefault VRF.

  NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.
- `group-address [source address]`—Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.
- `vlt`—Enter this keyword vlt to display multicast routes with a spanned incoming interface.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 pim mcache

PIM Multicast Routing Cache Table

(21::10, fffe:225:1:1::1)

  Incoming interface : vlan22

  Outgoing interface list :

     ethernet1/1/31:2
```

Supported Releases 10.5.4.0 or later

show ipv6 pim neighbor

Displays the PIM neighbor information.

Syntax `show ipv6 pim vrf [vrf-name] neighbor`

Parameters `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display PIM neighbor information corresponding to that nondefault VRF.

NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 pim neighbor
Neighbor Address Interface Uptime/Expires Ver DR Priority / Mode
--------------------------------------------------------------------
fe80::4e76:25ff:fee5:6744 vlan1001 05:37:23/00:01:21 v2 1 / S
```

Supported Releases 10.5.4.0 or later

show ipv6 pim rp

Displays PIM Rendezvous Point (RP) information.

Syntax `show ipv6 pim [vrf vrf-name] rp [mapping | group-address]`

Parameters

- `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display PIM RP information corresponding to that nondefault VRF.

  NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.
- `mapping`—Enter this keyword to display group-to-RP mapping information.
- `group-address`—Enter the multicast group address in the x:x:x:x::x format to view RP mappings for a specific group.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 pim rp
Group                      RP
-----------------------------------
fffe:ffff:225:1::1         151:1:1::1
OS10#
OS10# show ipv6 pim rp  mapping

Group(s) : ff04::/16, Static
RP : 2001:192:171::100:1, v2
```

Supported Releases 10.5.4.0 or later

show ipv6 pim ssm-range

Displays the Source Specific Multicast (SSM) configuration.

Syntax `show ipv6 pim [vrf vrf-name] ssm-range`

Parameters `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display SSM configuration information corresponding to that nondefault VRF.

NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10(config)# do show ipv6 pim ssm-range
Group Address / MaskLen

FFFE::225:1:1::0 / 64
```

Supported Releases	10.5.4.0 or later

show ipv6 pim summary

Displays PIM summary information.

Syntax `show ipv6 pim [vrf vrf-name] [summary]`

Parameters `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display PIM summary information corresponding to that nondefault VRF.

NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 pim summary

Entries in PIM-TIB/MFC: 1/1

Active Modes:
    PIM-SM

Interface summary:
    2 active PIM interfaces
    0 passive PIM interfaces
    1 active PIM neighbor

TIB Summary:
    1/1 (*,G) entries in PIM-TIB/MFC
    0/0 (S,G) entries in PIM-TIB/MFC
    0/0 (S,G,Rpt) entries in PIM-TIB/MFC

    1 RP
    0 sources
    0 Register states

Message Summary:

    0(S,G) synced entries in MFC
    0(S,G,Rpt) synced entries in MFC
```

Supported Releases	10.5.4.0 or later

show ipv6 pim tib

Displays the PIM multicast routing database information.

Syntax

```
show ipv6 pim [vrf vrf-name] tib [group-address [source-address]]
```

Parameters

- `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display PIM multicast-routing information corresponding to that nondefault VRF.

  NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.
- *group-address*—Enter the multicast group address to view RP mappings for a specific group.
- *source-address*—Enter the source address.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10#show ipv6 pim tib

PIM Multicast Routing Table
Flags: S - Sparse, C - Connected, L - Local, P - Pruned,
R - RP-bit set, F - Register Flag, T - SPT-bit set, J - Join SPT,
K - Ack-Pending state
Timers: Uptime/Expires
Interface state: Interface, next-Hop, State/Mode

(*, fffe:ffff:225:1:1::), uptime 00:01:27, expires 00:00:00, RP
151:1:1::1, flags: SCJ
  Incoming interface: Ethernet 1/1/1, RPF neighbor
fe80::3617:ebff:fe1f:6b82
  Outgoing interface list:
    Ethernet 1/1/12  Forward/Sparse   00:01:27/Never
```

Supported Releases 10.5.4.0 or later

show ipv6 rpf

Displays the RFP table information.

Syntax

```
show ipv6 [vrf vrf-name] rpf network-address [summary]
```

Parameters

- `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display RPF table information corresponding to that nondefault VRF.

  NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.
- `network-address`—Enter this keyword to display network address information.
- `summary`—Enter this keyword to display summary of RPF routes.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 rpf
RPF information for 151:1:1::1
    RPF interface: vlan1002
    RPF neighbor: 2:2:2::2
    RPF route/mask: 151:1:1::/ffff:ffff:ffff:ffff::
    RPF type: Unicast

OS10# show ipv6 rpf summary
```

```
RPF Lookup Table
Total 1 route(s)
```

Supported Releases 10.5.4.0 or later

show running-configuration mld

Displays current operating MLD configurations.

Syntax `show running-configuration mld`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show running-configuration mld
!
interface vlan2001
ipv6 mld immediate-leave
```

Supported Releases 10.5.4.0 or later

show running-configuration pim6

Displays currently operational IPv6 PIM configurations.

Syntax `show running-configuration pim6`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show running-configuration pim6
!
ipv6 multicast-routing
!
interface vlan1001
ipv6 pim sparse-mode
!
interface vlan2001
ipv6 pim sparse-mode
!
```

Supported Releases 10.5.4.0 or later

show vlt inconsistency ipv6 mcache

Displays mcache inconsistent routes.

Syntax `show vlt inconsistency ipv6 mcache vrf [vrf-name]`

Parameters

- `vrf [vrf-name]`—Enter the keyword vrf followed by the name of the VRF to display mcache inconsistent routes corresponding to that VRF.

  NOTE: Applies to specific VRF instance if input is provided, else applies to the default VRF.
- *group-address*—Enter the group address.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show vlt inconsistency ipv6 mcache

Spanned Multicast Routing IIF Inconsistency
Multicast Route                       LocalIIF          PeerIIF
(::, fffe:225:1:1::1)                 vlan12            vlan10
(16:0:0::10, fffe:225:1:1::1)         vlan12            vlan10
```

Supported Releases 10.5.4.0 or later

show vlt mismatch

Displays information that enables an administrator to identify configuration mismatches corresponding to the Layer3 multicast commands on the VLT nodes.

Syntax `show vlt vlt-id mismatch [pim]`

Parameters

- `vlt [vlt-id]`—Enter the VLT domain ID.
- *[pim]*—Displays PIM mismatch in VLT peers.

Default None

Command Mode EXEC

Usage Information You can use this command to identify the configuration mismatches corresponding to the following Layer 3 multicast commands on the VLT nodes:

- Presence of global IPv6 multicast-routing enable or disable configuration.
- Presence of PIM sparse mode per interface level enable or disable configuration.
- Presence of PIM SSM range configuration.
- Presence of PIM join, neighbor, and register filter configurations.
- Presence of anycast RP configuration.

Supported Releases 10.5.4.0 or later

IPv4 multicast traffic reduction

IGMP snooping

IGMP snooping uses the information in IGMP packets to generate a forwarding table that associates ports with multicast groups. When switches receive multicast frames, they forward them to their intended receivers. OS10 supports IGMP snooping on virtual local area network (VLAN) interfaces.

Effective with OS10 release 10.4.3.0, IGMP snooping is enabled by default.

NOTE: OS10 supports IGMP snooping only with proxy reporting. OS10 does not relay the IGMP join packets received from hosts as is. Instead, OS10 generates, bundles, and sends IGMP join packets to mrouter port based on the version of IGMP queries received from IGMP routers. Proxy reporting reduces the number of IGMP control packets sent to the multicast router.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

If you configure and unconfigure a static connection to a multicast router on an interface using the ip igmp snooping mrouter interface command in VLAN mode, the router port still appears in the show ip igmp snooping mrouter vlan output. To remove the VLAN port from the show output, configure the VLAN port again using the `ip igmp snooping mrouter interface` command, and then unconfigure it using the no version of the command.

Configure IGMP snooping

- Enable IGMP snooping globally using the `ip igmp snooping enable` command in CONFIGURATION mode. This command enables IGMP snooping on all VLAN interfaces.

  NOTE: You cannot enable IGMP or MLD snooping when configuring VLAN scale profile. If you enable VLAN scale profile, OS10 disables IGMP and MLD snooping globally. When you disable VLAN scale profile configuration, you must explicitly enable IGMP and MLD snooping globally.
- (Optional) Disable IGMP snooping on specific VLAN interfaces using the `no ip igmp snooping` command in VLAN INTERFACE mode.
- (Optional) Multicast flood control is enabled by default. To disable the multicast flood restrict feature, use the `no multicast snooping flood-restrict` command in CONFIGURATION mode. To reenable the feature globally, use the `multicast snooping flood-restrict` command in CONFIGURATION mode.
- In a network, the snooping switch is connected to a multicast Router that sends IGMP queries. On a Layer 2 network that does not have a multicast router, you can configure the snooping switch to act as querier. Use the `ip igmp snooping querier` command in VLAN INTERFACE mode to send the queries.
- OS10 learns the multicast router interface dynamically based on the interface on which IGMP membership query is received. To assign a multicast router interface statically, use the `ip igmp snooping mrouter interface` *`interface-type`* command in VLAN INTERFACE mode.

  NOTE:

  IGMP snooping dynamically detects the mrouter interface based on IGMP queries that it receives. If there are more than one multicast routers connected to the snooping switch, one of them will send IGMP queries and the interface connected to that router is dynamically learnt as an mrouter port. You must configure the interfaces connected to other multicast routers as static mrouter port.
- (Optional) Configure the IGMP version using the `ip igmp version` *`version-number`* command in VLAN INTERFACE mode.
- (Optional) The fast leave option allows the IGMP snooping switch to remove an interface from the multicast group immediately on receiving the *leave* message. Enable fast leave with the `ip igmp snooping fast-leave` command in VLAN INTERFACE mode.
- (Optional) Configure the time interval for sending IGMP general queries with the `ip igmp snooping query-interval` *`query-interval-time`* command in VLAN INTERFACE mode.
- (Optional) Configure the maximum time for responding to a query advertised in IGMP queries using the `ip igmp snooping query-max-resp-time` *`query-response-time`* command in VLAN INTERFACE mode.
- (Optional) Configures the time interval between group-specific IGMP query messages with the `ip igmp snooping last-member-query-interval` *`query-interval-time`* command in VLAN INTERFACE mode.

IGMP snooping configuration

```
OS10(config)# ip igmp snooping enable
OS10(config)# interface vlan 100
OS10(conf-if-vl-100)# ip igmp snooping mrouter interface ethernet 1/1/32
OS10(conf-if-vl-100)# ip igmp snooping querier
OS10(conf-if-vl-100)# ip igmp version 3
OS10(conf-if-vl-100)# ip igmp snooping fast-leave
OS10(conf-if-vl-100)# ip igmp snooping query-interval 60
OS10(conf-if-vl-100)# ip igmp snooping query-max-resp-time 10
OS10(conf-if-vl-100)# ip igmp snooping last-member-query-interval 1000
```

Unknown multicast flood control

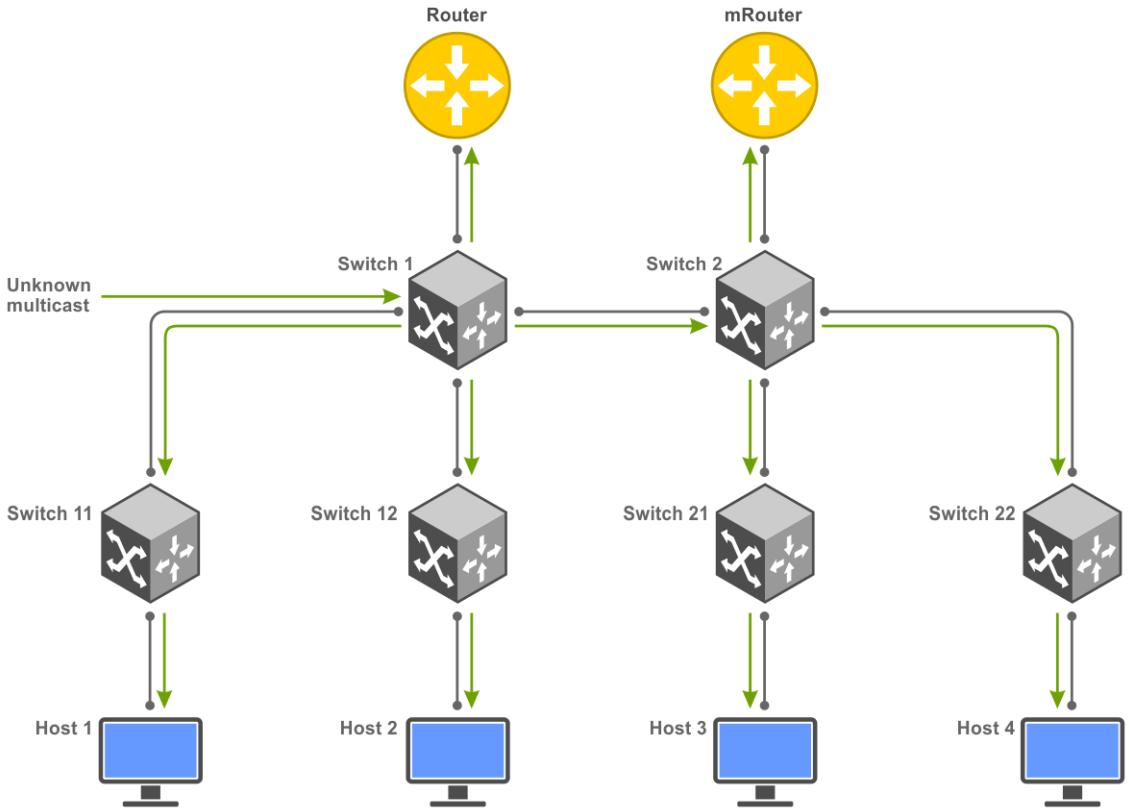
The unknown multicast flood control feature enables the system to forward unknown multicast packets only to a multicast router (mrouter).

When you enable multicast snooping, OS10 forwards multicast frames, whose destination is already learned, to their intended recipients. When the system receives multicast frames whose destination is not known, it floods the frames for all ports on the specific VLAN. All hosts that receive these multicast frames must process them. With multicast flood control, the system forwards unknown multicast frames only to the interface that leads to the mrouter. The mrouter can then forward the traffic to the intended destinations.

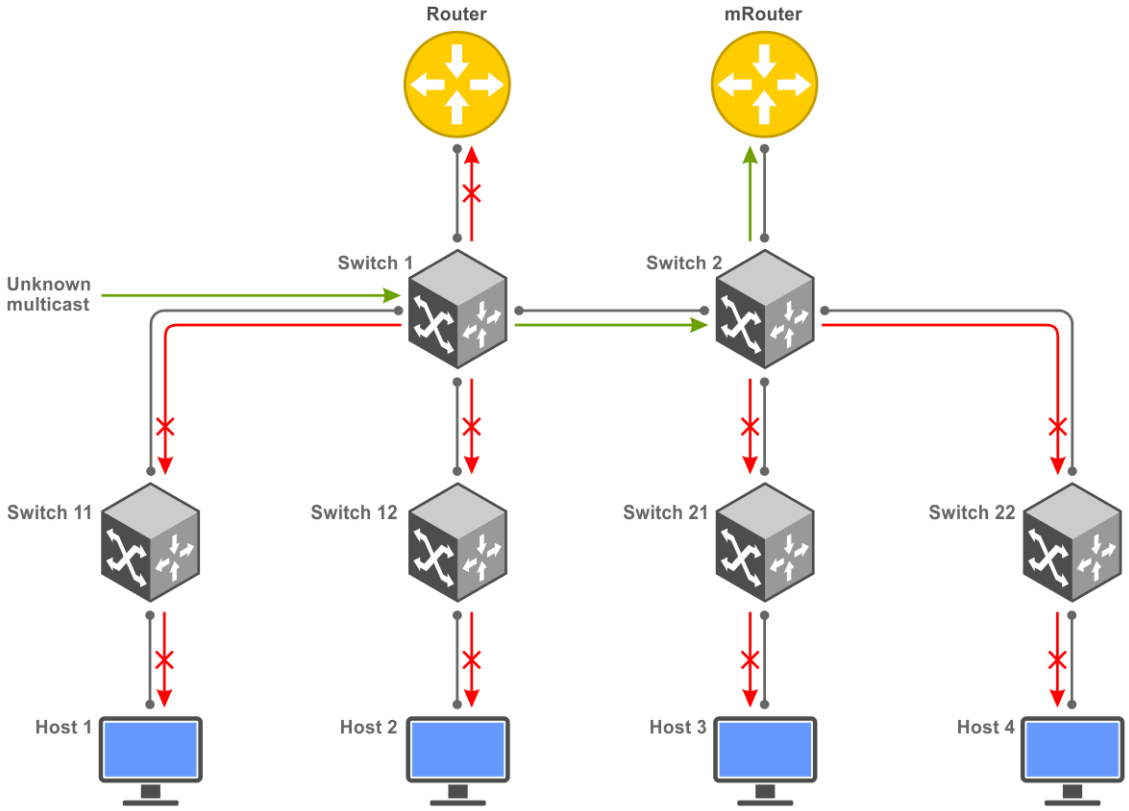
For multicast flood control to work, you must enable both IGMP and MLD snooping on the system. By default, multicast flood control, IGMP snooping, and MLD snooping are enabled.

NOTE: The Multicast flood control feature is not supported on the S4248FB-ON and S4248FBL-ON switches.

The following describes a scenario where a multicast frame is flooded on all ports of all switches. The switches and hosts in the network need not receive these frames because they are not the intended destinations.



With multicast flood control, multicast frames, whose destination is not known, are forwarded only to the designated mrouter port. OS10 learns of the mrouter interface dynamically based on the interface where an IGMP membership query is received. You can also statically configure the mrouter interface using the `ip igmp snooping mrouter` and `ipv6 mld snooping mrouter` commands.



Enable multicast flood control

Multicast flood control is enabled on OS10 by default. If it is disabled, use the following procedure to enable multicast flood control:

1. Configure IGMP snooping. To know how to configure IGMP snooping, see the IGMP snooping section.
2. Configure MLD snooping. To know how to configure MLD snooping, see the MLD Snooping section.
3. Enable the multicast flood control feature.

```
OS10(config)# multicast snooping flood-restrict
```

4. Verify the configuration.

```
OS10# show ip igmp snooping interface
Vlan11 is up, line protocol is up
IGMP version is 3
IGMP snooping is enabled on interface
IGMP snooping query interval is 60 seconds
IGMP snooping querier timeout is 130 seconds
IGMP snooping last member query response interval is 1000 ms
IGMP Snooping max response time is 10 seconds
IGMP snooping fast-leave is disabled on this interface
IGMP snooping querier is disabled on this interface
Multicast snooping flood-restrict is enabled on this interface
```

Multicast flood control commands

multicast snooping flood-restrict

Enables multicast snooping flood control for IGMP snooping and MLD snooping.

Syntax	`multicast snooping flood-restrict` The `no` version of this command disables multicast flood control.
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	Multicast snooping flood control, IGMP snooping, and MLD snooping are enabled by default. For multicast flood restrict to be effective on a VLAN, IGMP snooping and MLD snooping must be enabled at both global and VLAN levels. To disable multicast snooping flood control, use the `no multicast snooping flood-restrict` command.
Example	`OS10(config)# multicast snooping flood-restrict`
Supported Releases	10.4.3.0 or later

Multicast snooping on VLANs

OS10 supports multicast snooping (IGMP and MLD snooping) on all the supported platforms in the Full Switch Mode and the SmartFabric Services Mode. Starting from Release 10.5.2.1 and later releases:

- OS10 supports multicast snooping with VLAN scale profile configuration. However, this support is not available on the S4200-ON series switches.
- To enable the snooping querier functionality on scaled VLANs, you must use the `mode l3` command.
- With scale profile VLAN configuration, multicast snooping is enabled only at the global level and disabled at the per VLAN interface level.
- Multicast snooping is supported on a maximum of 512 VLANs or 1024 instances (IGMP snooping on 512 VLANs and MLD snooping on 512 VLANs). If there are more than 1024 instances, multicast snooping is disabled on the remaining VLANs. A syslog message similar to the following appears:

  ```
  IGMP/MLD Snooping instance limit exceeded. IGMP/MLD snooping would not be enabled on further vlans.
  ```

  When the number of configured VLAN instances goes below 1024, a syslog message similar to the following appears:

  ```
  IGMP/MLD Snooping instance limit receded.IGMP/MLD snooping can be enabled on some vlans.
  ```

Upgrade from an earlier release to Release 10.5.2.1 introduces the following changes. The following table indicates the multicast snooping configuration setting at the global level and at the per VLAN interface level pre and post upgrade.

Table 66. Full Switch Mode

Scale profile VLAN configuration	Upgrade from 10.5.0.x or earlier to 10.5.2.1 or later		Upgrade from 10.5.1.0 to 10.5.2.1 or later		Restrictions
Disabled	**Pre Upgrade**	**Post Upgrade**	**Pre Upgrade**	**Post Upgrade**	OS10 supports multicast

Table 66. Full Switch Mode (continued)

Scale profile VLAN configuration	Upgrade from 10.5.0.x or earlier to 10.5.2.1 or later		Upgrade from 10.5.1.0 to 10.5.2.1 or later		Restrictions
	• Global: Enabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Enabled until the maximum number of VLAN instances (1024) is reached and disabled for the remaining VLANs.	snooping only on up to a maximum of 1024 VLAN instances. If the number of VLAN instances exceed 1024, multicast snooping is disabled.
Enabled	• Global: Disabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Disabled **NOTE:** Multicast snooping is disabled at the per VLAN interface level and enabled globally.	• Global: Disabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Disabled **NOTE:** Multicast snooping is disabled at the per VLAN interface level and enabled globally.	

Table 67. SmartFabric Services Mode

Scale profile VLAN configuration	Upgrade from 10.5.0.x or earlier to 10.5.2.1 or later		Upgrade from 10.5.1.0 to 10.5.2.1 or later		Restrictions
Disabled	**Pre Upgrade**	**Post Upgrade**	**Pre Upgrade**	**Post Upgrade**	OS10 supports multicast snooping only on up to a maximum of 1024 VLAN instances. If the number of VLAN instances exceed 1024, multicast snooping is disabled.
	• Global: Disabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Enabled	• Global: Disabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Enabled **NOTE:** Multicast snooping configuration is enabled at the global as well.	
Enabled	• Global: Disabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Disabled **NOTE:** Multicast snooping is disabled at the per VLAN interface level and enabled globally.	• Global: Disabled • Per VLAN: Enabled	• Global: Enabled • Per VLAN: Disabled **NOTE:** Multicast snooping is disabled at the per VLAN interface level and enabled globally.	

Use the show ip igmp snooping summary and show ipv6 mld snooping summary commands to view the number of multicast snooping-enabled interfaces.

IPv6 multicast traffic reduction

Multicast Listener Discovery Protocol

IPv6 networks use Multicast Listener Discovery (MLD) Protocol to manage multicast groups.

OS10 supports MLDv1and MLDv2 to manage the multicast group memberships on IPv6 networks.

MLD snooping

MLD snooping enables switches to use the information in MLD packets and generate a forwarding table that associates ports with multicast groups. When switches receive multicast frames, they forward them to their intended receivers.

OS10 supports MLD snooping on VLAN interfaces. Effective with OS10 release 10.4.3.0, MLD snooping is enabled by default.

Configure MLD snooping

- Enable MLD snooping globally with the `ipv6 mld snooping enable` command in the CONFIGURATION mode. This command enables both MLDv2 and MLDv1 snooping on all VLAN interfaces.
- (Optional) You can disable MLD snooping on specific VLAN interfaces using the `no ipv6 mld snooping` command in the VLAN INTERFACE mode.
- (Optional) Multicast flood control is enabled by default. To disable the multicast flood restrict feature, use the `no multicast snooping flood-restrict` command in CONFIGURATION mode. To reenable the feature globally, use the `ip igmp snooping enable` command in CONFIGURATION mode.
- In a network, the snooping switch is connected to a multicast Router that sends MLD queries. On a Layer 2 network that does not have a multicast router, you can configure the snooping switch to act as querier. Use the `ipv6 mld snooping querier` command in the VLAN INTERFACE mode to send the queries.
- OS10 learns the multicast router interface dynamically based on the interface on which MLD membership query is received. To assign a multicast router interface statically, use the `ipv6 mld snooping mrouter interface` *`interface–type`* command in VLAN INTERFACE mode.
- (Optional) Configure the MLD version using the `ipv6 mld version` *`version-number`* command in the VLAN INTERFACE mode.
- (Optional) The fast leave option allows the MLD snooping switch to remove an interface from the multicast group immediately on receiving the leave message. Enable fast leave with the `ipv6 mld snooping fast-leave` command in VLAN INTERFACE mode.
- (Optional) Configure the time interval for sending MLD general queries with the `ipv6 mld snooping query-interval` *`query-interval-time`* command in VLAN INTERFACE mode.
- (Optional) Configure the maximum time for responding to a query advertised in MLD queries using the `ipv6 mld snooping query-max-resp-time` *`query-response-time`* command in VLAN INTERFACE mode.
- (Optional) Configures the time interval between group-specific MLD query messages with the `ipv6 mld snooping last-member-query-interval` *`query-interval-time`* command in VLAN INTERFACE mode.

MLD snooping configuration

```
OS10(config)# ipv6 mld snooping enable
OS10(config)# interface vlan 11
OS10(conf-if-vl-11)# ipv6 mld snooping mrouter interface ethernet 1/1/32
OS10(conf-if-vl-11)# ipv6 mld snooping querier
OS10(conf-if-vl-11)# ipv6 mld version 1
OS10(conf-if-vl-11)# ipv6 mld snooping fast-leave
OS10(conf-if-vl-11)# ipv6 mld snooping query-interval 60
OS10(conf-if-vl-11)# ipv6 mld snooping query-max-resp-time 10
OS10(conf-if-vl-11)# ipv6 mld snooping last-member-query-interval 1000
```

MLD snooping commands

ipv6 mld snooping

Enables MLD snooping on the specified VLAN interface.

Syntax `ipv6 mld snooping`

Parameters	None
Default	Enabled
Command Mode	VLAN INTERFACE
Usage Information	When you enable MLD snooping globally, the configuration is applied to all the VLAN interfaces. You can disable the MLD snooping on specified VLAN interfaces. The `no` version of this command disables the MLD snooping on the specified VLAN interface.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# no ipv6 mld snooping`
Supported Releases	10.4.1.0 or later

ipv6 mld snooping enable

Enables MLD snooping globally.

Syntax	`ipv6 mld snooping enable`
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the MLD snooping.
Example	`OS10(config)# ipv6 mld snooping enable`
Supported Releases	10.4.1.0 or later

ipv6 mld snooping fast-leave

Enables fast leave in MLD snooping for specified VLAN.

Syntax	`ipv6 mld snooping fast-leave`
Parameters	None
Default	Disabled
Command Mode	VLAN INTERFACE
Usage Information	The fast leave option allows the MLD snooping switch to remove an interface from the multicast group immediately on receiving the `leave` message. The `no` version of this command disables the fast leave functionality.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld snooping fast-leave`
Supported Releases	10.4.1.0 or later

ipv6 mld snooping last-member-query-interval

Configures the time interval between group-specific MLD query messages.

Syntax	`ipv6 mld snooping last-member-query-interval` *`query-interval-time`*
Parameters	*`query-interval-time`*—Enter the query time interval in milliseconds, ranging from 100 to 65535.

Default	1000 milliseconds
Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command resets the last member query interval time to the default value.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld snooping last-member-query-interval 2500`
Supported Releases	10.4.1.0 or later

ipv6 mld snooping mrouter

Configures the specified VLAN member port as a multicast router interface.

Syntax	`ipv6 mld snooping mrouter interface` *interface-type*
Parameters	*interface-type*—Enter the interface type details. The interface must be a member of the VLAN. In a PVLAN domain, only the promiscuous port type is supported. Secondary ports are not supported.
Default	Not configured
Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command removes the multicast router configuration from the VLAN member port.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld snooping mrouter interface ethernet 1/1/1`
Supported Releases	10.4.1.0 or later

ipv6 mld snooping querier

Enables MLD querier on the specified VLAN interface.

Syntax	`ipv6 mld snooping querier`
Parameters	None
Default	Not configured
Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command disables the MLD querier on the VLAN interface.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld snooping querier`
Supported Releases	10.4.1.0 or later

ipv6 mld snooping query-interval

Configures the time interval for sending MLD general queries.

Syntax	`ipv6 mld snooping query-interval` *query-interval-time*
Parameters	*query-interval-time*—Enter the interval time in seconds, ranging from 2 to 18000.
Default	60 seconds

Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command resets the query interval to the default value.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld snooping query-interval 120`
Supported Releases	10.4.1.0 or later

ipv6 mld query-max-resp-time

Configures the maximum time for responding to a query advertised in MLD queries.

Syntax	`ipv6 mld snooping query-max-resp-time` *`query-response-time`*
Parameters	*`query-response-time`*—Enter the query response time in seconds, ranging from 1 to 25.
Default	10 seconds
Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command resets the query response time to default value.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld snooping query-max-resp-time 15`
Supported Releases	10.4.1.0 or later

ipv6 mld version

Configures the MLD version.

Syntax	`ipv6 mld version` *`version-number`*
Parameters	*`version-number`*—Enter the version number as 1 or 2.
Default	2
Command Mode	VLAN INTERFACE
Usage Information	The `no` version of this command resets the version number to the default value.
Example	`OS10(config)# interface vlan 100` `OS10(conf-if-vl-100)# ipv6 mld version 1`
Supported Releases	10.4.1.0 or later

show ipv6 mld snooping groups

Displays MLD snooping group membership details.

Syntax	`show ipv6 mld snooping groups [vlan` *`vlan-id`* `| private-vlan` *`pvlan-id`*`] [`*`ipv6-address`*`]`
Parameters	• *`vlan-id`*—(Optional) Enter the VLAN ID, from 1 to 4093. • *`ipv6-address`*—(Optional) Enter the IPv6 address of the multicast group. • *`pvlan-id`*—(Optional) Enter the private VLAN id, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information The `show ipv6 mld snooping groups` command displays the primary VLAN information.

- Use the `private-vlan` keyword to view information about the secondary VLANs.
- Enter a primary VLAN ID to view MLD snooping group membership information learned on that PVLAN domain, including primary and its associated secondary VLANs.
- Enter an isolated or community VLAN ID to view MLD snooping group membership information learned on that isolated or community VLAN.

Example

```
OS10# show ipv6 mld snooping groups
Total Number of Groups: 280
MLD Connected Group Membership
Group Address                 Interface                     Mode
 Expires
ff02::2                       vlan3531                      Exclude
 00:01:38
ff0e:225:1::                  vlan3531                      MLDv1-Compat
 00:01:52
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::1                 vlan3531                      MLDv1-Compat
 00:01:52
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::2                 vlan3531                      MLDv1-Compat

  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
<Output Truncated>
```

Example (with VLAN)

```
OS10# show ipv6 mld snooping groups vlan 3531
Total Number of Groups: 7
MLD Connected Group Membership
Group Address                 Interface           Mode          Expires
ff02::2                       vlan3531            Exclude       00:02:08
ff0e:225:1::                  vlan3531            MLDv1-Compat  00:02:12
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::1                 vlan3531            MLDv1-Compat  00:02:12
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::2                 vlan3531            MLDv1-Compat  00:02:12
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::3                 vlan3531            MLDv1-Compat  00:02:12
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::4                 vlan3531            MLDv1-Compat  00:02:12
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
ff0e:225:1::5                 vlan3531            MLDv1-Compat  00:02:12
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
```

Example (with VLAN and multicast IP address)

```
OS10# show ipv6 mld snooping groups vlan 3531 ff0e:225:1::
MLD Connected Group Membership
Group Address      Interface           Mode          Expires
ff0e:225:1::      vlan3531            MLDv1-Compat  00:01:30
  Member-ports :port-channel41,ethernet1/1/51,ethernet1/1/52
```

Example (with PVLAN)

```
OS10#show ipv6 mld snooping groups private-vlan 100

Flags: P-Primary vlan, I-Isolated vlan, C-Community vlan
Total Number of Groups: 1
MLD Connected Group Membership
Group Address           Interface           Mode                Expires
ff02::2                  vlan100            Include             00:01:37
  Member-ports :
  port-channel11(I-vlan200),port-channel12(C-vlan300),port-channel13(P-
vlan100)
```

Supported Releases 10.4.0E(R1) or later

show ipv6 mld snooping groups detail

Displays the MLD source information along with detailed member port information.

Syntax `show ipv6 mld snooping groups [vlan vlan-id] [group ipv6-address] detail`

Parameters

- *vlan-id*—(Optional) Enter the VLAN ID, from 1 to 4093.
- *ipv6-address*—(Optional) Enter the IPv6 address of the multicast group.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 mld snooping groups detail
Interface      vlan3041
Group          ff02::2
Source List

```

Supported Releases

10.4.1.0 or later

show ipv6 mld snooping interface

Displays the details of MLD snooping interfaces.

Syntax `show ipv6 mld snooping interface [vlan vlan-id]`

Parameters *vlan-id*—(Optional) Enter the VLAN ID, from 1 to 4093. For a PVLAN domain, enter the VLAN ID of the primary VLAN, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information The multicast flood control feature is not available on the S4248FB-ON and S4248FBL-ON devices.

Example

```
OS10# show ipv6 mld snooping interface vlan 3031
Vlan3031 is up, line protocol is up
MLD version is 2
MLD snooping is enabled on interface
MLD snooping query interval is 60 seconds
MLD snooping querier timeout is 130 seconds
MLD snooping last member query response interval is 1000 ms
MLD snooping max response time is 10 seconds
MLD snooping fast-leave is disabled on this interface
MLD snooping querier is disabled on this interface
```

```
OS10# show ipv6 mld snooping interface vlan 2
Vlan2 is up, line protocol is up
MLD version is 2
MLD snooping is enabled on interface
MLD snooping query interval is 60 seconds
MLD snooping querier timeout is 130 seconds
MLD snooping last member query response interval is 1000 ms
MLD snooping max response time is 10 seconds
MLD snooping fast-leave is disabled on this interface
MLD snooping querier is disabled on this interface
Multicast flood-restrict is enabled on this interface
```

Example (with PVLAN)

```
OS10# show ipv6 mld snooping interface vlan 100
Vlan 100 is up, line protocol is up
Isolated VLAN: 200
Community VLANs: 300, 350-355
MLD snooping is enabled on interface
MLD snooping query interval is 60 seconds
MLD snooping querier timeout is 125 seconds
MLD snooping last member query response interval is 1000 ms
MLD snooping fast-leave is disabled on this interface
MLD snooping querier is disabled on this interface
```

Supported Releases 10.4.1.0 or later

show ipv6 mld snooping mrouter

Displays the details of multicast router ports.

Syntax `show ipv6 mld snooping mrouter [vlan vlan-id]`

Parameters *vlan-id*—(Optional) Enter the VLAN ID, ranging from 1 to 4093. For a PVLAN domain, enter the VLAN ID of the primary VLAN, from 1 to 4093.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 mld snooping mrouter vlan 11
Interface    Router Ports
Vlan 11      ethernet 1/1/32
```

Supported Releases 10.4.1.0 or later

show ipv6 mld snooping summary

Displays the number of MLD-enabled snooping instances.

Syntax `show ipv6 mld snooping summary`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show ipv6 mld snooping summary
Maximum number of IGMP and MLD Instances: 1024
Total Number of enabled MLD Instances: 512
```

Supported Releases 10.5.2.1 or later

14

VXLAN

A virtual extensible LAN (VXLAN) extends Layer 2 (L2) server connectivity over an underlying Layer 3 (L3) transport network in a virtualized data center. A virtualized data center consists of virtual machines (VMs) in a multitenant environment. OS10 supports VXLAN as described in RFC 7348.

VXLAN provides a L2 overlay mechanism on an existing L3 network by encapsulating the L2 frames in L3 packets. The VXLAN-shared forwarding domain allows hosts such as virtual and physical machines, in tenant L2 segments to communicate over the shared IP network. Each tenant L2 segment is identified by a 24-bit ID called a VXLAN network identifier (VNI).

Deployed as a VXLAN gateway, an OS10 switch performs encapsulation/de-encapsulation of L2 frames in L3 packets while tunneling server traffic. In this role, an OS10 switch operates as a VXLAN tunnel endpoint (VTEP). Using VXLAN tunnels, server VLAN segments communicate through the extended L2 forwarding domain.

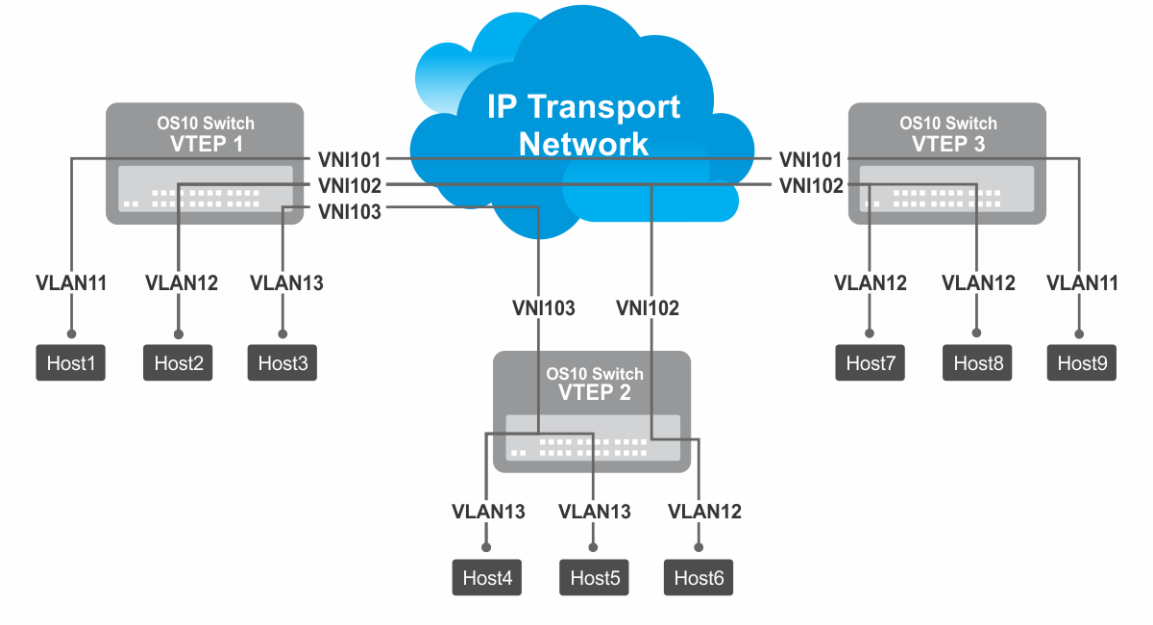

Figure 7. VXLAN topology

NOTE:

- The platforms that support only L2 VXLAN gateway include: S4048-ON, Z9100-ON, and Z9264F-ON
- The platforms that support both L2 VXLAN and L3 VXLAN routing (Routing In and Out of Tunnels (RIOT)) include:
  - Asymmetric IRB: S4048T-ON, S4248-ON series, S4100-ON series, S5200-ON series, and S6010-ON
  - Symmetric IRB: S4048T-ON, S4100-ON series, S5200-ON series, and S6010-ON

L2 VXLAN over VLT and L3 VXLAN features are not supported on the Z9664F-ON platform.

After VXLAN decapsulation, routing between virtual networks and regular VLANs (VLAN that is not configured as a virtual network) is supported only on the following platforms:

- S4200-ON series
- S5200-ON series

On other platforms, routing after decapsulation is performed only between virtual networks. If routing is needed for a regular VLAN after decapsulation, a virtual network should be configured instead of a regular VLAN (even though that VLAN exists only on access ports) to overcome this limitation on other platforms. On border leaf switches, an access port

of this virtual network could then be connected to an external router and a protocol such as BGP or static routing could be used on this virtual network interface for external reachability.

This feature is not supported on the following platforms:

- S3048-ON
- Z9332F-ON
- E3224F-ON

NOTE: The Layer 2 service in the VXLAN overlay network does not participate in the Spanning tree protocol. As a result, blocking of a link in a loop-free overlay network does not prevent a loop. To prevent the network from forming loops, you can perform either of the following two actions:

- Ensure that the network topology is loop free.
- Configure BPDU gaurd on all the access ports.

NOTE: Z9100-ON platform supports 16K port, VLAN combination table (hash table), but about 90% of this table only can be used due to hash collision. Due to this hardware constraint, using whole 16K is not supported.

VXLAN concepts

Network virtualization overlay (NVO)	An overlay network extends L2 connectivity between server virtual machines (VMs) in a tenant segment over an underlay L3 IP network. A tenant segment can be a group of hosts or servers that are spread across an underlay network. • The NVO overlay network uses a separate L2 bridge domain (virtual network), which is independent of legacy VLAN forwarding. • The NVO underlay network operates in the default VRF using the existing L3 infrastructure and routing protocols.
Virtual extensible LAN (VXLAN)	A type of network virtualization overlay that encapsulates a tenant payload into IP UDP packets for transport across the IP underlay network.
VXLAN network identifier (VNI)	A 24-bit ID number that identifies a tenant segment and transmits in a VXLAN-encapsulated packet.
VXLAN tunnel endpoint (VTEP)	A switch with connected end hosts that are assigned to virtual networks. The virtual networks map to VXLAN segments. Local and remote VTEPs perform encapsulation and de-capsulation of VXLAN headers for the traffic between end hosts. A VTEP is also known as a network virtualization edge (NVE) node.
Bridge domain	A L2 domain that receives packets from member interfaces and forwards or floods them to other member interfaces based on the destination MAC address of the packet. OS10 supports two types of bridge domains: simple VLAN and virtual network. • Simple VLAN: A bridge domain a VLAN ID represents. Traffic on all member ports is assigned with the same VLAN ID. • Virtual network: A bridge domain a virtual network ID (VNID) represents. A virtual network supports overlay encapsulation and maps with either a single VLAN ID in a *switch-scoped VLAN* or with multiple (Port,VLAN) pairs in a *port-scoped VLAN*.
Distributed routing	All VTEPs in a virtual network perform intersubnet routing and serve as L3 gateways in two possible modes: • Asymmetric routing: All VTEPs can perform routing. Routing decisions are made only on ingress VTEPs. Egress VTEPs perform bridging. • Symmetric routing: All VTEPs perform routing. Routing decisions are made on both ingress and egress VTEPs.
Virtual network	In OS10, each L2 flooding domain in the overlay network is represented as a *virtual network*.
Virtual network identifier (VNID)	A 16-bit ID number that identifies a virtual network in OS10.
Virtual-network interface	A router interface that connects a virtual network bridge to a tenant VRF routing instance.
Access port	A port on a VTEP switch that connects to an end host and is part of the overlay network.

Network port	A port on a VTEP switch that connects to the underlay network.
Switch-scoped VLAN	A VLAN that is mapped to a virtual network ID (VNID) in OS10. All member ports of the VLAN are automatically added to the virtual network. ● You can map only one VLAN ID to a virtual network. ● Ideally suited for existing tenant VLANs that stretch over an IP fabric using VXLAN.
Port-scoped VLAN	A Port,VLAN pair that maps to a virtual network ID (VNID) in OS10. Assign an individual member interface to a virtual network either with an associated tagged VLAN or as an untagged member. Using a port-scoped VLAN, you can configure: ● The same VLAN ID on different access interfaces to different virtual networks. ● Different VLAN IDs on different access interfaces to the same virtual network.

VXLAN as NVO solution

Network virtualization overlay (NVO) is a solution that addresses the requirements of a multi-tenant data center, especially one with virtualized hosts. An NVO network is an overlay network that is used to extend L2 connectivity among VMs belonging to a tenant segment over an underlay IP network. Each tenant payload is encapsulated in an IP packet at the originating VTEP. To access the payload, the tenant payload is stripped of the encapsulation at the destination VTEP. Each tenant segment is also known as a *virtual-network* and is uniquely identified in OS10 using a virtual network ID (VNID).

VXLAN is a type of encapsulation used as an NVO solution. VXLAN encapsulates a tenant payload into IP UDP packets for transport across the IP underlay network. In OS10, each virtual network is assigned a 24-bit number that is called a *VXLAN network identifier* (VNI) that the VXLAN-encapsulated packet carries. The VNI uniquely identifies the tenant segment on all VTEPs. OS10 sets up ASIC tables to:

- Enables creation of a L2 bridge flooding domain across a L3 network.
- Facilitates packet forwarding between local ports and tunneling packets from the local device to a remote device.

Configure VXLAN

To extend a L2 tenant segment using VXLAN, follow these configuration steps on each VTEP switch:

1. Configure the source IP address used in encapsulated VXLAN packets.
2. Configure a virtual network and assign a VXLAN VNI.
3. Configure VLAN-tagged access ports.
4. Configure untagged access ports.
5. (Optional) Enable routing for hosts on different virtual networks.
6. Advertise the local VXLAN source IP address to remote VTEPs.
7. (Optional) Configure VLT.

Configure source IP address on VTEP

When you configure a switch as a VXLAN tunnel endpoint (VTEP), configure a Loopback interface, whose IP address is used as the source IP address in encapsulated packet headers. Only a Loopback interface assigned to a network virtualization edge (NVE) instance is used as a source VXLAN interface.

- Do not reconfigure the VXLAN source interface or the IP address assigned to the source interface if there is at least one VXLAN network ID (VNI) already assigned to a virtual-network ID (VNID) on the switch.
- The source Loopback IP address must be reachable from a remote VTEP.
- An IPv6 address is not supported as the source VXLAN address.
- Do not assign the source Loopback interface to a non-default VRF instance.
- Underlay reachability of remote tunnel endpoints is supported only in the default VRF.
- Do not assign the IP address that is configured as the source IP address to end hosts in any VRF.

To configure source IP address on VTEP:

1. Configure a Loopback interface to serve as the source VXLAN tunnel endpoint in CONFIGURATION mode. The range is from 0 to 255.

   ```
   interface loopback number
   ```

2. Configure an IP address on the Loopback interface in INTERFACE mode. The IP address allows the source VTEP to send VXLAN frames over the L3 transport network.

   ```
   ip address ip-address/mask
   ```

3. Return to CONFIGURATION mode.

   ```
   exit
   ```

4. Enter NVE mode from CONFIGURATION mode. NVE mode allows you to configure the VXLAN tunnel endpoint on the switch.

   ```
   nve
   ```

5. Configure the Loopback interface as the source tunnel endpoint for all virtual networks on the switch in NVE mode.

   ```
   source-interface loopback number
   ```

6. Return to CONFIGURATION mode.

   ```
   exit
   ```

Configure a VXLAN virtual network

To create a VXLAN, assign a VXLAN segment ID (VNI) to a virtual network ID (VNID) and configure a remote VTEP. A unique 2-byte VNID identifies a virtual network. You cannot assign the same VXLAN VNI to more than one virtual network. Manually configure VXLAN tunnel endpoints in a static VXLAN or use BGP EVPN to automatically discover the VXLAN tunnel endpoints.

1. Create a virtual-network bridge domain in CONFIGURATION mode. Valid VNID numbers are from 1 to 65535.

   ```
   virtual-network vn-id
   ```

2. Assign a VXLAN VNI to the virtual network in VIRTUAL-NETWORK mode. The range is from 1 to 16,777,215. Configure the VNI for the same tenant segment on each VTEP switch.

   ```
   vxlan-vni vni
   ```

3. (Optional) If you use BGP EVPN for VXLAN, this step is not required — To set up a static VXLAN, configure the source IP address of a remote VTEP in VXLAN-VNI mode. You can configure up to 1024 remote VTEP addresses for a VXLAN VNI.

   ```
   remote-vtep ip-address
   ```

   After you configure the remote VTEP, when the IP routing path to the remote VTEP IP address in the underlay IP network is known, the virtual network sends and receives VXLAN-encapsulated traffic from and to downstream servers and hosts. All broadcast, multicast, and unknown unicast (BUM) traffic received on access interfaces replicate and are sent to all configured remote VTEPs. Each packet contains the VXLAN VNI in its header.

   By default, MAC learning from a remote VTEP is enabled and unknown unicast packets flood to all remote VTEPs. To configure additional remote VTEPs, re-enter the `remote-vtep ip-address` command.

Configure VLAN-tagged access ports

Configure local access ports in the VXLAN overlay network using either a switch-scoped VLAN or port-scoped VLAN. Only one method is supported. You cannot assign tagged VLAN member interfaces to a virtual network using both switch-scoped and port-scoped VLANs.

- You cannot assign the same Port, VLAN member interface pair to more than one virtual network.
- You can assign the same `vlan-tag` VLAN ID with different member interfaces to different virtual networks.
- You can assign a member interface with different `vlan-tag` VLAN IDs to different virtual networks.

- To use a switch-scoped VLAN to add VLAN-tagged member ports to a virtual network:
  1. Assign a VLAN to the virtual network in VLAN Interface mode.

     ```
     interface vlan vlan-id
     virtual-network vn-id
     ```

  2. Configure port interfaces as trunk members of the VLAN in Interface mode.

     ```
     interface ethernet node/slot/port[:subport]
     switchport mode trunk
     switchport trunk allowed-vlan vlan-id
     exit
     ```

     The local physical ports assigned to the VLAN transmit packets over the virtual network.

     NOTE: A switch-scoped VLAN assigned to a virtual network cannot have a configured IP address and cannot participate in L3 routing; for example:

     ```
     OS10(config)# interface vlan 102
     OS10(conf-if-vlan-102)# ip address 1.1.1.1/24
     % Error: vlan102, IP address cannot be configured for VLAN attached to Virtual
     Network.
     ```

- To use a port-scoped VLAN to add VLAN-tagged member ports to a virtual network:
  1. Configure interfaces as trunk members in Interface mode.

     ```
     interface ethernet node/slot/port[:subport]
     switchport mode trunk
     exit
     ```

  2. Assign a trunk member interface as a Port,VLAN ID pair to the virtual network in VIRTUAL-NETWORK mode. All traffic sent and received for the virtual network on the interface carries the VLAN tag. Multiple tenants connected to different switch interfaces can have the same `vlan-tag` VLAN ID.

     ```
     virtual-network vn-id
     member-interface ethernet node/slot/port[:subport] vlan-tag vlan-id
     ```

     The Port,VLAN pair starts to transmit packets over the virtual network.

The VLAN ID tag is removed from packets transmitted in a VXLAN tunnel. Each packet is encapsulated with the VXLAN VNI in the packet header before it is sent from the egress source interface for the tunnel. At the remote VTEP, the VXLAN VNI is removed and the packet transmits on the virtual-network bridge domain. The VLAN ID regenerates using the VLAN ID associated with the virtual-network egress interface on the VTEP and is included in the packet header.

Configure untagged access ports

Add untagged access ports to the VXLAN overlay network using either a switch-scoped VLAN or port-scoped VLAN. Only one method is supported.

- To use a switch-scoped VLAN to add untagged member ports to a virtual network:
  1. Assign a VLAN to a virtual network in VLAN Interface mode.

     ```
     interface vlan vlan-id
     virtual-network vn-id
     exit
     ```

  2. Configure port interfaces as access members of the VLAN in Interface mode.

     ```
     interface ethernet node/slot/port[:subport]
     switchport access vlan vlan-id
     exit
     ```

     Packets received on the untagged ports transmit over the virtual network.
- To use a port-scoped VLAN to add untagged member ports to a virtual network:

1. Create a reserved VLAN ID to assign untagged traffic on member interfaces to a virtual network in CONFIGURATION mode. The VLAN ID is used internally for all untagged member interfaces on the switch that belong to virtual networks.

```
virtual-network untagged-vlan untagged-vlan-id
```

2. Configure port interfaces as trunk members and remove the access VLAN in Interface mode.

```
interface ethernet node/slot/port[:subport]
switchport mode trunk
no switchport access vlan
exit
```

3. Assign the trunk interfaces as untagged members of the virtual network in VIRTUAL-NETWORK mode. You cannot use the reserved VLAN ID for a legacy VLAN or for tagged traffic on member interfaces of virtual networks.

```
virtual-network vn-id
member-interface ethernet node/slot/port[:subport] untagged
exit
```

If at least one untagged member interface is assigned to a virtual network, you cannot delete the reserved untagged VLAN ID. If you reconfigure the reserved untagged VLAN ID, you must either reconfigure all untagged member interfaces in the virtual networks to use the new ID or reload the switch.

Enable overlay routing between virtual networks

The previous sections describe how a VTEP switches traffic between hosts in the same L2 tenant segment on a virtual network, and transports traffic over an IP underlay fabric. This section describes how a VTEP enables hosts *in different* L2 segments belonging to the same tenant VRF to communicate with each other.

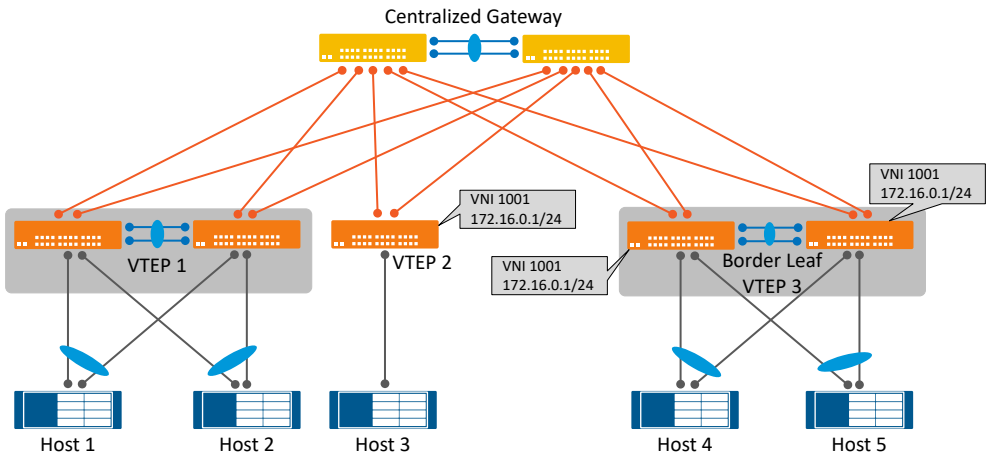
NOTE: On the S4248-ON switch, IPv6 overlay routing between virtual networks is not supported with static VXLAN. IPv6 overlay routing is, however, supported with BGP EVPN asymmetric IRB.

Each tenant is assigned a VRF and each virtual-network interface is assigned an IP subnet in the tenant VRF. The VTEP acts as the L3 gateway that routes traffic from one tenant subnet to another in the overlay before encapsulating it in the VXLAN header and transporting it over the IP underlay fabric.

To enable host traffic routing between virtual networks, configure an interface for each virtual network and associate it to a tenant VRF. Assign an IP address in the IP subnet range associated with the virtual network to each virtual-network interface on each VTEP.

NOTE: You can assign the same virtual network interface IP address to all the VTEP interfaces that are in the same virtual network.

In the following illustration, the same IP address is assigned to the virtual-network interface 1001 on all the VTEPs.



This way, you need only one virtual network interface IP apart from the anycast gateway IP.

To enable efficient traffic forwarding on a VTEP, OS10 supports distributed and centralized gateway routing. A distributed gateway means that multiple VTEPs act as the gateway router for a tenant subnet. The VTEP nearest to a host acts as its gateway router. To support seamless migration of hosts and virtual machines on different VTEPs, configure a common virtual IP address, known as an anycast IP address, on all VTEPs for each virtual network. Use this anycast IP address as the gateway IP address on VMs.

To support multiple tenants when each tenant has its own L2 segments, configure a different IP VRF for each tenant. All tenants share the same VXLAN underlay IP fabric in the default VRF.

1. Create a non-default VRF instance for overlay routing in Configuration mode. For multi-tenancy, create a VRF instance for each tenant.

   ```
   ip vrf tenant-vrf-name
   exit
   ```

2. Configure the anycast gateway MAC address all VTEPs use in all VXLAN virtual networks in Configuration mode.

   When a VM sends an Address Resolution Protocol (ARP) request for the anycast gateway IP address in a VXLAN virtual network, the nearest VTEP responds with the configured anycast MAC address. Configure the same MAC address on all VTEPs so that the anycast gateway MAC address remains the same if a VM migrates to a different VTEP. Because the configured MAC address is automatically used for all VXLAN virtual networks, configure it in global Configuration mode.

   ```
   ip virtual-router mac-address mac-address
   ```

   Example:

   ```
   OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
   ```

3. Configure a virtual-network interface, assign it to the tenant VRF, and configure an IP address.

   You can configure an IPv6 address on the virtual-network interface. Different virtual-network interfaces you configure on the same VTEP must have virtual-network IP addresses in different subnets. If you do not assign the virtual-network interface to a tenant VRF, it is assigned to the default VRF.

   ```
   interface virtual-network vn-id
   ip vrf forwarding tenant-vrf-name
   ip address ip-address/mask
   no shutdown
   exit
   ```

4. Configure an anycast gateway IPv4 or IPv6 address for each virtual network in INTERFACE-VIRTUAL-NETWORK mode. This anycast IP address must be in the same subnet as the IP address of the virtual-network interface in Step 3.

   Configure the same IPv4 or IPv6 address as the anycast IP address on all VTEPs in a virtual network. All hosts use the anycast gateway IP address as the default gateway IP address in the subnet that connects to the virtual-network interface configured in Step 3. Configure the anycast gateway IP address on all downstream VMs. Using the same anycast gateway IP address allows host VMs to move from one VTEP to another VTEP in a VXLAN. Dell Technologies recommends using an anycast gateway in both VLT and non-VLT VXLAN configurations.

   ```
   interface virtual-network vn-id
   ip virtual-router address ip-address
   ```

Configuration notes for virtual-network routing:

- VXLAN overlay routing includes routing tenant traffic on the ingress VTEP and bridging the traffic on the egress VTEP. The ingress VTEP learns ARP entries and associates all destination IP addresses of tenant VMs with the corresponding VM MAC addresses in the overlay. On the ingress VTEP, configure a virtual network for each destination IP subnet even if there are no locally attached hosts for an IP subnet.
- Open Shortest Path First (OSPF) routing protocol is not supported on the virtual-network interface in the overlay network. However, BGP and static routes that point to a virtual-network interface or to a next-hop IP address that belongs to a virtual-network subnet are supported.

  NOTE: You cannot specify anycast IP address corresponding to a virtual-network as the BGP neighbor. You can specify only an interface IP address that belongs to a virtual-network subnet as the virtual-network address or the next-hop IP address.
- VLT peer routing is not supported in a virtual network. A packet destined to the virtual-network peer MAC address L2 switches instead of IP routes. To achieve active-active peer routing in a virtual network, configure the same virtual anycast gateway IP and MAC addresses on both VTEP VLT peers and use the anycast IP as the default gateway on the VMs.

- Virtual Router Redundancy Protocol (VRRP) is not supported on a virtual-network interface. Configure the virtual anycast gateway IP address to share a single gateway IP address on both VTEP VLT peers and use the anycast IP as default gateway on the VMs.
- Internet Group Management Protocol (IGMP) and Protocol-Independent Multicast (PIM) are not supported on a virtual-network interface.

The following tables show how to use anycast gateway IP and MAC addresses in a data center with three virtual networks and multiple VTEPs:

- Globally configure an anycast MAC address for all VTEPs in all virtual networks. For example, if you use three VTEP switches in three virtual networks:

Table 68. MAC address for all VTEPs

Virtual network	VTEP	Anycast gateway MAC address
VNID 11	VTEP 1	00.11.22.33.44.55
	VTEP 2	00.11.22.33.44.55
	VTEP 3	00.11.22.33.44.55
VNID 12	VTEP 1	00.11.22.33.44.55
	VTEP 2	00.11.22.33.44.55
	VTEP 3	00.11.22.33.44.55
VNID 13	VTEP 1	00.11.22.33.44.55
	VTEP 2	00.11.22.33.44.55
	VTEP 3	00.11.22.33.44.55

- Configure a unique IP address on the virtual-network interface on each VTEP across all virtual networks. Configure the same anycast gateway IP address on all VTEPs in a virtual-network subnet. For example:

Table 69. IP address on the virtual-network interface on each VTEP

Virtual network	VTEP	Virtual-network IP address	Anycast gateway IP address
VNID 11	VTEP 1	10.10.1.201	10.10.1.254
	VTEP 2	10.10.1.202	10.10.1.254
	VTEP 3	10.10.1.203	10.10.1.254
VNID 12	VTEP 1	10.20.1.201	10.20.1.254
	VTEP 2	10.20.1.202	10.20.1.254
	VTEP 3	10.20.1.203	10.20.1.254
VNID 13	VTEP 1	10.30.1.201	10.30.1.254
	VTEP 2	10.30.1.202	10.30.1.254
	VTEP 3	10.30.1.203	10.30.1.254

Configuration notes

In a static VXLAN, overlay routing is supported on:

- S4100-ON Series
- S4200-ON Series
- S5200-ON Series
- S4048T-ON
- S6010-ON

Advertise VXLAN source IP address

1. Advertise the IP address of the local source tunnel interface to all VTEPs in the underlay IP network using the existing routing infrastructure. This example uses OSPF to advertise the VXLAN source IP address on Ethernet1/1/3, which is the underlay network-facing interface:

```
OS10(config)# router ospf 100
OS10(config-ospf)# router-id 110.111.170.195
OS10(config-ospf)# exit
OS10(config)# interface ethernet1/1/3
OS10(config-if-eth1/1/3)# ip ospf 100 area 0.0.0.0
OS10(config-if-eth1/1/3)# exit
OS10(config)# interface loopback 1
OS10(config-if-lo-1)# ip ospf 100 area 0.0.0.0
```

   Each VTEP switch in the underlay IP network learns the IP address of the VXLAN source interface. If a remote VTEP switch is not reachable, its status displays as `DOWN` in the `show nve remote-vtep` output.

2. Configure the MTU value on L3 underlay network-facing interfaces in Interface mode to be at least 50 bytes higher than the MTU on the server-facing links to allow for VXLAN encapsulation. The range is from 1312 to 9216.

```
mtu value
```

3. Return to CONFIGURATION mode.

```
exit
```

Configure VLT

(Optional) To use VXLAN in a VLT domain, configure the VLT domain — including the VLT Interconnect (VLTi) interfaces, backup heartbeat, and VLT MAC address — as described in the *OS10 Enterprise Edition User Guide* in the *Virtual link trunking* section.

Required VLT VXLAN configuration:

- The IP address of the VTEP source Loopback interface must be same on the VLT peers.
- If you use a port-scoped VLAN to assign tagged access interfaces to a virtual network, to identify traffic belonging to each virtual network, you must configure a unique VLAN ID for the VLT Interconnect (VLTi) link.
- Configure a VLAN to transmit VXLAN traffic over the VLTi link in VIRTUAL-NETWORK mode. All traffic sent and received from a virtual network on the VLTi carries the VLTi VLAN ID tag.

  Configure the same VLTi VLAN ID on both VLT peers. You cannot use the ID of an existing VLAN on a VLT peer or the reserved untagged VLAN ID. You can use the VLTi VLAN ID to assign tagged or untagged access interfaces to a virtual network.

```
virtual-network vn-id
vlti-vlan vlan-id
```

- Although a VXLAN virtual network has no access port members that connect to downstream servers, you must configure a switch-scoped VLAN or VLTi VLAN. The presence of this VLAN ensures that the VLTi link is added as a member of the virtual network so that mis-hashed ARP packets received from the VXLAN tunnel reach the intended VLT node.

Best practices:

- If a VLT peer loses connectivity to the underlay L3 network, it continues to transmit routing traffic to the network through the VLTi link on a dedicated L3 VLAN to the other VLT peer. Configure a L3 VLAN between VLT peers in the underlay network and enable routing on the VLAN; for example:

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 41.1.1.1/24
OS10(config-if-vl-4000)# ip ospf 1 area 0.0.0.0
```

- To reduce traffic loss when a VLT peer boots up and joins an existing VLT domain, or when the VLTi links fails and the VLT peer is still up as detected by the VLT heartbeat, create an uplink state group. Configure all access VLT port channels on the peer as upstream links. Configure all network-facing links as downstream link. For example:

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel 10
```

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

To check mismatch of MAC address table entries between VLT peers, use the `show vlt mac-inconsistency` command. To identify mismatches in VLT configuration on peer switches, use the `show vlt domain-name mismatch` command.

```
OS10# show vlt-mac-inconsistency
Checking Vlan 228 .. Found 7 inconsistencies .. Progress 100%
VLAN 128
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
VLAN 1
----------
MAC 00:a0:c9:00:00:18 is missing from Node(s) 2
MAC 00:a0:c9:00:00:20 is missing from Node(s) 2
VLAN 131
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2

----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
VLAN 137
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
Run "show vlt d1 mismatch ..." commands to identify configuration issues
```

L3 VXLAN route scaling

The S4100-ON series, S5200-ON series, S4048T-ON, S4248-ON series, and S6010-ON switches support native VxLAN routing — routing in and out of tunnels (RIOT). RIOT requires dedicated hardware resources reserved for overlay routing. You cannot use these dedicated resources for underlay routing.

Each overlay ARP entry requires a routing next-hop in the hardware to bind a destination tenant VM IP address to the corresponding tenant VM MAC address and VNI. Each virtual-network interface assigned to an IP subnet requires a routing interface in the hardware.

OS10 supports preset profiles to re-allocate the number of resources reserved for overlay ARP entries. The number of entries reserved for each preset mode differs according to OS10 switch.

Table 70. Routing next-hops reserved on OS10 switches

OS10 Switch	Overlay next-hop entries	Underlay next-hop entries	Overlay L3 RIF entries	Underlay L3 RIF entries
S41xx-ON series:	—	—	—	—
default-overlay-routing	4096	28672	2048	10240
disable-overlay-routing	0	32768	0	12288
balanced-overlay-routing	16384	16384	6144	6144
scaled-overlay-routing	24576	8192	10240	2048
S4048T-ON and S6010-ON:	—	—	—	—
	8192	4096	2048	2048

Table 70. Routing next-hops reserved on OS10 switches (continued)

OS10 Switch	Overlay next-hop entries	Underlay next-hop entries	Overlay L3 RIF entries	Underlay L3 RIF entries
default-overlay-routing disable-overlay-routing balanced-overlay-routing scaled-overlay-routing	0 24576 40960	49152 24576 8192	49152 24576 8192	0 6144 10240
S52xx-ON series: default-overlay-routing disable-overlay-routing balanced-overlay-routing scaled-overlay-routing	— 8192 0 32768 53248	— 57344 65536 32768 12288	— 2048 0 8192 12288	— 14336 16384 8192 4096
S4248-ON: default-overlay-routing	— 20480	— 110592	— 4096	— 28672

NOTE: The S4248-ON switch supports only one default profile to reserve resources for overlay ARP entries.

To activate the profile after you configure an overlay routing profile, save the configuration and reload the switch.

Configure an overlay routing profile

- Enable an overlay routing profile in Configuration mode or disable the configured profile and return to the default.

```
OS10(config)# hardware overlay-routing-profile {disable-overlay-routing | balanced-
overlay-routing |
scaled-overlay-routing}
```

Display overlay routing profiles

- View the hardware resources available for overlay routing in different profiles; for example, in the S5200-ON series:

```
OS10# show hardware overlay-routing-profile mode all
Mode                      Overlay Next-hop  Underlay Next-hop  Overlay L3 RIF
Underlay L3 RIF
                           Entries           Entries            Entries         Entries
default-overlay-routing    8192              57344              2048            14336

disable-overlay-routing    0                 65536              0               16384

balanced-overlay-routing   32768             32768              8192            8192

scaled-overlay-routing     53248             12288              12288           4096
```

- View the currently configured overlay routing profile; for example, in the S5200-ON series:

```
show hardware overlay-routing-profile mode
                                    Overlay    Underlay   Overlay   Underlay
Setting     Mode                    Next-hop   Next-hop   L3 RIF    L3 RIF
                                    Entries    Entries    Entries   Entries
Current     default-overlay-routing   8192     57344      2048      14336
Next-boot   default-overlay-routing   8192     57344      2048      14336
```

DHCP relay on VTEPs

Dynamic Host Configuration Protocol (DHCP) clients in overlay communicate with a DHCP server using the DHCP relay on the VTEP switch. DHCP server and the client can reside in the same VRF or in different VRFs. If they are in different VRFs, configure the route-leaking to allow communication between the client subnet in the client-VRF and the server in the server-VRF. If they are in the same VRF, route leaking need not be configured.

DHCPv4 relay on VTEPs supports the following option 82 sub-options:

- Server ID override suboption - Sub-option `11 (0xb)`
- Link selection suboption- Sub-option `5 (0x5)`
- DHCPv4 virtual subnet selection option - Sub-option `151 (0x97)`
- DHCPv4 virtual subnet selection control - Sub-option `152 (0x98)`
- `source-interface` CLI for relay agents. The gateway address (`giaddr`) field carries the source interface address.

Use the Link selection suboption, Server ID override suboption, and source-interface to minimize the route leaking configurations. Only the DHCP server subnet needs to be leaked into client-VRF and the DHCP client-subnets in client-VRF need not be leaked into server-VRF. The source-interface must be reachable from the server-VRF, and the DHCP server sends responses to the source-interface IP.

Use the VSS suboption to send the configured client VRF information to the DHCP server to allocate an IP address based on the VRF.

Configure DHCP relay on VTEPs

To configure DHCP relay on the virtual-network interface of the tenant VRF, run the following commands:

```
OS10(config)# interface virtual-network 10
OS10(conf-if-vn-10)# ip helper-address 40.1.1.1 vrf tenant01
```

View VXLAN configuration

Use `show` commands to verify the VXLAN configuration and monitor VXLAN operation.

View the VXLAN virtual network

```
OS10# show virtual-network
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD - Unknown-Unicast-Drop
Un-tagged VLAN: 888
Virtual Network: 60000
   VLTi-VLAN: 2500
   Members:
      VLAN 1000: port-channel1, ethernet1/1/9, ethernet1/1/10
      VLAN 2500: port-channel1000
   VxLAN Virtual Network Identifier: 16775000
      Source Interface: loopback100(222.222.222.222)
      Remote-VTEPs (flood-list): 55.55.55.55(DP),77.1.1.1(DP)
```

View the VXLAN virtual-network port

```
OS10# show virtual-network interface ethernet 1/1/1
Interface          Vlan      Virtual-network
ethernet1/1/1      100         1000
ethernet1/1/1      200         2000
ethernet1/1/1      300         3000
```

View the VXLAN virtual-network VLAN

```
OS10# show virtual-network vlan 100
Vlan  Virtual-network   Interface
100    1000             ethernet1/1/1,ethernet1/1/2
100    5000             ethernet1/1/2
```

View the VXLAN virtual-network VLANs

```
OS10# show vlan
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
@ - Attached to Virtual Network
Q: A - Access (Untagged), T - Tagged

 NUM    Status Description Q Ports
* 1      up                A Eth1/1/1-1/1/48
@ 100    up                T Eth1/1/2,Eth1/1/3
                           A Eth1/1/1
```

```
@ 101    up               T port-channel5
  200    up               T Eth1/1/11-1/1/15
```

View the VXLAN virtual-network statistics

```
OS10# show virtual-network counters
Virtual-Network      Input (Packets/Bytes)       Output (Packets/Bytes)
1000                 857/8570                    257/23709
2000                 457/3570                    277/13709
```

```
OS10# show virtual-network counters interface 1/1/3 vlan 100
Virtual-Network      Input (Packets/Bytes)       Output (Packets/Bytes)
1000                 857/8570                    257/23709
2000                 457/3570                    277/13709
```

NOTE: Using flex counters, OS10 may display additional packets in the `Output` field number, but the additional packets do not transmit. For an accurate count, use the `Output Bytes` number.

View the VXLAN remote VTEPs

```
OS10# show nve remote-vtep summary
Remote-VTEP      State
---------------------
2.2.2.2          up
```

```
OS10# show nve remote-vtep
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD - Unknown-Unicast-Drop
IP Address: 2.2.2.2,  State: up, Encap: VxLAN
   VNI list: 10000(DP), 200(DP), 300(DP)
```

The `show nve remote-vtep` command displays the L2 VxLAN VNI and the EVPN VRF L3 VNI spanned with the other remote VTEPs.

```
OS10# show nve remote-vtep
IP Address: 31.1.1.1, State: up, Encap: VxLAN
VNI list: 100-101,200,300,400,500,600,700,800
L3VNI list: 65000
```

The `show nve remote-vtep summary` command displays the state of the remote VTEP as `up` when an L2 VxLAN VNI or an EVPN VRF L3 VNI is spanned with the specific remote VTEP.

```
OS10# show nve remote-vtep summary
Remote-VTEP State
-----------------------------
31.1.1.1 up
```

View the VXLAN statistics on the remote VTEPs

The `show nve remote-vtep counters` command displays the packet counters and byte counter statistics for a specific remote VTEP. The counters for a remote VTEP include both the counters corresponding to the L2 VNI spanned with the VTEP as well as the EVPN-VRF L3 VNI spanned with the VTEP.

```
OS10# show nve remote-vtep counters
Remote-VTEP          Input (Packets/Bytes)       Output (Packets/Bytes)
-------------------------------------------------------------------------
10.10.10.10          857/8570                    257/23709
20.20.20.20          457/3570                    277/13709
```

```
OS10# show nve remote-vtep 31.1.1.1 counters
Remote-VTEP: 31.1.1.1
Input (Packets/Bytes) : 277/38776
Output (Packets/Bytes) : 261/36400
```

View the VXLAN virtual network by VNID

```
OS10# show nve vxlan-vni
VNI     Virtual-Network    Source-IP      Remote-VTEPs
```

```
-----------------------------------------------------
101     101                44.44.44.44    11.11.11.11,22.22.22.22,33.33.33.33

```

VXLAN MAC addresses

Use the `show mac address-table virtual-network` or `show mac address-table extended` commands to display the MAC addresses learned on a VXLAN virtual network or learned on both VXLAN virtual networks and legacy VLANs.

Use the `clear mac address-table dynamic virtual-network` and `clear mac address-table dynamic nve remote-vtep` commands to delete address entries from the MAC address virtual-network table.

NOTE: The existing `show mac address-table` and `clear mac-address table` commands do not display and clear MAC addresses in a virtual-network bridge domain even when access ports in a switch-scoped VLAN are assigned to a VXLAN virtual network.

Display VXLAN MAC addresses

Table 71. Display VXLAN MAC addresses

Command	Description
`show mac address-table virtual-network [vn-id | local | remote | static | dynamic | address mac-address | interface {ethernet node/slot/port:subport | port-channel number}]`	Displays all MAC addresses learned on all or a specified virtual network. *vn-id*: Displays only information about the specified virtual network. `local`: Displays only locally-learned MAC addresses. `remote`: Displays only remote MAC addresses. `static`: Displays only static MAC addresses. `dynamic`: Displays only dynamic MAC addresses. `address` *mac-address*: Displays only information about the specified MAC address. `interface ethernet` *node/slot/port:subport*: Displays only MAC addresses learned on the specified interface. `interface port-channel` *number*: Displays only MAC addresses learned on the specified port channel.
`show mac address-table extended [address mac-address | interface {ethernet node/slot/port:subport | port-channel number} | static | dynamic]`	Displays MAC addresses learned on all VLANs and VXLANs (default). `address` *mac-address*: Displays only information about the specified MAC address. `interface ethernet` *node/slot/port:subport*: Displays only MAC addresses learned on the specified interface. `interface port-channel` *number*: Displays only MAC addresses learned on the specified port channel. `static`: Displays only static MAC addresses. `dynamic`: Displays only dynamic MAC addresses.
`show mac address-table nve {vxlan-vni` *vn-id* `| remote-vtep` *ip-address*`}`	`vxlan-vni` *vn-id*: Displays MAC addresses learned on NVE from the specified VXLAN virtual-network ID. `remote-vtep` *ip-address*: Displays MAC addresses learned on NVE from the specified remote VTEP.
`show mac address-table count virtual-network [dynamic | local | remote | static | interface {ethernet` *node/slot/port:subport* `| port-channel` *number*`} |` *vn-id*`]`	Displays the number of MAC addresses learned on all virtual networks (default). `dynamic`: Displays the number of dynamic MAC addresses learned on all or a specified virtual network. `local`: Displays the number of locally-learned MAC addresses. `remote`: Displays the number of remote MAC addresses learned on all or a specified virtual network. `static`: Displays the number of static MAC addresses learned on all or a specified virtual network.

Table 71. Display VXLAN MAC addresses (continued)

Command	Description
	`interface ethernet node/slot/port:subport`: Displays the number of MAC addresses learned on the specified interface. `interface port-channel number`: Displays the number of MAC addresses learned on the specified port channel. `vn-id`: Displays the number of MAC addresses learned on the specified virtual network.
`show mac address-table count nve {remote-vtep ip-address | vxlan-vni vn-id}`	Displays the number of MAC addresses learned for a virtual network or from a remote VTEP. `remote-vtep ip-address`: Displays the number of MAC addresses learned on the specified remote VTEP. `vxlan-vni vn-id`: Displays the number of MAC addresses learned on the specified VXLAN virtual network.
`show mac address-table count extended [interface ethernet node/slot/port:subport | port-channel number]}`	Displays the number of MAC addresses learned on all VLANs and VXLAN virtual networks. `interface ethernet node/slot/port:subport`: Displays the number of MAC addresses learned from VLANs and VXLANs on the specified interface. `port-channel number`: Displays the number of MAC addresses learned from VLANs and VXLANs on the specified port channel.

Clear VXLAN MAC addresses

Table 72. Clear VXLAN MAC addresses

Command	Description
`clear mac address-table dynamic virtual-network [interface {ethernet node/slot/port:subport | port-channel number} | local | vn-id [address mac-address | local]]`	Clears all MAC addresses learned on all VXLAN virtual networks. `interface ethernet node/slot/port:subport`: Clears only MAC addresses learned on the specified interface. `interface port-channel number`: Clears only MAC addresses learned on the specified port channel. `local`: Clears only locally-learned MAC addresses. `vn-id`: Clears only the MAC addresses learned on the specified virtual network. `vn-id address mac-address`: Clears only the MAC address learned on the specified virtual network.
`clear mac address-table dynamic nve remote-vtep ip-address`	Clears all MAC addresses learned from the specified remote VTEP.

VXLAN commands

hardware overlay-routing-profile

Configures the number of reserved ARP table entries for VXLAN overlay routing.

Syntax

```
hardware overlay-routing-profile {balanced-overlay-routing | scaled-overlay-routing | disable-overlay-routing}
```

Parameters

balanced-overlay-routing	Reserve routing entries for balanced VXLAN tenant routing: • S4048T-ON and S6010-ON: 24576 entries • S4100-ON series: 16384 entries • S5200-ON series switches: 32768 entries
scaled-overlay-routing	Reserve routing entries for scaled VXLAN tenant routing: • S4048T-ON and S6010-ON: 36864 entries • S4100-ON series: 24576 entries • S5200-ON series switches: 53248 entries
disable-overlay-routing	Allocate 0 next-hop entries for overlay routing and all next-hop entries for underlay routing.

Default

S4048T-ON and S6010-ON switches reserve 8192 ARP table entries.

S4100-ON series switches reserve 4096 ARP table entries.

S5200-ON series switches reserve 8192 ARP table entries.

Command mode

CONFIGURATION

Usage information

The number of reserved table entries in a profile varies according to the OS10 switch. To view the available overlay routing profiles for a switch, use the `show hardware overlay-routing-profile mode all` command. After you configure a profile, reload the switch to activate the profile. The `no` form of the command disables the configured profile and restores the default number of reserved ARP table entries.

Example

```
OS10(config)# hardware overlay-routing-profile balanced-overlay-routing
OS10(config)# exit
OS10# write memory
OS10# reload
```

Supported releases

10.4.3.0 or later

interface virtual-network

Configures a virtual-network router interface.

Syntax

```
interface virtual-network vn-id
```

Parameters

virtual-network *vn-id*	Enter a virtual-network ID, from 1 to 65535.

Default

Not configured

Command mode

CONFIGURATION

Usage information

Configure a virtual-network router interface to enable hosts connected to a virtual network to route traffic to hosts on another virtual network in the same VRF. The virtual-network IP address must be unique on each VTEP, including VTEPs in VLT pairs.

Example

```
OS10(config)# interface virtual-network 10000
OS10(config-if-vn-10000)# ip vrf forwarding tenant1
OS10(config-if-vn-10000)# ip address 10.1.0.1/16
OS10(config-if-vn-10000)# no shutdown
```

Supported releases 10.4.3.0 or later

ip virtual-router address

Configures an anycast gateway IP address for a VXLAN virtual network.

Syntax `ip virtual-router address ip-address`

Parameters

address *ip-address*	Enter the IP address of the anycast L3 gateway.

Default Not configured

Command mode INTERFACE-VIRTUAL-NETWORK

Usage information Configure the same anycast gateway IP address on all VTEPs in a VXLAN virtual network. Use the anycast gateway IP address as the default gateway IP address if the host VMs move from one VTEP to another in a VXLAN. The anycast gateway IP address must be in the same subnet as the IP address of the virtual-network router interface.

Example

```
OS10(config)# interface virtual-network 10000
OS10(config-if-vn-10000)# ip virtual-router address 10.1.0.100
```

Supported releases 10.4.3.0 or later

ip virtual-router mac-address

Configures the MAC address of an anycast L3 gateway for VXLAN routing.

Syntax `ip virtual-router mac-address mac-address`

Parameters

mac-address *mac-address*	Enter the MAC address of the anycast L3 gateway.

Default Not configured

Command mode CONFIGURATION

Usage information Configure the same MAC address on all VTEPs so that the anycast gateway MAC address remains the same if a VM migrates to a different VTEP. Because the configured MAC address is automatically used for all VXLAN virtual networks, configure it in global Configuration mode.

Example

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Supported releases 10.4.3.0 or later

member-interface

Assigns untagged or tagged VLAN traffic on a member interface to a virtual network.

Syntax

```
member-interface {ethernet node/slot/port[:subport] | port-channel number}
{vlan-tag vlan-id | untagged}
```

Parameters	**ethernet** ***node/slot/port[:subport]***	Assign the specified interface to a virtual network.
	port-channel ***number***	Assign the specified port channel to a virtual network.
	untagged	Assign untagged traffic on an interface or port channel to a virtual network.
	vlan-tag ***vlan-id***	Assign tagged traffic on the specified VLAN to a virtual network.
Default	Not configured	
Command mode	VIRTUAL-NETWORK	
Usage information	Use this command to assign traffic on the same VLAN or interface to different virtual networks. The `no` version of this command removes the configured value.	

Example

```
OS10(config)# virtual-network 10000
OS10(config-vn)# member-interface port-channel 10 vlan-tag 200
OS10(config-vn)# member-interface port-channel 20 untagged
```

Supported releases 10.4.2.0 or later

nve

Enters network virtualization edge (NVE) configuration mode to configure the source VXLAN tunnel endpoint.

Syntax `nve`

Parameters None

Default None

Command mode CONFIGURATION

Usage information In NVE mode, configure the source tunnel endpoint for all virtual networks on the switch.

Example

```
OS10# nve
OS10(config-nve)#
```

Supported releases 10.4.2.0 or later

remote-vtep

Configures the IP address of a remote tunnel endpoint in a VXLAN network.

Syntax `remote-vtep` *`ip-address`*

Parameters *`ip-address`* — Enter the IP address of a remote virtual tunnel endpoint (VTEP).

Default Not configured

Command mode VIRTUAL-NETWORK VXLAN-VNI

Usage information After you configure the remote VTEP, the VXLAN virtual network is enabled to start sending server traffic. You can configure multiple remote VTEPs. All broadcast, multicast, and unknown unicast (BUM) traffic received on an access interface is replicated on remote VTEPs. The `no` version of this command removes the configured value.

Example

```
OS10(config-vn-vxlan-vni)# remote-vtep 20.20.20.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# remote-vtep 30.20.20.1
```

Supported releases 10.4.2.0 or later

show hardware overlay-routing-profile mode

Displays the number of hardware resources available for overlay routing in different profiles.

Syntax `show hardware overlay-routing-profile mode [all]`

Parameters

all	View the number of tenant entries available in each hardware partition for overlay routing profiles.

Default Not configured

Command mode EXEC

Usage information On S4100-ON series, S5200-ON series, S4048T-ON, S4248-ON, and S6010-ON switches, L3 VXLAN overlay routing requires reserved hardware resources. The number of reserved table entries in a profile varies according to the OS10 switch.

Example (S5200-ON series)

```
OS10# show hardware overlay-routing-profile mode all
                          Overlay    Underlay   Overlay    Underlay
Mode                      Next-hop   Next-hop   L3 RIF     L3 RIF

```

Supported releases 10.4.3.0 or later

show interface virtual-network

Displays the configuration of virtual-network router interfaces and packet statistics.

Syntax `show interface virtual-network [vn-id]`

Parameters

vn-id	Enter a virtual-network ID, from 1 to 65535.

Default Not configured

Command mode EXEC

Usage information Use this command to display the virtual-network IP address used for routing traffic in a virtual network. Traffic counters also display.

Example

```
show interface virtual-network 102
Virtual-network 102 is up, line protocol is up
Address is 14:18:77:25:6f:84, Current address is 14:18:77:25:6f:84
```

```
Interface index is 66
Internet address is 12.12.12.2/24
Mode of IPv4 Address Assignment: MANUAL
Interface IPv6 oper status: Enabled
Link local IPv6 address: fe80::1618:77ff:fe25:6eb9/64
MTU 1532 bytes, IP MTU 1500 bytes
ARP type: ARPA, ARP Timeout: 60
Last clearing of "show interface" counters: 10:24:21
Queuing strategy: fifo
Input statistics:
    89 packets, 10056 octets
Output statistics:
    207 packets, 7376 octets
Time since last interface status change: 10:23:21
```

Supported releases 10.4.3.0 or later

show nve remote-vtep

Displays information about remote VXLAN tunnel endpoints.

Syntax `show nve remote-vtep [ip-address | summary | counters]`

Parameters

ip-address	Display detailed information about a specified remote VTEP.
summary	Display summary information about remote VTEPs.
counters	Display statistics on remote VTEP traffic.

Default Not configured

Command mode EXEC

Usage information Use this command to display the IP address, operational state, and configured VXLANs for each remote VTEP. The remote MAC learning and unknown unicast drop settings used for each VXLAN ID (VNI) also display.

Example

```
OS10# show nve remote-vtep summary
Remote-VTEP       State
----------------------
2.2.2.2           up
```

```
OS10# show nve remote-vtep
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD -
Unknown-Unicast-Drop
IP Address: 2.2.2.2,  State: up, Encap: VxLAN
   VNI list: 10000(DP), 200(DP), 300(DP)
```

Supported releases 10.4.2.0 or later

show nve remote-vtep counters

Displays VXLAN packet statistics for a remote VTEP.

Syntax `show nve remote-vtep [ip-address] counters`

Parameters

- *ip-address* — Enter IP address of a remote VTEP.

Default Not configured

Command mode EXEC

Usage information

Use this command to display input and output statistics for VXLAN traffic on a remote VTEP. A VTEP is identified by its IP address.

Use the `clear nve remote-vtep [ip-address] counters` command to clear VXLAN packet statistics.

Example

```
OS10# show nve remote-vtep counters
Peer                Input (Packets/Bytes)       Output (Packets/Bytes)
10.10.10.10          857/8570                    257/23709
20.20.20.20          457/3570                    277/13709
```

Supported releases

10.4.2.0 or later

show nve vxlan-vni

Displays information about the VXLAN virtual networks on the switch.

Syntax

```
show nve vxlan-vni
```

Parameters

None

Default

Not configured

Command mode

EXEC

Usage information

Use this command to display information about configured VXLAN virtual networks. Each VXLAN virtual network is identified by its virtual-network ID.

Example

```
OS10# show nve vxlan-vni
VNI        Virtual-Network    Source-IP    Remote-VTEPs
-----------------------------------------------------
10000      1                  1.1.1.1      2.2.2.2
200        2                  1.1.1.1      2.2.2.2
300        300                1.1.1.1      2.2.2.2
```

Supported releases

10.4.2.0 or later

show virtual-network

Displays a virtual-network configuration, including all VXLAN configurations.

Syntax

```
show virtual-network [vn-id]
```

Parameters

vn-id Enter a virtual-network ID, from 1 to 65535.

Default

Not configured

Command mode

EXEC

Usage information

Use this command to display the VNID, port members, source interface, and remote tunnel endpoints of a VXLAN virtual network.

Example

```
OS10# show virtual-network
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD -
Unknown-Unicast-Drop
Un-tagged VLAN: 888
Virtual Network: 60000
   VLTi-VLAN: 2500
   Members:
      VLAN 1000: port-channel1, ethernet1/1/9, ethernet1/1/10
      VLAN 2500: port-channel1000
   VxLAN Virtual Network Identifier: 16775000
```

```
      Source Interface: loopback100(222.222.222.222)
      Remote-VTEPs (flood-list): 55.55.55.55(DP),77.1.1.1(DP)
```

Supported releases 10.4.2.0 or later

show virtual-network counters

Displays packet statistics for virtual networks.

Syntax `show virtual-network [vn-id] counters`

Parameters

vn-id	Enter a virtual-network ID, from 1 to 65535.

Default Not configured

Command mode EXEC

Usage information Use this command to monitor the packet throughput on virtual networks, including VXLANs. Use the `clear virtual-network counters` command to clear virtual-network counters.

Example

```
OS10# show virtual-network counters
Virtual-Network       Input (Packets/Bytes)       Output (Packets/Bytes)
1000                  857/8570                    257/23709
2000                  457/3570                    277/13709
```

Supported releases 10.4.2.0 or later

show virtual-network interface counters

Displays packet statistics for a member port, port channel, or VLAN in VXLAN virtual networks.

Syntax `show virtual-network interface {ethernet node/slot/port:subport | port-channel number} [vlan vlan-id] counters`

Parameters

interface ethernet *node/slot/port[:subport]*	Enter the port information for an Ethernet interface.
interface port-channel *number*	Enter a port-channel number, from 1 to 999 or 1001 to 2000.
vlan *vlan-id*	(Optional) Enter a VLAN ID, from 1 to 4093.

Default Not configured

Command mode EXEC

Usage information Use this command to monitor the packet throughput on a port interface that is a member of a VXLAN virtual network. Assign a VLAN member interface to only one virtual network. To clear VXLAN packet counters on a member port or VLAN members of a virtual network, use the `clear virtual-network interface {ethernet node/slot/port:subport | port-channel number} [vlan vlan-id] counters` command.

Example

```
OS10# show virtual-network interface 1/1/3 vlan 100 counters
Virtual-Network       Input (Packets/Bytes)       Output (Packets/Bytes)
2000                  457/3570                    277/13709
```

Supported releases 10.4.2.0 or later

show virtual-network interface

Displays the VXLAN virtual networks and server VLANs where a port is assigned.

Syntax

```
show virtual-network interface {ethernet node/slot/port:subport | port-channel number}
```

Parameters

interface ethernet *node/slot/port[:subport]*	Enter the port information for an Ethernet interface.
interface port-channel *number*	Enter a port-channel number, from 1 to 999 or 1001 to 2000.

Default Not configured

Command mode EXEC

Usage information Use this command to verify the VXLAN VLANs where an Ethernet port connected to downstream servers is a member.

Example

```
OS10# show virtual-network interface ethernet 1/1/1
Interface          Vlan      Virtual-network
ethernet1/1/1      100         1000
ethernet1/1/1      200         2000
ethernet1/1/1      300         3000
```

Supported releases 10.4.2.0 or later

show virtual-network vlan

Displays the VXLAN virtual networks where a VLAN is assigned.

Syntax

```
show virtual-network vlan vlan-id
```

Parameters

vlan *vlan-id*	Enter a VLAN ID, from 1 to 4093.

Default Not configured

Command mode EXEC

Usage information Use this command to verify the VXLAN virtual networks where a VLAN is assigned, including the port members connected to downstream servers.

Example

```
OS10# show show virtual-network 100
Vlan  Virtual-network   Interface
100    1000             ethernet1/1/1,ethernet1/1/2
```

Supported releases 10.4.2.0 or later

show vlan (virtual network)

Displays the VLANs assigned to virtual networks.

Syntax `show vlan`

Parameters None

Default Not configured

Command mode EXEC

Usage information Use this command to display the VLAN port interfaces that transmit VXLAN packets over a virtual network.

Example

```
OS10# show vlan
Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring
VLANs,
@ - Attached to Virtual Network
Q: A - Access (Untagged), T - Tagged

  NUM  Status  Description  Q  Ports
* 1    up                   A  Eth1/1/1-1/1/48
@ 100  up                   T  Eth1/1/2,Eth1/1/3
                            A  Eth1/1/1
@ 101  up                   T  port-channel5
  200  up                   T  Eth1/1/11-1/1/15
```

Supported releases 10.4.2.0 or later

source-interface loopback

Configures a dedicated Loopback interface as the source VTEP.

Syntax `source-interface loopback number`

Parameters

loopback *number*	Enter the Loopback interface used as the source interface of a VXLAN virtual tunnel, from 0 to 16383.

Default Not configured

Command mode NVE-INSTANCE

Usage information The IP address of the Loopback interface serves as the source IP address in encapsulated packets transmitted from the switch as an NVE VTEP.

- The Loopback interface must have an IP address configured. The Loopback IP address must be reachable from the remote VTEP.
- You cannot change the source interface if at least one VXLAN virtual network ID (VNID) is configured for the NVE instance.

Use this command in NVE mode to override a previously configured value and reconfigure the source IP address. The `no` version of this command removes the configured value.

Examples

```
OS10(config-nve)# source-interface loopback 1
```

Supported releases 10.4.2.0 or later

virtual-network

Creates a virtual network for VXLAN tunneling.

Syntax `virtual-network vn-id`

Parameters

vn-id	Enter the virtual-network ID, from 1 to 65535.

Default Not configured

Command mode CONFIGURATION

Usage information The virtual network operates as a L2 bridging domain. To add a VXLAN to the virtual network, use the `vxlan-vni` command. The `no` version of this command removes the configured virtual network.

Example

```
OS10(config)# virtual-network 1000
OS10(config-vn)#
```

Supported releases 10.4.2.0 or later

virtual-network untagged-vlan

Configures a dedicated VLAN for internal use to transmit untagged traffic on member ports in virtual networks on the switch.

Syntax `virtual-network untagged-vlan vlan-id`

Parameters

id	Enter the reserved untagged VLAN ID, from 1 to 4093.

Default Not configured

Command mode CONFIGURATION

Usage information The untagged VLAN ID is used internally for all untagged member interfaces that belong to virtual networks. You cannot use the reserved untagged VLAN ID for a simple VLAN bridge or for tagged traffic on member interfaces of virtual networks. The `no` version of this command removes the configured value.

Example

```
OS10(config)# virtual-network untagged-vlan 10
```

Supported releases 10.4.2.0 or later

vxlan-vni

Assigns a VXLAN ID to a virtual network.

Syntax `vxlan-vni vni`

Parameters

vni	Enter the VXLAN ID for a virtual network, from 1 to 16,777,215.

Default Not configured

Command mode VIRTUAL-NETWORK

Usage information This command associates a VXLAN ID number with a virtual network. The `no` version of this command removes the configured ID.

Example

```
OS10(conf-vn-100)# vxlan-vni 100
OS10(config-vn-vxlan-vni)#
```

Supported releases 10.4.2.0 or later

VXLAN MAC commands

clear mac address-table dynamic nve remote-vtep

Clears all MAC addresses learned from a remote VTEP.

Syntax `clear mac address-table dynamic nve remote-vtep ip-address`

Parameters

remote-vtep *ip-address*	Clear MAC addresses learned from the specified remote VTEP.

Default Not configured

Command mode EXEC

Usage information To display the MAC addresses learned from a remote VTEP, use the `show mac address-table nve remote-vtep` command. Use this command to delete all MAC address entries learned from a remote VTEP.

Example

```
OS10# clear mac address-table dynamic nve remote-vtep 32.1.1.1
```

Supported releases 10.4.2.0 or later

clear mac address-table dynamic virtual-network

Clears MAC addresses learned on all or a specified VXLAN virtual network.

Syntax `clear mac address-table dynamic virtual-network [interface {ethernet node/slot/port:subport | port-channel number} | local | vn-id [address mac-address | local]]`

Parameters

interface ethernet *node/slot/port[:subport]*	Clear all MAC addresses learned on the specified interface.
interface port-channel *number*	Clear all MAC addresses learned on the specified port channel.
virtual-network *vn-id*	Clear all MAC addresses learned on the specified virtual network, from 1 to 65535.
local	Clear only locally-learned MAC addresses.
vn-id	Clear learned MAC addresses on the specified virtual network, from 1 to 65535.
***vn-id* local**	Clear locally learned MAC addresses on the specified virtual network, from 1 to 65535.
vn-id* address *mac-address	Clear only the MAC address entry learned in the specified virtual network. Enter the MAC address in *EEEE.EEEE.EEEE* format.

Default Not configured

Command mode EXEC

Usage information Use this command with no optional parameters to delete all dynamic MAC address entries that are learned only on virtual-network bridges from the MAC address table. This command does not delete MAC address entries learned on simple VLAN bridges. Use the `show mac address-table virtual-network` command to display the MAC addresses learned on a virtual network.

Example

```
OS10# clear mac address-table dynamic virtual-network
```

Supported releases 10.4.2.0 or later

show mac address-table count extended

Displays the number of MAC addresses learned on all VLANs and VXLAN virtual networks.

Syntax `show mac address-table count extended [interface {ethernet node/slot/port:subport | port-channel number}]`

Parameters

interface ethernet *node/slot/port[:subport]*	Display the number of MAC addresses learned on all VLANs and VXLANs on the specified interface.
interface port-channel *number*	Display the number of MAC addresses learned on all VLANs and VXLANs on the specified port channel.

Default Not configured

Command mode EXEC

Usage information Use this command to display the number of MAC address entries learned on all VLANs and VXLAN virtual networks.

Example

```
OS10# show mac address-table count extended
MAC Entries for all vlans :
Dynamic Address Count :                  10
Static Address (User-defined) Count :    2
Total MAC Addresses in Use:              12
```

Supported releases 10.4.2.0 or later

show mac address-table count nve

Displays the number of MAC addresses learned on a VXLAN virtual network or from a remote VXLAN tunnel endpoint.

Syntax `show mac address-table count nve {vxlan-vni vni | remote-vtep ip-address}`

Parameters

vxlan-vni *vni*	Display MAC addresses learned on the specified VXLAN virtual network, from 1 to 16,777,215.
remote-vtep *ip-address*	Display MAC addresses learned from the specified remote VTEP.

Default Not configured

Command mode EXEC

Usage information Use the `clear mac address-table dynamic nve remote-vtep` command to delete all MAC address entries learned from a remote VTEP. Use the `clear mac address-table dynamic virtual-network vn-id` command to delete all dynamic MAC address entries learned on a virtual-network bridge.

Example

```
OS10# show mac address-table count nve vxlan-vni 1001
MAC Entries for all vlans :
Dynamic Address Count :                  1
```

```
Static Address (User-defined) Count :    0
Total MAC Addresses in Use:              1

OS10# show mac address-table count nve remote-vtep 32.1.1.1
MAC Entries for all vlans :
Dynamic Address Count :                  2
Static Address (User-defined) Count :    0
Total MAC Addresses in Use:              2
```

Supported releases 10.4.2.0 or later

show mac address-table count virtual-network

Displays the number of MAC addresses learned on virtual networks.

Syntax

```
show mac address-table count virtual-network [dynamic | local | remote |
static | interface {ethernet node/slot/port:subport | port-channel number}
| vn-id]
```

Parameters

dynamic	Display the number of local dynamically-learned MAC addresses.
local	Display the number of local MAC addresses.
remote	Display the number of MAC addresses learned from remote VTEPs.
static	Display the number of local statically-configured MAC addresses.
interface ethernet *node/slot/port[:subport]*	Display the number of MAC addresses learned on the specified interface.
interface port-channel *number*	Display the number of MAC addresses learned on the specified port channel.
vn-id	Display the number of MAC addresses learned on the specified virtual network, from 1 to 65535.

Default Not configured

Command mode EXEC

Usage information Use this command to display the number of MAC address entries learned on virtual networks in the MAC address table.

Example

```
OS10# show mac address-table count virtual-network
MAC Entries for all vlans :
Dynamic Address Count :                  8
Static Address (User-defined) Count :    0
Total MAC Addresses in Use:              8
```

Supported releases 10.4.2.0 or later

show mac address-table extended

Displays MAC addresses learned on all VLANs and VXLANs.

Syntax

```
show mac address-table extended [address mac-address | interface {ethernet
node/slot/port:subport | port-channel number} | static | dynamic]
```

Parameters

address *mac-address*	Display only information about the specified MAC address.
interface ethernet *node/slot/port[:subport]*	Display only MAC addresses learned on the specified interface.
interface port-channel *number*	Display only MAC addresses learned on the specified port channel.
static	Display only static MAC addresses.
dynamic	Display only dynamic MAC addresses.

Default Not configured

Command mode EXEC

Usage information By default, MAC learning from a remote VTEP is enabled. Use this command to verify the MAC addresses learned both on VXLAN virtual networks and VLANs on the switch. The `show mac address-table` command displays the MAC addresses learned only on LAN port and VLAN interfaces.

Example

```
OS10# show mac address-table extended
Virtual-Network  VlanId  MAC Address         Type      Interface/Remote-VTEP
-------------------------------------------------------------------------------
-                500     00:00:00:00:11:11   dynamic   ethernet1/1/31:1
-                500     00:00:00:00:44:44   dynamic   port-channel1000
-                1       aa:bb:cc:dd:f0:03   static    port-channel1000
-                500     aa:bb:cc:dd:f0:03   static    port-channel1000
-                4000    aa:bb:cc:dd:f0:03   static    port-channel1000
10000                    00:00:00:00:00:11   dynamic   ethernet1/1/31:1
10000            100     00:00:00:00:00:44   dynamic   port-channel1000
10000            100     00:00:00:00:00:55   dynamic   port-channel10
10000                    00:00:00:00:00:77   dynamic   VxLAN(32.1.1.1)
20000            300     00:00:00:00:00:22   dynamic   port-channel100
20000            300     00:00:00:00:00:33   dynamic   port-channel1000
20000            300     00:00:00:00:00:66   dynamic   port-channel10
20000                    00:00:00:00:00:88   dynamic   VxLAN(32.1.1.1)
```

Supported releases 10.4.2.0 or later

show mac address-table nve

Displays MAC addresses learned on a VXLAN virtual network or from a remote VXLAN tunnel endpoint.

Syntax `show mac address-table nve {vxlan-vni vni | remote-vtep ip-address}`

Parameters

vxlan-vni *vni*	Display MAC addresses learned on the specified VXLAN virtual network, from 1 to 16,777,215.
remote-vtep *ip-address*	Display MAC addresses learned from the specified remote VTEP.

Default Not configured

Command mode EXEC

Usage information Use the `clear mac address-table dynamic nve remote-vtep` command to delete all MAC address entries learned from a remote VTEP. Use the `clear mac address-table dynamic virtual-network vn-id` command to delete all dynamic MAC address entries learned on a virtual-network bridge.

Example

```
OS10# show mac address-table nve remote-vtep 32.1.1.1
Virtual-Network  VNI    MAC Address        Type     Remote-VTEP
-----------------------------------------------------------------
10000            9999   00:00:00:00:00:77  dynamic  VxLAN(32.1.1.1)
20000            19999  00:00:00:00:00:88  dynamic  VxLAN(32.1.1.1)

OS10# show mac address-table nve vxlan-vni 9999
Virtual-Network  VNI    MAC Address        Type     Remote-VTEP
-----------------------------------------------------------------
10000            9999   00:00:00:00:00:77  dynamic  VxLAN(32.1.1.1)
```

Supported releases 10.4.2.0 or later

show mac address-table virtual-network

Displays the MAC addresses learned on all or a specified virtual network.

Syntax `show mac address-table virtual-network [vn-id | local | remote | static | dynamic | address mac-address | interface {ethernet node/slot/port:subport | port-channel number}]`

Parameters

vn-id	Display only information about the specified virtual network.
local	Display only locally learned MAC addresses.
remote	Display only remote MAC addresses.
static	Display only static MAC addresses.
dynamic	Display only dynamic MAC addresses.
address *mac-address*	Display only information about the specified MAC address. Enter the MAC address in *EEEE.EEEE.EEEE* format.
interface ethernet *node/slot/port[:subport]*	Display only MAC addresses learned on the specified interface.
interface port-channel *number*	Display only MAC addresses learned on the specified port channel.

Default Not configured

Command mode EXEC

Usage information Use this command to verify the MAC addresses learned on VXLAN virtual networks. By default, MAC learning from a remote VTEP is enabled.

Example

```
OS10# show mac address-table virtual-network
Virtual-Network VlanId   MAC Address         Type    Interface/Remote-VTEP

20000           300      34:a0:a0:a1:a2:f6   dynamic  port-channel10
```

Supported releases	10.4.2.0 or later

Example: VXLAN with static VTEP

This example uses a typical Clos leaf-spine topology with static VXLAN tunnel endpoints (VTEPs) in VLT dual-homing domains. The individual switch configuration shows how to set up an end-to-end VXLAN. The underlay IP network routes advertise using OSPF.

- On VTEPs 1 and 2, access ports are assigned to the virtual network using a switch-scoped VLAN configuration.
- On VTEPs 3 and 4, access ports are assigned to the virtual network using a port-scoped VLAN configuration.
- Overlay routing between hosts in different IP subnets is configured on the VTEPs.

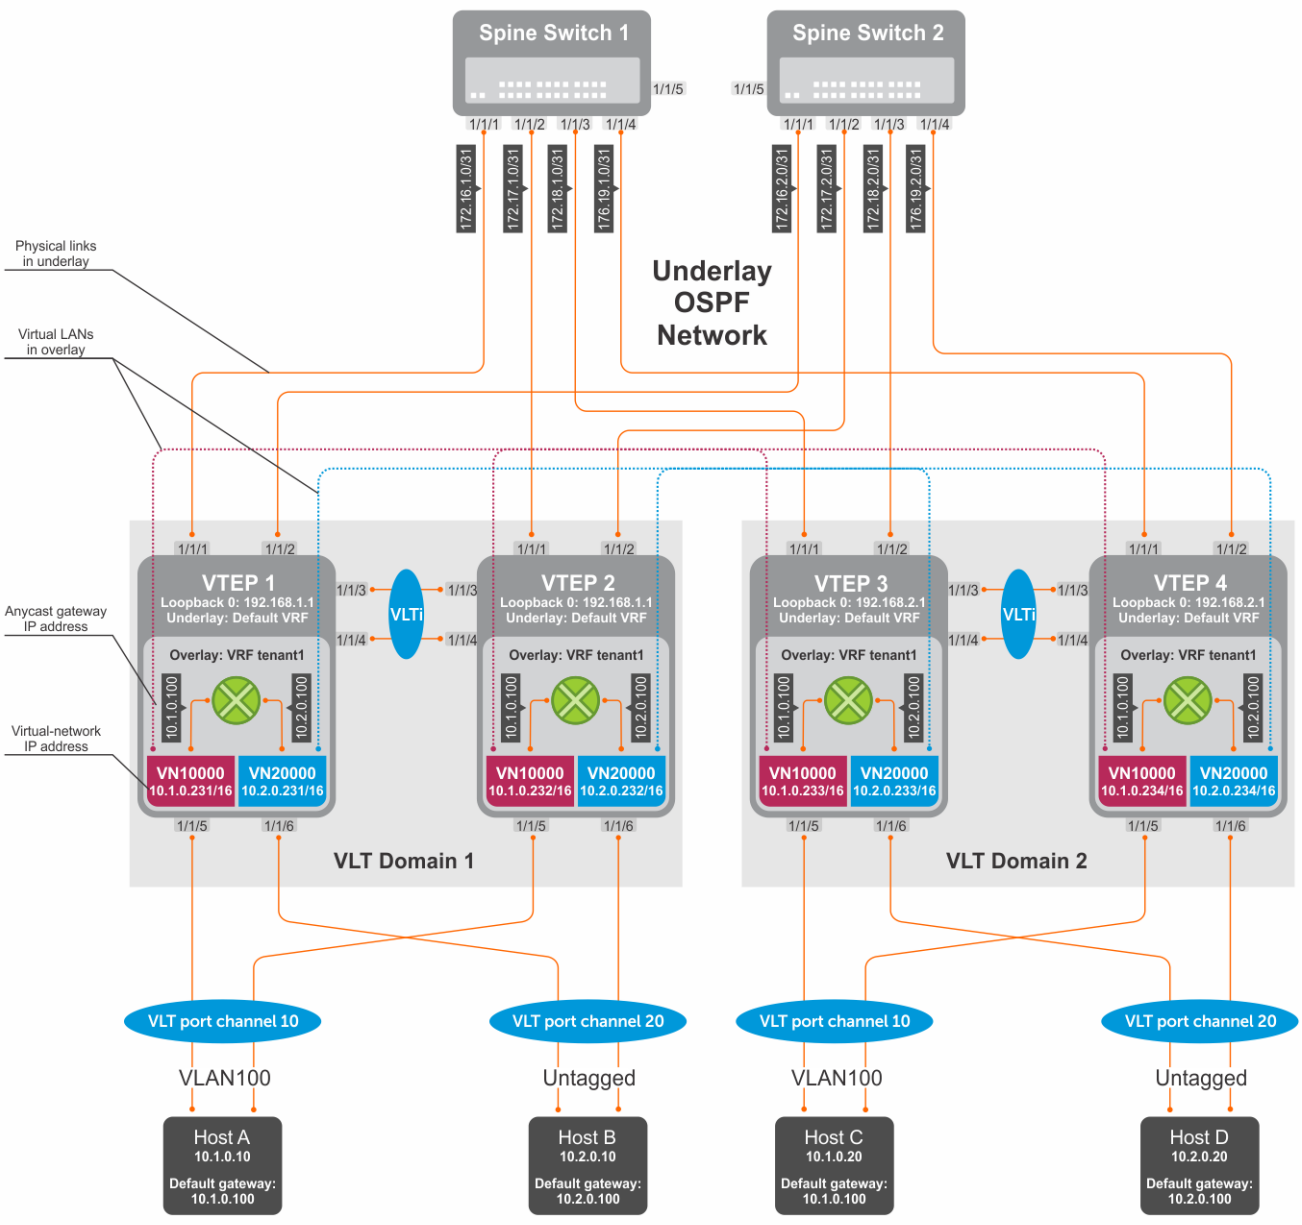

Figure 8. Static VXLAN use case

VTEP 1 Leaf Switch

1. Configure the underlay OSPF protocol.

Do not configure the same IP address for the router ID and the source loopback interface in Step 2.

```
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 172.16.0.1
OS10(config-router-ospf-1)# exit
```

2. Configure a Loopback interface.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# ip ospf 1 area 0.0.0.0
OS10(conf-if-lo-0)# exit
```

3. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

4. Configure VXLAN virtual networks with a static VTEP.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.2.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.2.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

5. Assign VLAN member interfaces to virtual networks.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
OS10(config)# interface vlan200
OS10(config-if-vl-100)# virtual-network 20000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
```

6. Configure access ports as VLAN members for switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport access vlan 200
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
```

```
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.16.1.0/31
OS10(conf-if-eth1/1/1)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.16.2.0/31
OS10(conf-if-eth1/1/2)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/2)# exit
```

8. Configure VLT

Configure a dedicated L3 underlay path to reach the VLT Peer in case of network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.1/30
OS10(config-if-vl-4000)# ip ospf 1 area 0.0.0.0
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure the VLTi member links.

```
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

9. Configure overlay IP routing

Create the tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure the anycast L3 gateway MAC address for all VTEPs.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing with an anycast gateway IP address for each virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(config-if-vn-10000)# ip vrf forwarding tenant1
OS10(config-if-vn-10000)# ip address 10.1.0.231/16
OS10(config-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(config-if-vn-10000)# no shutdown
OS10(config-if-vn-10000)# exit
OS10(config)# interface virtual-network 20000
OS10(config-if-vn-20000)# ip vrf forwarding tenant1
OS10(config-if-vn-20000)# ip address 10.2.0.231/16
OS10(config-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(config-if-vn-20000)# no shutdown
OS10(config-if-vn-20000)# exit
```

VTEP 2 Leaf Switch

1. Configure the underlay OSPF protocol.

Do not configure the same router ID on other VTEP switches.

```
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 172.17.0.1
OS10(config-router-ospf-1)# exit
```

2. Configure a Loopback interface.

The source-interface IP address must be same as the source-interface IP address on the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# ip ospf 1 area 0.0.0.0
OS10(conf-if-lo-0)# exit
```

3. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

4. Configure VXLAN virtual networks with a static VTEP.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.2.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.2.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

5. Assign a switch-scoped VLAN to a virtual network.

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
OS10(config)# interface vlan200
OS10(config-if-vl-100)# virtual-network 20000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
```

6. Configure access ports as VLAN members.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode access
OS10(conf-if-po-10)# switchport access vlan 200
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode access
OS10(conf-if-po-20)# switchport access vlan 200
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.17.1.0/31
OS10(conf-if-eth1/1/1)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.17.2.0/31
OS10(conf-if-eth1/1/2)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/2)# exit
```

8. Configure VLT

Configure a dedicated L3 underlay path to reach the VLT Peer in case of network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.2/30
OS10(config-if-vl-4000)# ip ospf 1 area 0.0.0.0
OS10(config-if-vl-4000)# exit
```

Configure a VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt port-channel 10
OS10(conf-if-po-10)# exit
```

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure a VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.2
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

9. Configure overlay IP routing

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast L3 gateway MAC address for all VTEPs.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing with anycast gateway IP address for each virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(config-if-vn-10000)# ip vrf forwarding tenant1
OS10(config-if-vn-10000)# ip address 10.1.0.232/16
OS10(config-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(config-if-vn-10000)# no shutdown
OS10(config-if-vn-10000)# exit
OS10(config)# interface virtual-network 20000
OS10(config-if-vn-20000)# ip vrf forwarding tenant1
OS10(config-if-vn-20000)# ip address 10.2.0.232/16
OS10(config-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(config-if-vn-20000)# no shutdown
OS10(config-if-vn-20000)# exit
```

VTEP 3 Leaf Switch

1. Configure the underlay OSPF protocol.

Do not configure the same IP address for the router ID and the source loopback interface in Step 2.

```
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 172.18.0.1
OS10(config-router-ospf-1)# exit
```

2. Configure a Loopback interface.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# ip ospf 1 area 0.0.0.0
OS10(conf-if-lo-0)# exit
```

3. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

4. Configure VXLAN virtual networks with a static VTEP.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.1.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.1.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

5. Configure a reserved VLAN ID for untagged member interfaces.

```
OS10(config)# virtual-network untagged-vlan 1000
```

6. Configure access ports.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

7. Add access ports to the VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn-10000)# exit
```

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn-20000)# exit
```

NOTE: This step shows how to add access ports using port-scoped VLAN-to-VNI mapping. You can also add access ports using a switch-scoped VLAN-to-VNI mapping. However, you cannot use both methods at the same time; you must use either a port-scoped or switch-scoped VLAN-to-VNI mapping.

8. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.18.1.0/31
OS10(conf-if-eth1/1/1)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.18.2.0/31
OS10(conf-if-eth1/1/2)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/2)# exit
```

9. Configure VLT

Configure VLTi VLAN for the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vlti-vlan 100
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vlti-vlan 200
OS10(config-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.9/30
OS10(config-if-vl-4000)# ip ospf 1 area 0.0.0.0
OS10(config-if-vl-4000)# exit
```

Configure a VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure a VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.3
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:dd:cc:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

10. Configure overlay IP routing

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast L3 gateway.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing with an anycast gateway IP address for each virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(config-if-vn-10000)# ip vrf forwarding tenant1
OS10(config-if-vn-10000)# ip address 10.1.0.233/16
OS10(config-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(config-if-vn-10000)# no shutdown
OS10(config-if-vn-10000)# exit
OS10(config)# interface virtual-network 20000
OS10(config-if-vn-20000)# ip vrf forwarding tenant1
OS10(config-if-vn-20000)# ip address 10.2.0.233/16
OS10(config-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(config-if-vn-20000)# no shutdown
OS10(config-if-vn-20000)# exit
```

VTEP 4 Leaf Switch

1. Configure the underlay OSPF protocol.

Do not configure the same IP address for the router ID and the source loopback interface in Step 2..

```
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 172.19.0.1
OS10(config-router-ospf-1)# exit
```

2. Configure a Loopback interface.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# ip ospf 1 area 0.0.0.0
OS10(conf-if-lo-0)# exit
```

3. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

4. Configure VXLAN virtual networks with a static VTEP.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.1.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# remote-vtep 192.168.1.1
OS10(config-vn-vxlan-vni-remote-vtep)# exit
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

5. Configure a reserved VLAN ID for untagged member interfaces.

```
OS10(config)# virtual-network untagged-vlan 1000
```

6. Configure access ports.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

7. Add access ports to the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn-20000)# exit
```

8. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.19.1.0/31
OS10(conf-if-eth1/1/1)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.19.2.0/31
```

```
OS10(conf-if-eth1/1/2)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/2)# exit
```

9. Configure VLT

Configure VLTi VLAN for the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vlti-vlan 200
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vlti-vlan 100
OS10(config-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.10/30
OS10(config-if-vl-4000)# ip ospf 1 area 0.0.0.0
OS10(config-if-vl-4000)# exit
```

Configure a VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure a VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.4
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:dd:cc:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

10. Configure overlay IP routing.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast L3 gateway for all VTEPs in all virtual networks.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing with an anycast gateway IP address for each virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(config-if-vn-10000)# ip vrf forwarding tenant1
OS10(config-if-vn-10000)# ip address 10.1.0.234/16
OS10(config-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(config-if-vn-10000)# no shutdown
OS10(config-if-vn-10000)# exit
OS10(config)# interface virtual-network 20000
OS10(config-if-vn-20000)# ip vrf forwarding tenant1
OS10(config-if-vn-20000)# ip address 10.2.0.234/16
OS10(config-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(config-if-vn-20000)# no shutdown
OS10(config-if-vn-20000)# exit
```

Spine Switch 1

1. Configure downstream ports on underlay links to leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.1.1/31
OS10(conf-if-eth1/1/1)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.1.1/31
OS10(conf-if-eth1/1/2)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/2)# exit

OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.1.1/31
OS10(conf-if-eth1/1/3)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.1.1/31
OS10(conf-if-eth1/1/4)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/4)# exit
```

2. Configure the underlay OSPF protocol.

```
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 172.200.0.1
OS10(config-router-ospf-1)# exit
```

Spine Switch 2

1. Configure downstream ports on underlay links to leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.2.1/31
OS10(conf-if-eth1/1/1)# ip ospf 1 area 0.0.0.0
```

```
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.2.1/31
OS10(conf-if-eth1/1/2)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/2)# exit

OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.2.1/31
OS10(conf-if-eth1/1/3)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.2.1/31
OS10(conf-if-eth1/1/4)# ip ospf 1 area 0.0.0.0
OS10(conf-if-eth1/1/4)# exit
```

2. Configure the underlay OSPF protocol.

```
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 172.201.0.1
OS10(config-router-ospf-1)# exit
```

BGP EVPN for VXLAN

Ethernet Virtual Private Network (EVPN) is a control plane for VXLAN that reduces flooding in the network and resolves scalability concerns. EVPN uses MP-BGP to exchange information between VTEPs. EVPN was introduced in RFC 7432 and is based on BGP MPLS-based VPNs. RFC 8365 describes VXLAN-based EVPN.

The MP-BGP EVPN control plane provides protocol-based remote VTEP discovery, and MAC and ARP learning. This configuration reduces flooding related to L2 unknown unicast traffic. The distribution of host MAC and IP reachability information supports virtual machine (VM) mobility and scalable VXLAN overlay network designs.

The BGP EVPN protocol groups MAC addresses and ARP/neighbor addresses under EVPN instances (EVIs) to exchange them between VTEPs. In OS10, each EVI is associated with a VXLAN VNI in 1:1 mapping.

Benefits of a BGP EVPN-based VXLAN

- Eliminates the flood-and-learn method of VTEP discovery by enabling control-plane learning of end-host L2 and L3 reachability information.
- Minimizes network flooding of unknown unicast and broadcast traffic through EVPN-based MAC and IP route advertisements on local VTEPs.
- Provides support for host mobility.

NOTE: This feature is not supported on the E3224F-ON platform.

BGP EVPN compared to static VXLAN

OS10 supports two types of VXLAN NVO overlay networks:

- Static VXLAN
- BGP EVPN

Configure and operate static VXLANs and BGP EVPNs for VXLAN in the same way:

- Manually configure the overlay and underlay networks.
- Manually configure each virtual network and VNI.
- Manually configure access port membership in a virtual network.
- Existing routing protocols provision and learn underlay reachability to VTEP peers.

However, static VXLANs and BGP EVPNs for VXLAN differ as described:

Table 73. Differences between Static VXLAN and VXLAN BGP EVPN

Static VXLAN	VXLAN BGP EVPN
To start sending and receiving virtual-network traffic to and from a remote VTEP, manually configure the VTEP as a member of the virtual network.	No manual configuration is required. Each remote VTEP is automatically learned as a member of a virtual network from the EVPN routes received from the remote VTEP. After a remote VTEP address is learned, VXLAN traffic is sent to, and received from, the VTEP.
Data packets learn remote hosts after decapsulation of the VXLAN header in the data plane.	Remote host MAC addresses are learned in the control plane using BGP EVPN Type 2 routes and MAC/IP advertisements.

VXLAN BGP EVPN operation

The EVPN address family allows VXLAN to carry EVPN routes in External Border Gateway Protocol (eBGP) and Internal Border Gateway Protocol (iBGP) sessions. In a data center network, use eBGP or iBGP for route exchange in both the IP underlay network and EVPN.

The following sample BGP EVPN topology shows a leaf-spine data center network where eBGP exchanges IP routes in the IP underlay network, and exchanges EVPN routes in the VXLAN overlay network. All spine nodes are in one autonomous system—AS 65535. All leaf nodes are in another autonomous system—AS 65000.

To advertise underlay IP routes, eBGP peer sessions establish between the leaf and spine nodes using an interface IP address. To advertise EVPN routes, eBGP peer sessions between the leaf and spine nodes use a Loopback IP address.

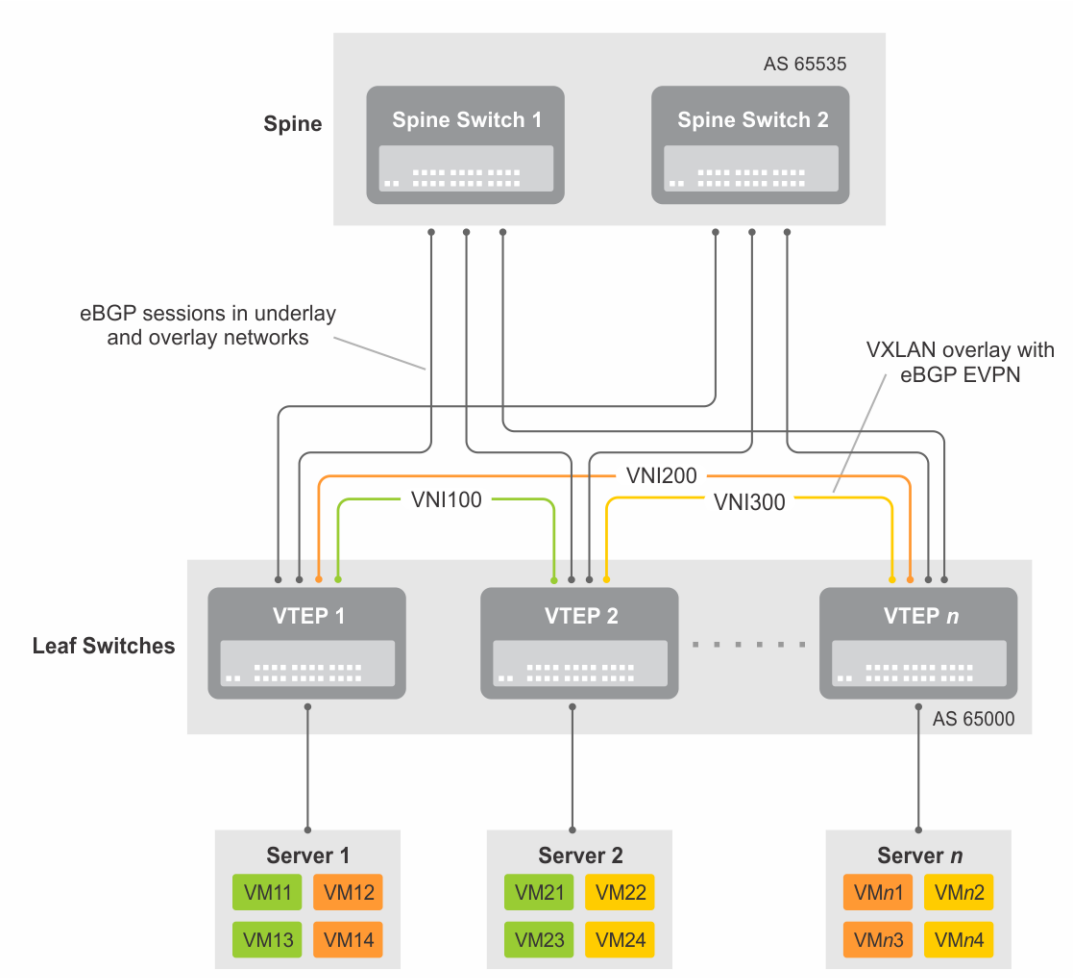

Figure 9. BGP EVPN topology

Leaf nodes

Leaf nodes are typically top-of-rack (ToR) switches in a data center network. They act as the VXLAN tunnel endpoints and perform VXLAN encapsulation and decapsulation. Leaf nodes also participate in the MP-BGP EVPN to support control plane and data plane functions.

Control plane functions include:

- Initiate and maintain route adjacencies using any routing protocol in the underlay network.
- Advertise locally learned routes to all MP-BGP EVPN peers.
- Process the routes that are received from remote MP-BGP EVPN peers and install them in the local forwarding plane.

Data plane functions include:

- Encapsulate server traffic with VXLAN headers and forward the packets in the underlay network.
- Decapsulate VXLAN packets received from remote VTEPs and forward the native packets to downstream hosts.
- Perform underlay route processing, including routing based on the outer IP address.

Spine nodes

The role of a spine node changes based on its control plane and data plane functions. Spine nodes participate in underlay route processing to forward packets and in the overlay network to advertise EVPN routes to all MP-BGP peers.

Control plane functions include:

- Initiate BGP peering with all neighbor leaf nodes.
- Advertise BGP routes to all BGP peers.
- Initiate and maintain routing adjacencies with all leaf and spine nodes in the underlay network.

Data plane functions include:

- Perform only underlay route processing based on the outer header in VXLAN encapsulated packets.
- Does not perform VXLAN encapsulation or decapsulation.

The BGP EVPN running on each VTEP listens to the exchange of route information in the local overlay, encodes the learned routes as BGP EVPN routes, and injects them into BGP to advertise to the peers. Tunnel endpoints advertise as Type 3 EVPN routes. MAC/IP addresses advertise as Type 2 EVPN routes.

EVPN instance

An EVPN instance (EVI) spans across the VTEPs that participate in an Ethernet VPN. Each virtual-network tenant segment, that is advertised using EVPN, must associate with an EVI. In OS10, configure EVIs in auto-EVI or manual configuration mode.

- Auto-EVI — After you configure a virtual network on a VTEP, auto-EVI mode automatically creates an EVPN instance. The route distinguisher (RD) and route target (RT) values automatically generate:
  - The EVI ID autogenerates with the same value as the virtual-network ID (VNID) configured on the VTEP and associates with the VXLAN network ID (VNI).
  - A Route Distinguisher autogenerates for each EVI ID. A Route Distinguisher maintains the uniqueness of an EVPN route between different EVPN instances.
  - A Route Target import and export value autogenerates for each EVI ID. A Route Target determines how EVPN routes distribute among EVPN instances.
- Manual EVI configuration — To specify the RD and RT values, manually configure EVPN instances and associate each EVI with the overlay virtual network using the VXLAN VNI. The EVI activates only when you configure the virtual network, RD, and RT values.

  In manual EVI configuration, you can either manually configure the RD and RT or have them autoconfigured.

NOTE: Dell Technologies recommends using manual EVI for interoperability with network equipment vendors.

Route distinguisher

The RD is an 8-byte identifier that uniquely identifies an EVI. Each EVPN route is prefixed with a unique RD and exchanged between BGP peers, making the tenant route unique across the network. In this way, overlapping address spaces among tenants are supported.

You can autogenerate or manually configure a RD for each EVI. In auto-EVI mode, the RD is autogenerated. In manual EVI configuration mode, you can autogenerate or manually configure the RD.

As specified in RFC 7432, a manually configured RD is encoded in the format: *4-octet-ipv4-address*:*2-octet-number*. An autogenerated RD has the format: *vtep-ip-address*:*evi*.

Route target

While a RD maintains the uniqueness of an EVPN route among different EVIs, a RT controls the way the EVPN routes are distributed among EVIs. Each EVI is configured with an import and export RT value. BGP EVPN routes advertise for an EVI carry

the export RT associated with the EVI. A receiving VTEP downloads information in the BGP EVPN route to EVIs that have a matching import RT value.

You can autogenerate or manually configure the RT import and export for each EVI. In auto-EVI mode, RT autogenerates. In manual EVI configuration mode, you can autogenerate or manually configure the RT.

The RT consists of a 2-octet *type* and a 6-octet *value*. If you autoconfigure a RT, the encoding format is different for a 2-byte and 4-byte AS number (ASN):

- For a 2-byte ASN, the RT *type* is set to 0200 (Type 0 in RFC 4364). The RT *value* is encoded in the format that is described in section 5.1.2.1 of RFC 8365: *2-octet-ASN*: *4-octet-number*, where the following values are used in the *4-octet-number* field:
  - Type: 1
  - D-ID: 0
  - Service-ID: VNI
- For a 4-byte ASN, the RT *type* is set to 0202 (Type 2 in RFC 4364). The RT *value* is encoded in the format: *4-octet-ASN*: *2-octet-number*, where the *2-octet-number* field contains the EVI ID. In auto-EVI mode, the EVI ID is the same as the virtual network ID (VNID). In 4-byte ASN deployment, OS10 supports RT autoconfiguration if the VNID-to-VNI mapping is the same on all VTEPs.

NOTE: Dell Technologies recommends using manual route-target for interoperability with network equipment vendors.

Configure BGP EVPN for VXLAN

To set up BGP EVPN service in a VXLAN overlay network:

1. Configure the VXLAN overlay network. If you enable routing for VXLAN virtual networks, Integrated Routing and Bridging (IRB) for BGP EVPN is automatically enabled. For more information, refer to the *VXLAN* chapter of the *Dell SmartFabric OS10* User guide.
2. Configure BGP to advertise EVPN routes.
3. Configure EVPN, including the VNI, RD, and RT values associated with the EVPN instance.
4. Verify the BGP EVPN configuration.

Configuration

1. Configure BGP to advertise EVPN routes.

   EVPN requires that you establish MP-BGP sessions between leaf and spine nodes in the underlay network. On each spine and leaf node, configure at least two BGP peering sessions:

   - A directly connected BGP peer in the underlay network to advertise VTEP and Loopback IP addresses using the IPv4 unicast address family.
   - A BGP peer in the overlay network to advertise overlay information using the EVPN address family. In BGP peer sessions in the overlay, activate only the EVPN address family.

   For each BGP peer session in the underlay network:

   a. Create a BGP instance in CONFIGURATION mode. You enter router BGP configuration mode.

   ```
   router bgp as-number
   ```

   b. Assign an IP address to the BGP instance in ROUTER-BGP mode.

   ```
   router-id ip-address
   ```

   c. Enter IPv4 address-family configuration mode from ROUTER-BGP mode.

   ```
   address-family ipv4 unicast
   ```

   d. Advertise the IPv4 prefix to BGP peers in the address family in ROUTER-BGP-ADDRESS-FAMILY mode.

   ```
   network ip-address/mask
   ```

   e. Return to ROUTER-BGP mode.

   ```
   exit
   ```

f. Configure the BGP peer address in ROUTER-BGP mode.

```
neighbor ip-address
```

g. Assign the BGP neighbor to an autonomous system in ROUTER-BGP-NEIGHBOR mode.

```
remote-as as-number
```

h. Enable the peer session with the BGP neighbor in ROUTER-BGP-NEIGHBOR mode.

```
no shutdown
```

i. Return to ROUTER-BGP mode.

```
exit
```

For each BGP peer session in the overlay network:

a. Configure the BGP peer using its Loopback IP address on the VTEP in ROUTER-BGP mode.

```
neighbor loopback-ip-address
```

b. Assign the BGP neighbor Loopback address to the autonomous system in ROUTER-BGP-NEIGHBOR mode. The neighbor Loopback IP address is the source interface on the remote VTEP.

```
remote-as as-number
```

c. Use the local Loopback address as the source address in BGP packets sent to the neighbor in ROUTER-BGP-NEIGHBOR mode.

```
update-source loopback0
```

d. Send an extended community attribute to the BGP neighbor in ROUTER-BGP-NEIGHBOR mode.

```
send-community extended
```

e. Enable the peer session with the BGP neighbor in ROUTER-BGP-NEIGHBOR mode.

```
no shutdown
```

f. Configure the L2 VPN EVPN address family for VXLAN host-based routing to the BGP peer in ROUTER-BGP-NEIGHBOR mode.

```
address-family l2vpn evpn
```

g. Enable the exchange of L2VPN EVPN addresses with the BGP peer in ROUTER-BGP-NEIGHBOR mode.

```
activate
```

h. Return to ROUTER-BGP mode.

```
exit
```

i. Enter IPv4 address-family configuration mode from ROUTER-BGP mode.

```
address-family ipv4 unicast
```

j. Disable the exchange of IPv4 addresses with BGP peers in ROUTER-BGP mode.

```
no activate
```

k. Return to ROUTER-BGP-NEIGHBOR mode.

```
exit
```

l. (Optional) If all the leaf switches are configured in the same ASN:

- On each leaf switch, enter L2VPN EVPN address-family configuration mode from ROUTER-BGP-NEIGHBOR mode. Activate the exchange of L2VPN EVPN addresses with BGP peers. Configure the switch to accept a route with the local AS number in updates received from a peer in ROUTER-BGP-NEIGHBOR-AF mode.

```
OS10(config-router-bgp-neighbor)# address-family l2vpn evpn
OS10(config-router-neighbor-af)# activate
OS10(config-router-neighbor-af)# allowas-in 1
OS10(config-router-neighbor-af)# exit
OS10(config-router-bgp-neighbor)# exit
```

- On each spine switch, disable sender-side loop detection to leaf switch neighbors in ROUTER-BGP-NEIGHBOR-AF mode.

```
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
```

m. (Optional) In a VLT deployment, on each leaf switch, configure the number of multi-hop peer routes in ROUTER-BGP-NEIGHBOR mode to ensure that the BGP EVPN peer session establishes over the VLT VTEP peer if all local links to spine switches are down.

```
OS10(conf-router-neighbor)# ebgp-multihop 1
```

2. Configure EVPN.

An EVPN instance (EVI) spans across the VTEPs that participate in the EVPN. In OS10, configure an EVI in auto-EVI or manual configuration mode.

- **Auto-EVI mode**
  a. Enable the EVPN control plane in CONFIGURATION mode.

```
evpn
```

  b. Enable auto-EVI creation for overlay virtual networks in EVPN mode. Auto-EVI creation is supported only if BGP EVPN is used with 2-byte AS numbers and if at least one BGP instance is enabled with the EVPN address family. No further manual configuration is allowed in auto-EVI mode.

```
auto-evi
```

- **Manual EVI configuration mode**
  a. Enable the EVPN control plane in CONFIGURATION mode.

```
evpn
```

  b. Manually create an EVPN instance in EVPN mode. The range is from 1 to 65535.

```
evi id
```

  c. Configure the Route Distinguisher in EVPN EVI mode.

```
rd {A.B.C.D:[1-65535] | auto}
```

  Where:
  - `rd A.B.C.D:[1-65535]` configures the RD with a 4-octet IPv4 address then a 2-octet-number.
  - `rd auto` automatically generates the RD.

  d. Configure the RT values in EVPN EVI mode.

```
route-target {auto | value [asn4] {import | export | both}}
```

  Where:
  - `route-target auto` auto-configures an import and export value for EVPN routes.
  - `route-target value [asn4]{import | export | both}` configures an import or export value for EVPN routes in the format *2-octet-ASN*:*4-octet-number* or *4-octet-ASN*:*2-octet-number*.
    - The *2-octet* ASN number is 1 to 65535.
    - The *4-octet* ASN number is 1 to 4294967295.

    To configure the same value for the RT import and export values, use the `both` option. `asn4` advertises a 2-byte AS number as a 4-byte route target value. If you specify the `asn4` option, configure the VXLAN network

ID associated with the EVPN instance in EVPN EVI mode, from 1 to 16,777,215. Configure the same VNI value that you configure for the VXLAN virtual network. For more information, refer to the *VXLAN* chapter of the *Dell SmartFabric OS10* User guide.

```
vni vni
```

3. Verify the BGP EVPN configuration.

Display the EVPN instance configuration

```
OS10# show evpn evi 1
EVI : 65447, State : up
  Bridge-Domain       : (Virtual-Network)100, (VNI)100
  Route-Distinguisher : 1:110.111.170.102:65447(auto)
  Route-Targets       : 0:101:268435556(auto) both
  Inclusive Multicast : 110.111.170.107
```

Display the VXLAN overlay for the EVPN instance

```
OS10# show evpn vxlan-vni
VXLAN-VNI  EVI  Virtual-Network-Instance
100001     1    1
100010     2    2
```

Display the BGP neighbors in the EVPN instances

```
OS10# show ip bgp neighbors 110.111.170.102
BGP neighbor is 110.111.170.102, remote AS 100, local AS 100 internal link

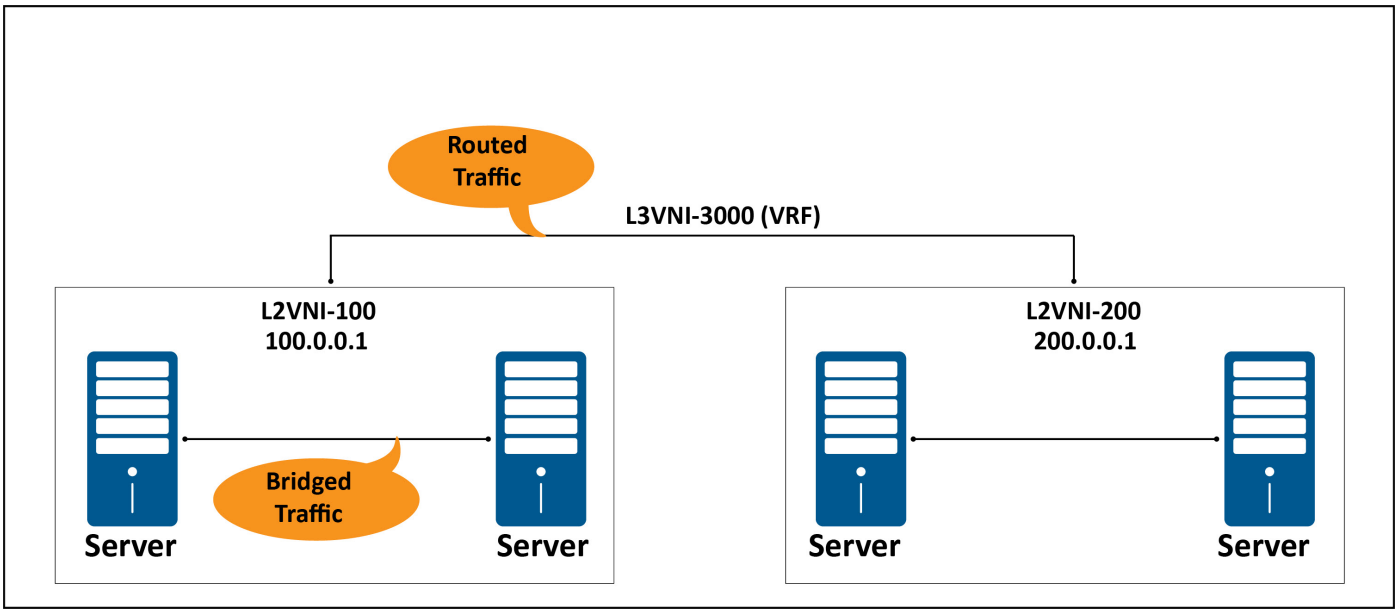
BGP EVPN with VXLAN overlay - Multi tenancy

In BGP-EVPN with VXLAN overlay, multitenancy is achieved by logically isolating the traffic from different entities of a tenant in a shared VXLAN network. The tenant can be a group of hosts or servers and tenant entities can be group of VMs in a server or applications within a VM. Each such tenant entity can be mapped to a VLAN or VRF depending on the type of network segments (Layer 2 or Layer 3) they belong to.

Each tenant that belongs to the same Layer 2 network is mapped to a VLAN and in turn each such VLAN is mapped to the same Layer 2 VNI. So, traffic between the tenant entities belonging to the same Layer 2 virtual network is tagged with a unique Layer 2 VNI and this traffic is bridged across the VXLAN network. The traffic between different Layer 2 virtual networks is routed. This routing is achieved by grouping Layer 2 virtual networks into a VRF. Each Layer 2 virtual network is assigned with an IP address.

The following figures captures the logical separation of tenant traffic based on the network segment they belong to:



Layer 2 Multi tenancy

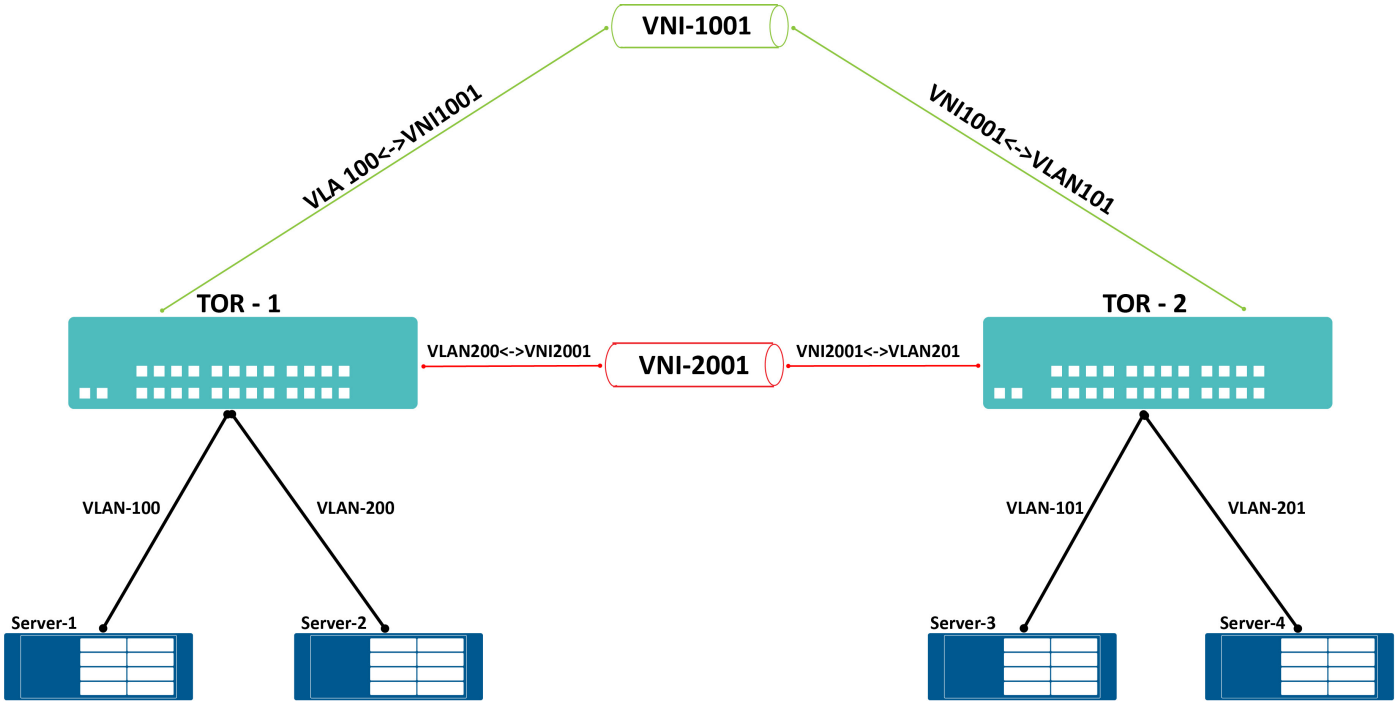
In SmartFabric OS10, Layer 2 multitenancy is achieved in the following two ways: VLAN attach Mode and Port-scoped VLAN Mode.

VLAN attach mode

In this mode, each tenant entity is mapped with one VLAN and each such VLAN is mapped 1:1 with one Layer 2 VNI.

In the following example, Server-1 and Server-3 belong to the same tenant.

Traffic from Server-1 is tagged with VLAN-100 and it is mapped to VNI1001. Similarly, traffic from Server-3 is tagged with VLAN-101 and mapped to VNI1001.



Port-scoped VLAN mode

In the port-scoped VLAN to VNI mapping mode, instead of attaching a VLAN to the virtual network, packets tagged with a specific vlan-id on a specific port are assigned to a virtual network for bridging.

To assign a packet tagged with a specific vlan-id on a specific port to a virtual network, perform the following steps:

1. Create a virtual network for VLAN tunnelling.

   ```
   OS10(config)# virtual-network 10000
   ```

2. Assign a member interface corresponding to a specific vlan-id on a specific port to the virtual network:

   ```
   OS10(config-vn)# member interface ethernet1/1/1 vlan 10
   ```

   Each vlan-id on a port cannot be a part of more than one virtual network bridge.

For example, if you apply the following configuration, an error message appears indicating that the operation is not allowed:

```
(config)# virtual-network 10
(config-vn)# member-interface ethernet 1/1/1 vlan 6
(config)# virtual-network 11

(config-vn)# member-interface ethernet 1/1/1 vlan 6
```

The following error message appears:

```
% Error: Operation not allowed. Reason:Only one VLAN can be mapped to an interface in a
particular Virtual-Network.
```

To reserve vlan-id to be used internally:

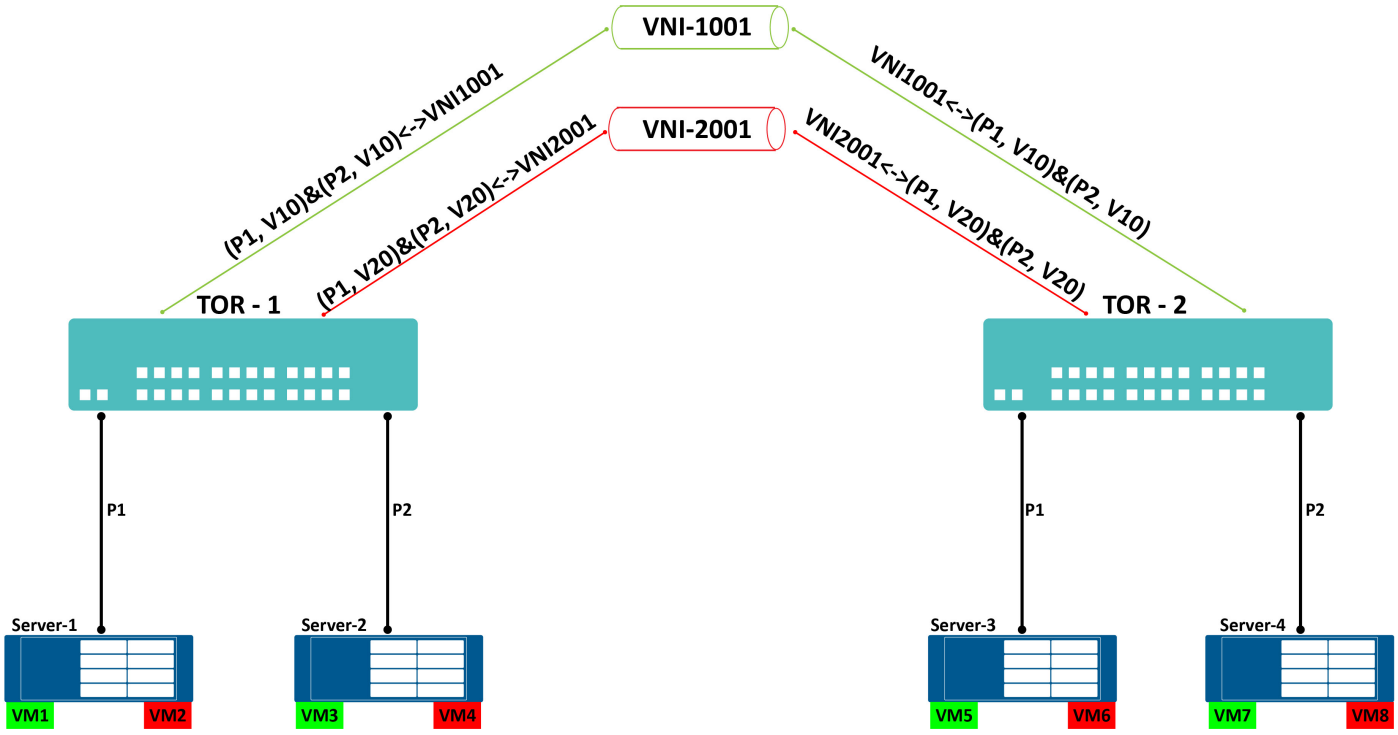
- `OS10(config)# virtual-network untagged-vlan 4001`

NOTE: Due to hardware limitations, you cannot use the default VLAN as the reserved VLAN for untagged virtual network members. The hardware expects a port configured as an untagged member of the virtual network to also be an untagged member of the reserved VLAN used (unlike the case of the tagged PV membership to virtual network). However, an untagged virtual network member port cannot be an untagged member of the default VLAN; because it results in traffic leaking. Therefore, a dedicated VLAN that does not have any other ports to be reserved as the untagged VLAN is required.

To add untagged ports using the port-scoped method, first reserve a vlan-id that you want to use internally. You need to reserve only one such VLAN for the entire switch; this VLAN is used internally for all untagged ports in all virtual networks.

Use the following commands to add the untagged port to the virtual network:

```
OS10(config)# virtual-network 10000
OS10(config-vn)# member interface ethernet1/1/1 untagged
```

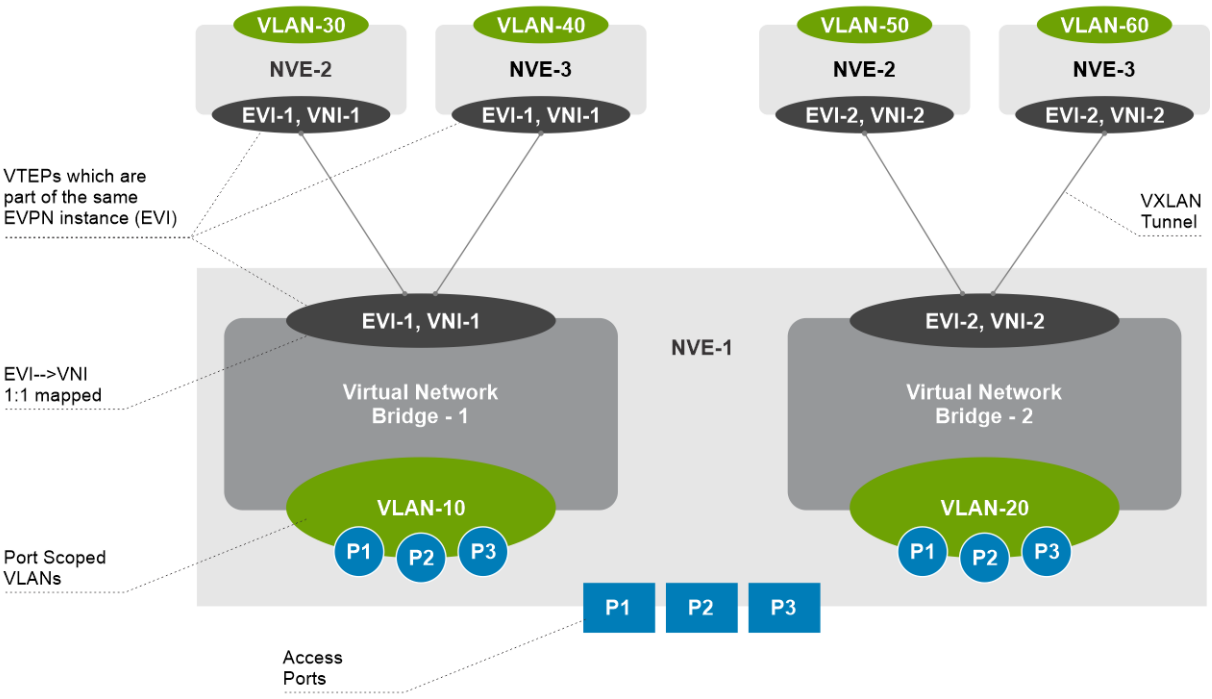


Enabling EVPN services

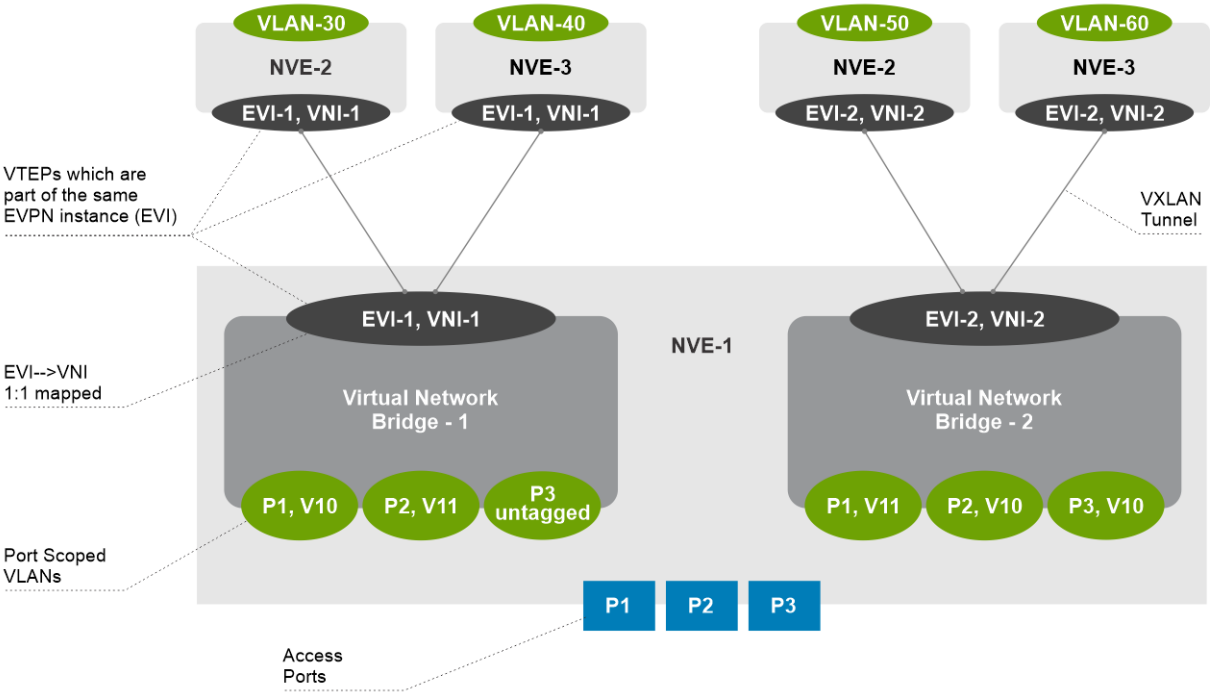
Enabling MP-BGP EVPN service involves the following sequence:

1. Setting up MP-BGP control plane to advertise L2VPN or EVPN address family in BGP control plane.
2. Enabling EVPN.
3. Setting up the EVPN Instance (EVI), which spans across multiple PEs or VTEPs participating in EVPN services.
4. Associating a virtual network (VNI) with EVI setting up the forwarding path, to perform VXLAN encapsulation and decapsulation.

The following diagram depicts an NVE (NVE-1) participating in two EVPN instances (EVI-1, EVI-2), in which two other NVEs (NVE-2, NVE3) are also participating:



The following diagram depicts an NVE (NVE1) with P1, P2, P3, V10, and V11:



Setting up MP-BGP control plane

Each NVE participating in EVPN should peer up with each other NVE through MP-BGP control plane. They also advertise their EVPN processing capability. In SmartFabric OS10, this feature is enabled using the following commands:

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 45.0.0.1
```

```
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
```

- You must enable EVPN address family on the BGP peers to carry EVPN routes.

Enable EVPN

The following sequence depicts the enabling of EVPN service in SmartFabric OS10:

1. `switch(config)# evpn`

   Enabling EVPN triggers BGP to advertise EVPN capability (with AFI=25 and SAFI=70) to all the BGP peers in a given AS.

2. `switch(config)# no evpn`

   Disabling EVPN triggers BGP to withdraw the EVPN capability.

Configuring an EVPN Instance (EVI)

Auto EVI Configuration mode

In this mode, an EVI is auto-allocated for each virtual network configured in the NVE.

The EVI Index is the same as the virtual network identifier.

The Route Distinguisher(RD) and the Route Target(RT) are also automatically generated as follows:

- The Route Distinguisher is Type 1 - derived from the overlay network source IP and the EVI index (Virtual-Network ID).
- The Route Target varies depending on the AS:
  - 2 byte AS: RT will be Type 0 derived from the 2 byte AS and the 3 byte VNI. (Type Encoded as 0x0002).
  - 4 byte AS: RT will be Type 2 derived from the 4 byte AS and the 2 byte EVI which is same as the virtual network ID that you have configured. (Type encoded as 0x0202)

This command is rejected if there are no BGP instances with EVPN address family enabled.

The Route target used for any given VNI needs to be identical on all VTEPs in order for EVPN to synchronize MAC addresses on all VTEPs.

In the case of 2 byte AS this is true for auto-derivation, since all the VTEPs are in the same AS and use the same VNI. In the case of 4 byte AS, the EVPN RFC recommends configuring manual Route target. However, SmartFabric OS10 switches support auto-derived Route targets even in case of 4 byte AS as follows:

- The Route target requires a 2 byte representation for each VNI.
- On SmartFabric OS10, the 2 byte representation for a VNI is its corresponding virtual network identifier.
- As long as the virtual network ID to VNI mapping is configured identical on all VTEPs, they will be able to use auto-derived Route targets even with 4 byte AS.

```
switch(config)# evpn
switch(config-evpn)# auto-evi
```

Explicit EVI Configuration mode

In this mode, an EVI is configured explicitly.

This mode allows User to configure Route Distinguisher and Route Targets explicitly.

The EVPN RFC recommends configuring manual Route Target in case of 4 byte AS.

```
switch(config)# evpn
switch(config-evpn)# evi 100
```

Auto configuration of RD and RT

The Route distinguisher is Type 1 - derived from the overlay network source IP and the user supplied EVI index.

The Route target is Type 2 - derived from the 4 byte AS and the user supplied EVI Index. (Type Encded as 0x0202).

```
switch(config)# evpn
switch(config-evpn)# evi 10
switch(config-evpn-evi-10)# rd
A.B.C.D:[1..65535]  4-octet-ipv4addr:2-octet-number
  auto                Enable auto rd mode
switch(config-evpn-evi-10)# rd auto

switch(config)# evpn
switch(config-evpn)# evi 10
switch(config-evpn-evi-10)# rd auto
switch(config-eqpn-evi-10)# route-target
    {import | export | both} {<value>|auto}
switch(config-evpn-evi-10)# route-target both auto
```

Explicit configuration of RD and RT

The following command sequence depicts the explicit configuration of RD and RT:

```
switch(config)# evpn
switch(config-evpn)# evi 10
switch(config-evpn-evi)# rd
A.B.C.D:[1..65535]  4-octet-ipv4addr:2-octet-number
  auto                Enable auto rd mode
switch(config-evpn-evi)# rd 111.111.111.111:65536

switch(config)# evpn
switch(config-evpn)# evi 10
switch(config-evpn-evi-10)# rd 111.111.111.111:65535
switch(config-eqpn-evi-10)# route-target
{import | export | both} {<value>|auto}
switch(config-evpn-evi-10)# route-target import
  1..65535:1..4294967295  2-octet-asn:4-octet-number
  1..4294967295:1..65535  4-octet-asn:2-octet-number
  auto                    Enable auto route target mode
switch(config-evpn-evi-10)# route-target import 1:2
switch(config-evpn-evi-10)# route-target import 1:3
  asn4  force 4-octet-asn:2-octet-number
switch(config-evpn-evi-10)# route-target import 1:3 asn4
switch(config-evpn-evi-10)# route-target export 1:4
```

NOTE:

1. If you want to configure both import and export RT with the same value, SmartFabric OS10 recommends to use `route-target both value` or `route-target both auto` commands.
2. If you explicitly configure, RT import and export with the same value, the last configured <type, value> overwrites the old configured <type, value>

   ```
   Example :
   route-target import 1:2
   route-target export  1:2  <--- This overwrites/deletes RT import value.
   route-target both 1:2      <--- Will configure RT export/import values with 1:2

   LVTEP1(config-evpn-evi-400)# route-target 1:1
     asn4                  Force 4-octet-asn:2-octet-number
     <import/export/both>  Set route target type
   ```

3. By default, Route target values are configured with 2Byte ASN value. If you want to explicitly advertise a 4Byte ASN, use the following configuration:

   ```
   route-target 1:2 asn4  <--- This enables, 4byte ASN to be encoded in the Route
   Target
   ```

Associate VNI with EVI (Setting up EVPN Control Plane)

A VNI has to be associated with an EVI, to advertise, VNI association with EVI in the MP-BGP control plane.

```
switch(config)# evpn
switch(config-evpn)# evi 10
switch(config-evpn-evi-10)# vni 100
```

Setting up VXLAN forwarding

To setup the VXLAN forwarding, for the VNI associated with an EVI, you must configure a virtual network with the given VNI.

```
switch(config)# evpn
switch(config-evpn)# evi 10
switch(config-evpn-evi-10)# vni 100

switch(config)# virtual-network bridge-1
switch(config-vn)# vxlan-vni 100
switch(config-vn)# member interface ethernet1/1/1 vlan 10
```

NOTE:

- With this configuration, BGP notifies all the BGP peers with inclusive multicast route.
- On Local NVE, VXLAN forwarding path is enabled.
- On the attached member interfaces, MAC learning is enabled.

EVPN configuration events and system behavior

In SmartFabric OS10, configuring EVPN instances and attaching virtual networks to EVPN instances, can happen in any order. The following section summarizes, configuration sequence and SmartFabric OS10 behavior in each such event:

Prerequisites:

- Each Leaf and Spine in the network needs to be configured with eBGP as IGP protocol and neighborship should be enabled with both "address family ipv4 unicast" and "address family l2vpn evpn".
- In this example, numbered interfaces (connected interfaces) are used for the underlay BGP peering. These sessions distribute the peer reachability. They only distribute the IPV4 address family routes.
- Loopback addresses are used for the overlay sessions. They are enabled with "l2vpn evpn" address family and distribute only the EVPN routes.

The following table captures the EVPN instance configuration sequence:

Table 74. EVPN instance configuration sequence

Spine	Leaf
OS10# show running-configuration bgp ! router bgp 100 router-id 110.111.170.195 ! address-family ipv4 unicast redistribute connected ! neighbor 11.1.1.2 remote-as 101 no shutdown ! address-family ipv4 unicast no sender-side-loop-detection ! neighbor 110.111.170.102 ebgp-multihop 2 remote-as 101 send-community extended	OS10# show running-configuration bgp ! router bgp 101 router-id 110.111.170.102 ! address-family ipv4 unicast redistribute connected ! neighbor 11.1.1.1 remote-as 100 no shutdown ! address-family ipv4 unicast allowas-in 1 ! neighbor 110.111.170.195 ebgp-multihop 2 remote-as 100 send-community extended

Table 75. Explicit EVI configuration events (continued)

Current system state --->Current configuration event | | V	Start up 1. evpn disabled	2. evi 10 vni 100 rd <x:y> rt <x:y>
2. virtual-network 10 vxlan-vni 100 .	N/A	• BGP Peer is notified with inclusive multicast route update. • Forwarding path is enabled with VXLAN overlay. • Remote MAC learning is disabled.
3. evi deleted	N/A	• BGP Peer is notified with inclusive multicast route withdrawal. • All the advertised local MAC routes are withdrawn.
4. virtual-network deleted	N/A	• BGP peer is notified that inclusive multicast route is withdraw • Forwarding path is disabled for VXLAN overlay. • All the advertised local MAC routes are withdrawn.

The following table captures the configuration events in Auto EVI configuration mode:

Table 76. Auto EVI configuration events

Current system state --->Current configuration event | | V	Start up 1. evpn disabled	2. auto-evi
1. evpn	BGP peer is notified with EVPN capability	N/A
2. virtual-network 10 vxlan-vni 100 .	N/A	• A new EVI with VNI 100 is created automatically. • RD and RT are generated automatically. • BGP Peer is notified with inclusive multicast route update. • Forwarding path is enabled with VXLAN overlay. • Remote MAC learning is disabled.
4. virtual-network deleted	N/A	• EVI with VNI 100 is deleted. • BGP Peer is notified with inclusive multicast route withdrawal notification. • Forwarding path is disabled for VXLAN overlay. • All the advertised local MAC routes are withdrawn.

EVPN constructs

EVPN provides constructs that are required to enable VXLAN overlay in Data Centers using MP-BGP control plane.

The following table captures the features that are supported to enable the VXLAN Overlay, these features form the basic constructs for EVPN:

Table 77. Features supported to enable VXLAN overlay

Feature name	SmartFabric OS10 support
Advertising the BGP capability supporting the AFI of 25 (L2VPN) and a SAFI of 70 (EVPN).	10.4.2
Exchange and understand the EVPN NLRI from the MP-BGP peers.	10.4.2
Supporting the following EVPN Route types: • Type 1 - Ethernet Auto-Discovery (A-D) route • Type 2 - MAC/IP Advertisement route • Type 3 - Inclusive Multicast Ethernet Tag route • Type 4 - Ethernet Segment route	10.4.2 (Only Type-2 and Type-3 routes)
Support following EVPN service interface types: • VLAN-based service interfaces.	10.4.2
Control plane MAC learning using MAC or IP advertisement route.	10.4.2
Auto-derived route targets.	10.4.2
MAC mobility procedures.	10.4.2
Ingress replication for BUM traffic	10.4.2

EVPN service types

This section describes various EVPN service types.

The following table captures the various EVPN service types:

Table 78. EVPN service types

Service type	Steps	Supported in Dell SmartFabric OS10	Description
VLAN based	1. VLAN --> VNI: 1:1 2. VNI --> EVI: 1:1 3. Single FDB per VLAN 4. VLAN is stripped at encapsulation 5. VLAN translation: Yes	Yes	
VLAN bundle	1. VLAN --> VNI: All:1 2. VNI --> EVI: 1:1 3. Single FDB for all VLANs 4. VLAN is carried in the packet 5. VLAN translation: No	No	Port based	1. VLAN --> VNI: N:1 2. VNI --> EVI: 1:1 3. Single FDB: Yes 4. VLAN is carried in the packet 5. VLAN translation: No	No	Special case of VLAN bundle

Table 78. EVPN service types (continued)

Service type	Steps	Supported in Dell SmartFabric OS10	Description
VLAN aware bundle	1. VLAN --> VNI: 1:1 2. VNI --> EVI: N:1 3. Single FDB per VLAN 4. VLAN is stripped at encapsulation 5. VLAN translation: Yes	No	Port based VLAN aware	1. VLAN --> VNI: 1:1 2. VNI --> EVI: All:1 3. Single FDB per VLAN 4. VLAN is stripped at encapsulation 5. VLAN translation: No	No	Special case of VLAN aware bundle

EVPN route types

The EVPN NLRI is carried in MP-BGP advertisements with an Address Family Identifier (AFI) of 25 (L2VPN) and a Subsequent Address Family Identifier (SAFI) of 70 (EVPN).

The following table captures the various EVPN route types:

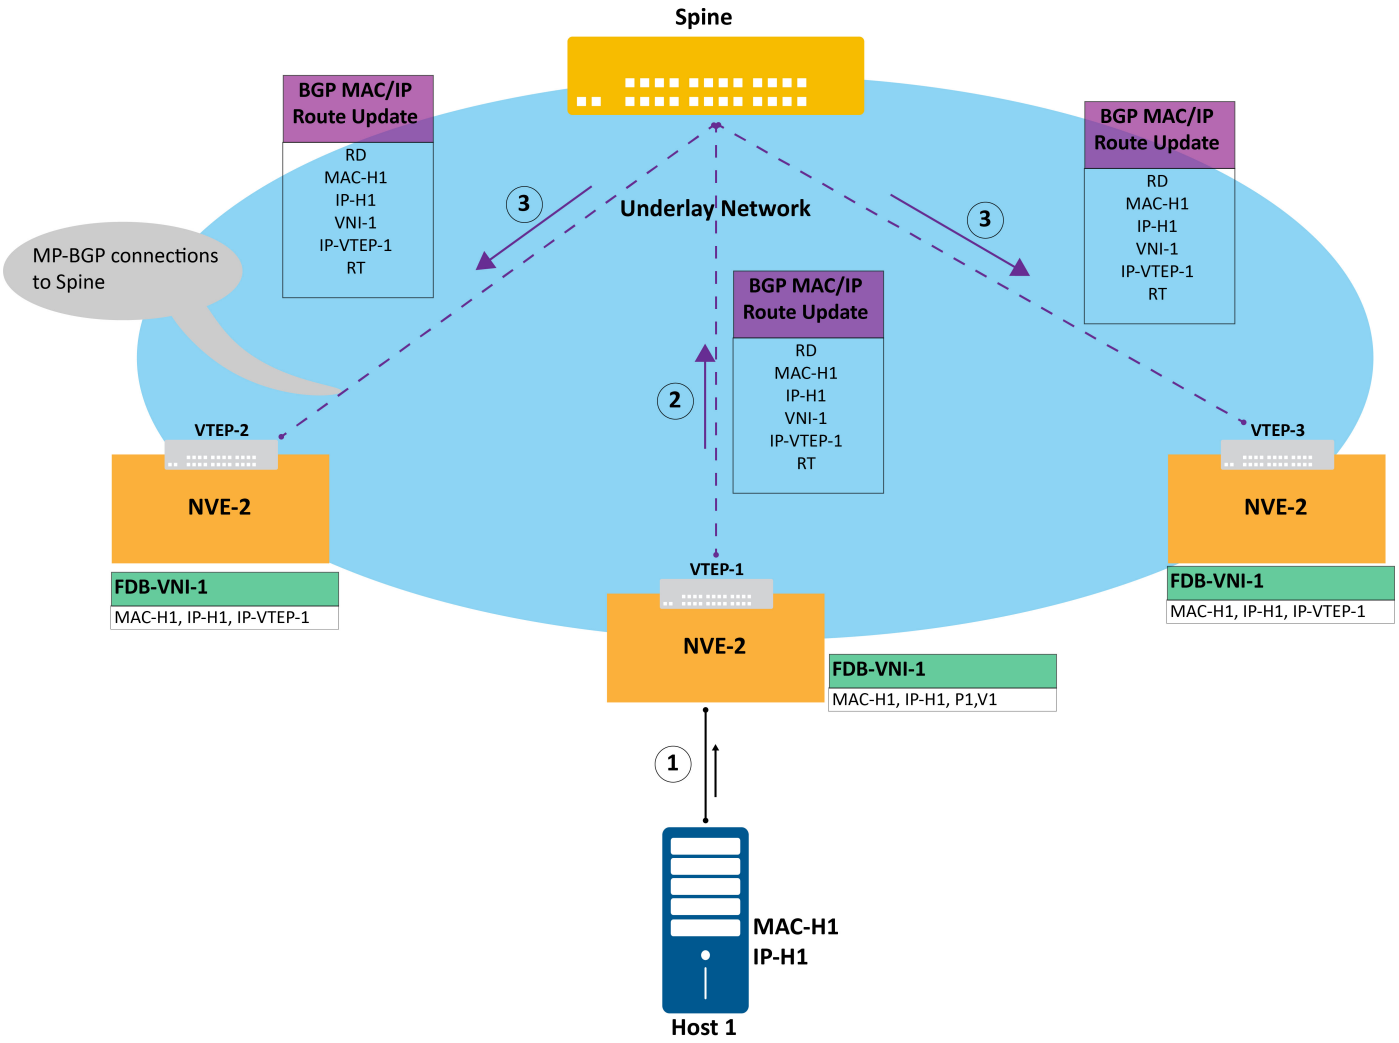
Table 79. EVPN route types

Route type	Description	Usage	Optional attributes carried in each	Supported release
2	MAC or IP -VNI Advertisement Route	Unicast forwarding , Proxy ARP Default gateway	MAC mobility extended community, Default gateway	10.4.2
3	Inclusive Multicast Route	BUM Traffic	PMSI tunnel attributes	10.4.2
5	IP Prefix Route	IP Route Advertisement	N/A	10.5.x.x

MAC learning using EVPN control plane

This section describes MAC learning using EVPN control plane.

The following figure illustrates local and remote MAC learning:



In this topology diagram, NVE-1, NVE-2, and NVE-3 are peering with the Spine switch. VTEP-1 learns the MAC and IP addresses of the connected Host H1, when H1 either sends an ARP request for remote Host or Gratuitous ARP. VTEP-1 also learns about Host1 being part of VNI-1 as it is connected by Port P1, VLAN V1. (P1,V1) is configured to be part of the bridge domain VNI-1. VTEP-1 advertises this information about H1 to all the remote VTEPs using MP-BGP EVPN control plane.

The following captures the route updates consisting of L2VPN AFI and EVPN SAFI values along with the NLRI attributes:

Table 80. NLRI attributes

NLRI attributes	Description
Route Distinguisher RD	Encoded as 8 Byte value <Type+IP address of VTEP-1+EVI>
MAC-H1	MAC address of the Host attached to the VTEP-1
IP-H1	IP Address of the Host attached to the VTEP-1
VNI-1	VNID of the Bridge domain that Host is part of
IP-VTEP-1	IP Address of the VTEP-1 itself as the Next Hop to reach the Host H1
RT - Export	Export value of the Route Target

When the remote VTEPs receive this MAC or IP route update, they compare the RT export attribute with the local import attributes. If they match, the route is downloaded and installed in the respective FDB.

MAC events and Dell SmartFabric OS10 behavior

The following table summarizes the behavior of SmartFabric OS10 for various events that trigger the MAC processing:

Prerequisites:

- Underlay IGP neighborship is established with BGP.
- BGP Peering with L2VPN is established.
- EVPN service is enabled.
- EVI is configured with VNI in the control plane.
- Virtual network configured with VNI and VXLAN overlay is enabled in the forwarding path.

Table 81. Behavior of SmartFabric OS10 for various events - Local MACs

Local MACs **Events**	**System behavior**
VLAN is attached to Virtual Network.	Expectation: MAC Learning is enabled on all the VLAN member interfaces. MACs learnt on these member interfaces are advertised to the BGP Peers. ● MACs learnt on the VLAN prior to attachment with virtual-network are all pulled by the virtual-network and are published one at a time. ● EVPN control plane advertises the MAC or IP route to the BGP peer (in this case to the Spine), which in turn advertises it to all the NVE peers in the EVPN instance
A new MAC learnt from one of the VLAN SubIfs	Expectation: The learnt MAC is advertised to the BGP peers. ● MAC is programmed in the local FDB of the virtual-network. ● Virtual-network published the MAC. ● EVPN control plane advertises the MAC or IP route to the BGP peer (in this case to the Spine), which in turn advertises it to all the NVE peers in the EVPN instance
New interface added to the attached VLAN	Expectation: MAC learning is enabled on the VLAN member interfaces. MACs learnt on these member interfaces are advertised to the BGP peers. ● MACs learnt on the interface prior to the addition to VLAN are all pulled by virtual-network and are published one at a time. ● EVPN control plane advertises the MAC or IP route to the BGP peer (in this case to the Spine), which in turn advertises it to all the NVE peers in the EVPN instance
VLAN SubIntf operationally goes down or Interface is deleted from the VLAN	Expectation: MACs learnt on this interface are withdrawn. BGP sends MAC withdraw notification to all the BGP peers. ● MAC deletion on a virtual-network is published to EVPN control plane. ● MACs are deleted from the local FDB. ● EVPN control plane advertises the MAC or IP route to the BGP peer (in this case to the Spine), which in turn advertises it to all the NVE peers in the EVPN instance
VLAN deleted from virtual-network	Expectation: MACs learnt on all the VLAN member interfaces are withdrawn. BGP sends MAC withdraw notification to all the BGP peers. ● Virtual-network publishes the MAC delete one-by-one to the EVPN control plane. ● MACs are deleted from the local FDB. ● EVPN control plane advertises the MAC or IP route to the BGP peer (in this case to the Spine), which in turn advertises it to all the NVE peers in the EVPN instance
Virtual-network delete or VNI delete from virtual-network	Expectation: All the Local MACs on the virtual-network are withdrawn. BGP sends MAC withdraw notification to all the BGP peers.

Table 81. Behavior of SmartFabric OS10 for various events - Local MACs (continued)

Local MACs Events	System behavior
	• Virtual-network publishes the MAC delete one-by-one to the EVPN control plane. • MACs are deleted from the local FDB. • EVPN control plane advertises the MAC or IP route to the BGP peer (in this case to the Spine), which in turn advertises it to all the NVE peers in the EVPN instance • EVPN control plane is withdraw along with the inclusive multicast route (with PMSI) attribute from all the NVE Peers.
Clear all local MACs	Expectation: All the Local MACs on the virtual-network are withdrawn. BGP sends MAC withdraw notification to all the BGP peers. • Virtual-network flushes all MACs in the FDB. • Virtual-network publishes the MAC delete one-by-one to the EVPN control plane. • EVPN control plane is withdraw along with the inclusive multicast route (with PMSI) attribute from all the NVE Peers.
Delete EVI or Delete VNI from EVI	Expectation: All the Local MACs on the virtual-network are withdrawn. BGP sends MAC withdraw notification to all the BGP peers. • EVPN control plane advertises MAC or IP withdraw notification to all the NVE peers. • EVPN control plane deletes its MAC database. • EVPN control plane deletes all the remote endpoints from the corresponding virtual-network.

The following table summarizes the behavior of SmartFabric OS10 for various events that trigger the MAC processing:

Table 82. Behavior of SmartFabric OS10 for various events - Remote MACs

Remote MACs Events	System behavior
MAC learnt from remote peer	Expectation: Remote MACs learnt are programmed in the local FDB. • EVPN control plane populates the virtual-network with remote MAC. • Virtual-network programs the MAC in FDB. • Additionally, if this is the first ever MAC learnt from the remote peer, EVPN control plane configures this remote-endpoint in the virtual-network. The remote-mac learnt on the network port, from this remote-endpoint is disabled.
MAC withdraw from the remote peer	Expectation: Remote MAC is deleted from the Local FDB. • EVPN control plane deletes the MAC from virtual-network. • Virtual-network deletes the MAC entry from the FDB. • Additionally, if this is the last MAC being withdrawn from the remote peer, EVPN control plane deletes this remote-endpoint in the virtual-network.
BGP peer down	Expectation: All the remote MACs learnt from the peer are deleted from the local FDB. • EVPN control plane deletes all the MACs learnt from remote BGP peer from the virtual-network.

Table 82. Behavior of SmartFabric OS10 for various events - Remote MACs (continued)

Remote MACs Events	System behavior
	• Virtual-network deletes all the remote MAC entries from the FDB. • EVPN control plane removes the remote-endpoints from the virtual-network after the last remote MAC is removed from the virtual-network.
Clear all remote MACs	Expectation: All the remote MACs learnt from the peer are deleted from the local FDB. • Virtual-network deletes all the remote MACs from the FDB. • Virtual-network publishes the MAC delete notification one-by-one to the EVPN control plane. • EVPN control plane re-adds each remote MAC to virtual-network. • Virtual-network programs the MAC in FDB.
Virtual-network delete or VNI delete from virtual-network	Expectation: All the Local and remote MACs learnt from the peer are deleted from the local FDB. • Virtual-network publishes the VN delete. • EVPN control plane deletes the EVPN bridge domain by withdrawing the inclusive multicast route (with PMSI) attribute from all the NVE peers. • Virtual-network publishes the MAC delete notification one-by-one to the EVPN control plane. • EVPN control plane deletes from its local database.
Delete EVI or Delete VNI from EVI	Expectation: All the remote MACs learnt from the peer are deleted from the local FDB. • EVPN control plane deletes all the remote-MACs from the corresponding virtual-network. • EVPN control plane deletes all the remote endpoints from the corresponding virtual-network.

MAC mobility

In a typical Data Center environment, VM's hosted in one server attached to a VTEP, can be moved to a different server attached to another VTEP, to facilitate the Workload mobility. This situation creates a unique problem of the same VM MAC being advertised by two VTEPs till the MAC entry is aged out from the VTEP, which is initially advertised. It also leads to traffic block-holing for a brief period of time. EVPN provides a mechanism to avoid this problem, by attaching a sequence number for each MAC advertised by a VTEP in the EVPN control plane. This sequence number is part of MAC mobility extended community, that is attached to each MAC advertisement.

When a VTEP learns a new MAC address from its attached hosts or servers and if that MAC address was previously advertised by another VTEP, it includes the MAC mobility extended community with an incremented sequence number in the MAC advertisement. After receiving this advertisement, the VTEP, which advertised the old MAC route, will initiate the MAC withdrawal, thus eliminating the traffic block-holing.

In this topology diagram, NVE-1, NVE-2, and NVE-3 are peering with the Spine switch. VTEP-1 learns the MAC and IP addresses of the connected Host H1, when H1 either sends an ARP request for remote Host or Gratuitous ARP. VTEP-1 also learns about Host1 being part of VNI-1 as it is connected by Port P1, VLAN V1. (P1,V1) is configured to be part of the bridge domain VNI-1. VTEP-1 advertises this information about H1 to all the remote VTEPs using MP-BGP EVPN control plane.

The following table captures the static MAC events and the Dell SmartFabric OS10 behavior:

Table 83. Static MAC events and SmartFabric OS10 behavior

Static MAC event	SmartFabric OS10 behavior
Static local MAC configured on a Virtual-network	• Virtual-network populates the static MAC in the local FDB.

Table 83. Static MAC events and SmartFabric OS10 behavior (continued)

Static MAC event	SmartFabric OS10 behavior
	• Virtual-network publishes the MAC to EVPN control plane.
Received a Static MAC from the Remote NVE	• EVPN control plane adds the static MAC to the virtual-network. • Virtual-network programs the MAC as static in its FDB.

BUM traffic handling

EVPN provides mechanisms in which each PE or VTEP that is destined to receive BUM traffic, advertises an inclusive multicast ethernet tag EVPN route (Type-3) for a given EVPN bridge domain or EVI.

This behavior is accompanied by provider multicast service interface (PMSI) tunnel attribute, which specifies the Tunnel Type (for example, Ingress Replication), Encapsulation type (VXLAN), to be used to forward the traffic to the VTEP or PE, and the routable address of the PE or VTEP.

Dell SmartFabric OS10 supports ingress replication of the BUM traffic to all the remote VTEPs that advertised the inclusive multicast EVPN route in a given EVI.

VXLAN BGP EVPN routing

This section describes how EVPN implements overlay routing between L2 segments associated with EVIs belonging to the *same* tenant on a VTEP. *IETF draft draft-ietf-bess-evpn-inter-subnet-forwarding-05* describes EVPN inter-subnet forwarding, Integrated Routing and Bridging (IRB), and how to use EVPN with IP routing between L2 tenant domains.

You set up overlay routing by assigning a VRF to each tenant, creating a virtual-network interface, and assigning an IP subnet in the VRF to each virtual-network interface. The VTEP acts as the L3 gateway that routes traffic from one tenant subnet to another in the overlay before encapsulating it in the VXLAN header and transporting it over the underlay fabric. On virtual networks that associate with EVIs, EVPN IRB is enabled only after you create a virtual-network interface.

When you enable IRB for a virtual network/EVI, EVPN operation on each VTEP also advertises the local tenant IP-MAC bindings learned on the EVPN-enabled virtual networks to all other VTEPs. The local tenant IP-MAC bindings are learned from ARP or ICMPv6 protocol operation. They advertise as EVPN Type-2 BGP route updates to other VTEPs, each of whom then imports and installs them as ARP/IPv6 neighbor entries in the dataplane.

To enable efficient traffic forwarding on a VTEP, OS10 supports distributed gateway routing. A distributed gateway allows multiple VTEPs to act as the gateway router for a tenant subnet. The VTEP that is located nearest to a host acts as its gateway router.

To enable L3 gateway/IRB functionality for BGP EVPN, configure a VXLAN overlay network and enable routing on a switch:

1. Create a non-default VRF instance for overlay routing. For multi-tenancy, create a VRF instance for each tenant.
2. Configure globally the anycast gateway MAC address used by all VTEPs.
3. Configure a virtual-network interface for each virtual network, (optional) assign it to the tenant VRF, and configure an IP address. Then enable the interface.
4. Configure an anycast gateway IP address for each virtual network. OS10 supports distributed gateway routing.

EVPN supports different types of IRB routing for tenants, VMs, and servers, that connect to each VTEP:

- Centralized routing: For each tenant subnet, one VTEP is designated as the L3 gateway to perform IRB inter-subnet routing. All other VTEPs perform L2 bridging.
- Distributed routing: For each tenant subnet, all VTEPs perform L3 gateway routing for the tenant VMs and servers connected to a VTEP. In a large multi-tenant network, distributed routing allows for more efficient bandwidth use and traffic forwarding. IRB routing is performed either:
  - Only on an ingress VTEP.
  - On both ingress and egress VTEPs.

Asymmetric IRB routing

In asymmetric IRB routing, IRB routing is performed only on ingress VTEPs. Egress VTEPs perform L2 bridging in the tenant subnet.

An ingress VTEP directly routes packets to a destination host MAC address in the destination virtual-network VNI. An egress VTEP only bridges packets to a host by removing the VXLAN header and forwarding a packet to the local Layer 2 domain using the VNI-to-VLAN mapping.

The ingress VTEP is configured with all destination virtual networks, and has the ARP entries and MAC addresses for all destination hosts in its hardware tables. Each VTEP learns the host MAC and MAC-to-IP bindings using ARP snooping for local addresses and type-2 route advertisements from remote VTEPs.

For VXLAN BGP EVPN examples that use asymmetric IRB, see Example: VXLAN with BGP EVPN and Example: VXLAN BGP EVPN — Multiple AS topology.

Symmetric IRB routing

In symmetric IRB routing, both ingress and egress VTEPs perform IRB routing and bridging for a tenant subnet. The ingress VTEP routes packets to an egress VTEP MAC address in an intermediate virtual-network VNI. The egress VTEP then routes the packet again to the destination host in the destination virtual-network VNI.

Using the L3 VNI associated with each tenant VRF, an ingress VTEP routes all traffic for the prefix to an egress VTEP on the L3 VNI. The egress VTEP routes from the L3 VNI to the destination virtual network or bridge domain. The L3 VNI does not have to be associated with an IP address; routing is set up in the data plane using the egress VTEP's MAC address. This behavior is known as IP-VRF to IP-VRF interface-less routing.

The ingress VTEP does not have to be configured with every destination virtual network; it must have the ARP and MAC addresses only to the egress VTEP, not to each host connected to the VTEP. For this reason, symmetric IRB routing allows the overlay network to scale larger than asymmetric routing. Assign the same router MAC address to each VLT peer in a VTEP VLT domain.

Each VTEP learns host MAC and MAC-to-IP bindings using ARP snooping for local addresses, and type-2 and type-5 route advertisements from remote VTEPs. In addition to L3 VNI-connected networks, type-5 route advertisements communicate external routes from a border leaf VTEP to all other VTEPs.

For a VXLAN BGP EVPN example that uses symmetric IRB and Type-5 route, see Example: VXLAN BGP EVPN — Symmetric IRB.

Configure Symmetric IRB for VXLAN BGP EVPN

Before you start

1. Follow the procedure in the *Configuring VXLAN* section of the *VXLAN* chapter of the *Dell SmartFabric OS10* User guide to:
   - Configure the VXLAN overlay network.
   - Enable routing for VXLAN virtual networks. Integrated Routing and Bridging (IRB) is automatically enabled.
   - Enable an overlay routing profile with the number of reserved ARP table entries for VXLAN overlay routing.
2. Follow the procedure in *Configuring BGP EVPN for VXLAN* section of the *VXLAN* chapter of the *Dell SmartFabric OS10* User guide to:
   - Configure BGP to advertise EVPN routes.
   - Configure EVPN for VXLAN virtual networks.

   For a sample configuration, see Example: VXLAN with BGP EVPN.

Configure symmetric IRB

1. (Optional) If the switch is a VTEP VLT peer, configure a local router MAC that is used by remote VTEPs as the destination address in VXLAN encapsulated packets sent to the switch in EVPN mode.

   If you assign a unique VLT MAC address on each pair of VLT peers, use the same MAC address as the local router MAC. By default, the router MAC is derived as an offset from the local system MAC address.

   In a VLT VTEP pair, the router MAC configured in both the VLT peers must be the same. Router MAC configuration is mandatory for VTEP VLT peers.

   ```
   OS10(config)# evpn
   OS10(config-evpn)# router-mac nn:nn:nn:nn:nn:nn
   ```

2. Configure a non-default VRF with a dedicated VXLAN VNI for each tenant VRF in EVPN mode. The tenant VRF is created using the `ip vrf` command when you enable overlay routing with IRB; see the *Enable overlay routing between virtual networks* section of the *VXLAN* chapter of the *Dell SmartFabric OS10* User guide. The VXLAN VNI associated with the tenant VRF for EVPN symmetric IRB must be unique on the switch.

By default, the route distinguisher value is auto-generated. To reconfigure it, use the `rd A.B.C.D:[1-65535]` command. The route target value is a mandatory entry.

```
OS10(config-evpn)# vrf tenant-vrf-name
OS10(config-evpn-vrf-vrf-tenant)# vni  vxlan-vni
OS10(config-evpn-vrf-vrf-tenant)# rd {A.B.C.D:[1-65535]}
OS10(config-evpn-vrf-vrf-tenant)# route-target {auto | value {import | export | both}
 [asn4]}
OS10(config-evpn-vrf-vrf-tenant)# exit
```

3. (Optional) Advertise the IP prefixes learned from external networks and directly connected networks into EVPN type-5 route advertisements in EVPN-VRF mode; for example:

```
OS10(config)# evpn
OS10(config-evpn)# vrf vrf-tenant1
OS10(config-evpn-vrf-vrf-tenant1)# advertise {ipv4 | ipv6} {connected | static| ospf
| bgp} [route-map map-name]
```

4. (Optional) To redistribute EVPN routes to a BGP or OSPF neighbor, configure the redistribution of L2VPN EVPN routes into BGP or OSPF IPv4/IPv6 routes on a border leaf VTEP in ROUTER-BGP or ROUTER-OSPF mode; for example:

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# vrf blue
OS10(conf-router-bgp-101-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn [route-map map-name]
```

5. Verify the VXLAN BGP EVPN with symmetric IRB configuration.

Display the EVPN instance configuration

```
OS10# show evpn evi 10000

EVI : 10000, State : up
  Bridge-Domain : Virtual-Network 10000, VNI 10000
  Route-Distinguisher : 1:110.111.170.195:10000(auto)
  Route-Targets : 0:10000:16787216(auto) both
  Inclusive Multicast : 110.111.170.107
  IRB : Enabled(VRF-TENANT-1)

OS10# show evpn evi 20000
  EVI : 20000, State : up
  Bridge-Domain : Virtual-Network 20000, VNI 20000
  Route-Distinguisher : 1:110.111.170.195:20000(auto)
  Route-Targets : 0:20000:16797216(auto) both
  Inclusive Multicast :
  IRB : Enabled(VRF-TENANT-1)
```

Display the EVPN Type 2 routes for host MAC/IP addresses

```
show evpn mac-ip
Type -(lcl): Local (rmt): remote
EVI   Mac Address       Type Seq No Host-IP     Interface/Next-Hops
10000 00:00:0b:0b:0b:0a lcl  0      10.10.10.10 ethernet1/1/6
10000 14:18:77:25:4e:82 rmt  0      10.10.10.11 110.111.170.107
```

Display the VRF instances used to forward EVPN routes in VXLAN overlay networks

```
OS10# show evpn vrf
VXLAN-VNI  EVI  Virtual-Network-Instance  VRF-Name
30         30   30                       vrf_30
40         40   40                       vrf_40

OS10# show evpn vrf l3-vni
VRF : vrf_30, State : up
  L3-VNI : 3030
  Route-Distinguisher : 1:80.80.1.1:3030(auto)
  Route-Targets : 0:200:268438486(auto) both
  Remote VTEP : 4.4.4.4

VRF : vrf_40, State : up
```

```
  L3-VNI : 4040
  Route-Distinguisher : 1:80.80.1.1:4040(auto)

BGP EVPN with VLT

OS10 supports BGP EVPN operation between VLT peers that you configure as VTEPs. For more information about configurations and best practices to set up VLT for VXLAN, refer to the *VXLAN* chapter of the *Dell SmartFabric OS10* User guide. This information also applies to BGP EVPN for VXLAN.

Dell Technologies recommends configuring iBGP peering for the IPv4 address family between the VTEPs in a VLT pair on a dedicated L3 VLAN that is used when connectivity to the underlay L3 network is lost. It is NOT required to enable the EVPN address family on the iBGP peering session between the VTEPs in a VLT pair because EVPN peering to the spine switch is performed on Loopback interfaces.

Both VTEPs in a VLT pair advertise identical EVPN routes, which provides redundancy if one of the VTEP peers fails. To set up redundant EVPN route advertisement, configure the same EVI, RD, and RT values for each VNI on both VTEPs in a VLT pair, including:

- In auto-EVI mode, this identical configuration is automatically ensured if the VNID-to-VNI association is the same on both VTEP peers.
- In manual EVI mode, you must configure the same EVI-to-VNID association on both VTEP peers.
- In manual EVI mode, you must configure the same RD and RT values on both VTEP peers.

In an EVPN configuration, increase the VLT delay-restore timer to allow for BGP EVPN adjacency to establish and for the remote MAC and neighbor entries to download by EVPN and install in the dataplane. The VLT delay-restore determines the amount of time the VLT Port channels are kept operationally down at bootup to allow the dataplane to set up and forward traffic, resulting in minimal traffic loss as the VLT peer node boots up and joins the VLT domain.

NOTE: The network links of the NVE or VTEP VLT pair cannot be VLT-Port channels.

For a sample BGP EVPN VLT configuration, see Example: VXLAN with BGP EVPN.

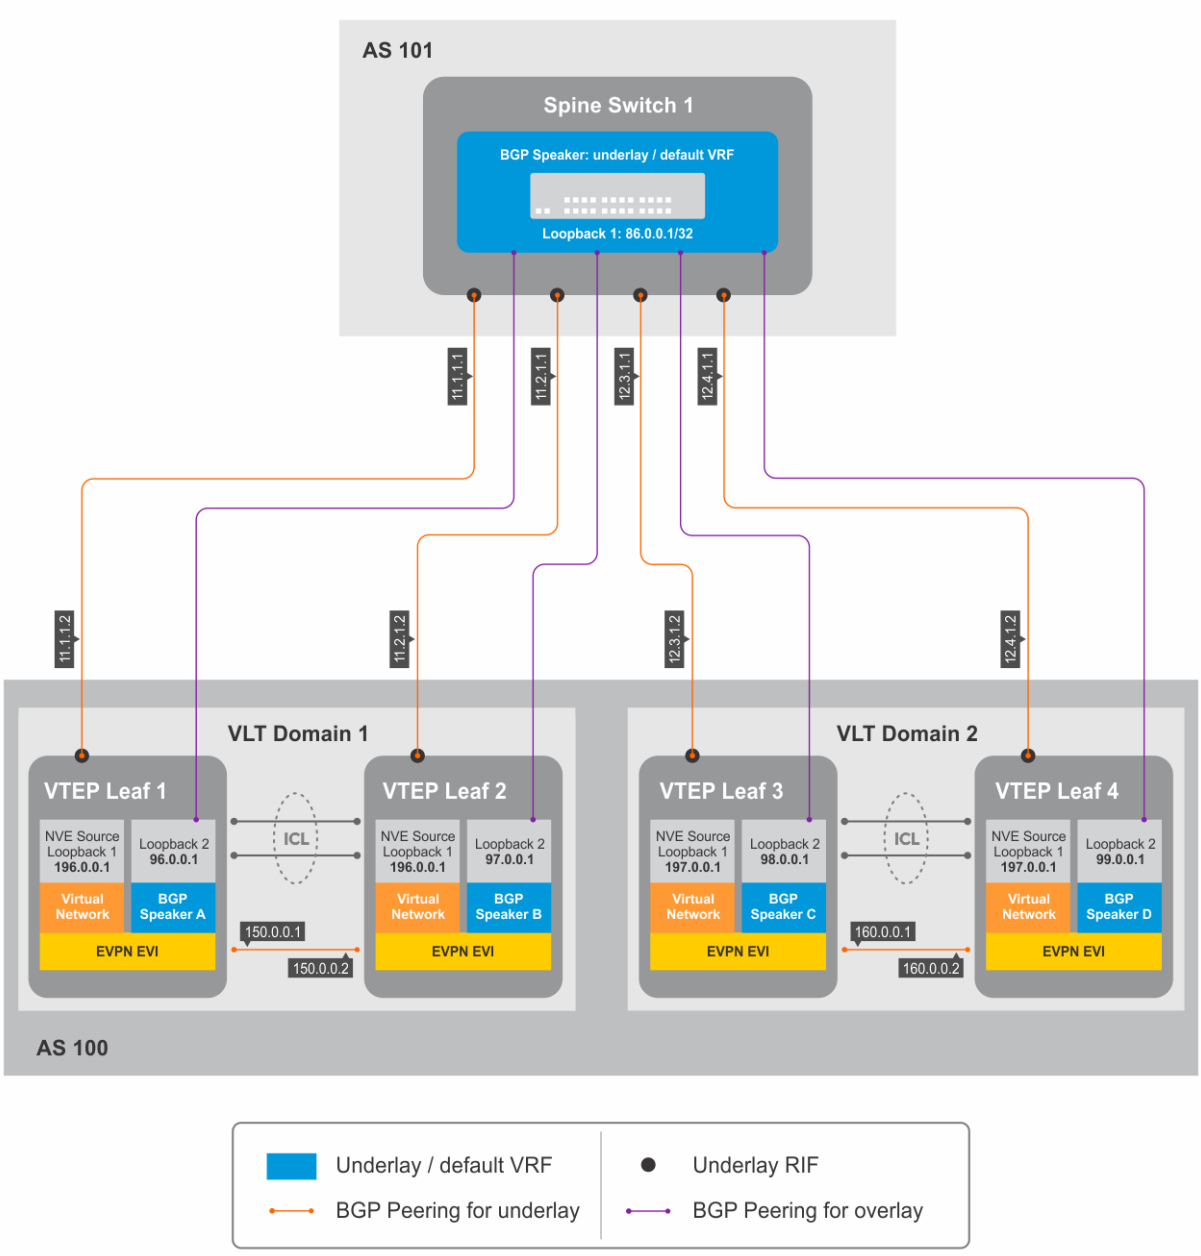

Figure 10. BGP EVPN in VLT domain

EVPN local route advertisement

BGP EVPN running on each VTEP listens to local overlay information, encodes them as BGP EVPN routes, and injects them into BGP to be advertised to remote VTEPs. This section describes EVPN local route advertisement functionality when the VTEPs are set up as VLT pairs.

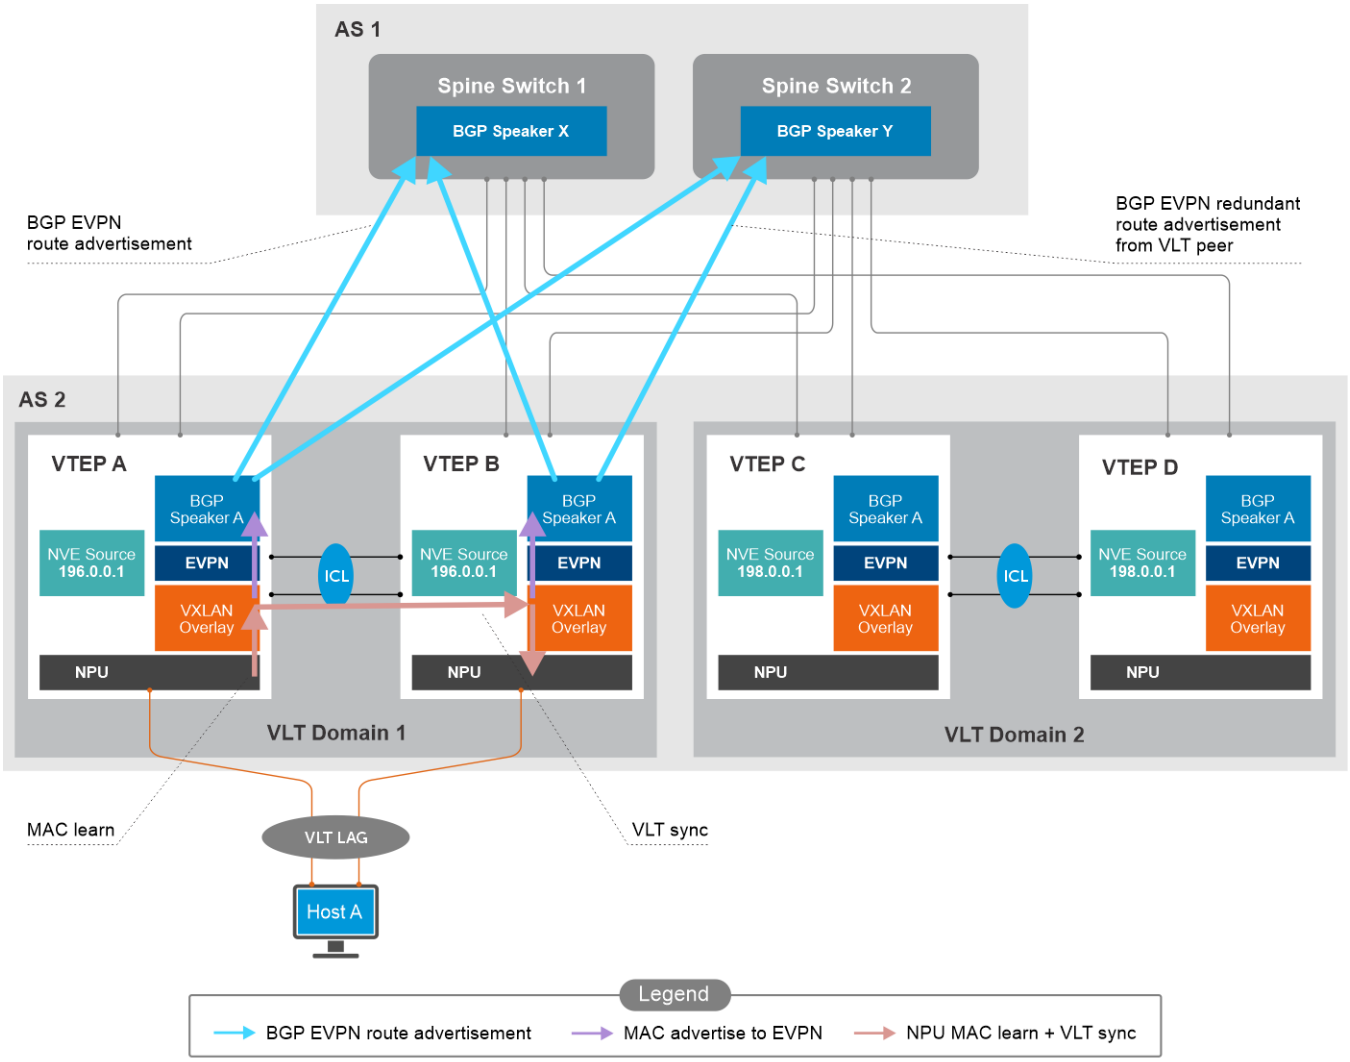
Overlay access MAC learn or age or flush or clear

For all MAC learn or age or flush or clear operations on local ports in the overlay, there is no change in the regular VLT functionality as defined for static Virtual-networks.

Meaning, when VLT node A learns a MAC address in the virtual-network from the data-plane on its access port, it synchronizes this MAC address with VLT to its VLT peer node B.

Similarly, in case of MAC age or clear or flush operations for MACs on VLT ports, the MAC is removed from both VLT peers only if it has aged on both nodes. Also, for MACs on orphan ports the MAC is immediately removed on both VLT peers.

The following topology diagram depicts the overlay access MAC learn or age or clear process:



Identical EVPN routes by both VLT peer nodes

Since each VLT node is a separate BGP router, both VLT nodes individually advertise EVPN route for a MAC irrespective of whether it is locally learnt or is synchronized by VLT from the peer. However, since the remote VTEPs see the VLT pair as a single logical VTEP, the remote VTEPs need to see only one copy of this route.

This behavior is achieved by ensuring that the EVPN routes advertised by both VLT peer nodes have the same NLRI and Next-hop. The Next-hop is always same, since it is the common NVE source IP address that is shared by both VLT peers.

The NLRI varies according to Route type.

Route Type 2 - MAC or IP

- Advertised for each MAC learnt in each Virtual-network (EVI).

- The NLRI consists of RD, MAC, IP, Ethernet tag ID, or MPLS Label1 (VNI). Ethernet tag ID is always 0 in this case (1-1 VNI to EVI).
- Except RD, all the other parameters advertised by both VLT peers are the same.

Route Type 3 - Inclusive multicast route

- Advertised for each Virtual-network (EVI) that has a VNI associated with it.
- The NLRI consists of RD, Ethernet tag ID, or IP of VTEP. Ethernet tag ID is always 0 in this case (1-1 VNI to EVI).
- Except RD, all the other parameters advertised by both VLT peers are the same.

RD is the Route distinguisher that is used to ensure that BGP maintains identical route information belonging to different nodes that are separate from each other.

For EVPN we use Type 1 RD, which comprises of IP address to identify the VTEP node. EVI to identify each Virtual-network or VNI.

In order to have identical RDs between VLT peers in all route types:

- The common NVE source IP is used as the IP address in RD.
- Auto-EVI mode -
  - The Virtual-network ID is used as the EVI.
  - The Virtual-network ID is explicitly configured by user on both VLT peers and is already mandated to be identical for a given VNI.
- Manual-EVI mode -
  - If the RD is auto, then the EVI to VNI mapping that you configure needs to be identical on both VLT peers.
  - If the RD is manual, then the RD to VNI mapping that you configure needs to be identical on both VLT peers.

Setting up eBGP peering with VLT

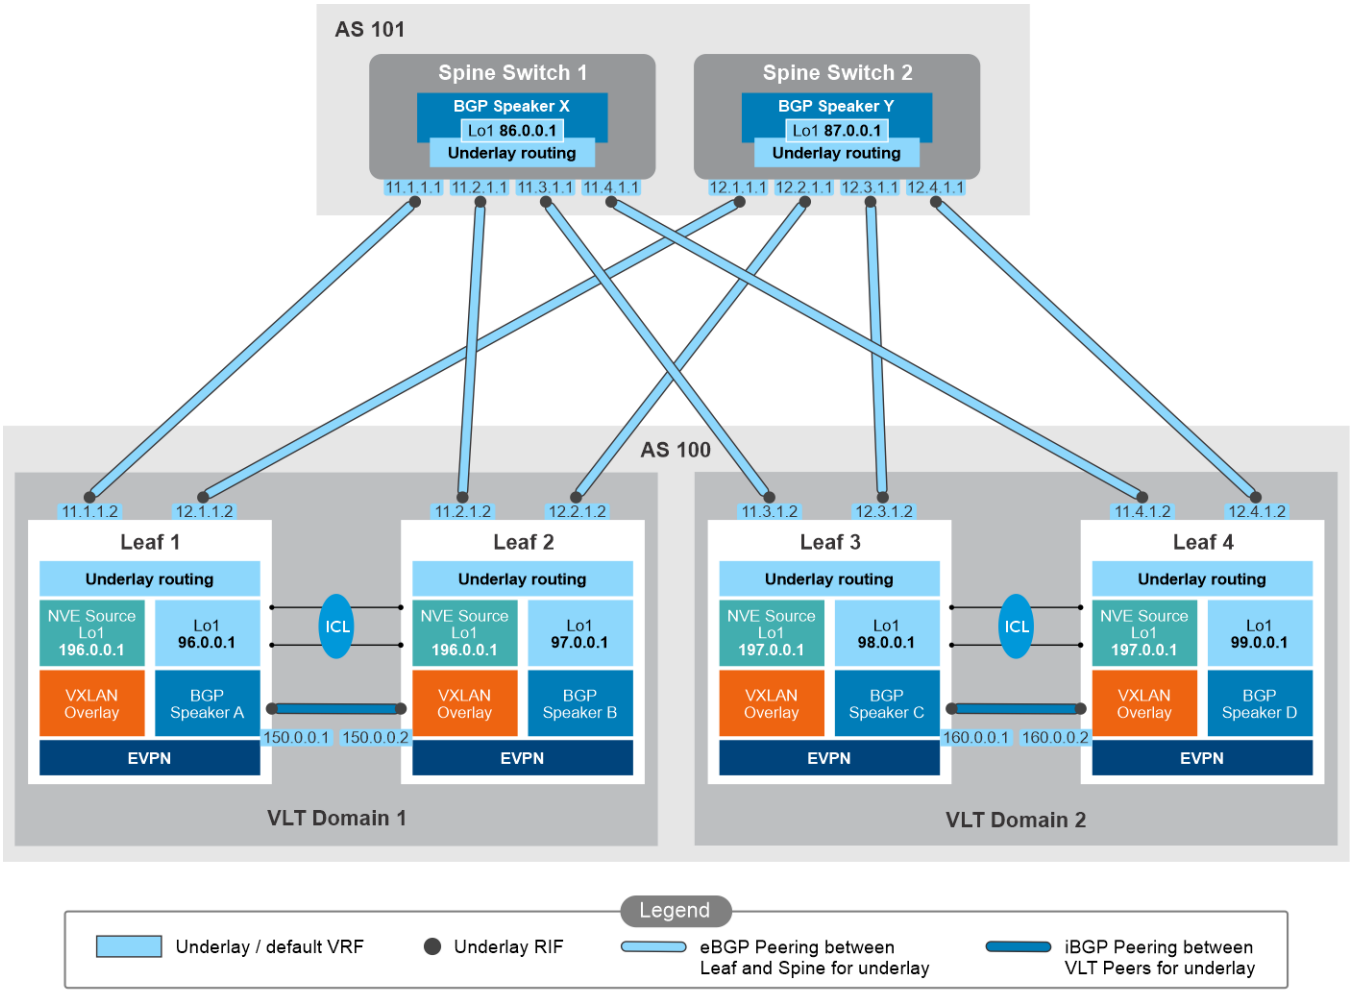
This section describes how eBGP peering is setup for underlay IP route advertisement and for overlay EVPN route advertisement.

BGP peering for underlay IP routes

eBGP peering session between Leaf and Spine using direct interface IP address.

iBGP session between VLT peers on dedicated VLAN configured over VLTi.

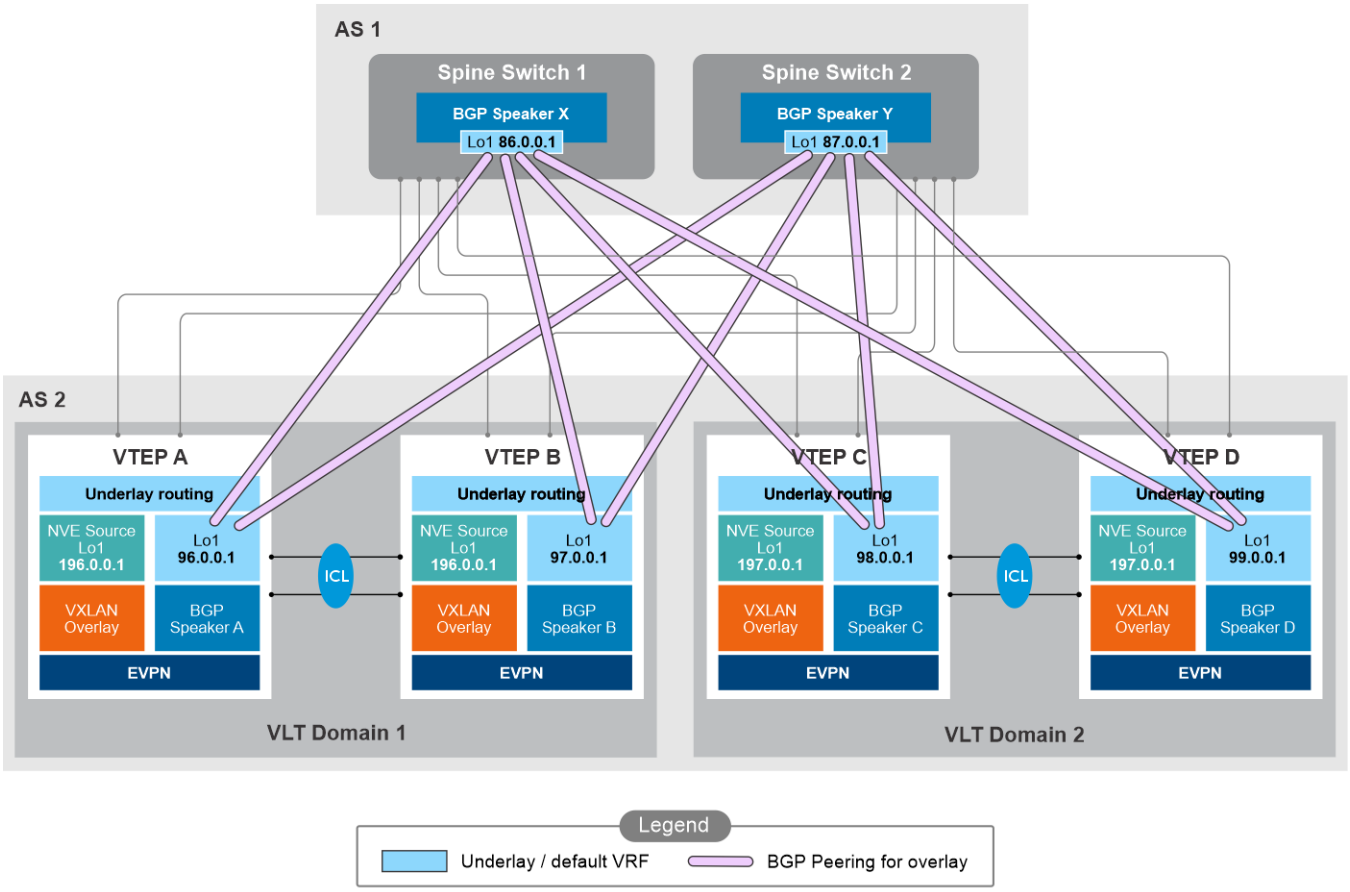
Following illustration shows setting up of eBGP peering with VLT:



BGP peering for Overlay services

This section describes eBGP Peering between loopback IP addresses between Leaf and Spine.

The following illustration depicts BGP peering for overlay services:



Each BGP router has two separate BGP sessions between each Leaf and Spine - one for underlay routes and one for overlay routes (Virtual Network MACs).

The following sequence describes the topology depicted in the BGP peering for overlay services image:

1. This topology requires two separate loopback interfaces.
2. BGP underlay session - IPv4 address family - used to learn underlay IP route reachability to remote VTEPs.
   a. Uses the point-to-point link IP address as the BGP neighbor IP address.
   b. IP reachability to both loopback IP addresses are advertised with the point-to-point IP as Next-hop.
   c. In case of failure of all network links on one of the VLT nodes, BGP sessions between VLT peers are needed for IPv4 address family to retain underlay routes.
3. BGP Overlay Session - EVPN address family - used to exchange overlay Layer 2 information between the VTEP nodes (Leaf nodes).
   a. Uses a unique loopback interface IP on each node (Leaf and Spine) as the BGP neighbor IP address.

b. An explicit override command (`update-source`) is needed to ensure that the local IP address that is used in the TCP session is the loopback IP address instead of the link IP address. This behavior ensures that the session is retained even if the links fail.
c. At the VTEPs, irrespective of the update-source override, the EVPN routes are always advertised with the NVE source IP address (Lo1) as the Next-Hop.
d. eBGP next-hop modification is disabled by default on all EVPN routes. So, the Spine nodes do not use their own Next-hop when advertising the EVPN routes to the remote VTEPs.
e. There is no EVPN address family peering between the VLT peer nodes within the same VLT domain.

4. By default, Dell SmartFabric OS10 does not override the Next-hop when advertising EVPN address family routes to even eBGP peers. So, EVPN routes received by Leaf nodes contain the originating Leaf node's IP address in the Next-Hop.
5. If all Leaf nodes are in the same AS, then the Spine nodes need to be explicitly configured to disable sender-side-loop-detection. Without this configuration, the eBGP on Spine does not distribute routes received from VTEP A (AS2) back to VTEP C (also AS2).

   NOTE: You must enable loop detection on the Leaf nodes (default). This configuration ensures that the Leaf VTEP nodes do not distribute the routes back to other Spine nodes again.
6. You can use any IP address that is unique to a node as the BGP Router ID. Typically, a separate loopback interface with static IP address is used for this purpose to avoid allocating this IP address for other purposes.
7. Even when a VLT node loses all its direct network links to the fabric, it still has reachability to its previous underlay First-hops (Spine or RR) over the VLTi with the VLT peer node as the new underlay First-hop.
   a. A VLT node's BGP EVPN sessions on loopback interfaces do not terminate even if it loses all direct connectivity to the underlay network.
   b. This behavior requires the BGP multi-hop parameter to be configured as 3.

NOTE: EVPN user configurations (for example, Auto-EVI or manual-EVI, RT and RD) are not synchronized between the VLT peers. Inline with existing VLT support, the expectation is that you configure both VLT nodes identically. Any mismatches are shown in the `show vlt mismatch` command.

The following sequence depicts the setup for common BGP session for underlay and overlay:

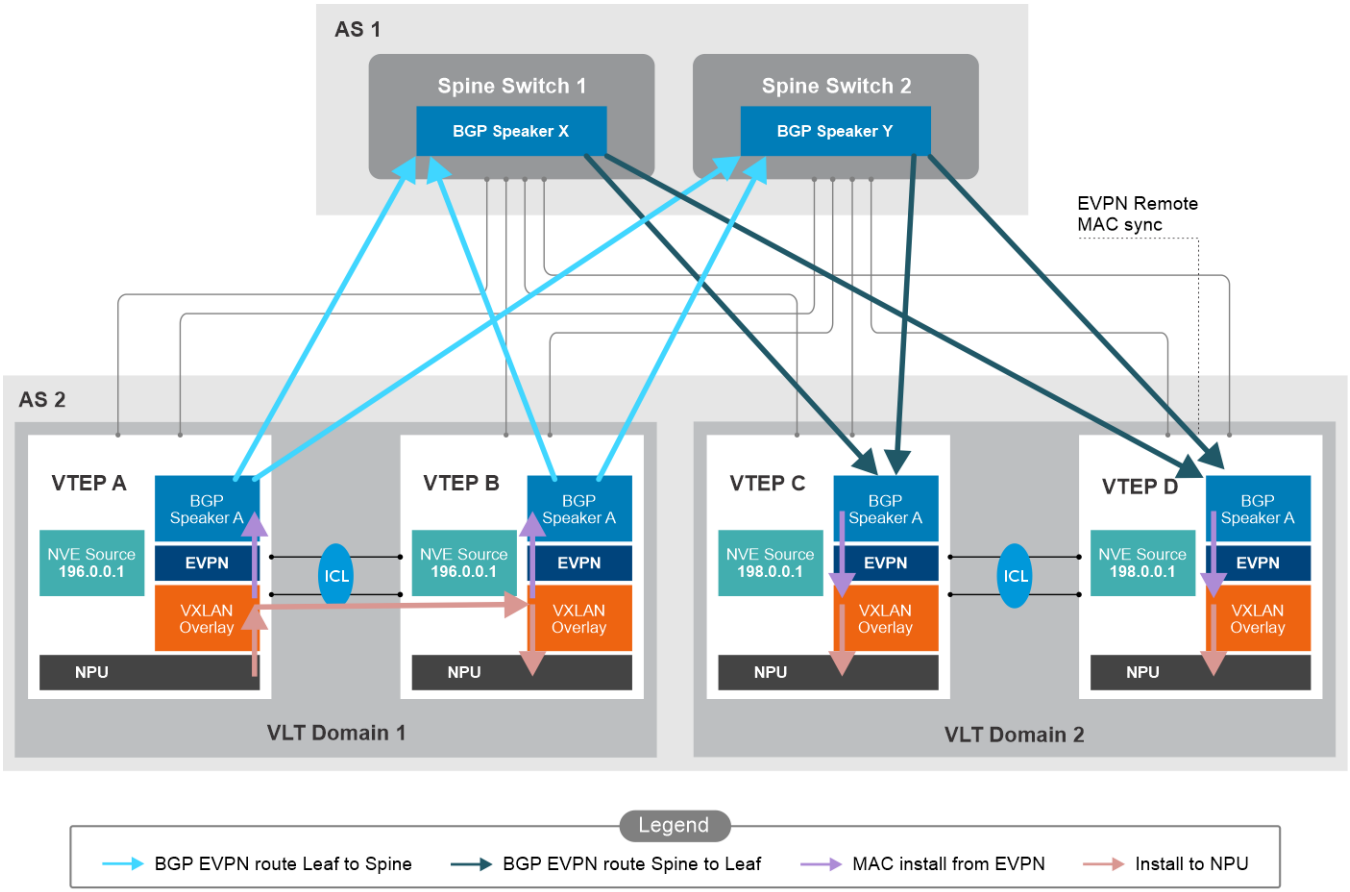
1. The same BGP session advertises both IP routes and EVPN address family routes.
2. The Network link IP address on each node is used as the BGP neighbor IP address.
3. A loopback interface IP address is needed on each node to act as NVE source IP address.
4. IP reachability to the loopback IP address is advertised with the link IP address as Next-hop.
5. At the VTEP, EVPN routes are always advertised with the NVE source IP address as Next-hop.
6. The Spine is internally setup to not override the EVPN address family route next-hops with its own IP address.
7. Any IP address that is unique to a node can be used as the BGP Router ID. Typically, a separate loopback interface with static IP address is used for this purpose to avoid allocating this IP address for other purposes.

NOTE: If there exist hosts that are moving across VLT-VTEPs and if these hosts do not actively send traffic, then Dell Technologies recommends to ignore comparing router-id information for external paths during dest-path selection on the Sping nods. You can configure this setting using the `bestpath router-id ignore` command.

EVPN remote route install

BGP EVPN running on each VTEP receives BGP EVPN routes from BGP, decodes the overlay information received from remote VTEPs in these routes, and configures the data-plane based on the decoded information. This section describes the functionality when the VTEPs are set up as VLT pairs.

The following topology diagram depicts the EVPN remote route install functionality:



Overlay remote MAC learn or remove

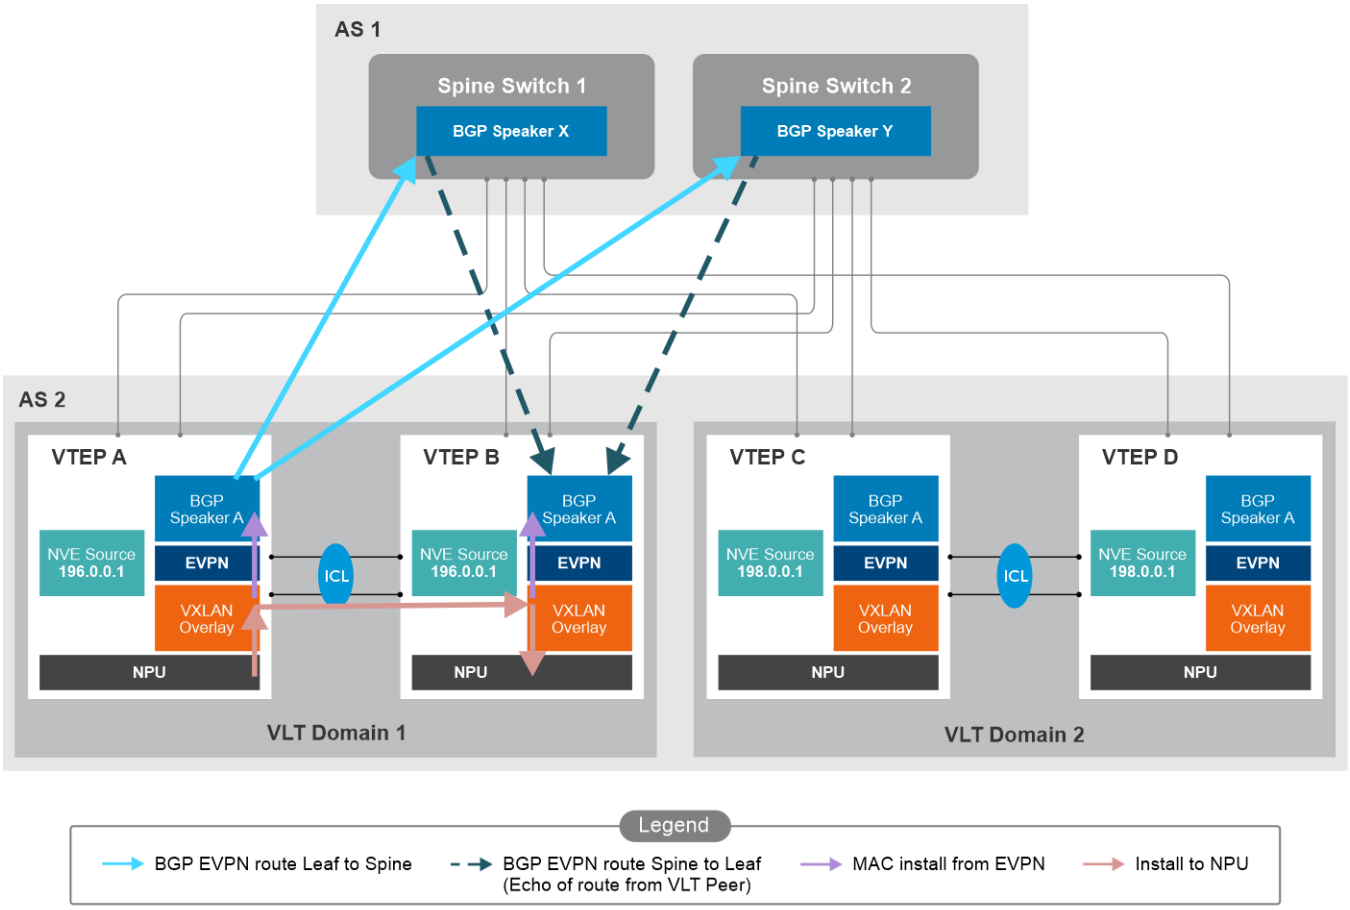
Remote MACs (MACs of hosts sitting behind remote VTEPs) that are installed by EVPN are not VLT synced to the peer since BGP-EVPN running on each VLT node will install these MACs independently.

Similarly withdrawal of Remote MACs is also not synced to the VLT peer.

MAC clear

The `mac clear` command issued on one of the VLT nodes is synced to the VLT peer node and all MACs including remote MACs are removed from data-plane - this behavior is the regular VLT behavior.

However, remote MACs installed by EVPN are considered sticky and are re-installed back immediately in the data-plane on both VLT peers.



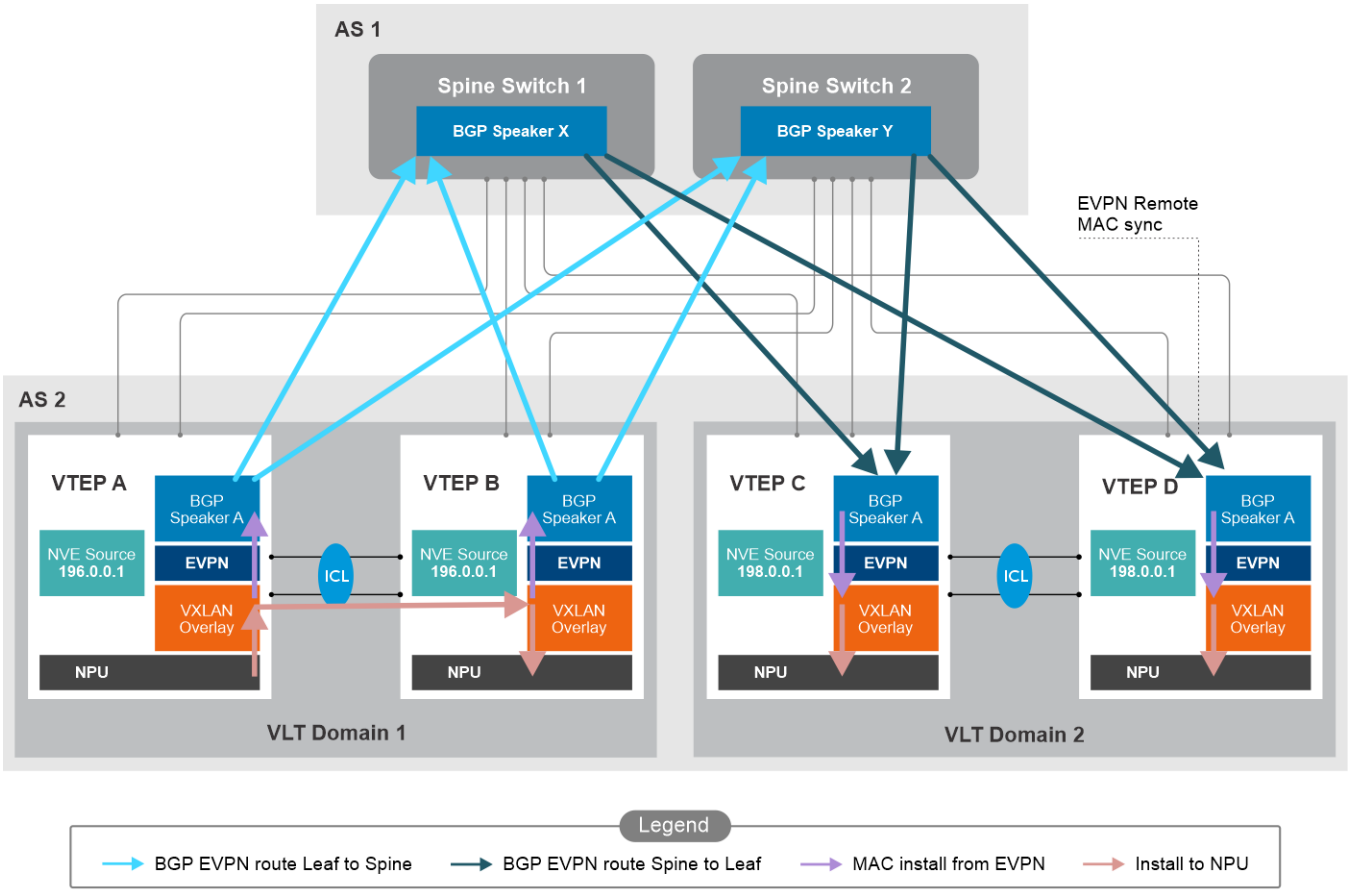
All EVPN routes advertised by a VLT node corresponding to its local EVIs or MAC addresses are also advertised by the BGP on VLT Peer. These BGP EVPN routes are echo-received back on the peer VLT nodes as remote routes. Since the EVPN routes advertised by both VLT nodes are identical for a given EVI or MAC address, BGP always prefers the local route and will not download the duplicate route received from the VLT peer to EVPN.

In case of race conditions, the EVPN echo route from VLT peer can be received before the local route is available. These peer EVPN routes are differentiated using their Next-hop VTEP IP, which is the same as their own local NVE source IP and ignored by the EVPN layer.

EVPN MAC move

When MAC moves from remote VTEP to local VTEP, the MAC is learnt on one of the Leaf nodes and is synced with VLT to the VLT peer node. This MAC is advertised to the EVPN and BGP modules. The MAC learn gets advertised as identical BGP-EVPN route updates from both VLT peer leaf nodes.

When MAC moves from local VTEP to remote VTEP or from one remote VTEP to another, both VLT leaf pairs independently receive BGP-EVPN route updates and install the MAC with the new destination in the hardware.



VLT events

This section describes the impact of VLT events on BGP EVPN control plane.

VLT local port failure

No change in BGP EVPN. The MAC addresses learnt on these ports are re-directed by VLT logic and continue to be advertised in EVPN.

When VLT port fails on both VLT nodes, then the MAC is removed from both nodes and is withdrawn by both BGP speakers. This causes the MAC to be removed from all remote VTEPs.

VLT single node failure

Since each VLT node is an independent BGP speaker there is no special handling needed in BGP EVPN. The local VLT MACs continue to be advertised by EVPN on the VLT peer.

All orphan port MACs on the failed peer that were installed on the VLTi locally, are removed by VLT logic; as a result, these MAC EVPN routes are withdrawn by the remaining VLT peer nodes as well.

VLT VLTi failure

When the Heartbeat is up (nodes are still alive), all VLT local ports and network ports are forced down on the VLT secondary node using UFD. This behavior causes all BGP sessions to go down and all remote MACs to be removed from the VLT secondary node. Effectively, the VLT secondary node is isolated from the network.

Orphan local MACs on the VLT secondary node are withdrawn from all the remote VTEPs.

VLT local MACs continue to be advertised by the VLT Primary node; as a result, they are retained in the remote VTEPs.

Network port failure

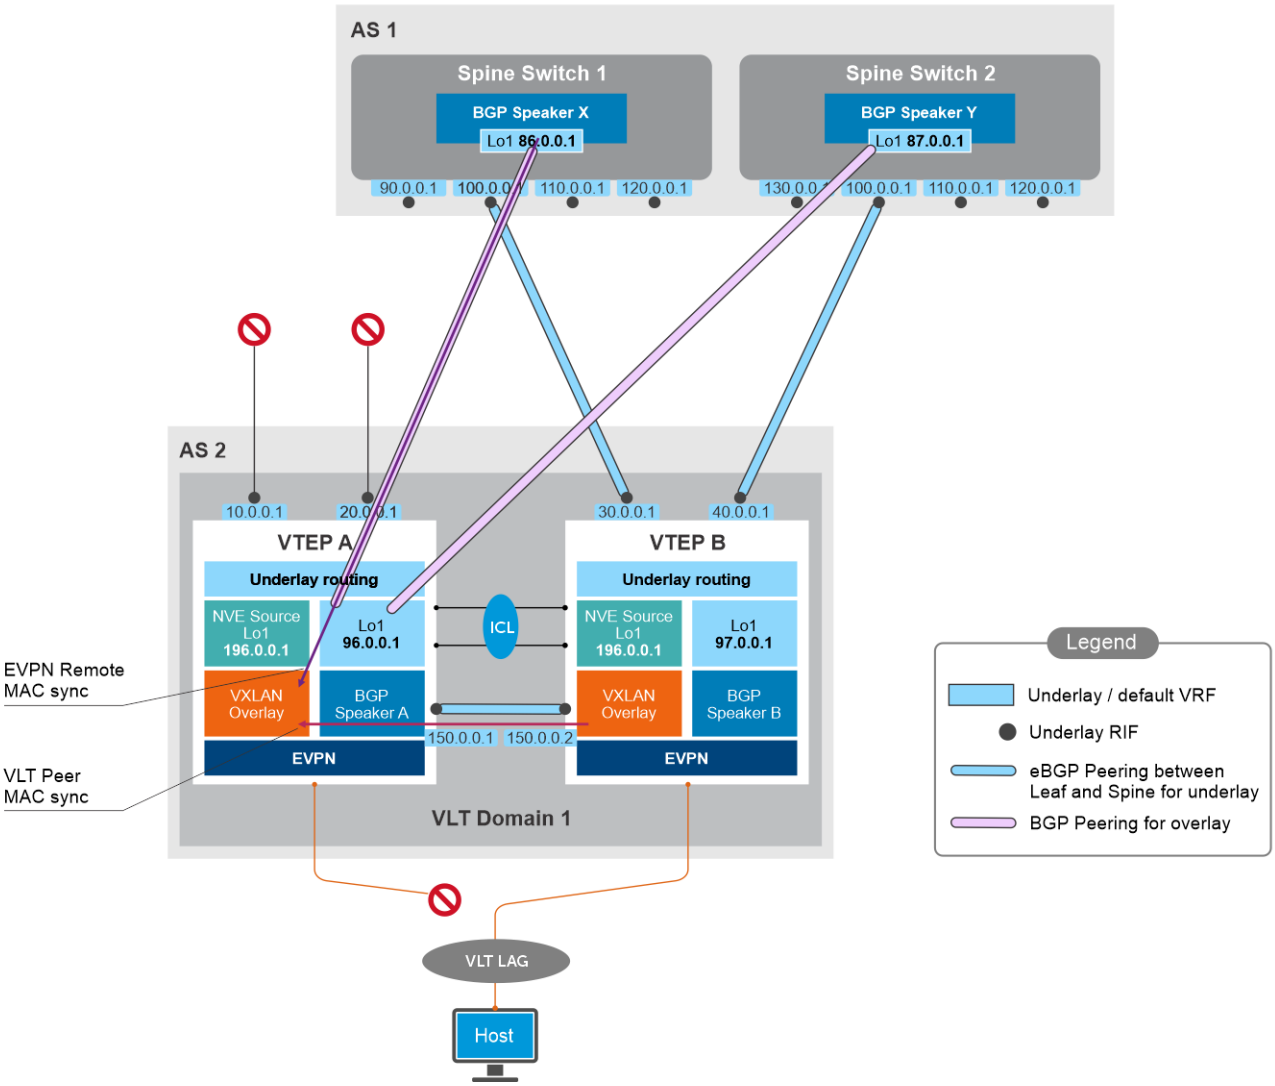
As long as the VTEP has connectivity to at least one Spine node, all the BGP routes are intact and there is no change.

When a VLT node has lost connectivity to all Spine nodes, the behavior differs depending on the deployment scenario:

- Separate overlay BGP session on separate loopback interface:
  - Leaf and Spine loopback IP addresses should still be reachable from each other in the underlay based on underlay routing re-convergence using the VLTi with the VLT peer as the first-hop.
  - In this case, the BGP sessions between Leaf and Spine nodes are still active.
  - Encapsulated data traffic from Leaf to Spine node is also redirected through VLTi once the underlay routing re-converges.
- Combined underlay and overlay BGP sessions directly on the network link:
  - BGP sessions between Leaf and Spine nodes go down. All EVPN remote MACs or ARPs are removed from the data-plane.
  - Overlay Layer 2 switched data traffic from Leaf to Spine node is flooded to all remote VTEPs. The encapsulated traffic is redirected through VLTi after the underlay routing re-converges.
  - Overlay Layer 3 routed data traffic from Leaf to Spine node is dropped.

VLT single node recovery

The following topology diagram depicts the VLT single node recovery scenario:



When a VLT node boots up, if the VLT role is detected as secondary, all the server facing VLT ports and all the network facing ports are held in down state for a specified interval. This phase is called the delay-restore phase.

Before the ports come up, the following are expected to be completed:

- The overlay BGP sessions are established ; this establishment happens between Leaf and Spine loopback IP addresses over VLTi with the VLT primary acting as transit hop.
- Overlay EVPN routes are received from remote VTEPs and all remote MACs and ARPs are installed in the data-plane.
- Underlay route reachability to remote VTEPs is installed in the data-plane through VLTi with primary acting as transit hop.

The VLT delay restore timer needs to be adjusted to accommodate these changes.

VLT with IRB

This section describes VLT with IRB.

Local ARP

Just as in the case of MAC, any ARP learnt from a locally attached host is VLT synced to the peer node. Both VLT nodes advertise identical MAC-IP EVPN routes so that the Spine nodes sees multiple redundant routes and does not withdraw the route even if one of the VLT peers fail.

Remote ARP

Just as in the case of MAC, any ARP for hosts connected to remote VTEPs is not VLT synced to the peer node.

ARP clear

Unlike MAC, ARP clear command executed on one of the VLT nodes is not synced to the VLT peer node. As a result, these ARPs are withdrawn from the remote VTEPs unless the ARP is cleared on both VLT Peers.

Immediately after ARP clears, all ARPs for hosts connected to remote VTEPs is installed back into the data-plane.

VLT events

VLT failure events like link failure node, failure, or VLTi failure have no impact on the ARPs advertised by EVPN routes.

When a VLT node fails and recovers, all remote MAC-IP routes need to be received and processed before the VLT delay-restore time is complete.

Configuration sequence

Create Virtual-network

```
OS10(config)# virtual-network 10000
OS10(config-vn)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn)# vxlan-vni 10000
OS10(config-vn)# exit
OS10(config)# virtual-network 20000
OS10(config-vn)# member-interface ethernet 1/1/6 untagged
OS10(config-vn)#vxlan-vni 20000
OS10(config-vn)# exit
```

Create Virtual-network interface

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding VRF-TENANT-1
OS10(conf-if-vn-10000)# ip address 10.10.10.1/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.10.10.10
OS10(conf-if-vn-10000)# no shutdown
OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding VRF-TENANT-1
OS10(conf-if-vn-20000)# ip address 20.20.20.1/16
OS10(conf-if-vn-10000)# ip virtual-router address 20.20.20.20
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

Create anycast gateway MAC address

```
OS10(config)# ip virtual-router mac-address 00:00:01:00:00:01
```

Enable EVPN and EVI

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# rd 110.111.170.195:10000
OS10(config-eqpn-evi-10000)# route-target auto both
OS10(config-eqpn-evi-10000)# vni 10000
OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# rd 110.111.170.195:20000
OS10(config-eqpn-evi-20000)# route-target auto both
OS10(config-eqpn-evi-20000)# vni 20000
```

NOTE: The **auto-evi** option can be enabled instead of manual EVI configuration.

Verification

```
OS10# show evpn evi 10000

EVI : 10000, State : up
  Bridge-Domain       : Virtual-Network 10000, VNI 10000

ARP suppression

This feature provides support to configure ARP-suppression on the switch.

Network Virtualization Overlay (NVO) is a solution in which an overlay network is used to extend L2 connectivity among VMs belonging to a tenant segment (or virtual network) over an underlay IP network.

This feature encapsulates the payload tenant within an IP packet at the originating end-point (ingress VTEP) and strips the encapsulated packets to access the payload at the destination end-point (egress VTEP). VXLAN is an example of NVO encapsulation.

Ethernet Virtual Private Network (EVPN) is a standards-based technology that is used to exchange control-plane information between the VTEPs. This control-plane information is exchanged using BGP, instead of manual configuration or flooding and learning in hardware. EVPN supports exchange of tenant IP-MAC binding between all VTEPs as part of its Type-2 route.

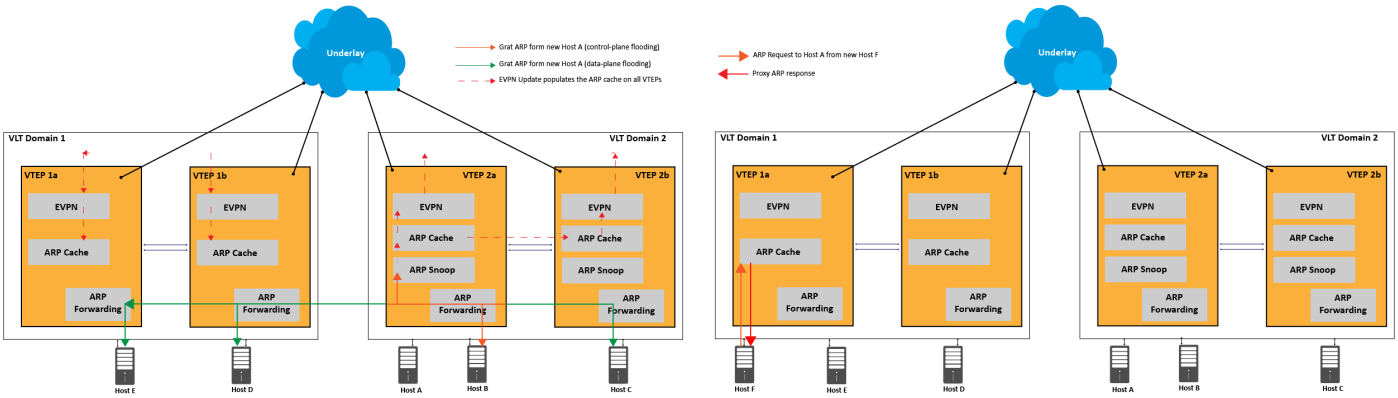
ARP suppression provides an option to minimize the flooding of tenant ARP or NS or NA packets in the underlay IP fabric to all the remote VTEPs saving both underlay bandwidth and CPU cycles on the end hosts. It requires each VTEP to maintain a cache of all the remote tenant IP-MAC bindings, so that when an ARP-request or NS is received for a remote tenant host within the tenant IP subnet (within virtual network), the ingress VTEP can retrieve the remote IP-MAC binding from its cache and responds on behalf of the remote host instead of flooding the ARP-requests or NS. This optimization is called ARP-suppression.

ARP flooding can occur for the initial ARP request to a silent host in the network. The VTEPs in the network do not see any traffic from the silent host until another host sends an ARP request for its IP address and an ARP response is sent back.

After the local VTEP learns about the MAC and IP addresses of the silent host, the information is distributed through BGP-EVPN control-plane to all other VTEPs. Any subsequent ARP requests do not must be flooded. Most end hosts send GARP, or RARP requests to announce themselves to the network immediately after they come online.

The local VTEP immediately has the opportunity to learn their MAC and IP addresses and distribute this information to other VTEPs through the BGP-EVPN control-plane. As a result, most active IP hosts in VXLAN EVPN must be learned by the VTEPs either through local learning or control-plane-based remote learning. So, ARP-suppression reduces the network flooding that is caused by host ARP learning behavior.

You can use the following figure to understand how OS10 learns host's MAC-IP by snooping the ARP or ND exchanges between hosts. Every VTEP learns the MAC-IP bindings of the hosts present in the local access ports and update the ARP-cache locally. It is exchanged to other VTEPs through BGP-EVPN. Only MAC-IP bindings corresponding to the local hosts are learned through packet snooping. MAC-IP bindings corresponding to the remote hosts are learned through BGP-EVPN.



Both the MAC-IP bindings are updated in the same ARP cache. After the VTEPs learn the MAC-IP bindings of both local and remote hosts, the VTEPs can avoid flooding the broadcast ARP-request or multicast NS received on any access port by ARP or NS proxy replying to the originator on behalf of the local or remote hosts. It helps reduce the flooding of ARP-request or NS to all other VTEPs, where the host is not present. It reduces network bandwidth utilization and CPU cycles of actual end host and other hosts, which unnecessarily process and ignore the transient ARP-request or NS.

In the figure, gratuitous-ARP is taken as an example to show how ARP-snooping module learns the host's MAC-IP bindings. Also, the snooper module learns through other packets (ARP-request or reply and NA).

Restrictions and limitations

Following are the restrictions and limitations that apply for this feature:

- ARP-suppression is not supported on the S4200-ON and Z9664F-ON platforms.
- ARP suppression must be disabled in the following scenarios:
  - Same host IP is mapped to multiple MACs and hosts are learned in L2 VN deployment.
  - Adaptive Load Balancing (ALB) is configured in L2 VN deployment.

Impact on software upgrade or downgrade

There is no impact on software upgrades or downgrades because of the ARP-suppression feature.

ARP-suppression feature an optimization feature that helps in reducing the ARP or NS packets flooding in the VXLAN network. So, it can work with other VTEPs that runs old software versions, which do not support ARP-suppression.

You can upgrade the VLT-nodes with ARP-suppression supported software one after the other without any impact. Until the other VLT-node is upgraded, the peer VLT-node snoops the ARP or ND packets and performs proxy-reply for ARP-req or NS packets received on that node. After other the VLT-node is upgraded, VLT-sync synchronizes the snooped MAC-IP binding of local hosts.

Configuration notes

- The ARP-suppression feature is disabled by default.
- ARP-suppression is supported only on VxLAN bridges (Virtual network interfaces) and is not supported on legacy VLAN bridges.
- ARP-suppression is supported on both Layer 2 and Layer 3 VxLAN bridges.
- ARP-suppression is supported on both asymmetric and symmetric BGP-EVPN modes.
- Disable ARP-suppression globally using the following command in the EVPN configuration mode:

```
OS10(config-evpn)# arp-nd-suppression disable
```

- Reenable ARP-suppression using the following command:

```
OS10(config-evpn)# no arp-nd-suppression disable
```

VLT functionality

- VLT-sync for L2-VXLAN bridges is enabled in OS10, so that snooped ARP-entries are synchronized between VLT-nodes.
- Proxy-replies to the ARP-requests sent by the local-host are replied only by the first VLT-node.
- No proxy-replies for the ARP-requests are received on the VLTi link. These proxy-replies are flooded to other virtual network interfaces by following VLT and VXLAN split-horizon rules.
- If there is a VLTi link failure, there is no change in the existing behavior.
- After clearing ARP or IPv6 neighbor entries in VLT peers, learning of ARP or IPv6 neighbors through ARP request or neighbor solicitation frames from host to gateway (virtual IP) happens only on VLT peer which receives the frame. Other VLT peer learns the ARP or IPv6 neighbor once traffic hits the other node or the ARP/IPv6 neighbor resolution packets hashes to other peer.

EVPN route selection based on AS path length

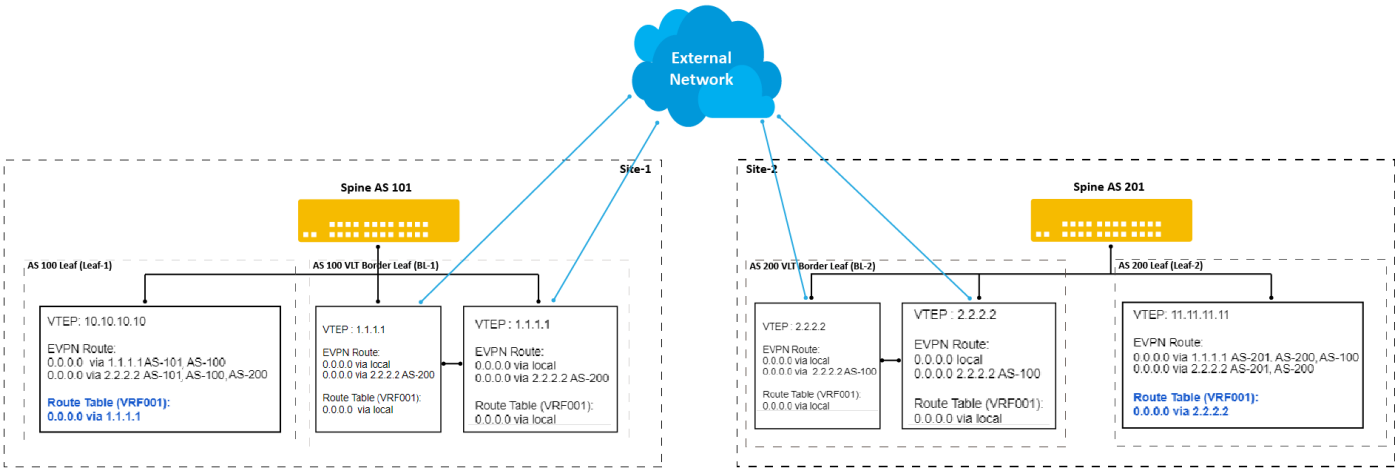
In BGP EVPN VXLAN, consider a scenario where there are two sites, Site1 and Site2, with each site containing its own border leaf switch.

When these sites are interconnected, the routes that are learned or configured on each border leaf switch on a site is advertised through BGP EVPN to other border leaf switches and also to other VTEP leaf switches in both the sites.

If the same prefix is learned or configured on all the border leaf switches, the leaf switches corresponding to both the sites have more than one path for the destination prefix. If all the paths for that route are considered as ECMP paths, the traffic may take a suboptimal path through a remote site.

The AS path length is shorter for the route that is received from the local border leaf switch and longer for routes that are received from the remote border leaf switches. The AS path length is considered for best path selection, so that the path through the local border leaf switch is preferred over the path through the remote border leaf switches.

The following topology depicts this scenario:



For a leaf VTEP to communicate to the external network, a default route is configured on the border leaf VTEP and advertised to all the leaf VTEPs through EVPN. This behavior can also be achieved by advertising the routes that are learned from the external network in the border leaf switch to all other leaf VTEPs.

When the routes that are advertised by the border leaf switch reach the leaf VTEPs, the routes have the AS path updated with the AS through which the route is advertised.

In Leaf-1 switch, the routes originating from BL-1 have the following AS paths: AS-100 and AS-101. The routes originating from BL-2 in Site2 have the following AS paths: AS-200, AS-100, and AS-101.

When traffic hits the default route in leaf-1 and if the default route is installed as ECMP, the traffic is forwarded to either BL-1 in the local site or BL-2 in the remote site based on the traffic hashing.

To send traffic to BL-2 in the other site is suboptimal. For optimal forwarding, the default route must be installed in the local site with BL-1 as the only path.

Achieve this behavior considering the AS path length for EVPN route selection. So, in Leaf-1, if there exists two routes for the prefix from BL-1 and BL-2, the route with the shorter AS path length (AS-100, AS-101) is selected as the best route.

NOTE: In an asymmetric scenario, the EVPN L2VPN routes are installed in the routing table. So, in an asymmetric scenario, there is no impact on EVPN L2VPN route selection based on AS path length.

The route selection process is applicable for both default routes and all other type5 route prefixes. For all the EVPN type5 routes in Symmetric IRB, route selection is done by default.

Supported platforms

All Symmetric IRB supported platforms including: S6010-ON, S4048T-ON, S4100-ON Series, S5200-ON Series, S5448F-ON, Z9432F-ON.

Restrictions and Limitations

In a scenario where a route has more than one path with different AS path lengths, the `show ip bgp l2vpn evpn` command displays all the routes. The `show ip/ipv6 route vrf` *`vrf-name`* command displays only those routes which have the shortest AS path length. However, the `show ip/ipv6 route vrf` *`vrf-name`* `all` command does not display the routes with longer AS path lengths as inactive or active.

VXLAN BGP commands

activate (l2vpn evpn)

Enables the exchange of L2 VPN EVPN address family information with a BGP neighbor or peer group.

Syntax	`activate`
Parameters	None
Default	Not configured
Command Mode	ROUTER-BGP-NEIGHBOR-AF
Usage Information	Use this command to exchange L2 VPN EVPN address information for VXLAN host-based routing with a BGP neighbor. The IPv4 unicast address family is enabled by default. Use the `no activate` command to disable an address family with a neighbor.
Example	`OS10(conf-router-neighbor)# address-family l2vpn evpn unicast` `OS10(conf-router-bgp-neighbor-af)# activate`
Supported Releases	10.2.0E or later

address-family l2vpn evpn

Configures the L2 VPN EVPN address family for VXLAN host-based routing to a BGP neighbor.

Syntax	`address-family l2vpn evpn`
Parameters	None
Default	Not configured
Command mode	ROUTER-NEIGHBOR
Usage information	To use BGP EVPN service in a VXLAN, you must configure and enable the L2VPN EVPN address family on a VTEP to support host-based routing to each BGP neighbor.

Example	`OS10(config)# router bgp 100`
	`OS10(config-router-bgp-100)# neighbor 45.0.0.1`
	`OS10(config-router-neighbor)# address-family l2vpn evpn`

Supported releases	10.4.2.0 or later

allowas-in

Configures the number of times the local AS number can appear in the BGP AS_PATH path attribute before the switch rejects the route.

Syntax	`allowas-in as-number`
Parameters	*as-number*—Enter the number of occurrences for a local AS number, from 1 to 10.
Default	Disabled
Command Mode	ROUTER-BPG-NEIGHBOR-AF
Usage Information	Use this command to enable the BGP speaker to accept a route with the local AS number in updates received from a peer for the specified number of times. The `no` version of this command resets the value to the default.
Example (IPv4)	`OS10(config-router-neighbor)# address-family ipv4 unicast` `OS10(conf-router-bgp-neighbor-af)# allowas-in 5`
Example (IPv6)	`OS10(conf-router-template)# address-family ipv6 unicast` `OS10(conf-router-bgp-template-af)# allowas-in 5`
Example (l2vpn)	`OS10(config-router-neighbor)# address-family l2vpn evpn` `OS10(config-router-bgp-neighbor-af)# allowas-in 3`
Supported Releases	10.3.0E or later

sender-side-loop-detection

Enables the sender-side loop detection process for a BGP neighbor.

Syntax	`sender-side-loop-detection`
Parameters	None
Default	Enabled
Command Mode	ROUTER-BGP-NEIGHBOR-AF
Usage Information	This command helps detect routing loops, based on the AS path before it starts advertising routes. To configure a neighbor to accept routes use the `neighbor allowas-in` command. The `no` version of this command disables sender-side loop detection for that neighbor.

Example (IPv4)	`OS10(conf-router-bgp-102)# neighbor 3.3.3.1`
	`OS10(conf-router-neighbor)# address-family ipv4 unicast`
	`OS10(conf-router-bgp-neighbor-af)# sender-side-loop-detection`

Example (IPv6)	`OS10(conf-router-bgp-102)# neighbor 32::1`
	`OS10(conf-router-neighbor)# address-family ipv6 unicast`
	`OS10(conf-router-bgp-neighbor-af)# no sender-side-loop-detection`

Supported Releases	10.3.0E or later

show ip bgp l2vpn evpn

Displays the internal BGP routes in the L2VPN EVPN address family in EVPN instances.

Syntax

```
show ip bgp l2vpn evpn [summary | neighbors [ip-address | interface interface-type]]
```

Parameters

summary	Displays a summary of the BGP routes in the L2VPN address family that exchange with remote VTEPs.
neighbors	Display the remote VTEPs with whom BGP routes in the L2VPN address family exchange.
ip-address	Displays information about a specific neighbor.
interface *interface-type*	Displays BGP information that is learned through an unnumbered neighbor.

Default Not configured

Command mode EXEC

Usage information Use this command to display the BGP routes used for the L2VPN EVPN address family in EVPN instances on the switch.

Examples

```
OS10# show ip bgp l2vpn evpn
BGP local RIB : Routes to be Added , Replaced , Withdrawn
BGP local router ID is 110.111.170.102
Status codes: s suppressed, S stale, d dampened, h history, * valid, >

Supported releases 10.4.2.0 or later

VXLAN EVPN commands

advertise

Advertises the IP prefixes learned from external networks and directly connected neighbors into EVPN.

Syntax `advertise {ipv4 | ipv6} {connected | static | ospf | bgp} [route-map map-name]`

Parameters

- `ipv4` — Advertise learned IPv4 routes.
- `ipv6` — Advertise learned IPv6 routes.
- `connected` — Advertise routes learned from directly connected neighbors.
- `static` — Advertise manually configured routes.
- `ospf` — Advertise OSPF routes into EVPN.
- `bgp` — Advertise BGP learned external routes into EVPN.
- `route-map map-name` — (Optional) Filter EVPN Type-5 advertised routes using the specified route map. You can add the match rule `inactive-path-additive` to the route map to advertise inactive routes.

Default None

Command Mode EVPN-VRF

Usage Information

EVPN uses Type 5 route advertisements. To specify the types of learned routes to use in EVPN Type 5 advertisements in a tenant VRF, use the `advertise` command. From Release 10.5.2.0 and beyond, the `advertise` command advertises only active routes. To advertise both the active and inactive routes, you must configure a route map with the `inactive-path-additive` rule and apply the route map to the `advertise` command.

Example – advertise active routes

```
OS10(config)# evpn
OS10(config-evpn)# vrf vrf-blue
OS10(config-evpn-vrf-vrf-blue)# advertise ipv4 connected route-map map-
connected
```

Example - advertise IPv4 static routes to L2VPN EVPN

```
OS10# configure terminal
OS10(config)# route-map redis-inactive-routes
OS10(config-route-map)# match inactive-path-additive

OS10(config)# evpn
OS10(config-evpn)# vrf vrf-blue
OS10(config-evpn-vrf-vrf-blue)# advertise ipv4 static route-map redis-
inactive-routes
```

Example - advertise IPv6 OSPF routes to L2VPN EVPN

```
OS10# configure terminal
OS10(config)# route-map redis-inactive-routes
OS10(config-route-map)# match inactive-path-additive

OS10(config)# evpn
OS10(config-evpn)# vrf vrf-blue
OS10(config-evpn-vrf-vrf-blue)# advertise ipv6 ospf route-map redis-
inactive-routes
```

Supported Releases

10.5.1 or later

arp-nd-suppression

Enables or disables ARP-suppression globally on Layer 2 and Layer 3 virtual networks.

Syntax

`[no] arp-nd-suppression disable`

Parameters

None.

Default

Disabled

Command Mode

EVPN

Security and access

`sysadmin`, `netadmin`, `netoperator`

Usage Information

You can use this command to enable or disable ARP-suppression feature globally. This configuration is applied on all Layer 2 Layer 3 VXLAN bridges.

The `no arp-nd-suppression disable` command enables ARP-suppression.

Example (enable)

To enable ARP-suppression globally, use the following command:

```
OS10 (conf) # evpn

OS10 (conf-evpn) # no arp-nd-suppression disable
```

Example (disable)

To disable ARP-suppression, use the following command:

```
OS10 (conf) # evpn

OS10 (conf-evpn) # arp-nd-suppression disable
```

Supported Releases	10.5.3.0 or later

auto-evi

Creates an EVPN instance automatically, including Route Distinguisher (RD) and Route Target (RT) values.

Syntax	`auto-evi`
Parameters	None
Default	Not configured
Command mode	EVPN
Usage information	In deployments running BGP with 2-byte or 4-byte autonomous systems, auto-EVI automatically creates EVPN instances when you create a virtual network on a VTEP in the overlay network. In auto-EVI mode, the RD and RT values automatically generate: ● For a 2-byte autonomous system: ○ The RD auto-configures as Type 1 from the overlay network source IP address and the auto-generated EVI index. ○ The RT auto-configures as Type 0 from the 2-byte AS and the 3-byte VNI—Type encoded as 0x0002. ● For a 4-byte autonomous system: ○ The RD auto-configures as Type 1 from the overlay network source IP address and the auto-generated EVI index. ○ The RT auto-configures as Type 2 from the 4-byte AS and the 2-byte EVI—Type encoded as 0x0202.
Example	`OS10(config)# evpn` `OS10(config-evpn)# auto-evi`
Supported releases	10.4.2.0 or later

disable-rt-asn

Sets the ASN value to 0 in auto-derived route targets.

Syntax	`disable-rt-asn`
Parameters	None
Default	Not configured
Command mode	EVPN
Usage information	In a Clos leaf-spine topology, if you configure the leaf nodes (VTEPs) in separate ASNs, the system cannot use the route targets that are automatically generated using the `auto-evi` or `route-target auto` commands. The route target includes the ASN and the route targets derived on each of the leaf nodes differ from one another. In such eBGP EVPN scenarios, use the `disable-rt-asn` command to automatically provision route targets in the leaf nodes. When you use this command, the `export route-target` has the ASN value set to 0 and ensures that identical route targets are generated on all the leaf nodes. The leaf VTEPs can import EVPN routes only based on VNI, even though the leaf VTEPs are on different ASNs. This command is applicable when you use the `auto-evi` or `route-target auto` commands for EVIs, symmetric IRB VRFs, or both. Note: You must manually configure the route target and set the ASN value to 0 in other vendor switches that do not support the `disable-rt-asn` feature.

Example 1

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
```

Example 2

```
OS10(config)# evpn
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# evi 1001
OS10(config-evpn-evi-1001)# route-target auto
OS10(config-evpn)# vrf BLUE
OS10(config-evpn-vrf-BLUE)# vni 64001
OS10(config-evpn-vrf-BLUE)# route-target auto
OS10(config-evpn-vrf-BLUE)#
```

Supported releases 10.5.1.0 or later

evi

Creates an EVPN instance (EVI) in EVPN mode.

Syntax `evi id`

Parameters

id Enter the EVPN instance ID, from 1 to 65535.

Default Not configured

Command mode EVPN

Usage information If an MP-BGP network uses 4-byte autonomous systems or to specify the RD and RT values, manually configure EVPN instances and associate each EVI with the overlay VXLAN virtual network. The EVI activates only when you configure the VXLAN network ID (VNI), RD, RT, and virtual network.

Example

```
OS10(config)# evpn
OS10(config-evpn)# evi 10
OS10(config-evpn-evi)#
```

Supported releases 10.4.2.0 or later

evpn

Enables the EVPN control plane for VXLAN.

Syntax `evpn`

Parameters None

Default Not configured

Command mode CONFIGURATION

Usage information Enabling EVPN triggers BGP to advertise EVPN capability with AFI=25 and SAFI=70 to all BGP peers in an autonomous system. The `no` version of this command disables EVPN on the switch.

Example

```
OS10(config)# evpn
OS10(config-evpn)#
```

Supported releases 10.4.2.0 or later

rd

Configures the Route Distinguisher (RD) value that EVPN routes use.

Syntax

```
rd {A.B.C.D:[1-65535] | auto}
```

Parameters

***A.B.C.D:*[1-65535]**	Manually configure the RD with a 4-octet IPv4 address, then a 2-octet-number from 1 to 65535.
auto	Configure the RD to automatically generate.

Default Not configured

Command mode EVPN-EVI and EVPN-VRF

Usage information A RD maintains the uniqueness of an EVPN route between different EVPN instances. Configure a route distinguisher in a tenant VRF used for EVPN symmetric IRB traffic. The RD auto-configures as Type 1 from the overlay network source IP address and the auto-generated EVPN instance ID.

The `rd auto` command is not supported in EVPN-VRF mode. When you create a VRF in EVPN mode, the RD is automatically generated. The `rd A.B.C.D:[1-65535]` command is supported in EVPN-VRF mode in 10.5.1 and later releases.

Example

```
OS10(config)# evpn
OS10(config-evpn)# evi 10
OS10(config-evpn-evi)# vni 10000
OS10(config-evpn-evi)# rd 111.111.111.111:65535
```

```
OS10(config)# evpn
OS10(config-evpn)# vrf vrf-blue
OS10(config-evpn-vrf-vrf-blue)# rd 111.111.111.111:65000
```

Supported releases 10.4.2.0 or later

redistribute l2vpn evpn

Redistributes L2VPN EVPN routes into BGP and OSPF IPv4/IPv6 routes.

Syntax

```
redistribute l2vpn evpn [route-map map name]
```

Parameters

- `route-map map-name` — (Optional) Filter the L2VPN EVPN routes that are redistributed in BGP and OSPF.

Default None

Command Mode ROUTER-BGPv4-AF, ROUTER-BGPv6-AF, ROUTER-OSPF, or ROUTER-OSPFv6

Usage Information Use the `redistribute l2vpn evpn` command to redistribute the L2VPN EVPN routes learned in non-default tenant VRFs for BGP and or OSPF IPv4/IPv6 routing.

Example

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# vrf blue
OS10(conf-router-bgp-101-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
```

```
OS10(config)# router ospf 1 vrf GREEN
OS10(config-router-ospf-1)# redistribute l2vpn evpn

OS10(config)# router ospfv3 2 vrf GREEN
OS10(config-router-ospfv3-2)# redistribute l2vpn evpn
```

Supported Releases 10.5.1 or later

route-target

Configures the Route Target (RT) values that EVPN routes use.

Syntax `route-target {auto | value {import | export | both} [asn4]}`

Parameters

***value* {import | export | both}**	Configure an RT import or export value, or both values in the format *2-octet-ASN*:*4-octet-number* or *4-octet-ASN*:*2-octet-number*. • The *2-octet* ASN or number is 1 to 65535. • The *4-octet* ASN or number is 1 to 4294967295.
auto	Configure the RT import and export values to automatically generate.
asn4	(Optional) Advertises a 4-byte AS number in RT values.

Default Not configured

Command mode EVPN-EVI and EVPN-VRF

Usage information A RT determines how EVPN routes distribute among EVPN instances. Configure each RT with an import and export value. When the EVPN routes advertise, the RT export value configured for export attaches to each route. The receiving VTEP compares a route export value with the local RT import value. If the values match, the routes download and install on the VTEP.

- For 2-byte autonomous systems, the RT auto-configures as Type 0 from the 2-byte AS and the 3-byte VNI—Type encoded as 0x0002.
- For 4-byte autonomous systems, the RT auto-configures as Type 2 from the 4-byte AS and the 2-byte EVI—Type encoded as 0x0202.

Configure a route target in a tenant VRF used for EVPN symmetric IRB traffic. The `route-target` command is supported in EVPN-VRF mode in 10.5.1 and later releases. In EVPN-VRF command mode, the manual route-target configuration should be unique across VRFs.

Example

```
OS10(config)# evpn
OS10(config-evpn)# evi 10
OS10(config-evpn-evi)# vni 10000
OS10(config-evpn-evi)# rd 111.111.111.111:65535
OS10(config-evpn-evi)# route-target 1:3 both
```

```
OS10(config)# evpn
OS10(config-evpn)# vrf vrf-blue
OS10(config-evpn-vrf-vrf-blue)# route-target auto
```

Supported releases 10.4.2.0 or later

router-mac

Configure the local router MAC address that is used by remote VTEPs as the destination address in VXLAN encapsulated packets sent to the switch.

Syntax `router-mac mac-address`

Parameters

mac-address	Enter the MAC address in *nn:nn:nn:nn:nn:nn* format.

Default Not configured

Command mode EVPN

Usage information The EVPN router MAC address is encoded in the router's MAC extended community in MAC/IP Type 2 and IP-prefix Type 5 route updates. It also serves as the destination MAC address in VXLAN encapsulated packets sent to the switch. In a VLT domain, configure the same router MAC address on both VLT VTEP peers.

Example

```
OS10(config-evpn)# router-mac 00:01:02:03:04:05
```

Supported releases 10.5.1 or later

show evpn arp-nd-suppression

Shows the global ARP-suppression enabled or disabled status.

Syntax `show evpn arp-nd-suppression`

Parameters None.

Default None.

Command Mode EXEC

Security and access `sysadmin`, `netadmin`, `netoperator`

Usage Information Use this command to display the global ARP-suppression enabled or disabled status.

Example

```
OS10# show evpn arp-nd-suppression

ARP-ND Suppression Status : Enabled

OS10# show evpn arp-nd-suppression

ARP-ND Suppression Status : Disabled
```

Supported Releases 10.5.3 or later

show evpn evi

Displays the configuration settings of EVPN instances.

Syntax `show evpn evi [id]`

Parameters *id* — (Optional) Enter the EVPN instance ID, from 1 to 65535.

Default Not configured

Command mode EXEC

Usage information Use this command to verify EVPN instance status, associated VXLAN virtual networks and the RD and RT values the BGP EVPN routes use in the EVI. The status of integrated routing and bridging (IRB) and the VRF used for EVPN traffic also display.

Example

```
OS10# show evpn evi 101
EVI : 101, State : up
  Bridge-Domain       : Virtual-Network 101, VNI 101
  Route-Distinguisher : 1:95.0.0.4:101(auto)
  Route-Targets       : 0:101:268435556(auto) both
  Inclusive Multicast : 95.0.0.3
  IRB                 : Enabled(VRF: default)
```

Supported releases 10.4.2.0 or later

show evpn mac

Displays BGP EVPN routes for host MAC addresses.

Syntax

```
show evpn mac {count | mac-address nn.nn.nn.nn | evi id [mac-address
nn.nn.nn.nn | count | next-hop ip-address count]}
```

Parameters

- `count` — Displays the total number of local and remote host MAC addresses in EVPN instances.
- `mac-address nn.nn.nn.nn` — Displays the BGP EVPN routes for a specific 48-bit host MAC address.
- `evi id` — Displays the host MAC addresses and next hops in a specified EVPN instance, from 1 to 65535. To filter the output, display information on the host MAC address count for an EVPN ID or for a next-hop IP address, and BGP routes for a specified MAC address.

Default Not configured

Command mode EXEC

Usage information Use this command to display the BGP routes for host MAC addresses in EVPN instances. The type 2 routes received from the remote VTEP is displayed only if there is a corresponding EVI configured locally.

Examples

```
OS10# show evpn mac
Type  -(lcl): Local (rmt): remote

EVI  Mac-Address        Type  Seq-No  Interface/Next-Hop
50   00:00:00:aa:aa:aa  rmt   0       55.1.1.3
```

```
OS10# show evpn mac count

Total MAC Entries :
  Local MAC Address Count  :    2
  Remote MAC Address Count :    5
```

```
OS10# show evpn mac evi 811 count

EVI 811 MAC Entries :
  Local MAC Address Count  :    1
  Remote MAC Address Count :    2
```

```
OS10# show evpn mac evi 811 next-hop 80.80.1.8 count

EVI 811 next-hop 80.80.1.8 MAC Entries :
  Remote MAC Address Count :    2
```

Supported releases 10.4.2.0 or later

show evpn mac-ip

Displays the BGP EVPN Type 2 routes used for host MAC-IP address binding.

Syntax

```
show evpn mac-ip [count | evi evi [mac-address mac-address] | mac-address
mac-address | next-hop ip-address]
```

Parameters

- `count` — Displays the total number of MAC addresses in EVPN MAC-IP address binding.
- `evi evi` — Enter an EVPN instance ID, from 1 to 65535.
- `host ip-address` — Enter the IP address of a host that communicates through EVPN routes.
- `mac-address mac-address` — Enter the MAC address of a host that communicates through EVPN routes in the format `nn:nn:nn:nn:nn`.
- `next-hop ip-address` — Enter the IP address of a next-hop switch.

Default Not configured

Command mode EXEC

Usage information Use this command to view the MAC-IP address binding for host communication in VXLAN tenant segments. The type 2 routes received from the remove VTEP displays only if there is a corresponding EVI configured locally.

Use this command to display the snooped MAC-IP binding (ARP entries) for Layer 2 VXLAN bridges. The functionality is extended to Layer 2 VXLAN bridges. Additionally, this command displays Layer 2 VXLAN related information also. Use this command to view snooped MAC-IP bindings of Layer 3 VXLAN bridges. All existing filters of this command are supported including VRF. The `show ip arp summary` command is supported for Layer 2 VXLAN.

Example

```
OS10# show evpn mac-ip

Type  -(lcl): Local (rmt): remote

EVI     Mac-Address        Type   Seq-No  Host-IP     Interface/Next-Hop
101     14:18:77:0c:e5:a3  rmt    0       11.11.11.3      95.0.0.5

103     14:18:77:25:4e:84  rmt    0       2001:13::13:1    95.0.0.3
106     14:18:77:25:4e:84  rmt    0       16.16.16.1       95.0.0.3
106     14:18:77:25:4e:84  rmt    0       2001:16::16:1    95.0.0.3
```

Example (ARP-suppression)

```
OS10# show evpn mac-ip

Type -(lcl): Local (rmt): remote

EVI Mac-Address Type Seq-No Host-IP Interface/Next-Hop
100  00:00:e7:dd:21:2c lcl 0 1.1.1.1 virtual-network100
100  00:00:e7:dd:3b:a9 lcl 0 1.1.1.2 virtual-network100
```

Supported releases 10.4.3.0 or later

show evpn router-mac remote-vtep

Displays both the local and remote router MAC addresses used in symmetric IRB.

Syntax `show evpn router-mac {router-vtep [vtep-ip-address]}`

Parameters *vtep-ip-address* — (Optional) Enter the IP address of a remote VTEP.

Default Not configured

Command mode EXEC

Usage information Use the `show evpn router-mac remote-vtep` command to display the router MAC address used on the switch and on specified remote VTEPs. Use the `router-mac` command to create a local router MAC address. The show evpn router-mac command displays the local router mac and router mac of all remote VTEPs. The show evpn router-mac remote-vtep [vtep-ip-address] command displays router mac of specified remote VTEP.

Example

```
OS10# show evpn router-mac

Local Router MAC : 14:18:77:25:4e:4d

Remote-VTEP      Router's-MAC
4.4.4.4          14:18:77:25:6f:4d
5.5.5.5          00:00:01:00:a3:b4
```

Supported releases 10.5.1.0 or later

show evpn vrf

Displays the VRF instances used to forward EVPN routes in VXLAN overlay networks.

Syntax `show evpn vrf [vrf-name]`

Parameters *vrf-name* — (Optional) Enter the name of a non-default tenant VRF instance.

Default Not configured

Command mode EXEC

Usage information Use this command to verify the tenant VRF instances used in EVPN instances to exchange BGP EVPN routes in VXLANs.

Example

```
show evpn vrf

VXLAN-VNI   EVI     Virtual-Network-Instance  VRF-Name
102         102     102                       blue
```

```
103          103      103                        default
104          104      104                        blue
106          106      106                        default
105          105      105                        blue
101          101      101                        default
```

Supported releases 10.4.3.0 or later

show evpn vrf l3-vni

Displays the configuration of the tenant VRF instances used for symmetric IRB.

Syntax `show evpn vrf l3-vni [tenant-vrf-name]`

Parameters *tenant- vrf-name* — (Optional) Enter the name of a non-default tenant VRF instance.

Default Not configured

Command mode EXEC

Usage information Use the `show evpn vrf l3-vni` command to display the configuration settings of each tenant VRF with its unique VXLAN VNI. Use the `show evpn vrf` command to display the tenant VRF instances used to exchange BGP EVPN routes in VXLANs.

Example

```
OS10# show evpn vrf l3-vni

VRF : vrf_30, State : up
 L3-VNI               : 3030
 Route-Distinguisher  : 1:80.80.1.1:3030(auto)
 Route-Targets        : 0:200:268438486(auto) both
 Remote VTEP          : 4.4.4.4

VRF : vrf_40, State : up
 L3-VNI               : 4040
 Route-Distinguisher  : 1:80.80.1.1:4040(auto)
 Route-Targets        : 0:200:268439496(auto) both
 Remote VTEP          : 4.4.4.4

VRF : vrf_50, State : up
 L3-VNI               : 5050
 Route-Distinguisher  : 1:80.80.1.1:5050(auto)
 Route-Targets        : 0:200:268440506(auto) both
 Remote VTEP          : 4.4.4.4
```

```
OS10# show evpn vrf
VXLAN-VNI  EVI  Virtual-Network-Instance  VRF-Name
30         30   30                        vrf_30
40         40   40                        vrf_40

OS10# show evpn vrf l3-vni vrf_30
VRF : vrf_30, State : up
 L3-VNI               : 3030
 Route-Distinguisher  : 1:80.80.1.1:3030(auto)
 Route-Targets        : 0:200:268435557(auto) both
 Remote VTEP          : 4.4.4.4
```

Supported releases 10.5.1.0 or later

show evpn vxlan-vni

Displays the VXLAN overlay network for EVPN instances.

Syntax `show evpn vxlan-vni [vni]`

Parameters	*vni* — (Optional) Enter the VXLAN virtual-network ID, from 1 to 16,777,215.
Default	Not configured
Command mode	EXEC
Usage information	Use this command to verify the VXLAN virtual network and bridge domain used by an EVPN instance.

Example	`OS10# show evpn vxlan-vni`
	
	`VXLAN-VNI  EVI  Bridge-Domain`
	`100  65447  65447`

Supported releases	10.4.2.0 or later

vni

Associates an EVPN instance with a VXLAN VNI or configures a VXLAN VNI to use for L3 EVPN symmetric IRB traffic.

Syntax	`vni vni`
Parameters	***vni*** Enter a VXLAN virtual-network ID, from 1 to 16,777,215.
Default	Not configured
Command mode	EVPN-EVI and EVPN-VRF
Usage information	Use this command: • In EVPN-EVI mode to configure an EVPN instance with RD and RT values for an overlay VXLAN virtual network. • In EVPN-VRF mode to configure a unique VXLAN VNI for EVPN symmetric IRB traffic in a tenant VRF.

Example	`OS10(config)# evpn`
	`OS10(config-evpn)# evi 10`
	`OS10(config-evpn-evi)# vni 10000`
	
	`OS10(config)# evpn`
	`OS10(config-evpn)# vrf vrf-blue`
	`OS10(config-evpn-vrf-vrf-blue)# vni 65536`

Supported releases	10.5.1 or later

vrf

Creates a non-default VRF instance for EVPN symmetric IRB traffic.

Syntax	`vrf vrf-name`
Parameters	• *vrf-name* — Enter the name of a non-default tenant VRF; 32 characters maximum.
Default	Not configured
Command Mode	EVPN
Usage Information	Configure a non-default VRF for symmetric IRB for each tenant VRF. The tenant VRF is created using the `ip vrf` command when you enable overlay routing with IRB; see Enable overlay routing between virtual networks.

Example

```
OS10(config)# evpn
OS10(config-evpn)# vrf vrf-blue
```

Supported Releases 10.5.1 or later

Example: VXLAN with BGP EVPN with asymmetric IRB

The following VXLAN with BGP EVPN example uses a Clos leaf-spine topology with VXLAN tunnel endpoints (VTEPs). The individual switch configuration shows how to set up an end-to-end VXLAN. eBGP is used to exchange IP routes in the IP underlay network, and EVPN routes in the VXLAN overlay network. All spine nodes are in one autonomous system—AS 101. All leaf nodes are in another autonomous system—AS 100.

- On VTEPs 1 and 2: Access ports are assigned to the virtual network using a switch-scoped VLAN. EVPN is configured using auto-EVI mode.
- On VTEPs 3 and 4: Access ports are assigned to the virtual network using a port-scoped VLAN. The EVPN instance is configured using manual configuration mode. The RD and RT are configured using auto mode.

All VTEPs perform asymmetric IRB routing, in which:

- IRB routing is performed only on ingress VTEPs.
- Egress VTEPs perform IRB bridging.

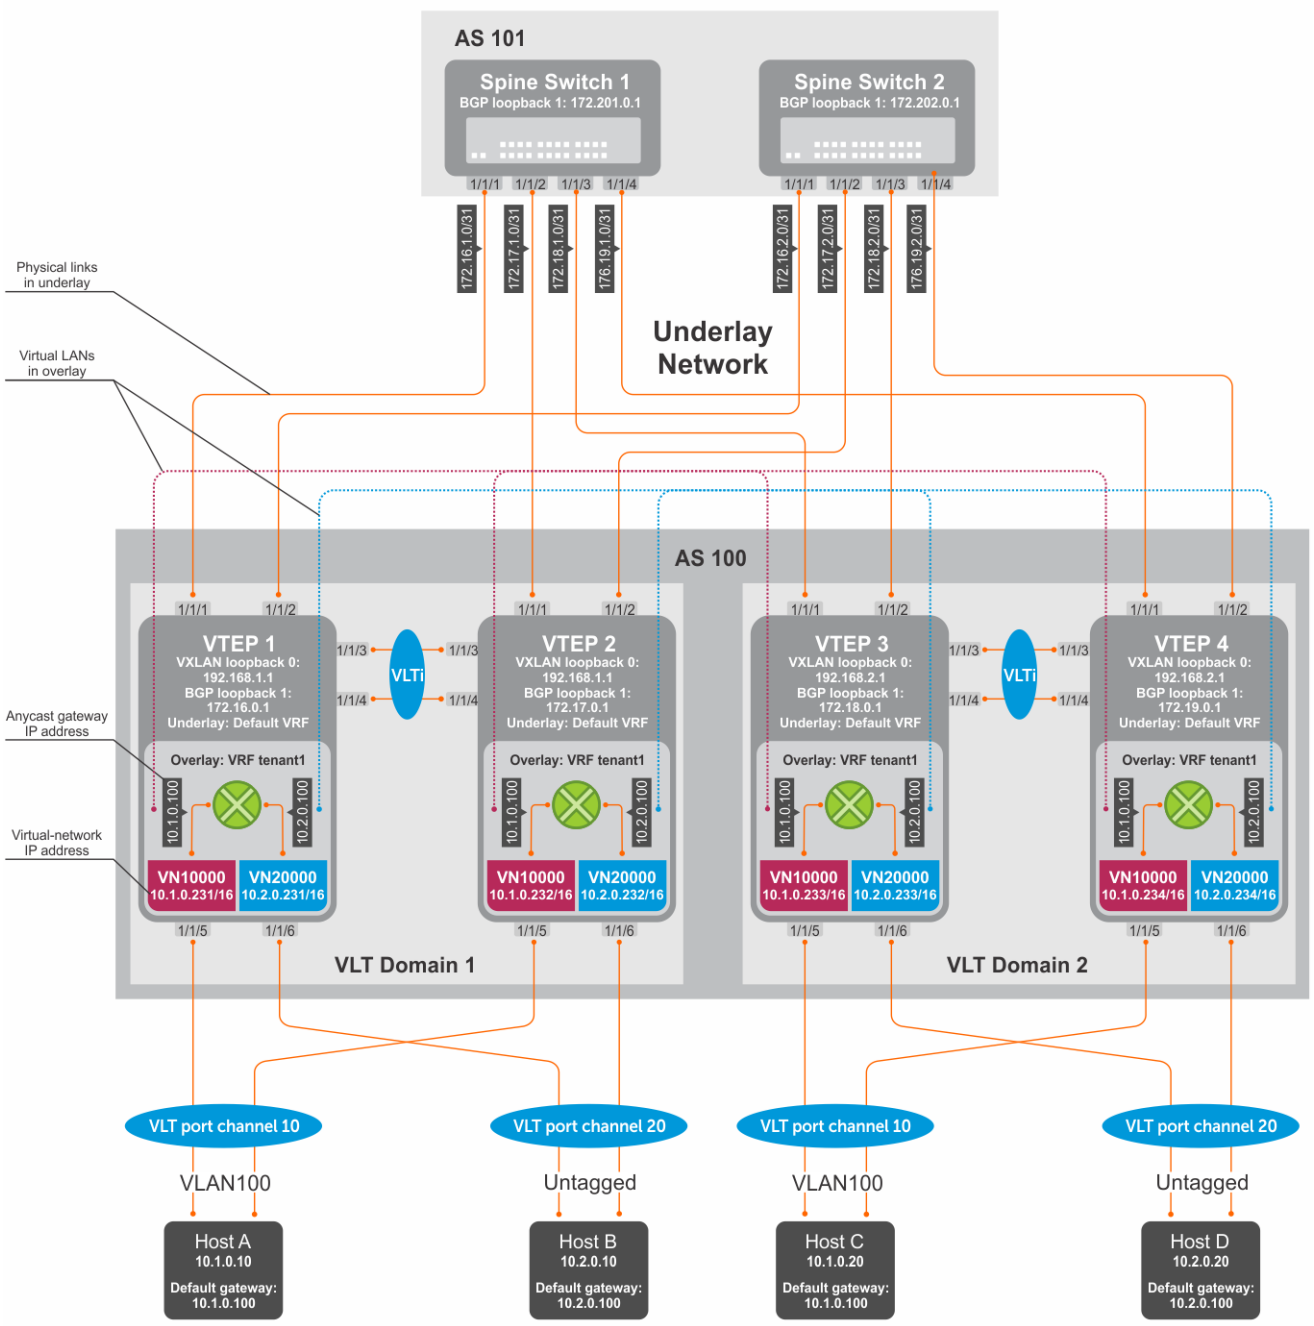

Figure 11. VXLAN BGP EVPN use case

VTEP 1 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Assign VLAN member interfaces to the virtual networks.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
OS10(config)# interface vlan200
OS10(config-if-vl-200)# virtual-network 20000
OS10(config-if-vl-200)# no shutdown
OS10(config-if-vl-200)# exit
```

5. Configure access ports as VLAN members for a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport access vlan 200
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.16.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.16.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

7. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.16.0.1
```

```
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(config-router-bgp-af)# redistribute connected
OS10(config-router-bgp-af)# exit
```

8. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.16.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.16.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

9. Configure a Loopback interface for BGP EVPN peering different from the VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.16.0.1/32
OS10(conf-if-lo-1)# exit
```

10. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

11. Configure EVPN.

Configure the EVPN instance, RD, and RT using auto-EVI mode:

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# exit
```

12. Configure VLT.

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.0/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure the VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.1
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

13. Configure IP switching in the overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.231/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.231/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 2 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using the same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Assign VLAN member interfaces to the virtual networks.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
OS10(config)# interface vlan200
OS10(config-if-vl-200)# virtual-network 20000
OS10(config-if-vl-200)# no shutdown
OS10(config-if-vl-200)# exit
```

5. Configure access ports as VLAN members for a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
```

```
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport access vlan 200
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.17.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.17.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

7. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.17.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

8. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.17.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.17.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

9. Configure a Loopback interface for BGP EVPN peering different from VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.17.0.1/32
OS10(conf-if-lo-1)# exit
```

10. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
```

```
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-bgp-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

11. Configure EVPN.

Configure the EVPN instance, RD, and RT using auto-EVI mode:

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# exit
```

12. Configure VLT.

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.1/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.2
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
```

```
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.0
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

13. Configure IP switching in overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.232/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.232/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 3 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
```

```
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn-20000)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.18.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.18.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

8. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.18.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
```

```
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.18.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.18.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

10. Configure a Loopback interface for BGP EVPN peering different from VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.18.0.1/32
OS10(conf-if-lo-1)# exit
```

11. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

12. Configure EVPN.

Configure the EVPN instance in manual configuration mode, and RD and RT configuration in auto mode:

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# vni 10000
OS10(config-evpn-evi-10000)# rd auto
```

```
OS10(config-evpn-evi-10000)# route-target auto
OS10(config-evpn-evi-10000)# exit

OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd auto
OS10(config-evpn-evi-20000)# route-target auto
OS10(config-evpn-evi-20000)# exit
OS10(config-evpn)# exit
```

13. Configure VLT.

Configure a VLTi VLAN for the virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vlti-vlan 100
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vlti-vlan 200
OS10(config-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.10/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channels.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.3
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.11
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

14. Configure IP routing in the overlay network.

Create the tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.233/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.233/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 4 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure the unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to the virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.19.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.19.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

8. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.19.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.19.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.19.2.1
```

```
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

10. Configure a Loopback interface for BGP EVPN peering different from the VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.19.0.1/32
OS10(conf-if-lo-1)# exit
```

11. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

12. Configure EVPN.

Configure the EVPN instance manual configuration mode, and RD, and RT configuration in auto mode:

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# vni 10000
OS10(config-evpn-evi-10000)# rd auto
OS10(config-evpn-evi-10000)# route-target auto
OS10(config-evpn-evi-10000)# exit

OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd auto
OS10(config-evpn-evi-20000)# route-target auto
OS10(config-evpn-evi-20000)# exit
OS10(config-evpn)# exit
```

13. Configure VLT.

Configure a VLTi VLAN for the virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vlti-vlan 100
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(conf-vn-20000)# vlti-vlan 200
OS10(conf-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.11/31
OS10(config-if-vl-4000)# exit
```

Configure VLT port channels.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.4
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between the VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.10
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

14. Configure IP routing in the overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.234/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.234/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

Spine Switch 1

1. Configure downstream ports on underlay links to the leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.1.1/31
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.1.1/31
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.1.1/31
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.1.1/31
OS10(conf-if-eth1/1/4)# exit
```

2. Configure eBGP.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.201.0.1
OS10(config-router-bgp-101)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
```

3. Configure eBGP IPv4 peer sessions on the P2P links.

```
OS10(conf-router-bgp-101)# neighbor 172.16.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit
```

```
OS10(conf-router-bgp-101)# neighbor 172.17.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-101)# exit
```

4. Configure a Loopback interface for BGP EVPN peering.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.201.0.1/32
OS10(conf-if-lo-1)# exit
```

5. Configure BGP EVPN peer sessions.

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# neighbor 172.16.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
```

```
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit
```

Spine Switch 2

1. Configure downstream ports on the underlay links to the leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.2.1/31
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.2.1/31
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.2.1/31
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.2.1/31
OS10(conf-if-eth1/1/4)# exit
```

2. Configure eBGP.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.202.0.1
OS10(config-router-bgp-101)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
```

3. Configure eBGP IPv4 peer sessions on the P2P links.

```
OS10(conf-router-bgp-101)# neighbor 172.16.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit
```

```
OS10(conf-router-bgp-101)# neighbor 172.18.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-101)# exit
```

4. Configure a Loopback interface for BGP EVPN peering.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.202.0.1/32
OS10(conf-if-lo-1)# exit
```

5. Configure BGP EVPN peer sessions.

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# neighbor 172.16.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended

Verify VXLAN with BGP EVPN configuration.

1. Verify virtual network configurations.

```
LEAF1# show virtual-network
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD - Unknown-Unicast-Drop
Virtual Network: 10000
   Members:
      VLAN 100: port-channel10, port-channel1000
   VxLAN Virtual Network Identifier: 10000
      Source Interface: loopback0(192.168.1.1)
      Remote-VTEPs (flood-list): 192.168.2.1(CP)

Virtual Network: 20000
   Members:
      Untagged: port-channel20
   VLAN 200: port-channel1000
      VxLAN Virtual Network Identifier: 20000
      Source Interface: loopback0(192.168.1.1)
      Remote-VTEPs (flood-list): 192.168.2.1(CP)
LEAF1#
```

2. Verify EVPN configurations and EVPN parameters.

```
LEAF1# show evpn evi

EVI : 10000, State : up
  Bridge-Domain       : Virtual-Network 10000, VNI 10000
  Route-Distinguisher : 1:192.168.1.1:10000(auto)
  Route-Targets       : 0:100:268445456(auto) both
  Inclusive Multicast : 192.168.2.1
  IRB                 : Enabled(tenant1)

--- 10.1.0.20 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4061ms
rtt min/avg/max/mdev = 0.737/0.783/0.866/0.047 ms
root@HOST-A:~#
```

6. Check connectivity between host A and host D.

```
root@HOST-A:~# ping 10.2.0.20 -c 5
PING 10.2.0.20 (10.2.0.20) 56(84) bytes of data.
64 bytes from 10.2.0.20: icmp_seq=1 ttl=63 time=0.707 ms
64 bytes from 10.2.0.20: icmp_seq=2 ttl=63 time=0.671 ms
64 bytes from 10.2.0.20: icmp_seq=3 ttl=63 time=0.687 ms
64 bytes from 10.2.0.20: icmp_seq=4 ttl=63 time=0.640 ms
64 bytes from 10.2.0.20: icmp_seq=5 ttl=63 time=0.644 ms

--- 10.2.0.20 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4089ms
rtt min/avg/max/mdev = 0.640/0.669/0.707/0.041 ms
root@HOST-A:~#
```

NOTE: Follow Steps 1 to 6 to check ping connectivity between combinations of other hosts, and between hosts through different virtual-network IP addresses.

Example: VXLAN BGP EVPN — Multiple AS topology with asymmetric IRB

The following VXLAN with BGP EVPN example uses a Clos leaf-spine example. The individual switch configuration shows how to set up an end-to-end VXLAN. eBGP is used to exchange IP routes in the IP underlay network, and EVPN routes in the VXLAN overlay network. All VTEPs perform asymmetric IRB routing, in which:

- IRB routing is performed only on ingress VTEPs.
- Egress VTEPs perform IRB bridging.

In this example, each node in the spine network and each VTEP in the leaf network belongs to a different autonomous system. Spine switch 1 is in AS 101. Spine switch 2 is in AS 102. For leaf nodes, VLT domain 1 is in AS 99; VLT domain 2 is in AS 100.

- On VTEPs 1 and 2: Access ports are assigned to the virtual network using a switch-scoped VLAN. EVPN instance along with RD and RT values are configured in manual mode.
- On VTEPs 3 and 4: Access ports are assigned to the virtual network using a port-scoped VLAN. EVPN instance along with RD and RT values are configured in manual mode.

NOTE: In multiple AS topology, you can configure route targets in an easier way using the `disable-rt-asn` command with `route-target auto` or `auto evi` commands.

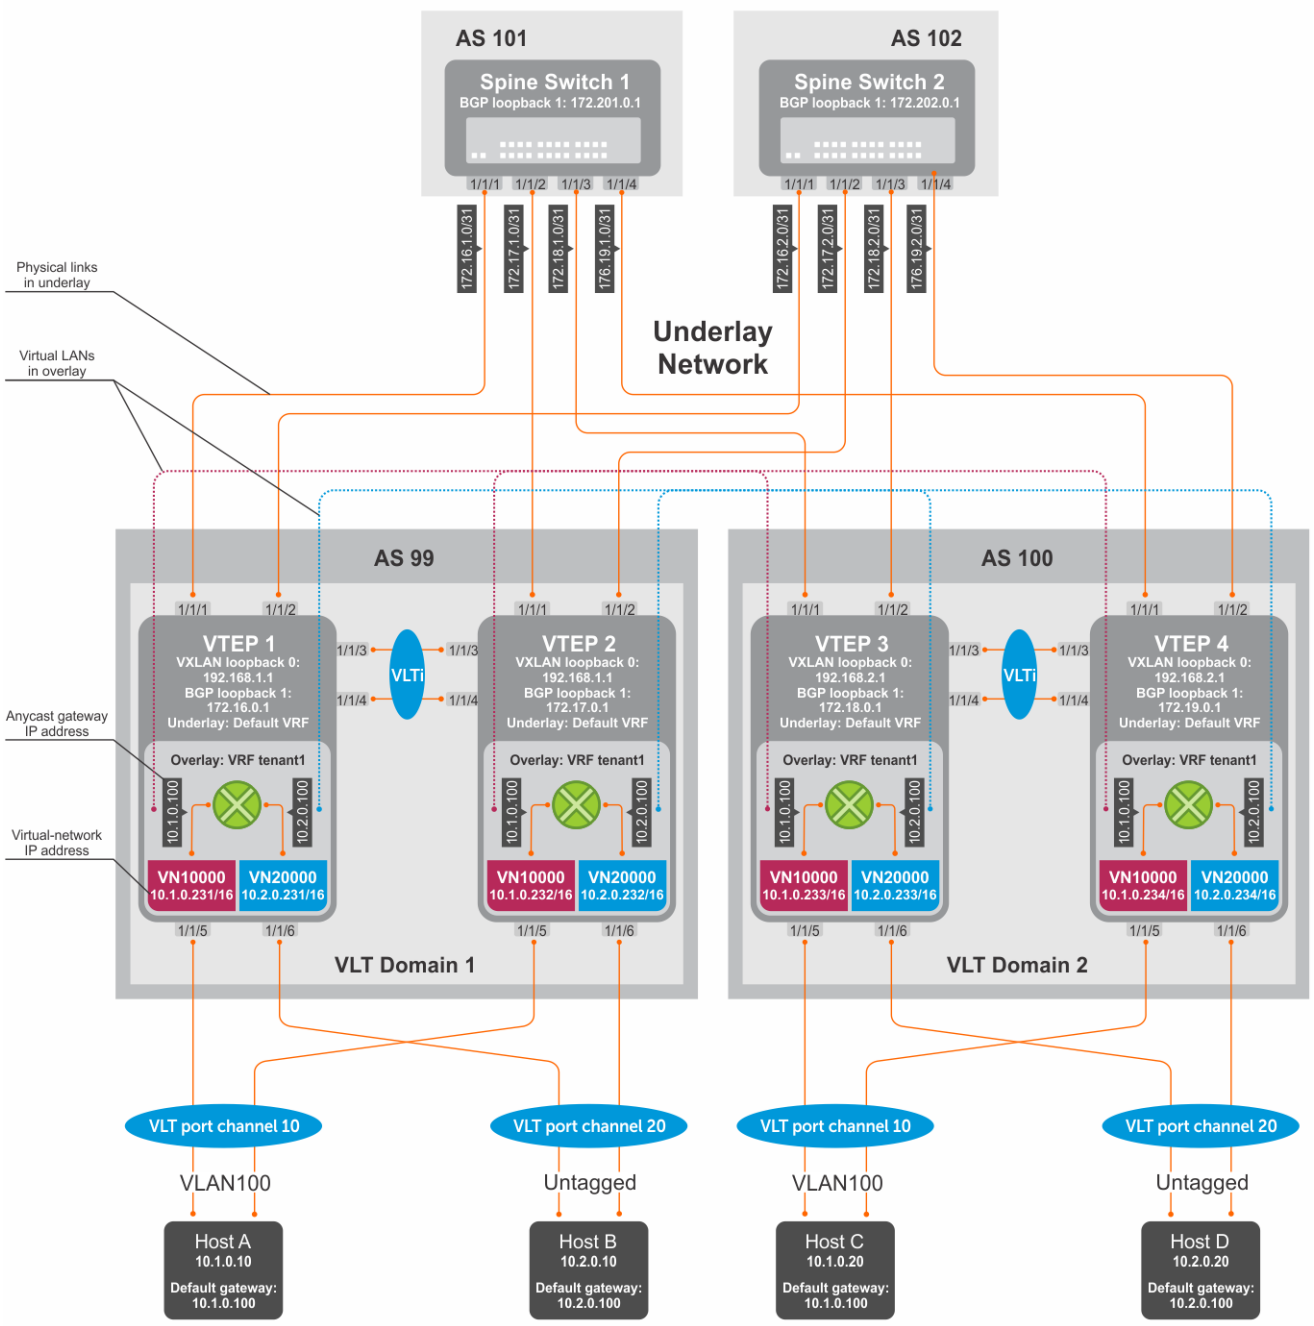

Figure 12. VXLAN BGP EVPN with multiple AS

VTEP 1 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Assign VLAN member interfaces to the virtual networks.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
OS10(config)# interface vlan200
OS10(config-if-vl-200)# virtual-network 20000
OS10(config-if-vl-200)# no shutdown
OS10(config-if-vl-200)# exit
```

5. Configure access ports as VLAN members for a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport access vlan 200
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.16.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.16.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

7. Configure eBGP.

```
OS10(config)# router bgp 99
OS10(config-router-bgp-99)# router-id 172.16.0.1
```

```
OS10(config-router-bgp-99)# address-family ipv4 unicast
OS10(config-router-bgp-af)# redistribute connected
OS10(config-router-bgp-af)# exit
```

8. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-99)# neighbor 172.16.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-99)# neighbor 172.16.2.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-99)# exit
```

9. Configure a Loopback interface for BGP EVPN peering different from the VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.16.0.1/32
OS10(conf-if-lo-1)# exit
```

10. Configure BGP EVPN peering.

```
OS10(config)# router bgp 99
OS10(config-router-bgp-99)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-99)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

11. Configure EVPN.

Configure the EVPN instance with RD and RT values in manual mode:

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# vni 10000
OS10(config-evpn-evi-10000)# rd 192.168.1.1:10000
OS10(config-evpn-evi-10000)# route-target 99:10000 both
OS10(config-evpn-evi-10000)# route-target 100:10000 import
OS10(config-evpn-evi-10000)#exit

OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd 192.168.1.1:20000
OS10(config-evpn-evi-20000)# route-target 99:20000 both
```

```
OS10(config-evpn-evi-20000)# route-target 100:20000 import
OS10(config-evpn-evi-20000)#exit
OS10(config-evpn)#
```

12. Configure VLT.

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.0/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure the VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 99
OS10(config-router-bgp-99)# neighbor 172.16.250.1
OS10(config-router-neighbor)# remote-as 99
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-99)# exit
```

13. Configure IP switching in the overlay network.

Create a tenant VRF

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.231/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.231/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 2 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using the same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn)# exit
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Assign VLAN member interfaces to the virtual networks.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
OS10(config)# interface vlan200
OS10(config-if-vl-200)# virtual-network 20000
OS10(config-if-vl-200)# no shutdown
OS10(config-if-vl-200)# exit
```

5. Configure access ports as VLAN members for a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit
```

```
OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# switchport access vlan 200
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.17.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.17.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

7. Configure eBGP.

```
OS10(config)# router bgp 99
OS10(config-router-bgp-99)# router-id 172.17.0.1
OS10(config-router-bgp-99)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

8. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-99)# neighbor 172.17.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-99)# neighbor 172.17.2.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-99)# exit
```

9. Configure a Loopback interface for BGP EVPN peering different from VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.17.0.1/32
OS10(conf-if-lo-1)# exit
```

10. Configure BGP EVPN peering.

```
OS10(config)# router bgp 99
OS10(config-router-bgp-99)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
```

```
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-99)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-bgp-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-99)# exit
```

11. Configure EVPN.

Configure the EVPN instance with RD and RT in manual configuration mode:

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# vni 10000
OS10(config-evpn-evi-10000)# rd 192.168.1.1:10000
OS10(config-evpn-evi-10000)# route-target 99:10000 both
OS10(config-evpn-evi-10000)# route-target 100:10000 import
OS10(config-evpn-evi-10000)#exit

OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd 192.168.1.1:20000
OS10(config-evpn-evi-20000)# route-target 99:20000 both
OS10(config-evpn-evi-20000)# route-target 100:20000 import
OS10(config-evpn-evi-20000)#exit
OS10(config-evpn)#
```

12. Configure VLT.

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.1/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
```

```
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.2
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 99
OS10(config-router-bgp-99)# neighbor 172.16.250.0
OS10(config-router-neighbor)# remote-as 99
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-99)# exit
```

13. Configure IP switching in overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.232/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.232/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 3 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn-20000)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.18.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
```

```
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.18.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

8. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.18.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.18.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.18.2.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

10. Configure a Loopback interface for BGP EVPN peering different from VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.18.0.1/32
OS10(conf-if-lo-1)# exit
```

11. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

12. Configure EVPN.

Configure the EVPN instance, RD, and RT in manual configuration mode:

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# vni 10000
```

```
OS10(config-evpn-evi-10000)# rd 192.168.2.1:10000
OS10(config-evpn-evi-10000)# route-target 99:10000 import
OS10(config-evpn-evi-10000)# route-target 100:10000 both
OS10(config-evpn-evi-10000)#exit

OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd 192.168.2.1:20000
OS10(config-evpn-evi-20000)# route-target 99:20000 import
OS10(config-evpn-evi-20000)# route-target 100:20000 both
OS10(config-evpn-evi-20000)#exit
OS10(config-evpn)#
```

13. Configure VLT.

Configure a VLTi VLAN for the virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vlti-vlan 100
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vlti-vlan 200
OS10(config-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.10/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channels.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.3
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.11
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

14. Configure IP routing in the overlay network.

Create the tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.233/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.233/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 4 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure the unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to the virtual networks.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# member-interface port-channel 10 vlan-tag 100
OS10(config-vn)# exit

OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.19.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.19.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

8. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.19.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.19.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.19.2.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# no shutdown
```

```
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

10. Configure a Loopback interface for BGP EVPN peering different from the VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.19.0.1/32
OS10(conf-if-lo-1)# exit
```

11. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 102
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

12. Configure EVPN.

Configure the EVPN instance,RD, RT in manual configuration mode:

```
OS10(config)# evpn
OS10(config-evpn)# evi 10000
OS10(config-evpn-evi-10000)# vni 10000
OS10(config-evpn-evi-10000)# rd 192.168.2.1:10000
OS10(config-evpn-evi-10000)# route-target 99:10000 import
OS10(config-evpn-evi-10000)# route-target 100:10000 both
OS10(config-evpn-evi-10000)#exit

OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd 192.168.2.1:20000
OS10(config-evpn-evi-20000)# route-target 99:20000 import
OS10(config-evpn-evi-20000)# route-target 100:20000 both
OS10(config-evpn-evi-20000)#exit
OS10(config-evpn)#
```

13. Configure VLT.

Configure a VLTi VLAN for the virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vlti-vlan 100
OS10(config-vn-10000)# exit

OS10(config)# virtual-network 20000
```

```
OS10(conf-vn-20000)# vlti-vlan 200
OS10(conf-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.11/31
OS10(config-if-vl-4000)# exit
```

Configure VLT port channels.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit

OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.4
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between the VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.10
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

14. Configure IP routing in the overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.234/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.234/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

Spine Switch 1

1. Configure downstream ports on underlay links to the leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.1.1/31
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.1.1/31
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.1.1/31
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.1.1/31
OS10(conf-if-eth1/1/4)# exit
```

2. Configure eBGP.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.201.0.1
OS10(config-router-bgp-101)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
```

3. Configure eBGP IPv4 peer sessions on the P2P links.

```
OS10(conf-router-bgp-101)# neighbor 172.16.1.0
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.1.0
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
```

```
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-101)# exit
```

4. Configure a Loopback interface for BGP EVPN peering.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.201.0.1/32
OS10(conf-if-lo-1)# exit
```

5. Configure BGP EVPN peer sessions.

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# neighbor 172.16.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit
```

Spine Switch 2

1. Configure downstream ports on the underlay links to the leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.2.1/31
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.2.1/31
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.2.1/31
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.2.1/31
OS10(conf-if-eth1/1/4)# exit
```

2. Configure eBGP.

```
OS10(config)# router bgp 102
OS10(config-router-bgp-102)# router-id 172.202.0.1
OS10(config-router-bgp-102)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
```

3. Configure eBGP IPv4 peer sessions on the P2P links.

```
OS10(conf-router-bgp-102)# neighbor 172.16.2.0
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-102)# neighbor 172.17.2.0
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-102)# neighbor 172.18.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-102)# neighbor 172.19.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-102)# exit
```

4. Configure a Loopback interface for BGP EVPN peering.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.202.0.1/32
OS10(conf-if-lo-1)# exit
```

5. Configure BGP EVPN peer sessions.

```
OS10(config)# router bgp 102
OS10(conf-router-bgp-102)# neighbor 172.16.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# send-community extended
```

```
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-102)# neighbor 172.17.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 99
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-102)# neighbor 172.18.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-102)# neighbor 172.19.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit
```

Verify VXLAN with BGP EVPN — Multiple AS topology.

1. Verify virtual network configurations.

```
LEAF1# show virtual-network
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD - Unknown-Unicast-Drop
Virtual Network: 10000
   Members:
      VLAN 100: port-channel10, port-channel1000
   VxLAN Virtual Network Identifier: 10000
      Source Interface: loopback0(192.168.1.1)
      Remote-VTEPs (flood-list): 192.168.2.1(CP)

Virtual Network: 20000
   Members:
      Untagged: port-channel20
   VLAN 200: port-channel1000
      VxLAN Virtual Network Identifier: 20000
      Source Interface: loopback0(192.168.1.1)
      Remote-VTEPs (flood-list): 192.168.2.1(CP)
LEAF1#
```

2. Verify EVPN configurations and EVPN parameters.

```
LEAF1# show evpn evi

EVI : 10000, State : up
  Bridge-Domain       : Virtual-Network 10000, VNI 10000
  Route-Distinguisher : 1:192.168.1.1:10000
  Route-Targets       : 0:99:10000 both, 0:100:10000 import
  Inclusive Multicast : 192.168.2.1
  IRB                 : Enabled(tenant1)

  Bridge-Domain       : Virtual-Network 20000, VNI 20000
  Route-Distinguisher : 1:192.168.1.1:20000
  Route-Targets       : 0:99:10000 both, 0:100:10000 import
  Inclusive Multicast : 192.168.2.1
  IRB                 : Enabled(tenant1)
LEAF1#
```

3. Verify BGP EVPN neighborship between leaf and spine nodes.

```
LEAF1# show ip bgp l2vpn evpn summary
BGP router identifier 172.16.0.1 local AS number 99
Neighbor     AS   MsgRcvd  MsgSent  Up/Down   State/Pfx
172.201.0.1  101  1132     1116     13:29:00  27
172.202.0.1  102  1131     1118     13:29:02  28
LEAF1#
```

4. Check connectivity between host A and host B.

```
root@HOST-A:~# ping 10.2.0.10 -c 5
PING 10.2.0.10 (10.2.0.10) 56(84) bytes of data.
64 bytes from 10.2.0.10: icmp_seq=1 ttl=63 time=0.824 ms
64 bytes from 10.2.0.10: icmp_seq=2 ttl=63 time=0.847 ms
64 bytes from 10.2.0.10: icmp_seq=3 ttl=63 time=0.835 ms
64 bytes from 10.2.0.10: icmp_seq=4 ttl=63 time=0.944 ms
64 bytes from 10.2.0.10: icmp_seq=5 ttl=63 time=0.806 ms

--- 10.2.0.10 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4078ms
rtt min/avg/max/mdev = 0.806/0.851/0.944/0.051 ms
root@HOST-A:~#
```

5. Check connectivity between host A and host C.

```
root@HOST-A:~# ping 10.1.0.20 -c 5
PING 10.1.0.20 (10.1.0.20) 56(84) bytes of data.
64 bytes from 10.1.0.20: icmp_seq=1 ttl=64 time=0.741 ms
64 bytes from 10.1.0.20: icmp_seq=2 ttl=64 time=0.737 ms
64 bytes from 10.1.0.20: icmp_seq=3 ttl=64 time=0.772 ms
64 bytes from 10.1.0.20: icmp_seq=4 ttl=64 time=0.799 ms
64 bytes from 10.1.0.20: icmp_seq=5 ttl=64 time=0.866 ms

--- 10.1.0.20 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4061ms
rtt min/avg/max/mdev = 0.737/0.783/0.866/0.047 ms
root@HOST-A:~#
```

6. Check connectivity between host A and host D.

```
root@HOST-A:~# ping 10.2.0.20 -c 5
PING 10.2.0.20 (10.2.0.20) 56(84) bytes of data.
64 bytes from 10.2.0.20: icmp_seq=1 ttl=63 time=0.707 ms
64 bytes from 10.2.0.20: icmp_seq=2 ttl=63 time=0.671 ms
64 bytes from 10.2.0.20: icmp_seq=3 ttl=63 time=0.687 ms
64 bytes from 10.2.0.20: icmp_seq=4 ttl=63 time=0.640 ms
64 bytes from 10.2.0.20: icmp_seq=5 ttl=63 time=0.644 ms

--- 10.2.0.20 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4089ms
```

```
rtt min/avg/max/mdev = 0.640/0.669/0.707/0.041 ms
root@HOST-A:~#
```

NOTE: Follow Steps 1 to 6 to check ping connectivity between combinations of other hosts, and between hosts through different virtual-network IP addresses.

Example: VXLAN BGP EVPN — Centralized L3 gateway with asymmetric IRB

The following VXLAN with BGP EVPN example uses a centralized Layer 3 gateway to perform virtual-network routing. It is based on the sample configuration in Example: VXLAN BGP EVPN — Multiple AS topology.

In the VXLAN BGP EVPN multiple AS topology, all VTEPs are configured to perform distributed L3 gateway routing, in which each VTEP routes VXLAN traffic. Routing decisions are made by ingress VTEPs.

However, in a multi-tenant network, some VTEPs may operate only in Layer 2 VXLAN mode and perform only Layer 2 functions. In this case, configure routing for Layer 2 VTEPs on one Layer 3 VTEP that supports Layer 3 VXLAN functionality. The Layer 2 VXLAN-capable VTEPs are connected with the centralized Layer 3 gateway either directly or through an IP underlay fabric. Any ingress routing traffic on a Layer 2 VTEP is switched to the Layer 3 centralized gateway. All routing decisions are made by the centralized gateway to forward VXLAN traffic to the destination Layer 2 VTEP.

The following centralized L3 gateway example for VXLAN BGP EVPN uses a Clos leaf-spine topology. In this example:

- VTEP 1 and VTEP 2 in VLT 1 operate as a L2 gateway.
- VTEP 3 and VTEP 4 in VLT 2 operate as a centralized L3 gateway.
- Host A and Host B are connected to the L2 gateway. The L2 gateway is connected to a centralized L3 gateway through an IP underlay fabric.
- You must configure the IP address and anycast IP address of the virtual networks in the centralized L3 gateway VTEP. It is not necessary to configure these addresses in the L2 gateway VTEPs.

Routing for tenant L3 traffic is not performed on the L2 VTEPs. The L2 VTEPs forward tenant traffic to the centralized L3 gateway in VLT 2. The L3 gateway routes traffic between L2 tenant segments.

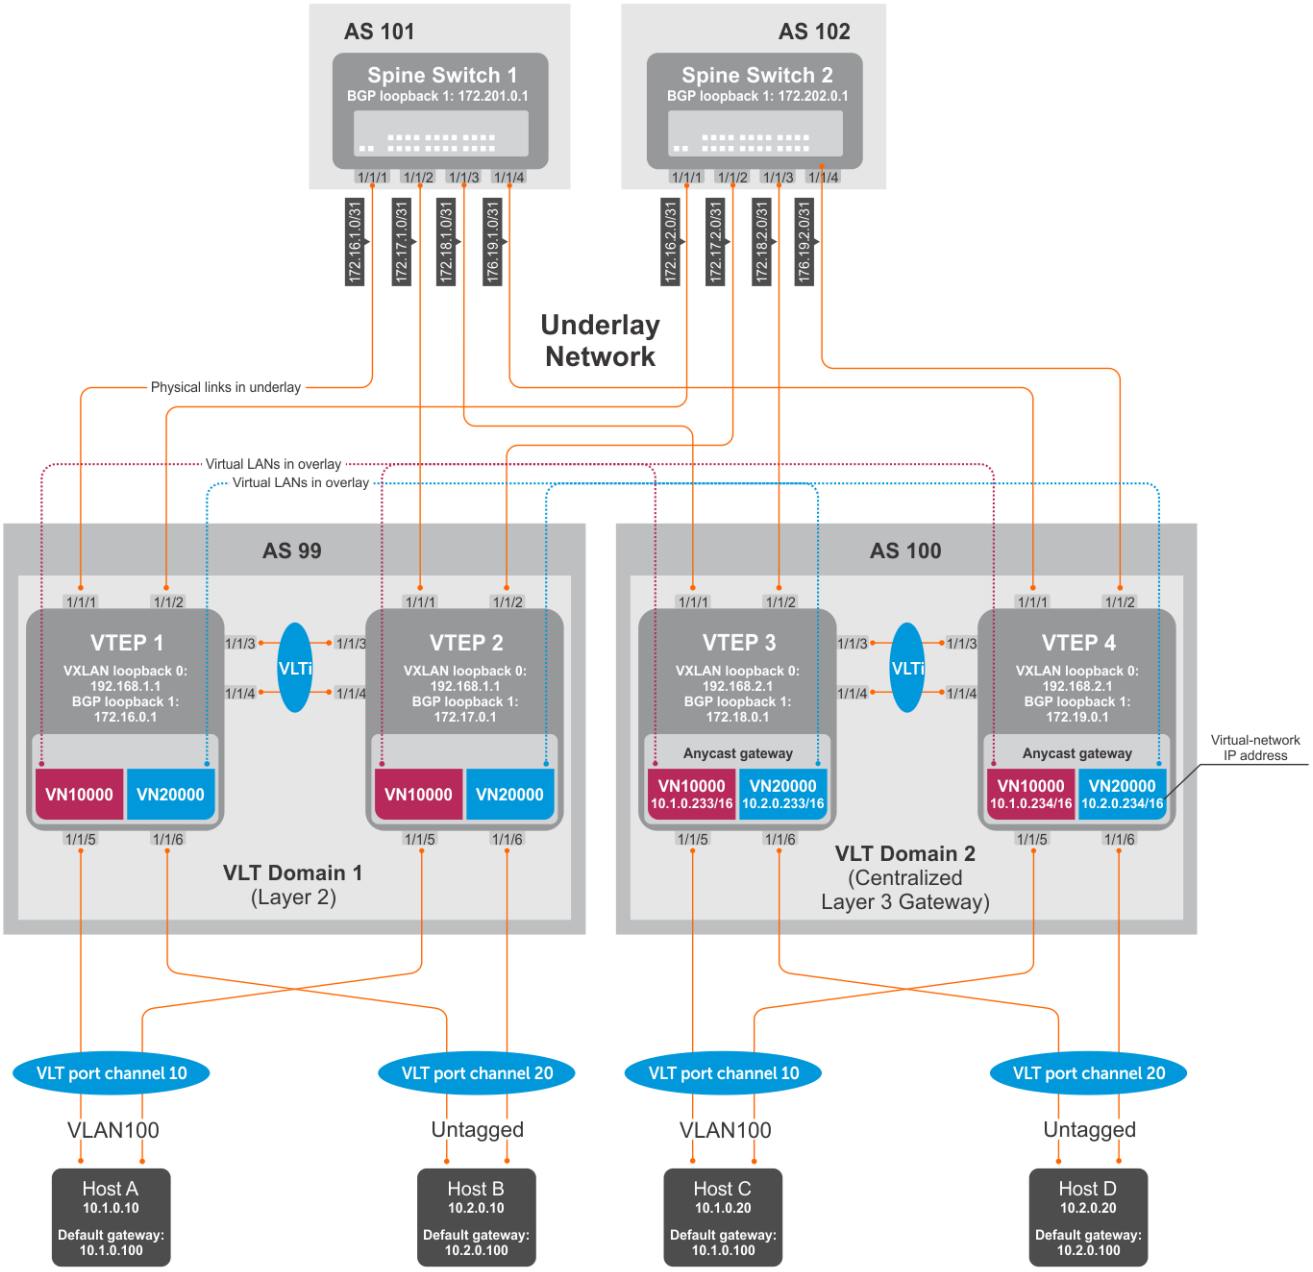

Figure 13. VXLAN BGP EVPN with centralized L3 gateway

NOTE: This centralized L3 gateway example for VXLAN BGP EVPN uses the same configuration steps as in Example: VXLAN BGP EVPN — Multiple AS topology. Configure each spine and leaf switch as in the Multiple AS topology example, except:

- Because VTEPs 1 and 2 operate only in Layer 2 VXLAN mode, do not configure **IP switching in the overlay network**. This step consists of configuring virtual network interfaces with IP addresses, anycast IP addresses, and anycast gateway MAC addresses.
- Configure **IP switching in the overlay network** only on VTEPs 3 and 4.

VTEP 3 Leaf Switch

1. Configure IP switching in the overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.233/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.233/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

VTEP 4 Leaf Switch

1. Configure IP switching in overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.234/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit

OS10(config)# interface virtual-network20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.234/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

Example: VXLAN BGP EVPN — Border leaf gateway with asymmetric IRB

This VXLAN BGP EVPN example shows how to transmit VXLAN traffic to an external network. Traffic from a tenant host that is destined to the Internet is transmitted to a border leaf gateway over L3 VTEPs and an IP underlay fabric.

NOTE: After VXLAN decapsulation, routing between virtual networks and tenant VLANs is supported only on the S4200-ON series and S5200-ON series due to NPU capability. On other Dell switches that support VXLAN routing, such as

S4048T-ON, S6010-ON, and the S4100-ON series, routing after decapsulation is performed only between virtual networks. You can connect an egress virtual network to a VLAN in an external router, which connects to the external network.

In the following example, VLT domain 1 is a VLT VTEP. VLT domain 2 is the border leaf VLT VTEP pair. All virtual networks in the data center network are configured in all VTEPs with virtual-network IP and anycast IP gateway addresses.

Configure a dedicated virtual network for sending VXLAN traffic to an external network on all VTEPs. Configure the anycast L3 gateway for the dedicated virtual network only on the border leaf VTEP pair in VLT domain 2. For asymmetric IRB, configure a static default route on all VTEPs, except the border leaf VTEPs. This allows traffic destined to an external network to be transmitted to the anycast L3 address of the dedicated virtual network on the border leaf VTEP. A different static route is configured on the border leaf VTEP. Using this second static route, traffic to an external network is transmitted on an egress VLAN to a WAN router or an Internet address.

When VLT domain 1 receives traffic destined to an external network, the traffic is routed to the dedicated virtual network in the ingress VTEP and sent to the border leaf VTEP. On the border leaf VTEP, the traffic is routed to the VLAN to which an external WAN router is connected or directly connected to the Internet. Similarly, any traffic destined to a VXLAN virtual network that is received on the border leaf VTEP is routed to the destination virtual network.

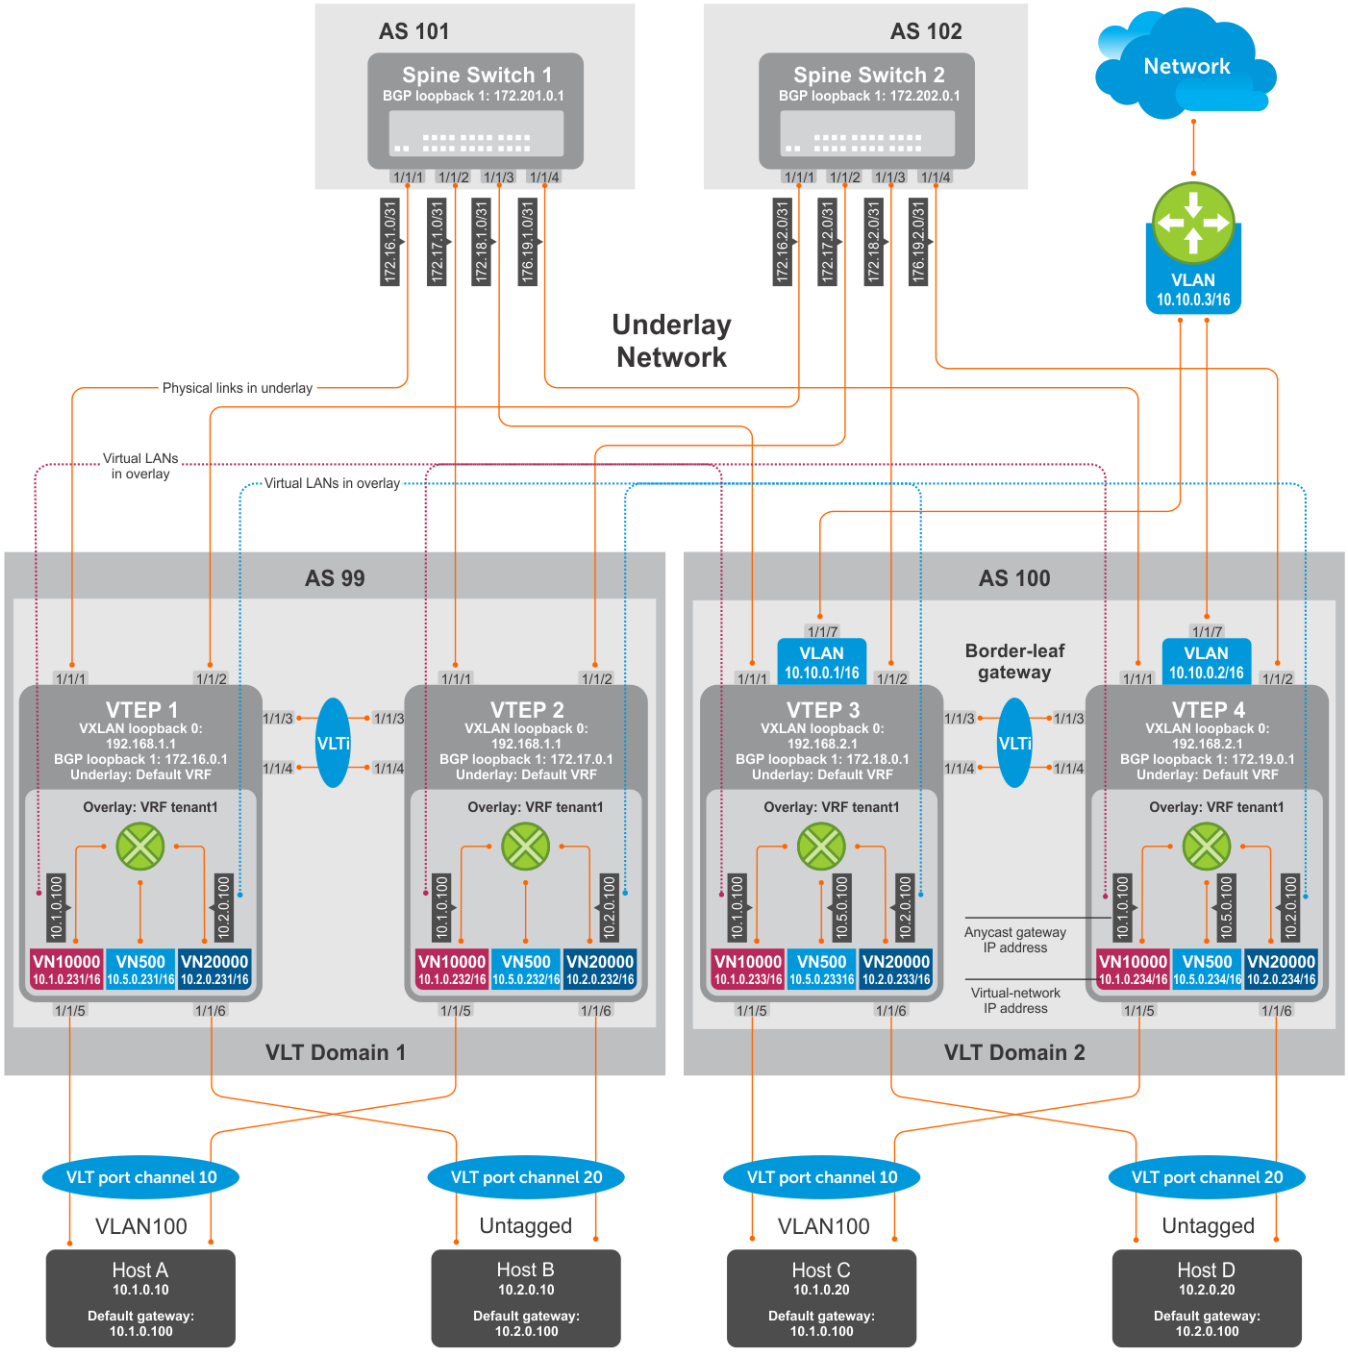

Figure 14. VXLAN BGP EVPN with border leaf gateway

NOTE: This border leaf gateway example for VXLAN BGP EVPN uses the same configuration steps as in Example: VXLAN BGP EVPN — Multiple AS topology. Configure each spine and leaf switch as in the Multiple AS topology example and add the following additional configuration steps on each VTEP.

VTEP 1 Leaf Switch

1. Configure a dedicated VXLAN virtual network.

```
OS10(config)# virtual-network 500
OS10(config-vn-500)# vxlan-vni 500
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
```

2. Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 500
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.5.0.231/16
```

3. Configure a static route for outbound traffic sent to the anycast MAC address of the dedicated virtual network.

```
OS10(config)#ip route 0.0.0.0/0 10.5.0.100
```

VTEP 2 Leaf Switch

1. Configure a dedicated VXLAN virtual network.

```
OS10(config)# virtual-network 500
OS10(config-vn-500)# vxlan-vni 500
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
```

2. Configure routing on the virtual networks.

```
OS10(config)# interface virtual-network 500
OS10(conf-if-vn-10000)# ip vrf forwarding tenant2
OS10(conf-if-vn-10000)# ip address 10.5.0.232/16
```

3. Configure a static route for outbound traffic sent to the anycast MAC address of the dedicated virtual network.

```
OS10(config)#ip route 0.0.0.0/0 10.5.0.100
```

VTEP 3 Leaf Switch

1. Configure a dedicated VXLAN virtual network.

```
OS10(config)# virtual-network 500
OS10(config-vn-500)# vxlan-vni 500
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
```

2. Configure an anycast gateway MAC address on the boder leaf VTEP. This MAC address must be different from the anycast gateway MAC address configured on non-border-leaf VTEPs.

```
OS10(config)# ip virtual-router mac-address 00:02:02:02:02:02
```

3. Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 500
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.5.0.233/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.5.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit
```

4. Configure externally connected VLAN.

```
OS10(conf)#interface vlan 200
OS10(conf-if-vlan)#ip address 10.10.0.1/16
OS10(conf-if-vlan)#no shutdown
OS10(conf-if-vlan)#exit

OS10(conf)#interface ethernet 1/1/7
switchport mode trunk
switchport trunk allowed vlan 200
```

5. Configure a static route for outbound traffic sent to VLAN 200.

```
OS10(config)#ip route 0.0.0.0/0 10.10.0.3
```

VTEP 4 Leaf Switch

1. Configure a dedicated VXLAN virtual network.

```
OS10(config)# virtual-network 500
OS10(config-vn-500)# vxlan-vni 500
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
```

2. Configure an anycast gateway MAC address on the boder leaf VTEP. This MAC address must be different from the anycast gateway MAC address configured on non-border-leaf VTEPs.

```
OS10(config)# ip virtual-router mac-address 00:02:02:02:02:02
```

3. Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 500
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.5.0.234/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.5.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit
```

4. Configure an externally connected VLAN.

```
OS10(conf)#interface vlan 200
OS10(conf-if-vlan)#ip address 10.10.0.2/16
OS10(conf-if-vlan)#no shutdown
OS10(conf-if-vlan)#exit

OS10(conf)#interface ethernet 1/1/7
switchport mode trunk
switchport trunk allowed vlan 200
```

5. Configure a static route for outbound traffic sent to VLAN 200.

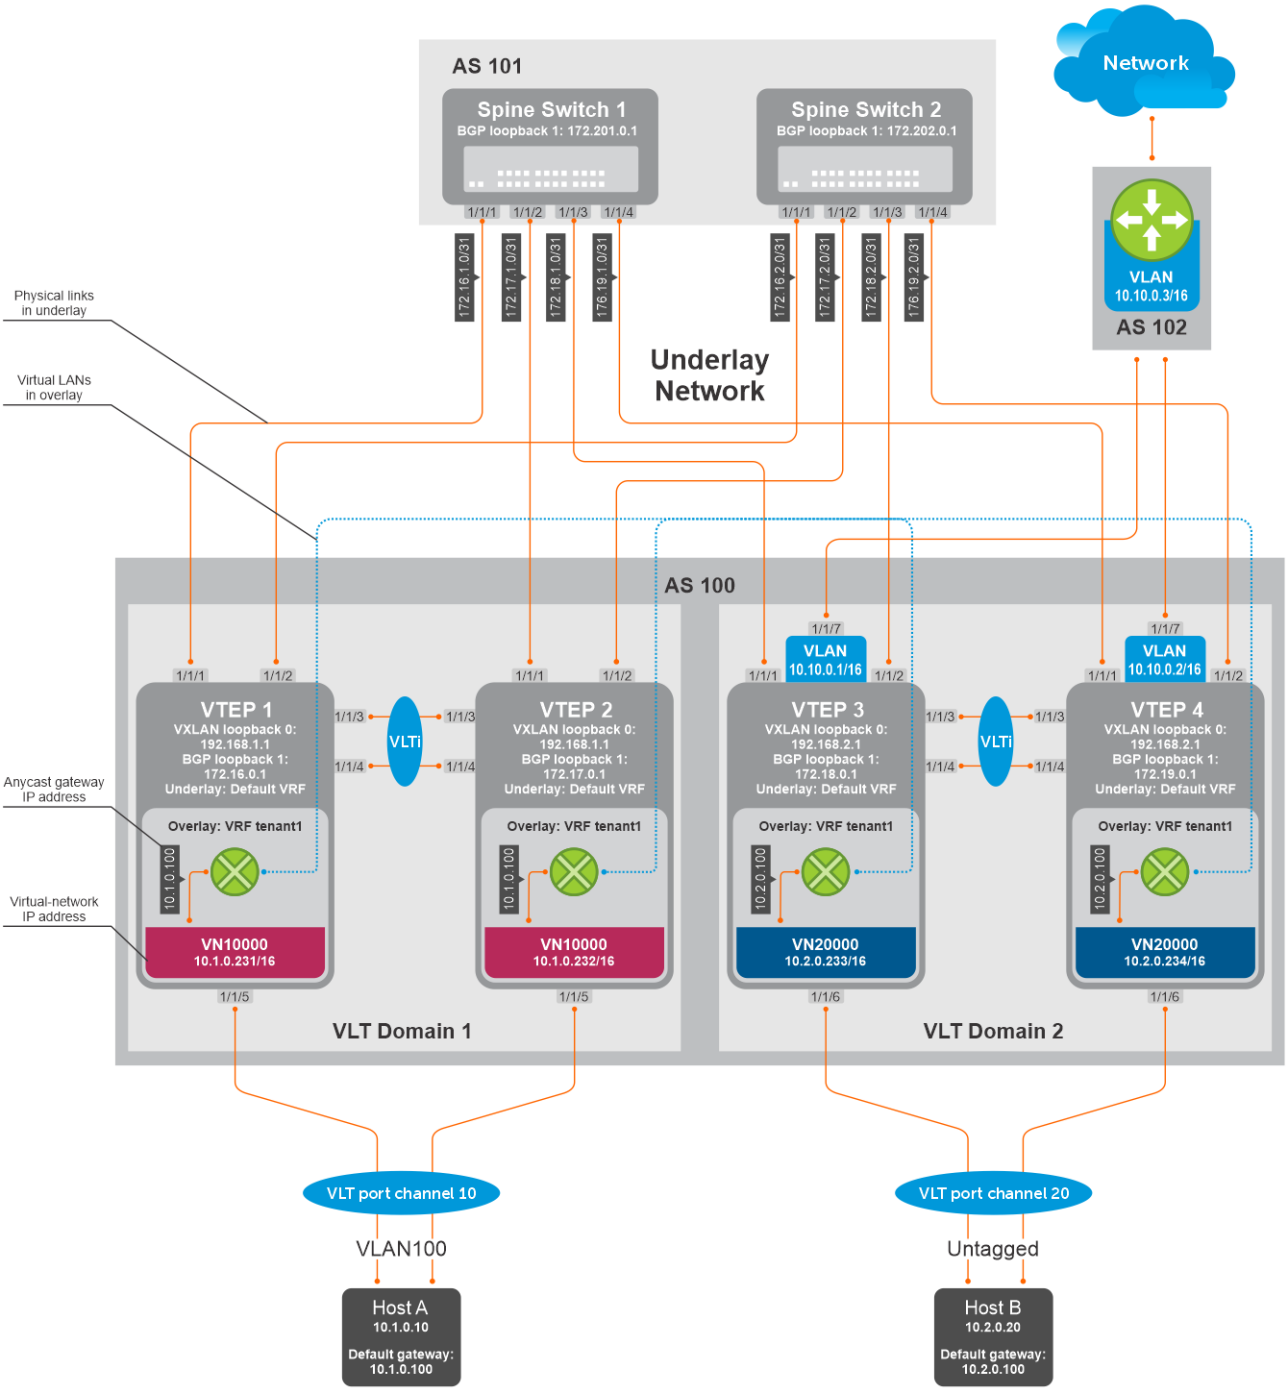
```
OS10(config)#ip route 0.0.0.0/0 10.10.0.3
```

Example: VXLAN BGP EVPN—Symmetric IRB

The following VXLAN with BGP EVPN example uses a Clos leaf-spine topology to show how to set up an end-to-end VXLAN with symmetric IRB. eBGP is used to exchange IP routes in the IP underlay network, and EVPN routes in the VXLAN overlay network. All spine nodes are in one autonomous system—AS 101. All leaf nodes are in another autonomous system—AS 100.

- On VTEPs 1 and 2, access ports are assigned to the virtual network using a switch-scoped VLAN. EVPN for the overlay VXLAN is configured using auto-EVI mode.
- On VTEPs 3 and 4, access ports are assigned to the virtual network using a port-scoped VLAN. The EVPN instance for the overlay VXLAN is configured using manual configuration mode. The RD and RT are configured using auto mode.
- On all VTEPs, symmetric IRB is configured in EVPN mode using a unique, dedicated VXLAN VNI and EVPN RD and RT values for each tenant VRF.
- The VLAN to an external network is configured only on VTEPs 3 and 4 in the VLT domain that serves as the border leaf gateway.

NOTE: In asymmetric IRB, you must configure all destination virtual-network subnets on each VTEP. Symmetric IRB simplifies the VXLAN intersubnet configuration by reducing the number of required VNI configurations. In this example, VLT domain 1 requires only VNI subnet 10.1.0.0/16; VLT domain 2 requires only VNI subnet 10.2.0.0/16. Symmetric IRB facilitates the scaling of VXLAN virtual networks.



VTEP 1 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
```

4. Assign VLAN member interfaces to the virtual network.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
```

5. Configure access ports as VLAN members for a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit
```

6. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.16.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.16.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

7. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.16.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(config-router-bgp-af)# redistribute connected
OS10(config-router-bgp-af)# exit
```

8. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.16.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.16.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
```

```
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

9. Configure a Loopback interface for BGP EVPN peering different from the VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.16.0.1/32
OS10(conf-if-lo-1)# exit
```

10. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

11. Configure EVPN for the VXLAN virtual network.

Configure the EVPN instance, RD, and RT using auto-EVI mode.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# exit
```

12. Configure VLT.

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.0/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit
```

Configure the VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
```

```
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.1
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

13. Configure IP routing in the overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.231/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit
```

14. Configure symmetric IRB.

In EVPN mode, configure the router MAC used by remote VTEPs as the destination address in VXLAN encapsulated packets sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

```
OS10(config)# evpn
OS10(config-evpn)# router-mac 00:01:02:03:04:05
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# vni 3000
OS10(config-evpn-vrf-tenant1)# route-target 65535:30000 both
OS10(config-evpn-vrf-tenant1)# exit
OS10(config-evpn)# exit
OS10(config)#
```

15. Configure advertisement of connected networks through EVPN type-5 routes.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 connected
OS10(config-evpn-vrf-tenant1)# exit
```

VTEP 2 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using the same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn)# exit
```

4. Assign VLAN member interfaces to the virtual network.

Use a switch-scoped VLAN-to-VNI mapping:

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# no shutdown
OS10(config-if-vl-100)# exit
```

5. Configure access ports as VLAN members for a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit

OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# no switchport
OS10(conf-if-eth1/1/5)# exit
```

6. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.17.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
```

```
OS10(conf-if-eth1/1/2)# ip address 172.17.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

7. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.17.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

8. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.17.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.17.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

9. Configure a Loopback interface for BGP EVPN peering different from VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.17.0.1/32
OS10(conf-if-lo-1)# exit
```

10. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-bgp-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

11. Configure EVPN for the VXLAN virtual network.

Configure the EVPN instance, RD, and RT using auto-EVI mode.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# exit
```

12. Configure VLT.

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.1/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# vlt-port-channel 10
OS10(conf-if-po-10)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.2
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.0
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

13. Configure IP routing in overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.232/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit
```

14. Configure symmetric IRB.

In EVPN mode, configure the router MAC used by remote VTEPs as the destination address in VXLAN encapsulated packets sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

```
OS10(config)# evpn
OS10(config-evpn)# router-mac 00:01:02:03:04:05
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# vni 3000
OS10(config-evpn-vrf-tenant1)# route-target 65535:30000 both
OS10(config-evpn-vrf-tenant1)# exit
OS10(config-evpn)# exit
OS10(config)#
```

15. Configure advertisement of connected networks through EVPN type-5 routes.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 connected
OS10(config-evpn-vrf-tenant1)# exit
```

VTEP 3 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit
```

```
OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to the virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn-20000)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.18.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.18.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

8. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.18.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.18.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.18.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

10. Configure a Loopback interface for BGP EVPN peering different from VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.18.0.1/32
OS10(conf-if-lo-1)# exit
```

11. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
```

```
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

12. Configure EVPN for the VXLAN virtual network.

Configure the EVPN instance in manual configuration mode, and RD and RT configuration in auto mode.

```
OS10(config)# evpn
OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd auto
OS10(config-evpn-evi-20000)# route-target auto
OS10(config-evpn-evi-20000)# exit
OS10(config-evpn)# exit
```

13. Configure VLT.

Configure a VLTi VLAN for the virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vlti-vlan 200
OS10(config-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.10/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.3
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.11
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

14. Configure IP routing in the overlay network.

Create the tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.233/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

15. Configure symmetric IRB.

In EVPN mode, configure the router MAC used by remote VTEPs as the destination address in VXLAN encapsulated packets sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

```
OS10(config)# evpn
OS10(config-evpn)# router-mac 00:01:02:03:04:06
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# vni 3000
OS10(config-evpn-vrf-tenant1)# route-target 65535:30000 both
OS10(config-evpn-vrf-tenant1)# exit
OS10(config-evpn)# exit
OS10(config)#
```

16. Configure an externally connected VLAN.

```
OS10(conf)# interface vlan 200
OS10(conf-if-vlan)# ip vrf forwarding tenant1
OS10(conf-if-vlan)# ip address 10.10.0.1/16
OS10(conf-if-vlan)# no shutdown
OS10(conf-if-vlan)# exit

OS10(conf)# interface ethernet 1/1/7
```

```
OS10(conf-if-eth1/1/7)# switchport mode trunk
OS10(conf-if-eth1/1/7)# switchport trunk allowed vlan 200
```

17. Configure advertisement of the connected networks via EVPN Type-5 routes.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 connected
OS10(config-evpn-vrf-tenant1)# exit
```

18. Configure BGP session with external router on the border-leaf VTEPs.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# neighbor 10.10.0.3
OS10(config-router-vrf-neighbor)# remote-as 102
OS10(config-router-vrf-neighbor)# no shutdown
OS10(config-router-vrf-neighbor)# end
```

19. Import external routes in to EVPN on the border-leaf switches.

External routes for WAN connectivity and other appliances can be imported in to a VXLAN pod using the following configuration on the border-leaf router.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 bgp
OS10(config-evpn-vrf-tenant1)# end
```

20. Export BGP EVPN routes out of border-leaf switch to external devices.

For interpod connectivity, use the following configuration to export the BGP EVPN routes of a VXLAN pod from the border-leaf router.

With connected routes of virtual networks present in an individual VTEP advertised as type-5 routes, the border-leaf router has information about all the virtual networks present in the pod.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute l2vpn evpn
OS10(configure-router-bgpv4-vrf-af)# end
```

The `redistribute l2vpn evpn` command redistributes both type-2 mac-ip (/32 routes) and type-5 routes (subnet routes). Use the `route-map` command to filter type-2 mac-ip (/32 routes) and redistribute only the type-5 routes.

```
OS10(config)# ip prefix-list deny_v4_host_routes seq 10 deny 0.0.0.0/0 ge 32 le 32
OS10(config)# ip prefix-list deny_v4_host_routes seq 20 permit 0.0.0.0/0 le 31
OS10(config)# route-map deny_v4_host_routes permit 10
OS10(config-route-map)# match ip address prefix-list deny_v4_host_routes
OS10(config-route-map)# exit

OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute l2vpn evpn route-map
deny_v4_host_routes
OS10(configure-router-bgpv4-vrf-af)# end
```

Use the following configuration to advertise the local connected routes on the border-leaf switches to external device:

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute connected
OS10(configure-router-bgpv4-vrf-af)# end
```

VTEP 4 Leaf Switch

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure the unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit

OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# no switchport
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to the virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn)# exit
```

7. Configure upstream network-facing ports.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ip address 172.19.1.0/31
OS10(conf-if-eth1/1/1)# exit

OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ip address 172.19.2.0/31
OS10(conf-if-eth1/1/2)# exit
```

8. Configure eBGP.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# router-id 172.19.0.1
OS10(config-router-bgp-100)# address-family ipv4 unicast
```

```
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure eBGP for the IPv4 point-to-point peering.

```
OS10(config-router-bgp-100)# neighbor 172.19.1.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.19.2.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

10. Configure a Loopback interface for BGP EVPN peering different from the VLT peer IP address.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.19.0.1/32
OS10(conf-if-lo-1)# exit
```

11. Configure BGP EVPN peering.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.201.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit

OS10(config-router-bgp-100)# neighbor 172.202.0.1
OS10(config-router-neighbor)# remote-as 101
OS10(config-router-neighbor)# ebgp-multihop 4
OS10(config-router-neighbor)# send-community extended
OS10(config-router-neighbor)# update-source loopback1
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# no activate
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# address-family l2vpn evpn
OS10(config-router-bgp-neighbor-af)# activate
OS10(config-router-bgp-neighbor-af)# allowas-in 1
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

12. Configure EVPN for the VXLAN virtual network.

Configure the EVPN instance manual configuration mode, and RD, and RT configuration in auto mode.

```
OS10(config)# evpn
OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd auto
```

```
OS10(config-evpn-evi-20000)# route-target auto
OS10(config-evpn-evi-20000)# exit
OS10(config-evpn)# exit
```

13. Configure VLT.

Configure a VLTi VLAN for the virtual network.

```
OS10(config)# virtual-network 20000
OS10(conf-vn-20000)# vlti-vlan 200
OS10(conf-vn-20000)# exit
```

Configure a dedicated L3 underlay path to reach the VLT Peer in case of a network failure.

```
OS10(config)# interface vlan4000
OS10(config-if-vl-4000)# no shutdown
OS10(config-if-vl-4000)# ip address 172.16.250.11/31
OS10(config-if-vl-4000)# exit
```

Configure the VLT port channel.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# vlt-port-channel 20
OS10(conf-if-po-20)# exit
```

Configure VLTi member links.

```
OOS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# exit

OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# exit
```

Configure the VLT domain.

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.150.4
OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
OS10(conf-vlt-1)# exit
```

Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel20
OS10(conf-uplink-state-group-1)# exit
```

Configure iBGP IPv4 peering between the VLT peers.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# neighbor 172.16.250.10
OS10(config-router-neighbor)# remote-as 100
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-100)# exit
```

14. Configure IP routing in the overlay network.

Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.234/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

15. Configure symmetric IRB.

In EVPN mode, configure the router MAC used by remote VTEPs as the destination address in VXLAN encapsulated packets sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

```
OS10(config)# evpn
OS10(config-evpn)# router-mac 00:01:02:03:04:06
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# vni 3000
OS10(config-evpn-vrf-tenant1)# route-target 65535:30000 both
OS10(config-evpn-vrf-tenant1)# exit
OS10(config-evpn)# exit
OS10(config)#
```

16. Configure an externally connected VLAN.

```
OS10(conf)# interface vlan 200
OS10(conf-if-vlan)# ip vrf forwarding tenant1
OS10(conf-if-vlan)# ip address 10.10.0.2/16
OS10(conf-if-vlan)# no shutdown
OS10(conf-if-vlan)# exit

OS10(conf)# interface ethernet 1/1/7
OS10(conf-if-eth1/1/7)# switchport mode trunk
OS10(conf-if-eth1/1/7)# switchport trunk allowed vlan 200
```

17. Configure advertisement of the connected networks via EVPN Type-5 routes.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 connected
OS10(config-evpn-vrf-tenant1)# exit
```

18. Configure BGP session with external router on the border-leaf VTEPs.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# neighbor 10.10.0.3
OS10(config-router-vrf-neighbor)# remote-as 102
OS10(config-router-vrf-neighbor)# no shutdown
OS10(config-router-vrf-neighbor)# end
```

19. Import external routes in to EVPN on the border-leaf switches.

External routes for WAN connectivity and other appliances can be imported in to a VXLAN pod using the following configuration on the border-leaf router.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 bgp
OS10(config-evpn-vrf-tenant1)# end
```

20. Export BGP EVPN routes out of border-leaf switch to external devices.

For interpod connectivity, use the following configuration to export the BGP EVPN routes of a VXLAN pod from the border-leaf router.

With connected routes of virtual networks present in an individual VTEP advertised as type-5 routes, the border-leaf router has information about all the virtual networks present in the pod.

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute l2vpn evpn
OS10(configure-router-bgpv4-vrf-af)# end
```

The `redistribute l2vpn evpn` command redistributes both type-2 mac-ip (/32 routes) and type-5 routes (subnet routes). Use the `route-map` command to filter type-2 mac-ip (/32 routes) and redistribute only the type-5 routes.

```
OS10(config)# ip prefix-list deny_v4_host_routes seq 10 deny 0.0.0.0/0 ge 32 le 32
OS10(config)# ip prefix-list deny_v4_host_routes seq 20 permit 0.0.0.0/0 le 31
OS10(config)# route-map deny_v4_host_routes permit 10
OS10(config-route-map)# match ip address prefix-list deny_v4_host_routes
OS10(config-route-map)# exit

OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute l2vpn evpn route-map
deny_v4_host_routes
OS10(configure-router-bgpv4-vrf-af)# end
```

Use the following configuration to advertise the local connected routes on the border-leaf switches to external device:

```
OS10(config)# router bgp 100
OS10(config-router-bgp-100)# vrf tenant1
OS10(config-router-bgp-100-vrf)# address-family ipv4 unicast
OS10(configure-router-bgpv4-vrf-af)# redistribute connected
OS10(configure-router-bgpv4-vrf-af)# end
```

Spine Switch 1

1. Configure downstream ports on underlay links to the leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.1.1/31
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.1.1/31
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.1.1/31
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.1.1/31
OS10(conf-if-eth1/1/4)# exit
```

2. Configure eBGP.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.201.0.1
OS10(config-router-bgp-101)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
```

3. Configure eBGP IPv4 peer sessions on the P2P links.

```
OS10(conf-router-bgp-101)# neighbor 172.16.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.1.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-101)# exit
```

4. Configure a Loopback interface for BGP EVPN peering.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.201.0.1/32
OS10(conf-if-lo-1)# exit
```

5. Configure BGP EVPN peer sessions.

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# neighbor 172.16.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit
```

```
OS10(conf-router-bgp-101)# neighbor 172.18.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit
```

Spine Switch 2

1. Configure downstream ports on the underlay links to the leaf switches.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# ip address 172.16.2.1/31
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# ip address 172.17.2.1/31
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# ip address 172.18.2.1/31
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# ip address 172.19.2.1/31
OS10(conf-if-eth1/1/4)# exit
```

2. Configure eBGP.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.202.0.1
OS10(config-router-bgp-101)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
```

3. Configure eBGP IPv4 peer sessions on the P2P links.

```
OS10(conf-router-bgp-101)# neighbor 172.16.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
```

```
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.2.0
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# exit
OS10(conf-router-bgp-101)# exit
```

4. Configure a Loopback interface for BGP EVPN peering.

```
OS10(config)# interface loopback1
OS10(conf-if-lo-1)# no shutdown
OS10(conf-if-lo-1)# ip address 172.202.0.1/32
OS10(conf-if-lo-1)# exit
```

5. Configure BGP EVPN peer sessions.

```
OS10(config)# router bgp 101
OS10(conf-router-bgp-101)# neighbor 172.16.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.17.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.18.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
```

```
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit

OS10(conf-router-bgp-101)# neighbor 172.19.0.1
OS10(conf-router-neighbor)# ebgp-multihop 4
OS10(conf-router-neighbor)# remote-as 100
OS10(conf-router-neighbor)# send-community extended
OS10(conf-router-neighbor)# update-source loopback1
OS10(conf-router-neighbor)# no shutdown
OS10(conf-router-neighbor)# address-family ipv4 unicast
OS10(conf-router-neighbor-af)# no activate
OS10(conf-router-neighbor-af)# exit
OS10(conf-router-neighbor)# address-family l2vpn evpn
OS10(conf-router-neighbor-af)# no sender-side-loop-detection
OS10(conf-router-neighbor-af)# activate
OS10(conf-router-neighbor-af)# exit
```

Verify VXLAN with BGP EVPN configuration.

1. Verify virtual network configurations.

```
LEAF1# show virtual-network
Codes: DP - MAC-learn Dataplane, CP - MAC-learn Controlplane, UUD - Unknown-Unicast-Drop
Virtual Network: 10000
   Members:
      VLAN 100: port-channel10, port-channel1000
   VxLAN Virtual Network Identifier: 10000
      Source Interface: loopback0(192.168.1.1)
      Remote-VTEPs (flood-list):
LEAF1#
```

2. Verify EVPN configurations and EVPN parameters.

```
LEAF1# show evpn evi

EVI : 10000, State : up
  Bridge-Domain       : Virtual-Network 10000, VNI 10000

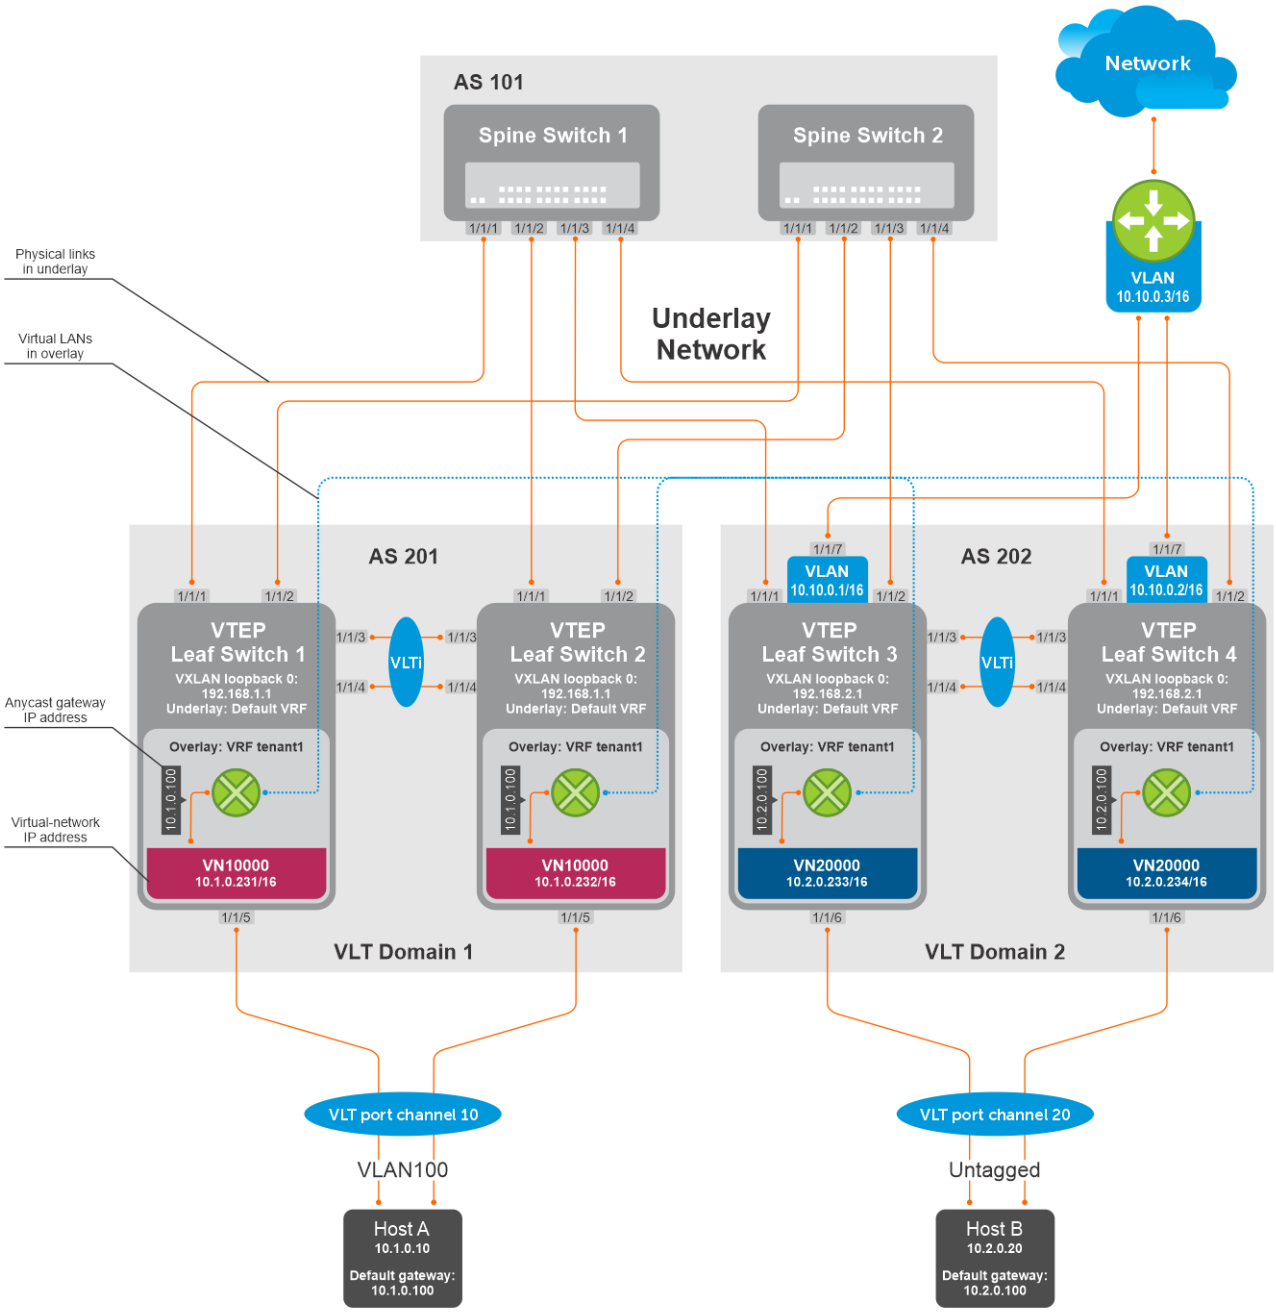
Example - VXLAN BGP EVPN symmetric IRB with unnumbered BGP peering

The following BGP EVPN example uses a Clos leaf-spine topology with BGP over unnumbered interfaces.



The following explains how the network is configured:

- External BGP (eBGP) over unnumbered interfaces is used to exchange both IPv4 routes and EVPN routes.
- You need not configure IP addresses on links that connect Spine and Leaf switches. BGP Unnumbered peering works without an IP address configuration on Spine-Leaf links.
- The remote AS is autodiscovered from BGP Open messages.
- All VTEPs perform Symmetric IRB routing. All spine nodes are in one autonomous system and each VTEP in the leaf network belongs to different autonomous systems. Both Spine Switch 1 and Spine Switch 2 are in AS 101. For leaf nodes, VLT domain 1 is in AS 201; VLT domain 2 is in AS 202.

- On leaf switches 1 and 2, access ports are assigned to a virtual network using a switch-scoped VLAN. EVPN for the overlay VXLAN is configured using auto-EVI mode.
- On leaf switches 3 and 4, access ports are assigned to a virtual network using a port-scoped VLAN. EVPN for the overlay VXLAN is configured using manual EVI mode with RT and RD values configured in auto mode.
- On all VTEPs, symmetric IRB is configured in EVPN mode using a unique, dedicated VXLAN VNI, and Auto RD and Auto RT values for each tenant VRF.
- On all VTEPs, the `disable-rt-asn` command is used to autoderive the RT that does not include the ASN in the RT value. This allows auto RT to be used even if there are different ASNs for each leaf node.
- The VLAN to an external network is configured only on VTEPs 3 and 4 in the VLT domain that serves as the border leaf gateway.

Spine Switch 1 configuration

1. Configure downstream ports as unnumbered interfaces. Configure the `ipv6 nd send-ra` command and lower RA intervals. These interfaces are used for BGP unnumbered peering.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/2)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/2)# ipv6 nd send-ra
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# mtu 1650
OS10(conf-if-eth1/1/3)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/3)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/3)# ipv6 nd send-ra
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# mtu 1650
OS10(conf-if-eth1/1/4)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/4)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/4)# ipv6 nd send-ra
OS10(conf-if-eth1/1/4)# exit
```

2. Configure BGP instance with router id.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.201.0.1
```

3. Configure the BGP unnumbered neighbor on Leaf-facing ports. Use a template to simplify the configuration on multiple interfaces. These neighbors are configured to carry IPv4 address family (default) and L2VPN EVPN address family.

```
OS10(config-router-bgp-101)# template ebgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface ethernet1/1/1
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-101)# neighbor interface ethernet1/1/2
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-101)# neighbor interface ethernet1/1/3
```

```
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-101)# neighbor interface ethernet1/1/4
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

Spine Switch 2 configuration

1. Configure downstream ports as unnumbered interfaces. Configure the `ipv6 nd send-ra` command and lower RA intervals. These interfaces are used for BGP unnumbered peering.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/2)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/2)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/2)# ipv6 nd send-ra
OS10(conf-if-eth1/1/2)# exit
OS10(config)# interface ethernet1/1/3
OS10(conf-if-eth1/1/3)# no shutdown
OS10(conf-if-eth1/1/3)# no switchport
OS10(conf-if-eth1/1/3)# mtu 1650
OS10(conf-if-eth1/1/3)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/3)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/3)# ipv6 nd send-ra
OS10(conf-if-eth1/1/3)# exit
OS10(config)# interface ethernet1/1/4
OS10(conf-if-eth1/1/4)# no shutdown
OS10(conf-if-eth1/1/4)# no switchport
OS10(conf-if-eth1/1/4)# mtu 1650
OS10(conf-if-eth1/1/4)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/4)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/4)# ipv6 nd send-ra
OS10(conf-if-eth1/1/4)# exit
```

2. Configure BGP instance with router id.

```
OS10(config)# router bgp 101
OS10(config-router-bgp-101)# router-id 172.202.0.1
```

3. Configure the BGP unnumbered neighbor on Leaf-facing ports. Use a template to simplify the configuration on multiple interfaces. These neighbors are configured to carry IPv4 address family (default) and L2VPN EVPN address family.

```
OS10(config-router-bgp-101)# template ebgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface ethernet1/1/1
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-101)# neighbor interface ethernet1/1/2
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-101)# neighbor interface ethernet1/1/3
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-101)# neighbor interface ethernet1/1/4
```

```
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

VTEP Leaf Switch 1 configuration

1. Configure a loopback interface for the VXLAN underlay using the same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-10000)# exit
```

4. Assign VLAN to the virtual network. Use a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# exit
```

5. Configure access ports as VLAN members.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit
OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# exit
```

6. Configure upstream network-facing ports as unnumbered interfaces. Configure the `ipv6 nd send-ra` command and lower RA intervals. These interfaces are used for BGP unnumbered peering.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/2)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/2)# ipv6 nd send-ra
OS10(conf-if-eth1/1/2)# exit
```

7. Configure BGP instance with router id.

```
OS10(config)# router bgp 201
OS10(config-router-bgp-201)# router-id 172.16.0.1
OS10(config-router-bgp-201)# address-family ipv4 unicast
```

```
OS10(config-router-bgp-af)# redistribute connected
OS10(config-router-bgp-af)# exit
```

8. Configure a BGP unnumbered neighbor over network facing ports. Use a template to simplify the configuration on multiple interfaces. These neighbors are configured to carry IPv4 address family (default) and L2VPN EVPN address family.

```
OS10(config-router-bgp-201)# template ebgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface ethernet1/1/1
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-201)# neighbor interface ethernet1/1/2
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

9. Configure EVPN for the VXLAN virtual network. Configure EVPN instances using auto-EVI mode and disable ASN in the generated RT.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# exit
```

NOTE: Use the `disable-rt-asn` command to autoderive RT that does not include the ASN in the RT value. This allows auto RT to be used even if the Clos leaf-spine design has separate ASN for each leaf node. Configure this command only when all the VTEPs are OS10 switches.

10. Configure VLT.
    - Configure a dedicated Layer 3 forwarding path through the other VLT peer for connectivity even if all spine links go down. This VLAN interface is an unnumbered interface and used for iBGP peering with the other VLT peer.

      ```
      OS10(config)# interface vlan4000
      OS10(config-if-vl-4000)# no shutdown
      OS10(config-if-vl-4000)# ipv6 nd max-ra-interval 4
      OS10(config-if-vl-4000)# ipv6 nd min-ra-interval 3
      OS10(config-if-vl-4000)# ipv6 nd send-ra
      OS10(config-if-vl-4000)# exit
      ```

    - Configure the VLT port channel.

      ```
      OS10(config)# interface port-channel10
      OS10(conf-if-po-10)# vlt-port-channel 10
      OS10(conf-if-po-10)# exit
      ```

    - Configure the VLTi member links.

      ```
      OS10(config)# interface ethernet1/1/3
      OS10(conf-if-eth1/1/3)# no shutdown
      OS10(conf-if-eth1/1/3)# no switchport
      OS10(conf-if-eth1/1/3)# exit
      OS10(config)# interface ethernet1/1/4
      OS10(conf-if-eth1/1/4)# no shutdown
      OS10(conf-if-eth1/1/4)# no switchport
      OS10(conf-if-eth1/1/4)# exit
      ```

    - Configure the VLT domain.

      ```
      OS10(config)# vlt-domain 1
      OS10(conf-vlt-1)# backup destination 10.16.150.1
      OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
      OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
      OS10(conf-vlt-1)# exit
      ```

- Configure UFD with uplink VLT ports and downlink network ports.

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
OS10(conf-uplink-state-group-1)# upstream port-channel10
OS10(conf-uplink-state-group-1)# exit
```

- Configure iBGP unnumbered peering between VLT peers with both IPv4 and L2VPN EVPN address families.

```
OS10(config)# router bgp 201
OS10(config-router-bgp-201)# template ibgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface vlan4000
OS10(config-router-neighbor)# inherit template ibgp_unified inherit-type ibgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

11. Configure IP routing in the overlay network.
    - Create a tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

    - Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

    - Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 10000
OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
OS10(conf-if-vn-10000)# ip address 10.1.0.231/16
OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
OS10(conf-if-vn-10000)# no shutdown
OS10(conf-if-vn-10000)# exit
```

12. Configure symmetric IRB.
    - In EVPN mode, configure the router MAC address that is used by remote VTEPs as the destination address in VXLAN encapsulated packets that are sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

```
OS10(config)# evpn
OS10(config-evpn)# router-mac 00:01:02:03:04:05
OS10(config-evpn)# vrf tenant1
OS10((config-evpn-vrf-tenant1))# vni 3000
OS10((config-evpn-vrf-tenant1))# route-target auto
OS10((config-evpn-vrf-tenant1))# exit
OS10(config-evpn)# exit
```

13. Configure advertisement of the connected networks through EVPN Type-5 routes.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10((config-evpn-vrf-tenant1))# advertise ipv4 connected
OS10((config-evpn-vrf-tenant1))# exit
```

VTEP Leaf Switch 2 configuration

1. Configure a loopback interface for the VXLAN underlay using the same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.1.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 10000
OS10(config-vn-10000)# vxlan-vni 10000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn)# exit
```

4. Assign VLAN member interfaces to the virtual network. Use a switch-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface vlan100
OS10(config-if-vl-100)# virtual-network 10000
OS10(config-if-vl-100)# exit
```

5. Configure access ports as VLAN members.

```
OS10(config)# interface port-channel10
OS10(conf-if-po-10)# no shutdown
OS10(conf-if-po-10)# switchport mode trunk
OS10(conf-if-po-10)# switchport trunk allowed vlan 100
OS10(conf-if-po-10)# no switchport access vlan
OS10(conf-if-po-10)# exit
OS10(config)# interface ethernet1/1/5
OS10(conf-if-eth1/1/5)# no shutdown
OS10(conf-if-eth1/1/5)# channel-group 10 mode active
OS10(conf-if-eth1/1/5)# exit
```

6. Configure upstream network-facing ports as unnumbered interfaces. Configure the `ipv6 nd send-ra` command and lower RA intervals. These interfaces are used for BGP unnumbered peering.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/2)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/2)# ipv6 nd send-ra
OS10(conf-if-eth1/1/2)# exit
```

7. Configure BGP instance with router id.

```
OS10(config)# router bgp 201
OS10(config-router-bgp-201)# router-id 172.17.0.1
OS10(config-router-bgp-201)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

8. Configure a BGP unnumbered neighbor on network facing ports. Use a template to simplify the configuration on multiple interfaces. These neighbors are configured to carry IPv4 address family (default) and L2VPN EVPN address family.

```
OS10(config-router-bgp-201)# template ebgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface ethernet1/1/1
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

```
OS10(config-router-bgp-201)# neighbor interface ethernet1/1/2
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

9. Configure EVPN for the VXLAN virtual network. Configure the EVPN instances using Auto EVI mode and Disable ASN in the generated RT.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# exit
```

NOTE: Use the `disable-rt-asn` command to autoderive RT that does not include the ASN in the RT value. This allows auto RT to be used even if the Clos leaf-spine design has separate ASN for each leaf node. Configure this command only when all the VTEPs are OS10 switches.

10. Configure VLT.
    - Configure a dedicated Layer 3 forwarding path through the other VLT peer for connectivity even if all spine links go down. This VLAN interface would be unnumbered interface and used for iBGP peering with the other VLT peer.

      ```
      OS10(config)# interface vlan4000
      OS10(config-if-vl-4000)# no shutdown
      OS10(config-if-vl-4000)# ipv6 nd max-ra-interval 4
      OS10(config-if-vl-4000)# ipv6 nd min-ra-interval 3
      OS10(config-if-vl-4000)# ipv6 nd send-ra
      OS10(config-if-vl-4000)# exit
      ```

    - Configure the VLT port channel.

      ```
      OS10(config)# interface port-channel10
      OS10(conf-if-po-10)# vlt-port-channel 10
      OS10(conf-if-po-10)# exit
      ```

    - Configure VLTi member links.

      ```
      OS10(config)# interface ethernet1/1/3
      OS10(conf-if-eth1/1/3)# no shutdown
      OS10(conf-if-eth1/1/3)# no switchport
      OS10(conf-if-eth1/1/3)# exit
      OS10(config)# interface ethernet1/1/4
      OS10(conf-if-eth1/1/4)# no shutdown
      OS10(conf-if-eth1/1/4)# no switchport
      OS10(conf-if-eth1/1/4)# exit
      ```

    - Configure the VLT domain.

      ```
      OS10(config)# vlt-domain 1
      OS10(conf-vlt-1)# backup destination 10.16.150.2
      OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
      OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ee:ff
      OS10(conf-vlt-1)# exit
      ```

    - Configure UFD with uplink VLT ports and downlink network ports.

      ```
      OS10(config)# uplink-state-group 1
      OS10(conf-uplink-state-group-1)# enable
      OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
      OS10(conf-uplink-state-group-1)# upstream port-channel10
      OS10(conf-uplink-state-group-1)# exit
      ```

    - Configure iBGP unnumbered peering between VLT peers with bothIPv4 and L2VPN EVPN address families.

      ```
      OS10(config)# router bgp 201
      OS10(config-router-bgp-201)# template ibgp_unified
      OS10(config-router-template)# send-community extended
      OS10(config-router-template)# address-family l2vpn evpn
      OS10(config-router-bgp-template-af)# activate
      OS10(config-router-bgp-template-af)# exit
      OS10(config-router-template)# neighbor interface vlan4000
      OS10(config-router-neighbor)# inherit template ibgp_unified inherit-type ibgp
      ```

```
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

11. Configure IP routing in overlay network.
    - Create a tenant VRF.

      ```
      OS10(config)# ip vrf tenant1
      OS10(conf-vrf)# exit
      ```

    - Configure an anycast gateway MAC address.

      ```
      OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
      ```

    - Configure routing on the virtual network.

      ```
      OS10(config)# interface virtual-network 10000
      OS10(conf-if-vn-10000)# ip vrf forwarding tenant1
      OS10(conf-if-vn-10000)# ip address 10.1.0.232/16
      OS10(conf-if-vn-10000)# ip virtual-router address 10.1.0.100
      OS10(conf-if-vn-10000)# no shutdown
      OS10(conf-if-vn-10000)# exit
      ```

12. Configure symmetric IRB. In EVPN mode, configure the router MAC address that is used by remote VTEPs as the destination address in VXLAN encapsulated packets that are sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

    ```
    OS10(config)# evpn
    OS10(config-evpn)# router-mac 00:01:02:03:04:05
    OS10(config-evpn)# vrf tenant1
    OS10(config-evpn-tenant1)# vni 3000
    OS10(config-evpn-tenant1)# route-target auto
    OS10(config-evpn-tenant1)# exit
    OS10(config-evpn)# exit
    ```

13. Configure advertisement of the connected networks through EVPN Type-5 routes.

    ```
    OS10(config)# evpn
    OS10(config-evpn)# vrf tenant1
    OS10(config-evpn-tenant1)# advertise ipv4 connected
    OS10(config-evpn-tenant1)# exit
    ```

VTEP Leaf Switch 3 configuration

1. Configure a Loopback interface for the VXLAN underlay using same IP address as the VLT peer.

   ```
   OS10(config)# interface loopback0
   OS10(conf-if-lo-0)# no shutdown
   OS10(conf-if-lo-0)# ip address 192.168.2.1/32
   OS10(conf-if-lo-0)# exit
   ```

2. Configure the loopback interface as the VXLAN source tunnel interface.

   ```
   OS10(config)# nve
   OS10(config-nve)# source-interface loopback0
   OS10(config-nve)# exit
   ```

3. Configure the VXLAN virtual network.

   ```
   OS10(config)# virtual-network 20000
   OS10(config-vn-20000)# vxlan-vni 20000
   OS10(config-vn-vxlan-vni)# exit
   OS10(config-vn-20000)# exit
   ```

4. Configure an unused VLAN ID for untagged membership.

   ```
   OS10(config)# virtual-network untagged-vlan 1000
   ```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

   ```
   OS10(config)# interface port-channel20
   OS10(conf-if-po-20)# no shutdown
   ```

```
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit
OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to the virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn-20000)# exit
```

7. Configure upstream network-facing ports as unnumbered interfaces. Configure the `ipv6 nd send-ra` command and lower RA intervals. These interfaces would be used for BGP unnumbered peering.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/2)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/2)# ipv6 nd send-ra
OS10(conf-if-eth1/1/2)# exit
```

8. Configure BGP instance with router id.

```
OS10(config)# router bgp 202
OS10(config-router-bgp-202)# router-id 172.18.0.1
OS10(config-router-bgp-202)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure BGP unnumbered neighbor over network facing ports. You can use a template to simplify the configuration on multiple interfaces. These neighbors are configured to carry IPv4 address family (default) and L2VPN EVPN address family.

```
OS10(config-router-bgp-202)# template ebgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface ethernet1/1/1
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor interface ethernet1/1/2
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

10. Configure EVPN for the VXLAN virtual network. Configure the EVPN instance in manual configuration mode, and RD and RT configuration in auto mode.

```
OS10(config)# evpn
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd auto
OS10(config-evpn-evi-20000)# route-target auto
OS10(config-evpn-evi-20000)# exit
OS10(config-evpn)# exit
```

NOTE: Use the `disable-rt-asn` command to autoderive RT that does not include the ASN in the RT value. This allows auto RT to be used even if the Clos leaf-spine design has separate ASN for each leaf node. Configure this command only when all the VTEPs are OS10 switches.

11. Configure VLT.
    - Configure a VLTi VLAN for the virtual network.

      ```
      OS10(config)# virtual-network 20000
      OS10(config-vn-20000)# vlti-vlan 200
      OS10(config-vn-20000)# exit
      ```

    - Configure a dedicated Layer 3 forwarding path through the other VLT peer for connectivity even if all spine links go down. This VLAN interface is an unnumbered interface and used for iBGP peering with the other VLT peer.

      ```
      OS10(config)# interface vlan4000
      OS10(config-if-vl-4000)# no shutdown
      OS10(config-if-vl-4000)# ipv6 nd max-ra-interval 4
      OS10(config-if-vl-4000)# ipv6 nd min-ra-interval 3
      OS10(config-if-vl-4000)# ipv6 nd send-ra
      OS10(config-if-vl-4000)# exit
      ```

    - Configure the VLT port channel.

      ```
      OS10(config)# interface port-channel20
      OS10(conf-if-po-20)# vlt-port-channel 20
      OS10(conf-if-po-20)# exit
      ```

    - Configure VLTi member links.

      ```
      OS10(config)# interface ethernet1/1/3
      OS10(conf-if-eth1/1/3)# no shutdown
      OS10(conf-if-eth1/1/3)# no switchport
      OS10(conf-if-eth1/1/3)# exit
      OS10(config)# interface ethernet1/1/4
      OS10(conf-if-eth1/1/4)# no shutdown
      OS10(conf-if-eth1/1/4)# no switchport
      OS10(conf-if-eth1/1/4)# exit
      ```

    - Configure the VLT domain.

      ```
      OS10(config)# vlt-domain 1
      OS10(conf-vlt-1)# backup destination 10.16.150.3
      OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
      OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
      OS10(conf-vlt-1)# exit
      ```

    - Configure UFD with uplink VLT ports and downlink network ports.

      ```
      OS10(config)# uplink-state-group 1
      OS10(conf-uplink-state-group-1)# enable
      OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
      OS10(conf-uplink-state-group-1)# upstream port-channel20
      OS10(conf-uplink-state-group-1)# exit
      ```

    - Configure iBGP unnumbered peering between VLT peers with both IPv4 and L2VPN EVPN address families.

      ```
      OS10(config)# router bgp 202
      OS10(config-router-bgp-202)# template ibgp_unified
      OS10(config-router-template)# send-community extended
      OS10(config-router-template)# address-family l2vpn evpn
      OS10(config-router-bgp-template-af)# activate
      OS10(config-router-bgp-template-af)# exit
      OS10(config-router-template)# neighbor interface vlan4000
      OS10(config-router-neighbor)# inherit template ibgp_unified inherit-type ibgp
      OS10(config-router-neighbor)# no shutdown
      OS10(config-router-neighbor)# exit
      ```

12. Configure IP routing in the overlay network.

- Create the tenant VRF.

```
OS10(config)# ip vrf tenant1
OS10(conf-vrf)# exit
```

- Configure an anycast gateway MAC address.

```
OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
```

- Configure routing on the virtual network.

```
OS10(config)# interface virtual-network 20000
OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
OS10(conf-if-vn-20000)# ip address 10.2.0.233/16
OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
OS10(conf-if-vn-20000)# no shutdown
OS10(conf-if-vn-20000)# exit
```

13. Configure symmetric IRB. In EVPN mode, configure the router MAC address that is used by remote VTEPs as the destination address in VXLAN encapsulated packets that are sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

```
OS10(config)# evpn
OS10(config-evpn)# router-mac 00:01:02:03:04:06
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# vni 3000
OS10(config-evpn-vrf-tenant1)# route-target auto
OS10(config-evpn-vrf-tenant1)# exit
OS10(config-evpn)# exit
```

14. Configure an externally connected VLAN.

```
OS10(conf)# interface vlan 200
OS10(conf-if-vlan)# ip vrf forwarding tenant1
OS10(conf-if-vlan)# ip address 10.10.0.1/16
OS10(conf-if-vlan)# no shutdown
OS10(conf-if-vlan)# exit
OS10(conf)# interface ethernet 1/1/7
OS10(conf-if-eth1/1/7)# switchport mode trunk
OS10(conf-if-eth1/1/7)# switchport trunk allowed vlan 200
```

15. Configure advertisement of the connected networks through EVPN Type-5 routes.

```
OS10(config)# evpn
OS10(config-evpn)# vrf tenant1
OS10(config-evpn-vrf-tenant1)# advertise ipv4 connected
OS10(config-evpn-vrf-tenant1)# exit
```

VTEP Leaf Switch 4 configuration

1. Configure a loopback interface for the VXLAN underlay using the same IP address as the VLT peer.

```
OS10(config)# interface loopback0
OS10(conf-if-lo-0)# no shutdown
OS10(conf-if-lo-0)# ip address 192.168.2.1/32
OS10(conf-if-lo-0)# exit
```

2. Configure the Loopback interface as the VXLAN source tunnel interface.

```
OS10(config)# nve
OS10(config-nve)# source-interface loopback0
OS10(config-nve)# exit
```

3. Configure the VXLAN virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# vxlan-vni 20000
OS10(config-vn-vxlan-vni)# exit
OS10(config-vn-20000)# exit
```

4. Configure an unused VLAN ID for untagged membership.

```
OS10(config)# virtual-network untagged-vlan 1000
```

5. Configure access ports as VLAN members for a port-scoped VLAN-to-VNI mapping.

```
OS10(config)# interface port-channel20
OS10(conf-if-po-20)# no shutdown
OS10(conf-if-po-20)# switchport mode trunk
OS10(conf-if-po-20)# no switchport access vlan
OS10(conf-if-po-20)# exit
OS10(config)# interface ethernet1/1/6
OS10(conf-if-eth1/1/6)# no shutdown
OS10(conf-if-eth1/1/6)# channel-group 20 mode active
OS10(conf-if-eth1/1/6)# exit
```

6. Add the access ports to the virtual network.

```
OS10(config)# virtual-network 20000
OS10(config-vn-20000)# member-interface port-channel 20 untagged
OS10(config-vn)# exit
```

7. Configure upstream network-facing ports as unnumbered interfaces. Configure the `ipv6 nd send-ra` command and lower RA intervals. These interfaces would be used for BGP unnumbered peering.

```
OS10(config)# interface ethernet1/1/1
OS10(conf-if-eth1/1/1)# no shutdown
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# mtu 1650
OS10(conf-if-eth1/1/1)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/1)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/1)# ipv6 nd send-ra
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet1/1/2
OS10(conf-if-eth1/1/2)# no shutdown
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# mtu 1650
OS10(conf-if-eth1/1/2)# ipv6 nd max-ra-interval 4
OS10(conf-if-eth1/1/2)# ipv6 nd min-ra-interval 3
OS10(conf-if-eth1/1/2)# ipv6 nd send-ra
OS10(conf-if-eth1/1/2)# exit
```

8. Configure BGP instance with router id.

```
OS10(config)# router bgp 202
OS10(config-router-bgp-202)# router-id 172.19.0.1
OS10(config-router-bgp-202)# address-family ipv4 unicast
OS10(configure-router-bgp-af)# redistribute connected
OS10(configure-router-bgp-af)# exit
```

9. Configure a BGP unnumbered neighbor over network facing ports. Use a template to simplify the configuration on multiple interfaces. These neighbors are configured to carry IPv4 address family (default) and L2VPN EVPN address family.

```
OS10(config-router-bgp-202)# template ebgp_unified
OS10(config-router-template)# send-community extended
OS10(config-router-template)# address-family l2vpn evpn
OS10(config-router-bgp-template-af)# activate
OS10(config-router-bgp-template-af)# exit
OS10(config-router-template)# neighbor interface ethernet1/1/1
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor interface ethernet1/1/2
OS10(config-router-neighbor)# inherit template ebgp_unified inherit-type ebgp
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

10. Configure EVPN for the VXLAN virtual network. Configure the EVPN instance manual configuration mode, and RD, and RT configuration in auto mode.

```
OS10(config)# evpn
OS10(config-evpn)# disable-rt-asn
```

```
OS10(config-evpn)# evi 20000
OS10(config-evpn-evi-20000)# vni 20000
OS10(config-evpn-evi-20000)# rd auto
OS10(config-evpn-evi-20000)# route-target auto
OS10(config-evpn-evi-20000)# exit
OS10(config-evpn)# exit
```

NOTE: Use the `disable-rt-asn` command to autoderive RT that does not include the ASN in the RT value. This allows auto RT to be used even if the Clos leaf-spine design has separate ASN for each leaf node. Configure this command only when all the VTEPs are OS10 switches.

11. Configure VLT.
    - Configure a VLTi VLAN for the virtual network.

      ```
      OS10(config)# virtual-network 20000
      OS10(conf-vn-20000)# vlti-vlan 200
      OS10(conf-vn-20000)# exit
      ```

    - Configure a dedicated Layer 3 forwarding path through the other VLT peer if all spine links go down. This VLAN interface is unnumbered interface and is used for iBGP peering with the other VLT peer.

      ```
      OS10(config)# interface vlan4000
      OS10(config-if-vl-4000)# no shutdown
      OS10(config-if-vl-4000)# ipv6 nd max-ra-interval 4
      OS10(config-if-vl-4000)# ipv6 nd min-ra-interval 3
      OS10(config-if-vl-4000)# ipv6 nd send-ra
      OS10(config-if-vl-4000)# exit
      ```

    - Configure the VLT port channel.

      ```
      OS10(config)# interface port-channel20
      OS10(conf-if-po-20)# vlt-port-channel 20
      OS10(conf-if-po-20)# exit
      ```

    - Configure VLTi member links.

      ```
      OS10(config)# interface ethernet1/1/3
      OS10(conf-if-eth1/1/3)# no shutdown
      OS10(conf-if-eth1/1/3)# no switchport
      OS10(conf-if-eth1/1/3)# exit
      OS10(config)# interface ethernet1/1/4
      OS10(conf-if-eth1/1/4)# no shutdown
      OS10(conf-if-eth1/1/4)# no switchport
      OS10(conf-if-eth1/1/4)# exit
      ```

    - Configure the VLT domain.

      ```
      OS10(config)# vlt-domain 1
      OS10(conf-vlt-1)# backup destination 10.16.150.4
      OS10(conf-vlt-1)# discovery-interface ethernet1/1/3,1/1/4
      OS10(conf-vlt-1)# vlt-mac aa:bb:cc:dd:ff:ee
      OS10(conf-vlt-1)# exit
      ```

    - Configure UFD with uplink VLT ports and downlink network ports.

      ```
      OS10(config)# uplink-state-group 1
      OS10(conf-uplink-state-group-1)# enable
      OS10(conf-uplink-state-group-1)# downstream ethernet1/1/1-1/1/2
      OS10(conf-uplink-state-group-1)# upstream port-channel20
      OS10(conf-uplink-state-group-1)# exit
      ```

    - Configure iBGP unnumbered peering between VLT peers with both IPv4 and L2VPN EVPN address families.

      ```
      OS10(config)# router bgp 202
      OS10(config-router-bgp-202)# template ibgp_unified
      OS10(config-router-template)# send-community extended
      OS10(config-router-template)# address-family l2vpn evpn
      OS10(config-router-bgp-template-af)# activate
      OS10(config-router-bgp-template-af)# exit
      OS10(config-router-template)# neighbor interface vlan4000
      OS10(config-router-neighbor)# inherit template ibgp_unified inherit-type ibgp
      ```

```
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

12. Configure IP routing in the overlay network.
    - Create a tenant VRF.

      ```
      OS10(config)# ip vrf tenant1
      OS10(conf-vrf)# exit
      ```

    - Configure an anycast gateway MAC address.

      ```
      OS10(config)# ip virtual-router mac-address 00:01:01:01:01:01
      ```

    - Configure routing on the virtual network.

      ```
      OS10(config)# interface virtual-network 20000
      OS10(conf-if-vn-20000)# ip vrf forwarding tenant1
      OS10(conf-if-vn-20000)# ip address 10.2.0.234/16
      OS10(conf-if-vn-20000)# ip virtual-router address 10.2.0.100
      OS10(conf-if-vn-20000)# no shutdown
      OS10(conf-if-vn-20000)# exit
      ```

13. Configure symmetric IRB. In EVPN mode, configure the router MAC address that is used by remote VTEPs as the destination address in VXLAN encapsulated packets that are sent to the switch. Configure a dedicated VXLAN VNI for symmetric IRB for each tenant VRF.

    ```
    OS10(config)# evpn
    OS10(config-evpn)# router-mac 00:01:02:03:04:06
    OS10(config-evpn)# vrf tenant1
    OS10(config-evpn-vrf-tenant1)# vni 3000
    OS10(config-evpn-vrf-tenant1)# route-target auto
    OS10(config-evpn-vrf-tenant1)# exit
    OS10(config-evpn)# exit
    ```

14. Configure an externally connected VLAN.

    ```
    OS10(conf)# interface vlan 200
    OS10(conf-if-vlan)# ip vrf forwarding tenant1
    OS10(conf-if-vlan)# ip address 10.10.0.2/16
    OS10(conf-if-vlan)# no shutdown
    OS10(conf-if-vlan)# exit
    OS10(conf)# interface ethernet 1/1/7
    OS10(conf-if-eth1/1/7)# switchport mode trunk
    OS10(conf-if-eth1/1/7)# switchport trunk allowed vlan 200
    ```

15. Configure advertisement of the connected networks through EVPN Type-5 routes.

    ```
    OS10(config)# evpn
    OS10(config-evpn)# vrf tenant1
    OS10(config-evpn-vrf-tenant1)# advertise ipv4 connected
    OS10(config-evpn-vrf-tenant1)# exit
    ```

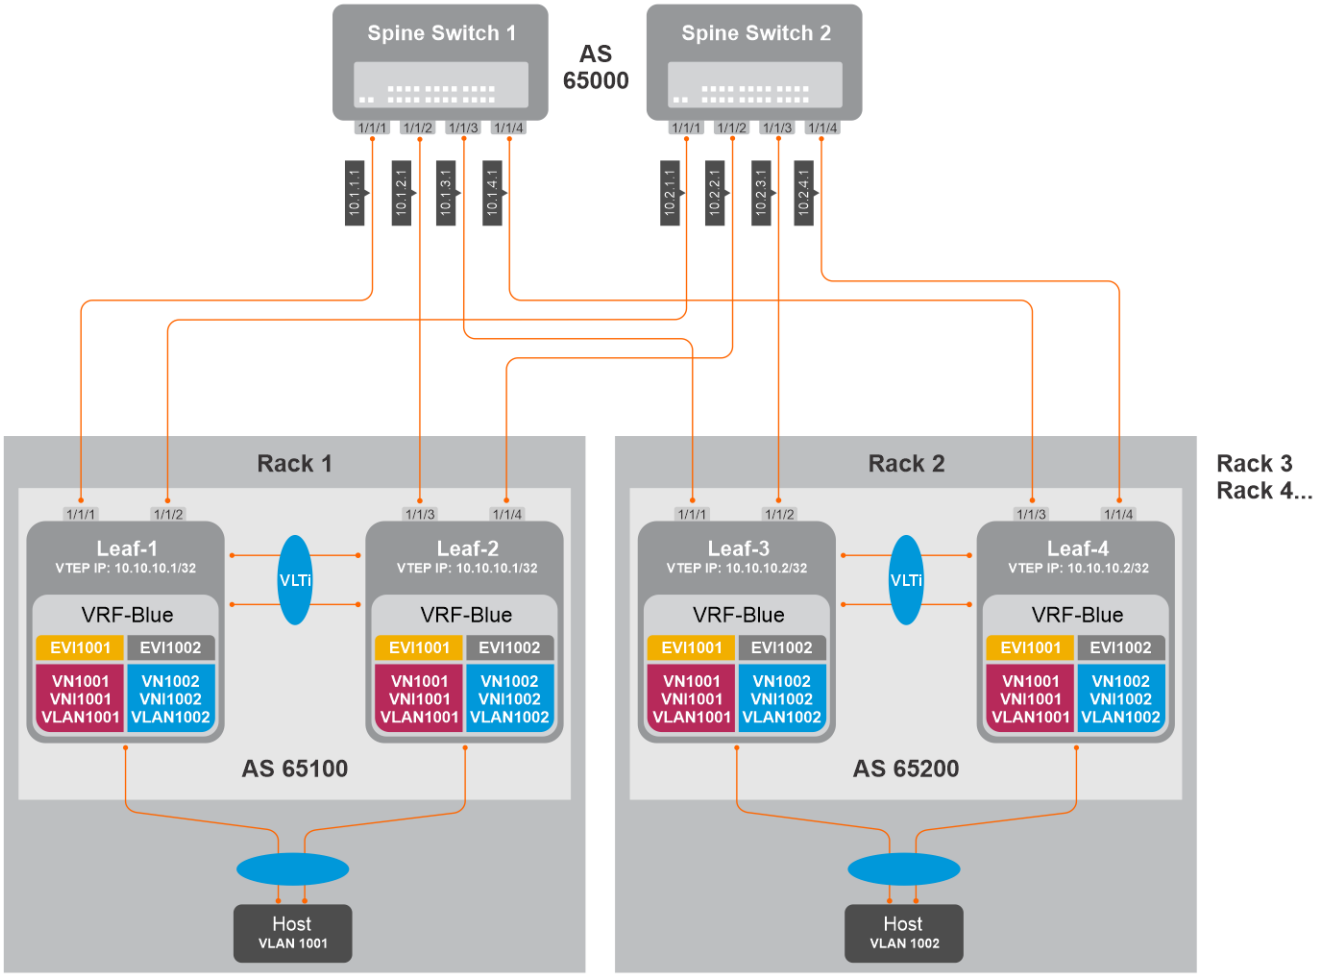
Example: Migrating from Asymmetric IRB to Symmetric IRB

Until Release 10.5.0, OS10 provided support only for the Asymmetric IRB mode. Starting from Release 10.5.1, OS10 supports the Symmetric IRB mode. Symmetric IRB mode efficiently uses next hop tables in the NPU. If there are no local hosts, Symmetric IRB mode does not require creation of destination VNI in the local VTEP. You can migrate your network from Asymmetric IRB mode to Symmetric IRB mode. For a seamless migration with less or no downtime in the VLT environment, perform the following steps:

NOTE:

- Before you start this migration, all leaf nodes acting as VTEPs in the Clos network must be upgraded to 10.5.1.x.
- If there are overlay hosts in default VRF, migration to Symmetric IRB mode is not supported because Symmetric IRB mode cannot be used in default VRF.



Asymmetric to Symmetric IRB migration steps

1. **Make the spines to send overlay traffic only to Leaf-2 by making Leaf-1 advertise VTEP IP with a higher metric in the underlay network.**

   Leaf-1 configuration

   a. Configure route-map with prefix-list to set the metric higher for the VTEP IP.

   ```
   Leaf-1(config)# ip prefix-list vtep_ip seq 10 permit 10.10.10.1/32
   Leaf-1(config)# route-map set_higher_metric permit 10
   Leaf-1(config-route-map)# match ip address prefix-list vtep_ip
   Leaf-1(config-route-map)# continue 20
   Leaf-1(config-route-map)# set metric 100
   Leaf-1(config-route-map)# exit
   Leaf-1(config)# route-map set_higher_metric permit 20
   Leaf-1(config-route-map)# exit
   ```

   b. Configure the route-map to the underlay BGP neighbors towards Spine.

   ```
   Leaf-1(config)# router bgp 65100
   Leaf-1(config-router-bgp-65100)# neighbor 10.1.1.1
   Leaf-1(config-router-neighbor)# address-family ipv4 unicast
   Leaf-1(config-router-bgp-neighbor-af)# route-map set_higher_metric out
   Leaf-1(config-router-bgp-neighbor-af)# exit
   Leaf-1(config-router-neighbor)# exit
   Leaf-1(config-router-bgp-65100)# neighbor 10.2.1.1
   Leaf-1(config-router-neighbor)# address-family ipv4 unicast
   Leaf-1(config-router-bgp-neighbor-af)# route-map set_higher_metric out
   Leaf-1(config-router-bgp-neighbor-af)# end
   ```

2. Spines would now send the overlay traffic destined to VLT domain 1 (Rack1) only to Leaf-2.
3. Configure Symmetric IRB mode in Leaf-2.

   Leaf-2 configuration

   a. Configure router-mac.

   ```
   Leaf-2(config)# evpn
   Leaf-2(config-evpn)# router-mac 02:10:10:10:10:10
   ```

   b. Configure IP VRF with L3 VNI.

   ```
   Leaf-2(config-evpn)# vrf BLUE
   Leaf-2(config-evpn-vrf-VRF001)# vni 65001
   ```

   c. Configure RT (auto or manual) and RD (optional, default is auto).

   ```
   Leaf-2(config-evpn-vrf-BLUE)# route-target auto
   ```

   d. Advertise IPv4 and IPv6 connected routes.

   ```
   Leaf-2(config-evpn-vrf-BLUE)# advertise ipv4 connected
   Leaf-2(config-evpn-vrf-BLUE)# advertise ipv6 connected
   ```

4. Leaf-2 is changed to Symmetric IRB mode. VTEPs in other racks could be using Symmetric IRB or Asymmetric IRB based on its own local configuration. Irrespective of what other remote VTEPs use, Leaf-2 could now handle VXLAN encapsulated traffic from both symmetric and asymmetric modes.
5. Configure Symmetric IRB in Leaf-1.

   Leaf-1 configuration

   a. Configure router-mac.

   ```
   Leaf-1(config)# evpn
   Leaf-1(config-evpn)# router-mac 02:10:10:10:10:10
   ```

   b. Configure IP VRF with L3 VNI.

   ```
   Leaf-1(config-evpn)# vrf BLUE
   Leaf-1(config-evpn-vrf-VRF001)# vni 65001
   ```

   c. Configure RT (auto or manual) and RD (optional, default is auto).

   ```
   Leaf-1(config-evpn-vrf-BLUE)# route-target auto
   ```

   d. Advertise IPv4 and IPv6 connected routes.

   ```
   Leaf-1(config-evpn-vrf-BLUE)# advertise ipv4 connected
   Leaf-1(config-evpn-vrf-BLUE)# advertise ipv6 connected
   ```

6. Remove the BGP MED configuration in Leaf-1. Spines start sending traffic to Leaf-1 as well. ECMP path from Spines towards Leaf-1 and Leaf-2 is restored.

   Leaf-1 configuration

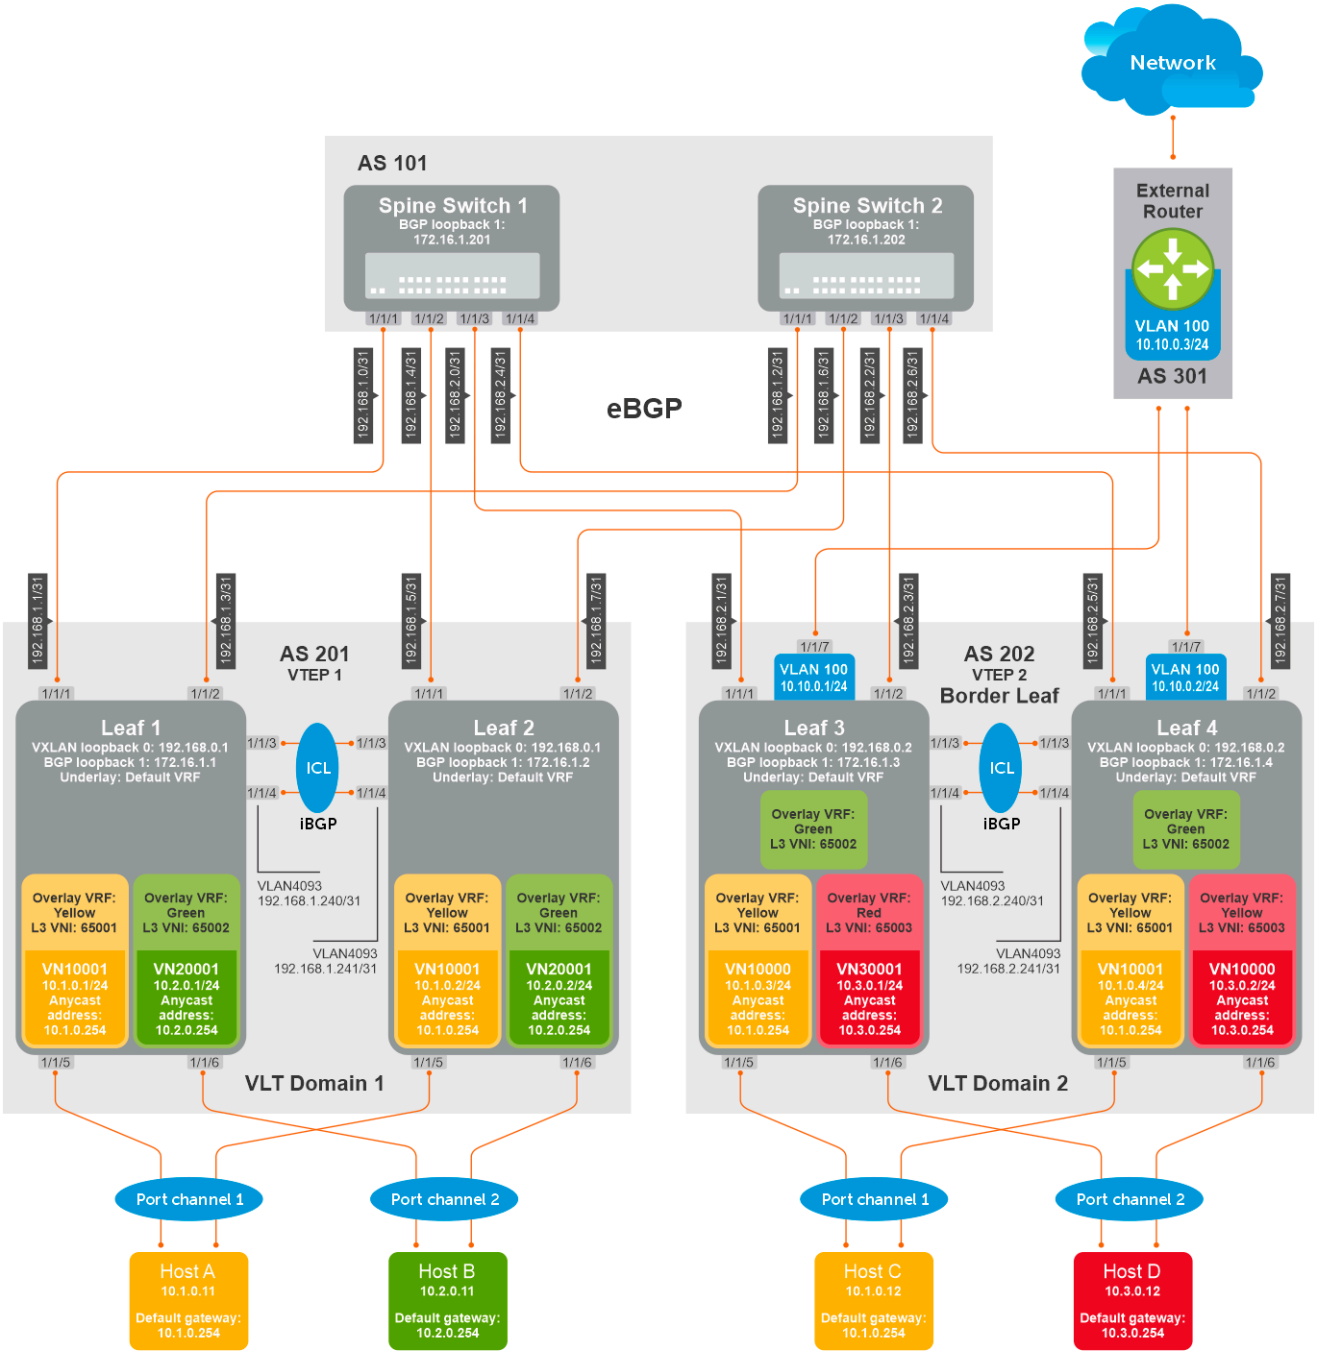
   ```
   Leaf-1(config)# router bgp 65100
   Leaf-1(config-router-bgp-65100)# neighbor 10.1.1.1
   Leaf-1(config-router-neighbor)# address-family ipv4 unicast
   Leaf-1(config-router-bgp-neighbor-af)# no route-map set_higher_metric out
   Leaf-1(config-router-bgp-neighbor-af)# exit
   Leaf-1(config-router-neighbor)# exit
   Leaf-1(config-router-bgp-65100)# neighbor 10.2.1.1
   Leaf-1(config-router-neighbor)# address-family ipv4 unicast
   Leaf-1(config-router-bgp-neighbor-af)# no route-map set_higher_metric out
   Leaf-1(config-router-bgp-neighbor-af)# end
   ```

7. Rack1 is migrated to use Symmetric IRB.
8. Repeat Steps 1-to-6 on Rack2 and other racks as well.
9. After changing all Racks to Symmetric IRB, you can perform the following optional configuration changes:
   a. If the L2 VNI (MAC-VRF VNI) does not have local hosts in the VTEPs, you can remove those VNIs on those VTEPs.

b. Default route configured in VTEPs pointing to border leaf using an intermediate VNI could be removed. Default route or external routes could now be advertised to the VTEPs from border leaf using `advertise` commands under EVPN-IP-VRF mode.

Example - Route leaking across VRFs in a VXLAN BGP EVPN symmetric IRB topology

The following VXLAN with BGP EVPN example uses a Clos leaf-spine topology to show how to set up route leaking across VRF in a symmetric IRB topology.



The following explains how the network is configured:

- All VTEPs perform symmetric IRB routing. In this example, all spine nodes are in one autonomous system and each VTEP in the leaf network belongs to a different autonomous system. Spine switch 1 is in AS 101. Spine switch 2 is in AS 101. For leaf nodes, VLT domain 1 is in AS 201; VLT domain 2 is in AS 202. VLT domain 2 is a border leaf VTEP.

- The individual switch configuration shows how to configure VRFs in the VTEPs and configure route leaking between VRFs. For other VXLAN and BGP EVPN configuration, see other examples and the VXLAN section.
- Route leaking is performed on the Border Leaf VTEP.
- There are three nondefault VRFs present in the network – Yellow, Green, and Red.
- Route leaking is done between:
  - VRF-Yellow and VRF-Green.
  - VRF-Yellow and VRF-Red.
  - VRF-Yellow and VRF-default (underlay with external router)

  NOTE: Route leaking is not performed between VRF-Green and VRF-Red.
- On VTEPs 1 and 2, two VRFs are present – VRF-Yellow and VRF-Green. VN10001 is part of VRF-Yellow and VN20001 is part of VRF-Green.
- On VTEPs 3 and 4, three VRFs are present – VRF-Yellow, VRF-Green and VRF-Red. VN10001 is part of VRF-Yellow and VN30001 is part of VRF-Red. VRF-Green does not have local VNs.
- On all VTEPs, symmetric IRB is configured in EVPN mode using a unique, dedicated VXLAN VNI, and Auto RD/RT values for each tenant VRF.
- On all VTEPs, the `disable-rt-asn` command is used to autoderive the RT that does not include the ASN in the RT value. This allows auto RT to be used even if there are separate ASNs for each leaf node.
- A VLAN to an external network is configured on VTEPs 3 and 4 in the VLT domain that serves as the border-leaf gateway.

Leaf 1 configuration

1. Configure VRFs Yellow and Green.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.1/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip vrf forwarding Green
OS10(conf-if-vn-20001)# ip address 10.2.0.1/24
OS10(conf-if-vn-20001)# ip virtual-router address 10.2.0.254
```

   NOTE: For creating the virtual-networks with access ports, check the relevant sections.

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# router-mac de:11:de:11:00:01
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
```

Leaf 2 configuration

1. Configure VRFs Yellow and Green.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.2/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 20001
OS10(conf-if-vn-20001)# ip vrf forwarding Green
OS10(conf-if-vn-20001)# ip address 10.2.0.2/24
OS10(conf-if-vn-20001)# ip virtual-router address 10.2.0.254
```

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# router-mac de:11:de:11:00:02
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
```

Leaf3 configuration:

1. Configure VRFs Yellow, Green, and Red.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.3/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip vrf forwarding Red
OS10(conf-if-vn-30001)# ip address 10.3.0.1/24
OS10(conf-if-vn-30001)# ip virtual-router address 10.3.0.254
```

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# router-mac de:11:de:11:00:02
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
OS10(config-evpn)# vrf Red
OS10(config-evpn-vrf-Red)# vni 65003
OS10(config-evpn-vrf-Red)# route-target auto
```

```
OS10(config-evpn-vrf-Red)# advertise ipv4 connected
OS10(config-evpn-vrf-Red)# exit
```

4. Configure the border-leaf to advertise the default route into the EVPN in each VRF. From the other VTEPs, any traffic to an external network and also to networks which are not within the local VRF reaches the Border Leaf router using this default route.
   a. **If the border-leaf is already getting a default route from an external router for each VRF**: Advertise the BGP route using the `advertise ipv4 bgp` command for each VRF in the EVPN.

```
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 bgp
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 bgp
OS10(config-evpn-vrf-Green)# exit
```

   b. **If the border-leaf does not get a default route from an external router**: Configure a static null default route in each VRF and advertise it using `advertise ipv4 static` command for each VRF in the EVPN.

```
OS10(config)# ip route vrf Yellow 0.0.0.0/0 interface null 0
OS10(config)# ip route vrf Green 0.0.0.0/0 interface null 0
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 static
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 static
OS10(config-evpn-vrf-Green)# exit
```

5. (Optional) Configure route-maps with a prefix-list to leak selective routes from each VRF.

```
OS10(config)# ip prefix-list PrefixList_DefaultVrf_Export permit 10.10.0.0/24
OS10(config)# ip prefix-list PrefixList_YellowVrf_Export permit 10.1.0.0/24 le 32
OS10(config)# ip prefix-list PrefixList_GreenVrf_Export permit 10.2.0.0/24
OS10(config)# ip prefix-list PrefixList_RedVrf_Export permit 10.3.0.0/24
OS10(config)# route-map RouteMap_DefaultVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_DefaultVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_YellowVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_YellowVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_GreenVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_GreenVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_RedVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_RedVrf_Export
OS10(config-route-map)# exit
```

   NOTE: While leaking EVPN routes, only the subnet routes must be leaked. Host routes (/32) need not be leaked and could be blocked using route-maps. But, if you have certain VNs stretched on the border-leaf as well (like in Yellow VRF), you must leak the host routes as well.

6. Configure route leaking between:
   - `Yellow` VRF and `default` VRF.
   - `Yellow` VRF and `Green` VRF.
   - `Yellow` VRF and `Red` VRF.

```
OS10(config)# ip vrf default
OS10(conf-vrf)# ip route-export 0:0 route-map RouteMap_DefaultVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip route-export 1:1 route-map RouteMap_YellowVrf_Export
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# ip route-import 3:3
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip route-export 2:2 route-map RouteMap_GreenVrf_Export
```

```
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip route-export 3:3 route-map RouteMap_RedVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
```

7. (Optional) For advertising leaked routes from `Yellow` VRF only to an external router on the `default` VRF and not to an underlay network, use route-maps on spine-facing eBGP neighbors and also on the iBGP neighbor between the VLT peers.

```
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes deny 10.1.0.0/24 le
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes permit 0.0.0.0/0 le 32
OS10(config)#
OS10(config)# route-map RouteMap_Deny_YellowVrfRoutes
OS10(config-route-map)# match ip address prefix-list PrefixList_Deny_YellowVrfRoutes
OS10(config-route-map)#
OS10(config-route-map)# router bgp 202
OS10(config-router-bgp-202)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.0
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.2
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.241
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 10.10.0.3
OS10(config-router-neighbor)# remote-as 301
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

Leaf 4 configuration

1. Configure VRFs Yellow, Green, and Red.

```
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# exit
```

2. Configure Layer 3 virtual-network interfaces with VRFs and IP addresses.

```
OS10(config)# interface virtual-network 10001
OS10(conf-if-vn-10001)# ip vrf forwarding Yellow
OS10(conf-if-vn-10001)# ip address 10.1.0.4/24
OS10(conf-if-vn-10001)# ip virtual-router address 10.1.0.254
OS10(conf-if-vn-10001)#
OS10(config)# interface virtual-network 30001
OS10(conf-if-vn-30001)# ip vrf forwarding Red
OS10(conf-if-vn-30001)# ip address 10.3.0.2/24
OS10(conf-if-vn-30001)# ip virtual-router address 10.3.0.254
```

3. Configure EVPN with IP-VRFs.

```
OS10(config)# evpn
OS10(config-evpn)# auto-evi
OS10(config-evpn)# disable-rt-asn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# vni 65001
OS10(config-evpn-vrf-Yellow)# route-target auto
```

```
OS10(config-evpn-vrf-Yellow)# advertise ipv4 connected
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# vni 65002
OS10(config-evpn-vrf-Green)# route-target auto
OS10(config-evpn-vrf-Green)# advertise ipv4 connected
OS10(config-evpn-vrf-Green)# exit
OS10(config-evpn)# vrf Red
OS10(config-evpn-vrf-Red)# vni 65003
OS10(config-evpn-vrf-Red)# route-target auto
OS10(config-evpn-vrf-Red)# advertise ipv4 connected
OS10(config-evpn-vrf-Red)# exit
```

4. Configure a border-leaf to advertise the default route into the EVPN in each VRF. From the other VTEPs, any traffic to external network and also to networks which are not within the local VRF reaches the Border-Leaf router using this default route.
   a. **If the border-leaf is already getting a default route from an external router for each VRF**: Advertise the BGP route using the `advertise ipv4 bgp` command for each VRF in the EVPN.

```
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 bgp
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 bgp
OS10(config-evpn-vrf-Green)# exit
```

   b. **If the border-leaf does not get a default route from an external router**: Configure a static null default route in each VRF and advertise it using the `advertise ipv4 static` command for each VRF in the EVPN.

```
OS10(config)# ip route vrf Yellow 0.0.0.0/0 interface null 0
OS10(config)# ip route vrf Green 0.0.0.0/0 interface null 0
OS10(config)# evpn
OS10(config-evpn)# vrf Yellow
OS10(config-evpn-vrf-Yellow)# advertise ipv4 static
OS10(config-evpn-vrf-Yellow)# exit
OS10(config-evpn)# vrf Green
OS10(config-evpn-vrf-Green)# advertise ipv4 static
OS10(config-evpn-vrf-Green)# exit
```

5. (Optional) Configure route-maps with a prefix-list to leak selective routes from each VRF.

```
OS10(config)# ip prefix-list PrefixList_DefaultVrf_Export permit 10.10.0.0/24
OS10(config)# ip prefix-list PrefixList_YellowVrf_Export permit 10.1.0.0/24 le 32
OS10(config)# ip prefix-list PrefixList_GreenVrf_Export permit 10.2.0.0/24
OS10(config)# ip prefix-list PrefixList_RedVrf_Export permit 10.3.0.0/24
OS10(config)#
OS10(config)# route-map RouteMap_DefaultVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_DefaultVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_YellowVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_YellowVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_GreenVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_GreenVrf_Export
OS10(config-route-map)# exit
OS10(config)# route-map RouteMap_RedVrf_Export
OS10(config-route-map)# match ip address prefix-list PrefixList_RedVrf_Export
OS10(config-route-map)# exit
```

   NOTE: While leaking EVPN routes, only the subnet routes must be leaked. Host routes (/32) need not be leaked and could be blocked using route-maps. But, if you have certain VNs stretched on border leaf as well (like in Yellow VRF), you must leak the host routes as well.

6. Configure route leaking between:
   - `Yellow` VRF and `default` VRF.
   - `Yellow` VRF and `Green` VRF.

- `Yellow` VRF and `Red` VRF.

```
OS10(config)# ip vrf default
OS10(conf-vrf)# ip route-export 0:0 route-map RouteMap_DefaultVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Yellow
OS10(conf-vrf)# ip route-export 1:1 route-map RouteMap_YellowVrf_Export
OS10(conf-vrf)# ip route-import 0:0
OS10(conf-vrf)# ip route-import 2:2
OS10(conf-vrf)# ip route-import 3:3
OS10(conf-vrf)# exit
OS10(config)# ip vrf Green
OS10(conf-vrf)# ip route-export 2:2 route-map RouteMap_GreenVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
OS10(config)# ip vrf Red
OS10(conf-vrf)# ip route-export 3:3 route-map RouteMap_RedVrf_Export
OS10(conf-vrf)# ip route-import 1:1
OS10(conf-vrf)# exit
```

7. (Optional) For advertising leaked routes from the `Yellow` VRF only to an external router in the default VRF and not to an underlay network, use route-maps on spine facing eBGP neighbors and also on the iBGP neighbor between the VLT peers.

```
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes deny 10.1.0.0/24 le 32
OS10(config)# ip prefix-list PrefixList_Deny_YellowVrfRoutes permit 0.0.0.0/0 le 32
OS10(config)#
OS10(config)# route-map RouteMap_Deny_YellowVrfRoutes
OS10(config-route-map)# match ip address prefix-list PrefixList_Deny_YellowVrfRoutes
OS10(config-route-map)#
OS10(config-route-map)# router bgp 202
OS10(config-router-bgp-202)# address-family ipv4 unicast
OS10(configure-router-bgpv4-af)# redistribute l2vpn evpn
OS10(configure-router-bgpv4-af)# redistribute connected
OS10(configure-router-bgpv4-af)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.4
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.5
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 192.168.2.240
OS10(config-router-neighbor)# address-family ipv4 unicast
OS10(config-router-bgp-neighbor-af)# route-map RouteMap_Deny_YellowVrfRoutes out
OS10(config-router-bgp-neighbor-af)# exit
OS10(config-router-neighbor)# exit
OS10(config-router-bgp-202)# neighbor 10.10.0.3
OS10(config-router-neighbor)# remote-as 301
OS10(config-router-neighbor)# no shutdown
OS10(config-router-neighbor)# exit
```

Verify leaked routes using show outputs on the the Border-Leaf switch:

UFT modes

A switch in a Layer 2 (L2) network may require a larger MAC address table size, while a switch in a Layer 3 (L3) network may require a larger routing table size. Unified forwarding table (UFT) offers the flexibility to configure internal L2/L3 forwarding table sizes.

OS10 supports several UFT modes for the forwarding tables. By default, OS10 selects a UFT mode that provides a reasonable size for all tables. The supported UFT modes are: default, scaled-l2–switch, scaled-l3–hosts, and scaled-l3–routes.

NOTE: This feature is not supported on the Z9332F-ON platform.

Table 84. UFT Modes — Table Size for Z9664F-ON

UFT Mode	L2 MAC Table Size	L3 Host Table Size	L3 Routes Table Size	Multicast Entries
Scaled-l2–switch	131072	32768	32768	IPv4 Multicast – 3.8k (or) IPv6 Multicast - 480
Scaled-l3–hosts	8192 (8k)	32768	368640	IPv4 Multicast - 9k (OR) IPv6 Multicast - 4k
Scaled-l3–routes	8192 (8k)	368640	32768	IPv4 Multicast - 9k (OR) IPv6 Multicast - 4k
Default	131072	32768	32768	IPv4 Multicast – 3.8k (or) IPv6 Multicast - 480

Table 85. UFT Modes — Table Size for S4048–ON, S4048T-ON, S6010–ON

UFT Mode	L2 MAC Table Size	L3 Host Table Size	L3 Routes Table Size
Scaled-l2–switch	294912	16384	16384
Scaled-l3–hosts	98304	212992	98304
Scaled-l3–routes	32768	16384	131072
Default	163840	147456	16384

Table 86. UFT Modes — Table Size for S3048–ON

UFT Mode	L2 MAC Table Size	L3 Host Table Size	L3 Routes Table Size
Scaled-l2–switch	40960	2048	8192
Scaled-l3–hosts	8192	18432	8192
Default	28672	8192	8192

Table 87. UFT Modes — Table Size for S41XX-ON series

UFT Mode	L2 MAC Table Size	L3 Host Table Size	L3 Routes Table Size

Scaled-l3–hosts	32768	278528	16384
Scaled-l3–routes	32768	16384	389120
Default	163840	147456	16384

Table 91. UFT Modes — Table Size for S42xxFB-ON

UFT Mode	L2 MAC Table Size	L3 Host Table Size	L3 Routes Table Size
Default	250 K	48 K	130 K

Table 92. UFT Modes — Table Size for S42xxFBL-ON

UFT Mode	L2 MAC Table Size	L3 Host Table Size	L3 Routes Table Size
Default	250 K	48 K	2 Million

NOTE: The L3 routes table size for Scaled-l3-routes mode might vary depending on the routes that are being installed.

Configure UFT modes

Available UFT modes include L2 MAC table, L3 host table, or L3 route table sizes. Save the configuration and reload the switch for the configuration changes to take effect.

- Select a mode to initialize the maximum table size in CONFIGURATION mode.

```
hardware forwarding-table mode [scaled-l2 | scaled-l3-routes | scaled-l3-hosts]
```

- Disable UFT mode in CONFIGURATION mode.

```
no hardware forwarding-table
```

Configure UFT mode

```
OS10(config)# hardware forwarding-table mode scaled-l3-hosts
OS10(config)# exit
OS10# write memory
OS10# reload
```

View UFT mode information

```
OS10# show hardware forwarding-table mode
                       Current Settings           Next-boot Settings
 Mode                  default-mode               scaled-l3-hosts
 L2 MAC Entries    :   163840                     98304
 L3 Host Entries   :   147456                     212992
 L3 Route Entries  :   32768                      98304
```

View UFT information for all modes

```
OS10# show hardware forwarding-table mode all
 Mode                default     scaled-l2   scaled-l3-routes   scaled-l3-hosts
 L2 MAC Entries      163840      294912      32768              98304
 L3 Host Entries     147456      16384       16384              212992
 L3 Route Entries    32768       32768       131072             98304
```

IPv6 extended prefix routes

IPv6 addresses that contain prefix routes with mask between /64 to /128 are called as IPv6 extended prefix routes. These routes require double the key size in the Longest prefix match (LPM) table.

You can configure the number of route entries for extended prefix using the `hardware l3 ipv6-extended-prefix` *`prefix-number`* command.

Save and Reload the switch for the settings to become effective.

Configure IPv6 extended prefix route

```
OS10# configure terminal
OS10(config)# hardware l3 ipv6-extended-prefix 2048
 % Warning: IPv6 Extended Prefix Installation will be applied only after a save and
reload.
OS10(config)# do write memory
OS10(config)# reload
```

View IPv6 extended prefix route configuration

```
OS10# show running-configuration | grep hardware
 hardware l3 ipv6-extended-prefix 2048
```

Configuration before reload:

```
OS10# show hardware l3
                              Current Settings       Next-boot Settings
 IPv6 Extended Prefix Entries: 0                      2048
```

Configuration after reload:

```
OS10# show hardware l3
                              Current Settings       Next-boot Settings
 IPv6 Extended Prefix Entries: 2048                   2048
```

The `no` version of the command removes the IPv6 extended prefix route configuration. Save and Reload the switch to remove the configuration.

```
OS10(config)# no hardware l3 ipv6-extended-prefix
 % Warning: Un-configuring IPv6 Extended Prefix will be applied only after a save and
reload.
```

UFT commands

hardware forwarding-table mode

Selects a mode to initialize the maximum scalability size. The available options are: scaled L2 MAC address table, scaled L3 routes table, or scaled L3 hosts table.

Syntax `hardware forwarding-table mode {scaled-l2 | scaled-l3-routes | scaled-l3-hosts}`

Parameters

- `scaled-l2` —Enter the L2 MAC address table size.
- `scaled-l3-routes` — Enter the L3 routes table size.
- `scaled-l3-hosts` — Enter the L3 hosts table size.

Defaults The default parameters vary according to the platform. See UFT modes.

Command Mode CONFIGURATION

Usage Information Configure the sizes of internal L2 and L3 forwarding tables for your requirements of the network environment. To apply the changes, reload the switch.

The `no` version of this command resets the UFT mode to default.

Example

```
OS10(config)# hardware forwarding-table mode scaled-l3-hosts
```

Supported Releases 10.3.0E or later

hardware l3 ipv6-extended-prefix

Configures the maximum number of route entries for IPv6 extended prefix route.

Syntax `hardware l3 ipv6-extended-prefix` *`prefix-number`*

Parameters *`prefix-number`*—Enter the maximum number of route entries for IPv6 extended prefix route. The options available are: 1024, 2048, or 3072.

Defaults None

Command Mode CONFIGURATION

Usage Information Save and Reload the switch for the settings to become effective. The `no` version of the command removes the IPv6 extended prefix route configuration.

NOTE:

- This configuration is not required in the S4200 platform as it is enabled by default.
- When the `startup.xml` file with a specific setting for `hardware l3 ipv6-extended-prefix` is copied to the switch, then two reloads may be necessary for that setting to be effective. Reload the switch without saving configuration after the `startup.xml` file is copied. After boot-up, run the `write memory` command and reload again.

Example

```
OS10# configure terminal
OS10(config)# hardware l3 ipv6-extended-prefix 2048
 % Warning: IPv6 Extended Prefix Installation will be applied only after
a save and reload.
OS10(config)# do write memory
OS10(config)# reload
```

Supported Releases 10.4.1.0 or later

show hardware forwarding-table mode

Displays the current hardware forwarding table mode, and the mode after the next boot.

Syntax `show hardware forwarding-table mode`

Parameters None

Defaults None

Command Mode EXEC

Usage Information None

Example

```
OS10# show hardware forwarding-table mode
                        Current Settings          Next-boot Settings
 Mode                   default-mode              scaled-l3-hosts
 L2 MAC Entries    :    163840                    98304
 L3 Host Entries   :    147456                    212992
 L3 Route Entries  :    32768                     98304
```

Supported Releases 10.3.0E or later

show hardware forwarding-table mode all

Displays table sizes for the hardware forwarding table modes.

Syntax `show hardware forwarding-table mode all`

Parameters None

Defaults None

Command Mode EXEC

Usage Information None

Example

```
OS10# show hardware forwarding-table mode all
 Mode                 default     scaled-l2   scaled-l3-routes
scaled-l3-hosts
 L2 MAC Entries       163840      294912      32768              98304
 L3 Host Entries      147456      16384       16384              212992
 L3 Route Entries     32768       32768       131072             98304
```

Supported Releases 10.3.0E or later

show hardware l3

Displays the IPv6 extended prefix route configuration.

Syntax `show hardware l3`

Parameters None

Defaults None

Command Mode EXEC

Usage Information None

Example

```
OS10# show hardware l3
                                  Current Settings       Next-boot Settings
 IPv6 Extended Prefix Entries: 2048                     2048
```

Supported Releases

10.4.1.0 or later

16

Security

Dell SmartFabric OS10 has several security features to protect the usability and integrity of the data available in the switch. OS10 also has security features to the user network from attacks and restrict network traffic.

Switch security

Dell SmartFabric OS10 has various inbuilt security features to secure the administrative access to the switch.

User management

OS10 controls the user access to the switch and what can they do after login based on the set roles and privileges.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

- Admin User—You can delete the default admin username, as long as there is a local user with sysadmin role present. The default admin user sees a warning message in MOTD, unless the user password is changed or the user is deleted.
- Linux Admin User—Password of the linuxadmin user must be modified via OS10 Command Line Interface (CLI). The linuxadmin user can also be enabled or disabled via another CLI.

```
Example (password modification):
OS10(config)# system-user linuxadmin password Dell@Force10!@
OS10(config)# exit
OS10# write memory
OS10#
OS10# exit

Example (disable):
OS10(config)# system-user linuxadmin disable
OS10(config)#

Example (enable):
OS10(config)# no system-user linuxadmin disable
OS10(config)#
```

NOTE: Only the linuxadmin user has SFTP access to the OS10 switch.

User accounts

OS10 allows you to create user accounts to access the OS10 switches. Each user account is defined with username, password and a role to limit OS10 switch access.

Role-based access control

RBAC provides control for access and authorization. Users are granted permissions based on defined roles — not on their individual system user ID. Create user roles based on job functions to help users perform their associated job functions. You can assign each user only a single role, and many users can have the same role. A user role authenticates and authorizes a user at login, and places the user in EXEC mode. For more information, see CLI basics.

OS10 supports four pre-defined roles: `sysadmin`, `secadmin`, `netadmin`, and `netoperator`. Each user role assigns permissions that determine the commands a user can enter, and the actions a user can perform. RBAC provides an easy and efficient way to administer user rights. If a user's role matches one of the allowed user roles for a command, command authorization is granted.

The OS10 RBAC model provides separation of duty and greater security. It places limitations on each role's permissions to allow you to partition tasks. For greater security, only some user roles can view events, audits, and security system logs.

Assign user role

To limit OS10 system access, assign a role when you configure each user.

- Enter a user name, password, and role in CONFIGURATION mode.

```
username username password password role role
```

  - `username username` — Enter a text string. A maximum of 32 alphanumeric characters; 1 character minimum.
  - `password password` — Enter a text string. A maximum of 32 alphanumeric characters; 9 characters minimum.
  - `role role` — Enter a user role:
    - `sysadmin` — Full access to all commands in the system, exclusive access to commands that manipulate the file system, and access to the system shell. A system administrator can create user IDs and user roles.
    - `secadmin` — Full access to configuration commands that set security policy and system access, such as password strength, AAA authorization, and cryptographic keys. A security administrator can display security information, such as cryptographic keys, login statistics, and log information.
    - `netadmin` — Full access to configuration commands that manage traffic flowing through the switch, such as routes, interfaces, and ACLs. A network administrator cannot access configuration commands for security features or view security information.
    - `netoperator` — Access to EXEC mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch.

Create user and assign role

```
OS10(config)# username smith password silver403! role sysadmin
```

View users

```
OS10# show users

Index Line  User    Role     Application Idle  Login-Time              Location
----- ----  ------  ------   ----------- ----  ---------------------   -------------
1     ttyS  root    root     -bash       >24h  2018-05-23 T23:05:03Z   console
2     pts/0 admin   sysadmin bash        1.1s  2018-05-30 T20:04:27Z   10.14.1.214[ssh]
```

Linuxadmin user configuration

OS10 supports two factory-default users: `admin` and `linuxadmin`. Use the `admin` user name to log in to the command-line interface. Use the `linuxadmin` user name to access the Linux shell.

To manage the default `linuxadmin` user from the CLI, you can:

- Configure a lost or forgotten `linuxadmin` password.
- Disable the `linuxadmin` user.

NOTE: These tasks allow you to manage only the default `linuxadmin` user, not other Linux users created at the root level.

Configure linuxadmin password from CLI

To configure a password for the `linuxadmin` user, use the `system-user linuxadmin password {clear-text-password | hashed-password}` command in CONFIGURATION mode. Save the new password using the `write memory` command. For example:

```
OS10(config)# system-user linuxadmin password Dell@admin10!@
OS10(config)# exit
OS10# write memory
```

```
OS10(config)# system-user linuxadmin
password $6$3M55wOYy$Sw1V9Ok3GE4Hmf6h1ARH.dBHy9gpEFYUvdu15ZpnCYzt.nJjFm0VIz/
rQvvJeX6krRtfYs2ZqBl6TkmLGAwtM
```

```
OS10(config)# exit
OS10# write memory
```

The `linuxadmin` password configured from the CLI takes precedence across reboots over the password configured from the Linux shell.

Verify the `linuxadmin` password using the `show running-configuration` command.

```
OS10# show running-configuration
system-user linuxadmin password
$6$5DdOHYg5$JCE1vMSmkQOrbh31U74PIPv7lyOgRmba1IxhkYibppMXs1KM4Y.gbTPcxyMP/PHUkMc5rdk/
ZLv9Sfv3ALtB61
```

Disable linuxadmin user

To disable or lock the `linuxadmin` user, use the `system-user linuxadmin disable` command in CONFIGURATION mode.

```
OS10(config)# system-user linuxadmin disable
```

To re-enable or unlock the `linuxadmin` user, use the `no system-user linuxadmin disable` command in CONFIGURATION mode.

```
OS10(config)# no system-user linuxadmin disable
```

Privilege levels

Controlling terminal access to a switch is one method of securing the device and network. To increase security, you can limit user access to a subset of commands using privilege levels.

Configure privilege levels, add commands to them, and restrict access to the command line with passwords. The system supports 16 privilege levels:

- Level 0—Provides users the least privilege, restricting access to basic commands.
- Level 1—Provides access to a set of `show` commands and certain operations such as ping, traceroute, and so on.
- Level 15—Provides access to all available commands for a particular user role.
- Levels 0, 1, and 15—System configured privilege levels with a predefined command set.
- Levels 2 to 14—Not configured. You can customize these levels for different users and access rights.

Privilege levels inherit the commands supported on all lower levels. After logging in with a user role, a user has access to commands assigned to his privilege level and lower levels.

For users assigned to the `sysadmin`, `netadmin`, and `secadmin` roles, you cannot configure a privilege level lower than 2. You can configure `netoperator` users with privilege levels 0 or 1.

After you assign commands to privilege levels, assign the privilege level to users with the `username` command. Use the `enable password privilege-level` command to switch between privilege levels and access the commands supported at each level. The `disable` command takes the user to a lower level.

When a remote user logs in, OS10 checks for a match in the local system. If a local user entry is found, the privilege level of the local user is applied to the remote user for the login session. If no match is found in the local system, OS10 assigns a default privilege level according to the role of the remote user:

- `sysadmin`, `secadmin`, and `netadmin` roles: Level 15
- `netoperator` role: Level 1

NOTE: The role of a local user in the system and the remote user who logs in must be the same at both ends.

Starting for Release 10.5.4.4, OS10 RADIUS client can process the privilege level attribute. The privilege level attribute is treated as a Dell vendor-specific TLV attribute. If the RADIUS server sends the privilege level attribute for a user, OS10 RADIUS client extracts the privilege level value from the RADIUS packet and configures the privilege level for the user accordingly. Use the `show users` and `show privilege` commands to view the privilege level configured for different users. In the previous releases, OS10 can only process the role attribute from RADIUS servers.

You must configure the privilege level on the RADIUS server using the vendor-specific attribute (VSA). The vendor ID of Dell Technologies is 674. Create a VSA with `Name = DellEMC-AVpair, OID = 1, Type = string`. For example, to set the privilege level of a user to 6, enter VSA as follows: `DellEMC-AVpair := "6"`.

The following is a sample output of the privilege level attribute that is captured from a RADIUS server packet with the privilege level value set to 6 for a user.

```
Vendor-Specific Attribute (26), length: 9, Value:Vendor: Unknown (674)
Vendor Attribute: 1, Length: 1, Value: 6
```

The following is the `show users` output taken on the OS10 device after the privilege level attribute has been set to a value of 6 from the RADIUS server for a username `user1`.

```
OS10# show users
Index Line  User   Role     Application  Idle  Login-Time  Location
Privilege-Level
----- ----- ------ -------- ------------ ----- ----------- ----------------------------
---------------
1     ttyS0 admin  sysadmin clish        2.7s  2022-09-30  T 10:10:46Z console
15
2     pts/0 user1  sysadmin bash         45.8s 2022-09-30  T 10:10:05Z 10.10.10.10 [ssh]
6
```

Configure privilege levels

To restrict CLI access, create the required privilege levels for user roles, assign commands to each level, and assign privilege levels to users.

1. Create privilege levels in CONFIGURATION mode.
   `privilege` *`mode`* `priv-lvl` *`privilege-level command-string`*
   - *`mode`* — Enter the privilege mode used to access CLI modes:
     - `exec` — Accesses EXEC mode.
     - `configure` — Accesses class-map, DHCP, logging, monitor, openflow, policy-map, QOS, support-assist, telemetry, CoS, Tmap, UFD, VLT, VN, VRF, WRED, and alias modes.
     - `interface` — Accesses Ethernet, fibre-channel, loopback, management, null, port-group, port channel, breakout, range, port-channel, and VLAN modes.
     - `route-map` — Accesses route-map mode.
     - `router` — Accesses router-bgp and router-ospf modes.
     - `line` — Accesses line-vty mode.
   - `priv-lvl` *`privilege-level`* — Enter the number of a privilege level, from 2 to 14.
   - *`command-string`* — Enter the commands supported at the privilege level.
2. Create a user name, password, and role, and assign a privilege level in CONFIGURATION mode.
   `username` *`username`* `password` *`password`* `role` *`role`* `priv-lvl` *`privilege-level`*
   - `username` *`username`* — Enter a text string; 32 alphanumeric characters maximum; one character minimum.
   - `password` *`password`* — Enter a text string; 32 alphanumeric characters maximum, nine characters minimum.
   - `role` *`role`* — Enter a user role:
     - `sysadmin` — Full access to all commands in the system, exclusive access to commands that manipulate the file system, and access to the system shell. A system administrator can create user IDs and user roles.
     - `secadmin` — Full access to configuration commands that set security policy and system access, such as password strength, AAA authorization, and cryptographic keys. A security administrator can display security information, such as cryptographic keys, login statistics, and log information.
     - `netadmin` — Full access to configuration commands that manage traffic flowing through the switch, such as routes, interfaces, and ACLs. A network administrator cannot access configuration commands for security features or view security information.
     - `netoperator` — Access to EXEC mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch.
   - `priv-lvl` *`privilege-level`*—Enter a privilege level, from 0 to 15. If you do not specify the `priv-lvl` option, the system assigns privilege level 1 for the `netoperator` user and privilege level 15 for the `sysadmin`, `secadmin`, and `netadmin` users.

The following is an example of configuring privilege levels and assigning them to a user:

```
OS10(config)# privilege exec priv-lvl 12 "show version"
OS10(config)# privilege exec priv-lvl 12 "configure terminal"
OS10(config)# privilege configure priv-lvl 12 "interface ethernet"
OS10(config)# privilege interface priv-lvl 12 "ip address"
OS10(config)# username delluser password $6$Yij02Phe2n6whp7b$ladskj0HowijIlkajg981 role
secadmin priv-lvl 12
```

The following example shows the privilege level of the current user:

```
OS10# show privilege
Current privilege level is 15.
```

The following example displays the privilege levels of all users who are logged into OS10:

```
OS10# show users

Index Line   User  Role     Application Idle Login-Time            Location         Privilege
----- ------ ----- -----    ----------- ---- -----------            --------         ---------
1     pts/0  admin sysadmin bash        >24h 2018-09-08 T06:51:37Z 10.14.1.91 [ssh] 15
2     pts/1  netad netadmin bash        >24h 2018-09-08 T06:54:33Z 10.14.1.91 [ssh] 10
```

Configure enable password for a privilege level

After you configure privilege levels for users, assign commands to each level and an enable password to access each level:

1. Configure a privilege level and assign commands to it in CONFIGURATION mode.

   `privilege` *`mode`* `priv-lvl` *`privilege-level command-string`*

   - *`mode`* — Enter the privilege mode used to access CLI modes:
     - `exec` — Accesses EXEC mode.
     - `configure` — Accesses class-map, DHCP, logging, monitor, openflow, policy-map, QOS, support-assist, telemetry, CoS, Tmap, UFD, VLT, VN, VRF, WRED, and alias modes.
     - `interface` — Accesses Ethernet, fibre-channel, loopback, management, null, port-group, port channel, breakout, range, port-channel, and VLAN modes.
     - `route-map` — Accesses route-map mode.
     - `router` — Accesses router-bgp and router-ospf modes.
     - `line` — Accesses line-vty mode.
   - `priv-lvl` *`privilege-level`* — Enter the number of a privilege level, from 2 to 14.
   - *`command-string`* — Enter the command supported at the privilege level.

   For `sysadmin`, `netadmin`, and `secadmin` roles, you cannot configure a privilege level less than 2 .

2. Configure an enable password for each privilege level in CONFIGURATION mode.

   `enable password` *`encryption-type password-string`* `priv-lvl` *`privilege-level`*

   - *`encryption-type`* — Enter an encryption type for the password entry:
     - `0` — Use plain text with no password encryption.
     - `sha-256` — Encrypt the password using the SHA-256 algorithm.
     - `sha-512` — Encrypt the password using the SHA-512 algorithm.
   - `priv-lvl` *`privilege-level`* — Enter a privilege level, from 1 to 15.

```
OS10(config)# privilege exec priv-lvl 3 "show version"
OS10(config)# enable password 0 P@$$w0Rd priv-lvl 3
```

```
OS10(config)# privilege exec priv-lvl 12 "configure terminal"
OS10(config)# privilege configure priv-lvl 12 route-map
OS10(config)# privilege route-map priv-lvl 12 "set local-preference"
OS10(config)# enable password sha-256 $5$2uThib1o$84p.tykjmz/w7j26ymoKBjrb7uepkUB priv-
lvl 12
```

Passwords for user accounts

OS10 allows you to configure password check and strength for the user accounts.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

When you enter a password in an OS10 command, either at a password prompt or in the command syntax, you can enter only alphanumeric and certain special characters - $ - _ . + ! * ' ( ) - unencoded. You cannot enter any other special characters in the password. Use URL encoding instead.

For example, in the image download command, the password a@b is not accepted: image download `ftp://username:a@b@10.11.63.122/filename`. You must enter the password as image download `ftp://username:a%40b@10.11.63.122/filename`. The URL encoding for @ is %40. For information about other characters that require URL encoding, go to URL Encoding.

Enable user lockout

By default, a maximum of three consecutive failed password attempts is supported on the switch. You can set a limit to the maximum number of allowed password retries with a specified lockout period for the user ID. Audit logs include authentication failures on the console as well.

This feature is available only for the `sysadmin` and `secadmin` roles.

NOTE: If you are downgrading OS10 to a release earlier than 10.5.2.1, check the `password-attributes` command and ensure that only the supported parameters are configured.

- Configure user lockout settings in CONFIGURATION mode.

```
password-attributes {[max-retry number ] [lockout-period minutes] [console-exempt]}
```

  - `max-retry number` — Sets the maximum number of consecutive failed login attempts for a user before the user is locked out, from 0 to 16; default 3.
  - `lockout-period minutes` — Sets the amount of time that a user ID is prevented from accessing the system after exceeding the maximum number of failed login attempts, from 0 to 43,200; default 5.

    NOTE: Dell Technologies recommends that you configure the lockout period to be a nonzero value. If you set this value to zero, no lockout period is configured. Any number of failed login attempts do not lock out a user.
  - `console-exempt`—Applicable only if the user lockout feature is enabled. Enables the user to log in through the console, even though the user ID is blocked because of an existing lockout.

When a user is locked out due to exceeding the maximum number of failed login attempts, other users can still access the switch.

Configure user lockout

```
OS10(config)# password-attributes max-retry 4 lockout period 360 console-exempt
```

Simple password check

By default, OS10 uses a strong password check when you configure user name passwords with the `username username password password role role [priv-lvl privilege-level]` command.

To turn off the strong password check and configure simpler passwords with no restrictions, use the `service simple-password` command.

To disable the simple password check and return to the default strong password check, use the `no service simple-password` command.

- Enter the command in CONFIGURATION mode.

```
service simple-password
```

Enable simple password check

```
OS10(config)# username abhishek password madmiamadam role sysadmin
     %Error: Password fail:  it does not contain enough DIFFERENT characters
    OS10(config)# service simple-password
    OS10(config)# username abhishek password madmiamadam role sysadmin
    OS10(config)#
```

Password strength

By default, the password you configure with the `username password role` and `enable password priv-lvl` commands must be at least nine alphanumeric characters. To increase password strength, you can create stronger password rules using the `password-attributes` command. These password rules apply to the user name and privilege-level password configuration.

When you enter the command, at least one parameter is required. When you enter the `character-restriction` parameter, at least one option is required.

- Create rules for stronger passwords in CONFIGURATION mode.

  ```
  password-attributes {[min-length number] [character-restriction {[upper number]
  [lower number][numeric number] [special-char number]}}
  ```

  - `min-length number` — Enter the minimum number of required alphanumeric characters, from 6 to 32; default 9.
  - `character-restriction` — Enter a requirement for the alphanumeric characters in a password:
    - `upper number` — Minimum number of uppercase characters required, from 0 to 31; default 0.
    - `lower number` — Minimum number of lowercase characters required, from 0 to 31; default 0.
    - `numeric number` — Minimum number of numeric characters required, from 0 to 31; default 0.
    - `special-char number` — Minimum number of special characters required, from 0 to 31; default 0.

To turn off the strong password check enabled with the `password-attributes` command, use the `service simple-password` command. No password rules, except for the minimum 9-character requirement, are applied to the user name and privilege-level passwords. To revert to the configured `password-attributes` settings, use the `no service simple-password` command.

Create strong password rules

```
OS10(config)# password-attributes min-length 7 character-restriction upper 4 numeric 2
```

Display password rules

```
OS10# show running-configuration password-attributes
password-attributes min-length 7 character-restriction upper 4 numeric 2
```

Disable strong password check

```
OS10(config)# password-attributes min-length 7 character-restriction upper 4 numeric 2
OS10(config)# username admin2 password 4newhire4 role sysadmin
  %Error: Password fail:  it does not contain enough DIFFERENT characters
OS10(config)# enable password 0 4newhire4 priv-lvl 5
  %Error: Password it does not contain enough DIFFERENT characters.
OS10(config)# service simple-password
OS10(config)# username admin2 password 4newhire4 role sysadmin
OS10(config)# enable password 0 4newhire4 priv-lvl 5
```

Re-enable strong password check

```
OS10(config)# no service simple-password
```

Obscure passwords

To obscure passwords in `show` command output so that text characters do not display, use the `service obscure-password` command. The command obscures the passwords configured for user names, NTP, BGP, SNMP, RADIUS servers, and TACACS+ servers. To disable the obscure passwords function, use the `no service obscure-password` command.

- Enter the command in CONFIGURATION mode.

```
service obscure-password
```

Obscure OS10 passwords

```
OS10(config)# service obscure-password

OS10(config)# show running-configuration users
username admin password **** role sysadmin priv-lvl 15
username test1 password **** role sysadmin priv-lvl 15

OS10(config)# show running-configuration radius-server
radius-server host 10.2.2.2 key 9 ****

OS10(config)# show running-configuration tacacs-server
tacacs-server host 10.1.1.1 auth-port 7777 key 9 ****
```

Disable obscure passwords

```
OS10(config)# no service obscure-password

OS10(config)# show running-configuration users
username admin password $6$q9QBeYjZ$jfxzVqGhkxX3smxJSH9DDz7/3OJc6m5wjF8nnLD7/
VKx8SloIhp4NoGZs0I/UNwh8WVuxwfd9q4pWIgNs5BKH role sysadmin priv-lvl 15
username test1 password $6$rounds=656000$50vutEWA9w3ImvF.
$2pSDnaINYTKCQ6WAlJqeabiFQNRvUgui3.
6vR2e.L/D7DBwnV0QtY.KtOBTZAIDDT5.AFWxQHVgs2/V3jC3yG1 role sysadmin priv-lvl 15

OS10(config)# show running-configuration radius-server
radius-server host 10.2.2.2 key 9
3c0e479bd43bb5baf4ebb16e1317a845f01f832e25a03836c70bd26b9754d6a0

OS10(config)# show running-configuration tacacs-server
tacacs-server host 10.1.1.1 auth-port 7777 key 9
27ca79bf3cbf351708c8d19caf50815661dcd0638719a06c865e88090d03558b
```

Configuration notes

All Dell PowerSwitches:

- Obscure password (`service obscure-password`) is enabled by default when upgrading to 10.5.2.0 or later if the setting is not changed before the upgrade.
- If the Obscure password configuration is explicitly disabled before the upgrade, it remains disabled after the upgrade as well.

User management commands

disable

Lowers the privilege level.

Syntax	`disable` *`privilege-level`*
Parameters	• *`privilege-level`*—Enter the privilege level, from 0 to 15.
Defaults	1
Command Mode	Privileged EXEC
Usage Information	If you do not specify a privilege level, the system assigns level 1.
Example	`OS10# disable`
	`OS10# disable 6`

Supported Releases	10.4.3.0 or later

enable

Enables a specific privilege level.

Syntax	`enable` *`privilege-level`*
Parameters	• *`privilege-level`*—Enter the configured privilege level, from 0 to 15.
Defaults	15
Command Mode	Exec
Usage Information	Dell Technologies recommends configuring a password for privilege level 15 using the `enable password` command. If you do not configure a password for a level, you can switch to that level without entering a password, unless a password is configured for a highest intermediate level. If you configure a password for an intermediate level, enter that password when prompted. To access privilege level 15, you must configure the `enable password` command. If you do not configure a password for privilege level 15, you cannot enter level 15. For privilege levels 0 to 14, the `enable password` command is optional. Privilege levels inherit all permitted commands from all lower levels. For example, if you log in to privilege level 10 using the `enable 10` command, all commands that are assigned to privilege level 10 and lower are available for use.
Example	`OS10# enable` `OS10# enable 10`
Supported Releases	10.4.3.0 or later

enable password priv-lvl

Sets a password for a privilege level.

Syntax	`enable password` *`encryption-type password-string`* `priv-lvl` *`privilege-level`*

Parameters	• *`encryption-type`* — Enter the type of password encryption:
	  ○ `0` — Use an unencrypted password.
	  ○ `sha-256` — Use a SHA-256 encrypted password.
	  ○ `sha-512` — Use a SHA-512 encrypted password.
	• `priv-lvl` *`privilege-level`* — Enter a privilege number from 1 to 15.

Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	To increase the required password strength, create stronger password rules using the `password-attributes` command. The `no` version of this command removes a privilege-level password. **NOTE:** When you create or modify a password, the password string that you input appears as a string of asterisks instead of plain text.

Example

```
OS10(conf)# enable password 0 P@$$w0Rd priv-lvl 12
```

```
OS10(conf)# enable password sha-256 $5$2uThib1o$84p.tykjmz/
w7j26ymoKBjrb7uepkUB priv-lvl 12
```

```
OS10(conf)# enable password sha-512
$6$Yij02Phe2n6whp7b$ladskj0HowijIlkajg981 priv-lvl 12
```

```
OS10# enable 12
password:
OS10# show privilege
Current privilege level is 12.
```

Supported Releases 10.4.3.0 or later

password-attributes

Configures rules for password entries.

Syntax `password-attributes {[min-length number] [character-restriction {[upper number] [lower number] [numeric number] [special-char number]}}`

Parameters

- `min-length number` — (Optional) Sets the minimum number of required alphanumeric characters, from 6 to 32; default 9.
- `character-restriction`:
  - `upper number` — (Optional) Sets the minimum number of uppercase characters required, from 0 to 31; default 0.
  - `lower number` — (Optional) Sets the minimum number of lowercase characters required, from 0 to 31; default 0.
  - `numeric number` — (Optional) Sets the minimum number of numeric characters required, from 0 to 31; default 0.
  - `special-char number` — (Optional) Sets the minimum number of special characters required, from 0 to 31; default 0.

Default

- Minimum length: 9 characters
- Uppercase characters: 0
- Lowercase characters: 0
- Numeric characters: 0
- Special characters: 0

Command Mode EXEC

Usage Information By default, the password you configure with the `username password` command must be at least nine alphanumeric characters.

Use this command to increase password strength. When you enter the command, at least one parameter is required. When you enter the `character-restriction` parameter, at least one option is required.

To reset parameters to their default values, use the `no password-attributes` command.

Example

```
OS10(config)# password-attributes min-length 6 character-restriction
upper 2 lower 2 numeric 2
```

Supported Releases 10.4.0E(R1) or later

password-attributes max-retry lockout-period console-exempt

Configures a maximum number of consecutive failed login attempts, the lockout period, and console login exemption for the user ID.

Syntax

```
password-attributes {[max-retry number] [lockout-period minutes] [console-exempt]}
```

Parameters

- `max-retry number` — (Optional) Sets the maximum number of consecutive failed login attempts for a user before the user is locked out, from 0 to 16.
- `lockout-period minutes` — (Optional) Sets the amount of time that a user ID is prevented from accessing the system after exceeding the maximum number of failed login attempts, from 0 to 43,200.
- `console-exempt`—Applicable only if the user lockout feature is enabled. Enables the user to log in through the console, even though the user ID is blocked because of existing lockout.

Default

- Maximum number of retries: 3
- Lockout period: 5 minutes

Command Mode

CONFIGURATION

Usage Information

To remove the configured `max-retry` or `lockout-period` or `console-exempt` settings, use the `no password-attributes {max-retry | lockout-period | console-exempt}` command.

When a user is locked out due to exceeding the maximum number of failed login attempts, other users can still access the switch. If the `console-exempt` option is enabled, the locked out user can log in through the console, even though the user ID is locked out because of failed password attempts.

NOTE: Dell Technologies recommends that you configure the lockout period to be a nonzero value. If you set this value to zero, no lockout period is configured. Any number of failed login attempts do not lock out a user.

Example

```
OS10(config)# password-attributes max-retry 5 lockout-period 30 console-exempt
```

Supported Releases

10.4.1.0 or later

privilege

Creates a privilege level and associates commands with it.

Syntax

```
privilege mode priv-lvl privilege-level command-string
```

Parameters

- *mode* — Enter the privilege mode used to access CLI modes:
  - `exec` — Accesses EXEC mode.
  - `configure` — Accesses class-map, DHCP, logging, monitor, openflow, policy-map, QOS, support-assist, telemetry, CoS, Tmap, UFD, VLT, VN, VRF, WRED, and alias modes.
  - `interface` — Accesses Ethernet, fibre-channel, loopback, management, null, port-group, port channel, breakout, range, port-channel, and VLAN modes.
  - `route-map` — Accesses route-map mode.
  - `router` — Accesses router-bgp and router-ospf modes.
  - `line` — Accesses line-vty mode.
- `priv-lvl privilege-level` — Enter the number of a privilege level, from 2 to 14.
- *command-string* — Enter the commands supported at the privilege level.

Defaults

Not configured

Command Mode

CONFIGURATION

Usage Information

For users assigned to `sysadmin`, `netadmin`, and `secadmin` roles, you cannot configure a privilege level less than 2.

If a command that you associate with a privilege level has a space, enter the command in double quotes ("). If a command does not have a space or if it has keywords separated by a hyphen, double quotes are not required.

The `no` version of this command removes a command from a privilege level.

Example

```
OS10(config)# privilege exec priv-lvl 3 "configure terminal"
OS10(config)# privilege configure priv-lvl 3 "interface ethernet"
OS10(config)# privilege interface priv-lvl  "ip address"
OS10(config)# privilege configure priv-lvl 3 route-map
OS10(config)# privilege route-map priv-lvl 3 "set local-preference"
```

Supported Releases 10.4.3.0 or later

service simple-password

Disables the strong password check configured with `username password role` and `password-attributes` commands.

Syntax `service simple-password`

Parameters None

Default Not configured

Command Mode CONFIGURATION

Usage Information Use the `service simple-password` command to turn off the strong password checks so that you can configure passwords with no restrictions.

To revert to the configured stronger password settings, use the `no service simple-password` command.

Example

```
OS10(config)# service simple-password
```

Supported Releases 10.5.0 or later

service obscure-password

Obscures passwords in `show` command output.

Syntax `service obscure-password`

Parameters None

Default Enabled

Command Mode CONFIGURATION

Usage Information Use `service obscure-password` command so that the text characters of passwords are not displayed in `show` command output. The command obscures the passwords that you configure for user names, NTP, BGP, SNMP, RADIUS servers, and TACACS+ servers. To disable the obscure passwords function, use the `no service obscure-password` command.

Example

```
OS10(config)# service obscure-password
```

Supported Releases 10.5.0 or later

show users

Displays information for all users logged into OS10.

Syntax `show users`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Updated the command to display the privilege levels of all users on OS10 version .

Example

```
OS10# show users

Index Line   User  Role     Application Idle Login-Time            Location
Privilege
----- ------ ----- -----   ----------- ---- -----------            --------
---------
1     pts/0  admin sysadmin bash        >24h 2018-09-08 T06:51:37Z 10.14.1.91 [ssh] 15
2     pts/1  netad netadmin bash        >24h 2018-09-08 T06:54:33Z 10.14.1.91 [ssh] 10
```

Supported Releases 10.2.0E or later10.4.3.0 or later

show privilege

Displays your current privilege level.

Syntax `show privilege`

Parameters None

Defaults Not configured

Command Mode EXEC

Example

```
OS10# show privilege
Current privilege level is 15.
```

Supported Releases 10.4.3.0 or later

show running-configuration privilege

Displays the configured privilege levels of all users.

Syntax `show running-configuration privilege`

Parameters None

Defaults Not configured

Command Mode EXEC

Example

```
OS10# show running-configuration privilege
privilege exec priv-lvl 3 configure
privilege configure priv-lvl 4 "interface ethernet"
enable password sha-512 $6$Yij02Phe2n6whp7b$ladskj0HowijIlkajg981 priv-
lvl 12
```

Supported Releases 10.4.3.0 or later

system-user linuxadmin password

Configures a password for the `linuxadmin` user.

Syntax `system-user linuxadmin password {clear-text-password | hashed-password}`

Parameters None

Defaults Not configured

Command Mode CONFIGURATION

Usage Information Use this command to set a clear-text or hashed-password for the `linuxadmin` user.

NOTE: When you create or modify a password, the password string that you input appears as a string of asterisks instead of plain text.

Example

```
OS10(config)# system-user linuxadmin password Dell@Force10!@

OS10(config)# system-user linuxadmin password
$6$3M55wOYy$Sw1V9Ok3GE4Hmf6h1ARH.dBHy9gpEFYUvdu15ZpnCYzt.nJjFm0VIz/
rQvvJeX6krRtfYs2ZqBl6TkmLGAwtM
```

Supported Releases 10.4.3.0 or later

system-user linuxadmin disable

Disables the `linuxadmin` user.

Syntax `[no] system-user linuxadmin disable`

Parameters None

Defaults Enabled

Command Mode CONFIGURATION

Usage Information Use this command to disable and lock the `linuxadmin` user. The no version of the command enables and unlocks the `linuxadmin` user.

Example

```
OS10(config)# system-user linuxadmin disable

OS10(config)# no system-user linuxadmin disable
```

Supported Releases 10.4.3.0 or later

userrole inherit

Reconfigures the default `netoperator` role and permissions that OS10 assigns by default to a RADIUS or TACACS+-authenticated user with an unknown user role or privilege level. You can also configure an unknown RADIUS or TACACS+ user role to inherit permissions from an existing OS10 role.

Syntax `userrole {default | name} inherit existing-role-name`

Parameters

- `default inherit` — Reconfigure the default permissions assigned to an authenticated user with a missing or unknown role or privilege level.
- *`name`* `inherit` — Enter the name of the RADIUS or TACACS+ user role that inherits permissions from an OS10 user role; 32 characters maximum.
- *`existing-role-name`* — Assign the permissions associated with an OS10 user role:
  - `sysadmin` — Full access to all commands in the system, exclusive access to commands that manipulate the file system, and access to the system shell. A system administrator can create user IDs and user roles.

- secadmin — Full access to configuration commands that set security policy and system access, such as password strength, AAA authorization, and cryptographic keys. A security administrator can display security information, such as cryptographic keys, login statistics, and log information.
- netadmin — Full access to configuration commands that manage traffic flowing through the switch, such as routes, interfaces, and ACLs. A network administrator cannot access configuration commands for security features or view security information.
- netoperator — Access to EXEC mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch.

Default OS10 assigns the netoperator role to a user authenticated by a RADIUS or TACACS+ server with a missing or unknown role or privilege level.

Command Mode CONFIGURATION

Usage Information When a RADIUS or TACACS+ server authenticates a user and does not return a role or privilege level, or returns an unknown role or privilege level, OS10 assigns the netoperator role to the user by default. Use this command to reconfigure the default netoperator permissions.

To assign OS10 user role permissions to an unknown user role, enter the RADIUS or TACACS+ *name* with the inherit *existing-role-name* value. The no version of the command resets the role to netoperator.

Example

```
OS10(config)# userrole default inherit sysadmin
```

Supported Releases 10.4.0E(R3P3) or later

username password role

Creates an authentication entry based on a user name and password, and assigns a role to the user.

Syntax username *username* password *password* role *role* [priv-lvl *privilege-level*]

Parameters

- username *username*—Enter a text string. A maximum of 32 alphanumeric characters; one character minimum.

  NOTE: While creating a user account using the username password role command, the username attribute must adhere to the following regular expression: ^[a-z_][a-z0-9_-]*[$]?$
- password *password*—Enter a text string. A maximum of 32 alphanumeric characters; nine characters minimum. Password prefixes 1, 5, and6 are not supported in clear-text passwords.
- role *role*—Enter a user role:
  - sysadmin — Full access to all commands in the system, exclusive access to commands that manipulate the file system, and access to the system shell. A system administrator can create user IDs and user roles.
  - secadmin — Full access to configuration commands that set security policy and system access, such as password strength, AAA authorization, and cryptographic keys. A security administrator can display security information, such as cryptographic keys, login statistics, and log information.
  - netadmin — Full access to configuration commands that manage traffic flowing through the switch, such as routes, interfaces, and ACLs. A network administrator cannot access configuration commands for security features or view security information.
  - netoperator — Access to EXEC mode to view the current configuration with limited access. A network operator cannot modify any configuration setting on a switch.
- priv-lvl *privilege-level* — Enter a privilege level, from 0 to 15. If you do not specify the priv-lvl option, the system assigns privilege level 1 for the netoperator role and privilege level 15 for the sysadmin, secadmin, and netadmin roles.

Default

- User name and password entries are in clear text.
- There is no default user role.
- The default privilege levels are level 1 for netoperator, and level 15 for sysadmin, secadmin, and netadmin.

Command Mode CONFIGURATION

Usage Information

By default, the password must be at least nine alphanumeric characters. Only the following special characters are supported:

```
! # % & ' ( ) ; < = > [ ] * + - . / : ^ _
```

Enter the password in clear text. It is converted to SHA-512 format in the running configuration. For backward compatibility with OS10 releases 10.3.1E and earlier, passwords entered in MD-5, SHA-256, and SHA-512 format are supported.

NOTE: When you create or modify a password, the password string that you input appears as a string of asterisks instead of plain text.

You cannot assign a privilege level higher than privilege level 1 to a user with the `netoperator` role and higher than privilege level 2 for a `sysadmin`, `secadmin`, and `netadmin` roles.

To increase the required password strength, use the `password-attributes` command. The `no` version of this command deletes the authentication for a user.

Example

```
OS10(config)# username user05 password newpwd404 role sysadmin priv-lvl
10
```

Supported Releases

10.2.0E or later

AAA

Authentication, authorization, and accounting (AAA) services secure networks against unauthorized access. In addition to local authentication, OS10 supports remote authentication dial-in user service (RADIUS) and terminal access controller access control system (TACACS+) client/server authentication systems. For RADIUS and TACACS+, an OS10 switch acts as a client and sends authentication requests to a server that contains all user authentication and network service access information.

A RADIUS or TACACS+ server provides: authentication of user credentials, authorization using role-based permissions, and accounting services. You can configure the security protocol used for different login methods and users. RADIUS provides limited authorization and accounting services compared to TACACS+. If you use a RADIUS or TACACS+ security server, configure the required security parameters on the server by following the procedures in the server documentation.

AAA configuration

On the switch, AAA configuration consists of setting up access control and accounting services:

1. Configure the authentication methods used to allow access to the switch.
2. Configure the level of command authorization for authenticated users.
3. Configure security settings for user sessions.
4. Enable AAA accounting.

AAA authentication

An OS10 switch uses a list of authentication methods to define the types of authentication and the sequence in which they apply. By default, OS10 uses only the `local` authentication method.

The authentication methods in the method list execute in the order you configure them. Re-enter the methods to change the order. The `local` authentication method remains enabled even if you remove all configured methods in the list using the `no aaa authentication login {console | default}` command.

- Configure the AAA authentication method in CONFIGURATION mode.

  ```
  aaa authentication login {console | default} {local | group radius | group tacacs+}
  ```

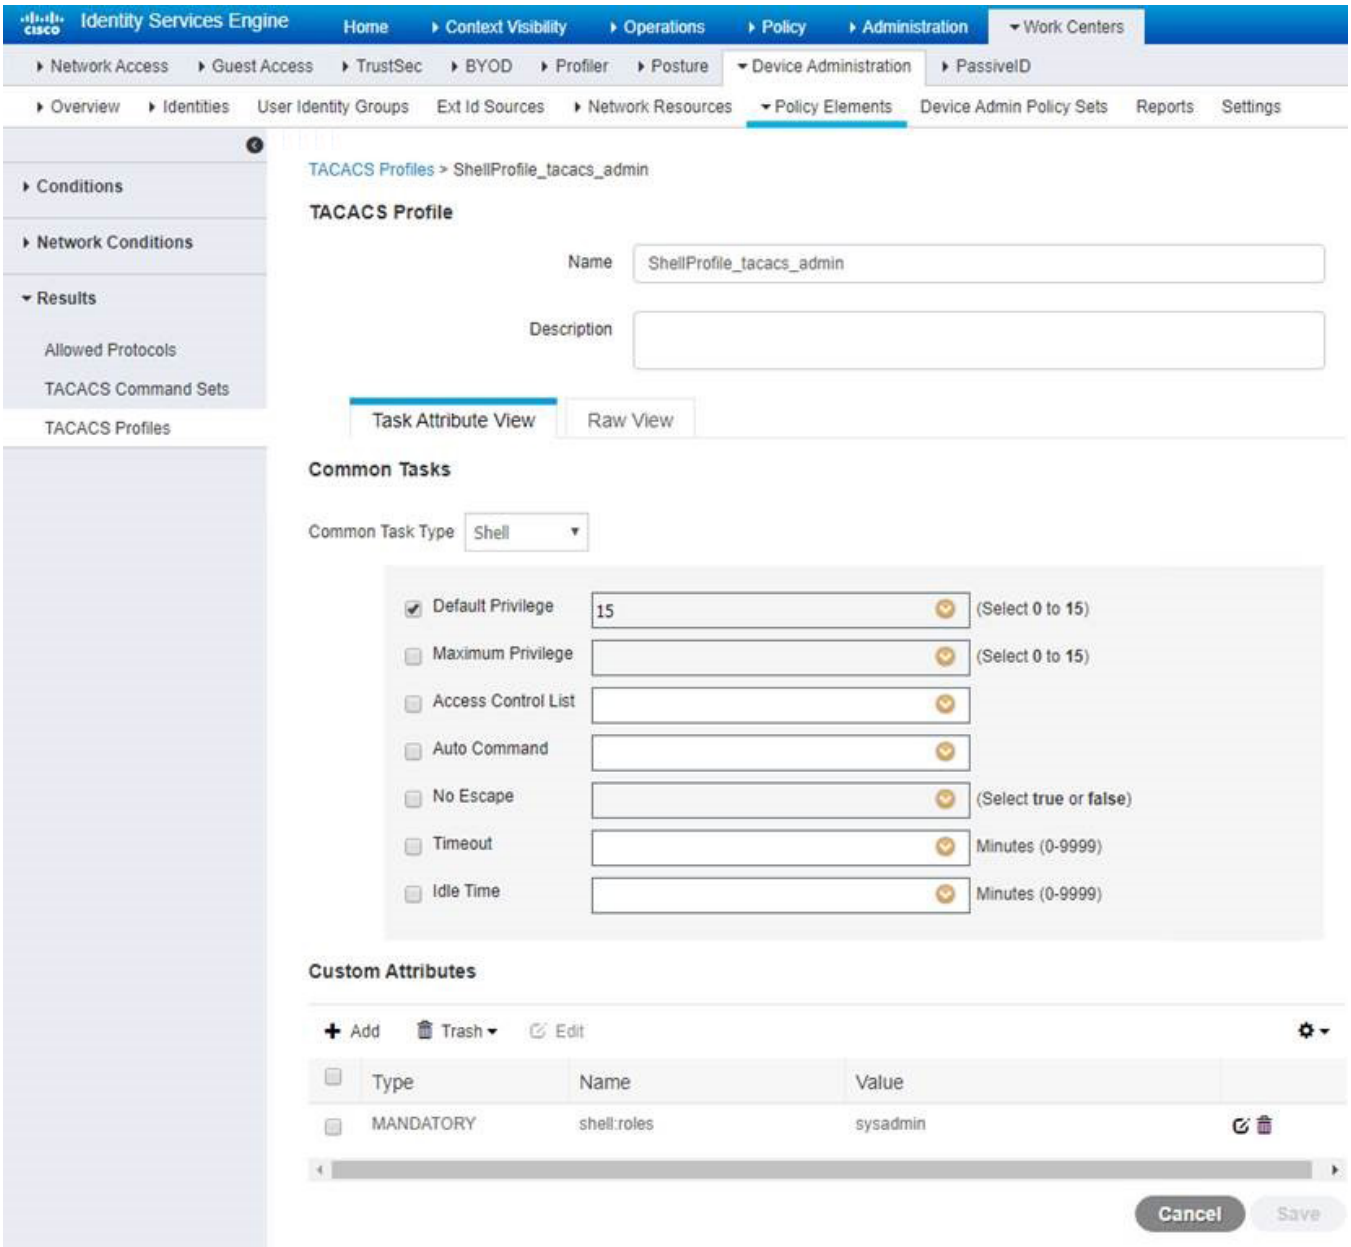
  - `console`—Configure authentication methods for console logins.
  - `default`—Configure authentication methods for nonconsole such as SSH and Telnet logins.
  - `local`—Use the local username, password, and role entries configured with the `username password role` command.
  - `group radius`—Configure RADIUS servers using the `radius-server host` command.

- `group tacacs+`—Configure TACACS+ servers using the `tacacs-server host` command.

Configure user role on server

If a console user logs in with RADIUS or TACACS+ authentication, the role you configured for the user on the RADIUS or TACACS+ server applies. User authentication fails if no role is configured on the authentication server.

To authenticate a user on OS10 through a TACACS+ server, configure the mandatory role with a value. This example uses Cisco ISE as the AAA server and the TACACS server configuration is shown in the following figure. This example uses the `sysadmin` role along with the corresponding privilege level `15` on the TACACS+ Server.



NOTE: OS10 supports only the VSA to assign user roles. Other VSAs are not supported.

Also, you must configure the user role on the RADIUS or TACACS+ server using the vendor-specific attribute (VSA) or the authentication fails. The vendor ID of Dell Technologies is 674. Create a VSA with `Name = Dell-group-name, OID = 2, Type = string`. Valid values for *Dell-group-name* are:

Table 93. OS10 user roles and privilege levels

User role	Default privilege level
`sysadmin`	15
`secadmin`	15

Table 93. OS10 user roles and privilege levels (continued)

User role	Default privilege level
netadmin	15
netoperator	1

Use the VSA *Dell-group-name* values when you create users on a Radius or TACACS+ server.

For more information about privilege levels, see Privilege levels.

For detailed information about how to configure vendor-specific attributes on a RADIUS or TACACS+ server, see the respective RADIUS or TACACS+ server documentation.

Configure AAA authentication

```
OS10(config)# aaa authentication login default group radius local
OS10(config)# do show running-configuration aaa
aaa authentication login default group radius local
aaa authentication login console local
```

Remove AAA authentication methods

```
OS10(config)# no aaa authentication login default
OS10(config)# do show running-configuration aaa
aaa authentication login default local
aaa authentication login console local
```

User re-authentication

To prevent users from accessing resources and performing tasks that they are not authorized to perform, OS10 requires users to re-authenticate by logging in again when:

- Adding or removing a RADIUS server using the `radius-server host` command
- Adding or removing an authentication method using the `aaa authentication login {console | default} {local | group radius | group tacacs+}` command

By default, user re-authentication is disabled. You can enable this feature so that user re-authentication is required when any of these actions are performed. In these cases, logged-in users are logged out of the switch and all OS10 sessions terminate.

Enable user re-authentication

- Enable user re-authentication in CONFIGURATION mode.

```
aaa re-authenticate enable
```

The `no` version of this command disables user re-authentication.

AAA with RADIUS authentication

To configure a RADIUS server for authentication, enter the server IP address or hostname, and the key that is used to authenticate the OS10 switch on a RADIUS host. You can enter the authentication key in plain text or encrypted format. You can change the User Datagram Protocol (UDP) port number on the server.

- Configure a RADIUS authentication server in CONFIGURATION mode. By default, a RADIUS server uses UDP port 1812.

```
radius-server host {hostname | ip-address}  key {0 authentication-key | 9
authentication-key | authentication-key} [auth-port port-number]
```

To configure more than one RADIUS server, re-enter the `radius-server host` command multiple times. If you configure multiple RADIUS servers, OS10 attempts to connect in the order you configured them. An OS10 switch connects with the configured RADIUS servers one at a time, until a RADIUS server responds with an accept or reject response. The switch tries to connect with a server for the configured number of retransmit retries and timeout period.

Configure global settings for the timeout and retransmit attempts that are allowed on RADIUS servers. By default, OS10 supports three RADIUS authentication attempts and times out after five seconds. No source interface is configured. The default VRF instance is used to contact RADIUS servers.

NOTE: You cannot configure both a nondefault VRF instance (including management VRF) and a source interface at the same time for RADIUS authentication.

NOTE: A RADIUS server that is configured with a hostname is not supported on a nondefault VRF.

- Configure the number of times OS10 retransmits a RADIUS authentication request in CONFIGURATION mode, from 0 to 100 retries; the default is 3.

```
radius-server retransmit retries
```

- Configure the timeout period used to wait for an authentication response from a RADIUS server in CONFIGURATION mode, from 0 to 1000 seconds; the default is 5.

```
radius-server timeout seconds
```

- (Optional) Specify an interface whose IP address is used as the source IP address for user authentication with RADIUS servers in CONFIGURATION mode. By default, no source interface is configured. OS10 selects the source IP address of any interface from which a packet is sent to a RADIUS server.

  An interface may have two IPv4 addresses and multiple IPv6 addresses. The selected OS10 source interface matches the version of the RADIUS server IP address: IPv4 or IPv6.
  - For an IPv4 RADIUS server, the primary IPv4 address is used.
  - For an IPv6 server, any of the global IPv6 addresses that are configured on the interface are used.
  - If no address of the same IP version as the RADIUS server is configured, RADIUS authentication is performed with no source interface, using the IP address of the management interface. The management IP address serves as the RADIUS network access server (NAS) IP address on the switch.

```
ip radius source-interface interface
```

  On the RADIUS server, you must update the configured IP routes using the Linux command line so that the source interface routes match the NAS IP route.

  If OS10 uses a RADIUS server VRF instance, a RADIUS server source interface is not supported and cannot be configured.

- (Optional) When you use management VRF for RADIUS authentication, configure the IP address of the network access server (NAS) using the radius-server nas-ip-address command.

```
radius-server nas-ip-address ipv4-address
```

- (Optional) By default, the switch uses the default VRF instance to communicate with RADIUS servers. You can optionally configure a nondefault or the management VRF instance for RADIUS authentication in CONFIGURATION mode.

```
radius-server vrf management
radius-server vrf vrf-name
```

NOTE: Before a RADIUS request is sent from Dell SmartFabric OS10, a DNS query is sent to resolve the name or IP address of the RADIUS server. So, when the IP name-servers are configured and these name-servers are unreachable, it may result in SSH time-out. In this case, it is better to increase the IP SSH login-grace-time.

Configure RADIUS server

```
OS10(config)# radius-server host 1.2.4.5 key secret1
OS10(config)# radius-server retransmit 10
OS10(config)# radius-server timeout 10
OS10(config)# ip radius source-interface mgmt 1/1/1
```

Configure RADIUS server for non-default VRFs

```
OS10(config)# ip vrf blue
OS10(conf-vrf)# exit
OS10(config)# radius-server vrf blue
```

Configure RADIUS server for management VRF

```
OS10(config)# ip vrf management
OS10(conf-vrf)# exit
OS10(config)# radius-server nas-ip-address 10.5.1.1
```

View RADIUS server configuration

```
OS10# show running-configuration
...
radius-server host 1.2.4.5 key 9
3a95c26b2a5b96a6b80036839f296babe03560f4b0b7220d6454b3e71bdfc59b
radius-server retransmit 10
radius-server timeout 10
ip radius source-interface mgmt 1/1/1
...
```

Delete RADIUS server

```
OS10# no radius-server host 1.2.4.5
```

RADIUS over TLS authentication

Traditional RADIUS-based user authentication runs over UDP and uses the MD5 message-digest algorithm for secure communications. To provide enhanced security in RADIUS user authentication exchanges, RFC 6614 defines the RADIUS over Transport Layer Security (TLS) protocol. RADIUS over TLS secures the entire authentication exchange in a TLS connection and provides additional security by:

- Performing mutual authentication of a client and server using public key infrastructure (PKI) certificates
- Encrypting the entire authentication exchange so that neither the user ID nor password is vulnerable to discovery

RADIUS over TLS authentication requires that X.509v3 PKI certificates are configured on a certification authority (CA) and installed on the switch. For more information, including a complete RADIUS over TLS use case, see X.509v3 certificates.

NOTE: If you enable FIPS using the `crypto fips enable` command, RADIUS over TLS operates in FIPS mode. In FIPS mode, RADIUS over TLS requires that a FIPS-compliant certificate and key pair are installed on the switch. In non-FIPS mode, RADIUS over TLS requires that a certificate is installed as a non-FIPS certificate. For information about how to install FIPS-compliant and non-FIPS certificates, see Request and install host certificates.

To configure RADIUS over TLS user authentication, use the `radius-server host tls` command. Enter the server IP address or host name, and the shared secret key used to authenticate the OS10 switch on a RADIUS host. You must enter the name of an X.509v3 security profile to use with RADIUS over TLS authentication — see Security profiles. You can enter the authentication key in plain text or encrypted format. By default, RADIUS over TLS connections use TCP port 2083, and require that the authentication key is `radsec`. You can change the TCP port number on the server.

- Configure a RADIUS over TLS authentication on a RADIUS server in CONFIGURATION mode.

```
radius-server host {hostname | ip-address} tls security-profile profile-name
[auth-port port-number] key {0 authentication-key | 9 authentication-key |
authentication-key}
```

To configure more than one RADIUS server for RADIUS over TLS authentication, re-enter the `radius-server host tls` command multiple times. If you configure multiple RADIUS servers, OS10 attempts to connect in the order you configured them. An OS10 switch connects with the configured RADIUS servers one at a time, until a RADIUS server responds with an accept or reject response. The switch tries to connect with a server for the configured number of retransmit retries and timeout period.

A security profile determines the X.509v3 certificate on the switch to use for TLS authentication with a RADIUS server. To configure a security profile for an OS10 application, see Security profiles.

Configure global settings for the timeout and retransmit attempts allowed on RADIUS servers as described in RADIUS authentication.

Configure RADIUS over TLS authentication server

```
OS10(config)# radius-server host 1.2.4.5 tls security-profile radius-prof key radsec
OS10(config)# radius-server retransmit 10
OS10(config)# radius-server timeout 10
```

AAA with TACACS+ authentication

Configure a TACACS+ authentication server by entering the server IP address or host name. You must also enter a text string for the key used to authenticate the OS10 switch on a TACACS+ host. The Transmission Control Protocol (TCP) port entry is optional.

TACACS+ provides greater data security by encrypting the entire protocol portion in a packet sent from the switch to an authentication server. RADIUS encrypts only passwords.

- Configure a TACACS+ authentication server in CONFIGURATION mode. By default, a TACACS+ server uses TCP port 49 for authentication.

  ```
  tacacs-server host {hostname | ip-address}  key {0 authentication-key | 9
  authentication-key | authentication-key} [auth-port port-number]
  ```

  Re-enter the `tacacs-server host` command multiple times to configure more than one TACACS+ server. If you configure multiple TACACS+ servers, OS10 attempts to connect in the order you configured them. An OS10 switch connects with the configured TACACS+ servers one at a time, until a TACACS+ server responds with an accept or reject response.

Configure a global timeout setting allowed on TACACS+ servers. By default, OS10 times out after five seconds. No source interface is configured. The default VRF instance is used to contact TACACS+ servers.

NOTE: You cannot configure both a nondefault VRF instance and a source interface at the same time for TACACS+ authentication.

NOTE: A TACACS+ server configured with a host name is not supported on a nondefault VRF.

- Configure the global timeout used to wait for an authentication response from TACACS+ servers in CONFIGURATION mode, from 1 to 1000 seconds; the default is 5.

  ```
  tacacs-server timeout seconds
  ```

- (Optional) Specify an interface whose IP address is used as the source IP address for user authentication with a TACACS+ server in CONFIGURATION mode. By default, no source interface is configured. OS10 selects the source IP address of any interface from which a packet is sent to a TACACS+ server.

  NOTE: If you configure a source interface which has no IP address, the IP address of the management interface is used.

  ```
  ip tacacs source-interface interface
  ```

- (Optional) By default, the switch uses the default VRF instance to communicate with TACACS+ servers. You can optionally configure a non-default or the management VRF instance for TACACS+ authentication in CONFIGURATION mode.

  ```
  tacacs-server vrf management
  tacacs-server vrf vrf-name
  ```

Configure TACACS+ server

```
OS10(config)# tacacs-server host 1.2.4.5 key mysecret
OS10(config)# ip tacacs source-interface loopback 2
```

Configure TACACS+ server for non-default VRFs

```
OS10(config)# ip vrf blue
OS10(conf-vrf)# exit
OS10(config)# tacacs-server vrf blue
```

View TACACS+ server configuration

```
OS10# show running-configuration
...
tacacs-server host 1.2.4.5 key 9
3a95c26b2a5b96a6b80036839f296babe03560f4b0b7220d6454b3e71bdfc59b
ip tacacs source-interface loopback 2
...
```

Delete TACACS+ server

```
OS10# no tacacs-server host 1.2.4.5
```

TACACS as Primary Authentication

The AAA authentication configuration must be present as one of the authentication methods. The following error message is displayed when you atempt to configure AAA authentication without first configuring the local authentication method:

```
% Error: local authentication not configured
```

After upgrading to 10.5.1 from an earlier release, there is no change in the AAA authentication configuration when this configuration has the local authentication method configured.

Configure authorization

AAA command authorization controls user access to a set of commands assigned to users and is performed after user authentication. When enabled, AAA authorization checks a remote authorization server for each command that a user enters on the switch. If the commands that are entered by the user are configured in the remote server for that user, the remote server authorizes the usage of the command.

By default, the role you configure with the `username password role` command sets the level of CLI commands that a user can access.

An OS10 switch uses a list of authorization methods and the sequence in which they apply to determine the level of command authorization granted to a user. You can configure authorization methods with the `aaa authorization` command. You can also configure TACACS+ server-based authorization. By default, OS10 uses only the `local` authorization method.

The authorization methods in the method list execute in the order you configure them. Re-enter the methods to change the order. The `local` authorization method remains enabled even if you remove all configured methods in the list using the `no aaa authorization` command.

- Enable authorization and configure the authorization methods for CLI access in CONFIGURATION mode. Re-enter the command to configure additional authorization methods and CLI access.

  NOTE: OS10 does not support the `local group tacacs+` order of authorization methods, which is supported in OS9. The OS10 command syntax is as follows:

  ```
  aaa authorization {commands | config-commands | exec-commands} {role user-role}
  {console | default} {[group tacacs+] [local]}
  ```

  - `commands`—Configure authorization for all CLI commands, including all EXEC and configuration commands.
  - `config-commands`—Configure authorization only for configuration commands.
  - `exec-commands`—Configure authorization only for EXEC commands.
  - `role` *`user-role`*—Configure command authorization for a user role: `sysadmin`, `secadmin`, `netadmin`, or `netoperator`.
  - `console`—Configure authorization for console-entered commands.
  - `default`—Configure authorization for non-console-entered commands and commands entered in non-console sessions, such as in SSH and VTY.
  - `group tacacs+`—Use the TACACS+ servers configured with the `tacacs-server host` command for command authorization.
  - `local`—Use the local username, password, and role entries configured with the `username password role` command for command authorization.

NOTE: Custom user roles are supported, but the custom privilege levels are not supported. The default privilege level based on the user role is assigned.

For detailed information about how to configure vendor-specific attributes on a security server, see the respective RADIUS or TACACS+ server documentation.

Examples: AAA authorization

- All commands entered from a console session with the `sysadmin` user role are authorized using configured TACACS+ servers first, and local user credentials next, if TACACS+ servers are not reachable or configured.

```
OS10(config)# aaa authorization commands role sysadmin console group tacacs+ local
```

- All configuration commands entered from a non-console session with the `sysadmin` user role are authorized using the configured TACACS+ servers.

```
OS10(config)# aaa authorization config-commands role sysadmin default group tacacs+
```

Remove AAA authorization methods

```
OS10(config)# no aaa authorization commands role sysadmin console
```

Enable AAA accounting

To record information about all user-entered commands, use the AAA accounting feature — not supported for RADIUS accounting. AAA accounting records login and command information in OS10 sessions on console connections using the `console` option and remote connections using the `default` option, such as Telnet and SSH.

AAA accounting sends accounting messages:

- Sends a start notice when a process begins, and a stop notice when the process ends using the `start-stop` option
- Sends only a stop notice when a process ends using the `stop-only` option
- No accounting notices are sent using the `none` option
- Logs all accounting notices in syslog using the `logging` option
- Logs all accounting notices on configured TACACS+ servers using the `group tacacs+` option

Enable AAA accounting

- Enable AAA accounting in CONFIGURATION mode.

```
aaa accounting commands all {console | default} {start-stop | stop-only | none}
[logging] [group tacacs+]
```

The `no` version of this command disables AAA accounting.

Example

The following example enables AAA accounting for all commands on the console. And also enables the system to send a start notice when a process begins, and a stop notice when the process ends to the console and a TACACS+ server.

```
OS10(config)# aaa accounting commands all console start-stop logging group tacacs+
```

AAA commands

aaa accounting

Enables AAA accounting.

Syntax `aaa accounting exec commands all {console | default} {start-stop | stop-only | none} [logging] [group tacacs+]`

Parameters

- `exec` — Record user authentication events.
- `commands all` — Record all user-entered commands. RADIUS accounting does not support this option.
- `console` — Record all user authentication and logins or all user-entered commands in OS10 sessions on console connections.
- `default` — Record all user authentication and logins or all user-entered commands in OS10 sessions on remote connections; for example, Telnet and SSH.
- `start-stop` — Send a start notice when a process begins, and a stop notice when the process ends.

- `stop-only` — Send only a stop notice when a process ends.
- `none` — No accounting notices are sent.
- `logging` — Logs all accounting notices in syslog.
- `group tacacs+` — Logs all accounting notices on the first reachable TACACS+ server.

Default AAA accounting is disabled.

Command Mode CONFIGURATION

Usage Information You can enable the recording of accounting events in both the syslog and on TACACS+ servers.

The `no` version of the command disables AAA accounting.

Example

```
OS10(config)# aaa accounting commands all console start-stop logging
group tacacs+
```

Supported Releases 10.4.1.0 or later

aaa authentication login

Configures the AAA authentication method for console, SSH, and Telnet logins.

Syntax `aaa authentication login {console | default} {local | group radius | group tacacs+}`

Parameters

- `console`—Configure authentication methods for console logins.
- `default`—Configure authentication methods for SSH and Telnet logins.
- `local`—Use the local username, password, and role entries configured with the `username password role` command.
- `group radius`—Use the RADIUS servers configured with the `radius-server host` command.
- `group tacacs+`—Use the TACACS+ servers configured with the `tacacs-server host` command.

Default Local authentication

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes all configured authentication methods and defaults to using local authentication.

Example

```
OS10(config)# aaa authentication login default group radius local
OS10(config)# do show running-configuration aaa
aaa authentication login default group radius local
aaa authentication login console local
```

```
OS10(config)# no aaa authentication login default
OS10(config)# do show running-configuration aaa
aaa authentication login default local
aaa authentication login console local
```

Supported Releases 10.4.1.0 or later

aaa authorization

Enables authorization and configure the authorization methods for CLI access.

Syntax `aaa authorization {commands | config-commands | exec-commands} {role` *`user-role`*`} {console | default} {[group tacacs+] [local]}`

Parameters

- `commands`—Configure authorization for all CLI commands, including all EXEC and configuration commands.

- `config-commands`—Configure authorization only for configuration commands.
- `exec-commands`—Configure authorization only for EXEC commands.
- `role` *`user-role`*—Configure command authorization for a user role: `sysadmin`, `secadmin`, `netadmin`, or `netoperator`.
- `console`—Configure authorization for console-entered commands.
- `default`—Configure authorization for non-console-entered commands and commands entered in non-console sessions, such as in SSH and VTY.
- `group tacacs+`—Use the TACACS+ servers configured with the `tacacs-server host` command for command authorization.
- `local`—Use the local username, password, and role entries configured with the `username password role` command for command authorization.

Default Local authorization

Command Mode CONFIGURATION

Usage Information Re-enter the command to configure additional authorization methods and CLI access. The authorization methods in the method list execute in the order you configure them. Re-enter the methods to change the order. The `local` authorization method remains enabled even if you remove all configured methods in the list using the `no aaa authorization` command.

If a console user logs in with TACACS+ authorization, the role you configured for the user on the TACACS+ server applies. If no role is configured on the security server, user authorization fails.

Example

```
OS10(config)# aaa authorization commands role sysadmin console group
tacacs+ local
```

```
OS10(config)# aaa authorization config-commands role sysadmin default
group tacacs+
```

```
OS10(config)# no aaa authorization commands role sysadmin console
```

Supported Releases 10.5.1 or later

aaa re-authenticate enable

Requires user re-authentication after a change in the authentication method or server.

Syntax `aaa re-authenticate enable`

Parameters None

Default Disabled

Command Mode EXEC

Usage Information After you enable user re-authentication and change the authentication method or server, users are logged out of the switch and prompted to log in again to re-authenticate. User re-authentication is triggered by:

- Adding or removing a RADIUS server as a configured server host with the `radius-server host` command.
- Adding or removing an authentication method with the `aaa authentication [local | radius]` command.

The `no` version of the command disables user re-authentication.

Example

```
OS10(config)# aaa re-authenticate enable
```

Supported Releases 10.4.0E(R1) or later

tacacs-server host

Configures a TACACS+ server and the key used to authenticate the switch on the server.

Syntax

```
tacacs-server host {hostname | ip-address} key {0 authentication-key | 9
authentication-key | authentication-key} [auth-port port-number]
```

Parameters

- *hostname* — Enter the host name of the TACACS+ server.
- *ip-address* — Enter the IPv4 (A.B.C.D) or IPv6 (x:x:x:x::x) address of the TACACS+ server.
- `key 0 authentication-key` — Enter an authentication key in plain text. A maximum of 42 characters.
- `key 9 authentication-key` — Enter an authentication key in encrypted format with a maximum of 128 characters.
- *authentication-key* — Enter an authentication in plain text with a maximum of 42 characters. It is not necessary to enter `0` before the key.
- `key authentication-key` — Enter a text string for the encryption key used to authenticate the switch on the TACACS+ server. A maximum of 42 characters.

Default Not configured

Command Mode CONFIGURATION

Usage Information The authentication key must match the key configured on the TACACS+ server. You cannot enter spaces in the key. The `show running-configuration` output displays both unencrypted and encrypted keys in encrypted format. Configure the global timeout allowed for authentication requests on TACACS+ servers using the `tacacs-server timeout` command. By default, OS10 times out an authentication attempt on a TACACS+ server after five seconds. The `no` version of this command removes a TACACS+ server configuration.

Example

```
OS10(config)# tacacs-server host 1.5.6.4 key secret1
```

Supported Releases 10.4.0E(R2) or later

tacacs-server timeout

Configures the global timeout used for authentication attempts on TACACS+ servers.

Syntax

```
tacacs-server timeout seconds
```

Parameters *seconds* — Enter the timeout period used to wait for an authentication response from a TACACS+ server, from 1 to 1000 seconds.

Default 5 seconds

Command Mode CONFIGURATION

Usage Information The `no` version of this command resets the TACACS+ server timeout to the default.

Example

```
OS10(config)# tacacs-server timeout 360
```

Supported Releases 10.4.0E(R2) or later

radius-server host

Configures a RADIUS server and the key used to authenticate the switch on the server.

Syntax

```
radius-server host {hostname | ip-address} key {0 authentication-key | 9
authentication-key | authentication-key} [auth-port port-number]
```

Parameters

- *hostname* — Enter the host name of the RADIUS server.

- *ip-address* — Enter the IPv4 (A.B.C.D) or IPv6 (x:x:x:x::x) address of the RADIUS server.
- key 0 *authentication-key* — Enter an authentication key in plain text. A maximum of 42 characters.
- key 9 *authentication-key* — Enter an authentication key in encrypted format. A maximum of 128 characters.
- *authentication-key* — Enter an authentication in plain text. A maximum of 42 characters. It is not necessary to enter 0 before the key.
- auth-port *port-number* — (Optional) Enter the UDP port number used on the server for authentication, from 1 to 65535, default 1812.

Default Not configured

Command Mode CONFIGURATION

Usage Information The authentication key must match the key configured on the RADIUS server. You cannot enter spaces in the key. The show running-configuration output displays both unencrypted and encrypted keys in encrypted format. Configure global settings for the timeout and retransmit attempts allowed on RADIUS servers using the radius-server retransmit and radius-server timeout commands. The no version of this command removes a RADIUS server configuration.

Example

```
OS10(config)# radius-server host 1.5.6.4 key secret1
```

Supported Releases 10.2.0E or later

radius-server host tls

Configures a RADIUS server for RADIUS over TLS user authentication and secure communication. For RADIUS over TLS authentication, the radsec shared key and a security profile that uses an X.509v3 certificate are required.

Syntax

```
radius-server host {hostname | ip-address} tls security-profile profile-name [auth-port tcp-port-number] key {0 authentication-key | 9 authentication-key | authentication-key}
```

Parameters

- *hostname* — Enter the host name of the RADIUS server.
- *ip-address* — Enter the IPv4 (A.B.C.D) or IPv6 (x:x:x:x::x) address of the RADIUS server.
- tls — Enter tls to secure RADIUS server communication using the TLS protocol.
- security-profile *profile-name* — Enter the name of an X.509v3 security profile to use with RADIUS over TLS authentication. To configure a security profile for an OS10 application, see Security profiles.
- auth-port *tcp-port-number* — (Optional) Enter the TCP port number that the server uses for authentication. The range is from 1 to 65535. The default is 2083.
- key 0 *authentication-key* — Enter the radsec shared key in plain text.
- key 9 *authentication-key* — Enter the radsec shared key in encrypted format.
- *authentication-key* — Enter the radsec shared key in plain text. It is not necessary to enter 0 before the key.

Default TCP port 2083 on a RADIUS server for RADIUS over TLS communication

Command Mode CONFIGURATION

Usage Information For RADIUS over TLS authentication, configure the radsec shared key on the server and OS10 switch. The show running-configuration output displays both the unencrypted and encrypted key in encrypted format. Configure global settings for the timeout and retransmit attempts allowed on a RADIUS over TLS servers using the radius-server retransmit and radius-server timeout commands.

RADIUS over TLS authentication requires that X.509v3 PKI certificates are configured on a certification authority and installed on the switch. For more information, including a complete RADIUS over TLS example, see X.509v3 certificates.

The no version of this command removes a RADIUS server from RADIUS over TLS communication.

Example

```
OS10(config)# radius-server host 1.5.6.4 tls security-profile radius-
admin key radsec
```

Supported Releases 10.4.3.0 or later

radius-server retransmit

Configures the number of authentication attempts allowed on RADIUS servers.

Syntax `radius-server retransmit retries`

Parameters *retries* — Enter the number of retry attempts, from 0 to 10.

Default An OS10 switch retransmits a RADIUS authentication request three times.

Command Mode CONFIGURATION

Usage Information Use this command to globally configure the number of retransmit attempts allowed for authentication requests on RADIUS servers. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# radius-server retransmit 5
```

Supported Releases 10.2.0E or later

radius-server timeout

Configures the timeout used to resend RADIUS authentication requests.

Syntax `radius-server timeout seconds`

Parameters *seconds* — Enter the time in seconds for retransmission, from 1 to 100.

Default An OS10 switch stops sending RADIUS authentication requests after five seconds.

Command Mode CONFIGURATION

Usage Information Use this command to globally configure the timeout value used on RADIUS servers. The `no` version of this command resets the value to the default.

Example

```
OS10(config)# radius-server timeout 90
```

Supported Releases 10.2.0E or later

radius-server vrf

Configures the RADIUS server for the management or non-default VRF instance.

Syntax `radius-server vrf {management | vrf-name}`

Parameters

- `management` — Enter the keyword to configure the RADIUS server for the management VRF instance.
- *vrf-name* — Enter the keyword then the name of the VRF to configure the RADIUS server for that non-default VRF instance.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information Use this command to associate RADIUS servers with a VRF. If you do not configure a VRF on the RADIUS server list, the servers are on the default VRF. RADIUS server lists and VRFs have one-to-one mapping.

The `no` version of this command removes the RADIUS server from the management VRF instance.

Example

```
OS10(config)# radius-server vrf management
OS10(config)# radius-server vrf blue
```

Supported Releases 10.4.0E(R1) or later

tacacs-server vrf

Creates an association between a TACACS server group and a VRF and source interface.

Syntax `tacacs-server vrf {management | vrf-name}`

Parameters

- `management` — Enter the keyword to associate TACACS servers to the management VRF instance. This option restricts the TACACS server association to the management VRF only.
- *`vrf-name`* — Enter the keyword then the name of the VRF to associate TACACS servers with that VRF.

Defaults None.

Command Mode CONFIGURATION

Usage Information Use this command to associate TACACS servers with a VRF instance. If you do not configure a VRF in the TACACS server list, the servers are on the default VRF instance. TACACS server lists and VRFs have one-to-one mapping. When you remove the VRF instance, the TACACS server lists are also removed automatically.

The `no` version of this command resets the value to the default.

Example

```
[no] tacacs-server management
[no] tacacs-server vrf red
```

Supported Releases 10.4.3.0E or later

ip radius source-interface

Specifies the interface whose IP address is used as the source IP address for user authentication with a RADIUS server.

Syntax `ip radius source-interface` *`interface`*

Parameters *`interface`*:

- `ethernet` *`node/slot/port[:subport]`* — Enter a physical Ethernet interface.
- `loopback` *`number`* — Enter a Loopback interface, from 0 to 16383.
- `mgmt 1/1/1` — Enter the management interface.
- `port-channel` *`channel-id`* — Enter a port-channel ID, from 1 to 28.
- `vlan` *`vlan-id`* — Enter a VLAN ID, from 1 to 4093.

Default Not configured.

Command Mode CONFIGURATION

Usage Information By default, no source interface is configured. OS10 selects the source IP address as the IP address of the interface from which a packet is sent to the RADIUS server. The `no` version of this command removes the configured source interface.

Example

```
OS10(config)# ip radius source-interface ethernet 1/1/10
```

Supported Releases 10.4.3.1 or later

ip tacacs source-interface

Specifies the interface whose IP address is used as the source IP address for user authentication with a TACACS+ server.

Syntax	`ip tacacs source-interface` *interface*
Parameters	*interface*: • `ethernet` *node/slot/port[:subport]* — Enter a physical Ethernet interface. • `loopback` *number* — Enter a Loopback interface, from 0 to 16383. • `mgmt 1/1/1` — Enter the management interface. • `port-channel` *channel-id* — Enter a port-channel ID, from 1 to 28. • `vlan` *vlan-id* — Enter a VLAN ID, from 1 to 4093.
Default	Not configured.
Command Mode	CONFIGURATION
Usage Information	By default, no source interface is configured. OS10 selects the source IP address as the IP address of the interface from which a packet is sent to the TACACS+ server. The `no` version of this command removes the configured source interface.
Example	`OS10(config)# ip tacacs source-interface ethernet 1/1/10`
Supported Releases	10.4.1.0 or later

Boot security

OS10 protects boot operation by allowing you to add GRUB password and image integrity validation.

Bootloader protection

To prevent unauthorized users with malicious intent from accessing your switch, protect the bootloader using a GRUB password. OS10 allows you to enable, disable, and view bootloader protection.

This feature is available only for the `sysadmin` and `secadmin` roles.

NOTE: When you enable bootloader protection, keep a copy of a configured user name and password. You cannot access the switch without configured credentials.

- Enable bootloader protection in EXEC mode. Use the `boot protect enable` command to configure a username and password. You can configure up to three users per switch.

  ```
  OS10# boot protect enable username root password calvin
  ```

  Disable bootloader protection for a specified user by using the `boot protect disable` command.

Enable bootloader protection

```
OS10# boot protect enable username root password calvin
```

Disable bootloader protection

```
OS10# boot protect disable username root
```

Display bootloader protectection

```
OS10# show boot protect
Boot protection enabled
Authorized users: root linuxadmin admin
```

Secure Boot

OS10 secure boot verifies the authenticity and integrity of the OS10 image. Secure boot protects a system from malicious code being loaded and executed during the boot process.

Using secure boot, you can validate the OS10 image during installation and on demand at any time.

Secure boot:

- verifies the OS10 image with the digital signature before installation
- prevents the OS10 software, including the kernel and system files, from being compromised during the boot operation
- protects and validates the startup configuration file at startup

OS10 checks the validity of the OS10 image before you install or upgrade your system:

- To check the validity of the OS10 image before you upgrade, see Validate and upgrade OS10 image.
- To check the validity of the OS10 image before you install it, see Validate OS10 image before manual installation from ONIE.

If you have already installed Release 10.5.1.0 or later, to enable secure boot, see Enable secure boot.

NOTE: You cannot directly go to ONIE from OS10, when secure boot is enabled. OS10 GRUB menu has options only for OS10 A and B. When you reload from OS10 to ONIE and when secure boot is enabled in OS10, go to BIOS and choose ONIE to boot.

Enable secure boot in OS10

Enabling the secure boot feature prevents the OS10 software (kernel and system binaries) from being compromised during the boot operation.

Secure boot is disabled by default. To enable secure boot, use the `secure-boot enable` command or RESTCONF API.

NOTE: On some switches, OS10 secure boot is enabled by default

OS10 stores the kernel signatures and system-file hashes internally. When you enable secure boot, OS10 uses the signatures and hashes to validate the binaries during the next and future reboots.

OS10 has two images, A and B. One image is active, which is the current running version and used as the running software at the next system reload. The other image remains standby, used for software upgrades.

NOTE: When you reload the switch from OS10 to ONIE and when secure boot is enabled in OS10, select ONIE from the BIOS to boot. You cannot directly go to ONIE from OS10, when secure boot is enabled.

You can use the `secure-boot verify` command to validate the kernel, system binaries, and startup configuration file for both the installed images at any time.

```
secure-boot verify {kernel | file-system-integrity | startup-config}
```

After a switch reboot:

- If kernel binary file validation fails, OS10 returns to the GRUB menu. The system returns to the GRUB menu when the kernel binary, kernel signature file, or both have been compromised. To load OS10, reboot your system using the other OS10 image. After OS10 loads, reinstall the OS10 image to replace the invalid image.
- If the OS10 system binary file validation fails, the OS10 image loads only in EXEC mode. Configuration mode is blocked. You can reboot your system using the other OS10 image and replace the invalid image with a valid OS10 image.
- If both the installed OS10 images are compromised, you must install a new image using ONIE. For more information, see *Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide*.
- If the validation of the kernel and OS10 system binary files succeeds, OS10 loads successfully.

NOTE: If you are installing OS10 image using zero touch deployment (ZTD):

- Secure boot is disabled after ZTD reloads the switch.
- ZTD cannot validate the image with Dell public key (PKI/sha256/GPG keys) and hence cannot perform secure installation of the OS10 image. However, if secure boot configuration is present in the ZTD configuration file, it is applied and the following secure boot features are available after installation:
  - Kernel validation during reboot
  - OS10 system binary files validation during reboot
  - Startup configuration file protection
  - All secure boot CLI commands are available

After the switch reboots, the system applies the protected version of the startup configuration. If a protected version of the startup configuration file is not available, the system applies the default configuration. You can check the status of the secure boot operation using the `show secure-boot status` and `show secure boot file-integrity-status` commands. The `show` command output displays the combined status of various secure boot features, including:

- Was secure boot used for the last reboot?
- Is secure boot enabled?
- Is the startup configuration protected?
- Were any OS10 binary files added, modified, or deleted?

```
OS10# show secure-boot status
Last boot was via secure boot : yes
Secure boot configured : yes
Latest startup config protected: yes
```

```
OS10# show secure-boot file-integrity-status
File Integrity Status: OK
```

Protect the startup configuration file

Protecting the startup configuration file saves a copy of the current startup configuration file internally. During switch boot up, the protected version of the startup configuration is loaded.

If you make OS10 configuration changes and save them to the startup configuration, protect the current startup configuration file by using the `secureboot protect startup-config` command. This command is supported in the `sysadmin`, `secadmin`, and `netadmin` roles.

When you enable secure boot and you try to save configuration changes using the `write memory` command, a warning message prompts you to first protect the startup configuration file:

```
Configuration has changed and secure boot is enabled. The protection of the
configuration needs to be updated prior to reboot.
```

If you reboot the system using the `reload` command and either the startup configuration is not protected or there are unsaved changes in the protected startup configuration, the warning message is displayed. The system reboot is not performed until you protect the current startup configuration file using the `secureboot protect startup-config` command.

If you reboot the system using a non-CLI method, such as power cycling, the last protected startup configuration is loaded. Any unsaved changes to the current startup configuration are lost. If the startup configuration is not protected, the default startup configuration settings are loaded.

Use the secure-boot verify startup configuration command to check if the current configuration is protected.

`secure-boot verify startup-config`

Validate OS10 image file on demand

You can validate an OS10 image file at any time using the `image verify` command in EXEC mode.

OS10 verifies the signature of the image files using hash-based authentication, GNU privacy guard (Gn uPG or GPG)-based signatures, or digital signatures (PKI-signed).

```
image verify image://PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin
pki signature tftp://10.16.127.7/users/PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-
installer-x86_64.bin.sha256.base64 public-key tftp://10.16.127.7/users/DellOS10.cert.pem
```

The image package that is verified consists of:

- PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin—OS10 image binary
- PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256.base64—PKI signature of the OS10 image binary
- PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256—The sha256 hash of the OS10 image binary
- PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.gpg—GNU privacy guard (GnuPG or GPG) signature of the OS10 image binary
- DellOS10.cert.pem—Dell public key certificate

Validate the OS10 kernel, system binaries, and startup configuration file

You can validate the OS10 kernel binary image, system binary files, and startup configuration file at system startup and CLI execution using the `secure-boot verify` command in EXEC mode.

```
OS10# secure-boot verify {kernel | file-system-integrity | startup-config}
```

Enable secure boot in BIOS

Refer S5448F-ON and Z9432F-ON platform installation guides to enable secure boot in BIOS.

NOTE:

- When OS10 boot up fails due to BIOS secure boot validation failure, reinstall OS10 from ONIE. Refer *Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide* for the steps to install.
- BIOS Secure is supported only on S5448F-ON and Z9432F-ON platforms.
- On some switches, secure boot is enabled by default in the BIOS.

ZTD and secure boot

When you enable secure boot in the BIOS, the BIOS validates the NOS boot loader during boot.

The OS10 images (from 10.5.2) that support BIOS secure boot sign the boot loader (OS10 GRUB) with the DELL standard PKI key and the corresponding public key is loaded in the BIOS during manufacturing. When the secure boot is enabled in BIOS, you cannot use ZTD to install any third-party NOS image that does not support the secure boot feature. In such cases, manually disable the feature in the BIOS using the BIOS UI to install third-party NOS images that does not support the secure boot feature.

Validate and upgrade OS10 image

You can validate and upgrade the OS10 installer image files with digital signatures using the `image secure-install` command in EXEC mode.

```
OS10# image secure-install image-filepath {sha256 signature signature-filepath | gpg
signature signature-filepath | pki signature signature-filepath public-key key-file}
```

The OS10 image installer verifies the signature of the image files using hash-based authentication, GNU privacy guard (GnuPG or GPG)-based signatures, or digital signatures (PKI-signed). Upgraded image files are installed after they are successfully validated.

NOTE:

- When secure boot is enabled and you install an OS10 image upgrade, the `image install` command is disabled. Use the `image secure-install` command instead. For more information, see *Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide*.
- If secure boot is not enabled, you can validate an OS10 image using PKI after you manually install the image by using the `image verify` command. PKI image validation occurs only once during the installation, not during each reload. After you manually install the image using the `image install` command, the image is extracted. The original binary image is not stored in the system.

Validate OS10 image before manual installation from ONIE

When you manually install an OS10 image using ONIE, you can validate the image using hash-based authentication (sha256) or digital certificates (PKI-signed).

The signature for the OS10 installer image is provided with the downloaded OS10 .tar file. You can extract the OS10 binary file image from the .tar file and install it from a local server. For more information, see *Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide*.

To validate and install an image using the X.509v3 certificate and OS10 image signature, use the `onie-nos-install` command during a manual installation.

```
$ onie-nos-install image_url pki signature_filepath certificate_filepath
```

Or

```
$ onie-nos-install image_url sha256 signature_filepath
```

The OS10 image installer verifies the signature of the image files using hash-based authentication or digital signatures (PKI-signed). The image files are installed after they are successfully validated.

View certificate information

Use the `show secure-boot pki-certificates` command in EXEC mode to view the certificate information.

When working with CA certificates, view the certificate information using the `show secure-boot pki-certificates` command in EXEC mode.

```
OS10# show secure-boot pki-certificates
Certificate Key Id   :  123
Version Number       : 3 (0x2)
Serial Number        : 17154672033164819608 (0xee11a353271dfc98)
Signature Algorithm  : sha256WithRSAEncryption
Issuer               : C=IN, ST=Some-State, L=some-city, O=Internet Widgits Pty Ltd
Validity             : Aug  1 11:45:39 2019 GMT - Jul 31 11:45:39 2020 GMT

Certificate Key Id   :  124
Version Number       : 3 (0x2)
Serial Number        : 17154672033164819608 (0xee11a353271dfc98)
Signature Algorithm  : sha256WithRSAEncryption
Issuer               : C=IN, ST=Some-State, L=some-city, O=Internet Widgits Pty Ltd
Validity             : Aug  1 11:45:39 2019 GMT - Jul 31 11:45:39 2020 GMT
```

Revoke an installed key

If either the public key or private key used in CA certificates is compromised, revoke the key by using the `revoke key` command in EXEC mode.

For *key-id*, enter the local file path where the downloaded or locally generated private key is stored.

```
OS10# revoke key key-id
```

The key is moved to the `Revoked` state.

Recover from image validation failures

This section explains how to recover from image validation failures and provides the recovery steps for the various failure scenarios.

Secure boot validates both the installed images. If validation fails for one of the images, you can install the other image. If validation fails for both the images, reinstall the OS10 image from ONIE.

OS10 kernel validation fails for one installed OS10 image

If kernel validation fails, the system enters GRUB mode. To recover from this validation failure:

1. Select the other installed OS10 image from the GRUB menu.
2. Reboot the system using the other installed OS10 image.
3. Replace the invalid OS10 image with a valid image using the `image secure-install` command.

```
OS10# image secure-install image://PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-
installer-x86_64.bin pki signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256.base64 public-key
tftp://10.16.127.7/users/DellOS10.cert.pem
```

OS10 kernel validation fails for both installed OS10 images

If kernel validation fails for both installed images, the system enters GRUB mode. Use the `secure-boot verify kernel` command to check the kernel validation status. To recover from this validation failure:

1. Boot into ONIE.
2. Install a valid OS10 image using the `onie-nos-install` command. For more information, see *Dell SmartFabric OS10 Installation, Upgrade, and Downgrade Guide*.

OS10 system binary validation fails for one installed OS10 image

If the system binary validation fails for one of the installed images, you can log into OS10 CLI EXEC mode. You cannot access CONFIGURATION mode. The following log message appears when you use the `show logging log-file` command:

```
Dell EMC (OS10) %SECURE_BOOT: OS10 sytem file integrity failed. OS10 image needs to be reinstalled.
```

To recover from this validation failure:

1. Reload the system using the `reload` command.
2. Select the other installed image from the GRUB menu and load that image.
3. Reboot the system using the other installed OS10 image.
4. Replace the invalid OS10 image with a valid image using the `image secure-install` command.

```
OS10# image secure-install image://PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin pki signature tftp://10.16.127.7/users/PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256.base64 public-key tftp://10.16.127.7/users/DellOS10.cert.pem
```

OS10 system binary validation fails for both installed OS10 images

If the system binary validation fails for one of the installed images, the system allows you to log into OS10 CLI EXEC mode. You cannot access CONFIGURATION mode. The following log message appears when you use the `show logging log-file` command:

```
Dell EMC (OS10) %SECURE_BOOT: OS10 sytem file integrity failed. OS10 image needs to be reinstalled.
```

To recover from this validation failure:

1. Boot into ONIE.
2. Install a valid OS10 image using the `onie-nos-install` command.

Boot security commands

boot protect disable username

Allows you to disable bootloader protection.

Syntax	`boot protect disable username` *`username`*
Parameters	• *`username`* - Enter the username to disable bootloader protection.
Default	Disabled
Command Mode	EXEC
Usage Information	You can disable bootloader protection for each individual user.
Example	`OS10# boot protect disable username root`
Supported Releases	10.4.3.0 or later

boot protect enable username password

Allows you to enable bootloader protection.

Syntax	`boot protect enable username` *`username`* `password` *`password`*
Parameters	• *`username`* — Enter the username to provide access to bootloader protection. • *`password`* — Enter a password for the specified username.
Default	Disabled
Command Mode	EXEC
Usage Information	You can enable bootloader protection by executing this command. You can configure a maximum of three username / password pairs for bootloader protection.
Example	`OS10# boot protect enable username root password calvin`
Supported Releases	10.4.3.0 or later

show boot protect

Displays the current list of configured users that have access to bootloader protection.

Syntax	`show boot protect`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	Displays the current list of authorised users for bootloader protection, but hides their passwords for security reasons.
Example (Disabled)	`OS10# show boot protect` `Boot protection disabled`

Example (Enabled)	`OS10# show boot protect`
	`Boot protection enabled`
	`Authorized users: root linuxadmin admin`

Supported Releases	10.4.3.0 or later

show secure-boot pki-certificates

Displays PKI certificates that are installed in the system.

Syntax	`show secure-boot pki-certificates`
Parameters	None
Default	None
Security and Access	Sysadmin and secadmin
Command Mode	EXEC
Usage Information	None

Example

```
OS10# show secure-boot pki-certificates
Certificate Key Id   :  123
Version Number       : 3 (0x2)
Serial Number        : 17154672033164819608 (0xee11a353271dfc98)
Signature Algorithm  : sha256WithRSAEncryption
Issuer               : C=IN, ST=Some-State, L=some-city, O=Internet
Widgits Pty Ltd
Validity             : Aug  1 11:45:39 2019 GMT - Jul 31 11:45:39 2020
GMT

Certificate Key Id   :  124
Version Number       : 3 (0x2)
Serial Number        : 17154672033164819608 (0xee11a353271dfc98)
Signature Algorithm  : sha256WithRSAEncryption
Issuer               : C=IN, ST=Some-State, L=some-city, O=Internet
Widgits Pty Ltd
Validity             : Aug  1 11:45:39 2019 GMT - Jul 31 11:45:39 2020
GMT
```

Supported Releases 10.5.1.0 or later

show secure-boot

Displays the secure boot or file integrity status.

Syntax `show secure-boot {status | file-integrity-status}`

Parameters

- `status`—Displays secure boot status.
- `file-integrity-status`—(Applicable only when you enable the secure boot feature) Displays file integrity status.

Default None

Security and Access Sysadmin and secadmin

Command Mode EXEC

Usage Information None

Example 1

```
OS10# show secure-boot status
Last boot was via secure boot : yes
Secure boot configured : yes
Latest startup config protected: yes
BIOS secure boot:
BIOS Secure boot configured: yes
```

Example 2

```
OS10# show secure-boot file-integrity-status
File Integrity Status: OK
```

Example 3

```
OS10# show secure-boot file-integrity-status
File Integrity Status: Failed
Potential Security Issues:
Files modified:
/opt/dell/os10/bin/dn_l3_core_services
Files added:
/opt/dell/os10/bin/trojan1
/opt/dell/os10/bin/virus123
```

Supported Releases 10.5.1.0 or later

secure-boot grub-key

Allows you to switch between standard and auto-generated key options.

Syntax `secure-boot grub-key{standard | auto-generated}`

Parameters
- `standard`— Dell Technologies recommended GPG key is used by GRUB to validate the OS10 kernel. The kernel is signed with the key during build time.
- `auto-generated`—The GPG keys are generated internally during OS10 installation and this key is used by the GRUB to validate the OS10 kernel. The kernel is signed with the key during image installation.

Default None

Security and Access Sysadmin and secadmin

Command Mode EXEC

Usage Information None

Example

```
DELL# secure-boot grub-key auto-generated
DELL# secure-boot grub-key standard
```

Supported Releases 10.5.2.0 or later

secure-boot verify

Validates the kernel, system, and startup configuration binary files of both the OS10 installed images.

Syntax `secure-boot verify {kernel | file-system-integrity | startup-config}`

Parameters
- `kernel`—Validate the kernel image.
- `file-system-integrity`—Validate the OS10 system binaries.
- `startup-config`—Validate the startup configuration file.

Default None

Security and Access Sysadmin

Command Mode EXEC

Usage Information None

Example 1 - Kernel verification

```
OS10# secure-boot verify kernel
Active Partition
Kernel signature verified:success
Standby Partition
Kernel signature verified:success
```

Example 2 - File system verification

```
OS10# secure-boot verify file-system-integrity
Active Partition
File-system integrity verified:success
Standby Partition
File-system integrity verified:success
```

Example 3 - Startup config verification

```
OS10# secure-boot verify startup-config
Latest startup config protected: yes
```

Supported Releases 10.5.1.0 or later

secure-boot revoke key

Revokes an installed key.

Syntax	`secure-boot revoke key key-id`
Parameters	*key-id*—key number of the installed key that is compromised.
Default	None
Security and Access	Sysadmin
Command Mode	EXEC
Usage Information	Use this command to revoke an installed key that is compromised.
Example	`OS10# secure-boot revoke key 5`
Supported Releases	10.5.1.0 or later

secure-boot protect startup-config

Protects the startup config file and its hash value.

Syntax	`secure-boot protect startup-config`
Parameters	None
Default	None
Security and Access	Sysadmin, secadmin, netadmin
Command Mode	EXEC
Usage Information	This CLI is available only when you enable secure boot. If the startup configuration file is deleted or compromised, use the protected version of the startup configuration file to restore the configuration during a reboot.
Example	`OS10# secure-boot protect startup-config`
Supported Releases	10.5.1.0 or later

secure-boot enable

Enables secure boot.

Syntax	`secure-boot enable`
Parameters	None
Default	Disabled
Security and Access	Sysadmin
Command Mode	CONFIGURATION
Usage Information	If you enable secure boot, ensure that you manually protect the startup configuration file before you reload the switch. The protected version of the startup configuration file is applied during the boot up process. If a protected version of the startup configuration file is not available, the system applies the default configuration. The `no` version of this command removes the configuration.

Example

```
OS10# secure-boot enable
```

Supported Releases 10.5.1.0 or later

image verify

Verifies the OS10 image file using sha256, PKI, or GPG signatures.

Syntax `image verify image-filepath {sha256 signature signature-filepath | gpg signature signature-filepath | pki signature signature-filepath public-key key-file}`

Parameters

- *image-filepath*—Enter the absolute path name of the OS10 image file.
- `sha256 signature` *signature-filepath*—Verify the SHA-256 cryptographic hash signature of the image file.
- `gpg signature` *signature-filepath*—Verify the GNU privacy guard signature of the image file.
- `pki signature` *signature-filepath* `public-key` *key-file*—Verify the PKI-signed digital signature of the image file.

Default None

Security and Access Sysadmin

Command Mode EXEC

Usage Information This command verifies the signature of the OS10 image file using hash-based authentication, GNU privacy guard (Gn uPG or GPG)-based signatures, or digital signatures (PKI-signed). For GPG validation, before you validate the OS10 image, use the `image gpg-key` command to install the GPG key in the switch keyring.

Example-sha256

```
OS10# image verify image://PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-
installer-x86_64.bin pki signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256.base64
public-key tftp://10.16.127.7/users/DellOS10.cert.pem
Image verified successfully.
```

Example-GPG key

```
OS10# image verify image://PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-
installer-x86_64.bin gpg signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.gpg
```

Example-PKI

```
OS10# image verify image://PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-
installer-x86_64.bin pki signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256.base64
public-key tftp://10.16.127.7/users/DellOS10.cert.pem
Image verified successfully.
```

Supported Releases 10.5.1.0 or later

image secure-install

Validates and installs the specified image.

Syntax `image secure-install image-filepath {sha256 signature signature-filepath | gpg signature signature-filepath | pki signature signature-filepath public-key key-file}`

Parameters

- *image-filepath*—Enter the absolute path name of the OS10 image file.

- `sha256 signature` *`signature-filepath`*—Verify the SHA-256 cryptographic hash signature of the image file.
- `gpg signature` *`signature-filepath`*—Verify the GNU privacy guard signature of the image file.
- `pki signature` *`signature-filepath`* `public-key` *`key-file`*—Verify the PKI-signed digital signature of the image file.

Default None

Security and Access Sysadmin

Command Mode EXEC

Usage Information This command is available only when you enable secure boot. This command is similar to the `image install` command. The system, before installing the image, verifies the signature of the OS10 image file using hash-based authentication, GNU privacy guard (Gn uPG or GPG)-based signatures, or digital signatures (PKI-signed). For GPG validation, before you validate the OS10 image, use the `image gpg-key` command to install the GPG key in the switch keyring.

Example - sha256

```
OS10# image secure-install image://
PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin
sha256 signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256
```

Example - GPG key

```
OS10# image secure-install image://
PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin
gpg signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.gpg
```

Example - PKI signature

```
OS10# image secure-install image://
PKGS_OS10-Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin
pki signature tftp://10.16.127.7/users/PKGS_OS10-
Enterprise-10.4.9999EX.3342stretch-installer-x86_64.bin.sha256.base64
public-key tftp://10.16.127.7/users/DellOS10.cert.pem
```

Supported Releases 10.5.1.0 or later

image gpg-key key-server

Installs the GPG key into the switch GPG key ring.

Syntax `image gpg-key key-server` *`key-server-name`* `key-id` *`key-id-string`*

Parameters

- *`key-server-name`*—Hostname address of the GPG key server.
- `key-id-string`—Key ID of the GPG key to be installed.

Default None

Security and Access `sysadmin`

Command Mode EXEC

Usage Information This command uses the `key-server` name and `key-id` to install the key into the switch GPG key ring. Use this command before you use the `image verify` or `image secure-install` commands with the GPG option. If the key is not installed in the key ring, the `image verify` and `image secure-install` commands fail when used with the GPG key.

Example

```
OS10# image gpg-key key-server keyserver.ubuntu.com key-id 7FDA043B
```

Supported Releases 10.5.1.0 or later

Switch management access

OS10 provides security to all management access through console, Telnet, SSH connections, and SNMP requests.

SSH server

In OS10, the secure shell server allows an SSH client to access an OS10 switch through a secure, encrypted connection. The SSH server authenticates remote clients using RADIUS challenge/response, a trusted host file, locally-stored passwords, and public keys.

NOTE: Only the SSH v2 protocol is supported; SSH v1 is not supported.

Configure SSH server

- The SSH server is enabled by default. You can disable the SSH server using the `no ip ssh server enable` command.
- Challenge response authentication is disabled by default. To enable, use the `ip ssh server challenge-response-authentication` command.
- Host-based authentication is disabled by default. To enable, use the `ip ssh server hostbased-authentication` command.
- Password authentication is enabled by default. To disable, use the `no ip ssh server password-authentication` command.
- Public key authentication is enabled by default. To disable, use the `no ip ssh server pubkey-authentication` command.
- Password-less login is disabled by default. To enable, use the `username sshkey` or `username sshkey filename` commands.
- Configure the list of cipher algorithms using the `ip ssh server cipher` *`cipher-list`* command.
- Configure key exchange algorithms using the `ip ssh server kex` *`key-exchange-algorithm`* command.
- Configure hash message authentication code (HMAC) algorithms using the `ip ssh server mac` *`hmac-algorithm`* command.
- Configure the SSH server listening port using the `ip ssh server port` *`port-number`* command.
- Configure the SSH server to be reachable on the management VRF using the `ip ssh server vrf` command.
- Configure the SSH login timeout using the `ip ssh server login-grace-time` *`seconds`* command, from 0 to 300; default 60. To reset the default SSH prompt timer, use the `no ip ssh server login-grace-time` command.
- Configure the maximum number of authentication attempts using the `ip ssh server max-auth-tries` *`number`* command, from 0 to 10; default 6. To reset the default, use the `no ip ssh server max-auth-tries` command.

  The `max-auth-tries` value includes all authentication attempts, including public-key and password. If you enable both, public-key based authentication and password authentication, the public-key authentication is the default and is tried first. If it fails, the number of `max-auth-tries` is reduced by one. In this case, if you configured `ip ssh server max-auth-tries 1`, the password prompt does not display.

Regenerate public keys

When enabled, the SSH server generates public keys by default and uses them for client authentication:

- A Rivest, Shamir, and Adelman (RSA) key using 2048 bits.
- An Elliptic Curve Digital Signature Algorithm (ECDSA) key using 256 bits
- An Ed25519 key using 256 bits

NOTE: RSA1 and DSA keys are not supported on the OS10 SSH server.

An SSH client must exchange the same public key to establish a secure SSH connection to the OS10 switch. If necessary, you can regenerate the keys used by the SSH server with a customized bit size. You cannot change the default size of the Ed25519 key. The `crypto key generate` command is available only to the `sysadmin` and `secadmin` roles.

1. Regenerate keys for the SSH server in EXEC mode.

```
crypto ssh-key generate {rsa {2048|3072|4096} | ecdsa {256|384|521} | ed25519}
```

2. Enter `yes` at the prompt to overwrite an existing key.

```
Host key already exists. Overwrite [confirm yes/no]:yes
Generated 2048-bit RSA key
```

3. Display the SSH public keys in EXEC mode.

```
show crypto ssh-key
```

After you regenerate SSH public keys, disable and re-enable the SSH server to use the new public keys. Restarting the SSH server does not impact current OS10 sessions.

Configure Host-Based SSH Authentication

Authenticate a particular host. This method uses SSH version 2.

This example explains how to configure host-based SSH authentication without using password.

Configuration on the Linux client

1. Install OpenSSH server on the Linux client. The following command is on Ubuntu; the command changes depending on the Linux platform.

```
apt-get install openssh-server
```

2. Create users (for example, test2, test3) using the following command with required default options:

```
root@linux_client:/home# adduser test2
root@linux_client:/home# adduser test3
```

3. Populate the Linux client with the public keys of the server.

```
root@linux_client:/etc/ssh# ssh-keyscan 100.10.10.10 | tee -a /etc/ssh/ssh_known_hosts
100.10.10.10 ecdsa-sha2-nistp256 AAAAE2VjZHNhLXNoYYAAAAIbmlzdHAyNTYAAABBBJXPCX4Sr/

```

4. Perform the following system-wide client configuration: Add below configurations in /etc/ssh/ssh_config.

```
HostbasedAuthentication yes
EnableSSHKeysign yes
```

Configuration on the OS10 switch

1. Perform the following steps on the OS10 switch.
   a. Enter configuration mode.

```
OS10# configure terminal
```

b. Configure a username on the switch.

```
OS10(config)# username test2 password testpassword2 role sysadmin priv-lvl 15
OS10(config)# username test3 password testpassword3 role sysadmin priv-lvl 15
```

c. Enable host-based authentication on the switch.

```
OS10(config)# ip ssh server hostbased-authentication
```

d. If you do not want to perform password authentication, run the following command.

```
OS10(config)# no ip ssh server password-authentication
```

2. Register the allowed client systems with the server.

```
root@OS10:/etc/ssh# vi shosts.equiv
100.10.10.13

root@OS10:/etc/ssh# cat shosts.equiv
100.10.10.13
```

3. Populate the server with the public keys of the client.

```
ssh-keyscan 100.10.10.13 | tee -a /etc/ssh/ssh_known_hosts

root@OS10-8676:/etc/ssh# cat ssh_known_hosts
100.10.10.13 ecdsa-sha2-nistp256

W5bA3ZA4aHx
```

4. The users test2 and test3 must be able to log in without password. Log in to the Linux client with the credentials of the test2 user, which was created in the OS10 device.

```
bash-3.2$ ssh test2@100.10.10.13
```

Now, log in to OS10 device with the management IP address.

```
test2@linux_client:~$ ssh 100.10.10.10
```

When you replace the switch, you need to perform this procedure again.

RESTCONF API

RESTCONF API allows to configure and monitor an OS10 switch using HTTP with the Transport Layer Security (TLS) protocol. For more information about RESTCONF API, see RESTCONF API.

Restrict SNMP access

To filter SNMP requests on the switch, assign access lists to an SNMP community. Both IPv4 and IPv6 access lists are supported.

These points are applicable when you assign an ACL to an SNMP community:

- By default, SNMP requests from all hosts are allowed.

- You can only apply `permit` ACL rules to an SNMP community. `deny` ACL rules do not take effect if you apply them.
- To permit SNMP requests for multiple hosts, apply individual `permit` ACL rules for hosts or prefixes.
- Applying ACL rules for an SNMP community in a non default VRF is not supported.

1. Create access lists with `permit` filters; for example:

```
OS10(config)# ip access-list snmp-read-only-acl
OS10(config-ipv4-acl)# permit ip 172.16.0.0 255.255.0.0 any
OS10(config-ipv4-acl)# exit
OS10(config)#
```

2. Apply ACLs to an SNMP community in CONFIGURATION mode.

```
OS10(config)# snmp-server community public ro acl snmp-read-only-acl
```

View SNMP ACL configuration

```
OS10# show snmp community
Community : public
Access : read-only
ACL : snmp-read-only-acl
```

Limit concurrent login sessions

To avoid an unlimited number of active sessions on a switch for the same user ID, limit the number of console and remote connections. Log in from a console connection by cabling a terminal emulator to the console serial port on the switch. Log in to the switch remotely through a virtual terminal line, such as Telnet and SSH.

- Configure the maximum number of concurrent login sessions in CONFIGURATION mode.

```
OS10(config)# login concurrent-session limit number
```

  - `limit` *`number`* — Sets the maximum number of concurrent login sessions allowed for a user ID, from 1 to 12; default 10.

When you configure the maximum number of allowed concurrent login sessions, take into account that:

- Each remote VTY connection counts as one login session.
- All login sessions from a terminal emulator on an attached console count as one session.

Configure concurrent login sessions

```
OS10(config)# login concurrent-session limit 4
```

If you log in to the switch after the maximum number of concurrent sessions are active, an error message displays. To log in to the system, close one of your existing sessions.

```
OS10(config)# login concurrent-session limit 4

Too many logins for 'admin'.
Last login: Wed Jan 31 20:37:34 2018 from 10.14.1.213
Connection to 10.11.178.26 closed.
Current sessions for user admin:
Line              Location
2  vty 0          10.14.1.97
3  vty 1          10.14.1.97
4  vty 2          10.14.1.97
5  vty 3          10.14.1.97
```

Virtual terminal line ACLs

To limit Telnet and SSH connections to the switch, apply access lists on a virtual terminal line (VTY).

There is no implicit deny rule. If none of the configured conditions match, the default behavior is to permit. If you need to deny traffic that does not match any of the configured conditions, explicitly configure a deny statement.

NOTE: VTY ACLs are used only to block the source IP hosts which connect through SSH or telnet to the device management IP. You cannot use these ACLs with any other qualifiers such as UDP or TCP port, destination IP, ICMP, and so on.

1. Create IPv4 or IPv6 access lists with `permit` or `deny` filters; for example:

```
OS10(config)# ip access-list permit10
OS10(config-ipv4-acl)# permit ip 172.16.0.0 255.255.0.0 any
OS10(config-ipv4-acl)# exit
OS10(config)#
```

2. Enter VTY mode using the `line vty` command in CONFIGURATION mode.

```
OS10(config)# line vty
OS10(config-line-vty)#
```

3. Apply the access lists to the VTY line with the `{ip | ipv6} access-class` *`access-list-name`* command in LINE-VTY mode.

```
OS10(config-line-vty)# ip access-class permit10
```

View VTY ACL configuration

```
OS10(config-line-vty)# show configuration
!
line vty
 ip access-class permit10
 ipv6 access-class deny10
OS10(config-line-vty)#
```

Initiate an SSH session with another switch

To initiate an SSH session to another switch:

1. Enter configuration mode.

```
OS10# configure terminal
```

2. Enable SSH client cli command.

```
OS10(config)#ip ssh client cli enable
```

By default, SSH Client CLI command is disabled. User cannot access the ssh command. This command must be performd to enable the SSH CLI. You must execute the `no ip ssh client enable` command to disable the SSH command.

3. Initiate an SSH session.

```
OS10# ssh 9.1.1.2
```

Connect remote switch whose IP address is as specified with port-id 22 (default port-id) and current session username (default username).

Switch management access

OS10 provides security to all management access through console, Telnet, SSH connections, and SNMP requests.

ip ssh client cli enable

Enables or disables SSH comand.

Syntax `ip ssh client cli enable`

Parameters	None.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The SSH command is disabled by default and it has to be explicitly enabled by you. **NOTE:** Only the system administrator (sysadmin) and secadmin roles are allowed to manage this configuration.
Example	`OS10-Switch(config)# ip ssh client cli enable`
Supported Releases	10.5.2.1 or Later

ip ssh server enable

Enables the SSH server.

Syntax	`ip ssh server enable`
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the SSH server.
Example	`OS10(config)# ip ssh server enable`
Supported Releases	10.3.0E or later

ip ssh server challenge-response-authentication

Enables challenge response authentication in the SSH server.

Syntax	`ip ssh server challenge-response-authentication`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the challenge response authentication.
Example	`OS10(config)# ip ssh server challenge-response-authentication`
Supported Releases	10.3.0E or later

ip ssh server cipher

Configures the list of cipher algorithms in the SSH server.

Syntax	`ip ssh server cipher` *`cipher-list`*

Parameters *cipher-list* — Enter a list of cipher algorithms. Separate entries with a blank space. The cipher algorithms supported by the SSH server are:

- 3des-cbc
- aes128-cbc
- aes192-cbc
- aes256-cbc
- aes128-ctr
- aes192-ctr
- aes256-ctr
- aes128-gcm@openssh.com
- aes256-gcm@openssh.com
- blowfish-cbc
- cast128-cbc
- chacha20-poly1305@opens

Default

- aes128-ctr
- aes192-ctr
- aes256-ctr
- aes128-gcm@openssh.com
- aes256-gcm@openssh.com
- chacha20-poly1305@opens

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the configuration.

Example

```
OS10(config)# ip ssh server cipher 3des-cbc aes128-cbc
```

Supported Releases 10.3.0E or later

ip ssh server hostbased-authentication

Enables host-based authentication in an SSH server.

Syntax `ip ssh server hostbased-authentication`

Parameters None

Default Disabled

Command Mode CONFIGURATION

Usage Information The `no` version of this command disables the host-based authentication.

Example

```
OS10(config)# ip ssh server hostbased-authentication
```

Supported Releases 10.3.0E or later

ip ssh server kex

Configures the key exchange algorithms used in the SSH server.

Syntax `ip ssh server kex` *key-exchange-algorithm*

Parameters *key-exchange-algorithm* — Enter the supported key exchange algorithms separated by a blank space. The SSH server supports these key exchange algorithms:

- curve25519-sha256

- curve25519-sha256@libssh.org
- diffie-hellman-group1-sha1
- diffie-hellman-group14-sha1
- diffie-hellman-group16-sha512
- diffie-hellman-group-exchange-sha1
- diffie-hellman-group-exchange-sha256
- ecdh-sha2-nistp256
- ecdh-sha2-nistp384
- ecdh-sha2-nistp521

Default
- curve25519-sha256
- diffie-hellman-group14-sha1
- diffie-hellman-group-exchange-sha256
- ecdh-sha2-nistp256
- ecdh-sha2-nistp384
- ecdh-sha2-nistp521

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the configuration.

Example

```
OS10(config)# ip ssh server kex curve25519-sha256 diffie-hellman-group1-
sha1
```

Supported Releases 10.3.0E or later

ip ssh server mac

Configures the hash message authentication code (HMAC) algorithms used in the SSH server.

Syntax `ip ssh server mac` *`hmac-algorithm`*

Parameters *`hmac-algorithm`* — Enter the supported HMAC algorithms separated by a blank space. The SSH server supports these HMAC algorithms:
- hmac-md5
- hmac-md5-96
- hmac-ripemd160
- hmac-sha1
- hmac-sha1-96
- hmac-sha2-256
- hmac-sha2-512
- umac-64@openssh.com
- umac-128@openssh.com
- hmac-md5-etm@openssh.com
- hmac-md5-96-etm@openssh.com
- hmac-ripemd160-etm@openssh.com
- hmac-sha1-etm@openssh.com
- hmac-sha1-96-etm@openssh.com
- hmac-sha2-256-etm@openssh.com
- hmac-sha2-512-etm@openssh.com
- umac-64-etm@openssh.com
- umac-128-etm@openssh.com

Default
- hmac-sha1
- hmac-sha2-256
- hmac-sha2-512
- umac-64@openssh.com

- umac-128@openssh.com
- hmac-sha1-etm@openssh.com
- hmac-sha2-256-etm@openssh.com
- hmac-sha2-512-etm@openssh.com
- umac-64-etm@openssh.com
- umac-128-etm@openssh.com

Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the configuration.
Example	`OS10(config)# ip ssh server mac hmac-md5 hmac-md5-96 hmac-ripemd160`
Supported Releases	10.3.0E or later

ip ssh server password-authentication

Enables password authentication in the SSH server.

Syntax	`ip ssh server password-authentication`
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the password authentication.
Example	`OS10(config)# ip ssh server password-authentication`
Supported Releases	10.3.0E or later

ip ssh server port

Configures the SSH server listening port.

Syntax	`ip ssh server port` *`port-number`*
Parameters	*`port-number`* — Enter the listening port number, from 1 to 65535.
Default	22
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the configuration.
Example	`OS10(config)# ip ssh server port 255`
Supported Releases	10.3.0E or later

ip ssh server pubkey-authentication

Enables public key authentication for the SSH server.

Syntax	`ip ssh server pubkey-authentication`

Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables the public key authentication.
Example	`OS10(config)# ip ssh server pubkey-authentication`
Supported Releases	10.3.0E or later

ip ssh server vrf

Configures an SSH server for the management or non-default VRF instance.

Syntax	`ip ssh server vrf {management | vrf-name}`
Parameters	• `management` — Configures the management VRF instance to reach the SSH server. • *`vrf-name`* — Enter the VRF instance used to reach the SSH server.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	The SSH server uses the management VRF.
Example	`OS10(config)# ip ssh server vrf management` `OS10(config)# ip ssh server vrf vrf-blue`
Supported Releases	10.4.0E(R1) or later

show ip ssh

Displays the SSH server information.

Syntax	`show ip ssh`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	Use this command to view information about the established SSH sessions.

Example	`OS10# show ip ssh`
	
	`SSH Server: Enabled`
	`--------------------------------------------------`
	`SSH Server Ciphers: chacha20-poly1305@openssh.com,aes128-ctr,`
	`aes192-ctr,aes256-ctr,`
	`aes128-gcm@openssh.com,aes256-`
	`gcm@openssh.com`
	`SSH Server MACs: umac-64-etm@openssh.com,umac-128-`
	`etm@openssh.com,`
	`hmac-sha2-256-etm@openssh.com,`
	`hmac-sha2-512-etm@openssh.com,`
	`hmac-sha1-`
	`etm@openssh.com,umac-64@openssh.com,`
	`umac-128@openssh.com,hmac-sha2-256,`
	`hmac-sha2-512,hmac-sha1`

```
SSH Server KEX algorithms:    curve25519-sha256@libssh.org,ecdh-sha2-
nistp256,
                              ecdh-sha2-nistp384,ecdh-sha2-nistp521,
                              diffie-hellman-group-exchange-sha256,
                              diffie-hellman-group14-sha1
Password Authentication:      Enabled
Host-Based Authentication:    Disabled
RSA Authentication:           Enabled
Challenge Response Auth:      Disabled
```

Supported Releases 10.3.0E or later

ssh

Starts an SSH client session.

Syntax `ssh [vrf {management | vrf-name} {-b source-ip-address] [-B source-interface] [-c encryption-cypher] [-l username] [-m HMAC-algorithm] [-p port-number] [-h] destination`

Parameters

- `vrf management` - (Optional) SSH to an IP address in a management VRF instance.
- `vrf vrf-name` - (Optional) SSH to an IP address to a specified VRF instance.
- `-b source-ip-address` - (Optional) Enter the source IPv4 or IPv6 address. If not mentioned, this option chooses the source address corresponding to the destination address from the route table.
- `-B source-intherface` - (Optional) Enter the source interface name without spaces. If not mentioned, this option chooses the source address corresponding to the destination interface from the route table.
  - For a physical Ethernet interface, enter ethernet<node/slot/port>; for example, ethernet1/1/1.
  - For a VLAN interface, enter vlan<vlan-id;> for example, vlan10.
  - For a Loopback interface, enter loopback<id>; for example, loopback1.
  - For Virtual-Network, enter virtual-network<vn-id>; for example, virtual-network20.
  - For a port-channel interface, enter port-channelchannel-id; for example, port-channel11.
- `-c encryption-cypher` - (Optional) Enter the supported encryption ciphers. You can issue multi encryption ciphers. For example, `ssh -c chacha20-poly1305@openssh.com,aes128-ctr,aes192-ctr,aes256-ctr,aes128-gcm@openssh.com,aes256-gcm@openssh.com 9.1.1.2`. Following is the default list of Cipher algorithms used by SSH Client for establishing the session when cipher algorithm is not explicitly mentioned by user, the first cipher algorithm matching the SSH server's list will be used for encryption.
  - chacha20-poly1305@openssh.com
  - aes128-ctr
  - aes192-ctr
  - aes256-ctr
  - aes128-gcm@openssh.com
  - aes256-gcm@openssh.com

  Following is the list of additional Ciphers supported in OS10 SSH Client CLI:
  - 3des-cbc
  - aes128-cbc
  - aes192-cbc
  - aes256-cbc
- `-l username` - (Optional) Enter the session username. If username is not specified, the current session username from which SSH client command is invoked is used to initiate an SSH session.
- `-m HMAC-algorithm` - (Optional) Enter the supported Host Message Authentication Code algorithm. You can issue multiple HMAC algorithms. For example, `ssh -m umac-64-etm@openssh.com,umac-128-etm@openssh.com,hmac-sha2-256-etm@openssh.com 9.1.1.2`. Following is the default list of Message Authentication code used by SSH Client for establishing the session when HMAC is not explicitly mentioned by user, the first HMAC matching the SSH server's list will be used for authentication.
  - umac-64-etm@openssh.com

- umac-128-etm@openssh.com
- hmac-sha2-256-etm@openssh.com
- hmac-sha2-512-etm@openssh.com
- hmac-sha1-etm@openssh.com
- umac-64@openssh.com
- umac-128@openssh.com
- hmac-sha2-256
- hmac-sha2-512
- hmac-sha1

Following is the list of additional HMAC's supported in OS10 SSH Client CLI:

- hmac-md5
- hmac-md5-96
- hmac-sha1-96
- hmac-md5-etm@openssh.com
- hmac-md5-96-etm@openssh.com
- hmac-sha1-96-etm@openssh.com

- `-p port-number` - (Optional) Enter the SSH server port number.Default port number is 22.
- `-h` - Displays help for this command.
- `destination` - Enter the IP address or name of the remote SSH server. Name of the SSH server can contain symbols. such as `os10-dell.com`.

Default

Following are the default values for the options listed:

- `vrf` - management.
- `-c` - `chacha20-poly1305@openssh.com,aes128-ctr,aes192-ctr,aes256-ctr,aes128-gcm@openssh.com,aes256-gcm@openssh.com`
- `-l` - Currrent session username.
- `-m` - `umac-64-etm@openssh.com,umac-128-etm@openssh.com,hmac-sha2-256-etm@openssh.com,hmac-sha2-512-etm@openssh.com,hmac-sha1-etm@openssh.com,umac-64@openssh.com,umac-128@openssh.com,hmac-sha2-256,hmac-sha2-512,hmac-sha1`
- `-p` - 22
- `-b and -B` - The default values depend on the source IP / Interface from the routing table for that specific destination.

Command Mode

EXEC

Usage Information

SSH is a command for logging into a remote machine and for executing commands on a remote machine. This provides a secure encrypted communication between two un-trusted hosts over an insecure network.

NOTE: OS10 considers -B {Source interface} as egress interface.

This command is available for all user-roles but it has to be enabled using the `ip ssh client cli enable` command which is accessible only for `sysadmin` and `secadmin` user roles .

If you try to invoke the SSH command when the SSH command is disabled, an Unrecognized command error appears.

Example

```
OS10_Switch_1# ssh 9.1.1.2
The authenticity of host '9.1.1.2 (9.1.1.2)' can't be established.
ECDSA key fingerprint is SHA256:43XxebRXcDxO8XBWFHcitZOFv/
h43VkRwSyczGWS4Og.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '9.1.1.2' (ECDSA) to the list of known hosts.

OS10_Switch_2#

OS10_Switch_1# ssh -h
usage: [-b source_ip_address] [-B source_interface] [-c
encryption_cipher] [-l username] [ -m HMAC_algorithm] [-p port-number]
[-h] Hostname

Linux options supported for SSH.

optional arguments:
-h, --help show this help message and exit

SSH Options:
-b [Source IP Address]
Source Address of the connection
-B [Source Interface]
Source Interface of the connection
-c [Encryption Cipher]
Encryption cipher to use
-l [Username] User name option
-m [HMAC Algorithm] HMAC algorithm to use
-p [Port Number] SSH server port option (default 22)
Hostname IP address or hostname of a remote system
S4000-6216#
```

Supported Releases 10.5.2.1 or Later

show crypto ssh-key

Displays the current host public keys used in SSH authentication.

Syntax `show crypto ssh-key {rsa | ecdsa | ed25119}`

Parameters

- `rsa` — Displays the RSA public key.
- `ecdsa` — Displays the ECDSA public key.
- `ed25519` — Displays the Ed25519 key.

Default Not configured

Command Mode EXEC

Usage Information After you regenerate an SSH server key with a customized bit size, disable and re-enable the SSH server to use the new public keys. To verify the changes, use the `show crypto` command.

If a remote SSH client uses strict host-key checking, copy a newly generated host key to the list of known hosts on the client device.

Example

```
OS10# show crypto ssh-key rsa
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQCogJtArA0fHJkFpioGaAcp+vrDQFC3l3XFHtd
41wXY9kM0Ar+37yRsDul8vKodqSDiGLRuPjFTcVjvDdSKWblJRsybkmA6nuHJIyPOScDepLlicM

WaFqp root@OS10
```

Supported Releases

10.4.1.0 or later

username sshkey

Enables SSH password-less login using the public key of a remote client. The remote client is not prompted to enter a password.

Syntax

`username` *`username`* `sshkey` *`sshkey-string`*

Parameters

- *`username`*—Enter the username. This value is the username that is configured with the `username password role` command.
- *`sshkey-string`*—Enter the public key of remote client device, as the text string. If *`sshkey-string`* contains a blank space, enclose the string in double quotes (").

Default

The default SSH public keys are an RSA key generated using 2048 bits, an ECDSA key with 256 bits, and an Ed2559 key with 256 bits.

Command Mode

CONFIGURATION

Usage Information

To configure multiple public keys for SSH password-less login of a specific user, use the `username` *`username`* `sshkey filename` command. The `no` form of the command removes the public key configuration of a specified user.

Remote client system stores the public key of a user in the `~/.ssh/id_rsa.pub` file. Use public key as the *`sshkey-string`* parameter.

NOTE: While running with FIPS mode enabled, SmartFabric OS10 accepts only RSA user keys. If the keys are installed before entering the FIPS mode, such keys are not affected.

Example

```
OS10(config)# username test sshkey "ssh-rsa AAAAB3NzaC1yc2EAAAABJQAAAQBqJaD
wgBgQX1PPPSEyx+F5DVG2RpBH4Zm1YQApE5YJsKlt6RpeOIT1wnJP/o54p1nCeMu38i7/zCLwuW

```

Supported Releases

10.4.1.0 or later

username sshkey filename

Enables SSH password-less login for remote clients using multiple public keys. A remote client is not prompted to enter a password.

Syntax

`username` *`username`* `sshkey filename` *`filepath`*

Parameters

- *`username`*—Enter an OS10 username who logs in on a remote client. This value is the username that is configured using the `username password role` command.
- *`filepath`*—Enter the absolute path name of the local file containing the public keys used by remote devices to log in to the OS10 switch.

Default

The default SSH public keys are an RSA key generated using 2048 bits, an ECDSA key with 256 bits, and an Ed2559 key with 256 bits.

Command Mode

CONFIGURATION

Usage Information

Before you use the command, locate the public keys on a remote client in the `~/.ssh/id_rsa.pub` file. Create a text file and copy the SSH public keys on the remote client into the file. Enter each public key on a separate line. Download the file to your home OS10 directory.

NOTE: Entering the command when an SSH key file is not present has no effect and results in a silent failure. SSH password-less login is not enabled.

The `no` version of the command removes the SSH password-less configuration for the specified username.

NOTE: While running with FIPS mode enabled, SmartFabric OS10 accepts only RSA user keys. If the keys are installed before entering the FIPS mode, such keys are not affected.

Example

```
OS10(config)# username user10 sshkey filename /test_file.txt

OS10(config)# do show running-configuration users
username admin password
$6$q9QBeYjZ$jfxzVqGhkxX3smxJSH9DDz7/3OJc6m5wjF8nnLD
7/VKx8SloIhp4NoGZs0I/UNwh8WVuxwfd9q4pWIgNs5BKH. role sysadmin

username user10 password
$6$rounds=656000$G10VRFTJB291ekwo$iTGf0zd4bTUcBBpI

role
 sysadmin

username user10 sshkey filename /test_file.txt
```

Supported Releases

10.4.1.0 or later

crypto ssh-key generate

Regenerates the public keys used in SSH authentication.

Syntax

`crypto ssh-key generate {rsa` *`bits`* `| ecdsa` *`bits`* `| ed25519}`

Parameters

- `rsa` *`bits`* — Regenerates the RSA key with the specified bit size: 2048, 3072, or 4096; default 2048.
- `ecdsa` *`bits`* — Regenerates the ECDSA key with the specified bit size: 256, 384, or 521; default 256.
- `ed25519` — Regenerates the Ed25519 key with the default bit size.

Default

The SSH server uses default public key lengths for client authentication:

- RSA key: 2048 bits
- ECDSA key : 256 bits
- Ed25519 key: 256 bits

Command Mode

EXEC

Usage Information	If necessary, you can regenerate the public keys used by the SSH server with a customized bit size. You cannot change the default size of the Ed25519 key. The `crypto ssh-key generate` command is available only to the `sysadmin` and `secadmin` roles.

Example	`OS10# crypto ssh-key generate rsa 4096`
	`Host key already exists. Overwrite [confirm yes/no]:yes`
	`Generated 4096-bit RSA key`
	`OS10#`

Supported Releases	10.4.1.0 or later

login concurrent-session limit

Configures the maximum number of concurrent login sessions allowed for a user ID.

Syntax	`login concurrent-session limit` *number*
Parameters	limit *number* — Enter the limit of concurrent login sessions, from 1 to 12.
Default	10 concurrent login sessions
Command Mode	CONFIGURATION
Usage Information	The total number of concurrent login sessions for the same user ID includes all console and remote connections, where: • Each remote VTY connection counts as one login session. • All login sessions from a terminal emulator on an attached console count as one session. The `no` version of the command disables the configured number of allowed login sessions.
Example	`OS10(config)# login concurrent-session limit 7`
Supported Releases	10.4.1.0 or later

line vty

Enters virtual terminal line mode to access the virtual terminal (VTY).

Syntax	`line vty`
Parameters	None
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# line vty` `OS10(config-line-vty)#`
Supported Releases	10.4.0E(R1) or later

ipv6 access-class

Filters connections in a virtual terminal line using an IPv6 access list.

Syntax	`ipv6 access-class` *access-list-name*

Parameters	*access-list-name* — Enter the access list name.
Default	Not configured
Command Mode	LINE VTY CONFIGURATION
Usage Information	The `no` version of this command removes the filter.
Example	`OS10(config)# line vty` `OS10(config-line-vty)# ipv6 access-class permit10`
Supported Releases	10.4.0E(R1) or later

ip access-class

Filters connections in a virtual terminal line using an IPv4 access list.

Syntax	`ip access-class` *access-list-name*
Parameters	*access-list-name* — Enter the access list name.
Default	Not configured
Command Mode	LINE VTY CONFIGURATION
Usage Information	The `no` version of this command removes the filter.
Example	`OS10(config)# line vty` `OS10(config-line-vty)# ip access-class deny10`
Supported Releases	10.4.0E(R1) or later

Switch management statistics

OS10 monitors user and system activities and provides output-related user login statistics.

Enable login statistics

To monitor system security, allow users to view their own login statistics when they sign in to the system. A large number of login failures or an unusual login location may indicate a system hacker. Enable the display of login information after a user successfully logs in; for example:

```
OS10 login: admin
Password:
Last login: Thu Nov  2 16:02:44 UTC 2017 on ttyS1
Linux OS10 3.16.43 #2 SMP Debian 3.16.43-2+deb8u5 x86_64
...
Time-frame for statistics     : 25 days
Role changed since last login : false
Failures since last login     : 0
Failures in time period       : 1
Successes in time period      : 14
OS10#
```

This feature is available only for the `sysadmin` and `secadmin` roles.

- Enable the display of login information in CONFIGURATION mode.

  ```
  login-statistics enable
  ```

To display information about user logins, use the `show login-statistics` command.

Enable login statistics

```
OS10(config)# login-statistics enable
```

To disable login statistics, use the `no login-statistics enable` command.

Audit log

To monitor user activity and configuration changes on the switch, enable the audit log. Only the `sysadmin` and `secadmin` roles can enable, view, and clear the audit log.

The audit log records configuration and security events, including:

- User logins and logouts on the switch, failed logins, and concurrent login attempts by a user
- User-based configuration changes recorded with the user ID, date, and time of the change. The specific parameter changes are not logged.
- Establishment of secure traffic flows, such as SSH, and violations on secure flows
- Certificate issues, including user access and changes made to certificate installation using `crypto` commands
- Adding and deleting users

Audit log entries are saved locally and sent to configured Syslog servers. To set up a Syslog server, see System logging.

Enable audit log

- Enable configuration and security event recording in the audit log on Syslog servers in CONFIGURATION mode.

```
logging audit enable
```

To disable audit logging, use the `no logging audit enable` command.

View audit log

- Display audit log entries in EXEC mode. By default, 24 entries are displayed, starting with the oldest event. Enter `reverse` to display entries starting with the most recent events. You can change the number of entries that display.

```
show logging audit [reverse] [number]
```

Clear audit log

- Clear all events in the audit log in CONFIGURATION mode.

```
clear logging audit
```

Example

```
OS10(config)# logging audit enable
OS10(config)# exit

OS10# show logging audit 4

```

Switch management statistics commands

login-statistics enable

Enables the display of login statistics to users.

Syntax	`login-statistics enable`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	Only the `sysadmin` and `secadmin` roles have access to this command. When enabled, user login information, including the number of successful and failed logins, role changes, and the last time a user logged in, displays after a successful login. The `no login-statistics enable` command disables login statistics.
Example	`OS10(config)# login-statistics enable`
Supported Releases	10.4.0E(R1) or later

show login-statistics

Displays statistics on user logins to the system.

Syntax	`show login-statistics {user` *`user-id`* `| all}`
Parameters	• `user` *`user-id`* — Enter an OS10 username. • `all` — Displays login statistics for all system users.
Default	Not configured
Command Mode	EXEC
Usage Information	Only the `sysadmin` and `secadmin` roles can access this command. The `show` output displays login information for system users, including the number of successful and failed logins, role changes, and the last time a user logged in.

Example

```
OS10# show login-statistics all
Display statistics upon user login: Enabled
Time-frame in days: 25

               #Fail
               since During
        Role   last  Timeframe                Last Login
User    Change Login #Fail #Success  Date/Time              Location
-------- ----- ----- --------------  -------------------    ----------
admin    False  0     1    13        2017-11-02T16:02:44Z  in
netadmin False  0     0     5        2017-11-02T15:59:04Z  (00:00)
mltest   False  0     0     1        2017-11-01T15:42:07Z  1001:10:16:210::4001

OS10# show login-statistics user mltest
User                          : mltest
Role changed since last login : False
Failures since last login     : 0
Time-frame in days            : 25
Failures in time period       : 0
```

```
Successes in time period      : 1
Last Login Time               : 2017-11-01T15:42:07Z
Last Login Location           : 1001:10:16:210::4001
```

Supported Releases

10.4.0E(R1) or later

clear logging audit

Deletes all events in the audit log.

Syntax	`clear logging audit`
Parameters	None
Defaults	Not configured
Command Mode	EXEC
Usage Information	To display the contents of the audit log, use the `show logging audit` command.
Example	`OS10# clear logging audit` `Proceed to clear all audit log messages [confirm yes/no(default)]:yes`
Supported Releases	10.4.3.0 or later

show logging audit

Displays audit log entries.

Syntax	`show logging audit [reverse] [number]`
Parameters	• `reverse` — Display entries starting with the most recent events. • *`number`* — Display the specified number of audit log entries users, from 1 to 65535.
Default	Display 24 entries starting with the oldest events.
Command Mode	EXEC
Usage Information	Only the `sysadmin` and `secadmin` roles can display the audit log. Enter `reverse` to display entries starting with the most recent events. You can change the number of entries displayed. Audit log records do not display on the console as they occur. They are saved in the audit log and forwarded to any configured Syslog servers.

Example

```
OS10# show logging audit 4
<14>1 2019-02-14T13:15:06.283337+00:00 OS10 audispd - - - Node.1-Unit.1:PRI [audit],
Dell EMC (OS10)  node=OS10 type=USER_END msg=audit(1550150106.277:597): pid=7908 uid=0

```

Supported Releases

10.4.3.0 or later

logging audit enable

Enables recording of configuration and security event in the audit log.

Syntax	`logging audit enable`
Parameters	None
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	Audit log entries are saved locally and sent to configured Syslog servers. Only the `sysadmin` and `secadmin` roles can enable the audit log. The `no` version of the command disables audit log recording.
Example	`OS10(conf)# logging audit enable`
Supported Releases	10.4.3.0 or later

X.509v3 certificates

OS10 supports X.509v3 certificates to secure communications between the switch and a host, such as a RADIUS server. Both the switch and the server exchange a public key in a signed X.509v3 certificate issued by a certificate authority (CA) to authenticate each other. The certificate authority uses its private key to sign the switch and host certificates.

The information in the certificate allows both devices to prove ownership and the validity of a public key. Assuming the CA is trusted, the switch and authentication server validate each other's identity and set up a secure, encrypted communications channel.

User authentication with a public key certificate is usually preferred over password-based authentication, although you can use both at the same time, to:

- Avoid the security risk of using low-strength passwords and provide greater resistance to brute-force attacks.
- Provide assurance of trusted, provable identities (when using certificates digitally signed by a trusted CA).
- Provide security and confidentiality in switch-server communications in addition to user authentication.

For example, you can download and install a X.509v3 certificate to enable public-key authentication in RADIUS over TLS authentication — also called `RadSec`. OS10 supports a public key infrastructure (PKI), including:

- Generation of self-signed certificates and certificate signing requests (CSRs), and their corresponding private keys
- Installation and deletion of self-signed certificates and CA-signed certificates
- Secure deletion of corresponding private keys
- Installation and deletion of CA certificates in the system "trust store"
- Display of certificate information

X.509v3 concepts

Certificate

A document that associates a network device with its public key. When exchanged between participating devices, certificates are used to validate device identity and the public key associated with the device. A PKI uses the following certificate types:

- CA certificate: The certificate of a CA that is used to sign host certificates. A CA certificate may be issued by other CAs or be self-signed. A self-signed CA certificate is called a *root certificate*.
- Host certificate: A certificate that is issued to a network device. A host certificate may be signed by a CA or self-signed.
- Self-signed certificate: A host-signed certificate, compared to a CA-signed certificate.

Certificate authority (CA)	An entity that verifies the contents of a certificate and signs it, indicating that the certificate is trusted and correct. An intermediate CA signs certificates transmitted between a root CA and a host.
Certificate revocation list (CRL)	A CA-signed document that contains a list of certificates that are no longer valid, even though they have not yet expired. For example, when a new certificate is generated for a server, and the old certificate is no longer supported.
Certificate signing request (CSR)	After generating a key pair, a switch signs a request to obtain a certificate using its secret private key, and sends the request to a certificate authority. The CSR contains information that identifies the switch and its public key. This public key is used to verify the private signature of the CSR and the distinguished name (DN) of the switch. A CSR is signed by a CA and returned to a host for use as a signed host certificate.
Privacy Enhanced Mail (PEM)	PKI standard used to format X.509v3 data in a secure message exchange; described in RFC 1421.
Public key infrastructure (PKI)	Application that manages the generation of private and public encryption keys, and the download, installation, and exchange of CA-signed certificates with network devices.
X.509v3	Standard for the public key infrastructure that manages digital certificates and public key encryption.

PKI certificate validation

The PKI certificate validation feature allows you to validate the following certificates:

- A PKI certificate that is already installed as a host certificate.
- A PKI certificate that is already installed as a CA certificate in the trust store.
- A host certificate, during its installation process. If validation fails, the host certificate is not installed.

The PKI certificate feature also allows acceptance of self-signed certificates from trusted servers. If validation fails, the host certificate and host key are not installed. The `crypto ca-cert install` command permits the installation of self-signed certificates of trusted servers during certificate validation.

This feature performs validation against either an existing installed PKI certificate or against a PKI certificate that is yet to be installed. If you use certificate revocation lists (CRLs) to verify the PKI certificates, there is no interaction with an external server. If you use the online certificate status protocol (OCSP) to verify the PKI certificates, OCSP uses the URL in the `Authority-Information-Access` field in the certificate and sends an OCSP request.

If the `CRL DP (CRL distribution point)` field is present in the certificate to be verified, its contents are used to fetch the CRL from its location.

If the `Authority-Information-Access` field is present, its contents are used to send a request to the OCSP server and await a response.

The CRL is pulled from its HTTP site or connects to an OCSP server; but some external server is contacted for up-to-date revocation information.

There are several reasons that cause the certificate validation to fail:

- An invalid `not before` date is present in the certificate.
- An invalid `not after` date is present in the certificate.
- A host certificate with the `basicConstraints` CA flag set to true.
- A certificate chain exists (for signed certificates), which cannot be validated.
- The PKI certificate is revoked.

During installation of a CA certificate, the certificate must be a CA signer; several fields are validated to check whether the certificate is a CA signer or not.

The trusted host must be self-signed and not capable of signing other certificates.

In all failure scenarios, an audit log entry that specifies the reason for the certificate validation failure is present. If the validation action succeeds, an audit log entry indicating success certificate validation must be present. The `commonName` (if present) or `subjectAltName` (if present) corresponding to the certificates must be present in all audit log entries for that action.

Restriction and limitation

- The PKI certificate feature must be usable on any platform running SmartFabric OS10. The validation commands do not modify the file system or certificates.

Public key infrastructure

To use X.509v3 certificates for secure communication and user authentication on OS10 switches in a network, a public key infrastructure (PKI) with a certificate authority (CA) is required. The CA signs certificates that prove the trustworthiness of network devices.

When an organization wants to assure customers that the connection to their network is secure, it may pay a commercial Certificate Authority, such as VeriSign or DigiCert, to sign a certificate for their domain. However, to implement an X.509v3 infrastructure, you can act as your own CA. While acting as your own CA, you can set up CAs to issue certificates to hosts in the same trusted domain to authenticate each other.

X.509v3 public key infrastructure

To set up a PKI using X.509v3 certificates, Dell Technologies recommends:

1. Configure a root CA that generates a private key and a self-signed CA certificate.
2. Configure one or more intermediate CAs that generate a private key and a certificate signing request (CSR), and send the CSR to the root CA.
   - Using its private key, the root CA signs an intermediate CA's CSR and generates a CA certificate for the intermediate CA.
   - The intermediate CA downloads and installs the CA certificate. Afterwards, the intermediate CA can sign certificates for hosts in the network and for other intermediate CAs that are lower in the PKI hierarchy.
   - The root and intermediate CA certificates, but not the corresponding private keys, are made publicly available on the network for network hosts to download.
   - Whenever possible, store private keys offline or in a location restricted from general access.
3. Generate private keys and create CSRs on OS10 switches using the `crypto cert generate request` command. A switch uploads a CSR to an intermediate CA. To store the private key in a local hidden location, Dell Technologies recommends using the `key-file private` parameter with the command.
4. Download and install a CA certificate on a host using the `crypto ca-cert install` command. After you install a CA certificate, a host trusts any certificates that are signed by the CA and presented by other network devices. You must first download a certificate to the home directory, and then install the certificate using the `crypto ca-cert install` command.
5. Download and install a signed host certificate and private key from an intermediate CA on an OS10 switch. Then install them using the `crypto cert install` command. After you install the host certificate, OS10 applications use the certificate to secure communication with network devices. The private key is installed in the internal file system on the switch and cannot be exported or viewed.

Manage CA certificates

OS10 supports the download and installation of public X.509v3 certificates from external certificate authorities.

In a data center environment, trusted CA servers can create CA certificates. A host operates as a trusted CA server. Network hosts install certificates that are digitally signed with the CA's private key to establish trust between participating devices in the network. The certificate on an OS10 switch is used to verify the certificates presented by clients and servers, such as Syslog and RADIUS servers, to establish a secure connection with these devices.

To import a CA server certificate:

1. Use the `copy` command to download an X.509v3 certificate created by a CA server using a secure method, such as HTTPS, SCP, or SFTP. Copy the CA certificate to the local directory on the switch, such as `home://` or `usb://`.
2. Use the `crypto ca-cert install` command to install the certificate. When you install a CA certificate, specify the local path where the certificate is stored.

The switch verifies the certificate and installs it in an existing directory of trusted certificates in PEM format.

Install CA certificate

- Install a CA certificate in EXEC mode.

```
crypto ca-cert install ca-cert-filepath [filename]
```

- *ca-cert-filepath* specifies the local path to the downloaded certificate; for example, `home://CAcert.pem` or `usb://CA-cert.pem`.
- *filename* specifies an optional filename that the certificate is stored under in the OS10 trust-store directory. Enter the filename in the *filename*`.crt` format.

Example: Download and install CA certificate

```
OS10# copy scp:///tftpuser@10.11.178.103:/tftpboot/certs/Dell_rootCA1.pem home://
Dell_rootCA1.pem
password:

OS10# crypto ca-cert install home://Dell_rootCA1.pem
Processing certificate ...
Installed Root CA certificate
  CommonName = Dell_rootCA1
  IssuerName = Dell_rootCA1
```

Display CA server certificate

```
OS10# show crypto ca-certs
 -------------------------------------
|    Locally installed certificates    |
 -------------------------------------
Dell_rootCA1.crt
```

```
OS10# show crypto ca-certs Dell_rootCA1.crt

Delete CA server certificate

```
OS10# crypto ca-cert delete Dell_rootCA1.crt
Successfully removed certificate
```

Certificate revocation

Before the switch and an external device, such as a RADIUS or TLS server, set up a secure connection, they present CA-signed certificates to each other. The certificate validation allows peers to authenticate each other's identity, and is followed by checking to ensure that the certificate has not been revoked by the issuing CA.

A certificate includes the URL and other information about the certificate distribution point (CDP) that issued the certificate. Using the URL, OS10 accesses the CDP to download a certificate revocation list (CRL). If the external device's certificate is on the list or if the CDP server does not respond, the connection is not set up.

A certificate revocation list contains a list of all revoked certificates. The CA that issued the certificates maintains the CRL. CAs publish a new CRL at periodic intervals. An OS10 switch automatically downloads the new CRL and uses it to verify certificates presented by connecting devices.

When a CA issues a certificate, it usually includes the CRL distribution point in the certificate. OS10 uses the CDP URL to access the server with the current CRL. OS10 supports using multiple CDPs and CRLs during a CRL revocation check. If a CRL check validates a certificate from an external device, OS10 sets up a secure connection to perform the tasks initiated by the application.

Like CA certificates, CRLs are maintained in the trust store on the switch and applied to all PKI-enabled applications. To use CRLs to validate certificates presented by external devices:

1. Configure the URL for a certificate distribution point in EXEC mode.

   ```
   crypto cdp add cdp-name cdp-url
   ```

   Verify the CDPs accessed by the switch in EXEC mode.

   ```
   show crypto cdp [cdp-name]
   ```

   To delete an installed CDP, use the `crypto cdp delete cdp-name` command.

2. Install CRLs that have been downloaded from CDPs in EXEC mode.

   ```
   crypto crl install crl-path [crl-filename]
   ```

   Display a list of the CRLs installed on the switch in EXEC mode.

   ```
   show crypto crl [crl-filename]
   ```

   To delete a manually installed CRL that was configured with the `crypto crl install` command, use the `crypto crl delete [crl-filename]` command.

To enable CRL checking on the switch, see Security profiles.

Example: Configure CDP

```
OS10# crypto cdp add cert1_cdp http://crl.chambersign.org/chambersignroot.crl
Successfully added CDP

OS10# show crypto cdp
--------------------------------------
|       Manually installed CDPs       |
--------------------------------------
cert1_cdp.crl_url
--------------------------------------
|      Automatically installed CDPs   |
--------------------------------------
```

Example: Install CRL

```
OS10# crypto crl install home://pki-regression/Network_Solutions_Certificate_
Authority.0.crl.pem
Processing file ...

issuer=C=US,O=Network Solutions L.L.C.,CN=Network Solutions Certificate
Authority.0.crl.pem
lastUpdate=Jul  7 04:15:08 2019 GMT
nextUpdate=Jul 11 04:15:08 2019 GMT

OS10# show crypto crl
--------------------------------------
|       Manually installed CRLs       |
--------------------------------------
Network_Solutions_Certificate_Authority.0.crl.pem
--------------------------------------
|           Downloaded CRLs           |
--------------------------------------
```

Request and install host certificates

OS10 also supports the switch obtaining its own X.509v3 host certificate. In this procedure, you generate a certificate signing request (CSR) and a private key. Store the private key locally in a secure location. Copy the CSR file to a certificate authority. The CA generates a host certificate for an OS10 switch by digitally signing the switch certificate contained in the CSR.

The administrator then copies the CA-signed host certificate to the home directory on the switch. Because a local private key is created when the CSR is generated, it is not necessary to install a private key using an uploaded file.

The switch presents its own host certificate to clients that require authentication, such as Syslog and RADIUS servers over TLS and HTTPS connections. The certificate is digitally signed with the private key of the OS10 switch. OS10 supports multiple host certificates so that you can use different certificates with different applications. For more information, see Security profiles.

To obtain a host certificate from a CA:

1. Create a private key and generate a certificate signing request for the switch.
2. Copy the CSR file to a CA server.
3. Copy the CA-signed certificate to the home directory on the switch. Install the trusted certificate.

Generate a certificate signing request and private key

- Create a private key and a CSR in EXEC mode. Store the CSR file in the home directory or `flash:` so that you can later copy it to a CA server. Specify a *keypath* to store the `device.key` file in a secure persistent location, such as the home directory, or use the `private` option to store the key file in a private hidden location in the internal file system that is not visible to users.

  ```
  crypto cert generate request [cert-file cert-path key-file {private | keypath}]
  [country 2-letter code] [state state] [locality city] [organization organization-name]
  [orgunit unit-name] [cname common-name] [email email-address] [validity days]
  [length length] [altname alt-name]
  ```

  If you enter the `cert-file` option, you must enter all the required parameters, such as the local paths where the certificate and private key are stored, country code, state, locality, and other values.

  If you do not specify the `cert-file` option, you are prompted to fill in the other parameter values for the certificate interactively; for example:

  ```
  You are about to be asked to enter information that will be incorporated into your
  certificate request.
  What you are about to enter is what is called a Distinguished Name or a DN.
  There are quite a few fields but you can leave some blank.
  For some fields there will be a default value; if you enter '.', the field will be
  left blank.
  Country Name (2 letter code) [US]:
  State or Province Name (full name) [Some-State]:California
  Locality Name (eg, city) []:San Francisco
  Organization Name (eg, company) []:Starfleet Command
  Organizational Unit Name (eg, section) []:NCC-1701A
  Common Name (eg, YOUR name) [hostname]:S4148-001
  Email Address []:scotty@starfleet.com
  ```

  The switch uses SHA-256 as the digest algorithm. The public key algorithm is RSA with a 2048-bit modulus. The KeyUsage bits of the certificate assert `keyEncipherment` (bit 2) and `keyAgreement` (bit 4). The `keyCertSign` bit (bit 5) is NOT set. The ExtendedKeyUsage fields indicate `serverAuth` and `clientAuth`.

  The attribute `CA:FALSE` is set in the Extensions section of the certificate. The certificate is NOT used to validate other certificates.

- If necessary, re-enter the command to generate multiple certificate-key pairs for different applications on the switch. You can configure a certificate-key pair in a security profile. Using different certificate-key pairs is necessary if you want to change the certificate-key pair for a specified application without out interrupting other critical services. For example, RADIUS over TLS may use a different certificate-key pair than SmartFabric services.

NOTE:

If the system is in FIPS mode using the `crypto fips enable` command, the CSR and private key are generated using FIPS-validated and compliant algorithms. You manage whether the keys are generated in FIPS mode or not.

Copy CSR to the CA server

You can copy the CSR from flash to a destination, such as a USB flash drive, using TFTP, FTP, or SCP.

```
OS10# copy home://DellHost.pem  scp:///tftpuser@10.11.178.103:/tftpboot/certs/
DellHost.pem
password:
```

The CA server signs the CSR with its private key. The CA server then makes the signed certificate available for the OS10 switch to download and install.

Install host certificate

1. Use the `copy` command to download an X.509v3 certificate signed by a CA server to the local home directory using a secure method, such as HTTPS, SCP, or SFTP.
2. Use the `crypto cert install` command to install the certificate and the private key generated with the CSR.

- Install a trusted certificate and key file in EXEC mode.

```
crypto cert install cert-file home://cert-filepath key-file {key-path | private}
[password passphrase] [fips]
```

  - `cert-file cert-filepath` specifies a source location for a downloaded certificate; for example, `home://s4048-001-cert.pem` or `usb://s4048-001-cert.pem`.
  - `key-file {key-path | private}` specifies the local path to retrieve the downloaded or locally generated private key. Enter `private` to install the key from a local hidden location and rename the key file with the certificate name.
  - `password passphrase` specifies the password used to decrypt the private key if it was generated using a password.
  - `fips` installs the certificate-key pair as FIPS-compliant. Enter `fips` to install a certificate-key pair that is used by a FIPS-aware application, such as RADIUS over TLS. If you do not enter `fips`, the certificate-key pair is stored as a non-FIPS-compliant pair.

    NOTE: You determine if the certificate-key pair is generated as FIPS-compliant. Do not use FIPS-compliant certificate-key pairs outside of FIPS mode. When FIPS mode is enabled, you can still generate CSRs for non-FIPS certificates for use with non-FIPS applications. Be sure to install these certificates as non-FIPS with the `crypto cert install` command.
  - If you enter `fips` after using the `key-file private` option in the `crypto cert generate request` command, a FIPS-compliant private key is stored in a hidden location in the internal file system that is not visible to users.

If the certificate installation is successful, the file name of the host certificate and its common name are displayed. Use the filename to configure the certificate in a security profile using the `crypto security-profile` command.

Example: Generate CSR and upload to server

```
OS10# crypto cert generate request cert-file home://DellHost.pem key-file home://
DellHost.key email admin@dell.com length 1024 altname DNS:dell.domain.com
Processing certificate ...
Successfully created CSR file /home/admin/DellHost.pem and key

OS10# copy home://DellHost.pem  scp:///tftpuser@10.11.178.103:/tftpboot/certs/
DellHost.pem
password:
```

Host certificate tip

When administering a large number of switches, you may choose to not generate numerous CSRs for all switches. An alternate method to installing a host certificate on each switch is to generate both the private key file and CSR offline; for example, on the CA server. The CSR is signed by the CA, which generates both a certificate and key file. You then copy the trusted certificate and key file to the switch using the `copy` command and install them using the `crypto cert install cert-file home://cert-filename key-file home://key-filename` command.

NOTE: For security reasons, the private key file is copied to an internal, secure location and removed from the viewable file system.

Example: Download and install trusted certificate and private key

```
OS10# copy scp:///tftpuser@10.11.178.103:/tftpboot/certs/Dell_host1_CA1.pem home://
Dell_host1_CA1.pem
password:

OS10# copy scp:///tftpuser@10.11.178.103:/tftpboot/certs/Dell_host1_CA1.key home://
Dell_host1_CA1.key
```

```
password:

OS10# crypto cert install cert-file home://Dell_host1_CA1.pem key-file home://
Dell_host1_CA1.key
Processing certificate ...
Certificate and keys were successfully installed as "Dell_host1_CA1.pem" that may be
used in a
security profile. CN = Dell_host1_CA1
```

Display trusted certificates

```
OS10# show crypto cert

```

Self-signed certificates

Administrators may prefer to not set up a Certificate Authority and implement a certificate trust model in the network, but still want to use the privacy features provided by the Transport Layer Security (TLS) protocol. In this case, self-signed certificates can be used.

A self-signed certificate is not signed by a CA. The switch presents itself as a trusted device in its certificate. Connecting clients may prompt their users to trust the certificate — for example, when a web browser warns that a site is unsafe — or to reject the certificate, depending on the configuration. A self-signed certificate does not provide protection against man-in-the-middle attacks.

To generate and install a self-signed certificate:

1. Create a self-signed certificate and key in a local directory or USB flash drive.
2. Install the self-signed certificate.

Generate a self-signed certificate

- Create a self-signed certificate in EXEC mode. Store the `device.key` file in a secure, persistent location, such as NVRAM.

  ```
  crypto cert generate self-signed [cert-file cert-path key-file {private | keypath}]
  [country 2-letter code] [state state] [locality city] [organization organization-name]
  [orgunit unit-name] [cname common-name] [email email-address] [validity days]
  [length length] [altname alt-name]
  ```

  If you enter the `cert-file` option, you must enter all the required parameters, including the local path where the certificate and private key are stored.

  If you do specify the `cert-file` option, you are prompted to enter the other parameter values for the certificate interactively; for example:

  ```
  You are about to be asked to enter information that will be incorporated in your
  certificate request.
  What you are about to enter is what is called a Distinguished Name or a DN.
  There are quite a few fields but you can leave some blank.
  For some fields there will be a default value; if you enter '.', the field will be
  left blank.
  Country Name (2 letter code) [US]:
  State or Province Name (full name) [Some-State]:California
  Locality Name (eg, city) []:San Francisco
  Organization Name (eg, company) []:Starfleet Command
  Organizational Unit Name (eg, section) []:NCC-1701A
  Common Name (eg, YOUR name) [hostname]:S4148-001
  Email Address []:scotty@starfleet.com
  ```

The switch uses SHA-256 as the digest algorithm. The public key algorithm is RSA with a 2048-bit modulus.

NOTE: When using self-signed X.509v3 certificates with Syslog and RADIUS servers, configure the server to accept self-signed certificates. Syslog and RADIUS servers require mutual authentication, which means that the client and server must verify each other's certificates. Dell Technologies recommends configuring a CA server to sign certificates for all trusted devices in the network.

Install self-signed certificate

- Install a self-signed certificate and key file in EXEC mode.

  ```
  crypto cert install cert-file home://cert-filename key-file {key-path | private}
  [password passphrase] [fips]
  ```

  - `cert-file cert-path` specifies a source location for a downloaded certificate; for example, `home://s4048-001-cert.pem` or `usb://s4048-001-cert.pem`.

- `key-file {key-path | private}` specifies the local path to retrieve the downloaded or locally generated private key. Enter `private` to install the key from a local hidden location and rename the key file with the certificate name.
- `password passphrase` specifies the password used to decrypt the private key if it was generated using a password.
- `fips` installs the certificate-key pair as FIPS-compliant. Enter `fips` to install a certificate-key pair that is used by a FIPS-aware application, such as RADIUS over TLS. If you do not enter `fips`, the certificate-key pair is stored as a non-FIPS compliant pair.

  NOTE: You determine if the certificate-key pair is generated as FIPS-compliant. Do not use FIPS-compliant certificate-key pairs outside of FIPS mode.
- If you enter `fips` after using the `key-file private` option in the `crypto cert generate request` command, a FIPS-compliant private key is stored in a hidden location in the internal file system that is not visible to users.

If the certificate installation is successful, the file name of the self-signed certificate and its common name are displayed. Use the file name to configure the certificate in a security profile using the `crypto security-profile` command.

Example: Generate and install self-signed certificate and key

```
OS10# crypto cert generate self-signed cert-file home://DellHost.pem key-file home://
DellHost.key email admin@dell.com length 1024 altname DNS:dell.domain.com validity 365
Processing certificate ...
Successfully created certificate file /home/admin/DellHost.pem and key

OS10# crypto cert install cert-file home://DellHost.pem key-file home://DellHost.key
Processing certificate ...
Certificate and keys were successfully installed as "DellHost.pem" that may be used in a
security profile. CN = DellHost.
```

Display self-signed certificate

```

```

Security profiles

To use independent sets of security credentials for different OS10 applications, you can configure multiple security profiles and assign them to OS10 applications. A security profile consists of a certificate and private key pair.

For example, you can maintain different security profiles for RADIUS over TLS authentication and SmartFabric services. You can assign a security profile to an application when you configure the profile.

When you install a certificate-key pair, both take the name of the certificate. For example, if you install a certificate using:

```
OS10# crypto cert install cert-file home://Dell_host1.pem key-file home://abcd.key
```

The certificate-key pair is installed as `Dell_host1.pem` and `Dell_host1.key`. In configuration commands, refer to the pair as `Dell_host1`. When you configure a security profile, you would enter `Dell_host1` in the `certificate` *`certificate-name`* command.

Configure security profile

1. Create an application-specific security profile in CONFIGURATION mode.

   ```
   crypto security-profile profile-name
   ```

2. Assign a certificate and private key pair to the security profile in SECURITY-PROFILE mode. For *`certificate-name`*, enter the name of the certificate-key pair as it appears in the `show crypto certs` output without the `.pem` extension.

   ```
   certificate certificate-name
   exit
   ```

3. (Optional) Enable CRL checking for certificates received from external devices in SECURITY-PROFILE mode. CRL checking verifies the validity of a certificate using the CRLs installed on the switch.

   ```
   revocation-check
   ```

4. (Optional) Enable peer name checking for certificates presented by external devices in SECURITY-PROFILE mode. Peer name checking ensures that the certificate matches the name of the peer device, such as a remote server name.

   ```
   peer-name-check
   ```

5. Use the security profile to configure X.509v3-based service; for example, to configure RADIUS over TLS authentication using an X.509v3 certificate, enter the `radius-server host tls` command:

   ```
   radius-server host {hostname | ip-address} tls security-profile profile-name
   [auth-port port-number] key {0 authentication-key | 9 authentication-key |
   authentication-key}
   ```

Example: Security profile in RADIUS over TLS authentication

```
OS10# show crypto cert
--------------------------------------
|    Installed non-FIPS certificates    |
--------------------------------------
dv-fedgov-s6010-1.pem
--------------------------------------
|    Installed FIPS certificates    |
--------------------------------------
OS10#
OS10(config)#
OS10(config)# crypto security-profile radius-prof
OS10(config-sec-profile)# certificate dv-fedgov-s6010-1
OS10(config-sec-profile)# revocation-check
OS10(config-sec-profile)# peer-name-check
OS10(config-sec-profile)# exit
OS10(config)#
OS10(config)# radius-server host radius-server-2.test.com tls security-profile radius-
prof key radsec
OS10(config)# end
```

```
OS10# show running-configuration crypto security-profile
!
crypto security-profile radius-prof
  certificate dv-fedgov-s6010-1

OS10# show running-configuration radius-server
radius-server host radius-server-2.test.com tls security-profile radius-prof key 9
2b9799adc767c0efe8987a694969b1384c541414ba18a44cd9b25fc00ff180e9
```

Cluster security

When you enable VLT or a fabric automation application, switches that participate in the cluster use secure channels to communicate with each other. The secure channels are enabled only when you enable the VLT or fabric cluster configuration on a switch. OS10 installs a default X.509v3 certificate-key pair to establish secure channels between the peer devices in a cluster.

NOTE: From 10.5.1.0 release onwards, there is no need for X.509v3 certificate in a VLT domain if both the VLT peers are running OS10 software version 10.5.1.0 or later. However, you still need the certificates during VLT upgrade from earlier version to 10.5.1.0. The upgraded VLT device has to communicate with the other VLT peer in a domain until the other device is also upgraded to 10.5.1.0.

Replace the default certificate-key pair used for cluster applications:

- In a deployment where untrusted devices access management or data ports on an OS10 switch.
- Before the default X.509v3 certificate expires on July 27, 2021. If the default certificate-key pair expires, the VLT domain on peer switches does not come up.

NOTE: The expiration date for the default certificate-key pair that is installed by OS10 on a switch running the 10.5.0.0 release is July 27, 2021. To ensure secure communication in a cluster before the expiration date, install a more recent X.509v3 certificate-key pair.

Create a custom X.509v3 certificate-key pair by configuring an application-specific security profile using the `cluster security-profile` command. Before the default or custom X.509v3 certificate-key pair that is used between the peer devices in a VLT domain or fabric application cluster expires, install a valid CA certificate by following the procedures in:

- Manage CA certificates.
- Request and install host certificates.

When you replace the default certificate-key pair for cluster applications, ensure that all devices in the cluster use the same custom certificate-key pair or a unique certificate-key pair that is issued by the same CA.

CAUTION: While you replace the default certificate-key pair, cluster devices temporarily lose their secure channel connectivity. Dell Technologies recommends that you change the cluster security configuration during a maintenance time.

This example shows how to install an X.509v3 CA and host certificate-key pair for a cluster application. For more information, see:

- Importing and installing a CA certificate — see Manage CA certificates.
- Generating a CSR and installing a host certificate — see Request and install host certificates.

1. Install a trusted CA certificate.

```
OS10# copy tftp://CAadmin:secret@172.11.222.1/GeoTrust_Universal_CA.crt
home:// GeoTrust_Universal_CA.crt

OS10# crypto ca-cert install home://GeoTrust_Universal_CA.crt
Processing certificate ...
Installed Root CA certificate

CommonName = GeoTrust Universal CA
IssuerName = GeoTrust Universal CA
```

2. Generate a CSR, copy the CSR to a CA server, download the signed certificate, and install the host certificate.

```
OS10# crypto cert generate request cert-file home://s4048-001.csr key-file home://
tsr6.key cname "Top of Rack 6" altname "IP:10.0.0.6 DNS:tor6.dell.com" email
admin@dell.com organization "Dell EMC" orgunit Networking locality "Santa Clara" state
California country US length 1024
Processing certificate ...
```

```
Successfully created CSR file /home/admin/tor6.csr and key

OS10# copy home://tor6.csr scp://CAadmin:secret@172.11.222.1/s4048-001-csr.pem

OS10# copy scp://CAadmin:secret@172.11.222.1/s4048-001.crt usb://s4048-001.crt

OS10# crypto cert install crt-file usb://s4048-001.crt key-file usb://s4048-001.key
This will replace the already installed host certificate.
Do you want to proceed ? [yes/no(default)]:yes
Processing certificate ...
Host certificate installed successfully.
```

3. Configure an X.509v3 security profile.

```
OS10# show crypto cert
-------------------------------------
|    Installed non-FIPS certificates    |
-------------------------------------
s4048-001
-------------------------------------
|    Installed FIPS certificates    |
-------------------------------------
OS10# config terminal
OS10(config)# crypto security-profile secure-cluster
OS10(config-sec-profile)# certificate s4048-001
OS10(config-sec-profile)# exit
```

4. Configure the cluster security profile.

```
OS10(config)# cluster security-profile secure-cluster
OS10(config)# exit
```

SSH Smart Card Authentication

OS10 allows you to use Common Access Card (CAC) and Personal Identity Verification (PIV) smart cards for authenticating users when connecting with Secure Shell (SSH). CAC and PIV smart cards contain Public Key Infrastructure (PKI) X.509v3 certificates that are issued by certificate authorities. This feature allows the OS10 software to verify user authentication and email signing and encryption. To use smart card authentication, use an SSH client that supports X.509v3 authentication.

The OS10 SSH server supports X.509v3 smart card authentication in two forms - with or without a password. When you use X.509v3 authentication with passwords, you can use X.509v3 authentication along with remote authentication using RADIUS or TACACS+ authentication.

Remote user authentication with a password

When you configure the switch for X.509v3 SSH authentication and remote authentication of users using RADIUS or TACACS+, and when connecting using SSH, the following sequence occurs:

1. Insert a CAC or PIV smart card into the card reader slot in your computer or keyboard.
2. Start an RFC 6187 X.509v3 compatible SSH client application, set authentication to smart card or CAC, and make a connection to the OS10 switch.
3. The SSH client application makes the initial connection to the switch, negotiates X.509v3 authentication, and validates the OS10 switch X.509v3 certificate.
4. The SSH client application prompts you to select the required authentication certificate from the CAC or PIV card.
5. The SSH client application prompts you to enter the PIN for the CAC or PIV card.
6. The SSH client application sends an authentication request with your X.509v3 certificate.
7. The OS10 SSH server validates the public certificate, including validating the trust chain, valid date range, and usage fields. If any of the fields are invalid, the authentication fails.
8. If the configured OS10 security profile calls for revocation checking, the OS10 SSH server verifies that the certificate is not revoked. Verification is done by checking either the appropriate CRL or by sending an OCSP request to the appropriate OCSP responder.
9. If the certificate is revoked, the authentication fails.
10. If peer-name-checking is enabled in the security profile, the OS10 SSH server matches the common name or principal name fields from the user certificate against the username. The authentication fails if there is no match.

11. The OS10 SSH server prompts you for a password.
12. The OS10 SSH server performs standard RADIUS or TACACS+ user authentication using the username and returned password.
13. On successful authentication, the SSH session continues.

Local user authentication with a password

When you configure the OS10 SSH server for X.509v3 SSH local authentication and when you connect using SSH, the following sequence occurs:

1. Insert a CAC or PIV smart card into the card reader slot in your computer or keyboard.
2. Start an RFC 6187 X.509v3 compatible SSH client application, set authentication to smart card or CAC, and make a connection to the OS10 switch.
3. The SSH client application makes the initial connection to the switch, negotiates X.509v3 authentication, and validates the X.509v3 certificate.
4. The SSH client application prompts you to select the required authentication certificate from the CAC or PIV card.
5. The SSH client application prompts you to enter the PIN for the CAC or PIV card.
6. The SSH client application sends an authentication request with the X.509v3 certificate.
7. The OS10 SSH server validates the public certificate, including validating the trust chain, valid date range, and usage fields. If any of the fields are invalid, the authentication fails.
8. If the configured OS10 security profile calls for revocation checking, the OS10 SSH server verifies that the certificate is not revoked. Verification is done by checking either the appropriate CRL or by sending an OCSP request to the appropriate OCSP responder.
9. If the certificate is revoked, the authentication fails.
10. If peer-name-checking is enabled in the security profile, the OS10 SSH server matches the common name or principal name fields from the user certificate against the username.
11. If there is no match, the OS10 SSH server attempts to match the user certificate fields against any configured certificate for that local username.
12. If there is no match, the authentication fails.
13. The OS10 SSH server prompts you for a password.
14. The OS10 SSH server performs standard local user authentication using the username and returned password.
15. On successful authentication, the SSH session continues.

Local user authentication without a password

When you configure OS10 SSH server for X.509v3 SSH local authentication, and when connecting using SSH, the following sequence occurs:

1. Insert a CAC or PIV smart card into the card reader slot in your computer or keyboard.
2. Start an RFC 6187 X.509v3 compatible SSH client application, set authentication to smart card or CAC, and make a connection to the OS10 switch.
3. The SSH client application makes the initial connection to the switch, negotiates X.509v3 authentication, and validates the OS10 switch X.509v3 certificate.
4. The SSH client application prompts you to select the required authentication certificate from the CAC or PIV card.
5. The SSH client application prompts you to enter the PIN for the CAC or PIV card.
6. The SSH client application sends an authentication request with the X.509v3 certificate.
7. The OS10 SSH server validates the public certificate, including validating the trust chain, valid date range, and usage fields. If any of the fields are invalid, the authentication fails.
8. If the configured OS10 security profile calls for revocation checking, the OS10 SSH server verifies that the certificate is not revoked. Verification is done by checking either the appropriate CRL or by sending an OCSP request to the appropriate OCSP responder.
9. If the certificate is revoked, the authentication fails.
10. The OS10 SSH server attempts to match the user certificate fields against the configured certificate for that local username.
11. If there is a match, the authentication succeeds and the SSH session proceeds without a password prompt.

General X.509v3 configuration for X.509v3 SSH authentication

Both forms of X.509v3 authentication require configuring the X.509v3 PKI support. The following are the security profile details:

- Install CA and host PKI certificates.

```
crypto ca-cert install ca-cert-filepath [filename]
crypto cert install cert-file home://cert-filepath key-file {key-path | private}
[password passphrase] [fips]
```

- Create a security profile with certificate and required attributes.

```
crypto security-profile profile-name
certificate certificate-name
peer-name-check
key-usage-check
revocation-check
```

Configure remote user authentication with a password

To support remote user authentication by smart card and password, configure the following:

- Enable RADIUS or TACACS+ authentication.

```
radius-server host {hostname | ip-address} key {0 authentication-key | 9
authentication-key | authentication-key} [auth-port port-number]
aaa authentication login default group radius local
```

- Enable X.509v3 authentication in the SSH server.

```
ip ssh server x509v3-authentication security-profile profile-name
```

- If all SSH login attempts require an X.509v3 certificate, disable the plain password authentication and SSH public key authentication in the SSH server.

```
no ip ssh server password-authentication
no ip ssh server pubkey-authentication
```

Configure local user authentication with a password

To support local user authentication by smart card and password, configure the following:

- Enable X.509v3 authentication in the SSH server.

```
ip ssh server x509v3-authentication security-profile profile-name
```

- If all SSH login attempts present an X.509v3 certificate, disable the plain password authentication and SSH public key authentication in the SSH server.

```
no ip ssh server password-authentication
no ip ssh server pubkey-authentication
```

- If you enable the key-usage-check in the security profile but the user certificates uses a different name syntax than the user login names, configure the user certificate details to allow the SSH server to match the user certificate to the account.

```
username username certificate subject “x509v3-subject-string”
or
username username certificate principal-name user-principal-name-string
or
username username certificate fingerprint fingerprint-value
```

Configure local user authentication without a password

To support password-less local user authentication using a smart card and password, configure the following:

- Enable password-less X.509v3 authentication in the SSH server.

```
ip ssh server x509v3-authentication security-profile profile-name password-less
```

- Leave plain password authentication enabled for users that do not have a configured certificate.

```
ip ssh server password-authentication
```

- Leave plain public key authentication enabled if it is required that users can alternatively use SSH public key password-less authentication.

```
ip ssh server pubkey-authentication
```

- Configure the user X.509v3 certificate details to allow the SSH server to match the user certificate to the account.

```
username username certificate subject "x509v3-subject-string"
or
username username certificate principal-name user-principal-name-string
or
username username certificate fingerprint fingerprint-value
```

Security profile settings used by X.509v3 authentication

When you log in with an X.509v3 certificate, OS10 validates the certificate before granting access. The options to control the applied validation are determined by the specific security profile that you configured for X.509v3 SSH authentication.

The following table describes each of the available security profile options, and how they are applied to X.509v3 SSH authentication.

Table 94. Security profile settings used by X.509v3 authentication

Security profile setting	Description
certificate	At initialization of the session, the SSH protocol exchanges host keys between the SSH server and client. The keys are used both to authenticate the SSH server and client, and to secure the initial session setup. OS10 supports both traditional SSH host keys and X.509v3 certificate host keys. In OS10 SSH, authentication works with or without a PKI host certificate that is associated with the security profile. If you configure a certificate name in the security profile and the certificate is installed, the SSH daemon exchanges the X.509v3 certificate with the client during the client/server authentication. This configuration enables the client to authenticate the server using a PKI certificate authority.
key-usage-check	When you configure the key-usage-check setting in the security profile, the OS10 SSH server validates the **key usage** and **extended key usage** fields in the user certificate. The **key usage** field must contain the digital signature purpose. If the **extended key usage** field is present in the user certificate, it must include the client authentication purpose. key-usage-check is disabled by default in security profiles, but Dell Technologies recommend using X509v3 SSH authentication.
ocsp-check	If you configure the ocsp-check option in the security profile and the user certificate contains an OCSP responder URL in the Authority Information Access section, the OS10 SSH server verifies the revocation status of the user certificate with the OCSP responder in the certificate. If you configure an OCSP responder URL in the security profile when verifying the revocation status, the OCSP responder URL is used instead of the OCSP URL in the certificate. In this way, you can configure the OCSP responder URL that is used as a proxy for the OCSP responder associated with a CA.
peer-name-check	When you configure the peer-name-check option, the OS10 SSH server verifies if the certificate presented by the user is associated with the username for the login attempt. The verification matches either the common name (CN) value from the **distinguished name** (DN) field or the user principal name from the **subject alternative name** (SAN) field of the certificate with the login username. Alternatively, if there is a configured user certificate in OS10 for this username, it is matched against the appropriate field in the user certificate. The configured user certificate validates user certificates that use different names when compared with the login name. The peer-name-check option is enabled by default and is not displayed in the running-configuration unless disabled.
revocation-check	If you configure the revocation-check option in the security profile, the OS10 SSH server verifies the revocation status of the user certificate in the installed or dynamically downloaded certificate revocation list (CRL) associated with the CA that signed the certificate.

Example: Configure RADIUS over TLS with X.509v3 certificates

This example shows how to install a trusted X.509v3 CA and a host certificate-key pair that supports RADIUS over TLS authentication.

1. Install a trusted CA certificate.

```
OS10# copy tftp://CAadmin:secret@172.11.222.1/GeoTrust_Universal_CA.crt home://
GeoTrust_Universal_CA.crt
OS10# crypto ca-cert install home://GeoTrust_Universal_CA.crt
Processing certificate ...
Installed Root CA certificate
CommonName = GeoTrust Universal CA
IssuerName = GeoTrust Universal CA
```

2. Generate a CSR, copy the CSR to a CA server, download the signed certificate, and install the host certificate.

```
OS10# crypto cert generate request cert-file home://s4048-001-csr.pem
key-file home://tsr6-key.pem cname "Top of Rack 6" altname "IP:10.0.0.6
DNS:tor6.dell.com"
email admin@dell.com organization "Dell EMC" orgunit Networking locality "santa Clara"
state California country US length 1024
Processing certificate ...
Successfully created CSR file /home/admin/tor6-csr.pem and key

OS10# copy home://tor6-csr.pem scp://CAadmin:secret@172.11.222.1/s4048-001-csr.pem

OS10# copy scp://CAadmin:secret@172.11.222.1/s4048-001.crt usb://s4048-001-crt.pem

OS10# crypto cert install crt-file usb://s4048-001-crt.pem key-file usb://s4048-001-
crt.key
This will replace the already installed host certificate.
Do you want to proceed ? [yes/no(default)]:yes
Processing certificate ...
Host certificate installed successfully.
```

3. Configure an X.509v3 security profile.

```
OS10# show crypto cert
-------------------------------------
|    Installed non-FIPS certificates    |
-------------------------------------
s4048-001-csr.pem
-------------------------------------
|    Installed FIPS certificates    |
-------------------------------------

OS10# config terminal
OS10(config)# crypto security-profile radius-admin
OS10(config-sec-profile)# certificate s4048-001-csr
OS10(config-sec-profile)# exit
```

4. Configure the RADIUS over TLS server.

```
OS10# radius-server host 10.0.0.1 tls security-profile radius-admin key radsec
```

5. Configure RADIUS-based user authentication.

```
OS10# aaa authentication login default group radius local
```

X.509v3 commands

certificate

Configures a certificate and private key pair in an application-specific security profile.

Syntax `certificate certificate-name`

Parameters *certificate-name* — Enter the name of the certificate-key pair as it appears in the `show crypto certs` output without the `.pem` extension.

Default Not configured

Command mode SEC-PROFILE

Usage information Use the `certificate` command to associate a certificate and private key with a security profile. An application-specific security profile allows you to change the certificate-key pair used by an OS10 application, such as SmartFabric services, without interrupting the service of other mission-critical applications.

When you install a certificate-key pair, both take the name of the certificate. Enter the certificate-key pair name without an extension as the *certificate-name* value. To remove a certificate-key pair from the profile, enter the `no certificate` command.

Example

```
OS10# crypto security-profile secure-radius-profile
OS10(config-sec-profile)# certificate Dell_host1
```

Supported releases 10.4.3.0 or later

crypto cert validate

Validates a certificate including the certificate chain.

Syntax `crypto cert validate {ca-cert cert-path | host-cert cert-path | file filepath}`

Parameters

- `ca-cert cert-path`—Enter the name of the CA certificate already installed in the trust store.
- `host-cert cert-path`—Enter the name of the host certificate already installed on the system.
- `file file-path`—Enter the local path where the certificate is stored. You can enter a full path or a relative path; for example, `home://s4048-001-cert.pem or usb:/s4048-001-cert.pem`.

Default Not configured

Command mode EXEC

Usage information Validation includes performing revocation checking of the certificate. This command validates a certificate, either installed or in the local file system, but does not change the system operation or behavior.

Supported releases 10.5.3.0 or later

cluster security-profile

Creates a security profile for a cluster application.

Syntax `cluster security-profile profile-name`

Parameters *profile-name* — Enter the name of the security profile; a maximum of 32 characters.

Default Not configured

Command mode CONFIGURATION

Usage information

When you enable VLT or a fabric automation application, switches that participate in the cluster use secure channels to communicate with each other. OS10 installs a default X.509v3 certificate-key pair to establish secure channels between the peer devices in a cluster. If untrusted devices access the management or data ports on the switch, replace the default certificate-key pair with a custom X.509v3 certificate-key pair using the `cluster security-profile` command. A security profile associates a certificate and private key pair using the `certificate` command. The `no` form of the command deletes the cluster security profile.

Example

```
OS10(config)# cluster security-profile secure-cluster
OS10(config)#
```

Supported releases

10.4.3.0 or later

crypto ca-cert delete

Deletes a CA certificate.

Syntax

`crypto ca-cert delete {`*`ca-cert-filepath`* `| all}`

Parameters

- *`ca-cert-filepath`* — Enter the local path where the downloaded CA certificate is stored; for example, `home://CAcert.pem` or `usb://CA-cert.pem`.
- `all` — Delete all CA certificates.

Default

Not configured

Command mode

EXEC

Usage information

To display the currently installed CA certificates, use the `show crypto ca-certs` command.

Example

```
OS10# crypto ca-cert delete Amazon_Root_CA.crt
Successfully removed certificate

OS10# crypto ca-cert delete all
Proceed to delete all installed CA certificates? [confirm yes/
no(default)]:yes
```

Supported releases

10.4.3.0 or later

crypto ca-cert install

Installs a certificate from a Certificate Authority that is copied to the switch.

Syntax

`crypto ca-cert install [trusted-host]` *`ca-cet-filepath`* `[`*`filename`*`] [home | usb]`

Parameters

- `trusted host`—(Optional) Enter `trusted-host` to apply a different validation to this certificate. Enables self-signed trusted server certificates to install the SmartFabric OS10 trust store even when the certificate is not a CA signer.
- *`ca-cert-filepath`*—Enter the local path where the downloaded CA certificate is stored; for example, `home://CAcert.pem` or `usb://CA-cert.pem`.
- *`filename`*—(Optional) Enter the filename that the CA certificate is stored under in the OS10 trust store directory. Enter the filename in the *`filename`*`.crt` format.
- `home`—Enter the certificate file name that is stored in the home directory.
- `usb`—Enter the certificate file name that is stored in a USB drive.

Default

Not configured

Command mode

EXEC

Usage information

Use the `trusted-host` keyword only for self-signed certificates corresponding to a trusted server, where the server is not a CA. This command validates a certificate based on two sets of rules: CA

certificate rules and trusted server rules. It is assumed that the certificate is CA signer unless you use the `trusted-host` keyword. If the validation fails, the certificate is not installed.

Example

```
OS10# crypto ca-cert install home://GeoTrust_Universal_CA.crt
Processing certificate ...
Installed Root CA certificate
CommonName = GeoTrust Universal CA
IssuerName = GeoTrust Universal CA
```

Example (Home or USB)

```
OS10#crypto ca-cert install home://ca-bundle.pem
```

Supported releases 10.4.3.0 or later

crypto cdp add

Installs a certificate distribution point (CDP) on the switch.

Syntax `crypto cdp add cdp-name cdp-url`

Parameters

- *cdp-name* — Enter a CDP name.
- *cdp-name* — Enter the HTTP URL used to reach the CDP.

Default Not configured

Command Mode EXEC

Usage Information Use the `show crypto cdp` command to display the CDPs already installed on the switch

Example

```
OS10# crypto cdp add Comsign http://fedir.comsign.co.il/crl/ComSignCA.crl
```

Supported Releases 10.5.0 or later

crypto cdp delete

Deletes a certificate distribution point from the trust store on the switch.

Syntax `crypto cdp delete crl-filename`

Parameters

- *cdp-name* — Enter a CDP name.

Default Not configured

Command Mode EXEC

Usage Information Before you delete a CDP, use the `show crypto cdp` command to display a list of all CDPs installed on the switch.

Example

```
OS10# crypto cdp delete Comsign
```

Supported Releases 10.5.0 or later

crypto cert delete

Deletes an installed host certificate and the private key created with it.

Syntax `crypto cert delete filename [fips]`

Parameters

- *filename* — Enter the file name of the host certificate as displayed in the `show crypto cert` command.
- `fips` — (Optional) Delete a FIPS-compliant certificate-key pair. To verify whether a certificate is non-FIPS or FIPS-compliant., use the `show crypto cert` command.

Default Not configured

Command mode EXEC

Usage information When you delete the system's certificate, you also delete the private key. Do not delete a host certificate that is used in a security profile. To display the currently installed host certificate and associated key, use the `show crypto cert` command.

NOTE: A FIPS-compliant and non-FIPS certificate may have the same file name. To delete a FIPS-compliant certificate, you must enter the `fips` parameter in the command.

Example

```
OS10# crypto cert delete Dell_host1_CA1.pem
Certificate and keys were successfully deleted. CN = Dell_host1_CA1
```

Supported releases 10.4.3.0 or later

crypto cert generate

Creates a certificate signing request (CSR) or a self-signed certificate.

Syntax

```
crypto cert generate {request | self-signed} [cert-file cert-path key-file
{private | keypath}] [country 2-letter code] [state state] [locality city]
[organization organization-name] [orgunit unit-name] [cname common-name]
[email email-address] [validity days] [length length] [altname alt-name]
```

Parameters

- `request` — Create a certificate signing request to copy to a CA.
- `self-signed` — Create a self-signed certificate.
- `cert-file cert-path` — (Optional) Enter the local path where the self-signed certificate or CSR is stored. You can enter a full path or a relative path; for example, `flash://certs/s4810-001-request.csr` or `usb://s4810-001.crt`. If you do not enter the `cert-file` option, the system interactively prompts you to fill in the remaining fields of the certificate signing request. Export the CSR to a CA using the `copy` command.
- `key-file {key-path | private}` — Enter the local path where the downloaded or locally generated private key is stored. If the key was downloaded to a remote server, enter the server path using a secure method, such as HTTPS, SCP, or SFTP. Enter `private` to store the key in a local hidden location.
- `country 2-letter-code` — (OPTIONAL) Enter the two-letter code that identifies the country.
- `state state` — Enter the name of the state.
- `locality city` — Enter the name of the city.
- `organization organization-name` — Enter the name of the organization.
- `orgunit unit-name` — Enter name of the unit.
- `cname common-name` — Enter the common name assigned to the certificate. Common name is the main identity presented to connecting devices. By default, the switch's host name is the common name. You can configure a different common name for the switch; for example, an IP address. If the *common-name* value does not match the device's presented identity, a signed certificate does not validate.
- `email email-address` — Enter a valid email address used to communicate with the organization.
- `validity days` — Enter the number of days that the certificate is valid. For a CSR, validity has no effect. For a self-signed certificate, the default is 3650 days or 10 years.

- `length bit-length` — Enter a bit value for the keyword length. For FIPS mode, the range is from 2048 to 4096; for non-FIPS mode, the range is from 1024 to 4096. The default key length for both FIPS and non-FIPS mode is 2048 bits. The minimum key length value for FIPS mode is 2048 bits. The minimum key length value for non-FIPS mode is 1024 bits.
- `altname altname` — Enter an alternate name for the organization; for example, using the IP address such as `altname IP:192.168.1.100`.

Default Not configured

Command mode EXEC

Usage information Generate a CSR when you want a CA to sign a host certificate. Generate a self-signed certificate if you do not set up a CA and implement a certificate trust model in your network.

If you enter the `cert-file` option, you must enter all the required parameters, including the local path where the certificate and private key are stored.

If you do not specify the `cert-file` option, you are prompted to fill in the other parameter values for the certificate interactively; for example:

```
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a
DN.
There are quite a few fields but you can leave some blank.
For some fields there will be a default value; if you enter '.', the
field will be left blank.
Country Name (2 letter code) [US]:
State or Province Name (full name) [Some-State]:California
Locality Name (eg, city) []:San Francisco
Organization Name (eg, company) []:Starfleet Command
Organizational Unit Name (eg, section) []:NCC-1701A
Common Name (eg, YOUR name) [hostname]:S4148-001
Email Address []:scotty@starfleet.com
```

If the system is in FIPS mode — `crypto fips enable` command — the CSR and private key are generated using approved algorithms from a cryptographic library that has been validated against the FIPS 140-2 standard. You can install the FIPS-compliant certificate-key pair using the `crypto cert install` command with the `fips` option.

Examples

```
OS10# crypto cert generate request cert-file home://cert1.pem key-file
home://cee OS10-VM email admin@dell.com length 1024 altname DNS.dell.com
Processing certificate ...

Successfully created CSR file /home/admin/cert1.pem and key
```

```
OS10# crypto cert generate self-signed cert-file home://cert2.pem key-
file home:e OS10-VM email admin@dell.com length 1024 altname.dell.com
validity 365
Processing certificate ...

Successfully created certificate file /home/admin/cert2.pem and key
```

Supported releases 10.4.3.0 or later

crypto cert install

Installs a host certificate and private key on the switch. A host certificate may be trusted from a CA or self-signed.

Syntax

```
crypto cert install cert-file cert-path key-file {key-path | private}
[password passphrase] [fips] [verify]
```

Parameters

- `cert-file` *`cert-path`*—Enter the local path where the downloaded certificate is stored. You can enter a full path or a relative path; for example, `home://s4048-001-cert.pem` or `usb://s4048-001-cert.pem` or `flash://certs/s4810-001-request.crt`.
- `key-file {`*`key-path`* `| private}`—Enter the local path to retrieve the downloaded or locally generated private key. Specify a *key-path* to install the key from a local directory. Enter `private` to install the key from a local hidden location. After the certificate is successfully installed, the private key is deleted from the specified *`key-path`* location and copied to the hidden location.
- `password` *`passphrase`*—(Optional) Enter the password used to decrypt the private key if it was generated using a password.
- `fips`—(Optional) Install the certificate-key pair as FIPS-compliant. Enter `fips` to install a certificate-key pair that a FIPS-aware application, such as RADIUS over TLS, uses. If you do not enter `fips`, the certificate-key pair is stored as a non-FIPS compliant pair.
- `verify`—(Optional) Validate the certificate and its certificate chain (if not self-signed). If the certificate does not validate, it does not install the certificate or key pair. Validation includes performing revocation checking of the certificate.

Default Not configured

Command mode EXEC

Security and access Accessible to `sysadmin` and `secadmin` roles.

Usage information Before using the `crypto cert install` command, copy a CA-signed certificate to the home directory on the switch using a secure connection, such as HTTPS, SCP, or SFTP, and (optionally) the private key. To delete a trusted certificate, use the `crypto cert delete` command.

A successful installation of a trusted certificate requires that:

- The downloaded certificate is correctly formatted.
- The downloaded certificate's public key corresponds to the private key.

You can assign an installed certificate-key pair to a security profile by entering the file name of the certificate without an extension.

It is possible to store a certificate in either FIPS mode or non-FIPS mode on the switch, but not in both modes, using the `crypto cert install` command and the optional `fips` option. You must ensure that certificates that are installed in FIPS mode are compliant with the FIPS 140-2 standard.

The certificate may be validated before performing the installation, if wanted. The validation checks the notBefore or notAfter fields, basicConstraints CA flag, and the certificate chain (if not self-signed). Failure to validate prevents the installation of the host certificate.

The `crypto cert install` command performs validation of a host certificate about to be installed, if the verify keyword is used. If the validation fails, then the host certificate is not installed. Also, the private key is not installed.

Example

```
OS10# crypto cert install cert-file home://Dell_host1_CA1.pem key-file
home://Dell_host1_CA1.key
Processing certificate ...
Certificate and keys were successfully installed as "Dell_host1_CA1.pem"
that may be used in a security profile. CN = Dell_host1_CA1.
```

Supported releases 10.4.3.0 or later

crypto crl delete

Deletes a Certificate Revocation List file in the trust store on the switch.

Syntax `crypto crl delete` *`crl-filename`*

Parameters

- *`crl-filename`* — Enter a CRL filename with the `.pem` extension as displayed under `Manually installed CRLs` in `show crypto crl` output.

Default Not configured

Command Mode EXEC

Usage Information	The `crypto crl delete` command deletes only manually installed CRLs. Before you delete a CRL, use the `show crypto crl` command to display a list of all CRLs installed on the switch.
Example	`OS10# crypto crl delete COMODO_Certification_Authority.0.crl.pem`
Supported Releases	10.5.0 or later

crypto crl install

Installs the Certificate Revocation List files that you copied to the switch.

Syntax	`crypto crl install` *`crl-path`* `[`*`crl-filename`*`]`
Parameters	• *crl-path* — Enter the path to the directory where the CRL is downloaded. • *`crl-filename`* — (Optional) Enter the CRL filename that you copied to the switch.
Default	Not configured
Command Mode	EXEC
Usage Information	Before you use the `crypto crl install` command, copy a CRL to the `home://` or `usb://` directory. If you do not enter a CRL filename in the command, you can copy and paste it when prompted. Use the `show crypto crl` command to view the CRLs that are already installed on the switch. In the `show` output, the CRLs displayed under `Manually installed CRLs` are installed using the `crypto crl install` command.

Example	`OS10# copy scp:///tftpuser@10.11.178.103:/crl_example_file.pem home://`
	`password:`
	
	`OS10# crypto crl install home://`
	`Network_Solutions_Certificate_Authority.0.crl.pem`
	
	`OS10# show crypto crl`
	`--------------------------------------`
	`|  Manually installed CRLs  |`
	`--------------------------------------`
	`Network_Solutions_Certificate_Authority.0.crl.pem`
	`--------------------------------------`
	`|  Downloaded CRLs  |`
	`--------------------------------------`

Supported Releases	10.5.0 or later

crypto fips enable

Enables FIPS mode.

Syntax	`crypto fips enable`
Parameters	None
Default	Not configured
Command mode	EXEC
Usage information	You can use OS10 in FIPS 140-2 compliant mode. In this mode, applications restrict their use of cryptographic algorithms to those supported by the NIST FIPS 140-2 standard and certification process. When you enable FIPS mode: • The SSH service restarts. Existing SSH sessions are not affected. Only new SSH sessions operate in the enabled FIPS mode. • SSH host keys are regenerated. • If SNMPv3 is configured with privacy settings, it operates in FIPS mode.

If you enable FIPS using the `crypto fips enable` command, RADIUS over TLS operates in FIPS mode. In FIPS mode, RADIUS over TLS requires that a FIPS-compliant certificate and key pair are installed on the switch.

NOTE: While running with FIPS mode enabled, SmartFabric OS10 accepts only RSA user keys. If the keys are installed before entering the FIPS mode, such keys are not affected.

Example

```
OS10# crypto fips enable
```

Supported releases 10.4.3.0 or later

crypto security-profile

Creates an application-specific security profile.

Syntax `crypto security-profile profile-name`

Parameters *profile-name* — Enter the name of the security profile; a maximum of 32 characters.

Default Not configured

Command mode CONFIGURATION

Usage information Create a security profile for a specific application on the switch, such as RADIUS over TLS. A security profile associates a certificate and private key pair using the `certificate` command. The `no` form of the command deletes the security profile.

Example

```
OS10# crypto security-profile secure-radius-profile
OS10(config-sec-profile)#
```

Supported releases 10.4.3.0 or later

peer-name-check

Enables peer name checking in a security profile for certificates presented by external devices.

Syntax `peer-name-check`

Parameters None

Default Not configured

Command mode SEC-PROFILE

Usage information Use the `peer-name-check` command to enable an OS10 application to verify that the certificate used to connect to the switch matches the name of the peer device, such as a remote server name. The no version of the command disables peer name checking in the security profile.

Example

```
OS10(config)# crypto security-profile profile-1
OS10(config-sec-profile)# peer-name-check

OS10(config)# crypto security-profile profile-1
OS10(config-sec-profile)# no peer-name-check
```

Supported releases 10.5.0 or later

revocation-check

Enables CRL checking in a security profile.

Syntax `revocation-check`

Parameters None

Default Not configured

Command mode SEC-PROFILE

Usage information Use the `revocation-check` command to enable the verification of certificates presented by external devices for a PKI-enablled application on the switch. Use the `show crypto crl` command to display the CRLs installed on the switch and used to ensure the validity and trustworthiness of certificates from external devices. The no version of the command disables CRL checking in a security profile.

Example

```
OS10(config)# crypto security-profile profile-1
OS10(config-sec-profile)# revocation-check

OS10(config)# crypto security-profile profile-1
OS10(config-sec-profile)# no revocation-check
```

Supported releases 10.5.0 or later

show crypto ca-certs

Displays all CA certificates installed on the switch.

Syntax `show crypto ca-certs [filename]`

Parameters *filename* — (Optional) Enter the text filename of a CA certificate as shown in the `show crypto ca-certs` output. Enter the filename in the format *filename*`.crt`.

Default Display all installed CA certificates.

Command mode EXEC

Usage information To delete a CA certificate, use the `crypto ca-cert delete` command. Enter the filename as shown in the `show crypto ca-certs` output.

Example

```
OS10# show crypto ca-certs
 -------------------------------------
|    Locally installed certificates    |
 -------------------------------------
Dell_interCA1.crt
Dell_rootCA1.crt
```

```
OS10# show crypto ca-certs Dell_interCA1.crt
Certificate:

```

Supported releases 10.4.3.0 or later

show crypto cdp

Displays a list of configured certificate distribution points (CDPs).

Syntax `show crypto cdp [cdp-name]`

Parameters

- *cdp-name* — (Optional) Display more detailed information by entering the CDP name displayed in `show crypto cdp` output.

Default Not configured

Command Mode EXEC

Usage Information Use the `show crypto cdp` command to verify the CDPs installed on the switch and display the URL to reach a CDP. OS10 uses the URL to access the CDP and download new CRLs. In the `show` output:

- Manually installed CDPs are installed using the `crypto cdp add` command.
- Automatically installed CDPs are automatically configured when you install a CA certificate with a specified CDP.

Add or delete CDPs using the `crypto cdp install` and `crypto cdp delete` commands.

Example

```
OS10# show crypto cdp
--------------------------------------
| Manually installed CDPs |
--------------------------------------
Comsign
--------------------------------------
| Automatically installed CDPs |
--------------------------------------
COMODO_Certification_Authority

OS10# show crypto cdp Comsign
http://fedir.comsign.co.il/crl/ComSignCA.crl
```

Supported Releases 10.5.0 or later

show crypto cert

Displays information about a specified certificate or all installed certificates.

Syntax `show crypto cert [filename]`

Parameters *filename* — (Optional) Enter the text filename of a certificate as displayed in the `show crypto certs` output. Enter the filename in the format *filename*`.crt`.

Default Display all installed host certificates.

Command mode EXEC

Usage information To delete a certificate, use the `crypto cert delete` *filename* command.

Example

```
OS10# show crypto cert
 -------------------------------------
|    Installed non-FIPS certificates    |
 -------------------------------------
Dell_host1_CA1.pem
 -------------------------------------
|    Installed FIPS certificates    |
 -------------------------------------
```

```
OS10# show crypto cert Dell_host1_CA1.pem
 ------------ Non FIPS certificate -----------------
Certificate:
    Data:

```

Supported releases 10.4.3.0 or later

show crypto crl

Displays the list of installed Certificate Revocation List files.

Syntax `show crypto crl [crl-filename]`

Parameters
- *crl-filename* — (Optional) Enter a CRL filename with the `.pem` extension.

Default Not configured

Command Mode EXEC

Usage Information

Use the `show crypto crl` command to verify the CRLs installed on the switch. In the `show` output:
- Manually installed CRLs are installed using the `crypto crl install` command.
- Downloaded CRLs are automatically installed from a configured CDP or when you install a CA certificate with a specified CDP.

Example

```
OS10# show crypto crl
--------------------------------------
| Manually installed CRLs |
--------------------------------------

Supported Releases	10.5.0 or later

ip ssh server x509v3-authentication security-profile

Enables RFC 6187 X.509v3 authentication in a SSH server.

Syntax	`ip ssh server x509v3-authentication security-profile profile-name [password-less]`
Parameters	*profile-name* — Enter the name of the security profile; a maximum of 32 characters. *password-less* - Use X.509v3 authentication for password-less authentication.
Default	Not configured
Command mode	CONFIGURATION
Security and Access	`sysadmin and secadmin`
Usage information	The security profile specifies the PKI certificate the SSH server uses. It also determines whether to apply OCSP revocation checks, CRL revocation checks, peer name checks, and key usage checks during client certificate validation. If you configure the password-less option, then SSH password-less login is supported by matching the client X.509v3 certificate against the configured certificate. By default, password-less login is disabled and the user is prompted for a password after the client certificate validates. When you set the password-less option with X.509v3 authentication, the system authenticates only locally. Configuring remote authentication using RADIUS or TACAC+ has no effect when X.509v3 authentication when using the password-less option. X.509v3 authentication requires an SSH client that supports RFC 6187 X.509v3 SSH authentication. The `no` version of this command disables the X.509v3 authentication.
Example	`OS10(config)# ip ssh server x509v3-authentication security-profile profile-1`
Supported releases	10.5.2.0 or later

ocsp-check [ocsp-url]

Enables OCSP revocation checks when validating certificates.

Syntax	`ocsp-check [ocsp-url]`
Parameters	*ocsp-url* — The URL of an OCSP responder used to check revocation. If specified, the URL is used to check if a certificate is revoked, instead of the OCSP URL in the certificate.
Default	Not configured
Command mode	SEC-PROFILE
Security and Access	`sysadmin and secadmin`
Usage information	Use the `ocsp-check` command to enable OCSP verification of certificates presented by the external devices for a PKI-enabled application on the switch. The `no` version of the command disables OCSP revocation checking in a security profile.
Example	`OS10(config)# crypto security-profile profile-1` `OS10(config-sec-profile)# ocsp-check http://ocspresponder.example.net`
Supported releases	10.5.2.0 or later

Network security

OS10 switch has security features to restrict network traffic, protect the network from attacks, and prevent unauthorized access to the network.

Access control lists

Access control lists (ACLs) restrict network traffic using policies and improve network performance. For more information about ACL, see Access control lists.

DHCP snooping

DHCP snooping protects your network from attacks by monitoring the DHCP messages and blocking untrusted or rogue DHCP servers. For more information about DHCP snooping, see DHCP snooping.

802.1X port access control

802.1x defines access control that prevents unauthorized devices or users from connecting to a network. For more information about 802.1X, see 802.1X.

Port security

Use the port security feature to restrict the number of workstations that can send traffic through an interface and to control MAC address movement.

Port security is a package of the following sub features that provide added security to the system:

1. MAC address learning limit (MLL)
2. Sticky MAC
3. MAC address movement control

MAC addresses that are learnt or statically configured on a port security enabled interface are called secure MAC addresses.

There are three types of Secure MAC addresses :

1. **Static secure MAC addresses** are configured manually. These MAC addresses are stored both in the MAC address table and in the running configuration of the switch. Similar to static MAC addresses, when the system reloads, the system does not remove the static secure MAC addresses. When you enable port security on an interface, all existing static MAC addresses become static secure MAC addresses. These static secure MAC addresses remain in the system until you remove them.
2. **Dynamic secure MAC addresses** are dynamically-learned by the switch and stored in the MAC address table. These MAC addresses are removed from the MAC address table when the switch restarts. By default, dynamic secure MAC addresses do not age out.
3. **Sticky secure MAC addresses** are learned dynamically but are saved in the running configuration. Secure sticky MAC addresses never age out.

After you enable port security on an interface, by default, the maximum number of MAC addresses that the interface can learn is one. This is applicable for both dynamic and static secure MAC addresses. After you enable port security on an interface, by default, sticky MAC addresses and MAC movement are disabled on the interface.

MAC address learning limit

Using the MAC address learning limit method, you can set an upper limit on the number of allowed MAC addresses on an interface. Limiting the MAC addresses protects switches from MAC address flooding attacks. After the configured limit is reached on an interface, by default, the system drops all traffic from any unknown device.

When you configure MAC address learning limit, ensure that the number of static MAC addresses present on the system is not greater than the MAC address learning limit that you configure. If the number of dynamically learned MAC addresses is greater than your MAC address limit, the system flushes all dynamically learned MAC addresses.

You can configure an interface to learn a maximum of 3072 MAC addresses. You can also disable the MAC address learning limit feature so that the interface can learn the maximum number MAC addresses that the system supports. Disabling the MAC address learning limit feature does not remove the previously learned or configured secure MAC addresses.

MAC address movement

A MAC address movement happens when the system detects the same MAC address on an interface which it has already learned through another port security-enabled interface on the same broadcast domain. MAC address movement is not allowed for secure static and sticky MAC addresses. By default, MAC address movement for dynamically-learned MAC address is disabled on the system.

Secure dynamic MAC address movement is allowed between port-security-enabled and port-security-disabled interfaces.

Sticky MAC addresses

When you reload the system, port security removes the dynamically learned secure MAC addresses. You can use the sticky feature to make the dynamically learned secure MAC addresses persist even after a system reboot so that the interface does not have to learn these MAC addresses again. Use the `copy running-configuration startup-configuration` command to save the sticky secure MAC addresses.

When you enable sticky MAC address learning on an interface, all existing dynamically-learned MAC addresses and MAC addresses that are learned in the future are converted to sticky MAC addresses.

To enable sticky MAC address learning on an interface, ensure that the `mac learn no-limit` command is not configured.

Port security violations

There are two types of port security violations.

- Mac address learning limit violation
- Mac address move violation

Mac address learning limit violation

After the number of secure MAC addresses reache the maximum value that is configured, if an interface receives a frame with the source MAC address different from any of the learned MAC addresses, the system considers this as a MAC address learning limit violation.

You can configure MAC address learning limit violation actions.

- `log`—The system drops the packet and displays a log message with the VLAN, interface, and the source MAC address that caused the violation.
- `drop`—The system drops the packet and does not display a log message.
- `forward`—The system forwards the packet without learning the source MAC address or displaying a log message.
- `shutdown`—The system shuts down the port.

Mac address move violation

If the system detects the same MAC address in a port-security-enabled interface which it has already learned through another port-security-enabled interface, by default, the system considers this as a MAC address move violation. You can configure MAC address move violation actions. You can also configure the system to permit MAC address movement across port security-enabled interfaces.

You can configure MAC address move violation actions.

- `log`—The system drops the packet and displays a log message with the VLAN, interface, and the source MAC address that caused the violation.
- `drop`—The system drops the packet and does not display a log message.
- `shutdown-both`—The system shuts down both the original and offending interfaces.
- `shutdown-offending`—The system shuts down the offending interface.
- `shutdown-original`—The system shuts down the interface that originally learned the MAC address that moved.

MAC address aging

By default, dynamically-learned secure MAC addresses do not age out. You can enable aging for secure MAC addresses so that the dynamically learned MAC addresses are deleted from the MAC address table after the configured aging period.

Enable port security on the system

To enable port security on the system globally:

1. Enter the following command in CONFIGURATION mode:

```
switchport port-security
```

NOTE: By default, port security is enabled globally. To disable the port security feature on the system, use the `no switchport port-security` command in CONFIGURATION mode.

Enable port security on an interface

To enable port security on an interface:

1. Enter the following command in INTERFACE mode:

```
switchport port-security
```

2. Enable port security in CONFIGURATION-PORT-SECURITY mode:

```
no disable
```

NOTE: To disable the port security feature on an interface, use the `disable` command in CONFIGURATION-PORT-SECURITY mode.

Configure the MAC address learning limit

After you enable port security on an interface, the interface can learn one secure MAC address by default. This limit is applicable for both secure dynamic and secure static MAC addresses.

To configure the MAC address learning limit:

1. Enter the following command in INTERFACE mode:

```
switchport port-security
```

2. Configure the number of secure MAC addresses that an interface can learn in INTERFACE PORT SECURITY mode:

```
mac-learn {limit | no-limit}
```

For the `limit` keyword, the range is from 1 to 3072. To enable the interface to learn the maximum number of MAC addresses that the hardware supports, use the `no-limit` keyword.

MAC address learning limit example

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(config-if-eth1/1/1)# switchport port-security
OS10(config-if-port-sec)# no disable
OS10(config-if-port-sec)# mac-learn limit 100
```

NOTE: While changing MAC learning limit, you must ensure that total number of configured (static) MAC addresses are less than or equal to newly configured MAC learn limit value. Otherwise, configuration is rejected.

Configure MAC address learning limit violation actions

Use the following commands in INTERFACE PORT SECURITY mode:

- To display which MAC address causes a violation, use the `log` option. The system also drops the packet.

```
OS10(config-if-port-sec)# mac-learn limit violation log
```

NOTE: If you want to know which MAC or host is causing the violation, you must set MAC learn limit violation as LOG. This violation action logs a violation message on the console and drop the packet in the hardware. For example, If the MAC learn limit is set to 10, but if more than 10 hosts (each host carries a different source MAC address) are appearing on that port, this is treated as violation and a log message is generated on the console. Following is an example log message:

```
Jul 10 09:12:24: Learn limit violation occurred on eth 1/1/1: vlan-100:
MAC-00:00:07:00:04:89
```

- To drop the packet when a MAC address learning limit violation occurs, use the `drop` option.

```
OS10(config-if-port-sec)# mac-learn limit violation drop
```

NOTE: On detecting MAC learn limit violation, this violation action drops all the received packets containing source MAC not learnt on this port.

- To forward the packet when a MAC address learning limit violation occurs, use the `flood` option. The system does not learn the MAC address.

```
OS10(config-if-port-sec)# mac-learn limit violation forward
```

- To shut down an interface on a MAC address learning limit violation, use the `shutdown` option.

```
OS10(config-if-port-sec)# mac-learn limit violation shutdown
```

NOTE: On detecting MAC learn limit violation, this violation action shutdowns the port. In `show interface status` command, interface status will be shown as `error-disable` instead of DOWN.

MAC address learning limit violation actions configuration example

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(config-if-eth1/1/1)# switchport port-security
OS10(config-if-port-sec)# no disable
OS10(config-if-port-sec)# mac-learn limit 100
OS10(config-if-port-sec)# mac-learn limit violation shutdown
```

Configure sticky MAC addresses

To enable sticky MAC address learning on an interface:

Enter the following command in INTERFACE PORT SECURITY mode:

```
sticky
```

If you enable the sticky feature on an interface, all the dynamic MAC address appearing on this interface are converted to sticky. Sticky MAC addresses are stored in a non-volatile storage in order to retain those MACs across re-boots and upgrades.

Dynamic and sticky address learning are mutually exclusive. When you enable sticky learning on an interface, the switch stops dynamic learning and performs sticky learning instead. If you disable sticky learning, the switch resumes dynamic learning.

NOTE: Before enabling sticky MAC address learning, ensure that you restrict the number of MAC address that an interface can learn using the `mac-learn limit` command.

Sticky MAC addresses configuration example

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(config-if-eth1/1/1)# switchport port-security
OS10(config-if-port-sec)# no disable
OS10(config-if-port-sec)# mac-learn limit 100
OS10(config-if-port-sec)# sticky
```

Permit MAC address movement

Use the following command in INTERFACE PORT SECURITY mode:

```
OS10(config-if-port-sec)# mac-move allow
```

MAC movement is not allowed for secure static and sticky MAC addresses. You can control secure dynamic MAC addresses MAC movement between port-security enabled ports.

By default, MAC movement is disabled even for secure dynamic MAC addresses. If a secure dynamic MAC learnt on one port-security enabled port appears on another port-security port, this movement is detected as violation as MAC movement is disabled by default. You can enable or disable MAC movement on a port security enabled port and this configuration is considered for secure dynamic MAC addresses alone.

MAC address movement configuration example

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(config-if-eth1/1/1)# switchport port-security
OS10(config-if-port-sec)# no disable
```

```
OS10(config-if-port-sec)# mac-learn limit 100
OS10(config-if-port-sec)# mac-move allow
```

Restrictions on MAC movement

Secure dynamic MAC address MAC movement is allowed only between port-security enabled ports.

The following table lists the restrictions on MAC movement:

Table 95. Restrictions on MAC movement

Combination	Port-security enabled port to port-security disabled port	Port-security enabled port to port-security enabled port	Port-security disabled port to port-security enabled port	Port-security disabled port to port-security disabled port
Secure Dynamic MAC address MAC movement	Not allowed.	Allowed.	Not Applicable. A MAC learnt on port-security disabled port is treated as unsecured MAC. As a result, this unsecured MAC is learnt as secure MAC.	Not Applicable.

Configure MAC address movement violation actions

Use the following commands in INTERFACE PORT SECURITY mode:

- To display which MAC address causes a violation, use the `log` option. The system also drops the packet.

```
OS10(config-if-port-sec)# mac-move violation log
```

- To drop the packet when a MAC address movement violation occurs, use the `drop` option.

```
OS10(config-if-port-sec)# mac-move violation drop
```

- To shut down the original interface that learned the MAC address on a MAC movement violation, use the `shutdown-original` option.

```
OS10(config-if-port-sec)# mac-move violation shutdown-original
```

- To shut down the interface that detected a MAC address that is already learned by another interface, use the `shutdown-offending` option.

```
OS10(config-if-port-sec)# mac-move violation shutdown-offending
```

- To shut down both original and offending interfaces, use the `shutdown-both` option.

```
OS10(config-if-port-sec)# mac-move violation shutdown-both
```

Recover an error-disabled interface

1. Shut down the interface in INTERFACE mode.

```
shutdown
```

2. Bring the interface up in INTERFACE mode.

```
no shutdown
```

NOTE: In order to recover a VLT port-channel, you must configure the `shutdown` and `no-shutdown` actions on both VLT peers.

Clear an error-disabled state of all interfaces

- To clear the error-disabled state of all interfaces that was caused by a MAC address learning limit violation, use the following command in CONFIGURATION mode:

```
errdisable reset cause mac-learn-limit violation
```

- To clear the error-disabled state of all interfaces that was caused by a MAC address movement violation, use the following command in CONFIGURATION mode:

```
errdisable reset cause mac-move-violation
```

- To clear the error-disabled state of all interfaces that was caused by all violation incidents, use the following command in CONFIGURATION mode:

```
errdisable reset cause all
```

Recover an error-disabled state of interfaces automatically

- To automatically recover error-disabled interfaces that was caused by a MAC address learning limit violation, use the following command in CONFIGURATION mode:

```
errdisable recovery cause mac-learn-limit violation
```

- To automatically recover error-disabled interfaces that was caused by a MAC address movement violation, use the following command in CONFIGURATION mode:

```
errdisable recovery cause mac-move-violation
```

- Configure the recovery interval timer to delay the recovery of an error-disabled interface in CONFIGURATION mode. The range is from 30 to 65,535 in seconds.

```
errdisable recovery interval 30
```

Configure secure static MAC addresses

- To configure a secure static MAC address, use the following command in CONFIGURATION mode:

```
mac address-table static mac-address vlan vlan-id interface {ethernet node/slot/
port[:subport] |
port-channel number}
```

NOTE: The configured MAC address becomes secure MAC address only if you enable the port security feature on the interface.

The static learning method allows you to manually add or remove secure MAC addresses on a port-security enabled port. These MAC addresses are saved to the startup-configuration file along with other running configurations, whenever you save the running-configuration. Since, MAC addresses are written to startup-configuration file, MACs are retained across re-boots.

Secure static MAC addresses remain in the system until you delete them.

You can use the existing MAC address-table command to configure the secure static MAC address.

Secure static MAC addresses configuration example

```
OS10# configure terminal
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# switchport port-security
OS10(config-if-port-sec)# no disable
OS10(config-if-po-1)# exit
OS10(config)# mac address-table static 03:ab:cd:21:ba:01 vlan 1 interface port-channel 1
```

Secure dynamic MAC address learning

By default, when you enable port-security globally and on an interface, the dynamic learning method is enabled. Interface learns dynamic secure MAC addresses until MAC learn limit is reached. If you do not configure the MAC learn limit, as the default limit value is 1, only one dynamic secure MAC address is learnt.

Dynamic secure MAC addresses are lost when the following events occur:

- Node is re-booted.
- Interface is down.
- MAC is aged.
- Interface is deleted or VLAN membership is deleted.
- Spanning-tree flush on interface.
- Newly configured MLL limit is less than the total number of secure dynamic MAC addresses learnt on that interface.

Perform the following steps to configure secure dynamic MAC address:

1. Enters configuration mode.

```
OS10# configure terminal
```

2. Enables port-security globally.

```
OS10(config)# switchport port-security
```

3. The following command prompts change to port-security configuration mode.

```
OS10(config-if)# switchport port-security
```

4. The following command enables port-security on this interface. When port-security is enabled globally and on interface, the following default values are set:
   - MAC learn limit value will be set to ONE.
   - sticky is disabled or dynamic MAC learning is enabled.
   - MAC movement is not allowed.

```
OS10(config-if-port-sec)# no disable
```

The following table lists the differences between secure, sticky, and dynamic MAC addresses:

Table 96. Differences between secure, sticky, and dynamic MAC addresses

Event	Interface down	Interface deletion	Node reboot	Software upgrade	On aging	Aging disabled	MAC movement	MLL limit change on an interface	Spanning-tree flush on an interface	Disabling port-security	No sticky
Secure Dynamic MAC addresses	MACs are flushed.	MACs are flushed.	MACs are flushed.	MACs are flushed.	MACs are flushed.	MACs are retained.	Configuration dependent. If MAC-movement is allowed on a port, secure dynamic addresses learnt on this port can move freely. Otherwise MAC addresses stick to the interface.	When the new limit is less than the total number of secure dynamic MAC addresses, secure dynamic MAC addresses are flushed out on that port.	MACs are flushed.	MACs are retained.	Not applicable.
Secure Sticky MAC ad	MACs are retained but are put in INACTIVE state.	MACs are flushed.	MACs are retained.	MACs are retained.	MACs are retained.	MACs are retained.	MAC movement is not allowed for these MACs.	When the new limit is less than the total number of secure sticky MAC	MACs are retained.	MACs are retained and are converted as DYNAMIC.	MACs are converted to DYNAMIC.

Table 96. Differences between secure, sticky, and dynamic MAC addresses (continued)

Event	Interface down	Interface deletion	Node reboot	Software upgrade	On aging	Aging disabled	MAC movement	MLL limit change on an interface	Spanning-tree flush on an interface	Disabling port-security	No sticky
dress								addresses, secure sticky MAC addresses are flushed out on that port.			

Clearing error disable status on all interfaces

The following table lists the sequence of steps to clear error disable status on all interfaces:

Table 97. Clear error disable status

Step	Command	Description

1	`OS10#errdisable reset cause all`
	`OS10#errdisable reset cause Mac-learning-limit-violation`
	`OS10(#errdisable reset cause mac-move-violation`
		Clears all the violations on all interfaces in the system.
		Clears MAC learn limit violation status on all interfaces.
		Clears the MAC move violation status on all interfaces.

Remove statically-configured secure MAC addresses

To remove statically-configured secure MAC addresses, use the following command in EXEC mode:

```
clear mac address-table secure {{dynamic | sticky} {address mac_addr | vlan vlan-id |
interface {ethernet node/slot/port[:subport] | port-channel}} | all}
```

Remove statically-configured secure MAC addresses configuration example

```
OS10# clear mac address-table secure sticky vlan 1
OS10#clear mac address-table secure sticky interface port-channel 128
OS10#clear mac address-table secure sticky address 00:00:00:00:00:01 vlan 100
```

View statically-configured secure MAC addresses

To view the statically-configured secure MAC addresses, use the following command in EXEC mode:

```
show mac address-table secure {{dynamic | static | sticky} {vlan vlan-id | interface
{ethernet node/slot/port[:subport] | port-channel}}}
```

View statically-configured secure MAC addresses example

```
OS10# show mac address-table secure sticky

VlanId   MAC Address                  Type                  Interface
1        4c:76:25:e5:4f:51          sticky                ethernet1/1/5
1        4c:76:25:e5:4f:55          sticky                ethernet1/1/6
1        4c:76:25:e5:4f:59          sticky                ethernet1/1/7

os10# show mac address-table secure dynamic

VlanId   MAC Address                  Type                  Interface
10       4c:76:25:e5:4f:51        dynamic               port-channel120
```

```
11       4c:76:25:e5:4f:55           dynamic               ethernet1/1/6
12       4c:76:25:e5:4f:59           dynamic                   ethernet1/1/7

os10# show mac address-table secure  static

VlanId   MAC Address                   Type                   Interface
10       4c:76:25:e5:4f:51           static                port-channel120
11       4c:76:25:e5:4f:55             static               ethernet1/1/6
12       4c:76:25:e5:4f:59           static                  ethernet1/1/7
```

View the number of secure MAC addresses on the system

- To view the number of secure MAC addresses on the system, use the following command in EXEC mode:

```
show mac address-table count [interface {ethernet slot/port:subport | port-channel
number | vlan vlan-id}]
```

View the number of secure MAC addresses on the system example

```
OS10# show MAC address-table count
MAC Entries for all vlans :
Dynamic Address Count: 10000
Total secure dynamic MAC addresses: 5000 of (10000)
Static Address (User-defined) Count : 5000
Total secure static MAC addresses:200 of (5000)
Total secure sticky MAC addresses :0
Total MAC Addresses in Use: 15000
```

View port-security parameters for all interfaces

To view port-security parameters for all interfaces, use the following command in EXEC mode:

```
show switchport port-security [interface {ethernet node/slot/port[:subport] | port-
channel port-channel-number}]
```

View port-security parameters for all interfaces example

```
OS10# show switchport port-security

Global Port-security status       :Enable

Interface name                    : eth1/1/1

Port security on SmartFabric OS10

Disable dynamic MAC learning

Use the `mac-learn disable` command to disable MAC learning on the physical, LAG, and virtual interfaces.

When MAC learning is disabled on a port, all the dynamic and sticky MAC addresses that are learnt are flushed and only the configured static MAC addresses are retained. All the packets with new source MAC address received on the MAC learn disabled port is handled based on the MAC address disable violation action configured on that port.

This feature is only supported on port-security enabled ports. On port-security enabled ports, both MAC address learning limit and MAC address learning disable features are mutually exclusive. When configurations for both features are present, MAC learn disable configuration takes precedence over MC learn limit configuration. However, when MAC address learning is enabled, MAC learning happens based on the MAC learn limit configured.

MAC learning disable violation actions

When new source MAC addresses are received on the MAC learn disabled port, you can configure different violation actions as follows:

- Log—A single log message is displayed on console indicating the port on which MAC learning disable violation occurred and drop that violated packet in the hardware. If more violations occur on the same source port, all violation logs are sent to the syslog server, if configured. This is the default violation action.
- Shutdown the port.
- Forward the packet—Do not learn the MAC address but forward the packet.
- Drop the packet—Packets received with a new source MAC address are dropped.

NOTE: Dynamic Layer 3 traffic over MAC address learning disabled interface is not supported.

Configure MAC learn disable

To disable dynamic MAC learning on the physical, LAG, and virtual interfaces:

1. Enter the CONFIGURATION mode.

```
OS10# configure terminal
OS10(config)#
```

2. Enter the INTERFACE CONFIGURATION mode.

```
OS10(config)# interface ethernet 1/1/1
```

3. Enable port security on the interface.

```
OS10(conf-if-eth1/1/1)# switchport port-security
OS10(conf-if-eth1/1/1-port-sec)# no disable
```

4. Disable MAC address learning on the interface.

```
OS10(conf-if-eth1/1/1-port-sec)# mac-learn disable
```

```
OS10# configure terminal
OS10(config)#
OS10(config)# interface vlan 2
 OS10(conf-if-vl-2)# mac-learn disable
```

Port-security on VLT

This feature provides port-security support on VLT topologies.

The port-security feature is enhanced to support VLT port channels. New mismatch configurations are added to show configuration and sticky MAC mismatch across VLT peers.

MACs learned on an orphan port with mac move deny configurations on one VLT peer is not allowed to move to port-security enabled orphan ports on the other VLT peer. Violation is triggered for such movements.

Sticky MACs are not allowed to move across VLT peers.

NOTE:

1. MAC movement is allowed between port-security enabled and disabled ports.
2. As part of VLT topology formation, while MACs are syncing up with each other, if there are any conflicts for MAC received in the sync message (MAC is present locally but with different egress port), the MAC is deleted and the delete is synced back to the peer node.
3. If there are mismatching sticky or mac move allow or mac move deny configurations on a VLT port across nodes, MACs can move from the VLT port to the other ports even though sticky or mac move deny is configured on one of the nodes.
4. It is not recommended to enable port-security on PVLAN ISL port.

Restrictions and limitations

The following restrictions and limitations apply to these port-security enhancements:

- When port-security is enabled on trunk ports (ports that are connected between two switches) with default `mac learn limit` (one), if peer switch sends control packets other than LACP, LLDP, and xSTP, it is possible that learn limit is reached immediately without learning a single MAC from the actual data packet. So, the network administrator must set the `mac learn limit` to accommodate all the MACs that can be learned from nondata packets.
- If a station moves across different secondary VLANs in the PVLAN domain where the source and destination ports are port-security enabled and `station move deny` is configured with violation action as either `Drop` or `Drop and Log`, then the `Drop` action is not allowed by SmartFabric OS10.
- Port-security is not supported on the Z9664F-ON platform.

Port security commands

aging

Enables the aging timer for dynamically-learned MAC addresses on an interface that is configured with port security.

Syntax	`aging {off | on}`
Parameters	None
Default	Dynamically-learned MAC addresses on an interface that is configured with port security do not age out.
Command Mode	CONFIGURATION-PORT-SECURITY
Usage Information	Secure sticky MAC addresses never age out.
Example	`OS10(config-if-port-sec)# aging on`
Supported Releases	10.5.1.0 or later

clear mac address-table secure

Clears sticky and dynamic secure MAC address entries from the MAC address table.

Syntax	`clear mac address-table secure {{dynamic | sticky} {address` *`mac_addr`* `| vlan` *`vlan-id`* `| interface {ethernet` *`node/slot/port[:subport]`* `| port-channel` *`channel-number`*`}} | all}`
Parameters	• `dynamic` — Displays secure dynamic MAC address table entries. • `sticky` — Displays secure sticky MAC address table entries. • `all` — Deletes all secure sticky and dynamic MAC address table entries. • `address` *`mac_addr`* — (Optional) Deletes a configured secure MAC address from the address table in nn:nn:nn:nn:nn:nn format.

- `vlan vlan-id` — (Optional) Delete all entries based on the VLAN number from the address table, from 1 to 4093.
- `interface` — (Optional) Clear the interface type:
  - `ethernet node/slot/port[:subport]` — Delete the Ethernet interface configuration from the address table.
  - `port-channel channel-number` —Delete the port-channel interface configuration from the address table. Valid values are from 1 to 999 or 1001 to 2000.

Default None

Command Mode EXEC

Usage Information This command deletes only sticky and dynamic secure MAC address entries from the MAC address table. The `clear mac address-table dynamic` command deletes all dynamic MAC address entries including secure dynamic MAC addresses.

Use the `all` parameter to remove all secure sticky and dynamic entries from the MAC address table.

Example

```
OS10# clear mac address-table secure sticky vlan 1

OS10#clear mac address-table secure sticky interface port-channel 128

OS10#clear mac address-table secure sticky address 00:00:00:00:00:01
vlan 100
```

Supported Releases 10.5.1.0 or later

errdisable recovery cause

Brings up an error-disabled interface automatically after the recovery timer expires.

Syntax

```
errdisable recovery cause {mac-learn-limit-violation | mac-move-violation |
mac-learn-disable-violation }
```

Parameters

- `mac-learn-limit-violation`—Brings up an error disabled interface that exceeded the maximum number of MAC addresses that it can learn.
- `mac-move-violation`—Brings up an error disabled interface that was brought down due to station move violation.
- `mac-learn-disable-violation`—Brings up an error disabled interface that was brought down due to MAC address learn disable violation.

Default Automatic recovery is disabled.

Command Mode CONFIGURATION

Usage Information The `no` version of this command disables automatic recovery.

NOTE: In order to recover a VLT port channel from error-disable state, configure matching `errdisable recovery` on both the VLT peers.

Example

```
OS10(config-if-port-sec)# errdisable recovery cause mac-learn-limit-
violation
```

Supported Releases 10.5.1.0 or later

errdisable reset cause

Resets the error disabled state of interfaces.

Syntax

```
errdisable reset cause {all | mac-learn-limit-violation | mac-move-violation | mac-learn-disable-violation}
```

Parameters

- `all`—Resets the error disabled state of all interfaces.
- `mac-learn-limit-violation`—Resets the error disabled state of interfaces that exceeded the maximum number of MAC addresses that it can learn.
- `mac-move-violation`—Resets the error disabled state of interfaces due to a station move violation.
- `mac-learn-disable-violation`—Resets the error disabled state of interfaces due to a MAC address learn disable violation.

Default None

Command Mode CONFIGURATION

Usage Information This command resets the error disabled state of all interfaces according to the option you select.

Example

```
OS10(config)# errdisable reset cause mac-learn-limit-violation
```

Supported Releases 10.5.1.0 or later

mac-learn

Configures the number of MAC addresses an interface can learn.

Syntax

```
mac-learn {limit learn-limit-value | no-limit}
```

Parameters

- `limit learn-limit-value`—Enter a value from 1 to 3072.
- `no-limit`—The interface learns the maximum number of MAC addresses that the system supports.

Default One MAC address

Command Mode CONFIGURATION-PORT-SECURITY

Usage Information

After you enable port security on an interface, by default, the interface learns a maximum of one MAC address. Use the `mac-learn limit` command to configure the number of MAC addresses an interface can learn.

If the system contains more static MAC addresses than the MAC address learn limit, the system displays an error message. You can delete a few static MAC addresses or increase the number of MAC addresses the port can learn.

If the total number of dynamic MAC addresses on an interface is greater than the newly configured MAC learn limit, the dynamic MAC addresses are flushed.

NOTE: It is not possible to enable the sticky feature without mac learning limit restriction on an interface. You must configure the MAC learning limit to any value with in the accepted range (1-3072). So, the `mac-learn no-limit` and `sticky` configurations are mutually exclusive.

When MLL is enabled, port-security is active and value changes from no-limit to a valid value, MACs are flushed on that port.

Example

```
OS10(config-if-port-sec)# mac-learn limit 100
```

Supported Releases 10.5.1.0 or later

mac-learn disable

Disables dynamic MAC address learning on the physical, LAG, and virtual interfaces.

Syntax `[no] mac-learn disable`

Parameters None

Default MAC address learning is enabled on all physical, LAG, and virtual interfaces.

Command Mode INTERFACE-PORT-SECURITY

VLAN INTERFACE CONFIGURATION

Usage Information MAC address learning disable works only on the port-security enabled ports. When MAC learning is disabled on a port, already existing dynamic and sticky MAC addresses are flushed and only the static MAC addresses are retained. Also, the new static MAC address configurations are accepted. Starting from Release 10.5.4.4, you can disable dynamic MAC address learning on the virtual interfaces.

Example (LAG)

```
OS10(config)# interface vlan 2
OS10(conf-if-vl-2)# mac-learn disable
```

Example (VLAN)

```
OS10(config)# interface port-channel 1
OS10(conf-if-po-1)# switchport port-security
OS10(conf-if-po-1-port-sec)# mac-learn disable
```

Supported Releases 10.5.4.2 or later

mac-learn disable violation

Configures MAC address learning disable violation actions.

Syntax `mac-learn disable violation {log | shutdown | drop | forward}`

Parameters

- `log`—Generates the log message with VLAN, port, and source MAC information that caused the violation and drop the violated packet.
- `shutdown`—Logs the violated packet and shutdown the port.
- `drop`—Drops all the packets on this port. Log message are not generated.
- `forward`—Forwards the packet when an interface receives it from a new device. Log message are not generated.

Default `log`

Command Mode INTERFACE-PORT-SECURITY

Usage Information The `no` version of this command disables MAC address learning disable violation actions.

Example

```
OS10(config-if-port-sec)# mac-learn disable violation drop
```

If you configure the system with the `mac-learn disable violation log` command, the system displays a log message similar to the following:

```
Jul 17 10:37:27 OS10 dn_infra_afs[1085]:
[INFRA_AFS:MAC_LEARN_DISABLE_VIOLATION] port-channel 1: vlan-100:
MAC-00:00:00:00:04:19
```

Supported Releases 10.5.4.2 or later

mac-learn limit violation

Configures MAC address learning limit violation actions.

Syntax

```
mac-learn limit violation {drop | forward | log | shutdown}
```

Parameters

- `drop` — Drops the packet when an interface receives it from a new device after the learning limit is reached.
- `forward` — Forwards the packet when an interface receives it from a new device after the learning limit is reached.
- `log` — Displays a log message when an interface receives a packet from a new device after the learning limit is reached and drops the packet.
- `shutdown` — Shuts down the interface when it receives a packet from a new device after the learning limit is reached.

Default

Disabled

Command Mode

CONFIGURATION-PORT-SECURITY

Usage Information

The `no` version of this command disables MAC address learning limit violation actions.

Example

```
OS10(config-if-port-sec)# mac-learn limit violation drop
```

If you configure the system with the `mac-learn limit violation log` command, the system displays a log message similar to the following:

```
Jan 10 09:12:24: Learn limit violation occurred on eth 1/1/1: vlan-100:
MAC-00:00:07:00:04:89
```

Supported Releases

10.5.1.0 or later

mac-move allow

Enables MAC address movement.

Syntax

```
mac-move allow
```

Parameters

None

Default

MAC address movement is disabled.

Command Mode

CONFIGURATION-PORT-SECURITY

Usage Information

MAC address movement is not allowed for secure static and sticky MAC addresses. By default, MAC address movement for dynamically-learned MAC address is disabled on the system.

The `no` version of this command disables MAC address movement.

Example

```
OS10(config-if-port-sec)# mac-move allow
```

Supported Releases

10.5.1.0 or later

mac-move violation

Configures station move violation actions.

Syntax

```
mac-move violation {drop | log | shutdown-both | shutdown-offending |
shutdown-original}
```

Parameters

- `drop` — Drops the received packet when an interface detects the same MAC address that the system has already learned on a different interface.
- `log` — Displays a log message when an interface detects the same MAC address that the system has already learned on a different interface.
- `shutdown-both` — Shuts down both interfaces that learned the same MAC address.
- `shutdown-offending` — Shuts down the interface which detects the same MAC address that the system has already learned on a different interface.
- `shutdown-original` — Shuts down the interface that originally learned the MAC address.

Default The system displays a log message when a MAC address move violation occurs.

Command Mode CONFIGURATION-PORT-SECURITY

Usage Information The `no` version of this command disables MAC move violation actions.

Example

```
OS10(config-if-port-sec)# mac-move-violation log
```

If you configure the system with the `mac-move-violation log` command, the system displays a log message similar to the following:

```
MAC Move Violation occurred: originalInterface: ethernet
1/13/1, offendingInterface: Ethernet 1/13/2,vlanId: 100, MACAddr:
00:00:07:00:04:15.
```

Supported Releases 10.5.1.0 or later

mac address-table static

Configures a static entry for the Layer 2 MAC address table.

Syntax

```
mac address-table static mac-address {vlan vlan-id | virtual-network VNI}
interface {ethernet node/slot/port[:subport] | port-channel number | VLTi}
```

Parameters

- `mac-address`—Enter the MAC address to add to the table in nn:nn:nn:nn:nn:nn format.
- `vlan vlan-id`—Enter the VLAN to apply the static MAC address to, from 1 to 4093.
- `virtual-network VNI`—Enter the virtual network to apply the static MAC address to, from 1 to 65535.
- `interface`—Enter the interface type:
  - `ethernet node/slot/port[:subport]`—Enter the Ethernet information.
  - `port-channel channel-number`—Enter a port channel interface number, from 1 to 999 or 1001 to 2000.
  - `VLTi`—Enter `VLTi` to configure static MAC address on VLTi interfaces.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the static MAC address.

When a static MAC configured on a non-VLT port-channel, is not supposed to be learnt on any other port in the VLT peer nodes, then you must configure the same MAC as static MAC on VLTi in the peer VLT node.

You can configure a static MAC on a VLTi even before the VLT domain or VLTi are created.

Un till the time when VLTi is created, the MAC is not installed in the NPU or kernel. Whenever the VLTi is discovered and created, the MAC is installed in the NPU or kernel.

The MAC is removed when the VLTi is removed or the VLT domain is deleted. This option is supported for both VLAN and VN configurations.

Example (VLAN)

```
OS10(config)# mac address-table static 34:17:eb:f2:ab:c6 vlan 1
interface ethernet 1/1/30
```

Example (Port-Channel)

```
OS10(config)# mac address-table static 34:17:eb:02:8c:33 vlan 10
interface port-channel 1
```

Example (VLTi)

```
OS10(config)#  mac  address-table static 00:00:00:00:00:01 vlan 1
interface vlti

OS10(config)#  no mac address-table static 00:00:00:00:00:01 vlan 1
interface vlti

OS10(config)#  mac  address-table static 00:00:00:00:00:aa virtual-
network 1 interface vlti

OS10(config)#  no mac address-table static 00:00:00:00:00:aa virtual-
network 1 interface vlti
```

Supported Releases 10.2.0E or later

disable

Disables the port-security feature.

Syntax `[no] disable`

The `no disable` command enables the port-security feature.

Parameters None.

Default Disabled. By default, the port-security feature is disabled on a physical or port channel interface.

Command Mode INTERFACE-PORT-SECURITY

Security and access `sysadmin`, `netadmin`, `netoperator`

Usage Information The port-security feature is disabled by default on physical or port channel interfaces. In order to enable the port-security feature (for example, on port channel 1), run the following commands:

```
OS10#config terminal

OS10(config)#interface port-channel 1

OS10(config-if)#switchport port-security

OS10(config-if-port-sec)#no disable.
```

The `no disable` command enables the port-security feature and operates either with default or user-configured values. Following are the default values:

- MAC learn-limit is 1.
- The sticky feature is disabled.
- MAC movement is disabled.

The default values are set only if the corresponding values are not configured. If you configure or provide these values before enabling port-security, all the user-configured values are retained even after enabling port-security.

The port-security feature functionality becomes active on a port only if the feature is enabled globally and on that particular port. Disabling this feature either at global level or per port renders this feature inactive on that port.

The following table describes the relationship between switch and port level port-security configuration:

Table 98. Relationship between switch and port level port-security configurations

Switch level port-security	Port level port-security	Effect
Enabled	Disabled	Disabled
Enabled	Enabled	Enabled
Disabled	Disabled	Disabled
Disabled	Enabled	Disabled

NOTE: When port-security becomes active on a port, all the MACs learned on that port are flushed if the mac-learning limit is not set to no-limit.

Example

```
OS10(config-if-port-sec)# no disable

OS10(config-if-port-sec)# disable
```

Supported Releases 10.5.1 or later

show errdisable

Displays information on errdisable configurations and port recovery status.

Syntax `show errdisable [detect | recovery]`

Parameters

- `detect`—Displays whether error disable detection is enabled.
- `recovery`—Displays details of recovery cause, recovery interval, and recovery status of the error disabled port.

Default None

Command Mode EXEC

Usage Information The `Errdisable Cause` column displays one or more reasons for the error-disabled state of an interface. If an interface is put in to error disabled state for multiple reasons, the interface does not come up unless you enable automatic recovery for all reasons.

Example

```
OS10# show errdisable detect

Error-Disable Cause               Detect Status
-------------------------------------------
bpduguard                          Enabled
```

```
OS10# show errdisable recovery

Error-Disable Recovery Timer Interval : 300 seconds

Error-Disable Reason Recovery Status
---------------------------------------
bpduguard                     Enabled

MLL violation                 Enabled

MAC-move-violation            Enabled

Mac-Learn-Disable violation   Enabled

                                                                  Recovery
Time Left
Interface          Errdisable Cause                            (seconds)
-------------------------------------------------------------------------
```

```
-
ethernet1/1/1:1    bpduguard                                  30
ethernet1/1/1:2    bpduguard                                  1
ethernet1/1/10     bpduguard/mac-learning-limit/mac-move      10
port-channel100    Mac-learning-limit                         50
port-channel128    mac-move                                   49
port-channel128    Mac-learn-disable                           9
```

Supported Releases 10.4.2.0 or later

show mac address-table count

Displays the number of entries in the MAC address table.

Syntax

```
show mac address-table count [interface {ethernet slot/port:subport | port-channel number | vlan vlan-id}]
```

Parameters

- `interface` — Displays the interface type:
  - `ethernet node/slot/port[:subport]` — Displays the Ethernet interface configuration from the address table.
  - `port-channel channel-number` — Displays the port-channel interface configuration from the address table. Valid values are from 1 to 999 or 1001 to 2000.
- `vlan vlan-id` — Displays information for a specific VLAN, from 1 to 4093.

Defaults None

Command Mode EXEC

Usage Information None

Example

```
OS10# show MAC address-table count
MAC Entries for all vlans :
Dynamic Address : 10000
Total secure dynamic MAC addresses: 5000 of (10000)
Static Address (User-defined) Count : 5000
Total secure static MAC addresses:200 of (5000)
Total secure sticky MAC addresses :0
Total MAC Addresses in Use: 15000
```

```
DUT1# show mac address-table count
MAC Entries for all vlans :
Dynamic Address count : 10000

Secure dynamic mac addresses: 5000 of (10000)
Static Address (User-defined) Count : 5000

Secure static mac addresses:200 of (5000)

Secure sticky mac addresses :0

Total MAC Addresses in Use: 15000
```

Supported Releases 10.1.0E or later

show mac address-table secure

Displays information about the secure MAC addresses in the MAC address table.

Syntax

```
show mac address-table secure {{dynamic | static | sticky} {vlan vlan-id | interface {ethernet node/slot/port[:subport] | port-channel}} | address mac-address}
```

Parameters

- `dynamic` — Displays secure dynamic MAC address table entries.
- `static` — Displays secure static MAC address table entries.
- `sticky` — Displays secure sticky MAC address table entries.
- `address` — Displays a specific MAC address table entry.
- `vlan vlan-id` — Displays all entries based on the VLAN number from the address table, from 1 to 4093.
- `interface` — Displays the interface type:
  - `ethernet node/slot/port[:subport]` — Displays the Ethernet interface configuration from the address table.
  - `port-channel channel-number` — Displays the port-channel interface configuration from the address table. Valid values are from 1 to 999 or 1001 to 2000.

Default None

Command Mode EXEC

Usage Information The system maintains secure static and sticky MAC address entries saved in the startup configuration file and deletes secure dynamic entries upon reboot.

Example (Address)

```
OS10# show MAC address-table secure sticky

VlanId   MAC Address                    Type                      Interface
1        4c:76:25:e5:4f:51            sticky
ethernet1/1/5
1        4c:76:25:e5:4f:55            sticky
ethernet1/1/6
1        4c:76:25:e5:4f:59            sticky
ethernet1/1/7
```

Supported Releases 10.5.1.0 or later

show switchport port-security

Displays port security information of interfaces.

Syntax

```
show switchport port-security [interface {ethernet node/slot/port[:subport]
| port-channel port-channel-number}]
```

Parameters

- `interface` — Displays the interface type:
  - `ethernet node/slot/port[:subport]` — Displays the port security information of an Ethernet interface.
  - `port-channel channel-number` — Displays the port security information of an Ethernet interface. Valid values are from 1 to 999 or 1001 to 2000.

Default None

Command Mode EXEC

Usage Information This command displays port security information of all interfaces.

Example (Address)

```
OS10# show switchport port-security

Global Port-security status        :Enable

Interface name                     : ethernet1/1/1

Port Security                      :Enabled
Port Status                        :Error-Disable (MLL violation)
Mac Learning                       :Disabled
Mac-learn-disable-violation action :Log
Mac learn limit                    :100
```

```
MAC-learn-limit-Violation action   :Shutdown
Sticky                             :Disabled
Mac-move-allow                     :Not Allowed
mac-move-violation action          :shutdown-both
Aging                              :Enabled
Total MAC Addresses                :10
Secure static MAC Addresses        :0
Sticky MAC Addresses               :0
Secure Dynamic MAC addresses       :10

Interface name                     : ethernet1/1/10

Port Security                      :Enabled
Port Status                        :Error-Disable (Mac movement
violation)
Mac Learning                       :Enabled
Mac-learn-disable-violation action :Drop
Mac learn limit                    :100
MAC-learn-limit-Violation action   :Shutdown
Sticky                             :Enabled
Mac-move-allow                     :Not Allowed
mac-move-violation action          :shutdown-both
Aging                              :Enabled
Total MAC Addresses                :11
Secure static MAC Addresses        :0
Sticky MAC Addresses               :11
Secure Dynamic MAC addresses       :0
```

```
OS10# show switchport port-security interface ethernet 1/1/1

Global Port-security status        :Enable

Interface name                     : ethernet1/1/1

Port Security                      :Enabled
Port Status                        :Error-Disable
Mac Learning                       :Disabled
Mac-learn-disable-violation action :Drop
Mac-learn-limit                    :1024
Mac-learn-limit-Violation Action   :Shutdown

Mac-move-allow                     :Not Allowed
Mac-move-violation                 :shutdown-both
Aging                              :Disabled
Total MAC Addresses                :10
Secure static MAC Addresses        :0
Sticky MAC Addresses               :10
Secure Dynamic MAC addresses       :0

OS10# show switchport port-security interface port-channel 120

Interface name                     :port-channel 120

Port Security                      :Disabled
Port Status                        :Up
Mac Learning                       :Enabled
Mac-learn-disable-violation action :Shutdown
mac-learning-limit                 :1024
Mac-learn-limit-Violation Action   :Flood
Sticky                             :Enabled
Mac-move-allow                     :Allowed
Mac-move-violation                 :shutdown-offending
Aging                              :Disabled
Total MAC Addresses                :11
Secure static MAC Addresses        :0
Sticky MAC Addresses               :11
Secure Dynamic MAC addresses       :0
```

Supported Releases 10.5.1.0 or later

sticky

Enables sticky MAC address learning or converts existing dynamic MAC addresses as sticky.

Syntax	`[no] sticky`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION-PORT-SECURITY
Usage Information	This command enables sticky MAC address learning or converts existing dynamic MAC addresses as sticky. Sticky MAC addresses persist system reloads. For the sticky MAC feature to function, enable MAC address learning limit using the `mac learn-limit` command. In order to convert sticky MAC addresses to dynamic addresses use the `no sticky` command. When there is a mismatch in the `sticky` configuration on a VLT port-channel, sticky MACs can move to other ports.
Example	`OS10(config-if-port-sec)# sticky` `OS10(config-if-port-sec)# no sticky`
Supported Releases	10.5.1.0 or later

switchport port-security (global)

Enables the port security feature on the system globally.

Syntax	`switchport port-security`
Parameters	None
Default	Port security is enabled globally.
Command Mode	• CONFIGURATION
Usage Information	After you enable the port security feature on the system globally, enable port security on the required interfaces using this command in INTERFACE CONFIGURATION mode. The `no` version of this command disables the port security feature on the system.
Example	`OS10(config)# no switchport port-security`
Supported Releases	10.5.1.0 or later

switchport port-security (interface)

Enables port security on an interface.

Syntax	`switchport port-security`
Parameters	None
Default	Disabled
Command Mode	INTERFACE

Usage Information

After you enable port security on an interface, by default, the maximum number of MAC addresses that the interface can learn is one. This is applicable for both dynamic and static secure MAC addresses. After you enable port security on an interface, by default, sticky MAC addresses and MAC movement are disabled on the interface.

This command enables port security on an interface. If you disable the feature globally, this command does not take effect on an interface.

The `no` version of this command disables port security on an interface.

Example

```
OS10(config-if-eth1/1/2)# switchport port-security
```

Supported Releases

10.5.1.0 or later

17

OpenFlow

Switches implement the control plane and data plane in the same hardware. Software-defined network (SDN) decouples the software (control plane) from the hardware (data plane). A centralized SDN controller handles the control plane traffic and hardware configuration for data plane flows.

The SDN controller is the "brain" of an SDN. The SDN controller uses north-bound application programming interfaces (APIs) to communicate with the business logic applications and south-bound APIs to set up controlled network devices, such as OS10 switches.

OpenFlow is an implementation of SDN. OpenFlow enables programmable networks. You can develop SDN controller network applications using representational state transfer (REST) or JAVA APIs (north-bound APIs) to business logic applications. The SDN controller uses OpenFlow south-bound APIs to communicate with the switches and relay information from business logic applications.

Advantages of an SDN include customization, accelerating new feature development, lower operating costs, and fostering an open, multi-vendor environment.

OS10 supports OpenFlow protocol versions 1.0 and 1.3.

OS10 supports OpenFlow-only mode. In this mode, the SDN controller controls data path of the switch. The OpenFlow pipeline processes all data packets.

NOTE: When the switch is in OpenFlow mode, all Layer 2 (L2) and Layer 3 (L3) protocols are disabled. Link-level protocols such as Link Layer Discovery Protocol (LLDP), Dot1x, and Virtual Link Trunking (VLT) are disabled as well.

NOTE: OpenFlow Hybrid mode is not supported.

Supported Platforms

- S4048–ON
- S4048T-ON
- S4100-ON
- S4248FB-ON
- S4248FBL-ON
- S5200-ON
- S6010–ON
- Z9100–ON
- Z9264F-ON
- Z9332F-ON

NOTE: S3048-ON, E3224F-ON, and Z9664F-ON are not supported.

OS10 OpenFlow implementation reserves VLANs 1 and 4095.

The following is a known OpenFlow restriction in OS10:

Converting the switch from OpenFlow mode back to Normal mode removes all OpenFlow configurations. The switch returns to the pre-Openflow status. The management, interface (maximum transmission unit (MTU) and LLDP), and authentication, authorization, and accounting (AAA) settings specified in the Normal mode are retained.

To start up the switch in Factory Default mode, you must:

1. Delete the startup configuration using the `delete startup-configuration` command.
2. Enter the `reload` command.

   NOTE: Do not use the `no openflow` or `no mode openflow-only` command.

```
OS10# delete startup-configuration
OS10# reload
```

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

The ONOS controller does not encode the DSCP flow entry values that are matched according to the Openflow 1.0 specification. Hence when you install a flow entry in OpenFlow 1.0, that matches the IP DSCP, the ONOS controller sets an incorrect flow-entry encoding value for IP DSCP.

OpenFlow logical switch instance

In OpenFlow-only mode, you can configure only one logical switch instance. After you enable OpenFlow mode, create a logical switch instance. The logical switch instance is disabled by default. When the logical switch instance is enabled, the OpenFlow application starts the connection with the configured controller.

When you create an OpenFlow logical switch instance, all the physical interfaces are automatically added to it.

OpenFlow controller

OS10 is qualified with the following SDN controllers:

- RYU
- Open Network Operating System (ONOS)

To establish a connection with the controller, configure the IPv4 address of the controller and port ID in the OpenFlow logical switch instance. The default port is 6653. You can connect controllers to the switch in OOB Connection mode. However, you can use any of the front-panel ports as the management interface using the `in-band` command. The inband port is removed from the OpenFlow switch instance and is not controlled by the controller.

The management port MTU is 1532 and the inband port MTU is 9216.

OpenFlow uses the Transmission Control Protocol (TCP) and Transport Layer Security (TLS) protocol for communication.

If the OpenFlow switch loses connection with the controller, the switch immediately enters Fail Secure mode. All the flows the controller installs are retained on the switch. The flow entries are removed based on the hard or idle timeout that you configure.

OpenFlow version 1.3

This section provides information about OpenFlow version 1.3 specifications for OS10.

Ports

An OpenFlow switch supports the following OpenFlow ports:

Table 99. Supported port types

Port types	Support
Physical ports	Supported
Logical ports	Not supported
Reserved ports	
(Required) ALL	Supported
(Required) CONTROLLER	Supported
(Required) TABLE	Not supported
(Required) IN PORT	Not supported
(Required) ANY	Supported
(Optional) LOCAL	Not supported
(Optional) NORMAL	Not supported

Table 99. Supported port types (continued)

Port types	Support
(Optional) FLOOD	Not supported

Flow table

An OpenFlow flow table consists of flow entries. Each flow table entry contains the following fields:

Table 100. Supported fields

Fields	Support
match_fields	Supported
priority	Supported
counters	Supported
instructions	Supported
timeouts	Supported
cookie	Not supported

Group table

Not supported

Meter table

Not supported

Instructions

Each flow entry contains a set of instructions that execute when a packet matches the entry.

Table 101. Supported instructions

Instruction	Support
(Optional) Meter meter id	Not supported
(Optional) Apply-Actions action(s)	Supported
(Optional) Clear-Actions	Not supported
(Required) Write-Actions action(s)	Supported
(Optional) Write-Metadata metadata/mask	Not supported
(Required) Goto-table next-table-id	Not supported

Action set

An action set associates with each packet.

Table 102. Supported action sets

Action set	Support
copy TTL inwards	Not supported

Table 102. Supported action sets (continued)

Action set	Support
pop	Not supported
push-MPLS	Not supported
push-VLAN	Not supported
copy TTL outwards	Not supported
decrement TTL	Not supported
set	Supported (selective fields)
qos	Not supported
group	Not supported
output	Supported

Action types

An action type associates with each packet.

Table 103. Supported action types

Action type	Support
Output	Supported
Set-queue	Not supported
Drop	Supported
Group	Not supported
Push-tag/Pop-tag	Not supported
Set-field	Partially supported • Source MAC—Supported • Destination MAC—Supported • VLAN ID—Supported • VLAN PCP—Supported • IP DSCP—Supported
change-TTL	Not supported

Counters

Counters are used for statistical purposes.

Table 104. Supported counters

Required/Optional	Counter	Bits	Support
Per flow table			
Required	Reference count (active entries)	32	Supported
Optional	Packet lookups	64	Supported
Optional	Packet matches	64	Supported
Per flow entry			
Optional	Received packets	64	Supported

Table 104. Supported counters (continued)

Required/Optional	Counter	Bits	Support
Optional	Received bytes	64	Supported
Required	Duration (seconds)	32	Supported
Optional	Duration (nanoseconds)	32	Supported
Per port			
Required	Received packets	64	Supported
Required	Transmitted packets	64	Supported
Optional	Received bytes	64	Supported
Optional	Transmitted bytes	64	Supported
Optional	Receive drops	64	Not supported
Optional	Transmit drops	64	Not supported
Optional	Receive errors	64	Supported
Optional	Transmit errors	64	Supported
Optional	Receive frame alignment errors	64	Not supported
Optional	Receive overrun errors	64	Not supported
Optional	Receive CRC errors	64	Supported
Optional	Collisions	64	Supported
Required	Duration (seconds)	32	Not supported
Optional	Duration (nanoseconds)	32	Not supported
Per queue			
Required	Transmit packets	64	Not supported
Optional	Transmit bytes	64	Not supported
Optional	Transmit overrun errors	64	Not supported
Required	Duration (seconds)	32	Not supported
Optional	Duration (nanoseconds)	32	Not supported
Per group			
Optional	Reference count (flow entries)	32	Not supported
Optional	Packet count	64	Not supported
Optional	Byte count	64	Not supported
Required	Duration (seconds)	32	Not supported
Optional	Duration (nanoseconds)	32	Not supported
Per group bucket			
Optional	Packet count	64	Not supported
Optional	Byte count	64	Not supported
Per meter			
Optional	Flow count	32	Not supported
Optional	Input packet count	64	Not supported

Table 104. Supported counters (continued)

Required/Optional	Counter	Bits	Support
Optional	Input byte count	64	Not supported
Required	Duration (seconds)	32	Not supported
Optional	Duration (nanoseconds)	32	Not supported
Per meter band			
Optional	In-band packet count	64	Not supported
Optional	In-band byte count	64	Not supported

Configuration notes

Dell PowerSwitch S4200-ON Series:

- In the `show interface vlan` command output, the VLAN octet counters are not displayed accurately.
- If a packet hits two ACL tables, the counter with higher priority statistics gets incremented and the other actions are merged and applied.

OpenFlow protocol

The OpenFlow protocol supports three message types, each with multiple subtypes:

- Controller-to-switch
- Asynchronous
- Symmetric

Controller-to-switch

Table 105. Supported controller-to-switch types

Controller-to-switch types	Supported/Not supported
Feature request	Supported
Configuration get	Supported
Configuration set	Supported
Modify-state	Supported
Read-state	Supported
Packet-out	Supported
Barrier	Supported
Role-request	Supported

Asynchronous

Table 106. Supported asynchronous types

Asynchronous types	Supported/Not supported
Packet-in	Supported
Flow-removed	Supported
Port-status	Supported
Error	Supported

Symmetric

Table 107. Supported symmetric types

Symmetric types	Supported/Not supported
Hello	Supported
Echo	Supported
Experimenter	Not supported

Connection setup TCP

Table 108. Supported modes

Modes	Supported/Not supported
Connection interruption	• fail-secure-mode—Supported • fail-standalone-mode—Not supported
TLS encryption	Supported
Multiple controller	Not supported
Auxiliary connections	Not supported
Number of logical switches	One

Supported controllers

OpenFlow use cases

OS10 OpenFlow protocol support allows the flexibility of using vendor-neutral applications and to use applications that you create. For example, the OS10 OpenFlow implementation supports L2 applications similar to the ones found in the following websites:

- https://github.com/osrg/ryu/tree/master/ryu/app (only L2 applications are supported)
- https://github.com/osrg/ryu/tree/master/ryu/app

NOTE: OS10 supports applications based on OpenFlow versions 1.0 and 1.3.

- **Switching loop removal**

  Consider the case of a single broadcast domain where switching loops are common. This issue occurs because of redundant paths in an L2 network.

  Switching loops create broadcast storms with broadcasts and multicasts being forwarded out of every switch port. Every switch in the network repeatedly re-broadcasts the messages and floods the entire network.

  To solve broadcast storms in an OpenFlow network, a centralized controller makes all the control plane decisions and manages the switches. The controller has the complete view of the topology. MAC address learning is centralized. OpenFlow identifies the correct path and forwards the packets to the relevant switch thereby avoiding switching loops.

- **Reactive flow installation**

  Consider the case of dynamic learning of flows for bidirectional traffic. Flows are learnt as and when a packet arrives.

  With dynamic learning in an OpenFlow network, the OpenFlow switch receives a packet that does not match the flow table entries and sends the packet to the SDN controller to process it. The controller identifies the path the packet has to traverse and updates the flow table with a new entry. The controller also decides the caching time of the flow table entries.

Configure OpenFlow

When you convert the switch from Normal mode to OpenFlow mode, the switch retains the management, interface, and AAA settings.

NOTE: Ensure IP connectivity between the switch and the controller.

The following lists the minimum configuration you need to establish a connection between the OpenFlow controller and a logical switch instance:

1. Enter the OPENFLOW configuration mode.

```
OS10# configure terminal
OS10 (config)# openflow
OS10 (config-openflow)#
```

2. Enable the OpenFlow-only mode.

```
OS10 (config-openflow)# mode openflow-only
```

   Reload the switch. Enter `yes` to enable OpenFlow-only mode.

   NOTE: When the switch starts up in OpenFlow mode, it disables all Layer 2 (L2) and Layer 3 (L3) protocols. Many CLI commands are not available in OpenFlow-only mode. For a list of available commands in OpenFlow-only mode, see OpenFlow-only mode commands.

3. Configure a logical switch instance.
   a. Option 1; for Out of Band (OOB) management:
      i. Configure an IP address for the management port. Ensure that there is IP connectivity between the switch and the controller.

```
OS10# configure terminal
OS10 (config)# interface management 1/1/1
OS10 (conf-if-ma-1/1/1)# ip address 11.1.1.1/24
OS10 (conf-if-ma-1/1/1)# no shutdown
OS10 (conf-if-ma-1/1/1)# exit
```

      ii. Configure the logical switch instance, *of-switch-1*.

```
OS10# configure terminal
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
```

   b. Option 2; for in-band management:

i. Configure one of the front-panel ports as the management port.

```
OS10# configure terminal
OS10 (config)# openflow
OS10 (config-openflow)# in-band-mgmt interface ethernet 1/1/1
OS10 (config-openflow)#
```

ii. Configure an IPv4 address on the front-panel management port.

```
OS10# configure terminal
OS10 (config)# interface ethernet 1/1/1
OS10 (conf-if-eth1/1/1)# ip address 11.1.1.1/24
OS10 (conf-if-eth1/1/1)# no shutdown
```

iii. Configure the logical switch instance, *of-switch-1*.

```
OS10# configure terminal
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
```

4. Configure one or more OpenFlow controllers with either IPv4 or IPv6 addresses to establish a connection with the logical switch instance. You can configure up to eight OpenFlow controllers.

```
OS10 (config-openflow-switch)# controller ipv4 ip-address port port-id
OS10 (config-openflow-switch)# controller ipv6 ipv6-address port port-id
```

```
OS10 (config-openflow-switch)# controller ipv4 10.1.1.1 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.1.8 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.1.12 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.2.17 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.23.12 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.99.121 port 6633
OS10 (config-openflow-switch)# controller ipv6 2025::1 port 6633
OS10 (config-openflow-switch)# controller ipv6 2025::12 port 6633
```

where `IP` or `IPv6` address is of the controller and port 6633 is for OpenFlow communication.

5. Enter the `no shutdown` command to enable the logical switch instance.

```
OS10 (config-openflow-switch) no shutdown
```

Establish TLS connection

- Generate the switch and controller certificates from a server that supports public-key infrastructure (PKI). You need the following certificates:
  - Controller certificate
  - Switch certificate
  - Private key file to verify the switch certificate
- The certificates and private key files must be in the Privacy-Enhanced Mail (PEM) format.

For certificate-based authentication, you must establish a TLS connection between the switch and the controller before you configure OpenFlow on the switch. The following procedure explains how to install the controller and switch certificates on the OS10 switch. Refer to the controller documentation for information on how to install the certificates on the controller.

NOTE: This procedure is optional. Use this procedure if you want to configure certificate-based authentication between the switch and the controller.

1. Log in to the OS10 switch with administrator credentials.
2. Enter the following command to copy the certificates to the OS10 switch.

   In the following commands, the destination path and the destination file name on the OS10 switch, for example, `config://../openflow/cacert.pem`, remain the same in your deployment. Ensure that you enter the destination path and destination file names as specified in the following example:

```
OS10# copy scp://username:password@server-ip/full-path-to-the-certificates/controller-
```

```
cert.pem config://../openflow/cacert.pem
OS10# copy scp://username:password@server-ip/full-path-to-the-certificates/switch-
cert.pem config://../openflow/sc-cert.pem
OS10# copy scp://username:password@server-ip/full-path-to-the-certificates/switch-
privkey.pem config://../openflow/sc-privkey.pem
```

where *server-ip* refers to the server where you have stored the certificates, and *username* and *password* refers to the credentials you need to access the server with the certificates.

3. Perform the steps described in the Configure OpenFlow protocol on the switch topic to configure OpenFlow.

OpenFlow commands

controller

Configures an OpenFlow controller that the logical switch instance connects to.

Syntax

```
controller {ipv4 ipv4-address| ipv6 ipv6-address [port port-number]
[security {none|tls}]
```

Parameters

- `ipv4 ipv4-address`—Enter `ipv4`, then the IP address of the controller.
- `ipv6 ipv6-address`—Enter `ipv6`, then the IPv6 address of the controller.
- `port port-number`—Enter the keyword, then the port number, from 1 to 65,535. The default port is 6653.
- `security {none|tls}`—Specify the type of connection. The default is `security none`. The TCP connection is used.

Default

TCP. The default port number is 6653.

Command Mode

OPENFLOW SWITCH CONFIGURATION

Usage Information

You can configure up to eight OpenFlow controllers.

If you specify the `security tls` option, the OpenFlow application looks for the following certificates and private key in the following locations specified for certificate-based authentication. For information about obtaining certificates and installing them on the switch and the controller, see Establish TLS connection between the switch and the controller.

ca_cert (certificate that identifies the controller as being trustworthy)	`/config/etc/opt/dell/os10/openflow/cacert.pem`
certificate (certificate that identifies the switch as being trustworthy)	`/config/etc/opt/dell/os10/openflow/sc-cert.pem`
private key (the private key corresponding to the switch certificate)	`/config/etc/opt/dell/os10/openflow/sc-privkey.pem`

Example

The following example configures an OpenFlow controller with IP address 10.11.63.56 on port 6633 for the logical switch instance, of-switch-1:

```
OS10# configure terminal
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
```

```
OS10 (config-openflow-switch)# controller ipv4 10.11.63.56 port 6633
OS10 (config-openflow-switch)#
```

The following example configures multiple OpenFlow controllers on port 6633 for the logical switch instance, of-switch-1:

```
OS10# configure terminal
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
OS10 (config-openflow-switch)# controller ipv4 10.1.1.1 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.1.8 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.1.12 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.2.17 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.23.12 port 6633
OS10 (config-openflow-switch)# controller ipv4 10.1.99.121 port 6633
OS10 (config-openflow-switch)# controller ipv6 2025::1 port 6633
OS10 (config-openflow-switch)# controller ipv6 2025::12 port 6633
```

Supported Releases 10.4.1.0 or later

dpid-mac-address

Specifies the MAC address bits of the datapath ID (DPID) of the logical switch instance.

Syntax `dpid-mac-address` *MAC-address*

Parameters *MAC-address*—48-bit MAC address in hexadecimal notation, nn:nn:nn:nn:nn:nn

Default MAC address

Command Mode OPENFLOW SWITCH CONFIGURATION

Usage Information The controller uses the DPID to identify the logical switch instance. The DPID is a 64-bit number that is sent to the controller in the `features_reply` message. The DPID is constructed from the instance ID, which is the most significant 16 bits (default to 0) and the DPID-MAC-ADDRESS, which is the least significant 48 bits. OS10 currently supports only one logical switch instance and the instance ID is automatically set to 0. This value is not configurable.

You can use this command to modify the MAC address bits of the DPID.

Example DPID MAC address is 00:00:00:00:00:0a.

```
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
OS10 (config-openflow-switch)# dpid-mac-address 00:00:00:00:00:0a
OS10 (config-openflow-switch)#
```

Supported Releases 10.4.1.0 or later

in-band-mgmt

Configures the front-panel ports as the management interface that the SDN controller connects to.

Syntax `in-band-mgmt interface ethernet` *node/slot/port[:subport]*

Parameters *node/slot/port[:subport]*—Enter the physical port information.

Default None

Command Mode OPENFLOW CONFIGURATION

Usage Information	Use this command to convert any one of the front-panel ports as the management interface. This port is not part of the OpenFlow logical switch instance. All the ports are L2 ports by default. If you configure one of the front-panel ports as the management interface, the port becomes an L3 port. You can configure an L3 IPv4 address only to the front-panel port that you have specified in this command. Ensure that you have IP connectivity between the specified port and the controller. The `no` form of this command removes this configuration and the front-panel port becomes part of the OpenFlow logical switch instance.

Example	`OS10# configure terminal`
	`OS10(config)# openflow`
	`OS10 (config-openflow)# in-band-mgmt interface ethernet 1/1/1`
	`OS10 (config-openflow)# no shutdown`

Supported Releases	10.4.1.0 or later

max-backoff

Configures the time interval, in seconds, that the logical switch instance waits after requesting a connection with the OpenFlow controller.

Syntax	`max-backoff` *`interval`*
Parameters	*`interval`*—Enter the amount of time, in seconds, that the logical switch instance waits after it attempts to establish a connection with the OpenFlow controller, from 1 to 65,535.
Default	8 seconds
Command Mode	OPENFLOW SWITCH CONFIGURATION
Usage Information	If the interval time lapses, the logical switch instance re-attempts to establish a connection with the OpenFlow controller.

Example	`OS10 (config)# openflow`
	`OS10 (config-openflow)# switch of-switch-1`
	`OS10 (config-openflow-switch)# max-backoff 25`
	`OS10 (config-openflow-switch)#`

Supported Releases	10.4.1.0 or later

mode openflow-only

Enables OpenFlow-only mode on the switch.

Syntax	`mode openflow-only`
Parameters	None
Default	None
Command Mode	OPENFLOW CONFIGURATION
Usage Information	Use this command to enable OpenFlow-only mode. This command reloads the switch and boots to OpenFlow-only mode. This command deletes all L2 and L3 configurations. However, the system management and AAA configurations are retained. The `no` form of this command prompts you to reload the switch. If you enter `yes`, the switch deletes all OpenFlow configurations, including the controller IP, port, certificates, and reloads, then returns to the Normal mode.

NOTE: For a list of available commands when the switch is in the OpenFlow-only mode, see CLI commands available in the OpenFlow-only mode.

Example

```
OS10 (config-openflow)# mode openflow-only
OS10 (config-openflow)#
```

Supported Releases 10.4.1.0 or later

openflow

Enters OPENFLOW configuration mode.

Syntax `openflow`

Parameters None

Default None

Command Mode CONFIGURATION

Usage Information All OpenFlow configurations are performed in this mode.

The `no` form of this command prompts a switch reload. If you enter `yes`, the system deletes all OpenFlow configurations and the switch returns to the normal mode after the reload.

Example

```
OS10# configure terminal
OS10(config)# openflow
OS10 (config-openflow)#
```

Supported Releases 10.4.1.0 or later

probe-interval

Configures the echo request interval, in seconds, for the controller configured with the logical switch instance.

Syntax `probe-interval` *`interval`*

Parameters *`interval`*—Enter the amount of time, in seconds, between the `keepalive` messages, also known as echo requests, from 1 to 65,535.

Default 5 seconds

Command Mode OPENFLOW SWITCH CONFIGURATION

Usage Information None

Example

```
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
OS10 (config-openflow-switch)# probe-interval 20
OS10 (config-openflow-switch)#
```

Supported Releases 10.4.1.0 or later

protocol-version

Specifies protocol version the logical switch interface uses.

Syntax `protocol-version version`

Parameters *version*—Choose from one of the following:

- `negotiate`—Enter the keyword to negotiate versions 1.0 or 1.3 with the controller. The highest of the supported versions is selected.
- `1.0`—Specify the logical switch instance OpenFlow protocol version as 1.0.
- `1.3`—Specify the logical switch instance OpenFlow protocol version as 1.3.

Default `negotiate`

Command Mode OPENFLOW SWITCH CONFIGURATION

Usage Information

NOTE: Only use this command should be run when the logical switch instance is disabled. Use the `shutdown` command to disable the logical switch instance. After you run this command, enter the `no shutdown` command to enable the logical switch instance again.

- When you specify, `negotiate`, the switch negotiates versions 1.0 and 1.3 and selects the highest of the versions supported by the controller. The negotiation is based on the hello handshake described in the OpenFlow Specification 1.3.
- When you specify, `1.0`, the switch establishes a connection with the controller that supports version 1.0 only.
- When you specify, `1.3`, the switch establishes a connection with the controller that supports version 1.3 only.

Example The following example shows a logical switch instance, of-switch-1, configured to interact with controllers that support the OpenFlow protocol version 1.3.

```
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
OS10 (config-openflow-switch)# shutdown
OS10 (config-openflow-switch)# protocol-version 1.3
OS10 (config-openflow-switch)# no shutdown
OS10 (config-openflow-switch)#
```

Supported Releases 10.4.1.0 or later

rate-limit packet_in

Configures the maximum packet rate for the controller connection, and the maximum packets permitted in a burst sent to the controller in a second.

Syntax `rate-limit packet_in` *`controller-packet-rate`* `[burst` *`maximum-packets-to-controller`*`]`

Parameters

- *`controller-packet-rate`*—Rate in packets per second for the controller OpenFlow channel connection, from 100 to 268000000 seconds. The default is 0 seconds, disabled.
- *`maximum-packets-to-controller`*—Burst in packets for the controller OpenFlow channel connection, from 25 to 1073000. The default is 0 seconds, disabled. This parameter is optional. It is set to 25% of the configured rate value, if not configured.

Default Disabled

Command Mode OPENFLOW SWITCH CONFIGURATION

Usage Information OpenFlow sets the specified rate and burst for the controller's connection with the logical switch instance. The actual rate and burst on the controller has a maximum of two times the configured values. For example, when you configure a rate of 1000 PPS and a burst of 300 packet bursts per second, the packets can egress on the connection at rates of up to 2000 PPS and 600 packet bursts per second.

The `no` form of this command disables rate limiting on the controller connection.

NOTE: This command is a software rate limiting command and applies only to the OpenFlow channel connection between the controller and the logical switch instance. This command is not related to the switch's data-plane rate limits.

Example

The following example configures a logical switch instance, of-switch-1, with an OpenFlow controller at a rate of 1000 PPS and packet bursts of 300 packets.

```
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
OS10 (config-openflow-switch)# controller ipv4 10.11.63.56 port 6633
OS10 (config-openflow-switch)# rate-limit packet_in 1000 burst 300
OS10 (config-openflow-switch)#
```

Supported Releases

10.4.1.0 or later

show openflow

Displays general OpenFlow switch and the logical switch instance information.

Syntax

`show openflow`

Parameters

None

Default

None

Command Mode

EXEC

Usage Information

None

Example

```
OS10# show openflow

Manufacturer                 : DELL
Hardware Description         :
Software Description         : Dell Networking OS10-Premium, Dell

```

Supported Releases

10.4.1.0 or later

show openflow flows

Displays OpenFlow flows for a specific logical switch instance.

Syntax `show openflow switch logical-switch-name flows`

Parameters `logical-switch-name`—Enter the logical switch instance name to view flow information.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show openflow switch of-switch-1 flows
Logical switch name: of-switch-1
Total flows: 1
  Flow: 0
   Table ID: 0, Table: Ingress ACL TCAM table
   Flow ID: 0
   Priority: 32768, Cookie: 0
   Hard Timeout: 0, Idle Timeout: 0
   Packets: 0, Bytes: 0
   Match Parameters:
    In Port: ethernet1/1/1
    EType: 0x800
    SMAC: 00:0b:c4:a8:22:b0/ff:ff:ff:ff:ff:ff
    DMAC: 00:0b:c4:a8:22:b1/ff:ff:ff:ff:ff:ff
    VLAN id: 2/4095
    VLAN PCP: 1
    IP DSCP: 4
    IP ECN: 1
    IP Proto: 1
    Src Ip: 10.0.0.1/255.255.255.255
    Dst Ip: 20.0.0.1/255.255.255.255
    ICMPv4 Type: 1
    ICMPv4 Code: 10
    L4 Src Port: *
    L4 Dst Port: *
  Apply-Actions:  Output= ethernet1/1/2, ethernet1/1/3:1
  Write-Actions:  Drop
```

Supported Releases 10.4.1.0 or later

show openflow ports

Displays the OpenFlow ports for a specific logical switch instance.

Syntax `show openflow switch logical-switch-name ports`

Parameters `logical-switch-name`—Enter the name of the logical switch instance to view port information.

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show openflow switch of-switch-1 ports
Logical switch name: of-switch-1
Interface Name of-port ID  Config-State  Link-State  SPEED  DUPLEX
AUTONEG TYPE
ethernet1/1/1     1        PORT_UP(CLI)  LINK_UP     40GB   FD      YES
```

```

Supported Releases 10.4.1.0 or later

show openflow switch

Displays OpenFlow parameters for the switch instance.

Syntax `show openflow switch`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show openflow switch
Logical switch name: of-switch-1
   Internal switch instance ID: 0
   Config state: true
   Signal Version: negotiate
   Data plane: secure
   Max backoff (sec): 8
   Probe Interval (sec): 5
   DPID: 90:b1:1c:f4:a5:23
   Switch Name : of-switch-1
   Number of buffers: 0
   Number of tables: 1
    Table ID: 0
    Table name: Ingress ACL TCAM table
    Max entries: 1000
    Active entries: 0
    Lookup count: 0
    Matched count: 0
   Controllers:
    10.16.208.150:6633, Protocol: none,
    packet-in Rate limit (packet per second): 0
    packet-in Burst limit: 0
```

Supported Releases 10.4.1.0 or later

show openflow switch controllers

Displays OpenFlow controllers for a specific logical switch instance.

Syntax `show openflow switch` *`logical-switch-name`* `controllers`

Parameters `logical-switch-name`—Enter the name of the logical switch instance to query.

Default None

Command Mode EXEC

Usage Information This command displays information for all active OpenFlow controllers.

Example

```
OS10# show openflow switch ice controllers
Logical switch name: ice
Total Controllers: 2
  Controller: 1
    Target: 10.16.132.59:6653
    Protocol: TCP
    Connected: YES
    Role: Master
    Last_error: Connection timed out
    State: ACTIVE
    sec_since_disconnect: 0
  Controller: 2
    Target: [2001::2]:6653
    Protocol: TCP
    Connected: YES
    Role: Equal
    Last_error: Connection timed out
    State: ACTIVE
    sec_since_disconnect: 0
```

Supported Releases 10.4.1.0 or later

switch

Creates a logical switch instance or modifies an existing logical switch instance.

Syntax `switch logical-switch-name`

Parameters `logical-switch-name`—Enter the name of the logical switch instance that you want to create or modify, a maximum of 15 characters. OS10 supports only one instance of the logical switch.

Default None

Command Mode OPENFLOW CONFIGURATION

Usage Information You must configure a controller for the logical switch instance. The logical switch instance is disabled by default. To establish a connection with the controller, enable the logical switch instance using the `no shutdown` command. All physical and logical interfaces in the switch are assigned to the configured logical switch.

The `no` form of this command removes the logical switch instance.

NOTE: OS10 supports only one instance of the logical switch. If you attempt to create a second logical switch instance, the following message appears:

```
% Warning: Only one Switch instance is supported
```

Example

```
OS10# config terminal
OS10 (config)# openflow
OS10 (config-openflow)# switch of-switch-1
OS10 (config-openflow-switch)# no shutdown
```

Supported Releases 10.4.1.0 or later

OpenFlow-only mode commands

When you configure the switch to OpenFlow-only mode, only the following commands are available; all other commands are disabled.

NOTE:

- The `ntp` subcommand under the `interface` command is not applicable when the switch is in OpenFlow mode.
- The `ip` and `ipv6` subcommands under the `interface` command are applicable only when you configure the interface as the management port using the `in-band-mgmt` command.
- The `ip` and `ipv6` commands must be used only in In-Band mode (using the `in-band-mgmt` command).

Table 122. Modes and CLI commands

Mode	Available CLI commands
CONFIGURATION	`aaa`
	`alias`
	`banner`
	`class-map`
	`clock`
	`control-plane`
	`crypto`
	`end`
	`eula-consent`
	`exec-timeout`
	`exit`
	`feature`
	`help`

Access Control Lists

OS10 uses two types of access policies — hardware-based ACLs and software-based route-maps. Use an ACL to filter traffic and drop or forward matching packets. To redistribute routes that match configured criteria, use a route-map.

ACLs

ACLs are a filter containing criterion to match; for example, examine internet protocol (IP), transmission control protocol (TCP), or user datagram protocol (UDP) packets, and an action to take such as forwarding or dropping packets at the NPU. ACLs permit or deny traffic based on MAC and/or IP addresses. The number of ACL entries is hardware-dependent.

ACLs have only two actions — forward or drop. Route-maps not only permit or block redistributed routes but also modify information associated with the route when it is redistributed into another protocol. When a packet matches a filter, the device drops or forwards the packet based on the filter's specified action. If the packet does not match any of the filters in the ACL, the packet drops, an implicit deny. ACL rules do not consume hardware resources until you apply the ACL to an interface.

ACLs process in sequence. If a packet does not match the criterion in the first filter, the second filter applies. If you configure multiple hardware-based ACLs, filter rules apply on the packet content based on the priority numeric processing unit (NPU) rule.

Route maps

Route-maps are software-based protocol filtering redistributing routes from one protocol to another and used in decision criterion in route advertisements. A route-map defines which of the routes from the specified routing protocol redistributes into the target routing process, see Route-maps.

Route-maps which have more than one match criterion, two or more matches within the same route-map sequence, have different match commands. Matching a packet against this criterion is an AND operation. If no match is found in a route-map sequence, the process moves to the next route-map sequence until a match is found, or until there are no more sequences. When a match is found, the packet forwards and no additional route-map sequences process. If you include a continue clause in the route-map sequence, the next route-map sequence also processes after a match is found.

IP ACLs

An ACL filters packets based on the:

- IP protocol number
- Source and destination IP address
- Source and destination TCP port number
- Source and destination UDP port number

For ACL, TCP, and UDP filters, match criteria on specific TCP or UDP ports. For ACL TCP filters, you can also match criteria on established TCP sessions.

When creating an ACL, the sequence of the filters is important. You can assign sequence numbers to the filters as you enter them or OS10 can assign numbers in the order you create the filters. The sequence numbers display in the `show running-configuration` and `show ip access-lists [in | out]` command output.

Ingress and egress hot-lock ACLs allow you to append or delete new rules into an existing ACL without disrupting traffic flow. Existing entries in the content-addressable memory (CAM) shuffle to accommodate the new entries. Hot-lock ACLs are enabled by default and support ACLs on all platforms.

NOTE: Hot-lock ACLs support ingress ACLs only.

NOTE: When applied on VLANs, the implicit deny rule in IP ACLs does not permit the following packets at egress:

- IPv4 Address Resolution Protocol (ARP)
- IPv6 Neighbor Discovery (ND)
- IPv6 Neighbor Solicitation (NS)

To permit these packets, you must configure an explicit `permit` statement for the specific hosts or subnetworks with the deny rule having a lower priority to drop the rest of the packets. The `deny ip any any` and `deny ipv6 any any` rules are implicit. You do not have to configure them explicitly.

Restrictions and limitations

Consider a scenario where you create a single IPv4 ACL using the `seq 10 permit ip any any count` command and apply it to 150 VLANs using the `range` command.

When you apply sequential rules in the hardware, negligible traffic loss occurs when the implicit deny rule is executed during the time interval between these rules.

For example, when you apply the following sequential rules, negligible traffic loss occurs in the IPv4 traffic streams:

1. Number of VLANs x number of tiles x 1 Implicit deny rule. For example, 150 x 4 x 1 = 600 rules.
2. Number of VLANs x number of tiles x actual number of rules in the list. For example, 150 x 4 x 1 = 600 rules.

You can see this behavior in multi-tile platforms such as Z9100-ON, Z9264-ON, Z9332-ON, and so on. Because, you need to install more number of implicit deny rules before actually configuring the ACL rules. In all other Dell SmartFabric OS10 platforms, you can see this behavior if you increase the number of VLANs in the same TC.

MAC ACLs

MAC ACLs filter traffic on the header of a packet. This traffic filtering is based on:

Source MAC packet address	MAC address range—address mask in 3x4 dotted hexadecimal notation, and *any* to denote that the rule matches all source addresses.
Destination MAC packet address	MAC address range—address-mask in 3x4 dotted hexadecimal notation, and *any* to denote that the rule matches all destination addresses.
Packet protocol	Set by its `EtherType` field contents and assigned protocol number for all protocols.
VLAN ID	Set in the packet header
Class of service	Present in the packet header

IPv4/IPv6 and MAC ACLs apply separately for inbound and outbound packets. You can assign an interface to multiple ACLs, with a limit of one ACL per packet direction per ACL type.

Control-plane ACLs

OS10 offers control-plane ACLs to selectively restrict packets that are destined to the CPU port, thereby providing increased security. Control-plane ACLs offer:

- An option to protect the CPU from denial of service (DoS) attacks.
- Fine-grained control to allow or block traffic going to the CPU.

Control-plane ACLs apply on the front-panel and management ports. Control-plane ACLs are one of the following types:

- IP ACL
- IPv6 ACL
- MAC ACL

  NOTE: MAC ACL is applied only on packets that enter through the front-panel ports.

There is no implicit deny rule. If none of the configured conditions match, the default behavior is to permit. If you need to deny traffic that does not match any of the configured conditions, explicitly configure a deny statement.

The control-plane ACL is mutually exclusive with VTY ACL, the management ACL. VTY ACL provides secure access for session connection protocols, such as SSH or TELNET; however, control-plane ACLs permit or deny any TCP or UDP, including SSH and TELNET sessions, from specific hosts and networks, and also filters both IPv4 and IPv6 traffic.

Configure control-plane ACL

To configure control-plane ACLs, use the existing ACL template and create the appropriate rules to permit or deny traffic as needed, similar to creating an access list for VTY ACLs. However, when you apply this control-plane ACL, you must apply it in CONTROL-PLANE mode instead of VTY mode. For example:

```
OS10# configure terminal
OS10(config)# control-plane
OS10(config-control-plane)# ip access-group acl_name in
```

where *acl_name* is the name of the control-plane ACL, a maximum of 140 characters.

NOTE: Apply control-plane ACLs on ingress traffic only.

Configuration notes

The control-plane MAC ACL is not supported for management port on all platforms.

Control-plane ACL qualifiers

This section lists the supported control-plane ACL rule qualifiers.

NOTE: OS10 supports only the qualifiers listed below. Ensure that you use only these qualifiers in ACL rules.

- IPv4 qualifiers:
  - `DST_IP`—Destination IP address
  - `SRC_IP`—Source IP address
  - `IP_TYPE`—IP type
  - `IP_PROTOCOL`—Protocols such as TCP, UDP, and so on
  - `L4_DST_PORT`—Destination port number
- IPv6 qualifiers:
  - `DST_IPv6`—Destination address
  - `SRC_IPv6`—Source address
  - `IP_TYPE`—IP Type; for example, IPv4 or IPv6
  - `IP_PROTOCOL`—TCP, UDP, and so on
  - `L4_DST_PORT`—Destination port
- MAC qualifiers:
  - `OUT_PORT`—Egress CPU port
  - `SRC_MAC`—Source MAC address
  - `DST_MAC`—Destination MAC address
  - `ETHER_TYPE`—Ethertype
  - `OUTER_VLAN_ID`—VLAN ID
  - `IP_TYPE`—IP type
  - `OUTER_VLAN_PRI`—DOT1P value

IP fragment handling

OS10 supports a configurable option to explicitly deny IP-fragmented packets, particularly for the second and subsequent packets. This option extends the existing ACL command syntax with the `fragments` keyword for all L3 rules:

- Second and subsequent fragments are allowed because you cannot apply a L3 rule to these fragments. If the packet is denied eventually, the first fragment must be denied and the packet as a whole cannot be reassembled.
- The system applies implicit permit for the second and subsequent fragment before the *implicit* deny.
- If you configure an *explicit* deny, the second and subsequent fragments do not hit the implicit permit rule for fragments.

IP fragments ACL

When a packet exceeds the maximum packet size, the packet is fragmented into a number of smaller packets that contain portions of the contents of the original packet. This packet flow begins with an initial packet that contains all of the L3 and

Layer 4 (L4) header information contained in the original packet, and is followed by a number of packets that contain only the L3 header information.

This packet flow contains all of the information from the original packet distributed through packets that are small enough to avoid the maximum packet size limit. This provides a particular problem for ACL processing.

If the ACL filters based on L4 information, the non-initial packets within the fragmented packet flow will not match the L4 information, even if the original packet would have matched the filter. Because of this filtering, packets are not processed by the ACL.

The examples show denying second and subsequent fragments, and permitting all packets on an interface. These ACLs deny all second and subsequent fragments with destination IP 10.1.1.1, but permit the first fragment and non-fragmented packets with destination IP 10.1.1.1. The second example shows ACLs which permits all packets — both fragmented and non-fragmented — with destination IP 10.1.1.1.

Deny second and subsequent fragments

```
OS10(config)# ip access-list ABC
OS10(conf-ipv4-acl)# deny ip any 10.1.1.1/32 fragments
OS10(conf-ipv4-acl)# permit ip any 10.1.1.1/32
```

Permit all packets on interface

```
OS10(config)# ip access-list ABC
OS10(conf-ipv4-acl)# permit ip any 10.1.1.1/32
OS10(conf-ipv4-acl)# deny ip any 10.1.1.1/32 fragments
```

L3 ACL rules

Use ACL commands for L3 packet filtering. TCP packets from host 10.1.1.1 with the TCP destination port equal to 24 are permitted, and all others are denied.

TCP packets that are first fragments or non-fragmented from host 10.1.1.1 with the TCP destination port equal to 24 are permitted, and all TCP non-first fragments from host 10.1.1.1 are permitted. All other IP packets that are non-first fragments are denied.

Permit ACL with L3 information only

If a packet's L3 information matches the information in the ACL, the packet's fragment offset (FO) is checked:

- If a packet's FO > 0, the packet is permitted
- If a packet's FO = 0, the next ACL entry processes

Deny ACL with L3 information only

If a packet's L3 information does not match the L3 information in the ACL, the packet's FO is checked:

- If a packet's FO > 0, the packet is denied
- If a packet's FO = 0, the next ACL line processes

Permit all packets from host

```
OS10(config)# ip access-list ABC
OS10(conf-ipv4-acl)# permit tcp host 10.1.1.1 any eq 24
OS10(conf-ipv4-acl)# deny ip any any fragment
```

Permit only first fragments and non-fragmented packets from host

```
OS10(config)# ip access-list ABC
OS10(conf-ipv4-acl)# permit tcp host 10.1.1.1 any eq 24
```

```
OS10(conf-ipv4-acl)# permit tcp host 10.1.1.1 any fragment
OS10(conf-ipv4-acl)# deny ip any any fragment
```

To log all packets denied and to override the implicit deny rule and the implicit permit rule for TCP/ UDP fragments, use a similar configuration. When an ACL filters packets, it looks at the FO to determine whether it is a fragment:

- FO = 0 means it is either the first fragment or the packet is a non-fragment
- FO > 0 means it is the fragments of the original packet

Assign sequence number to filter

IP ACLs filter on source and destination IP addresses, IP host addresses, TCP addresses, TCP host addresses, UDP addresses, and UDP host addresses. Traffic passes through the filter by filter sequence. Configure the IP ACL by first entering IP ACCESS-LIST mode and then assigning a sequence number to the filter.

User-provided sequence number

- Enter IP ACCESS LIST mode by creating an IP ACL in CONFIGURATION mode.

  ```
  ip access-list access-list-name
  ```

- Configure a drop or forward filter in IPV4-ACL mode.

  ```
  seq sequence-number {deny | permit | remark} {ip-protocol-number | icmp | ip |
  protocol | tcp | udp} {source prefix | source mask | any | host} {destination mask
  | any | host ip-address} [count [byte]] [fragments]
  ```

Auto-generated sequence number

If you are creating an ACL with only one or two filters, you can let the system assign a sequence number based on the order you configure the filters. The system assigns sequence numbers to filters using multiples of ten values.

- Configure a deny or permit filter to examine IP packets in IPV4-ACL mode.

  ```
  {deny | permit} {source mask | any | host ip-address} [count [byte]] [fragments]
  ```

- Configure a deny or permit filter to examine TCP packets in IPV4-ACL mode.

  ```
  {deny | permit} tcp {source mask] | any | host ip-address}} [count [byte]] [fragments]
  ```

- Configure a deny or permit filter to examine UDP packets in IPV4-ACL mode.

  ```
  {deny | permit} udp {source mask | any | host ip-address}} [count [byte]] [fragments]
  ```

Assign sequence number to filter

```
OS10(config)# ip access-list acl1
OS10(conf-ipv4-acl)# seq 5 deny tcp any any capture session 1 count
```

View ACLs and packets processed through ACL

```
OS10# show ip access-lists in
Ingress IP access-list acl1
 Active on interfaces :
  ethernet1/1/5
 seq 5 permit ip any any count (10000 packets)
```

Delete ACL rule

Before release 10.4.2, deleting ACL rules required a sequence number.

After release 10.4.2 or later, you can also delete ACL rules using the `no` form of the CLI command without using a sequence number.

While deleting ACL rules, the following conditions apply:

- Enter the exact `no` form of the CLI command. Each ACL rule is an independent entity. For example, the rule, `deny ip any any` is different from `deny ip any any count`.

  For example, if you configured the following rules:

  ```
  deny ip 1.1.1.1/24 2.2.2.2/24
  deny ip any any
  ```

  Using the `no deny ip any any` command deletes only the `deny ip any any` rule.

  To delete the `deny ip 1.1.1.1/24 2.2.2.2/24` rule, you must explicitly use the `no deny ip 1.1.1.1/24 2.2.2.2/24` command.

  NOTE: Wildcard option is not supported.
- You can no longer configure the same ACL rule multiple times using different sequence numbers. This option prevents duplicate rules from being entered in the system and taking up memory space.
- When you upgrade from a previous release to release 10.4.2 or later, the upgrade procedure removes all duplicate ACL rules and only one instance of an ACL rule remains in the system.

L2 and L3 ACLs

Configure both L2 and L3 ACLs on an interface in L2 mode. Rules apply if you use both L2 and L3 ACLs on an interface.

- L3 ACL filters packets and then the L2 ACL filters packets
- Egress L3 ACL filters packets

Rules apply in order:

- Ingress L3 ACL
- Ingress L2 ACL
- Egress L3 ACL
- Egress L2 ACL

NOTE: In ingress ACLs, L2 has a higher priority than L3 and in egress ACLs, L3 has a higher priority than L2.

Table 123. L2 and L3 targeted traffic

L2 ACL / L3 ACL	Targeted traffic
Deny / Deny	L3 ACL denies
Deny / Permit	L3 ACL permits
Permit / Deny	L3 ACL denies
Permit / Permit	L3 ACL permits

Assign and apply ACL filters

To filter an Ethernet interface, a port channel interface, or a VLAN, assign an IP ACL filter to the corresponding interface. The IP ACL applies to all traffic entering a physical, port channel, or VLAN interface. The traffic either forwards or drops depending on the criteria and actions you configure in the ACL filter.

To change the ACL filter functionality, apply the same ACL filters to different interfaces. For example, take ACL “ABCD” and apply it using the `in` keyword and it becomes an ingress ACL. If you apply the same ACL filter using the `out` keyword, it becomes an egress ACL.

NOTE: This note is applicable only for the S5200F-ON series platform switches. Applying an egress ACL to a VLAN interface with access ports as members (untagged) has no effect. The system does not apply egress ACL rules on untagged access ports.

You can apply an IP ACL filter to a physical interface, port channel interface, VLAN interface, or on the access ports which are members of the virtual-network interfaces. The number of ACL filters allowed is hardware-dependent.

1. Enter the interface information in CONFIGURATION mode.

```
interface ethernet node/slot/port
```

2. Configure an IP address for the interface, placing it in L3 mode in INTERFACE mode.

```
ip address ip-address
```

3. Apply an IP ACL filter to traffic entering or exiting an interface in INTERFACE mode.

```
ip access-group access-list-name {in | out}
```

Configure IP ACL

```
OS10(config)# interface ethernet 1/1/28
OS10(conf-if-eth1/1/28)# ip address 10.1.2.0/24
OS10(conf-if-eth1/1/28)# ip access-group abcd in
```

View ACL filters applied to interface

```
OS10# show ip access-lists in
Ingress IP access-list acl1
Active on interfaces :
 ethernet1/1/28
seq 10 permit ip host 10.1.1.1 host 100.1.1.1 count (0 packets)
seq 20 deny ip host 20.1.1.1 host 200.1.1.1 count (0 packets)
seq 30 permit ip 10.1.2.0/24 100.1.2.0/24 count (0 packets)
seq 40 deny ip 20.1.2.0/24 200.1.2.0/24 count (0 packets)
seq 50 permit ip 10.0.3.0 255.0.255.0 any count (0 packets)
seq 60 deny ip 20.0.3.0 255.0.255.0 any count (0 packets)
seq 70 permit tcp any eq 1000 100.1.4.0/24 eq 1001 count (0 packets)
seq 80 deny tcp any eq 2100 200.1.4.0/24 eq 2200 count (0 packets)
seq 90 permit udp 10.1.5.0/28 eq 10000 any eq 10100 count (0 packets)
seq 100 deny tcp host 20.1.5.1 any rst psh count (0 packets)
seq 110 permit tcp any any fin syn rst psh ack urg count (0 packets)
seq 120 deny icmp 20.1.6.0/24 any fragment count (0 packets)
seq 130 permit 150 any any dscp 63 count (0 packets)
```

To view the number of packets matching the ACL, use the `count` option when creating ACL entries.

- Create an ACL that uses rules with the count option, see Assign sequence number to filter.
- Apply the ACL as an inbound or outbound ACL on an interface in CONFIGURATION mode, and view the number of packets matching the ACL.

```
show ip access-list {in | out}
```

Ingress ACL filters

To create an ingress ACL filter, use the `ip access-group` command in EXEC mode. To configure ingress, use the `in` keyword. Apply rules to the ACL with the `ip access-list acl-name` command. To view the access-list, use the `show access-lists` command.

1. Apply an ingress access-list on the interface in INTERFACE mode.

```
ip access-group access-group-name in
```

2. Return to CONFIGURATION mode.

```
exit
```

3. Create the access-list in CONFIGURATION mode.

```
ip access-list access-list-name
```

4. Create the rules for the access-list in ACCESS-LIST mode.

```
permit ip host ip-address host ip-address count
```

Apply ACL rules to access-group and view access-list

```
OS10(config)# interface ethernet 1/1/28
OS10(conf-if-eth1/1/28)# ip access-group abcd in
OS10(conf-if-eth1/1/28)# exit
OS10(config)# ip access-list acl1
OS10(conf-ipv4-acl)# permit ip host 10.1.1.1 host 100.1.1.1 count
```

Configuration notes

Dell PowerSwitch S4200-ON Series:

- The following applications require ACL tables: VLT, iSCSI, L2 ACL, L3 v4 ACL, L3 v6 ACL, PBR v4, PBR v6, QoS L2, QoS L3, FCoE. In ingress ACL, you can create ACL tables for two or three applications at a time.
- When a packet matches more than one ACL table, the system increments the counter for the table with the highest priority.
- In IPv6 user ACL, PBR v6 ACL, and IPv6 QoS tables—destination-port, l4-source-port, flow label, and TCP flags are not supported.
- IP fragment supports only 2 options: non-fragment and head/non-head.

Dell PowerSwitch S5200-ON Series:

When you configure QoS service-policy on an S5200-ON switch that is in a VLT setup with MAC and IP ACLs configured, an error appears. This issue occurs because of ACL group width limitation in the S5200-ON series switches. VLT, IP, MAC, and QoS ACLs require double-width ACL table slice. The S5200-ON series switches support only three applications that require double-wide ACL table slice at a time. An error appears because the QoS application configuration requires a fourth ACL table slice.

Egress ACL filters

Egress ACL filters affect the traffic *leaving* the network. Configuring egress ACL filters onto physical interfaces protects the system infrastructure from a malicious and intentional attack by explicitly allowing only authorized traffic. These system-wide ACL filters eliminate the need to apply ACL filters onto each interface.

You can use an egress ACL filter to restrict egress traffic. For example, when you isolate denial of service (DoS) attack traffic to a specific interface, and apply an egress ACL filter to block the DoS flow from exiting the network, you protect downstream devices.

1. Apply an egress access-list on the interface in INTERFACE mode.

```
ip access-group access-group-name out
```

2. Return to CONFIGURATION mode.

```
exit
```

3. Create the access-list in CONFIGURATION mode.

```
ip access-list access-list-name
```

4. Create the rules for the access-list in ACCESS-LIST mode.

```
seq 10 deny ip any any count fragment
```

Apply rules to ACL filter

```
OS10(config)# interface ethernet 1/1/29
OS10(conf-if-eth1/1/29)# ip access-group egress out
OS10(conf-if-eth1/1/29)# exit
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 10 deny ip any any count fragment
```

View IP ACL filter configuration

```
OS10# show ip access-lists out
Egress IP access-list abcd
 Active on interfaces :
  ethernet1/1/29
 seq 10 deny ip any any fragment count (100 packets)
```

Configuration notes

Dell PowerSwitch S4200-ON Series:

- You can create either Layer 2 ACL or Layer 3 ACL. You cannot create both the tables at a time.
- In egress L3 IPv4 ACL, the fragment, TCP flags, and DSCP fields are not supported.
- IPv6 user ACL table is not supported.
- In egress ACLs, L2 user table is utilized only for switched packets and L3 user table is utilized only for routed packets.
- In L2 user ACL, Ether type is not supported.

VTY ACLs

To limit Telnet and SSH connections to the switch, apply access lists on a virtual terminal line (VTY). See Virtual terminal line ACLs for more information.

For VTY ACLs, there is no implicit deny rule. If none of the configured conditions match, the default behavior is to permit. If you need to deny traffic that does not match any of the configured conditions, explicitly configure a deny statement.

SNMP ACLs

To filer SNMP requests on the switch, assign access lists to an SNMP community. Both IPv4 and IPv6 access lists are supported to restrict IP source addresses. See Restrict SNMP access for more information.

NOTE: SNMP ACL works only when the SNMP server is reachable through the default VRF.

Clear access-list counters

Clear IPv4, IPv6, or MAC access-list counters for a specific access-list or all lists. The counter counts the number of packets that match each permit or deny statement in an access-list. To get a more recent count of packets matching an access-list, clear the counters to start at zero. If you do not configure an access-list name, all IP access-list counters clear.

To view access-list information, use the `show access-lists` command.

- Clear IPv4 access-list counters in EXEC mode.

  ```
  clear ip access-list counters access-list-name
  ```

- Clear IPv6 access-list counters in EXEC mode.

  ```
  clear ipv6 access-list counters access-list-name
  ```

- Clear MAC access-list counters in EXEC mode.

  ```
  clear mac access-list counters access-list-name
  ```

IP prefix-lists

IP prefix-lists control the routing policy. An IP prefix-list is a series of sequential filters that contain a matching criterion and an permit or deny action to process routes. The filters process in sequence so that if a route prefix does not match the criterion in the first filter, the second filter applies, and so on.

A route prefix is an IP address pattern that matches on bits within the IP address. The format of a route prefix is `A.B.C.D/x`, where `A.B.C.D` is a dotted-decimal address and `/x` is the number of bits that match the dotted decimal address.

When the route prefix matches a filter, the system drops or forwards the packet based on the filter's designated action. If the route prefix does not match any of the filters in the prefix-list, the route drops, an implicit deny.

For example, in `112.24.0.0/16`, the first 16 bits of the address `112.24.0.0` match all addresses between `112.24.0.0` to `112.24.255.255`. Use permit or deny filters for specific routes with the `le` (less or equal) and `ge` (greater or equal) parameters, where `x.x.x.x/x` represents a route prefix:

- To deny only `/8` prefixes, enter `deny x.x.x.x/x ge 8 le 8`
- To permit routes with the mask greater than `/8` but less than `/12`, enter `permit x.x.x.x/x ge 8 le 12`
- To deny routes with a mask less than `/24`, enter `deny x.x.x.x/x le 24`
- To permit routes with a mask greater than `/20`, enter `permit x.x.x.x/x ge 20`

The following rules apply to prefix-lists:

- A prefix-list without permit or deny filters allows all routes
- An *implicit deny* is assumed — the route drops for all route prefixes that do not match a permit or deny filter
- After a route matches a filter, the filter's action applies and no additional filters apply to the route

NOTE: Use prefix-lists in processing routes for routing protocols such as open shortest path first (OSPF), route table manager (RTM), and border gateway protocol (BGP).

To configure a prefix-list, use commands in PREFIX-LIST and ROUTER-BGP modes. Create the prefix-list in PREFIX-LIST mode and assign that list to commands in ROUTER-BGP modes.

Route-maps

Route-maps are a series of commands that contain a matching criterion and action. They change the packets meeting the matching criterion. ACLs and prefix-lists can only drop or forward the packet or traffic while route-maps process routes for route redistribution. For example, use a route-map to filter only specific routes and to add a metric.

- Route-maps also have an *implicit deny*. Unlike ACLs and prefix-lists where the packet or traffic drops, if a route does not match the route-map conditions, the route does not redistribute.
- Route-maps process routes for route redistribution. For example, to add a metric, a route-map can *filter* only specific routes. If the route does not match the conditions, the route-map decides where the packet or traffic drops. The route does not redistribute if it does not match.
- Route-maps use commands to decide what to do with traffic. To remove the match criteria in a route-map, use the `no match` command.
- In a BGP route-map, if you repeat the same match statements; for example, a match metric, with different values in the same sequence number, only the last match and set values are taken into account.

Configure match metric

```
OS10(config)# route-map hello
OS10(conf-route-map)# match metric 20
```

View route-map

```
OS10(conf-route-map)# do show route-map
route-map hello, permit, sequence 10
  Match clauses:
    metric 20
```

Change match

```
OS10(conf-route-map)# match metric 30
```

View updated route-map

```
OS10(conf-route-map)# do show route-map
route-map hello, permit, sequence 10
  Match clauses:
    metric 30
```

To filter the routes for redistribution, combine route-maps and IP prefix lists. The following table explains the action performed for multiple match commands under a single route-map.

Table 124. Multiple match commands under a single route-map

Route-map clause	Prefix list	Incoming Route	Action
permit	permit	MATCH	The route is permitted.
	permit	NO MATCH	Continue with next route-map clause.
	deny	MATCH	Continue with next route-map clause.
	deny	NO MATCH	Continue with next route-map clause.
deny	permit	MATCH	The route is denied.
	permit	NO MATCH	Continue with next route-map clause.
	deny	MATCH	Continue with next route-map clause.
	deny	NO MATCH	Continue with next route-map clause.

View both IP prefix-list and route-map configuration

```
OS10(conf-router-bgp-neighbor-af)# do show ip prefix-list
ip prefix-list p1:
seq 1 deny 10.1.1.0/24
seq 10 permit 0.0.0.0/0 le 32
ip prefix-list p2:
seq 1 permit 10.1.1.0/24
seq 10 permit 0.0.0.0/0 le 32
```

View route-map configuration

```
OS10(conf-router-bgp-neighbor-af)# do show route-map
route-map test1, deny, sequence 10
Match clauses:
ip address prefix-list p1
Set clauses:
route-map test2, permit, sequence 10
Match clauses:
ip address prefix-list p1
Set clauses:
route-map test3, deny, sequence 10
Match clauses:
ip address prefix-list p2
Set clauses:
route-map test4, permit, sequence 10
Match clauses:
ip address prefix-list p2
Set clauses:
```

Match routes

Configure match criterion for a route-map. There is no limit to the number of `match` commands per route map, but keep the number of match filters in a route-map low. The `set` commands do not require a corresponding `match` command.

- Match routes with a specific metric value in ROUTE-MAP mode, from 0 to 4294967295.

  ```
  match metric metric-value
  ```

- Match routes with a specific tag in ROUTE-MAP mode, from 0 to 4294967295.

  ```
  match tag tag-value
  ```

- Match routes whose next hop is a specific interface in ROUTE-MAP mode.

```
match interface interface
```

  - `ethernet` — Enter the Ethernet interface information.
  - `port-channel` — Enter the port-channel number.
  - `vlan` — Enter the VLAN ID number.

Check match routes

```
OS10(config)# route-map test permit 1
OS10(conf-route-map)# match tag 250000
OS10(conf-route-map)# set weight 100
```

Set conditions

There is no limit to the number of `set` commands per route map, but keep the number of set filters in a route-map low. The `set` commands do not require a corresponding `match` command.

- Enter the IP address in A.B.C.D format of the next-hop for a BGP route update in ROUTE-MAP mode.

```
set ip next-hop address
```

- Enter an IPv6 address in A::B format of the next-hop for a BGP route update in ROUTE-MAP mode.

```
set ipv6 next-hop address
```

- Enter the range value for the BGP route's LOCAL_PREF attribute in ROUTE-MAP mode, from 0 to 4294967295.

```
set local-preference range-value
```

- Enter a metric value for redistributed routes in ROUTE-MAP mode, from 0 to 4294967295.

```
set metric {+ | - | metric-value}
```

- Enter an OSPF type for redistributed routes in ROUTE-MAP mode.

```
set metric-type {type-1 | type-2 | external | internal}
```

- Enter an ORIGIN attribute in ROUTE-MAP mode.

```
set origin {egp | igp | incomplete}
```

- Enter a tag value for the redistributed routes in ROUTE-MAP mode, from 0 to 4294967295.

```
set tag tag-value
```

- Enter a value as the route's weight in ROUTE-MAP mode, from 0 to 65535.

```
set weight value
```

Check set conditions

```
OS10(config)# route-map ip permit 1
OS10(conf-route-map)# match metric 2567
```

Continue clause

Only BGP route-maps support the `continue` clause. When a match is found, `set` clauses run and the packet forwards — no route-map processing occurs. If you configure the `continue` clause without configuring a module, the next sequential module processes.

If you configure the `continue` command at the end of a module, the next module processes even after a match is found. The example shows a continue clause at the end of a route-map module — if a match is found in the route-map `test` module 10, module 30 processes.

Route-map continue clause

```
OS10(config)# route-map test permit 10
OS10(conf-route-map)# continue 30
```

ACL flow-based monitoring

Flow-based monitoring conserves bandwidth by selecting only the required flow to mirror instead of mirroring entire packets from an interface. This feature is available for L2 and L3 ingress traffic. Specify flow-based monitoring using ACL rules. Flow-based monitoring copies incoming packets that match the ACL rules applied on the ingress port and forwards, or mirrors them to another port. The source port is the monitored port (MD), and the destination port is the monitoring port (MG).

When a packet arrives at a monitored port, the packet validates against the configured ACL rules. If the packet matches an ACL rule, the system examines the corresponding flow processor and performs the action specified for that port. If the mirroring action is set in the flow processor entry, the port details are sent to the destination port.

Flow-based mirroring

Flow-based mirroring is a mirroring session in which traffic matches specified policies that mirrors to a destination port. Port-based mirroring maintains a database that contains all monitoring sessions, including port monitor sessions. The database has information regarding the sessions that are enabled or not enabled for flow-based monitoring. Flow-based mirroring is also known as policy-based mirroring.

To enable flow-based mirroring, use the `flow-based enable` command. Traffic with particular flows that traverse through the ingress interfaces are examined. Appropriate ACL rules apply in the ingress direction. By default, flow-based mirroring is not enabled.

To enable evaluation and replication of traffic traversing to the destination port, configure the monitor option using the `permit`, `deny`, or `seq` commands for ACLs assigned to the source or the monitored port (MD). Enter the keywords `capture session` *`session-id`* with the `seq`, `permit`, or `deny` command for the ACL rules to allow or drop IPv4, IPv6, ARP, UDP, EtherType, ICMP, and TCP packets.

IPV4-ACL mode

`seq` *`sequence-number`* `{deny | permit} {source [mask] | any | host` *`ip-address`*`} [count [byte]] [fragments] [threshold-in-msgs` *`count`*`] [capture session` *`session-id`*`]`

If you configure the `flow-based enable` command and do not apply an ACL on the source port or the monitored port, both flow-based monitoring and port mirroring do not function. Flow-based monitoring is supported only for ingress traffic.

The `show monitor session` *`session-id`* command displays output that indicates if a particular session is enabled for flow-monitoring.

View flow-based monitoring

```
OS10# show monitor session 1
S.Id  Source        Destination    Dir  SrcIP  DstIP  DSCP  TTL  State Reason
-------------------------------------------------------------------------------
1    ethernet1/1/1  ethernet1/1/4  both  N/A   N/A    N/A  N/A  true   Is UP
```

Traffic matching ACL rule

```
OS10# show ip access-lists in
Ingress IP access-list testflow
 Active on interfaces :
  ethernet1/1/1
 seq 5 permit icmp any any capture session 1 count (0 packets)
 seq 10 permit ip 102.1.1.0/24 any capture session 1 count bytes (0 bytes)
 seq 15 deny udp any any capture session 2 count bytes (0 bytes)
 seq 20 deny tcp any any capture session 3 count bytes (0 bytes)
```

Enable flow-based monitoring

Flow-based monitoring conserves bandwidth by mirroring only specified traffic, rather than all traffic on an interface. It is available for L2 and L3 ingress and egress traffic. Configure traffic to monitor using ACL filters.

1. Create a monitor session in MONITOR-SESSION mode.

```
monitor session session-number type  {local | rspan-source}
```

2. Enable flow-based monitoring for the mirroring session in MONITOR-SESSION mode.

```
flow-based enable
```

3. Define ACL rules that include the keywords `capture session session-id` in CONFIGURATION mode. The system only considers port monitoring traffic that matches rules with the keywords `capture session`.

```
ip access-list
```

4. Apply the ACL to the monitored port in INTERFACE mode.

```
ip access-group access-list
```

Enable flow-based monitoring

```
OS10(config)# monitor session 1 type local
OS10(conf-mon-local-1)# flow-based enable
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# seq 5 permit icmp any any capture session 1
OS10(conf-ipv4-acl)# seq 10 permit ip 102.1.1.0/24 any capture session 1 count byte
OS10(conf-ipv4-acl)# seq 15 deny udp any any capture session 2 count byte
OS10(conf-ipv4-acl)# seq 20 deny tcp any any capture session 3 count byte
OS10(conf-ipv4-acl)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# ip access-group testflow in
OS10(conf-if-eth1/1/1)# no shutdown
```

View access-list configuration

```
OS10# show ip access-lists in
Ingress IP access-list testflow
 Active on interfaces :
  ethernet1/1/1
 seq 5 permit icmp any any capture session 1 count (0 packets)
 seq 10 permit ip 102.1.1.0/24 any capture session 1 count bytes (0 bytes)
 seq 15 deny udp any any capture session 2 count bytes (0 bytes)
 seq 20 deny tcp any any capture session 3 count bytes (0 bytes)
```

View monitor sessions

```
OS10(conf-if-eth1/1/1)# show monitor session all
S.Id  Source       Destination    Dir  SrcIP  DstIP  DSCP TTL  State  Reason
--------------------------------------------------------------------------
1   ethernet1/1/1  ethernet1/1/4  both  N/A   N/A    N/A  N/A  true   Is UP
```

View ACL table utilization report

The `show acl-table-usage detail` command shows the ingress and egress ACL tables for the various features and their utilization.

The hardware pool area displays the ingress application groups (pools), the features mapped to each of these groups, and the amount of used and free space available in each of the pools. The amount of space required to store a single ACL rule in a pool depends on the keywidth of the TCAM slice.

The service pool displays the amount of used and free space for each of the features. The number of ACL rules configured for a feature is displayed in the configured rules column. The number of used rows depends on the number of ports the configured rules are applied on. Under Allocated pools, you can view the percentage of dedicated space reserved for a particular

feature or the phrase Shared if you have not reserved space for each of the features individually, against the total number of pools allocated for the application group. In the example given below, the SYSTEM_FLOW feature has 15 percentage of space reserved in ingress app-group-1 with a pool count of 1, which is represented by 15:1.

```
OS10# show acl-table-usage detail
Ingress ACL utilization

Known behavior

- On the S4200-ON platform, the `show acl-table-usage detail` command output lists several hardware pools as available (FREE), but you will see an "ACL CAM table full" warning log when the system creates a new service pool. The system will not be able to create any new service pools. The existing groups, however, can continue to grow up to the maximum available pool space.
- On the S4200-ON platform, the `show acl-table usage detail` command output lists all the available hardware pools under Ingress ACL utilization table and none under the Egress ACL utilization table. The system allocates pool space for Egress ACL table only when you configure Egress ACLs. You can run the `show acl-table-usage detail` command again to view pool space allocated under Egress ACL utilization table as well.
- On S52xx-ON, Z91xx-ON, Z92xx-ON platforms, the number of Configured Rules listed under Service Pools for each of the features is the number of ACLs multiplied by the number of ports on which they are applied. This number is cumulative. You can view the Used rows and Free rows that indicate the actual amount of space that is utilized and available in the hardware.

ACL logging

You can configure ACLs to filter traffic, drop, or forward packets that match certain conditions. The ACL logging feature allows you to get additional information about packets that match an access control entry (ACE) applied on an interface in inbound direction.

ACL logging helps to administer and manage traffic that traverses your network and is useful for network supervision and maintenance activities. High volumes of network traffic can result in large volume of logs, which can negatively impact system performance and efficiency. You can configure the log update threshold, logging interval, and logging rate limit to reduce impact on device CPU load.

This feature is applicable only for IP user ACLs and control-plane ACLs.

Important notes

The ACL logging feature is:

- Applicable only for IPv4 and IPv6 user ACLs and control-plane ACLs. MAC ACLs are not logged.
- Applicable only for IP user ACLs or control-plane ACLs applied on interfaces in the inbound direction. Even though ACL logging cannot be enabled for outbound ACLs, ACL configuration is applied.
- ACL logging is not supported for control-plane ACL data.

For IP user ACLs, Dell Technologies recommends a maximum scale of 128 log-enabled ACL entries. If logging cannot be enabled on further ACL entries, a syslog error message appears to indicate that logging cannot be enabled. However, the ACL entries are applied.

IP ACL logging

The IP ACL logging feature allows you to monitor the user-created ACL flows and log packets that match ACEs applied on an interface in inbound direction. To control the volume of logs, specify the threshold after which a log is created and the interval at which the logs must be created.

You can specify the threshold after which a log is created and the interval at which the logs must be created. The threshold defines how often a log message is created after an initial packet match. The default threshold is 10 messages. This value is configurable, and the range is from 1 to 100 messages.

By default, the interval is set to 5 minutes and logs are created every 5 minutes. During this interval, the system continues to examine the packets against the configured ACL rule and permits or denies traffic, but logging is halted temporarily. This value is configurable, and the range is from 1 to 10 minutes.

For example, if you have configured a threshold value of 20 and an interval of 10 minutes, after an initial packet match is logged, the 20th packet that matches the ACE is logged. The system then waits for the interval period of 10 minutes to elapse, during which time no logging occurs. Once the interval period elapses, the 20th packet that matches the ACE is logged again.

Control-plane management ACL logging

Control-plane management ACL logging is used to monitor the packets that ingress from the management interface, and drop or forward packets that match certain conditions. OS10 creates a log message that includes additional information about the packet, when a matching packet hits a log-enabled ACE. This feature is applicable only for control-plane ACLs applied on the management interface in the inbound direction.

By default, this feature limits the number of logged packets per ACL rule at the rate of two packets per minute and a burst size of two packets. Use the `logging access-list mgmt rate` and `logging access-list mgmt burst` commands to reconfigure the logging rate and burst size of a control-plane ACL applied on the management interface. Use the `show control-plane logging` command to view the configured burst size and logging rate for control-plane management ACL.

ACL commands

clear ip access-list counters

Clears ACL counters for a specific access-list.

Syntax	`clear ip access-list counters [`*`access-list-name`*`]`
Parameters	*`access-list-name`* — (Optional) Enter the name of the IP access-list to clear counters. A maximum of 140 characters.
Default	Not configured
Command Mode	EXEC
Usage Information	If you do not enter an access-list name, all IPv6 access-list counters clear. The counter counts the number of packets that match each permit or deny statement in an access-list. To get a more recent count of packets matching an access list, clear the counters to start at zero. To view access-list information, use the `show access-lists` command.
Example	`OS10# clear ip access-list counters`
Supported Releases	10.2.0E or later

clear ipv6 access-list counters

Clears IPv6 access-list counters for a specific access-list.

Syntax	`clear ipv6 access-list counters [`*`access-list-name`*`]`

Parameters	*access-list-name* — (Optional) Enter the name of the IPv6 access-list to clear counters. A maximum of 140 characters.
Default	Not configured
Command Mode	EXEC
Usage Information	If you do not enter an access-list name, all IPv6 access-list counters clear. The counter counts the number of packets that match each permit or deny statement in an access list. To get a more recent count of packets matching an access list, clear the counters to start at zero. To view access-list information, use the `show access-lists` command.
Example	`OS10# clear ipv6 access-list counters`
Supported Releases	10.2.0E or later

clear mac access-list counters

Clears counters for a specific or all MAC access lists.

Syntax	`clear mac access-list counters [access-list-name]`
Parameters	*access-list-name* — (Optional) Enter the name of the MAC access list to clear counters. A maximum of 140 characters.
Default	Not configured
Command Mode	EXEC
Usage Information	If you do not enter an access-list name, all MAC access-list counters clear. The counter counts the number of packets that match each permit or deny statement in an access list. To get a more recent count of packets matching an access list, clear the counters to start at zero. To view access-list information, use the `show access-lists` command.
Example	`OS10# clear mac access-list counters`
Supported Releases	10.2.0E or later

deny

Configures a filter to drop packets with a specific IP address.

Syntax

```
deny [protocol-number | icmp | ip | tcp | udp] [A.B.C.D | A.B.C.D/x | any
| host ip-address] [A.B.C.D | A.B.C.D/x | any | host ip-address] [capture |
count | dscp value | fragment | log]
```

Parameters

- *protocol-number* — (Optional) Enter the protocol number identified in the IP header, from 0 to 255.
- `icmp` — (Optional) Enter the ICMP address to deny.
- `ip` — (Optional) Enter the IP address to deny.
- `tcp` — (Optional) Enter the TCP address to deny.
- `udp` — (Optional) Enter the UDP address to deny.
- `A.B.C.D` — Enter the IP address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits to match to the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ip-address* — (Optional) Enter the keyword and the IP address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.

- `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# deny udp any any
```

Supported Releases 10.2.0E or later

deny (IPv6)

Configures a filter to drop packets with a specific IPv6 address.

Syntax

```
deny [protocol-number | icmp | ipv6 | tcp | udp] [A::B | A::B/x | any |
host ipv6-address] [A::B | A::B/x | any | host ipv6-address] [capture |
count | dscp value | fragment | log]
```

Parameters

- *protocol-number* — (Optional) Enter the protocol number identified in the IP header, from 0 to 255.
- `icmp` — (Optional) Enter the ICMP address to deny.
- `ipv6` — (Optional) Enter the IPv6 address to deny.
- `tcp` — (Optional) Enter the TCP address to deny.
- `udp` — (Optional) Enter the UDP address to deny.
- `A::B` — Enter the IPv6 address in dotted decimal format.
- `A::B/x` — Enter the number of bits to match to the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ipv6-address` — (Optional) Enter the keyword and the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# deny ipv6 any any capture session 1
```

Supported Releases 10.2.0E or later

deny (MAC)

Configures a filter to drop packets with a specific MAC address.

Syntax

```
deny {nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any} {nn:nn:nn:nn:nn:nn
[00:00:00:00:00:00] | any} [protocol-number | capture | cos | count | vlan]
```

Parameters

- *nn:nn:nn:nn:nn:nn* — Enter the MAC address of the network from or to which the packets are sent.
- *00:00:00:00:00:00* — (Optional) Enter which bits in the MAC address must match. If you do not enter a mask, a mask of 00:00:00:00:00:00 applies.
- any — (Optional) Set routes which are subject to the filter.
  - *protocol-number* — (Optional) MAC protocol number identified in the header, from 600 to ffff.
  - capture — (Optional) Capture packets the filter processes.
  - cos — (Optional) CoS value, from 0 to 7.
  - count — (Optional) Count packets the filter processes.
  - vlan — (Optional) VLAN number, from 1 to 4093.

Default Disabled

Command Mode MAC-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the count byte options, only bytes increment. The no version of this command removes the filter.

Example

```
OS10(config)# mac access-list macacl
OS10(conf-mac-acl)# deny any any cos 7
OS10(conf-mac-acl)# deny any any vlan 2
```

Supported Releases 10.2.0E or later

deny icmp

Configures a filter to drop all or specific Internet Control Message Protocol (ICMP) messages.

Syntax

```
deny icmp [A.B.C.D | A.B.C.D/x | any | host ip-address] [[A.B.C.D |
A.B.C.D/x | any | host ip-address] [capture | count | dscp value | fragment
| log]
```

Parameters

- A.B.C.D — Enter the IP address in hexadecimal format separated by colons.
- A.B.C.D/x — Enter the number of bits to match to the IP address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IP address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the count byte options, only bytes increment. The no version of this command removes the filter.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# deny icmp any any capture session 1
```

Supported Releases	10.2.0E or later

deny icmp (IPv6)

Configures a filter to drop all or specific ICMP messages.

Syntax

```
deny icmp [A::B | A::B/x | any | host ipv6-address] [A::B | A::B/x | any |
host ipv6-address] [capture | count | dscp value | fragment | log]
```

Parameters

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits to match to the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ipv6-address` — (Optional) Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# deny icmp any any capture session 1
```

Supported Releases	10.2.0E or later

deny ip

Configures a filter to drop all or specific packets from an IPv4 address.

Syntax

```
deny ip [A.B.C.D | A.B.C.D/x | any | host ip-address] [[A.B.C.D | A.B.C.D/x
| any | host ip-address] [capture |count [byte] | dscp value | fragment]
```

Parameters

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits to match to the dotted decimal address.
- `any` — (Optional) Set all routes which are subject to the filter:
  - `capture` — (Optional) Capture packets the filter processes.
  - `count` — (Optional) Count packets the filter processes.
  - `byte` — (Optional) Count bytes the filter processes.
  - `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
  - `fragment` — (Optional) Use ACLs to control packet fragments.
- `host ip-address` — (Optional) Enter the IPv4 address to use a host address only.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# deny ip any any capture session 1 count
```

Supported Releases	10.2.0E or later

deny ipv6

Configures a filter to drop all or specific packets from an IPv6 address.

Syntax

```
deny ipv6 [A::B | A::B/x | any | host ipv6-address] [A::B | A:B/x | any |
host ipv6-address] [capture | count [byte] | dscp | fragment]
```

Parameters

- `A::B` — (Optional) Enter the source IPv6 address from which the packet was sent and the destination address.
- `A::B/x` — (Optional) Enter the source network mask in /prefix format (/x) and the destination mask.
- `any` — (Optional) Set all routes which are subject to the filter:
  - `capture` — (Optional) Capture packets the filter processes.
  - `count` — (Optional) Count packets the filter processes.
  - `byte` — (Optional) Count bytes the filter processes.
  - `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
  - `fragment` — (Optional) Use ACLs to control packet fragments.
- `host ipv6-address` — (Optional) Enter the IPv6 address to use a host address only.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# deny ipv6 any any capture session 1
```

Supported Releases 10.2.0E or later

deny tcp

Configures a filter that drops Transmission Control Protocol (TCP) packets meeting the filter criteria.

Syntax

```
deny tcp [A.B.C.D | A.B.C.D/x | any | host ip-address [operator]] [[A.B.C.D
| A.B.C.D/x | any | host ip-address [operator]] [ack | fin | psh | rst |
syn | urg] [capture | count | dscp value | fragment | log]
```

Parameters

- `A.B.C.D` — Enter the IPv4 address in A.B.C.D format.
- `A.B.C.D/x` — Enter the number of bits to match in A.B.C.D/x format.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ip-address` — (Optional) Enter the keyword and the IPv4 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.

- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *`operator`* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# deny tcp any any capture session 1
```

Supported Releases 10.2.0E or later

deny tcp (IPv6)

Configures a filter that drops TCP IPv6 packets meeting the filter criteria.

Syntax

```
deny tcp [A::B | A::B/x | any | host ipv6-address [operator]] [A::B | A:B/x
| any | host ipv6-address [operator]] [ack | fin | psh | rst | syn | urg]
[capture | count | dscp value | fragment | log]
```

Parameters

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits to match to the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *`ipv6-address`* — (Optional) Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *`value`* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *`operator`* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# deny tcp any any capture session 1
```

Supported Releases 10.2.0E or later

deny udp

Configures a filter to drop User Datagram Protocol (UDP) packets meeting the filter criteria.

Syntax

```
deny udp [A.B.C.D | A.B.C.D/x | any | host ip-address [operator]] [A.B.C.D
| A.B.C.D/x | any | host ip-address [operator]] [ack | fin | psh | rst |
syn | urg] [capture | count | dscp value | fragment | log]
```

Parameters

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits to match to the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ip-address` — (Optional) Enter the IPv4 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# deny udp any any capture session 1
```

Supported Releases 10.2.0E or later

deny udp (IPv6)

Configures a filter to drop UDP IPv6 packets that match filter criteria.

Syntax

```
deny udp [A::B | A::B/x | any | host ipv6-address [operator]] [A::B | A:B/x
| any | host ipv6-address [operator]] [ack | fin | psh | rst | syn | urg]
[capture | count | dscp value | fragment | log]
```

Parameters

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits to match to the IPv6 address.

- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *`ipv6-address`* — (Optional) Enter the keyword and the IPv6 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *`value`* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *`operator`* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you use the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# deny udp any any capture session 1
```

Supported Releases 10.2.0E or later

description

Configures an ACL description.

Syntax `description` *`text`*

Parameters *`text`* — Enter the description text string. A maximum of 80 characters.

Default Disabled

Command Modes IPV4-ACL, IPV6-ACL, MAC-ACL

Usage Information

- To use special characters as a part of the description string, enclose the string in double quotes.
- To use comma as a part of the description string add double back slash before the comma.
- The `no` version of this command deletes the ACL description.

Example

```
OS10(conf-ipv4-acl)# description ipacltest
```

Supported Releases 10.2.0E or later

ip access-group

Configures an IPv4 access group.

Syntax `ip access-group access-list-name {in | out}`

Parameters
- *access-list-name* — Enter the name of an IPv4 access list. A maximum of 140 characters.
- `in` — Apply the ACL to incoming traffic.
- `out` — Apply the ACL to outgoing traffic.

Default Not configured

Command Mode INTERFACE

CONTROL-PLANE

Usage Information Use this command in the CONTROL-PLANE mode to apply a control-plane ACL. Control-plane ACLs are only applied on the ingress traffic. By default, the control-plane ACL is applied to the front-panel ports as well as the management port.The `no` version of this command deletes the IPv4 ACL configuration.

Example
```
OS10(conf-if-eth1/1/8)# ip access-group testgroup in
```

Example (Control-plane ACL)
```
OS10# configure terminal
OS10(config)# control-plane
OS10(config-control-plane)# ip access-group aaa-cp-acl in
```

Supported Releases 10.2.0E or later; 10.4.1 or later (control-plane ACL)

ip access-list

Creates an IP access list to filter based on an IP address.

Syntax `ip access-list access-list-name`

Parameters *access-list-name* — Enter the name of an IPv4 access list. A maximum of 140 characters.

Default Not configured

Command Mode CONFIGURATION

Usage Information None

Example
```
OS10(config)# ip access-list acl1
```

Supported Releases 10.2.0E or later

ip as-path access-list

Create an AS-path ACL filter for BGP routes using a regular expression. The AS values should be configured only in the plain format (regular expressions) and not in the dotted format. This works similar to the AS values received in the BGP update messages.

Syntax `ip as-path access-list name {deny | permit} regexp-string`

Parameters
- *name* — Enter an access list name.
- `deny | permit` — Reject or accept a matching route.
- *regexp-string* — Enter a regular expression string to match an AS-path route attribute.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information

You can specify an access-list filter on inbound and outbound BGP routes. The ACL filter consists of regular expressions. If a regular expression matches an AS path attribute in a BGP route, the route is rejected or accepted. The AS path does not contain the local AS number. The `no` version of this command removes a single access list entry if you specify `deny` and a `regexp`. Otherwise, the entire access list is removed.

The following table provides a list of characters that you can use in the regular expression string and indicates whether the character is supported or not:

Table 125. Special characters supported in regular expression

Character	Supported/Not supported
Question mark (?)	Not supported
Pipe (|)	Supported
Plus (+)	Supported
Caret (^)	Supported; use the `caret (^)` character to represent the beginning of a new line.
Dollar ($)	Supported
Square brackets ([ ])	Supported
Asterisk (*)	Supported
Dot (.)	Supported
Backslash (\)	Supported; precede the character with a `backslash(\)`. For example, enter `\\`.
Double quotes (")	Supported; precede the character with a `backslash(\)`. For example, enter `\"`.
Curly brackets ({ })	Not supported; as a workaround, precede the open and close parentheses with a backslash, for example, `"\(" and "\)"`.
Parentheses (())	Supported
Comma (,)	Supported; `comma(,)` can be used to match space in AS-PATH
Space	Not supported; as a workaround, use `comma(,)` or `[[:punct:]]`.
Underscore (_)	Not supported

Example

```
OS10(config)# ip as-path access-list abc deny 123
```

Supported Release 10.3.0E or later

ip community-list standard deny

Creates a standard community list for BGP to deny access.

Syntax

```
ip community-list standard name deny {aa:nn | no-advertise | local-AS | no-export | internet}
```

Parameters

- **name** — Enter the name of the standard community list used to identify one more deny groups of communities. Do not use the term `none` as the name of the standard community list.

- *aa:nn* — Enter the community number in the format *aa:nn*, where *aa* is the number that identifies the autonomous system and *nn* is a number the identifies the community within the autonomous system.
- no-advertise — BGP does to not advertise this route to any internal or external peer.
- local-AS — BGP does not advertise this route to external peers.
- no-export — BGP does not advertise this route outside a BGP confederation boundary.
- internet — BGP does not advertise this route to an Internet community.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The no version of this command removes the community list.

Example

```
OS10(config)# ip community-list standard STD_LIST deny local-AS
```

Supported Release 10.3.0E or later

ip community–list standard permit

Creates a standard community list for BGP to permit access.

Syntax

```
ip community-list standard name permit {aa:nn | no-advertise | local-as |
no-export | internet}
```

Parameters

- **name** — Enter the name of the standard community list used to identify one more permit groups of communities. Do not use the term none as the name of the standard community list.
- *aa:nn* — Enter the community number in the format *aa:nn*, where *aa* is the number that identifies the autonomous system and *nn* is a number the identifies the community within the autonomous system.
- no-advertise — BGP does not advertise this route to any internal or external peer.
- local-as — BGP does not advertise this route to external peers.
- no-export — BGP does not advertise this route outside a BGP confederation boundary
- internet — BGP does not advertise this route to an Internet community.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The no version of this command removes the community list.

Example

```
OS10(config)# ip community-list standard STD_LIST permit local-AS
```

Supported Release 10.3.0E or later

ip extcommunity-list standard deny

Creates an extended community list for BGP to deny access.

Syntax

```
ip extcommunity-list standard name deny {4byteas-generic | rt | soo}
```

Parameters

- *name*—Enter the name of the community list used to identify one or more deny groups of extended communities. Do not use the term none as the name of the extended community list.
- 4byteas-generic—Enter the generic extended community then the keyword transitive or non-transitive.
- *rt* — Enter the route target.
- *soo* — Enter the route origin or site-of-origin.

Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the extended community list.
Example	`OS10(config)# ip extcommunity-list standard STD_LIST deny 4byteas-generic transitive 1.65534:40`
Supported Release	10.3.0E or later

ip extcommunity-list standard permit

Creates an extended community list for BGP to permit access.

Syntax	`ip extcommunity-list standard` *name* `permit {`*4byteas-generic* `|` *rt* `|` *soo*`}`
Parameters	• *name* — Enter the name of the community list used to identify one or more permit groups of extended communities. Do not use the term `none` as the name of the extended community list. • *rt* — Enter the route target. • *soo* — Enter the route origin or site-of-origin.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the extended community list.
Example	`OS10(config)# ip extcommunity-list standard STD_LIST permit 4byteas-generic transitive 1.65412:60`
Supported Release	10.3.0E or later

ip prefix-list description

Configures a description of an IP prefix list.

Syntax	`ip prefix-list name` *description*
Parameters	• `name` — Enter the name of the prefix list. • *description* — Enter the description for the named prefix list.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the specified prefix list.
Example	`OS10(config)# ip prefix-list TEST description TEST_LIST`
Supported Release	10.3.0E or later

ip prefix-list deny

Creates a prefix list to deny route filtering from a specified network address.

Syntax `ip prefix-list name deny [A.B.C.D/x [ge | le]] prefix-len`

Parameters
- *name* — Enter the name of the prefix list.
- A.B.C.D/x — (Optional) Enter the source network address and mask in /prefix format (/x).
- ge — Enter to indicate the network address is greater than or equal to the range specified.
- le — Enter to indicate the network address is less than or equal to the range specified.
- *prefix-len* — Enter the prefix length.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The no version of this command removes the specified prefix-list.

Example
```
OS10(config)# ip prefix-list denyprefix deny 10.10.10.2/16 le 30
```

Supported Release 10.3.0E or later

ip prefix-list permit

Creates a prefix-list to permit route filtering from a specified network address.

Syntax `ip prefix-list name permit [A.B.C.D/x [ge | le]] prefix-len`

Parameters
- *name* — Enter the name of the prefix list.
- A.B.C.D/x — (Optional) Enter the source network address and mask in /prefix format (/x).
- ge — Enter to indicate the network address is greater than or equal to the range specified.
- le — Enter to indicate the network address is less than or equal to the range specified.
- *prefix-len* — Enter the prefix length.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The no version of this command removes the specified prefix-list.

Example
```
OS10(config)# ip prefix-list allowprefix permit 10.10.10.1/16 ge 10
```

Supported Release 10.3.0E or later

ip prefix-list seq deny

Configures a filter to deny route filtering from a specified prefix list.

Syntax `ip prefix-list name seq num deny {A.B.C.D/x [ge | le] prefix-len}`

Parameters
- *name* — Enter the name of the prefix list.
- *num* — Enter the sequence list number.
- A.B.C.D/x — Enter the source network address and mask in /prefix format (/x).
- ge — Enter to indicate the network address is greater than or equal to the range specified.
- le — Enter to indicate the network address is less than or equal to the range specified.
- *prefix-len* — Enter the prefix length.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the specified prefix list.

Example

```
OS10(config)# ip prefix-list seqprefix seq 65535 deny 10.10.10.1/16 ge 10
```

Supported Release 10.3.0E or later

ip prefix-list seq permit

Configures a filter to permit route filtering from a specified prefix list.

Syntax `ipv6 prefix-list [name] seq num permit A::B/x [ge | le} prefix-len`

Parameters

- *name* — Enter the name of the prefix list.
- *num* — Enter the sequence list number.
- `A.B.C.D/x` — Enter the source network address and mask in /prefix format (/x).
- `ge` — Enter to indicate the network address is greater than or equal to the range specified.
- `le` — Enter to indicate the network address is less than or equal to the range specified.
- *prefix-len* — Enter the prefix length.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the specified prefix list.

Example

```
OS10(config)# ip prefix-list seqprefix seq 65535 permit 10.10.10.1/16 le
30
```

Supported Release 10.3.0E or later

ipv6 access-group

Configures an IPv6 access group.

Syntax `ipv6 access-group access-list-name {in | out}`

Parameters

- *access-list-name* — Enter the name of an IPv6 ACL. A maximum of 140 characters.
- `in` — Apply the ACL to incoming traffic.
- `out` — Apply the ACL to outgoing traffic.

Default Not configured

Command Mode INTERFACE

CONTROL-PLANE

Usage Information Use this command in the CONTROL-PLANE mode to apply a control-plane ACL. Control-plane ACLs are only applied on the ingress traffic. By default, the control-plane ACL is applied to the front-panel ports as well as the management port. The `no` version of this command deletes an IPv6 ACL configuration.

Example

```
OS10(conf-if-eth1/1/8)# ipv6 access-group test6 in
```

Example (Control-plane ACL)	`OS10# configure terminal`
	`OS10(config)# control-plane`
	`OS10(config-control-plane)# ipv6 access-group aaa-cp-acl in`

Supported Releases	10.2.0E or later; 10.4.1 or later (control-plane ACL)

ipv6 access-list

Creates an IP access list to filter based on an IPv6 address.

Syntax	`ipv6 access-list` *access-list-name*
Parameters	*access-list-name* — Enter the name of an IPv6 access list. A maximum of 140 characters.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# ipv6 access-list acl6`
Supported Release	10.2.0E or later

ipv6 prefix-list deny

Creates a prefix list to deny route filtering from a specified IPv6 network address.

Syntax	`ipv6 prefix-list` *prefix-list-name* `deny {A::B/x [ge | le]` *prefix-len*`}`
Parameters	• *prefix-list-name* — Enter the IPv6 prefix list name. • `A::B/x` — Enter the IPv6 address to deny. • `ge` — Enter to indicate the network address is greater than or equal to the range specified. • `le` — Enter to indicate the network address is less than or equal to the range specified. • *prefix-len* — Enter the prefix length.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the specified prefix list.
Example	`OS10(config)# ipv6 prefix-list TEST deny AB10::1/128 ge 10 le 30`
Supported Release	10.3.0E or later

ipv6 prefix-list description

Configures a description of an IPv6 prefix-list.

Syntax	`ipv6 prefix-list name` *description*
Parameters	• `name` — Enter the name of the IPv6 prefix-list. • *description* — Enter the description for the named prefix-list.
Defaults	Not configured

Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the specified prefix list.
Example	`OS10(config)# ipv6 prefix-list TEST description TEST_LIST`
Supported Release	10.3.0E or later

ipv6 prefix-list permit

Creates a prefix-list to permit route filtering from a specified IPv6 network address.

Syntax	`ipv6 prefix-list` *`prefix-list-name`* `permit {A::B/x [ge | le]` *`prefix-len`*`}`
Parameters	• *`prefix-list-name`* — Enter the IPv6 prefix-list name. • `A::B/x` — Enter the IPv6 address to permit. • `ge` — Enter to indicate the network address is greater than or equal to the range specified. • `le` — Enter to indicate the network address is less than or equal to the range specified. • *`prefix-len`* — Enter the prefix length.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the specified prefix-list.
Example	`OS10(config)# ipv6 prefix-list TEST permit AB20::1/128 ge 10 le 30`
Supported Release	10.3.0E or later

ipv6 prefix-list seq deny

Configures a filter to deny route filtering from a specified prefix-list.

Syntax	`ipv6 prefix-list [name] seq` *`num`* `deny {A::B/x [ge | le]` *`prefix-len`*`}`
Parameters	• `name` — (Optional) Enter the name of the IPv6 prefix-list. • *`num`* — Enter the sequence number of the specified IPv6 prefix-list. • `A::B/x` — Enter the IPv6 address and mask in /prefix format (/x). • `ge` — Enter to indicate the network address is greater than or equal to the range specified. • `le` — Enter to indicate the network address is less than or equal to the range specified. • *`prefix-len`* — Enter the prefix length.
Defaults	Not configured
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the specified prefix-list.
Example	`OS10(config)# ipv6 prefix-list TEST seq 65535 deny AB20::1/128 ge 10`
Supported Release	10.3.0E or later

ipv6 prefix-list seq permit

Configures a filter to permit route filtering from a specified prefix-list.

Syntax `ipv6 prefix-list [name] seq num permit A::B/x [ge | le} prefix-len`

Parameters

- `name` — (Optional) Enter the name of the IPv6 prefix-list.
- *num* — Enter the sequence number of the specified IPv6 prefix list.
- `A::B/x` — Enter the IPv6 address and mask in /prefix format (/x).
- `ge` — Enter to indicate the network address is greater than or equal to the range specified.
- `le` — Enter to indicate the network address is less than or equal to the range specified.
- *prefix-len* — Enter the prefix length.

Defaults Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the specified prefix-list.

Example

```
OS10(config)# ipv6 prefix-list TEST seq 65535 permit AB10::1/128 ge 30
```

Supported Release 10.3.0E or later

logging access-list mgmt burst

Configures the burst size for control-plane ACL applied on the management interface.

Syntax `[no] logging access-list mgmt burst value`

Parameters *value*—Specify the burst size (maximum tokens), from 1 to 10.

Default 2

Command Mode CONTROL-PLANE

Usage Information The `no` version of this command resets the value to the default.

Example

```
OS10(config)# control-plane
OS10(config-control-plane)# logging access-list mgmt burst 5
```

Supported Releases 10.5.2.1 or later

logging access-list mgmt rate

Configures the logging rate of control-plane ACL applied on the management interface.

Syntax `[no] logging access-list mgmt rate value`

Parameters *value*—Specify the logging rate value, from 1 to 10.

Default 2

Command Mode CONTROL-PLANE

Usage Information The `no` version of this command resets the value to the default.

Example

```
OS10(config)# control-plane
OS10(config-control-plane)# logging access-list mgmt rate 5
```

Supported Releases	10.5.2.1 or later

mac access-group

Configures a MAC access group.

Syntax	`mac access-group` *`access-list-name`* `{in | out}`
Parameters	• *`access-list-name`* — Enter the name of a MAC access list. A maximum of 140 characters. • `in` — Apply the ACL to incoming traffic. • `out` — Apply the ACL to outgoing traffic.
Default	Not configured
Command Mode	CONFIGURATION CONTROL-PLANE
Usage Information	Use this command in the CONTROL-PLANE mode to apply a control-plane ACL. Control-plane ACLs are only applied on the ingress traffic. By default, the control-plane ACL is applied to the front-panel ports. The `no` version of this command resets the value to the default.
Example	`OS10(config)# mac access-group maclist in` `OS10(conf-mac-acl)#`

Example (Control-plane ACL)	`OS10# configure terminal`
	`OS10(config)# control-plane`
	`OS10(config-control-plane)# mac access-group maclist in`

Supported Releases	10.2.0E or later; 10.4.1 or later (control-plane ACL)

mac access-list

Creates a MAC access list to filter based on a MAC address.

Syntax	`mac access-list` *`access-list-name`*
Parameters	*`access-list-name`* — Enter the name of a MAC access list. A maximum of 140 characters.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# mac access-list maclist`
Supported Releases	10.2.0E or later

permit

Configures a filter to allow packets with a specific IPv4 address.

Syntax	`permit [`*`protocol-number`* `| icmp | ip | tcp | udp] [A.B.C.D | A.B.C.D/x | any | host` *`ip-address`*`] [A.B.C.D | A.B.C.D/x | any | host` *`ip-address`*`] [capture | count | dscp` *`value`* `| fragment | log]`

Parameters

- *protocol-number* — (Optional) Enter the protocol number identified in the IP header, from 0 to 255.
- icmp — (Optional) Enter the ICMP address to permit.
- ip — (Optional) Enter the IPv4 address to permit.
- tcp — (Optional) Enter the TCP address to permit.
- udp — (Optional) Enter the UDP address to permit.
- A.B.C.D — Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# permit udp any any capture session 1
```

Supported Releases 10.2.0E or later

permit (IPv6)

Configures a filter to allow packets with a specific IPv6 address.

Syntax

```
permit [protocol-number | icmp | ipv6 | tcp | udp] [A::B | A::B/x | any
| host ipv6-address] [A::B | A:B/x | any | host ipv6-address] [capture |
count | dscp value | fragment | log]
```

Parameters

- *protocol-number* — (Optional) Enter the protocol number identified in the IPv6 header, from 0 to 255.
- icmp — (Optional) Enter the ICMP address to permit.
- ipv6 — (Optional) Enter the IPv6 address to permit.
- tcp — (Optional) Enter the TCP address to permit.
- udp — (Optional) Enter the UDP address to permit.
- A::B — Enter the IPv6 address in hexadecimal format separated by colons.
- A::B/x — Enter the number of bits that must match the IPv6 address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv6 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# permit udp any any capture session 1
```

Supported Releases 10.2.0E or later

permit (MAC)

Configures a filter to allow packets with a specific MAC address.

Syntax `permit {nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any} {nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any} [protocol-number | capture | count [byte] | cos | vlan]`

Parameters

- *nn:nn:nn:nn:nn:nn* — Enter the MAC address.
- *00:00:00:00:00:00* — (Optional) Enter which bits in the MAC address must match. If you do not enter a mask, a mask of `00:00:00:00:00:00` applies.
- `any` — (Optional) Set which routes are subject to the filter:
  - *protocol-number* — Enter the MAC protocol number identified in the MAC header, from 600 to ffff.
  - `capture` — (Optional) Enter the capture packets the filter processes.
  - `count` — (Optional) Enter the count packets the filter processes.
  - `byte` — (Optional) Enter the count bytes the filter processes.
  - `cos` — (Optional) Enter the CoS value, from 0 to 7.
  - `vlan` — (Optional) Enter the VLAN number, from 1 to 4093.

Default Not configured

Command Mode MAC-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# mac access-list macacl
OS10(conf-mac-acl)# permit 00:00:00:00:11:11 00:00:11:11:11:11 any cos 7
OS10(conf-mac-acl)# permit 00:00:00:00:11:11 00:00:11:11:11:11 any vlan 2
```

Supported Releases 10.2.0E or later

permit icmp

Configures a filter to permit all or specific ICMP messages.

Syntax `permit icmp [A.B.C.D | A.B.C.D/x | any | host ip-address] [[A.B.C.D | A.B.C.D/x | any | host ip-address] [capture | count | dscp value | fragment | log]`

Parameters

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.

- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# permit icmp any any capture session 1
```

Supported Releases 10.2.0E or later

permit icmp (IPv6)

Configures a filter to permit all or specific ICMP messages.

Syntax

```
permit icmp [A::B | A::B/x | any | host ipv6-address] [A::B | A:B/x | any |
host ipv6-address] [capture | count | dscp value | fragment | log]
```

Parameters

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ipv6-address` — (Optional) Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Cunt bytes the filter processes.
- `dscp value` — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# permit icmp any any capture session 1
```

Supported Releases 10.2.0E or later

permit ip

Configures a filter to permit all or specific packets from an IPv4 address.

Syntax

```
permit ip [A.B.C.D | A.B.C.D/x | any | host ip-address] [[A.B.C.D |
A.B.C.D/x | any | host ip-address] [capture | count | dscp value | fragment
| log]
```

Parameters

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits to match to the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ip-address` — (Optional) Enter the IPv4 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.

- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragments` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(conf-ipv4-acl)# permit ip any any capture session 1
```

Supported Releases 10.2.0E or later

permit ipv6

Configures a filter to permit all or specific packets from an IPv6 address.

Syntax

```
permit ipv6 [A::B | A::B/x | any | host ipv6-address] [A::B | A:B/x | any |
host ipv6-address] [capture | count | dscp value | fragment | log]
```

Parameters

- `A::B` — (Optional) Enter the source IPv6 address from which the packet was sent and the destination address.
- `A::B/x` — (Optional) Enter the source network mask in /prefix format (`/x`) and the destination mask.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ipv6-address` — Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Enter to capture packets the filter processes.
- `count` — (Optional) Enter to count packets the filter processes.
- `byte` — (Optional) Enter to count bytes the filter processes.
- `dscp value` — (Optional) Enter to deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Enter to use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(conf-ipv6-acl)# permit ipv6 any any count capture session 1
```

Supported Releases 10.2.0E or later

permit tcp

Configures a filter to permit TCP packets meeting the filter criteria.

Syntax

```
permit tcp [A.B.C.D | A.B.C.D/x | any | host ip-address [operator]]
[[A.B.C.D | A.B.C.D/x | any | host ip-address [operator] ] [ack | fin | psh
| rst | syn | urg] [capture | count | dscp value | fragment | log]
```

Parameters

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.

- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
  NOTE: The control-plane ACLs do not support the `any` parameter.
- `host` *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *value* — (Optional) Permit a packet based on the DSCP values, 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

  NOTE: The control-plane ACLs support only the `eq` operator.

Default Not configured

Command Mode IPV4–ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(conf-ipv4-acl)# permit tcp any any capture session 1
```

Supported Releases 10.2.0E or later

permit tcp (IPv6)

Configures a filter to permit TCP packets meeting the filter criteria.

Syntax

```
permit tcp [A::B | A::B/x | any | host ipv6-address [eq | lt | gt | neq
| range]] [A::B | A:B/x | any | host ipv6-address [eq | lt | gt | neq |
range]] [ack | fin | psh | rst | syn | urg] [capture | count | dscp value |
fragment | log]
```

Parameters

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
  NOTE: The control-plane ACLs do not support the `any` parameter.
- `host` *ipv6-address* — (Optional) Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# permit tcp any any capture session 1
```

Supported Releases 10.2.0E or later

permit udp

Configures a filter that allows UDP packets meeting the filter criteria.

Syntax

```
permit udp [A.B.C.D | A.B.C.D/x | any | host ip-address [eq | lt | gt |
neq | range]] [[A.B.C.D | A.B.C.D/x | any | host ip-address [eq | lt | gt |
neq | range] ] [ack | fin | psh | rst | syn | urg] [capture | count | dscp
value | fragment | log]
```

Parameters

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ip-address` — (Optional) Enter the IPv4 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes filter processes.
- `dscp value` — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — (Optional) Permit packets which are equal to.
  - `lt` — (Optional) Permit packets which are less than.
  - `gt` — (Optional) Permit packets which are greater than.
  - `neq` — (Optional) Permit packets which are not equal to.
  - `range` — (Optional) Permit packets with a specific source and destination address.

    NOTE: The control-plane ACL supports only the `eq` operator.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# permit udp any any capture session 1
```

Supported Releases 10.2.0E or later

permit udp (IPv6)

Configures a filter to permit UDP packets meeting the filter criteria.

Syntax

```
permit udp [A::B | A::B/x | any | host ipv6-address [operator]] [A::B |
A:B/x | any | host ipv6-address [operator]] [ack | fin | psh | rst | syn |
urg] [capture | count | dscp value | fragment | log]
```

Parameters

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.

  NOTE: The control-plane ACL supports only the `eq` operator.
- `host ipv6-address` — (Optional) Enter the keyword and the IPv6 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter.

Example

```
OS10(conf-ipv6-acl)# permit udp any any capture session 1 count
```

Supported Releases 10.2.0E or later

remark

Specifies an ACL entry description.

Syntax

```
remark description
```

Parameters *description* — Enter a description. A maximum of 80 charaters.

Default Not configured

Command Mode IPV4-ACL

Usage Information Configure up to 16777214 remarks for a given IPv4, IPv6, or MAC. The `no` version of the command removes the ACL entry description.

Supported Releases 10.2.0E or later

seq deny

Assigns a sequence number to deny IPv4 addresses while creating the filter.

Syntax

```
seq sequence-number deny [protocol-number | icmp | ip | tcp | udp] [A.B.C.D
| A.B.C.D/x | any | host ip-address] [A.B.C.D | A.B.C.D/x | any | host ip-
address] [capture | count | dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the ACL for editing and sequencing number, from 1 to 16777214.
- *protocol-number* — (Optional) Enter the protocol number, from 0 to 255.
- icmp — (Optional) Enter the ICMP address to deny.
- ip — (Optional) Enter the IPv4 address to deny.
- tcp — (Optional) Enter the TCP address to deny.
- udp — (Optional) Enter the UDP address to deny.
- A.B.C.D — (Optional) Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — (Optional) Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# seq 10 deny tcp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny (IPv6)

Assigns a sequence number to deny IPv6 addresses while creating the filter.

Syntax

```
seq sequence-number deny [protocol-number icmp | ip | tcp | udp] [A::B |
A::B/x | any | host ipv6-address] [A::B | A::B/x | any | host ipv6-address]
[capture | count | dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- *protocol-number* — (Optional) Enter the protocol number, from 0 to 255.
- icmp — (Optional) Enter the ICMP address to deny.
- ip — (Optional) Enter the IPv6 address to deny.
- tcp — (Optional) Enter the TCP address to deny.
- udp — (Optional) Enter the UDP address to deny.

- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *`ipv6-address`* — (Optional) Enter to use an IPv6 host address only.
- `capture` — (Optional) Enter to capture packets the filter processes.
- `count` — (Optional) Enter to count packets the filter processes.
- `byte` — (Optional) Enter to count bytes the filter processes.
- `dscp` *`value`* — (Optional) Enter to deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Enter to use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *`sequence-number`* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 5 deny ipv6 any any capture session 1 count log
```

Supported Releases 10.2.0E or later

seq deny (MAC)

Assigns a sequence number to a deny filter in a MAC access list while creating the filter.

Syntax

```
seq sequence-number deny {nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any}
{nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any} [protocol-number | capture |
cos | count [byte] | vlan]
```

Parameters

- *`sequence-number`* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- *`nn:nn:nn:nn:nn:nn`* — Enter the source MAC address.
- *`00:00:00:00:00:00`* — (Optional) Enter which bits in the MAC address must match. If you do not enter a mask, a mask of `00:00:00:00:00:00` applies.
- `any` — (Optional) Set all routes which are subject to the filter:
  - *`protocol-number`* — Protocol number identified in the MAC header, from 600 to ffff.
  - `capture` — (Optional) Capture packets the filter processes.
  - `cos` — (Optional) CoS value, from 0 to 7.
  - `count` — (Optional) Count packets the filter processes.
  - `byte` — (Optional) Count bytes the filter processes.
  - `vlan` — (Optional) VLAN number, from 1 to 4093.

Default Not configured

Command Mode CONFIG-MAC-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *`sequence-number`* command if you know the filter's sequence number.

Example

```
OS10(config)# mac access-list macacl
OS10(conf-mac-acl)# seq 10 deny 00:00:00:00:11:11 00:00:11:11:11:11 any
cos 7
OS10(conf-mac-acl)# seq 20 deny 00:00:00:00:11:11 00:00:11:11:11:11 any
vlan 2
```

Supported Releases	10.2.0E or later

seq deny icmp

Assigns a filter to deny ICMP messages while creating the filter.

Syntax

```
seq sequence-number deny icmp [A.B.C.D | A.B.C.D/x | any | host ip-address]
[A.B.C.D | A.B.C.D/x | any | host ip-address] [capture | count | dscp value
| fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A.B.C.D — Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host IP address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 5 deny icmp any any capture session 1 log
```

Supported Releases	10.2.0E or later

seq deny icmp (IPv6)

Assigns a sequence number to deny ICMP messages while creating the filter.

Syntax

```
seq sequence-number deny icmp [A::B | A::B/x | any | host ipv6-address]
[A::B | A::B/x | any | host ipv6-address] [capture | count | dscp value |
fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A::B — Enter the IPv6 address in hexadecimal format separated by colons.
- A::B/x — Enter the number of bits that must match the IPv6 address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ipv6-address* — (Optional) Enter the IPv6 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 10 deny icmp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny ip

Assigns a sequence number to deny IPv4 addresses while creating the filter.

Syntax `seq` *sequence-number* `deny ip [A.B.C.D | A.B.C.D/x | any | host` *ip-address*`] [A.B.C.D | A.B.C.D/x | any | host` *ip-address*`] [capture | count | dscp` *value* `| fragment | log]`

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(config-ipv4-acl)# seq 10 deny ip any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny ipv6

Assigns a filter to deny IPv6 addresses while creating the filter.

Syntax `seq` *sequence-number* `deny ip [A::B | A::B/x | any | host` *ipv6-address*`] [A::B | A:B/x | any | host` *ipv6-address*`] [capture | count | dscp` *value* `| fragment | log]`

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.

- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` —(Optional) Enter the keyword `any` to specify any source or destination address.
- `host` *`ip-address`* — (Optional) Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *`value`* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *`sequence-number`* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 10 deny ipv6 any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny tcp

Assigns a filter to deny TCP packets while creating the filter.

Syntax

```
seq sequence-number deny tcp [A.B.C.D | A.B.C.D/x | any | host ip-address
[operator]] [[A.B.C.D | A.B.C.D/x | any | host ip-address [operator] ] [ack
| fin | psh | rst | syn | urg] [capture | count | dscp value | fragment |
log]
```

Parameters

- *`sequence-number`* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *`ip-address`* — (Optional) Enter the IPv4 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *`value`* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *`operator`* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to

- range — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 10 deny tcp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny tcp (IPv6)

Assigns a filter to deny TCP packets while creating the filter.

Syntax `seq` *sequence-number* `deny tcp [A::B | A::B/x | any | host` *ipv6-address* `[`*operator*`]] [A::B | A:B/x | any | host` *ipv6-address* `[`*operator*`]] [ack | fin | psh | rst | syn | urg] [capture | count | dscp` *value* `| fragment | log]`

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ip-address* — (Optional) Enter the IPv6 address to use a host address only.
- `ack` — (Optional) Set the bit as acknowledgement.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 10 deny tcp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny udp

Assigns a filter to deny UDP packets while creating the filter.

Syntax `seq sequence-number deny udp [A.B.C.D | A.B.C.D/x | any | host ip-address [operator]] [[A.B.C.D | A.B.C.D/x | any | host ip-address [operator] ] [ack | fin | psh | rst | syn | urg] [capture | count | dscp value | fragment | log]`

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A.B.C.D — Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- ack — (Optional) Set the bit as acknowledgment.
- fin — (Optional) Set the bit as finish—no more data from sender.
- psh — (Optional) Set the bit as push.
- rst — (Optional) Set the bit as reset.
- syn — (Optional) Set the bit as synchronize.
- urg — (Optional) Set the bit set as urgent.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - eq — Equal to
  - gt — Greater than
  - lt — Lesser than
  - neq — Not equal to
  - range — Range of ports, including the specified port numbers.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 10 deny udp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq deny udp (IPv6)

Assigns a filter to deny UDP packets while creating the filter.

Syntax

```
seq sequence-number deny udp [A::B | A::B/x | any | host ipv6-address
[operator]] [A::B | A:B/x | any | host ipv6-address [operator]] [ack | fin
| psh | rst | syn | urg] [capture | count | dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A::B — Enter the IPv6 address in hexadecimal format separated by colons.
- A::B/x — Enter the number of bits that must match the IPv6 address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ipv6-address* — (Optional) Enter the IPv6 address to use a host address only.
- ack — (Optional) Set the bit as acknowledgment.
- fin — (Optional) Set the bit as finish—no more data from sender.
- psh — (Optional) Set the bit as push.
- rst — (Optional) Set the bit as reset.
- syn — (Optional) Set the bit as synchronize.
- urg — (Optional) Set the bit set as urgent.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - eq — Equal to
  - gt — Greater than
  - lt — Lesser than
  - neq — Not equal to
  - range — Range of ports, including the specified port numbers.

Default

Not configured

Command Mode

IPV6-ACL

Usage Information

OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 10 deny udp any any capture session 1 log
```

Supported Releases

10.2.0E or later

seq permit

Assigns a sequence number to permit packets while creating the filter.

Syntax

```
seq sequence-number permit [protocol-number A.B.C.D | A.B.C.D/x | any |
host ip-address] [A.B.C.D | A.B.C.D/x | any | host ip-address] [capture |
count | dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.

- *protocol-number* — (Optional) Enter the protocol number, from 0 to 255.
- A.B.C.D — Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list testflow
OS10(conf-ipv4-acl)# seq 10 permit ip any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq permit (IPv6)

Assigns a sequence number to permit IPv6 packets, while creating a filter.

Syntax

```
seq sequence-number permit protocol-number [A::B | A::B/x | any | host
ipv6-address] [A::B | A:B/x | any | host ipv6-address] [capture | count |
dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- *protocol-number* — (Optional) Enter the protocol number, from 0 to 255.
- A::B — Enter the IPv6 address in hexadecimal format separated by colons.
- A::B/x — Enter the number of bits that must match the IPv6 address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ipv6-address* — (Optional) Enter the IPv6 address to be used as the host address.
- capture — (Optional) Enter to capture packets the filter processes.
- count — (Optional) Enter to count packets the filter processes.
- byte — (Optional) Enter to count bytes the filter processes.
- dscp *value* — (Optional) Enter the DSCP value to permit a packet, from 0 to 63.
- fragment — (Optional) Enter to use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 10 permit ipv6 any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq permit (MAC)

Assigns a sequence number to permit MAC addresses while creating a filter.

Syntax

```
seq sequence-number permit {nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any}
{nn:nn:nn:nn:nn:nn [00:00:00:00:00:00] | any} [protocol-number | capture |
cos | count [byte] | vlan]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing, from 1 to 16777214.
- *nn:nn:nn:nn:nn:nn* — Enter the MAC address of the network from or to which the packets were sent.
- *00:00:00:00:00:00* — (Optional) Enter which bits in the MAC address must match. If you do not enter a mask, a mask of `00:00:00:00:00:00` applies.
- `any` — (Optional) Set all routes to be subject to the filter:
  - *protocol-number* — (Optional) Enter the protocol number identified in the MAC header, from 600 to ffff.
  - `capture` — (Optional) Enter the capture packets the filter processes.
  - `cos` — (Optional) Enter the CoS value, from 0 to 7.
  - `count` — (Optional) Enter the count packets the filter processes.
  - `byte` — (Optional) Enter the count bytes the filter processes.
  - `vlan` — (Optional) Enter the VLAN number, from 1 to 4093.

Default Not configured

Command Mode MAC-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# mac access-list macacl
OS10(conf-mac-acl)# seq 10 permit 00:00:00:00:11:11 00:00:11:11:11:11
any cos 7
OS10(conf-mac-acl)# seq 20 permit 00:00:00:00:11:11 00:00:11:11:11:11
any vlan 2
```

Supported Releases 10.2.0E or later

seq permit icmp

Assigns a sequence number to allow ICMP messages while creating the filter

Syntax

```
seq sequence-number permit icmp [A.B.C.D | A.B.C.D/x | any | host ip-
address] [A.B.C.D | A.B.C.D/x | any | host ip-address] [capture | count |
dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.

- `dscp value` — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq sequence-number` command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 5 permit icmp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq permit icmp (IPv6)

Assigns a sequence number to allow ICMP messages while creating the filter.

Syntax

```
seq sequence-number permit icmp [A::B | A::B/x | any | host ipv6-address]
[A::B | A:B/x | any | host ipv6-address] [capture | count | dscp value |
fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host ipv6-address` — (Optional) Enter the IPv6 address to use a host address only.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp value` — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq sequence-number` command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list ipv6test
OS10(conf-ipv6-acl)# seq 5 permit icmp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq permit ip

Assigns a sequence number to allow packets while creating the filter.

Syntax

```
seq sequence-number permit ip [A.B.C.D | A.B.C.D/x | any | host ip-address]
[A.B.C.D | A.B.C.D/x | any | host ip-address] [capture | count | dscp value
| fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A.B.C.D — Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 5 permit ip any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq permit ipv6

Assigns a sequence number to allow packets while creating the filter.

Syntax

```
seq sequence-number permit ipv6 [A::B | A::B/x | any | host ipv6-address]
[A::B | A:B/x | any | host ipv6-address] [capture | count | dscp value |
fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A::B — Enter the IPv6 address in hexadecimal format separated by colons.
- A::B/x — Enter the number of bits that must match the IPv6 address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ipv6-address* — (Optional) Enter the IPv6 address to use a host address only.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list egress
OS10(conf-ipv6-acl)# seq 5 permit ipv6 any any capture session 1 log
```

Supported Releases	10.2.0E or later

seq permit tcp

Assigns a sequence number to allow TCP packets while creating the filter.

Syntax

```
seq sequence-number permit tcp [A.B.C.D | A.B.C.D/x | any | host ip-address
[operator]] [[A.B.C.D | A.B.C.D/x | any | host ip-address [operator] ] [ack
| fin | psh | rst | syn | urg] [capture | count | dscp value | fragment |
log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A.B.C.D — Enter the IPv4 address in dotted decimal format.
- A.B.C.D/x — Enter the number of bits that must match the dotted decimal address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - eq — Equal to
  - gt — Greater than
  - lt — Lesser than
  - neq — Not equal to
  - range — Range of ports, including the specified port numbers.
- ack — (Optional) Set the bit as acknowledgment.
- fin — (Optional) Set the bit as finish—no more data from sender.
- psh — (Optional) Set the bit as push.
- rst — (Optional) Set the bit as reset.
- syn — (Optional) Set the bit as synchronize.
- urg — (Optional) Set the bit set as urgent.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 5 permit tcp any any capture session 1 log
```

Supported Releases	10.2.0E or later

seq permit tcp (IPv6)

Assigns a sequence number to allow TCP IPv6 packets while creating the filter.

Syntax

```
seq sequence-number permit tcp [A::B | A::B/x | any | host ipv6-address
[operator]] [A::B | A:B/x | any | host ipv6-address [operator]] [ack | fin
| psh | rst | syn | urg] [capture | count | dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- A::B — Enter the IPv6 address in hexadecimal format separated by colons.
- A::B/x — Enter the number of bits that must match the IPv6 address.
- any — (Optional) Enter the keyword any to specify any source or destination IP address.
- host *ipv6-address* — (Optional) Enter the IPv6 address to use a host address only.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - eq — Equal to
  - gt — Greater than
  - lt — Lesser than
  - neq — Not equal to
  - range — Range of ports, including the specified port numbers.
- ack — (Optional) Set the bit as acknowledgment.
- fin — (Optional) Set the bit as finish—no more data from sender.
- psh — (Optional) Set the bit as push.
- rst — (Optional) Set the bit as reset.
- syn — (Optional) Set the bit as synchronize.
- urg — (Optional) Set the bit set as urgent.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default

Not configured

Command Mode

IPV6-ACL

Usage Information

OS10 cannot count both packets and bytes; when you enter the count byte options, only bytes increment. The no version of this command removes the filter, or use the no seq *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list egress
OS10(conf-ipv6-acl)# seq 5 permit tcp any any capture session 1 log
```

Supported Releases

10.2.0E or later

seq permit udp

Assigns a sequence number to allow UDP packets while creating the filter.

Syntax

```
seq sequence-number permit udp [A.B.C.D | A.B.C.D/x | any | host ip-address
[operator]] [[A.B.C.D | A.B.C.D/x | any | host ip-address [operator] ] [ack
| fin | psh | rst | syn | urg] [capture | count | dscp value | fragment |
log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.

- `A.B.C.D` — Enter the IPv4 address in dotted decimal format.
- `A.B.C.D/x` — Enter the number of bits that must match the dotted decimal address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ip-address* — (Optional) Enter the IPv4 address to use a host address only.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than
  - `neq` — Not equal to
  - `range` — Range of ports, including the specified port numbers.
- `ack` — (Optional) Set the bit as acknowledgment.
- `fin` — (Optional) Set the bit as finish—no more data from sender.
- `psh` — (Optional) Set the bit as push.
- `rst` — (Optional) Set the bit as reset.
- `syn` — (Optional) Set the bit as synchronize.
- `urg` — (Optional) Set the bit set as urgent.
- `capture` — (Optional) Capture packets the filter processes.
- `count` — (Optional) Count packets the filter processes.
- `byte` — (Optional) Count bytes the filter processes.
- `dscp` *value* — (Optional) Deny a packet based on the DSCP values, from 0 to 63.
- `fragment` — (Optional) Use ACLs to control packet fragments.
- `log` — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV4-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ip access-list egress
OS10(conf-ipv4-acl)# seq 5 permit udp any any capture session 1 log
```

Supported Releases 10.2.0E or later

seq permit udp (IPv6)

Assigns a sequence number to allow UDP IPv6 packets while creating a filter.

Syntax

```
seq sequence-number permit udp [A::B | A::B/x | any | host ipv6-address
[operator]] [A::B | A:B/x | any | host ipv6-address [operator]] [ack | fin
| psh | rst | syn | urg] [capture | count | dscp value | fragment | log]
```

Parameters

- *sequence-number* — Enter the sequence number to identify the route-map for editing and sequencing number, from 1 to 16777214.
- `A::B` — Enter the IPv6 address in hexadecimal format separated by colons.
- `A::B/x` — Enter the number of bits that must match the IPv6 address.
- `any` — (Optional) Enter the keyword `any` to specify any source or destination IP address.
- `host` *ipv6-address* — (Optional) Enter the IPv6 address to use a host address only.
- *operator* — (Optional) Enter a logical operator to match the packets on the specified port number. The following options are available:
  - `eq` — Equal to
  - `gt` — Greater than
  - `lt` — Lesser than

- neq — Not equal to
- range — Range of ports, including the specified port numbers.

- ack — (Optional) Set the bit as acknowledgment.
- fin — (Optional) Set the bit as finish—no more data from sender.
- psh — (Optional) Set the bit as push.
- rst — (Optional) Set the bit as reset.
- syn — (Optional) Set the bit as synchronize.
- urg — (Optional) Set the bit set as urgent.
- capture — (Optional) Capture packets the filter processes.
- count — (Optional) Count packets the filter processes.
- byte — (Optional) Count bytes the filter processes.
- dscp *value* — (Optional) Permit a packet based on the DSCP values, from 0 to 63.
- fragment — (Optional) Use ACLs to control packet fragments.
- log — (Optional) Enables ACL logging. Information about packets that match an ACL rule are logged.

Default Not configured

Command Mode IPV6-ACL

Usage Information OS10 cannot count both packets and bytes; when you enter the `count byte` options, only bytes increment. The `no` version of this command removes the filter, or use the `no seq` *sequence-number* command if you know the filter's sequence number.

Example

```
OS10(config)# ipv6 access-list egress
OS10(conf-ipv6-acl)# seq 5 permit udp any any capture session 1 log
```

Supported Releases 10.2.0E or later

show access-group

Displays IP, MAC, or IPv6 access-group information.

Syntax `show {ip | mac | ipv6} access-group` *name*

Parameters

- ip — View IP access group information.
- mac — View MAC access group information.
- ipv6 — View IPv6 access group information.
- access-group *name* — Enter the name of the access group.

Default Not configured

Command Mode EXEC

Usage Information None

Example (IP)

```
OS10# show ip access-group aaa
Ingress IP access list aaa on ethernet1/1/1
Ingress IP access list aaa on ethernet1/1/2
Egress IP access list aaa on ethernet1/1/2
```

Example (MAC)

```
OS10# show mac access-group bbb
Ingress MAC access list aaa on ethernet1/1/1
Ingress MAC access list aaa on ethernet1/1/2
Egress MAC access list aaa on ethernet1/1/2
```

Example (IPv6)

```
OS10# show ipv6 access-group ccc
Ingress IPV6 access list aaa on ethernet1/1/1
```

```
Ingress IPV6 access list aaa on ethernet1/1/2
Egress IPV6 access list aaa on ethernet1/1/2
```

Example (Control-plane ACL - IP)

```
OS10# show ip access-group aaa-cp-acl
Ingress IP access-list aaa-cp-acl on control-plane data mgmt
```

Example (Control-plane ACL - MAC)

```
OS10# show mac access-group aaa-cp-acl
Ingress MAC access-list aaa-cp-acl on control-plane data
```

Example (Control-plane ACL - IPv6)

```
OS10# show ipv6 access-group aaa-cp-acl
Ingress IPV6 access-list aaa-cp-acl on control-plane data mgmt
```

Supported Releases 10.2.0E or later; 10.4.1 or later (control-plane ACL)

show access-lists

Displays IP, MAC, or IPv6 access-list information.

Syntax `show {ip | mac | ipv6} access-lists {in | out} access-list-name`

Parameters

- `ip` — View IP access list information.
- `mac` — View MAC access list information.
- `ipv6` — View IPv6 access list information.
- `access-lists in | out` — Enter either `access lists in` or `access lists out`.
- *`access-list–name`* — Enter the name of the access-list.

Default Not configured

Command Mode EXEC

Usage Information None

Example (MAC In)

```
OS10# show mac access-lists in
Ingress MAC access list aaa
Active on interfaces :
  ethernet1/1/1
  ethernet1/1/2
 seq 10 permit any any
 seq 20 permit 11:11:11:11:11:11 22:22:22:22:22:22 any monitor count
bytes (0 bytes)
```

Example (MAC Out)

```
OS10# show mac access-lists out
Egress MAC access list aaa
 Active on interfaces :
  ethernet1/1/1
  ethernet1/1/2
 seq 10 permit any any
 seq 20 permit 11:11:11:11:11:11 22:22:22:22:22:22 any monitor count
bytes (0 bytes)
```

Example (IP In)

```
OS10# show ip access-lists in
Ingress IP access list aaaa
 Active on interfaces :
  ethernet1/1/1
  ethernet1/1/2
 seq 10 permit ip any any log
 seq 20 permit tcp any any count (0 packets)
 seq 30 permit udp any any count bytes (0 bytes)
```

Example (IP Out)

```
OS10# show ip access-lists out
Egress IP access list aaaa
 Active on interfaces :
  ethernet1/1/1
  ethernet1/1/2
 seq 10 permit ip any any
 seq 20 permit tcp any any count (0 packets)
 seq 30 permit udp any any count bytes (0 bytes)
```

Example (IPv6 In)

```
OS10# show ipv6 access-lists in
Ingress IPV6 access list bbb
 Active on interfaces :
  ethernet1/1/1
  ethernet1/1/2
 seq 10 permit any any
Ingress IPV6 access list ggg
 Active on interfaces :
  ethernet 1/1/3
 seq 5 permit ipv6 11::/32 any log count (0 packets)
```

Example (IPv6 Out)

```
OS10# show ipv6 access-lists out
Egress IPV6 access list bbb
 Active on interfaces :
  ethernet1/1/1
  ethernet1/1/2
 seq 10 permit any any
Egress IPV6 access list ggg
 Active on interfaces :
  ethernet 1/1/1
 seq 5 permit ipv6 11::/32 any count (0 packets)
```

Example (IP In - Control-plane ACL)

```
OS10# show ip access-lists in
Ingress IP access-list aaa-cp-acl
 Active on interfaces :
  control-plane data
 seq 10 permit ip any any
  control-plane mgmt
 seq 10 permit ip any any
```

Example (IPv6 In - Control-plane ACL)

```
OS10# show ipv6 access-lists in
Ingress IPV6 access-list aaa-cp-acl
 Active on interfaces :
  control-plane data
 seq 10 permit ipv6 any any
  control-plane mgmt
 seq 10 permit ipv6 any any
```

Example (MAC In - Control-plane ACL)

```
OS10# show mac access-lists in
Ingress MAC access-list mac-cp1
 Active on interfaces :
control-plane data
 seq 10 deny any any count (159 packets)
```

Supported Releases 10.2.0E or later; 10.4.1 or later (control-plane ACL)

show acl-table-usage detail

Displays the ingress and egress ACL tables, the features that are used, and their space utilizations.

Syntax `show acl-table-usage detail`

Parameters None

Default None

Command Mode EXEC

Usage Information The hardware pool displays the ingress application groups (pools), the features mapped to each of these groups, and
space available in each of the pools. The amount of space required to store a single ACL rule in a pool depends on th

The service pool displays the amount of used and free space for each of the features. The number of ACL rules conf
displayed in the configured rules column. The number of used rows depends on the number of ports the configured

Examples Z9100-ON platform

```
OS10# show acl-table-usage detail

```

Supported Releases 10.4.2 and later

show control-plane logging

Displays the configured burst size and logging rate for control-plane management ACL.

Syntax `show control-plane logging access-list mgmt`

Parameters	None
Default	None
Command Mode	EXEC
Usage Information	None

Example

```
OS10# show control-plane logging access-list mgmt

Control plane Management ACL Logging
Burst : 2 packets (default)
Rate  : 2 packets per minute (default)
```

Supported Releases	10.5.2.1 or later

show ip as-path-access-list

Displays the configured AS path access lists.

Syntax	`show ip as-path-access-list [name]`
Parameters	*name* — (Optional) Specify the name of the AS path access list.
Defaults	None
Command Mode	EXEC
Usage Information	None

Example

```
OS10# show ip as-path-access-list
ip as-path access-list hello
        permit 123
        deny 35
```

Supported Releases	10.3.0E or later

show ip prefix-list

Displays configured IPv4 or IPv6 prefix list information.

Syntax	`show {ip | ipv6} prefix-list [prefix-name]`
Parameters	• `ip | ipv6`—(Optional) Displays information related to IPv4 or IPv6. • *prefix-name* — Enter a text string for the prefix list name. A maximum of 140 characters.
Defaults	None
Command Mode	EXEC
Usage Information	None

Example

```
OS10# show ip prefix-list
ip prefix-list hello:
seq 10 deny 1.2.3.4/24
seq 20 permit 3.4.4.5/32
```

Example (IPv6)

```
OS10# show ipv6 prefix-list
ipv6 prefix-list hello:
```

```
seq 10 permit 1::1/64
seq 20 deny 2::2/64
```

Supported Releases 10.3.0E or later

show logging access-list

Displays the ACL logging threshold and interval configuration.

Syntax `show logging access-list`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show logging access-list
ACL Logging
Threshold      :   10
Interval       :   5
```

Supported Releases 10.4.3.0 or later

Route-map commands

continue

Configures the next sequence of the route map.

Syntax `continue` *seq-number*

Parameters *seq-number* — Enter the next sequence number, from 1 to 65535.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes a match.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# continue 65535
```

Supported Releases 10.3.0E or later

match as-path

Configures a filter to match routes that have a certain AS path in their BGP paths.

Syntax `match as-path` *as-path-name*

Parameters *as-path-name* — Enter the name of an established AS-PATH ACL. A maximum of 140 characters.

Default Not configured

Command Mode	ROUTE-MAP
Usage Information	The `no` version of this command deletes a match AS path filter.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# match as-path pathtest1`
Supported Releases	10.3.0E or later

match community

Configures a filter to match routes that have a certain COMMUNITY attribute in their BGP path.

Syntax	`match community` *`community-list-name`* `[exact-match]`
Parameters	• *`community-list-name`* — Enter the name of a configured community list. • `exact-match` — (Optional) Select only those routes with the specified community list name.
Default	Not configured
Command Mode	ROUTE-MAP
Usage Information	The `no` version of this command deletes the community match filter.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# match community commlist1 exact-match`
Supported Releases	10.3.0E or later

match extcommunity

Configures a filter to match routes that have a certain EXTCOMMUNITY attribute in their BGP path.

Syntax	`match extcommunity` *`extcommunity-list-name`* `[exact-match]`
Parameters	• *`extcommunity-list-name`* — Enter the name of a configured extcommunity list. • `exact-match` — (Optional) Select only those routes with the specified extcommunity list name.
Default	Not configured
Command Mode	ROUTE-MAP
Usage Information	The `no` version of this command deletes the extcommunity match filter.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# match extcommunity extcommlist1 exact-match`
Supported Releases	10.3.0E or later

match inactive-path-additive

Configures a filter to include inactive route paths when used with the `redistribute` or `advertise` commands.

Syntax	`match inactive-path-additive`
Parameters	None

Default	None
Command Mode	ROUTE-MAP
Usage Information	You can use this command in ROUTE-MAP configuration mode in addition to the other match rules. The `no` version of this command deletes the match filter.

Example	`OS10# configure terminal`
	`OS10(config)# route-map redis-inactive-routes`
	`OS10(config-route-map)# match inactive-path-additive`

Supported Releases	10.5.2.0 or later

match interface

Configures a filter to match routes whose next-hop is the configured interface.

Syntax	`match interface interface`
Parameters	*interface* — Interface type: • `ethernet` *node/slot/port[:subport]* — Enter the Ethernet interface information as the next-hop interface. • `port-channel` *id-number*—Enter the port-channel number as the next-hop interface, from 1 to 999 or 1001 to 2000. • `vlan` *vlan-id*—Enter the VLAN number as the next-hop interface, from 1 to 4093.
Default	Not configured
Command Mode	ROUTE-MAP
Usage Information	The `no` version of this command deletes the match.
Example	`OS10(conf-route-map)# match interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)#`
Supported Releases	10.2.0E or later

match ip address

Configures a filter to match routes based on IP addresses specified in IP prefix lists.

Syntax	`match ip address {prefix-list` *prefix-list-name* `|` *access-list-name*`}`
Parameters	• *prefix-list-name* — Enter the name of the configured prefix list. A maximum of 140 characters. • *access-list-name* — Enter the name of the configured access list.
Default	Not configured
Command Mode	ROUTE-MAP
Usage Information	The `no` version of this command deletes a match.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# match ip address  prefix-list test10`
Supported Releases	10.3.0E or later

match ip next-hop

Configures a filter to match based on the next-hop IP addresses specified in IP prefix lists.

Syntax `match ip next-hop prefix-list prefix-list`

Parameters *prefix-list* — Enter the name of the configured prefix list. A maximum of 140 characters.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# match ip next-hop  prefix-list test100
```

Supported Releases 10.3.0E or later

match ipv6 address

Configures a filter to match routes based on IPv6 addresses specified in IP prefix lists.

Syntax `match ipv6 address {prefix-list prefix-list | access-list}`

Parameters

- *prefix-list* — Enter the name of the configured prefix list. A maximum of 140 characters.
- *access-list* — Enter the name of the access group or list.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# match ipv6 address test100
```

Supported Releases 10.3.0E or later

match ipv6 next-hop

Configures a filter to match based on the next-hop IPv6 addresses specified in IP prefix lists.

Syntax `match ipv6 next-hop prefix-list prefix-list`

Parameters *prefix-list* — Enter the name of the configured prefix list. A maximum of 140 characters.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# match ipv6 next-hop  prefix-list test100
```

Supported Releases 10.3.0E or later

match metric

Configures a filter to match on a specific value.

Syntax `match metric metric-value`

Parameters *metric-value* — Enter a value to match the route metric against, from 0 to 4294967295.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(conf-route-map)# match metric 429132
```

Supported Releases 10.2.0E or later

match origin

Configures a filter to match routes based on the origin attribute of BGP.

Syntax `match origin {egp | igp | incomplete}`

Parameters

- `egp` — Match only remote EGP routes.
- `igp` — Match only on local IGP routes.
- `incomplete` — Match on unknown routes that are learned through some other means.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# match origin egp
```

Supported Releases 10.3.0E or later

match route-type

Configures a filter to match routes based on how the route is defined.

Syntax `match route-type {{external {type-1 | type-2} | internal | local }`

Parameters

- `external` — Match only on external OSPF routes. Enter the keyword then one of the following:
  - `type-1` — Match only on OSPF Type 1 routes.
  - `type-2` — Match only on OSPF Type 2 routes.
-
- `internal` — Match only on routes generated within OSPF areas.
- `local` — Match only on routes generated locally.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# match route-type external type-1
```

Supported Releases 10.3.0E or later

match tag

Configures a filter to redistribute only routes that match a specific tag value.

Syntax `match tag tag-value`

Parameters *tag-value* — Enter the tag value to match with the tag number, from 0 to 4294967295.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the match.

Example

```
OS10(conf-route-map)# match tag 656442
```

Supported Releases 10.2.0E or later

route-map

Enables a route-map statement and configures its action and sequence number.

Syntax `route-map map-name [permit | deny | sequence-number]`

Parameters

- *map-name* — Enter the name of the route-map. A maximum of 140 characters.
- *sequence-number* — (Optional) Enter the number to identify the route-map for editing and sequencing number from 1 to 65535. The default is 10.
- `permit` — (Optional) Set the route-map default as permit.
- `deny` — (Optional) Set the route default as deny.

Default Not configured

Command Mode CONFIGURATION

Usage Information

NOTE: Exercise caution when you delete route-maps — if you do not enter a sequence number, all route-maps with the same map-name are deleted.

The `no` version of this command removes a route-map.

Example

```
OS10(config)# route-map route1 permit 100
OS10(config-route-map)#
```

Supported Releases 10.2.0E or later

set comm-list add

Add communities in the specified list to the COMMUNITY attribute in a matching inbound or outbound BGP route.

Syntax `set comm-list {community-list-name} add`

Parameters *community-list-name* — Enter the name of an established community list. A maximum of 140 characters.

Defaults	None
Command Mode	ROUTE-MAP
Usage Information	In a route map, use this `set` command to add a list of communities that pass a permit statement to the COMMUNITY attribute of a BGP route sent or received from a BGP peer. Use the `set comm-list delete` command to delete a community list from a matching route.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# set comm-list comlist1 add`
Supported Releases	10.4.0E(R1) or later

set comm-list delete

Remove communities in the specified list from the COMMUNITY attribute in a matching inbound or outbound BGP route.

Syntax	`set comm-list {`*`community-list-name`*`} delete`
Parameters	*`community-list-name`* — Enter the name of an established community list. A maximum of 140 characters.
Defaults	None‘
Command Mode	ROUTE-MAP
Usage Information	Configure the community list you use in the `set comm-list delete` command so that each filter contains only one community. For example, the filter `deny 100:12` is acceptable, but the filter `deny 120:13 140:33` results in an error. If you configure the `set comm-list delete` command and the `set community` command in the same route map sequence, the deletion `set comm-list delete` command processes before the insertion `set community` command . To add communities in a community list to the COMMUNITY attribute in a BGP route, use the `set comm-list add` command.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# set comm-list comlist1 delete`
Supported Releases	10.3.0E or later

set community

Sets the community attribute in BGP updates.

Syntax	`set community {none |` *`community-number`*`}`
Parameters	• `none` — Enter to remove the community attribute from routes meeting the route map criteria. • *`community-number`* — Enter the community number in `aa:nn` format, where `aa` is the AS number, 2 bytes, and `nn` is a value specific to that AS.
Default	Not configured
Command Mode	ROUTE-MAP
Usage Information	The `no` version of this command deletes a BGP COMMUNITY attribute assignment.
Example	`OS10(config)# route-map bgp` `OS10(conf-route-map)# set community none`
Supported Releases	10.3.0E or later

set extcomm-list add

Add communities in the specified list to the EXTCOMMUNITY attribute in a matching inbound or outbound BGP route.

Syntax `set extcomm-list extcommunity-list-name add`

Parameter *extcommunity-list-name* — Enter the name of an established extcommunity list. A maximum of 140 characters.

Defaults None

Command Mode ROUTE-MAP

Usage Information In a route map, use this `set` command to add an extended list of communities that pass a permit statement to the EXTCOMMUNITY attribute of a BGP route sent or received from a BGP peer. Use the `set extcomm-list delete` command to delete an extended community list from a matching route.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# set extcomm-list TestList add
```

Supported Releases 10.4.0E(R1) or later

set extcomm-list delete

Remove communities in the specified list from the EXTCOMMUNITY attribute in a matching inbound or outbound BGP route.

Syntax `set extcomm-list extcommunity-list-name delete`

Parameter *extcommunity-list-name* — Enter the name of an established extcommunity list. A maximum of 140 characters.

Defaults None

Command Mode ROUTE-MAP

Usage Information To add communities in an extcommunity list to the EXTCOMMUNITY attribute in a BGP route, use the `set extcomm-list add` command.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# set extcomm-list TestList delete
```

Supported Releases 10.3.0E or later

set extcommunity

Sets the extended community attributes in a route map for BGP updates.

Syntax `set extcommunity rt {asn2:nn | asn4:nnnn | ip-addr:nn}`

Parameters

- `asn2:nn` — Enter an AS number in 2-byte format; for example, 1–65535:1–4294967295.
- `asn4:nnnn` — Enter an AS number in 4-byte format; for example, 1–4294967295:1–65535 or 1–65535.1–65535:1–65535.
- `ip-addr:nn` — Enter an AS number in dotted format, from 1 to 65535.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the set clause from a route map.

Example

```
OS10(config)# route-map bgp
OS10(conf-route-map)# set extcommunity rt 10.10.10.2:325
```

Supported Releases 10.3.0E or later

set local-preference

Sets the preference value for the AS path.

Syntax `set local-preference value`

Parameters *value* — Enter a number as the LOCAL_PREF attribute value, from 0 to 4294967295.

Default Not configured

Command Mode ROUTE-MAP

Usage Information This command changes the LOCAL_PREF attribute for routes meeting the route map criteria. To change the LOCAL_PREF for all routes, use the `bgp default local-preference` command. The `no` version of this command removes the LOCAL_PREF attribute.

Example

```
OS10(conf-route-map)# set local-preference 200
```

Supported Releases 10.2.0E or later

set metric

Set a metric value for a routing protocol.

Syntax `set metric [+ | -] metric-value`

Parameters

- `+` — (Optional) Add a metric value to the redistributed routes.
- `-` — (Optional) Subtract a metric value from the redistributed routes.
- *metric-value* — Enter a new metric value, from 0 to 4294967295.

Default Not configured

Command Mode ROUTE-MAP

Usage Information To establish an absolute metric, do not enter a plus or minus sign before the metric value. To establish a relative metric, enter a plus or minus sign immediately preceding the metric value. The value is added to or subtracted from the metric of any routes matching the route map. You cannot use both an absolute metric and a relative metric within the same route map sequence. Setting either metric overrides any previously configured value. The `no` version of this command removes the filter.

Example (Absolute)

```
OS10(conf-route-map)# set metric 10
```

Example (Relative)

```
OS10(conf-route-map)# set metric -25
```

Supported Releases 10.2.0E or later

set metric-type

Set the metric type for the a redistributed routel.

Syntax `set metric-type {type-1 | type-2 | external}`

Parameters

- `type-1` — Adds a route to an existing community.
- `type-2` — Sends a route in the local AS.
- `external` — Disables advertisement to peers.

Default Not configured

Command Mode ROUTE-MAP

Usage Information

- **BGP**

  Affects BGP behavior only in outbound route maps and has no effect on other types of route maps. If the route map contains both a `set metric-type` and a `set metric` clause, the `set metric` clause takes precedence. If you enter the `internal` metric type in a BGP outbound route map, BGP sets the MED of the advertised routes to the IGP cost of the next hop of the advertised route. If the cost of the next hop changes, BGP is not forced to readvertise the route.

  - `external` — Reverts to the normal BGP rules for propagating the MED, the default.
  - `internal` — Sets the MED of a received route that is being propagated to an external peer equal to the IGP costs of the indirect next hop.
- **OSPF**
  - `external` — Sets the cost of the external routes so that it is equal to the sum of all internal costs and the external cost.
  - `internal` — Sets the cost of the external routes so that it is equal to the external cost alone, the default.

The `no` version of this command removes the set clause from a route map.

Example

```
OS10(conf-route-map)# set metric-type internal
```

Supported Releases 10.2.0E or later

set next-hop

Sets an IPv4 or IPv6 address as the next-hop.

Syntax `set {ip | ipv6} next-hop` *`ip-address`*

Parameters *`ip-address`* — Enter the IPv4 or IPv6 address for the next-hop.

Default Not configured

Command Mode ROUTE-MAP

Usage Information If you apply a route-map with the `set next-hop` command in ROUTER-BGP mode, it takes precedence over the `next-hop-self` command used in ROUTER-NEIGHBOR mode. In a route-map configuration, to configure more than one next-hop entry, use multiple `set {ip | ipv6} next-hop` commands. When you apply a route-map for redistribution or route updates in ROUTER-BGP mode, configure only one next-hop. Configure multiple next-hop entries only in a route-map used for other features, such as policy-based routing (PBR). The `no` version of this command deletes the setting.

Example

```
OS10(conf-route-map)# set ip next-hop 10.10.10.2
```

Example (IPv6)

```
OS10(conf-route-map)# set ipv6 next-hop 11AA:22CC::9
```

Supported Releases 10.2.0E or later

set origin

Set the origin of the advertised route.

Syntax `set origin {egp | igp | incomplete}`

Parameters
- `egp` — Enter to add to existing community.
- `igp` — Enter to send inside the local-AS.
- `incomplete` — Enter to not advertise to peers.

Default Not configured

Command Mode ROUTE-MAP

Usage Information The `no` version of this command deletes the set clause from a route map.

Example
```
OS10(conf-route-map)# set origin egp
```

Supported Releases 10.2.0E or later

set tag

Sets a tag for redistributed routes.

Syntax `set tag tag-value`

Parameters *tag-value* — Enter a tag number for the route to redistribute, from 0 to 4294967295.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command deletes the set clause from a route map.

Example
```
OS10(conf-route-map)# set tag 23
```

Supported Releases 10.2.0E or later

set weight

Set the BGP weight for the routing table.

Syntax `set weight weight`

Parameters *weight* — Enter a number as the weight the route uses to meet the route map specification, from 0 to 65535.

Default Default router-originated is 32768 — all other routes are 0.

Command Mode ROUTE-MAP

Usage Information The `no` version of the command deletes the set clause from the route map.

Example
```
OS10(conf-route-map)# set weight 200
```

Supported Releases 10.2.0E or later

show route-map

Displays the current route map configurations.

Syntax `show route-map [map-name]`

Parameters *map-name* — (Optional) Specify the name of a configured route map. A maximum of 140 characters.

Defaults None

Command Mode EXEC

Usage Information None

Example

```
OS10# show route-map
route-map abc, permit, sequence 10
  Match clauses:
    ip address (access-lists): hello
    as-path abc
    community hello
    metric 2
    origin egp
    route-type external type-1
    tag 10
  Set clauses:
    metric-type type-1
    origin igp
    tag 100
```

Supported Releases 10.3.0E or later

19

Quality of service

Enterprise networks carry various data traffic including voice and video traffic. To efficiently use the available network resources, Quality of Service (QoS) offers several features that help to:

- Allocate sufficient bandwidth for certain types of traffic, such as video traffic.
- Prioritize voice traffic.
- Transfer data reliably.
- Optimize performance.

QoS defines how reliable, available, and efficient a network is. Availability determines the quality of a network. Some of the factors that affect the quality of a network include:

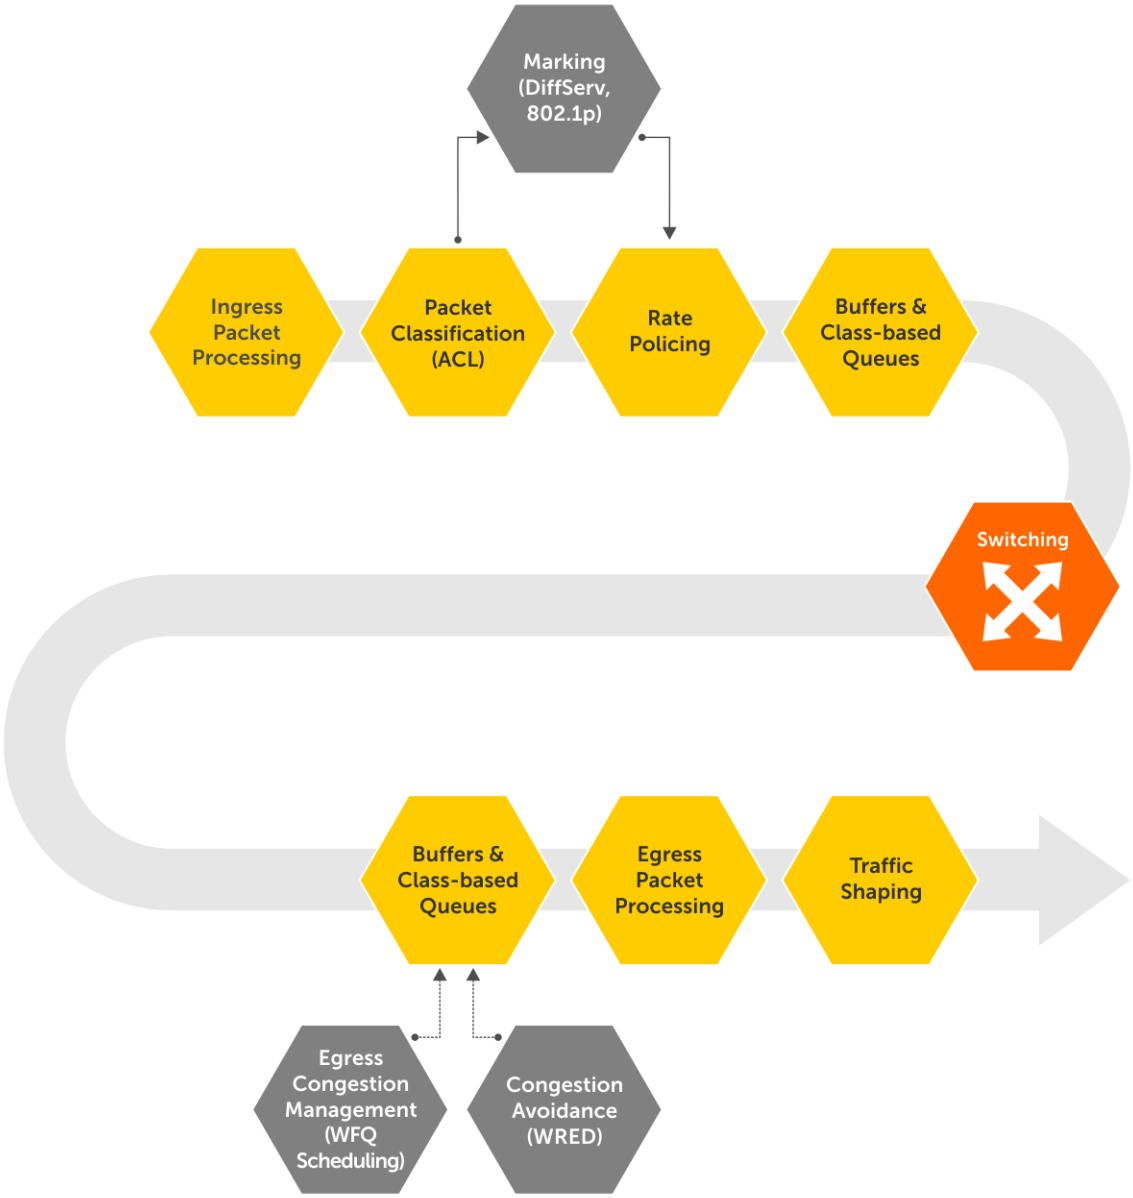
- **Delay**—The amount of time it takes for a packet to reach the destination from the time the sender transmits it.
- **Jitter**—A difference in delay between two data packets.
- **Loss**—One or more data packets that are lost during transit in a network.
- **Drop**—One or more data packets that are dropped during transit in a network. Packet drop causes data loss.

Quality of service (QoS) reserves network resources for highly critical application traffic with precedence over less critical application traffic. QoS prioritizes different types of traffic and ensures quality of service.

You can configure QoS features on the switch to allocate sufficient bandwidth, offer lossless data transfer, prevent network congestion, and prioritize some traffic over others.

The following terms are used in this chapter:

- Ingress traffic—Traffic that comes in to the switch is called ingress traffic.
- Egress traffic—Traffic that leaves the switch is called egress traffic.



Different QoS features control the traffic flow parameters, as the traffic traverses a network device from ingress to egress interfaces.

Classification

To prioritize traffic, you must first classify it. Classification is the process that differentiates one type of traffic from another and categorizes it in to different groups.

OS10 groups network traffic into different traffic classes, from class 0 to 7 based on various parameters. Grouping traffic into different classes helps to identify and prioritize traffic as it goes through the switch.

NOTE: Traffic class is also called as QoS group.

Ingress traffic can either be data or control traffic. By default, OS10 does not classify data traffic. OS10 assigns the default traffic class ID `0` to all data traffic.

You can classify traffic based on:

- Access control lists (ACLs)
- Class of Service (CoS) at L2
- Differentiated Services Code Point (DSCP) at L3

ACL-based classification consumes significant amount of network processor resources. Trust-based classification (CoS and DSCP) classifies traffic in a predefined way without using network processor resources.

OS10 implicitly classifies all control traffic such as STP, OSPF, ICMP, and so on, and forwards the traffic to control plane applications. See Control-plane policing for more information.

Data traffic classification

You can classify the data traffic based on ACL or trust.

ACL-based classification consumes significant amount of network processor resources. Trust-based classification classifies traffic in a pre-defined way without using network processor resources.

Trust based classification

OS10 supports classification based on the 802.1p CoS field (L2) or DSCP field (L3).

802.1p CoS trust map:

Trust the 802.1p CoS field to mark with a traffic-class ID and color for the CoS flow. Weighted random early detection (WRED) uses color to define drop-probabilities and thresholds for egress traffic. See Color traffic for more information. By default, 802.1p priority level 0 is assigned traffic class (TC) ID 1 and 802.1p priority level 1 is assigned TC 0. The rest of the 802.1p priority levels (2 through 7) are assigned the respective TC IDs.

Table 126. Default 802.1p CoS trust map

CoS	Traffic class ID	Color
0	1	G
1	0	G
2	2	G
3	3	G
4	4	G
5	5	G
6	6	G
7	7	G

NOTE: You cannot modify the default CoS trust map.

User–defined 802.1p CoS trust map

You can override the default mapping by creating a dot1p trust map. All the unspecified dot1p entries map to the default traffic class ID 0.

Configure user–defined 802.1p CoS trust map

1. Create a dot1p trust map.

```
OS10(config)# trust dot1p-map example-dot1p-trustmap-name
OS10(config-tmap-dot1p-map)#
```

2. Define the set of dot1p values mapped to traffic-class, the qos-group ID.

```
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 0-4
OS10(config-tmap-dot1p-map)# qos-group 5 dot1p 5-7
```

3. Verify the map entries.

```
OS10# show qos maps type trust-map-dot1p example-dot1p-trustmap-name

DOT1P Priority to Traffic-Class Map : example-dot1p-trustmap-name
Traffic-Class    DOT1P Priority
-------------------------------
```

```
3                       0-4
5                       5-7
```

4. Apply the map on a specific interface or on system-qos, global level.
   - Interface level

     ```
     OS10(conf-if-eth1/1/1)# trust-map dot1p example-dot1p-trustmap-name
     ```

     NOTE: In the interface level, the `no` version of the command returns the configuration to the system-qos level. If there is no configuration available at the system-qos level, the configuration returns to default mapping.
   - System-qos level

     ```
     OS10(config-sys-qos)# trust-map dot1p example-dot1p-trustmap-name
     ```

Apply CoS trust map

After you create a trust map, you must apply the trust map at the interface or system-qos level. To apply the trust map on a specific interface or on system-qos (global) level:

- Interface level

  ```
  OS10(conf-if-eth1/1/1)# trust-map dot1p example-dot1p-trustmap-name
  ```

  NOTE: In the interface level, the `no` version of the command returns the configuration to system-qos level. If there is no configuration available at the system-qos level, then the configuration returns to default mapping.
- System-qos level

  ```
  OS10(config-sys-qos)# trust-map dot1p example-dot1p-trustmap-name
  ```

DSCP trust map:

Assign a predefined and reserved trust classification in the policy map for the DSCP flow. Weighted random early detection (WRED) uses the color assigned to a particular traffic to determine the drop-probability and threshold.

Table 127. Default DSCP trust map

DSCP values	Traffic class ID	Color
0-3	0	G
4-7	0	Y
8-11	1	G
12-15	1	Y
16-19	2	G
20-23	2	Y
24-27	3	G
28-31	3	Y
32-35	4	G
36-39	4	Y
40-43	5	G
44-47	5	Y
48-51	6	G

Table 127. Default DSCP trust map (continued)

DSCP values	Traffic class ID	Color
52-55	6	Y
56-59	7	G
60-62	7	Y
63	7	R

NOTE: You cannot modify the default DSCP trust map.

User–defined DCSP trust map

You can override the default mapping by creating a user-defined DSCP trust map. All the unspecified DSCP entries map to the default traffic class ID `0` and color `G`.

Configure user–defined DSCP trust map

1. Create a DSCP trust map.

```
OS10(config)# trust dscp-map example-dscp-trustmap-name
OS10(config-tmap-dscp-map)#
```

2. Define the set of dscp values mapped to traffic-class, the qos-group ID.

```
OS10(config-tmap-dscp-map)# qos-group 3 dscp 0-15
OS10(config-tmap-dscp-map)# qos-group 5 dscp 16-30
```

3. Verify the map entries.

```
OS10# show qos maps type trust-map-dscp example-dscp-trustmap-name

DSCP Priority to Traffic-Class Map  : example-dscp-trustmap-name
Traffic-Class    DSCP Priority
------------------------------
3                   0-15
5                   16-30
```

4. Apply the map on a specific interface or on system-qos global level.
   - Interface level

     ```
     OS10(conf-if-eth1/1/1)# trust-map dscp example-dscp-trustmap-name
     ```

   - System-qos level

     ```
     OS10(config-sys-qos)# trust-map dscp example-dscp-trustmap-name
     ```

Apply DSCP trust map

You must apply the trust map at the interface or system-qos level. To apply the trust map on a specific interface or on system-qos (global) level:

- Interface level

```
OS10(conf-if-eth1/1/1)# trust-map dscp example-dscp-trustmap-name
```

- System-qos level

```
OS10(config-sys-qos)# trust-map dscp example-dscp-trustmap-name
```

ACL-based classification

Classify the ingress traffic by matching the packet fields using ACL entries.

Classify the traffic flows based on QoS-specific fields or generic fields, using IP or MAC ACLs. Create a class-map template to match the fields.

OS10 allows matching *any* of the fields or *all* the fields based on the match type you configure in the class-map.

Use the access-group match filter to match MAC or IP ACLs. You can configure a maximum of four access-group filters in a class-map:

- 802.1p CoS
- VLAN ID (802.1.Q)
- DSCP + ECN
- IP precedence

OS10 supports configuring a range of or comma-separated values of match filters, except for VLAN ID. When you apply the same match filter with new values, the system overwrites the previous values with the new values.

Configure ACL based classification

1. Create a class-map of type *qos*.

```
OS10(config)# class-map type qos example-cmap-cos
```

2. Define the field to match:

```
OS10(config-cmap-qos)# match cos 3
```

3. Create a qos-type policy-map to refer the classes to.

```
OS10(config)# policy-map type qos example-pmap-cos
```

4. Refer the class-maps in the policy-map and define the required action for the flows.

```
OS10# configure terminal
OS10(config)# class-map type qos example-cmap-cos
OS10(config-cmap-qos)# match cos 3
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos example-pmap-cos
OS10(config-pmap-qos)# class example-cmap-cos
OS10(config-pmap-c-qos)# set qos-group 3
```

5. Apply the qos-type policy-map globally or to an interface. In this example, the policy-map is applied to an interface.

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/14
OS10(conf-if-eth1/1/14)# service-policy input type qos example-pmap-cos
```

If the traffic that arrives at the interface matches the 802.1p criteria that you have configured, it is assigned to TC 3 or qos group 3.

ACL-based classification with trust

This section describes how to configure ACL based classification when you configure trust-based classification.

If you configure ACL-based classification for a set of DSCP/COS values as well as trust-based classification on a particular port, the ACL-based classification takes precedence over trust-based classification.

1. Create a user defined dscp or dot1p trust-map.

```
OS10(config)# trust dscp-map userdef-dscp
OS10(config-tmap-dscp-map)# qos-group 3 dscp 15
OS10(config-tmap-dscp-map)# qos-group 5 dscp 30
```

2. Apply user-defined trust map to an interface or in system QoS.

```
OS10(conf-if-eth1/1/1)# trust-map dscp userdef-dscp
```

```
or

OS10(config)# system qos
OS10(config-sys-qos)# trust-map dscp userdef-dscp
```

3. Create a class-map and attach it to a policy where trust is configured. This example uses 802.1p cos to define the match criteria. You can use dscp or other access group match filters. If the 802.1p traffic matches the defined criteria, the `set qos-group 1` command assigns the traffic to TC 1.

```
OS10(config)# class-map type qos example-class-map
OS10(config-cmap-qos)# match cos 1
OS10(config-cmap-qos)# exit

OS10(config)# policy-map type qos example-policy-map
OS10(config-pmap-qos)# class example-class-map
OS10(config-pmap-c-qos)# set qos-group 1
```

4. Attach the policy map to an interface or in system QoS mode.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# service-policy input type qos example-policy-map

or

OS10(config)# system qos
OS10(config-sys-qos)# service-policy input type qos example-policy-map
```

In this example, DSCP 15 flow is mapped to traffic class 3 or qos-group 3 and DSCP 30 flow is mapped to TC 5 or qos-group 5. The rest of the DSCP flows are mapped based on the trust that is configured.

Control-plane policing

Control-plane policing (CoPP) increases security on the system by protecting the route processor from unnecessary traffic and giving priority to important control plane and management traffic. CoPP uses a dedicated control plane configuration through the QoS CLIs to set rate-limiting capabilities for control plane packets.

If the rate of control packets towards the CPU is higher than the packet rate that the CPU can handle, CoPP provides a method to selectively drop some of the control traffic so that the CPU can process high-priority control traffic. You can use CoPP to rate-limit traffic through each CPU port queue of the network processor (NPU).

CoPP applies policy actions on all control-plane traffic. The control-plane class map does not use any match criteria. To enforce rate-limiting or rate policing on control-plane traffic, create policy maps. You can use the `control-plane` command to attach the CoPP service policies directly to the control-plane.

Starting from release 10.4.2, the default rate limits have changed from 12 CPU queues and the protocols mapped to each CPU queue are changed.

NOTE: When you upgrade from a previous release to release 10.4.2 and you have CoPP policy with rate limits configured in the previous release, the CoPP policies are automatically remapped based on the new CoPP protocol mappings to queues. For example:

- You have a CoPP policy configured for queue 5 in release 10.4.1, which is for ARP Request, ICMPv6-RS-NS, iSCSI snooping, and iSCSI-COS.
- After upgrade to release 10.4.2, the CoPP policy for queue 5 is remapped based on the new CoPP protocol mappings to queues as follows:
  - ARP Request is mapped to queue 6
  - ICMPv6-RS-NS is mapped to queue 5
  - iSCSI is mapped to queue 0

  The rate limit configuration in CoPP policy before upgrade is automatically remapped to queues 6, 5, and 0 respectively after upgrade.

For example, in release 10.4.1, the following policy configuration is applied on queue 5, which in 10.4.1 is mapped to ARP_REQ, ICMPV6_RS, ICMPV6_NS, and ISCSI protocols:

```
policy-map type control-plane test
!
class test
  set qos-group 5
  police cir 300 pir 300
```

After upgrade to release 10.4.2, the policy configuration appears as follows:

```
policy-map type control-plane test
!
class test_Remapped_0
  set qos-group 0
  police cir 300 pir 300
!
class test_Remapped_5
  set qos-group 5
  police cir 300 pir 300
!
class test_Remapped_6
  set qos-group 6
  police cir 300 pir 300
```

In release 10.4.2, ARP_REQ is mapped to queue 6, ICMPV6_RS and ICMPV6_NS are mapped to queue 5, and ISCSI is mapped to queue 0.

By default, CoPP traffic towards the CPU is classified into different queues as shown below.

Table 128. CoPP: Protocol mappings to queues - prior to release 10.4.2

Queue	Protocol
0	IPv6
1	—
2	IGMP
3	VLT, NDS
4	ICMPv6, ICMPv4
5	ARP Request, ICMPV6-RS-NS, ISCSI snooping, ISCSI-COS
6	ICMPv6-RA-NA, SSH, TELNET, TACACS, NTP, FTP
7	RSTP,PVST, MSTP,LACP
8	Dot1X,LLDP, FCOE-FPORT
9	BGPv4, OSPFv6
10	DHCPv6, DHCPv4, VRRP
11	OSPF Hello, OpenFlow

The following table lists the CoPP protocol mappings to queues, and default rate limits and buffer sizes on the S4148FE-ON platform. The number of control-plane queues is dependent on the hardware platform.

Table 129. CoPP: Protocol mappings to queues, and default rate limits and buffer sizes - from release 10.4.2 and later

Queue	Protocols	Minimum rate limit (in pps)	Maximum rate limit (in pps)	Minimum guaranteed buffer (in bytes)	Static shared limit (in bytes)
0	ISCSI UNKNOWN UNICAST	600	600	1664	20800
1	sFlow®	1000	1000	1664	20800
2	IGMP, MLD, PIM control	400	400	1664	48880
3	VLT, NDS	600	1000	1664	48880
4	IPv6 ICMP, IPv4 ICMP	500	1000	1664	20800
5	ICMPv6 RS, RA, NS, NA	500	1000	1664	48880
6	ARP request Serviceability	500	1000	1664	48880
7	ARP response	500	1000	1664	48880
8	SSH, TELNET, NTP, FTP, TACACS	500	500	1664	20800
9	FCoE	600	600	1664	48880
10	LACP	600	1000	1664	48880
11	RSTP, PVST, MSTP	400	400	1664	48880
12	DOT1X, LLDP, FEFD	500	500	1664	48880
13	IPv6 OSPF, IPV4_OSPF	600	1000	1664	48880

15	BGP	600	1000	1664	48880
16	IPv4 DHCP, IPv6 DHCP	500	500	1664	48880
17	VRRP	600	1000	1664	48880
18	BFD	700	700	1664	48880
19	Remote CPS, OpenFlow	700	1000	1664	48880
20	MCAST data	100	100	1664	20800
21	ACL logging	100	100	1664	20800
22	MCAST known data	100	100	1664	20800
23	PTP	300	6400	TBD	TBD
24	Port Security	100	100	TBD	TBD

For information about the current protocol to queue mapping and the rate-limit configured per queue, see show control-plane info.

Configure control-plane policing

Rate-limiting the protocol CPU queues requires configuring control-plane type QoS policies.

- Create QoS policies, class maps and policy maps, for the desired CPU-bound queue.
- Associate the QoS policy with a particular rate-limit.
- Assign the QoS service policy to control plane queues.

By default, the peak information rate (`pir`) and committed information rate (`cir`) values are in packets per second (pps) for control plane. CoPP for CPU queues converts the input rate from kilobits per second (kbps) to packets per second (pps), assuming 64 bytes is the average packet size, and applies that rate to the corresponding queue – One kbps is roughly equivalent to two pps.

1. Create a `control-plane` type class-map and configure a name for the class-map in CONFIGURATION mode.

   ```
   class-map type control-plane example-copp-class-map-name
   ```

2. Return to CONFIGURATION mode.

   ```
   exit
   ```

3. Create an input policy-map to assign the QoS policy to the desired service queues in CONFIGURATION mode.

   ```
   policy-map type control-plane example-copp-policy-map-name
   ```

4. Associate a policy-map with a class-map in POLICY-MAP mode.

   ```
   class example-copp-class-map-name
   ```

5. Configure marking for a specific queue number in POLICY-MAP-CLASS-MAP mode. Use the `show control-plane info` command to view the list of control-plane queues.

   ```
   set qos-group queue-number
   ```

6. Configure rate policing on incoming traffic in POLICY-MAP-CLASS-MAP mode.

   ```
   police {cir committed-rate | pir peak-rate}
   ```

   - `cir committed-rate`—Enter a committed rate value in pps, from 0 to 4000000.
   - `pir peak rate` — Enter a peak-rate value in pps, from 0 to 40000000.

Create QoS policy for CoPP

```
OS10(config)# class-map type control-plane example-copp-class-map-name
OS10(config-cmap-control-plane)# exit
OS10(config)# policy-map type control-plane example-copp-policy-map-name
OS10(config-pmap-control-plane)# class example-copp-class-map-name
OS10(config-pmap-c)# set qos-group 2
OS10(config-pmap-c)# police cir 100 pir 100
```

View policy-map

```
OS10(config)# do show policy-map
Service-policy (control-plane) input: example-copp-policy-map-name
  Class-map (control-plane): example-copp-class-map-name
    set qos-group 2
    police cir 100 bc 100 pir 100 be 100
```

Configuration notes

Dell PowerSwitch S4200-ON Series:

- Shaping does not support traffic less than 468 kbps. Configure the shaping rates in multiples of 468.
- In System Flow ACL, ARP request and ARP response packets share the same CPU queue.
- CPU queues support shaping instead of rate limiting.
- Port shaping, storm control rate shaping, and CoPP rates are converted to kbps internally, even when configured in pps.

Assign service-policy

Rate controlling the traffic towards CPU requires configuring the **control-plane** type policy. To enable CoPP, apply the defined policy-map to CONTROL-PLANE mode.

1. Enter CONTROL-PLANE mode from CONFIGURATION mode.

```
control-plane
```

2. Define an`input` type service-policy and configure a name for the service policy in CONTROL-PLANE mode.

```
service-policy input example-copp-policy-map-name
```

Assign control-plane service-policy

```
OS10(config)# control-plane
OS10(conf-control-plane)# service-policy input example-copp-policy-map-name
```

View control-plane service-policy

```
OS10(conf-control-plane)# do show qos control-plane
 Service-policy (input): example-copp-policy-map-name
```

Re-map protocols to queues

On switches that have a fewer number of queues, multiple protocols are mapped to a single queue. OS10 allows you to re-map the protocols to available queues depending on your needs.

NOTE: This feature is not supported on the S4200-ON and S5100-ON series platforms.

For example, if your deployment does not need multicast protocols, re-map the multicast protocols to another queue. And use the original multicast queue, queue 2 for other protocols or applications that you need.

If the protocols or applications that your deployment needs share the same queue, re-map some of them to other queues that are mapped to protocols or applications that are not required.

If your deployment uses only a few protocols or applications, you can re-map these protocols or applications to individual queues. Also, you can change the buffer settings for the remaining queues that are mapped to unused protocols or applications. Ensure that you transfer the allocated buffer space from such queues to the common pool, which is used for lossy or lossless traffic.

If you re-map the protocols or applications to different queues when the system is operational, then until queue transition completes, egress traffic flows through queue 0.

The following `show` commands display protocol-to-queue mapping:

- `show control-plane info default` — Displays the default protocol-to-queue mapping.
- `show control-plane info` — Displays the currently configured protocol-to-queue mapping.

NOTE: You cannot re-map protocols and applications to queues that are mapped to CPS, port security, and Precision Time Protocol (PTP):

- CPS—Queue 19
- PTP—Queue 23
- Port security—Queue 24

The following error message appears when you re-map protocols, applications, or both to an invalid queue:

```
% Error: QOS : Invalid copp protocol queue mapping
```

Configure protocol to queue remapping

You can re-map protocols or applications to queues that are mapped to unused protocols or applications.

The `show control-plane info default` command output displays default protocol-to-queue mapping. VRRP is mapped to queue 17 by default.

1. Create a `control-plane` type class-map.

```
OS10(config)# class-map type control-plane example-cmap-protocol-queue-remap
```

2. Apply the match criteria by specifying the names of the protocols or applications. In this example, VRRP is re-mapped to queue 4.

```
OS10(config-cmap-control-plane)# match vrrp
```

NOTE: You cannot configure the same protocols or application groups under multiple class-maps within the same policy-map.

3. Create a `control-plane` type policy-map and add the class-map to the policy-map.

```
OS10(config)# policy-map type control-plane example-pmap-protocol-queue-remap
OS10(config-pmap-control-plane)# class example-cmap-protocol-queue-remap
```

4. Map the policy to the queue.

```
OS10(config-pmap-c)# set qos-group 4
```

5. Apply the policy-map in control-plane mode.

```
OS10(config)# control-plane
OS10(config-control-plane)# service-policy input example-pmap-protocol-queue-remap
```

In this example, VRRP is mapped to queue 4 from queue 17. The `show control-plane info` command output displays the current configuration.

```
OS10# show control-plane info
Queue     Min Rate Limit(in pps)   Max Rate Limit(in pps) Protocols
0         600                      600                    ISCSI UNKNOWN UNICAST

13                 0                  0                       0                       0
14                 1265               108790                  0                       0
15                 422                36075                   0                       0
16                 0                  0                       0                       0
17                 0                  0                       0                       0
18                 0                  0                       0                       0
19                 0                  0                       0                       0
```

Marking Traffic

After you classify the ingress traffic, you can set the value or change an existing value (remarking) for CoS or DSCP. Marking sets the IP precedence or IP DSCP value for traffic at ingress. The switch then uses the new marking to process the traffic.

Traffic class IDs identify the traffic flow when the traffic reaches egress for queue scheduling.

Mark traffic

1. Create a QoS type class-map to match the traffic flow.

```
OS10(config)# class-map cmap-cos3
OS10(config-cmap-qos)# match cos 3
```

2. Create a QoS type policy-map to mark it with a traffic class ID and assign it to the CoS flow.

```
OS10(config)# policy-map cos3-TC3
OS10(config-pmap-qos)# class cmap-cos3
OS10(config-pmap-c-qos)# set qos-group 3
```

Queuing

The egress bandwidth of a port is logically divided into eight queues (0 to 7).

Data that is classified at ingress into the different traffic classes is assigned to the respective queue by default. You can override the default mapping. Depending on the priority that is configured for the traffic, you can assign the traffic flow to different queues at egress. Queues with higher priority are serviced first before moving on to queues with lower priority.

By default, the value of traffic class ID for all the traffic is `0`.

You can set the traffic class ID for a flow by enabling trust or by classifying ingress traffic and marking it with a traffic class ID using a policy map (qos-map). The order of precedence for a qos-map is:

1. Interface-level map
2. System-qos-level map
3. Default map

Table 130. Default mapping of traffic class ID to queue

Traffic class ID (802.1p CoS value)	Queue ID
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7

User–defined QoS map

You can override the default mapping by creating a QoS map.

Configure user–defined QoS map

1. Create a QoS map.

```
OS10(config)# qos-map traffic-class tc-q-map
```

2. Define the set of traffic class values mapped to a queue.

```
OS10(config-qos-map)# queue 3 qos-group 0-3
```

NOTE: For the Z9332F-ON platform, you must specify the type of queue. For example:

```
OS10(config-qos-map)# queue 3 qos-group 0-3 type ucast
```

3. Verify the map entries.

```
OS10# show qos maps type tc-queue

Traffic-Class to Queue Map: tc-q-map

Queue        Traffic-Class

--------------------------

3              0-3
```

4. Apply the map on a specific interface or on a system-QoS global level.
   - Interface level

     ```
     OS10(conf-if-eth1/1/1)# qos-map traffic-class tc-q-map
     ```

   - System-qos level

     ```
     OS10(config-sys-qos)# qos-map traffic-class tc-q-map
     ```

Choose all traffic classified for a queue

1. Create a queuing type class-map to match queue 5.

```
OS10(config)# class-map type queuing q5
```

2. Define the queue to match.

```
OS10(config-cmap-queuing)# match queue 5
```

Policing traffic

Policing allows you to control the speed of traffic that enters a network or an interface. Use rate policing to limit the rate of ingress traffic flow. The flow can be all the ingress traffic on a port or a particular flow defined using a QoS class-map. In addition, use policing to color the traffic:

- When traffic arrives at a rate less than the committed rate, the color is green.
- When traffic propagates at an average rate greater than or equal to the committed rate and less than peak-rate, the color is yellow.
- When the traffic rate is above the configured peak-rate, the traffic drops to guarantee a bandwidth limit for an ingress traffic flow.

Interface rate policing limits the rate of traffic that is received on an interface. You can configure policing rates for the different traffic types. You can also monitor the traffic to check if the traffic conforms to the rate limits that you have configured.

Peak rate is the maximum rate for traffic arriving or leaving an interface under normal traffic conditions. Peak burst size indicates the maximum size of unused peak bandwidth that is aggregated. This aggregated bandwidth enables brief durations of burst traffic that exceeds the peak rate.

Configure Interface rate policing

1. Create a QoS type empty class-map to match all the traffic.

```
OS10(config)# class-map example-cmap-all-traffic
```

2. Create a QoS type policy-map to define a policer.

```
OS10(config)# policy-map example-interface-policer
OS10(config-pmap-qos)# class example-cmap-all-traffic
OS10(config-pmap-c-qos)#police cir 4000 pir 6000
```

3. Apply the QoS type policy-map to an interface.

```
OS10(config)# interface ethernet 1/1/14
OS10(conf-if-eth1/1/14)# service-policy input type qos example-interface-policer
```

Flow rate policing controls the rate of flow of traffic.

Configure flow rate policing

1. Create a QoS type class-map to match the traffic flow.

```
OS10(config)# class-map example-cmap-cos3
OS10(config-cmap-qos)# match cos 3
```

2. Create a QoS type policy-map to define a policer, and optionally assign a traffic class ID for the CoS flow to redirect the policed traffic to a nondefault queue.

```
OS10(config)# policy-map example-flow-policer
OS10(config-pmap-qos)# class example-cmap-cos3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)#police cir 4000 pir 6000
```

3. Apply the QoS type policy-map to an interface.

```
OS10(config)# interface ethernet 1/1/15
OS10(conf-if-eth1/1/15)# service-policy input type qos example-flow-policer
```

Coloring traffic

You can select a traffic flow and mark it with a color. Color the traffic flow based on:

- Metering. See Policing traffic.
- Default trust. See Trust-based classification.
- DSCP, ECN capable traffic (ECT), or non-ECT capable traffic. Use the `set color` command to color traffic based on DSCP, ECN capable, or non-ECN capable traffic.

Traffic policing and traffic coloring using DSCP values are mutually exclusive. You cannot configure both at the same time. Policing and marking using DSCP values take precedence over trust-based classification. Trust-based classification has the lowest priority.

Color traffic based on DSCP, ECT, or non-ECT

1. Create a QoS type class-map to match the traffic flow.

```
OS10(config)# class-map type qos example-cmap-dscp-3-ect
OS10(config-cmap-qos)# match ip dscp 3
```

2. Create a QoS type policy-map to color the traffic flow.

```
OS10(config)# policy-map type qos example-pmap-ect-color
OS10(config-pmap-qos)# class example-cmap-dscp-3-ect
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set color yellow
```

Modifying packet fields

You can modify the value of CoS or DSCP fields.

1. Create a QoS type class-map to match a traffic flow.

```
OS10(config)# class-map cmap-dscp-3
OS10(config-cmap-qos)# match ip dscp 3
```

2. Modify the policy-map to update the DSCP field.

```
OS10(config)# policy-map modify-dscp
OS10(config-pmap-qos)# class cmap-dscp-3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set dscp 10
```

Shaping traffic

Shaping allows you to control the speed of traffic that goes out of an interface. Use this feature to match the traffic flow to the speed of the destination interface. You can enable traffic shaping and configure the data rate. When you enable rate shaping, the system buffers all traffic exceeding the specified rate until the buffer memory is exhausted. Rate shaping uses all buffers reserved for an interface or queue and shares buffer memory, until it reaches the configured threshold. This feature prevents traffic rate mismatches and packet loss.

Configure traffic shaping

1. Enter the `queuing` type policy-map and configure a policy-map name in CONFIGURATION mode.

```
policy-map type queuing policy-map-name
```

2. Enter a class name to apply to the shape rate in POLICY-MAP-QUEUEING mode. A maximum of 32 characters.

```
class class-name
```

3. (Optional) Configure rate shaping on a specific queue by matching the corresponding qos-group in the class-map. If you do not configure the `match qos-group` command, rate shaping applies to all queues.

```
match qos-group queue-number
```

4. Enter a minimum and maximum shape rate value in POLICY-MAP-QUEUEING-CLASS mode.

```
shape {min {kbps | mbps | pps}min-value} {max {kbps | mbps | pps}max-value}
```

- 0 to 40000000—kilobits per second kilobits per second—kbps
- 0 to 40000—megabits per second—mbps
- 1 to 268000000—in packets per second (pps)

Bandwidth allocation

You can allocate relative bandwidth to limit large flows and prioritize smaller flows. Allocate the relative amount of bandwidth to nonpriority queues when priorities queues are consuming maximum link bandwidth.

Weighted Deficit Round Robin (WDRR) is a scheduling method that uses a deficit counter to allocate bandwidth for traffic flows.

Schedule each egress queue of an interface per Weighted Deficit Round Robin (WDRR) or by strict-priority (SP), which are mutually exclusive. If the `bandwidth percent` command is present, you cannot configure the `priority` command.

NOTE: Bandwidth allocation and strict priority queuing are mutually exclusive.

1. Create a `queuing` type class-map and configure a name for the class-map in CONFIGURATION mode.

```
class-map type queuing example-que-cmap-name
```

2. Apply the match criteria for the queue in CLASS-MAP mode.

```
match queue queue-number
```

3. Return to CONFIGURATION mode.

```
exit
```

4. Create a `queuing` type policy-map and configure a policy-map name in CONFIGURATION mode.

```
policy-map type queuing example-que-pmap-name
```

5. Configure a queuing class in POLICY-MAP mode.

```
class example-que-cmap-name
```

6. Assign a bandwidth percent, from 1 to 100 to nonpriority queues in POLICY-MAP-CLASS-MAP mode.

```
bandwidth percent value
```

Configure bandwidth allocation

```
OS10(config)# class-map type queuing example-que-cmap-name
OS10(config-cmap-queuing)# match queue 5
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing example-que-pmap-name
OS10(config-pmap-queuing)# class example-que-cmap-name
OS10(config-pmap-c-que)# bandwidth percent 80
```

View class-map

```
OS10(conf-cmap-queuing)# do show class-map
  Class-map (queuing): example-que-cmap-name
   Match: queue 5
```

View policy-map

```
OS10(conf-pmap-c-que)# do show policy-map
 Service-policy (queuing) output: example-que-pmap-name
   Class-map (queuing): example-que-cmap-name
     bandwidth percent 80
```

Strict priority queuing

When you configure strict priority queuing to a queue, the system services this queue first irrespective of traffic in other queues. When you configure strict priority queuing on more than one queue, the queue with the highest number is serviced first. By default, all queues schedule traffic per Weighted Deficit Round Robin (WDRR). A queue with strict priority queuing enabled can starve other queues for the same egress interface.

Use the `priority` command to assign the priority to a single unicast queue—this configuration supersedes the `bandwidth percent` configuration. A queue with priority enabled can starve other queues for the same egress interface.

Create class-map

1. Create a class-map and configure a name for the class-map in CONFIGURATION mode.

```
class-map type queuing class-map-name
```

2. Configure a match criteria in CLASS-MAP mode.

```
match queue queue-id
```

Define a policy-map

1. Define a policy-map and create a policy-map name CONFIGURATION mode.

```
policy-map type queuing policy-map-name
```

2. Create a queuing class and configure a name for the policy-map in POLICY-MAP mode.

```
class class-map-name
```

3. Set the scheduler as strict priority in POLICY-MAP-CLASS-MAP mode.

```
priority
```

Apply policy-map

1. Apply the policy-map to the interface in INTERFACE mode or all interfaces in SYSTEM-QOS mode.

```
system qos
```

OR

```
interface ethernet node/slot/port[:subport]
```

2. Enter the output service-policy in SYSTEM-QOS mode or INTERFACE mode.

```
service-policy {output} type {queuing} policy-map-name
```

Enable strict priority on class-map and apply the policy-map globally

```
OS10(config)# class-map type queuing example-cmap-strictpriority
OS10(config-cmap-queuing)# match queue 7
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing example-pmap-strictpriority
OS10(config-pmap-queuing)# class example-cmap-strictpriority
OS10(config-pmap-c-que)# priority
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
OS10(config)# system qos
OS10(config-sys-qos)# service-policy output type queuing example-pmap-strictpriority
```

Enable strict priority on interface

NOTE: You can apply a policy-map globally in SYSTEM-QOS mode or apply it on the interface. OS10 does not support applying the same policy-map in SYSTEM-QOS mode as well as at the interface level.

However, you can apply a different queuing policy-map in SYSTEM-QOS mode or at the interface level. In this case, the policy-map applied at the interface takes precedence over the policy-map applied globally.

```
OS10(config)# interface ethernet 1/1/5
OS10(conf-if-eth1/1/5)# service-policy output type queuing example-pmap-strictpriority
```

View policy-map

```
OS10(conf-if-eth1/1/5)# do show policy-map
 Service-policy(queuing) output: example-pmap-strictpriority
   Class-map (queuing): example-cmap-strictpriority
     priority
```

Configuration notes

Dell PowerSwitch S4200-ON Series:

If PFC is provisioned, the control packets injected by CPU shares queue-7 while egressing on a front panel interface. If queues other than queue-7 are provisioned as strict priority, it is recommended to provision queue-7 as strict priority too, to reduce latency or loss of control packets.

Rate adjustment

QoS features such as policing and shaping do not include overhead fields such as Preamble, smart frame delimiter (SFD), inter-frame gap (IFG), and so on. For rate calculations, these feature only include the frame length between the destination MAC address (DMAC) and the CRC field.

You can optionally include the following overhead fields in rate calculations by enabling rate adjustment:

- Preamble—7 bytes
- Start frame delimiter—1 byte

- Destination MAC address—6 bytes
- Source MAC address—6 bytes
- Ethernet type/length—2 bytes
- Payload—variable
- Cyclic redundancy check—4 bytes
- Inter-frame gap—variable

The rate adjustment feature is disabled by default. To enable rate adjustment, use the `qos-rate-adjust value_of_rate_adjust` command. For example:

```
qos-rate-adjust 8
```

If you have configured WDRR and shaping on a particular queue, the queue can become congested. You should configure the QoS rate adjust value considering the overhead field size to avoid traffic drops on uncongested queues.

If you have multiple streams within a queue, you must find the overhead size for the different streams and the QoS rate adjust value should be the highest overhead size from among the various streams within that queue.

Consider the example where you have configured WDRR and shaping on a queue that has two different traffic streams, TS1 and TS2, that uses preamble, SFD, and IFG overhead fields:

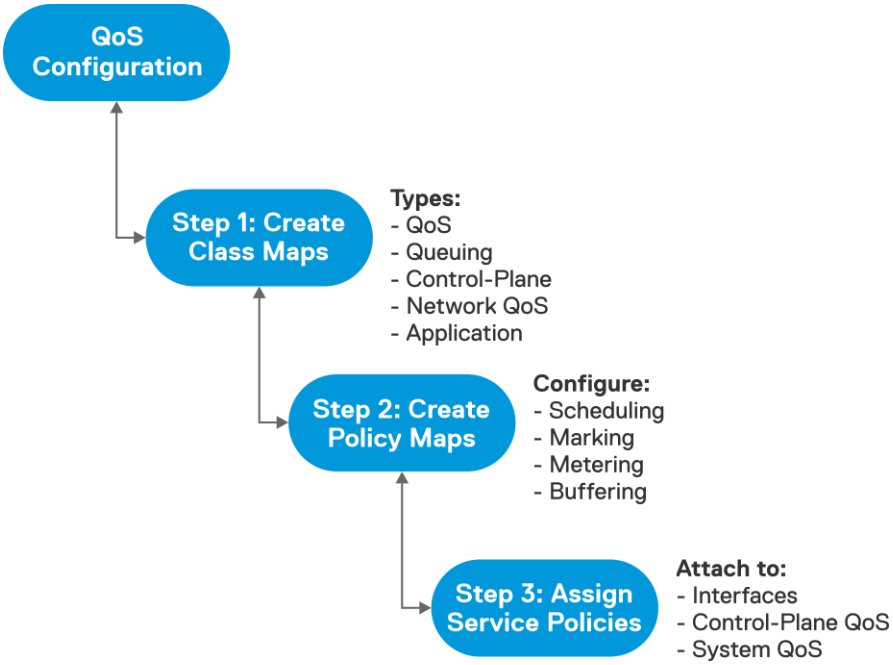
- If the IFG in TS1 uses 16 bytes, QoS rate adjust value should be 24 (preamble + SFD requires 8 bytes and IFG 16 bytes).
- If the IFG in TS2 uses 12 bytes, QoS rate adjust value should be 20 (preamble + SFD requires 8 bytes and IFG 12 bytes).

In this case, the highest QoS rate adjust value between the two streams is 24 bytes. Hence, you must configure the QoS rate adjust value as 24.

NOTE: This feature is not supported on the S4200-ON Series platforms.

Configure quality of service

Configuring QoS is a three-step process:



1. Create class-maps to classify the traffic flows. The following are the different types of class-maps:
   - qos (default)—Classifies ingress data traffic.
   - queuing—Classifies egress queues.
   - control-plane—Classifies control-plane traffic.
   - network-qos—Classifies traffic-class IDs for ingress buffer configurations.
   - application—Classifies application-type traffic. The reserved policy-map **policy-iscsi** defines the actions for **class-iscsi** traffic.

2. Create policy-maps to define the policies for the classified traffic flows. The following are the different types of policy-maps:
   - qos (default)—Defines the following actions on the traffic classified based on **qos** class-map:
     - Policing
     - Marking with a traffic class ID
     - Modifying packet fields such as CoS and DSCP
   - queuing —Defines the following actions on the egress queues classified based on **queuing** class-map:
     - Shaping
     - Assigning bandwidth for queues
     - Assigning strict priority for queues
     - Buffering configuration for queues
     - Weighted random early detection (WRED)/Explicit congestion notification (ECN) configuration on queues
   - control-plane—Defines the policing of control queues for rate-limiting the **control-plane** traffic on CPU queues.
   - network-qos—Defines the Ingress buffer configuration for selected traffic-classes matched based on **network-qos** class-map.
   - application —Defines the following actions for the **application** classified traffic:
     - Modifying packet fields such as CoS and DSCP.
     - Marking traffic class IDs.
3. Apply the policy-maps to the port interface, system for all interfaces, or control-plane traffic as follows:
   - Apply control-plane polices in Control-Plane mode.
   - Apply QoS and network-QoS policies in the input direction on physical interfaces or in System-QoS mode.
   - Apply queuing policies in the output direction on physical interfaces or in System-QoS mode.
   - Apply an application type policy-map in System-QoS mode.

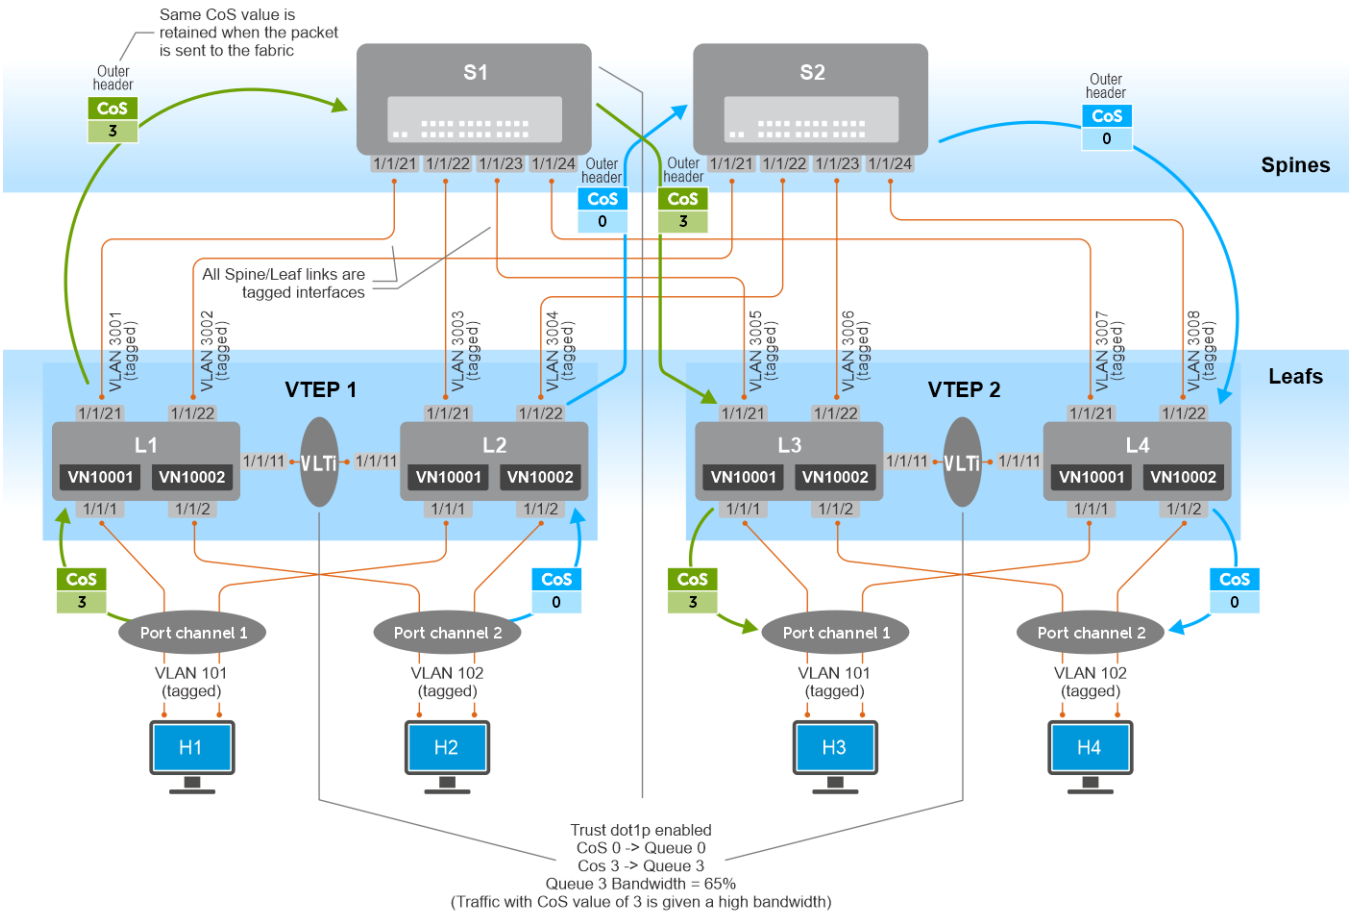
   When you apply a policy at the system level (System-QoS mode), the policy is effective on all the ports in the system. However, the interface-level policy takes precedence over the system-level policy.

Example 1: Traffic classification and bandwidth allocation in VXLAN topology using CoS value

This example describes how to configure QoS in a VXLAN topology using the Class of Service (CoS) values.

In this example:

- The interfaces between the leaf switches and the hosts are VLAN-tagged interfaces.
- The interfaces between the leaf switches and the spine nodes are VLAN-tagged interfaces.
- VLAN-tagged interfaces use the CoS value to classify the traffic, allocate appropriate egress queue, and bandwidth. In this example, traffic with a CoS value of 3 is assigned to queue 3.
- Trust dot1p configuration is used on leaf and spine switches. This configuration maps dot1p priority (CoS) value of 3 to queue 3. OS10 by default maps all other traffic to queue 0.
- Queue 3 is allocated 65% bandwidth. Traffic with CoS value of 3 gets 65% bandwidth. If there is congestion at the egress port, this traffic gets additional bandwidth thus avoiding traffic loss. Traffic with other CoS values gets the remaining bandwidth per the default settings.
- The trust dot1p and queuing configurations are applied at the system-qos level to simplify the configuration and also to apply the QoS configurations globally.



NOTE: For Underlay, Overlay VXLAN configuration, see the VXLAN chapter. The network ports and access ports must be VLAN-tagged interfaces for QoS settings to be applied based on dot1p priority.

S1 Switch

1. Configure trust map with different dot1p priority values mapped to different traffic classes (queues).

```
OS10# configure terminal
OS10(config)# trust dot1p-map TRUST_DOT1P_MAP
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# end
```

2. Configure queuing at egress with bandwidth allocation of 65% for queue 3.

```
OS10# configure terminal
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# end
```

3. Apply the dot1p trust map and queuing configuration at the system-qos level (global configuration).

```
OS10# configure terminal
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p TRUST_DOT1P_MAP
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

S2 Switch

1. Configure trust map with different dot1p priority values mapped to different traffic classes (queues).

```
OS10# configure terminal
OS10(config)# trust dot1p-map TRUST_DOT1P_MAP
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# end
```

2. Configure queuing at egress with bandwidth allocation of 65% for queue 3.

```
OS10# configure terminal
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# end
```

3. Apply the dot1p trust map and queuing configuration at the system-qos level (global configuration).

```
OS10# configure terminal
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p TRUST_DOT1P_MAP
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L1 Switch

1. Configure trust map with different dot1p priority values mapped to different traffic classes (queues).

```
OS10# configure terminal
OS10(config)# trust dot1p-map TRUST_DOT1P_MAP
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# end
```

2. Configure queuing at egress with bandwidth allocation of 65% for queue 3.

```
OS10# configure terminal
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# end
```

3. Apply the dot1p trust map and queuing configuration at the system-qos level (global configuration).

```
OS10# configure terminal
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p TRUST_DOT1P_MAP
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L2 Switch

1. Configure trust map with different dot1p priority values mapped to different traffic classes (queues).

```
OS10# configure terminal
OS10(config)# trust dot1p-map TRUST_DOT1P_MAP
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
```

```
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# end
```

2. Configure queuing at egress with bandwidth allocation of 65% for queue 3.

```
OS10# configure terminal
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# end
```

3. Apply the dot1p trust map and queuing configuration at the system-qos level (global configuration).

```
OS10# configure terminal
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p TRUST_DOT1P_MAP
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L3 Switch

1. Configure trust map with different dot1p priority values mapped to different traffic classes (queues).

```
OS10# configure terminal
OS10(config)# trust dot1p-map TRUST_DOT1P_MAP
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# end
```

2. Configure queuing at egress with bandwidth allocation of 65% for queue 3.

```
OS10# configure terminal
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# end
```

3. Apply the dot1p trust map and queuing configuration at the system-qos level (global configuration).

```
OS10# configure terminal
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p TRUST_DOT1P_MAP
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L4 Switch

1. Configure trust map with different dot1p priority values mapped to different traffic classes (queues).

```
OS10# configure terminal
OS10(config)# trust dot1p-map TRUST_DOT1P_MAP
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# end
```

2. Configure queuing at egress with bandwidth allocation of 65% for queue 3.

```
OS10# configure terminal
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
```

```
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# end
```

3. Apply the dot1p trust map and queuing configuration at the system-qos level (global configuration).

```
OS10# configure terminal
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p TRUST_DOT1P_MAP
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

Verify the configuration

- Verify trust map configuration.

```
OS10# show qos maps TRUST_DOT1P_MAP
DOT1P Priority to Traffic-Class Map : TRUST_DOT1P_MAP
Traffic-Class    DOT1P Priority
-------------------------------
0                    0
1                    1
2                    2
3                    3
4                    4
5                    5
6                    6
7                    7
```

- Verify the bandwidth settings.

```
OS10# show queuing weights interface ethernet 1/1/21
Interface ethernet1/1/21
Queue    Weight(In percentage)
--------------------------------
0          5
1          5
2          5
3          65
4          5
5          5
6          5
7          5
```

- Verify that the packets are assigned to the respective queues. Packets with dot1p priority 3 must be assigned to queue 3 and packets with dot1p priority 0 must be assigned to queue 0. Bandwidth allocation of 65% to queue 3 ensures that traffic in queue 3 gets more bandwidth and traffic in other queues get less bandwidth. The drop counter indicates packet drops for queue 0 whereas there are no drops for queue 3 during traffic congestion.

  L1 switch network port (ingress VTEP)

```
OS10# show queuing statistics interface ethernet 1/1/21
Interface ethernet1/1/21
Queue Packets    Bytes         Dropped-Packets  Dropped-Bytes
0     6095735    1865280018    8725959          2233833888
1     0          0             0                0
2     0          0             0                0
3     14828189   4537425834    0                0
4     0          0             0                0
5     0          0             0                0
6     0          0             0                0
7     0          0             0                0
```

  L3 switch access port (destination VTEP)

```
OS10# show queuing statistics interface ethernet 1/1/1
Interface ethernet1/1/1
Queue Packets    Bytes         Dropped-Packets  Dropped-Bytes
```

```
0      0           0              0                  0

```

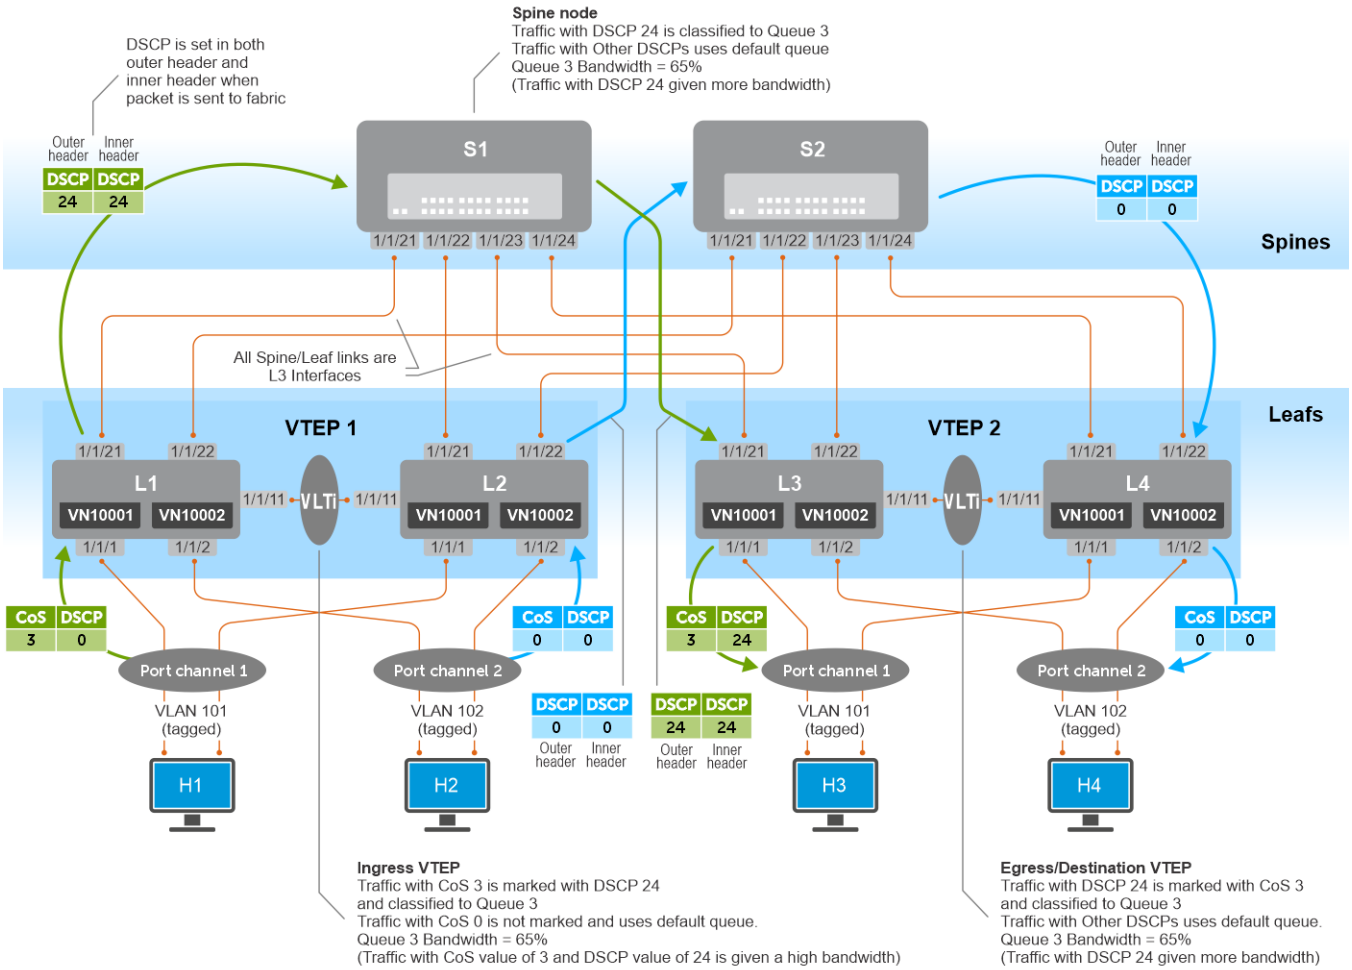
Example 2: Traffic classification and bandwidth allocation in VXLAN topology using CoS value on access ports and DSCP value on network ports

This example describes how to configure QoS in a VXLAN topology using Class of Service (CoS) value on access ports and DSCP value on network ports.

In this example:

- The interfaces between the leaf switches and the hosts are VLAN-tagged interfaces.
- The interfaces between the leaf and the spine switches are L3 interfaces.
- Traffic from the hosts comes with its respective CoS value. This configuration maps dot1p priority (CoS) value of 3 to queue 3. OS10 by default maps all other traffic to queue 0. At the ingress VTEP, the CoS value is matched and the packet with a CoS value of 3 is marked with a DSCP value of 24 and is assigned to queue 3. The packet from ingress VTEP reaches the spine switch with the modified DSCP value in both the inner and outer IP header.
- On the spine nodes, the DSCP value is matched and the packet with a DSCP value of 24 is assigned to queue 3.
- At the egress VTEP, the DSCP value is matched and the packet with a DSCP value of 24 is marked with a CoS value of 3 and assigned to queue 3.
- The packet reaches the destination with a CoS value of 3.
- Queue 3 is assigned 65% bandwidth on all nodes. Traffic with a CoS value of 3 or a DSCP value of 24 is given 65% bandwidth. If there is congestion at the egress port, this traffic (queue 3) gets more bandwidth and avoids traffic loss. All other traffic gets the remaining bandwidth per the default settings.
- Bandwidth allocation is done globally in `system-qos` mode.
- Classification and marking are done at the interface level with different settings for access and network ports.

NOTE: On ingress VTEP, the match criteria used in the class map could be based on access-list, VLAN, CoS, or DSCP. On the destination VTEP, the lookup is done based on the inner header fields of the IP header.



NOTE: For Underlay, Overlay VXLAN configuration, see the VXLAN chapter.

L1 Switch

1. Configure class map and policy map for access port. Traffic with a CoS value of 3 is matched, assigned to qos-group 3, and marked with a DSCP value of 24.

```
OS10(config)# class-map type qos CM_QOS_MATCH_CS3
OS10(config-cmap-qos)# match cos 3
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_ACCESS_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set dscp 24
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

2. Configure class map and policy map for the network port. Traffic with a DSCP value of 24 is matched, assigned to qos-group 3, and marked with a CoS value of 3.

```
OS10(config)# class-map type qos CM_QOS_MATCH_DSCP24
OS10(config-cmap-qos)# match ip dscp 24
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_NETWORK_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set cos 3
```

```
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

3. Configure queuing at egress with a bandwidth allocation of 65% for queue 3.

```
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# !
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
```

4. Configure policy map for the VLTi port.

```
OS10(config)# policy-map type qos PM_QOS_VLTI
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# !
OS10(config-pmap-c-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

5. Apply the QoS configuration on the access, network, and VLTi ports.

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/11
OS10(conf-if-eth1/1/11)# service-policy input type qos PM_QOS_VLTI
OS10(config)# interface ethernet 1/1/21
OS10(conf-if-eth1/1/21)# service-policy input type qos PM_QOS_NETWORK_PORT
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# service-policy input type qos PM_QOS_NETWORK_PORT
```

6. Apply the queuing policy map globally in the `system-qos` mode.

```
OS10(config)# system qos
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L2 Switch

1. Configure class map and policy map for access port. Traffic with a CoS value of 3 is matched, assigned to qos-group 3, and marked with a DSCP value of 24.

```
OS10(config)# class-map type qos CM_QOS_MATCH_CS3
OS10(config-cmap-qos)# match cos 3
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_ACCESS_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set dscp 24
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

2. Configure class map and policy map for the network port. Traffic with a DSCP value of 24 is matched, assigned to qos-group 3, and marked with a CoS value of 3.

```
OS10(config)# class-map type qos CM_QOS_MATCH_DSCP24
OS10(config-cmap-qos)# match ip dscp 24
OS10(config-cmap-qos)# exit
```

```
OS10(config)# policy-map type qos PM_QOS_NETWORK_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set cos 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

3. Configure queuing at egress with a bandwidth allocation of 65% for queue 3.

```
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# !
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
```

4. Configure policy map for the VLTi port.

```
OS10(config)# policy-map type qos PM_QOS_VLTI
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# !
OS10(config-pmap-c-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

5. Apply the QoS configuration on the access, network, and VLTi ports.

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/11
OS10(conf-if-eth1/1/11)# service-policy input type qos PM_QOS_VLTI
OS10(config)# interface ethernet 1/1/21
OS10(conf-if-eth1/1/21)# service-policy input type qos PM_QOS_NETWORK_PORT
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# service-policy input type qos PM_QOS_NETWORK_PORT
```

6. Apply the queuing policy map globally in the `system-qos` mode.

```
OS10(config)# system qos
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L3 Switch

1. Configure class map and policy map for access port. Traffic with a CoS value of 3 is matched, assigned to qos-group 3, and marked with a DSCP value of 24.

```
OS10(config)# class-map type qos CM_QOS_MATCH_CS3
OS10(config-cmap-qos)# match cos 3
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_ACCESS_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set dscp 24
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

2. Configure class map and policy map for the network port. Traffic with a DSCP value of 24 is matched, assigned to qos-group 3, and marked with a CoS value of 3.

```
OS10(config)# class-map type qos CM_QOS_MATCH_DSCP24
OS10(config-cmap-qos)# match ip dscp 24
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_NETWORK_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set cos 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

3. Configure queuing at egress with a bandwidth allocation of 65% for queue 3.

```
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# !
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
```

4. Configure policy map for the VLTi port.

```
OS10(config)# policy-map type qos PM_QOS_VLTI
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# !
OS10(config-pmap-c-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

5. Apply the QoS configuration on the access, network, and VLTi ports.

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/11
OS10(conf-if-eth1/1/11)# service-policy input type qos PM_QOS_VLTI
OS10(config)# interface ethernet 1/1/21
OS10(conf-if-eth1/1/21)# service-policy input type qos PM_QOS_NETWORK_PORT
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# service-policy input type qos PM_QOS_NETWORK_PORT
```

6. Apply the queuing policy map globally in the `system-qos` mode.

```
OS10(config)# system qos
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

L4 Switch

1. Configure class map and policy map for access port. Traffic with a CoS value of 3 is matched, assigned to qos-group 3, and marked with a DSCP value of 24.

```
OS10(config)# class-map type qos CM_QOS_MATCH_CS3
OS10(config-cmap-qos)# match cos 3
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_ACCESS_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_CS3
```

```
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set dscp 24
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

2. Configure class map and policy map for the network port. Traffic with a DSCP value of 24 is matched, assigned to qos-group 3, and marked with a CoS value of 3.

```
OS10(config)# class-map type qos CM_QOS_MATCH_DSCP24
OS10(config-cmap-qos)# match ip dscp 24
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_NETWORK_PORT
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# set cos 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

3. Configure queuing at egress with a bandwidth allocation of 65% for queue 3.

```
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# !
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
```

4. Configure policy map for the VLTi port.

```
OS10(config)# policy-map type qos PM_QOS_VLTI
OS10(config-pmap-qos)# !
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# !
OS10(config-pmap-c-qos)# class CM_QOS_MATCH_CS3
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

5. Apply the QoS configuration on the access, network, and VLTi ports.

```
OS10# configure terminal
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# service-policy input type qos PM_QOS_ACCESS_PORT
OS10(config)# interface ethernet 1/1/11
OS10(conf-if-eth1/1/11)# service-policy input type qos PM_QOS_VLTI
OS10(config)# interface ethernet 1/1/21
OS10(conf-if-eth1/1/21)# service-policy input type qos PM_QOS_NETWORK_PORT
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# service-policy input type qos PM_QOS_NETWORK_PORT
```

6. Apply the queuing policy globally in the `system-qos` mode.

```
OS10(config)# system qos
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# end
```

S1 Switch

1. Configure class map and policy map for the access port. Traffic with a DSCP value of 24 is matched and assigned to qos-group 3.

```
OS10(config)# class-map type qos CM_QOS_MATCH_DSCP24
OS10(config-cmap-qos)# match ip dscp 24
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_LEAF_PORT
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

2. Configure queuing at egress with a bandwidth allocation of 65% for queue 3.

```
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
```

3. Apply the queuing policy globally in the `system-qos` mode.

```
OS10(config)# system qos
OS10(config-sys-qos)# show configuration
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# exit
```

4. Apply QoS configuration on the leaf node-facing ports.

```
OS10(config)# interface ethernet 1/1/21
OS10(conf-if-eth1/1/21)# service-policy input type qos PM_QOS_LEAF_PORT
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# service-policy input type qos PM_QOS_LEAF_PORT
OS10(config)# interface ethernet 1/1/23
OS10(conf-if-eth1/1/23)# service-policy input type qos PM_QOS_LEAF_PORT
OS10(config)# interface ethernet 1/1/24
OS10(conf-if-eth1/1/24)# service-policy input type qos PM_QOS_LEAF_PORT
```

S2 Switch

1. Configure class map and policy map for the access port. Traffic with a DSCP value of 24 is matched and assigned to qos-group 3.

```
OS10(config)# class-map type qos CM_QOS_MATCH_DSCP24
OS10(config-cmap-qos)# match ip dscp 24
OS10(config-cmap-qos)# exit
OS10(config)# policy-map type qos PM_QOS_LEAF_PORT
OS10(config-pmap-qos)# class CM_QOS_MATCH_DSCP24
OS10(config-pmap-c-qos)# set qos-group 3
OS10(config-pmap-c-qos)# exit
OS10(config-pmap-qos)# exit
```

2. Configure queuing at egress with a bandwidth allocation of 65% for queue 3.

```
OS10(config)# class-map type queuing CM_QUEUING_Q3
OS10(config-cmap-queuing)# match queue 3
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing PM_QUEUING
OS10(config-pmap-queuing)# class CM_QUEUING_Q3
OS10(config-pmap-c-que)# bandwidth percent 65
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# exit
```

3. Apply the queuing policy globally in the `system-qos` mode.

```
OS10(config)# system qos
OS10(config-sys-qos)# show configuration
OS10(config-sys-qos)# service-policy output type queuing PM_QUEUING
OS10(config-sys-qos)# exit
```

4. Apply QoS configuration on the leaf node-facing ports.

```
OS10(config)# interface ethernet 1/1/21
OS10(conf-if-eth1/1/21)# service-policy input type qos PM_QOS_LEAF_PORT
OS10(config)# interface ethernet 1/1/22
OS10(conf-if-eth1/1/22)# service-policy input type qos PM_QOS_LEAF_PORT
OS10(config)# interface ethernet 1/1/23
OS10(conf-if-eth1/1/23)# service-policy input type qos PM_QOS_LEAF_PORT
OS10(config)# interface ethernet 1/1/24
OS10(conf-if-eth1/1/24)# service-policy input type qos PM_QOS_LEAF_PORT
```

Verify the configuration

- Verify the bandwidth settings.

```
OS10# show queuing weights interface ethernet 1/1/99:3
Interface ethernet1/1/99:3
Queue    Weight(In percentage)
---------------------------------
0          5
1          5
2          5
3          65
4          5
5          5
6          5
7          5
```

- Verify if the packets are assigned to the respective queues. Packets with a dot1p priority of 3 or DSCP value of 24 is assigned queue 3 and packets with other dot1p priority or DSCP value is assigned to queue 0. Given that we have allocated a bandwidth of 65% to queue 3, queue 3 traffic gets more bandwidth and other traffic gets less bandwidth. During congestion, the drop counter indicates packet drops for queue 0 and no drops for queue 3. Notice that in the following `show` outputs, traffic from queue 0 is dropped when there is congestion; however, queue 3 still gets a guaranteed bandwidth of 65%.

  Network port of L1 switch (ingress VTEP):

```
OS10# show queuing statistics interface ethernet 1/1/21
Interface ethernet1/1/21
Queue  Packets   Bytes       Dropped-Packets  Dropped-Bytes
0      6278443   1896079620  8363856          2559327800
1      0         0           0                0
2      0         0           0                0
3      14648249  4423771198  0                0
4      0         0           0                0
5      0         0           0                0
6      0         0           0                0
7      0         0           0                0
```

  Access ports of L3 switch (destination VTEP):

```
OS10# show queuing statistics interface ethernet 1/1/1
Interface ethernet1/1/1
Queue  Packets   Bytes       Dropped-Packets  Dropped-Bytes

7      0             0               0                0
```

Buffer management

OS10 devices distribute the total available buffer resources into two buffer pools at ingress direction and three buffer pools at egress direction of all physical ports.

You can map a single traffic class or a group of traffic classes to a priority group. All ports in a system are allocated a certain amount of buffers from corresponding pools based on the configuration state of each priority-group or queue. The remaining buffers in the pool are shared across all similarly configured ports.

The following buffer pools are available:

- Ingress buffer pools:
  - Lossy pool (default)
  - Lossless pool
    - PFC—For all platforms
    - LLFC—For all platforms except the S4200-ON series switches
- Egress buffer pools:
  - Lossy pool (default)
  - Lossless pool
    - PFC—For all platforms
    - LLFC—For all platforms except the S4200-ON series switches
  - CPU pool (CPU control traffic)

The following terms are used in this section:

- Default buffer—By default, the system allocates a certain amount of default buffer to all the ports.

- Reserved buffer—The system reserves a dedicated amount of buffer to a port or a priority group (at ingress) and a port or a queue (at egress).
- Shared buffer—Is the total available buffer space minus the reserved buffer space. Shared buffer is used for CPU control traffic and is dynamically allocated to the ports when memory space is needed.
- Alpha value—Is a configurable value from 0 to 10 that determines the dynamic shared buffer threshold, and maintains dynamic buffer space during congestion events.
- Xoff threshold (transmit off)—When the system reaches the Xoff threshold, to prevent traffic loss, the system pauses and does not accept any further packets.
- Xon threshold (transmit on)—When the system reaches the Xon threshold, the system resumes and accepts the packets.

For example, when all ports are allocated as reserved buffers from the lossy (default) pool, the remaining buffers in the lossy pool are shared across all ports, except the CPU port.

When you enable priority flow control (PFC) on the ports, all the PFC-enabled queues and priority-groups use the buffers from the lossless pool.

You must use the network QoS policy type to configure PFC on the ports.

OS10 dedicates a separate buffer pool for CPU traffic. All default reserved buffers for the CPU port queues are from the CPU pool. The remaining buffers are shared across all CPU queues. You can modify the buffer settings of CPU queues.

You can configure the size of the CPU pool using the `control-plane-buffer-size` command.

OS10 allows configuration of buffers per priority-group and queue for each port.

Buffer-usage accounting happens for ingress packets on ingress pools and egress packets on egress pool. You can configure ingress-packet buffer accounting per priority-group and egress-packet buffer accounting per queue level.

Configuration notes

Dell PowerSwitch S4200-ON Series:

- Provisioning LLFC is not supported when deep buffer mode is enabled.
- Stop the traffic before applying or modifying the LLFC configuration.

Configure ingress buffer

By default, all traffic classes map to the default priority group (PG) 7 for ingress buffers. The buffer reservation is based on the default priority group ID 7. All buffers are part of the default pool and all ports share buffers from the default pool. When you configure a network qos policy map, a new priority group is created for which buffers are assigned from the lossless pool. The rest of the traffic classes that are not mapped to any PFC-related PGs, use the default buffer.

The reserved buffer size is 9360 bytes for the speed of 10G, 25G, 40G, 50G, and 100G. The supported speed varies for different platforms.

Table 131. Maximum buffer size

Platforms	Max buffer size
S4000	12 MB
S6010–ON, S4048–ON	16 MB
S4100-ON Series	12 MB
S4200-ON Series	6 GB
S5200-ON Series	32 MB
Z9100–ON	16 MB
Z9264F-ON	42 MB

The following table lists the values allocated for the default ingress buffers on the S4100-ON series platform. These values may differ for different platforms and speeds. Use the `show qos ingress buffers` command to view the default ingress buffers on your switch.

Table 132. Default ingress buffers on the S4100-ON series platform

Speed	10G	25G	40G	50G	100G
Reserved buffers for PG 7 (default)	9KB	9KB	9KB	9KB	9KB

The following lists the link-level flow control (LLFC) buffer settings for default priority group 7:

Table 133. Default setting for LLFC

Speed	10G	25G	40G	50G	100G
Default reserved buffer	9KB	9KB	18KB	18KB	36KB
Default Xon threshold	36KB	45KB	75KB	91KB	142KB
Default Xoff threshold	9KB	9KB	9KB	9KB	9KB
Default dynamic shared buffer threshold (alpha value)	9KB	9KB	9KB	9KB	9KB

NOTE: The supported speed varies for different platforms. After the reserved buffers are used, each LLFC starts consuming shared buffers from the lossless pool with the alpha value determining the threshold except for the S4200-ON series platform.

The following table lists the priority flow control (PFC) buffer settings per PFC priority group:

Table 134. Default settings for PFC

Speed	10G	25G	40G	50G	100G
Default reserved buffer for S4000, S4048–ON, S6010–ON	9KB	NA	9KB	NA	NA
Default reserved buffer for S41xx, Z9100–ON	9KB	9KB	18KB	18KB	36KB
Default Xoff threshold	36KB	45KB	75KB	91KB	142KB
Default Xon threshold	9KB	9KB	9KB	9KB	9KB
Default dynamic share buffer threshold (alpha value)	9KB	9KB	9KB	9KB	9KB

NOTE: The supported speed varies for different platforms. After the reserved buffers are used, each PFC starts consuming shared buffers from the lossless pool with the alpha value determining the threshold.

You can override the default priority group settings when you enable LLFC or PFC.

1. Create a network-qos type class-map to match the traffic classes. For LLFC, match all the traffic classes from 0 to 7. For PFC, match the required traffic class.

```
OS10(config)# class-map type network-qos example-cmap-in-buffer
OS10 (config-cmap-nqos)# match qos-group 0-7
```

2. Create network-qos type policy-map to define the actions for traffic classes, such as a buffer configuration and threshold.

```
OS10(config)# policy-map type network-qos example-pmap-in-buffer
OS10(config-pmap-network-qos)# class example-cmap-in-buffer
OS10 (config-pmap-c-nqos)# pause buffer-size 300 pause-threshold 200 resume-threshold
100
OS10 (config-pmap-c-nqos)# queue-limit thresh-mode dynamic 5
```

Configure egress buffer

All port queues are allocated with reserved buffers. When the reserved buffers are consumed, each queue starts using the shared buffers from the default pool.

The following table lists the values allocated for the default egress buffers on the S4100-ON series platform. These values may differ for different platforms and speeds. Use the `show qos egress buffers` command to view the default egress buffers on your switch.

Table 135. Default egress buffers on the S4100-ON series platform

Speed	10G	25G	40G	50G	100G
Reserved buffers for each queue of a port (default)	1664 bytes	1664 bytes	1664 bytes	1664 bytes	1664 bytes

The default dynamic shared buffer threshold is 8.

1. Create a queuing type class-map to match the queue.

```
OS10(config)# class-map type queuing example-cmap-eg-buffer
OS10(config-cmap-queuing)# match queue 1
```

2. Create a queuing type policy-map to define the actions for queues, such as a buffer configuration and threshold.

```
OS10(config)# policy-map type queuing example-pmap-eg-buffer
OS10(config-pmap-queuing)# class example-cmap-eg-buffer
OS10(config-pmap-c-que)# queue-limit queue-len 200 thresh-mode dynamic 5
```

Deep Buffer mode

NOTE: This feature is supported only on the S4200-ON series.

OS10 provides the flexibility to configure the buffer mode based on your system requirements.

The S4200-ON series switch comes with a default deep buffer size of 4.63 GB. You can use the `hardware deep-buffer-mode` command to enhance the deep buffer size to 6.24 GB. For information about how to configure deep buffer mode, see Configure Deep Buffer mode. The following lists the total buffer availability in the different modes:

Table 136. Buffer availability in different modes

Platform	Default deep buffer	Enhanced deep buffer
S4200–ON series	4.63 GB	6.24 GB

Deep Buffer mode takes effect only after saving it in the startup configuration and reloading the switch.

NOTE: Disabling the Deep Buffer mode configuration during runtime is not supported.

Configuration notes

1. When the switch is in Deep Buffer mode, the PFC and LLFC features are not available. The following commands are not supported:
   - `priority-flow-control mode on`—Configure Priority Flow Control mode on an interface.
   - `service-policy input type network-qos` *`policy-name`*—Apply a network service policy on an interface.
   - `flowcontrol transmit on`—Configure flow control transmit.
   - `pfc-max-buffer-size` *`size`*—Configure maximum buffer size for PFC.
   - `pfc-shared-buffer-size` *`size`*—Configure shared buffer size for PFC.

   NOTE: To view the PFC, LLFC, or service policy configured on the interfaces, use `show running-configuration` command. Use interface range command to disable network QoS-related configurations before enabling Deep Buffer mode.
2. The other QoS features such as traffic classification, policing, marking, shaping, priority queuing, and scheduling are supported in Deep Buffer mode.

Configure Deep Buffer mode

By default, Deep Buffer mode is disabled. To configure Deep Buffer mode on a switch, enable the mode, save the configuration, and reload the switch for the feature to take effect.

NOTE: Disable all the network QoS configurations; for example, PFC and LLFC, before configuring the Deep Buffer mode.

To configure Deep Buffer mode:

1. Enable Deep Buffer mode in CONFIGURATION mode.

   ```
   hardware deep-buffer-mode
   ```

   After you configure Deep Buffer mode, the system displays a warning stating that the configuration takes effect only after saving it in the startup configuration and reloading the switch.

   NOTE: To disable Deep Buffer mode, use the `no` form of the command. Disabling Deep Buffer mode takes effect only after saving it in the startup configuration and reloading the switch.

2. Save Deep Buffer mode in the startup configuration in EXEC mode.

   ```
   write memory
   ```

3. Reload the switch in EXEC mode.

   ```
   reload
   ```

Configure Deep Buffer mode

The configuration shows how to enable Deep Buffer mode in a switch.

```
OS10# configure terminal
OS10(config)# hardware deep-buffer-mode
% Warning: Deep buffer mode configuration will be applied only after a save and reload.
OS10(config)# exit
OS10# write memory
OS10# reload

Proceed to reboot the system? [confirm yes/no]: Y
```

To view Deep Buffer mode status, use the `show hardware deep-buffer-mode` command. The `show` command output displays the status of Deep Buffer mode in the current boot and the next boot.

The following is Deep Buffer mode status before enabling it, the default setting:

```
OS10# show hardware deep-buffer-mode
  Deep Buffer Mode Configuration Status
-----------------------------------------
    Current-boot Settings : Disabled

    Next-boot Settings    : Disabled
```

The following is Deep Buffer mode status after saving the configuration in the startup configuration:

```
OS10# show hardware deep-buffer-mode
  Deep Buffer Mode Configuration Status
-----------------------------------------
    Current-boot Settings : Disabled

    Next-boot Settings    : Enabled
```

The following is Deep Buffer mode status after the switch reloads:

```
OS10# show hardware deep-buffer-mode
  Deep Buffer Mode Configuration Status
-----------------------------------------
    Current-boot Settings : Enabled

    Next-boot Settings    : Enabled
```

Congestion avoidance

Congestion avoidance anticipates and takes necessary actions to avoid congestion. The following mechanisms avoid congestion:

- **Tail drop**—Packets are buffered at traffic queues. When the buffers are exhausted or reach the configured threshold, excess packets drop. By default, OS10 uses tail drop for congestion avoidance.
- **Random early detection (RED)**—In tail drop, different flows are not considered in buffer utilization. When multiple hosts start retransmission, tail drop causes TCP global re-synchronization. Instead of waiting for the queue to get filled up completely, RED starts dropping excess packets with a certain drop-probability when the average queue length exceeds the configured minimum threshold. The early drop ensures that only some of TCP sources slow down, which avoids global TCP re-synchronization.
- **Weighted random early detection (WRED)**—This allows different drop-probabilities and thresholds for each color — red, yellow, green — of traffic. You can configure the drop characteristics for three different flows by assigning the colors to the flow. Assign colors to a particular flow or traffic using various methods, such as ingress policing, qos input policy-maps, and so on.
- **Explicit congestion notification (ECN)**—This is an extension of WRED. Instead of dropping the packets when the average queue length crosses the minimum threshold values, ECN marks the Congestion Experienced (CE) bit of the ECN field in a packet as ECN-capable traffic (ECT).

1. Configure a WRED profile in CONFIGURATION mode.

```
OS10(config)# wred example-wred-prof
```

2. Configure WRED threshold parameters for different colors in WRED CONFIGURATION mode.

```
OS10(config-wred)# random-detect color yellow minimum-threshold 100 maximum-threshold
300 drop-probability 40
```

3. Configure the exponential weight value for the WRED profile in WRED CONFIGURATION mode.

```
OS10(config-wred)# random-detect weight 4
```

4. Enable ECN.

```
OS10(config-wred)# random-detect ecn
```

5. Enable WRED/ECN on a queue.

```
OS10(config)# class-map type queuing example-cmap-wred
OS10(config-cmap-queuing)# match queue 2
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing example-pmap-wred
OS10(config-pmap-queuing)# class example-cmap-wred
OS10(config-pmap-c-que)# random-detect example-wred-prof
```

6. Enable WRED/ECN on a port.

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# random-detect example-wred-prof
```

7. Enable WRED/ECN on a service-pool.

```
OS10(config)# system qos
OS10(config-sys-qos)# random-detect pool 0 example-wred-prof
```

NOTE: On the S4200–ON Series platform, enable ECN globally only. Also, apply ECN configurations only at the queue level. You cannot configure ECN at the interface or service-pool levels. If you try to apply the ECN configuration at the interface or service-pool levels, the configuration is not accepted.

To enable ECN globally:

1. Configure a WRED profile in CONFIGURATION mode.

```
OS10(config)# wred example-wred-prof-1
```

2. Configure WRED threshold parameters for different colors in WRED CONFIGURATION mode.

```
OS10(config-wred)# random-detect color yellow minimum-threshold 100 maximum-threshold
300 drop-probability 40
```

3. Configure the exponential weight value for the WRED profile in WRED CONFIGURATION mode.

```
OS10(config-wred)# random-detect weight 4
```

4. Configure the ECN threshold parameters in WRED CONFIGURATION mode.

```
OS10(config-wred)#random-detect ecn minimum-threshold 100 maximum-threshold 300 drop-
probability 40
```

5. Exit WRED CONFIGURATION mode.

```
OS10(config-wred)#exit
```

6. Create a QoS class-map.

```
OS10(config)# class-map type queuing example-cmap-wred-1
OS10(config-cmap-queuing)# match queue 2
```

7. Enter QOS POLICY-MAP mode and create a queuing policy type.

```
OS10(config)#policy-map type queuing example-pmap-wred-1
OS10(config-pmap-queuing)# class example-cmap-wred-1
```

8. Assign a WRED profile to the specified queue.

```
OS10(config-pmap-c-que)#random-detect example-wred-prof-1
```

9. Exit CLASS MAP and POLICY MAP modes.

```
OS10(config-pmap-c-que)#exit
OS10(config-pmap-queuing)#exit
```

10. Enter SYSTEM QOS mode.

```
OS10(config)# system-qos
```

11. Enable ECN globally.

```
OS10(config-sys-qos)#random-detect ecn
```

After you enable ECN globally, ECN marks the CE bit of the ECN field in a packet as ECT.

In the S4200–ON Series platform, configure separate thresholds for ECN capable traffic (ECT). If you enable ECN, ECT is marked based on the configured ECN threshold and non-ECT drops based on the WRED thresholds.

Storm control

Traffic storms created by packet flooding or other reasons may degrade the performance of the network. The storm control feature allows you to control unknown unicast, multicast, and broadcast traffic on L2 and L3 physical interfaces.

OS10 devices monitor the current level of the traffic rate at fixed intervals, compares the traffic rate with the configured levels, and drops excess traffic.

By default, storm control is disabled on all interfaces. Enable storm control using the `storm-control { broadcast | multicast | unknown-unicast }` *`rate-in-pps`* command in INTERFACE mode.

NOTE: This feature is not supported on the S5448F-ON, Z9332F-ON, and Z9664F-ON platforms.

- Enable broadcast storm control with a rate of 1000 packets per second (pps) on Ethernet 1/1/1.

```
OS10(conf-if-eth1/1/1)# storm-control broadcast 1000
```

NOTE: Storm control configuration is supported only for 16 interfaces on the Z9432F-ON platform.

RoCE for faster access and lossless connectivity

Remote Direct Memory Access (RDMA) enables memory transfers between two computers in a network without involving the CPU of either computer.

RDMA networks provide high bandwidth and low latency without appreciable CPU overhead for improved application performance, storage and data center utilization, and simplified network management. RDMA was traditionally supported only in an InfiniBand environment. Currently, RDMA over Converged Ethernet (RoCE) is also implemented in data centers that use Ethernet or a mixed-protocol environment.

OS10 devices support RoCE v1 and RoCE v2 protocols.

- RoCE v1 – An Ethernet layer protocol that allows for communication between two hosts that are in the same Ethernet broadcast domain.
- RoCE v2 – An Internet layer protocol that allows RoCE v2 packets to be routed, called Routable RoCE (RRoCE).

To enable RoCE, configure the QoS service policy on the switch in ingress and egress directions on all the interfaces. For more information about this configuration, see Configure RoCE on the switch.

Configure RoCE on the switch

To configure RoCE, classify the ingress and egress traffic as lossy and lossless traffic. Based on the classification, assign the ECN threshold and bandwidth for the respective queues. For RoCEv1, ECN threshold configuration is not required.

Configuration notes

- Use the trust-map or policy-map CLI commands to configure dot1p and DSCP traffic-class markings. For RoCEv2, classification is based only on DSCP.
- Use the qos-map CLI command to apply the traffic class to queues.
- Use the network-type policy-map to classify any of the priority values as lossless and fine-tune the respective buffer value depending on traffic congestion.
- Adjust the ECN threshold based on the traffic pattern.
- Use the queuing-type policy-map to modify the bandwidth allocation for lossy and lossless queues.
- If you are using RoCEv1, only bandwidth allocation is required. ECN and ECN queue association are not required.
- To ensure lossless traffic flow, configure PFC on all lossless interfaces.

The following example describes the steps to configure RoCE on the switch. This configuration example uses priority 3 for RoCE.

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
OS10 (config)#
```

2. Enable the Data Center Bridging Exchange protocol (DCBX). See Data center bridging exchange (DCBX) for more information.

```
OS10 (config)# dcbx enable
```

3. Create a VLAN. In this example, VLAN 55 switches the RoCE traffic. You can configure any value from 1 to 4093.

```
OS10 (config)# interface vlan 55
OS10 (conf-if-vl-55)# no shutdown
```

4. Apply the dot1p trust globally or at the interface level. In this example, the dot1p trust is applied globally.

NOTE:

- If PFC configuration is not enabled on all the ports in the switch, do not apply dot1p trust globally. Apply the dot1p trust on the specific interfaces.
- For RoCEv1, use the `trust-map dot1p default` command or the user-defined `trust-map dot1p` configuration.
- For RoCEv2:
  - If the network is VLAN tagged, use the `trust-map dot1p default` command or the user-defined `trust-map dot1p` configuration.

- If the network is non-VLAN tagged, use the `trust-map dscp default` command or the user-defined `trust-map dscp` configuration.

```
OS10 (config)# system qos
OS10 (config-sys-qos)# trust-map dot1p default
```

5. Create a network-qos type class-map and policy-map for priority flow control (PFC). This configuration fine tunes the buffer settings for the particular priority.

```
OS10 (config)# class-map type network-qos pfcdot1p3
OS10 (config-cmap-nqos)# match qos-group 3

OS10 (config)# policy-map type network-qos policy_pfcdot1p3
OS10(config-pmap-network-qos)# class pfcdot1p3
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 3
```

NOTE: When you use the `pause` command without any parameters, the system uses the default buffer settings. To modify the buffer settings, use the `pause` command and specify the buffer size, pause threshold, and resume threshold. See Priority flow control and the pause command for more information.

6. Create queuing-type class-maps and policy-map for enhanced transmission selection (ETS), bandwidth, and ECN configurations. See Enhanced transmission selection and Bandwidth allocation for more information.

Bandwidth configuration for RoCEv1:

```
OS10 (config)# class-map type queuing Q0
OS10 (config-cmap-queuing)# match queue 0
OS10 (config)# class-map type queuing Q3
OS10 (config-cmap-queuing)# match queue 3
```

```
OS10 (config)# policy-map type queuing policy_2Q
OS10 (config-pmap-queuing)# class Q0
OS10 (config-pmap-c-que)# bandwidth percent 30
OS10 (config-pmap-c-que)# exit
OS10 (config-pmap-queuing)# class Q3
OS10 (config-pmap-c-que)# bandwidth percent 70
```

Bandwidth and ECN configuration for RoCEv2 with ECN queue association:

```
OS10 (config)# class-map type queuing Q0
OS10 (config-cmap-queuing)# match queue 0
OS10 (config)# class-map type queuing Q3
OS10 (config-cmap-queuing)# match queue 3
```

```
OS10(config)# wred wred_ecn
OS10(config-wred)# random-detect ecn
OS10(config-wred)# random-detect color green minimum-threshold 1000 maximum-threshold
2000 drop-probability 100
OS10(config-wred)# random-detect color yellow minimum-threshold 500 maximum-threshold
1000 drop-probability 100
OS10(config-wred)# random-detect color red minimum-threshold 100 maximum-threshold
500 drop-probability 100
OS10(config-wred)# exit
```

```
OS10(config)# policy-map type queuing policy_2Q
OS10(config-pmap-queuing)# class Q0
OS10(config-pmap-c-que)# bandwidth percent 30
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# class Q3
OS10(config-pmap-c-que)# bandwidth percent 70
OS10(config-pmap-c-que)# random-detect wred_ecn
OS10(config-pmap-c-que)# end
OS10#
```

7. Create a QoS map for ETS to map the lossy and lossless traffic to the respective queues.

```
OS10 (config)# qos-map traffic-class 2Q
OS10(config-qos-map)# queue 0 qos-group 0-2, 4-7
OS10(config-qos-map)# queue 3 qos-group 3
```

NOTE: On the Z9332F-ON platform, you must also specify the type of queue, whether it is a unicast or multicast queue. For example:

```
OS10(config)# qos-map traffic-class 2Q
OS10(config-qos-map)# queue 0 qos-group 0-2,4-7 type ucast
OS10(config-qos-map)# queue 3 qos-group 3 type ucast
OS10(config-qos-map)# queue 0 qos-group 0-2,4-7 type mcast
OS10(config-qos-map)# queue 1 qos-group 3 type mcast
```

8. Perform the following configurations on all switch interfaces where you want to support RoCE:
   - For RoCEv1:
     a. Enter INTERFACE mode and enter the `no shutdown` command.

     ```
     OS10# configure terminal
     OS10 (config)# interface ethernet 1/1/1
     OS10 (conf-if-eth1/1/1)# no shutdown
     ```

     b. Change the switch port mode to Trunk mode.

     ```
     OS10 (conf-if-eth1/1/1)# switchport mode trunk
     ```

     c. Specify the allowed VLANs on the trunk port.

     ```
     OS10 (conf-if-eth1/1/1)# switchport trunk allowed vlan 55
     ```

     d. Apply the network-qos type policy-map to the interface.

     ```
     OS10 (conf-if-eth1/1/1)# service-policy input type network-qos policy_pfcdot1p3
     ```

     e. Apply the queuing policy to egress traffic on the interface.

     ```
     OS10 (conf-if-eth1/1/1)# service-policy output type queuing policy_2Q
     ```

     f. Enable ETS on the interface.

     ```
     OS10 (conf-if-eth1/1/1)# ets mode on
     ```

     g. Apply the qos-map for ETS configurations on the interface.

     ```
     OS10 (conf-if-eth1/1/1)# qos-map traffic-class 2Q
     ```

     h. Enable PFC on the interface.

     ```
     OS10 (conf-if-eth1/1/1)# priority-flow-control mode on
     ```

   - For RoCEv2 (untagged L3 traffic):
     a. Enter INTERFACE mode and enter the `no shutdown` command.

     ```
     OS10 (config)# interface ethernet 1/1/1
     OS10 (conf-if-eth1/1/1)# no shutdown
     ```

     b. Apply the network-qos type policy-map to the interface.

     ```
     OS10 (conf-if-eth1/1/1)# service-policy input type network-qos policy_pfcdot1p3
     ```

     c. Apply the queuing policy to egress traffic on the interface.

     ```
     OS10 (conf-if-eth1/1/1)# service-policy output type queuing policy_2Q
     ```

     d. Enable ETS on the interface.

     ```
     OS10 (conf-if-eth1/1/1)# ets mode on
     ```

e. Apply the qos-map for ETS configurations on the interface.

```
OS10 (conf-if-eth1/1/1)# qos-map traffic-class 2Q
```

f. Enable PFC on the interface.

```
OS10 (conf-if-eth1/1/1)# priority-flow-control mode on
```

- For RoCEv2 (tagged L3 traffic):
  a. Create a VLAN.

```
OS10(config)# interface vlan 55
OS10(conf-if-vl-55)# no shutdown
```

  b. Enter INTERFACE mode and enter the `no shutdown` command.

```
OS10 (config)# interface ethernet 1/1/1
OS10 (conf-if-eth1/1/1)# no shutdown
```

  c. Change the switch port mode to trunk and specify the allowed VLANs on the trunk port.

```
OS10(conf-if-eth1/1/1)# switchport mode trunk
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 55
```

  d. Apply the network-qos type policy-map to the interface.

```
OS10 (conf-if-eth1/1/1)# service-policy input type network-qos policy_pfcdot1p3
```

  e. Apply the queuing policy to egress traffic on the interface.

```
OS10 (conf-if-eth1/1/1)# service-policy output type queuing policy_2Q
```

  f. Enable ETS on the interface.

```
OS10 (conf-if-eth1/1/1)# ets mode on
```

  g. Apply the qos-map for ETS configurations on the interface.

```
OS10 (conf-if-eth1/1/1)# qos-map traffic-class 2Q
```

  h. Enable PFC on the interface.

```
OS10 (conf-if-eth1/1/1)# priority-flow-control mode on
```

View configuration and statistics

Use the following show commands to view the configuration and statistics:

- To view the PFC and ETS configuration details at the interface level, use the `show qos interface` command:

```
OS10# show qos interface ethernet 1/1/4
```

- To view the buffer allocation for the ingress interface, use the `show qos ingress buffers` command:

```
OS10# show qos ingress buffers interface ethernet 1/1/4
```

- To view the buffer utilization at the ingress interface, use the `show qos ingress buffer-stats` command:

```
OS10# show qos ingress buffer-stats interface ethernet 1/1/4
```

- To view the buffer allocation for the egress interface, use the `show qos egress buffers` command:

```
OS10# show qos egress buffers interface ethernet 1/1/4
```

- To view the buffer utilization at the egress interface, use the `show qos egress buffer-stats` command:

```
OS10# show qos egress buffer-stats interface ethernet 1/1/4
```

- To view the PFC configuration, operational status, and statistics on the interface, use the `show interface` *`interface-name`* `priority-flow-control details` command:

```
OS10(config)# show interface ethernet 1/1/15 priority-flow-control details
```

- To view the ECN markings on an interface, use the `show queuing statistics interface` *`interface-name`* `wred` command:

```
OS10# show queuing statistics interface ethernet 1/1/1 wred
```

- To view any egress packet loss, use the `show queuing statistics` command:

  NOTE: There should not be any packet drops in lossless queues.

```
OS10# show queuing statistics interface ethernet 1/1/1
```

- To view qos map details such as dot1p or DSCP to traffic class mapping and traffic class to queue mapping, use the `show qos maps` command:

```
OS10# show qos maps
```

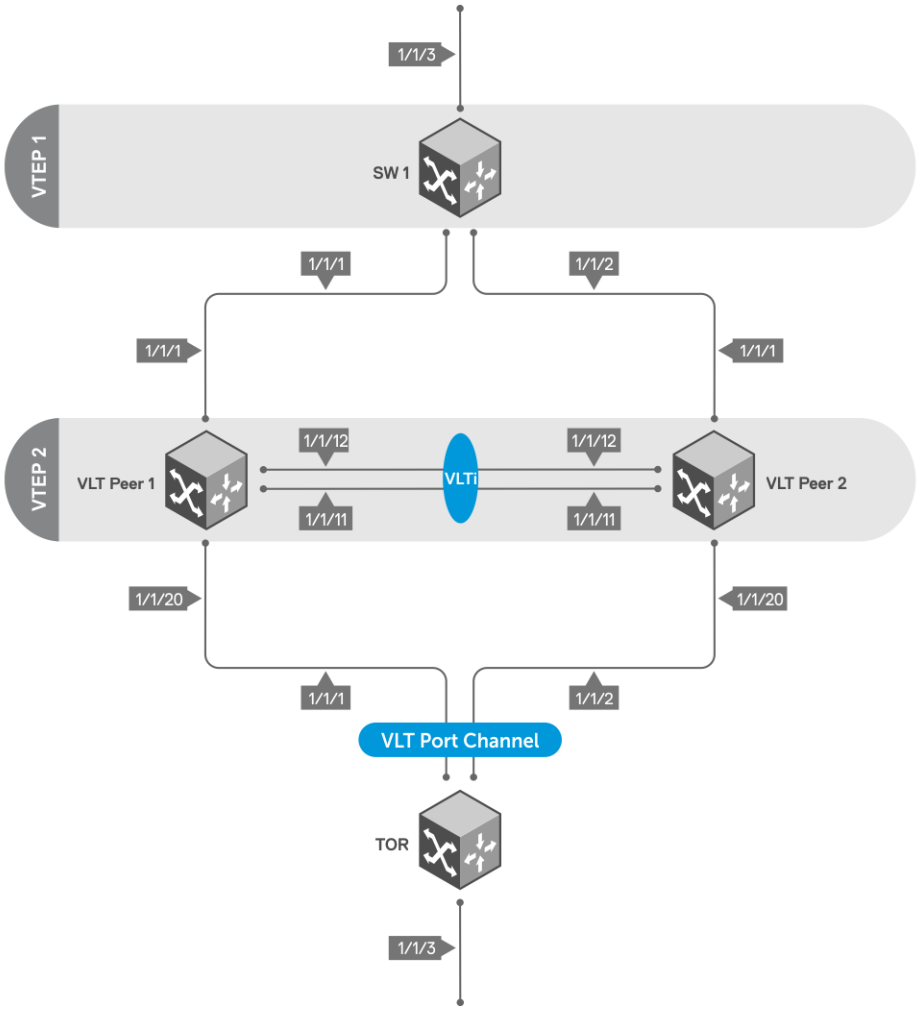
RoCE for VXLAN over VLT

OS10 supports RoCE for VXLAN in a VLT setup. Configuring RoCE with VXLAN is similar to configuring RoCE without VXLAN. When you configure VXLAN and span that across a VLT topology, apply the configuration on all interfaces across the VLT topology where you want to support RoCE.

For more information about how to configure RoCE, see the Configure RoCE on the switch section.

Sample configuration of RoCE for VXLAN over VLT

The following describes a topology where RoCE is enabled with VXLAN over VLT. SW1 is configured as VTEP1 and is the upstream switch that connects to the outer network. VLT peer 1 and VLT peer 2 form a VLT topology and are also configured as VTEP 2. A top-of-rack (ToR) switch is connected to the VLT peers through a VLT port channel. The ToR is the downstream switch for end devices, such as, virtual machines.



The following examples show each device in this network and their respective configuration:

SW1 configuration

VXLAN configuration — SW1

```
OS10# configure terminal
OS10(config)# interface vlan 3000
OS10(conf-if-vl-3000)# exit
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# exit
OS10(config)# interface loopback 1
OS10(conf-if-lo-1)# ip address 1.1.1.1/32
OS10(conf-if-lo-1)# exit
OS10(config)# router ospf 1
OS10(config-router-ospf-1)# router-id 8.8.8.8
OS10(config-router-ospf-1)# exit
OS10(config)# interface vlan 3000
OS10(conf-if-vl-3000)# ip ospf 1 area 0
OS10(conf-if-vl-3000)# exit
OS10(config)# interface loopback 1
OS10(conf-if-lo-1)# ip ospf 1 area 0
OS10(conf-if-lo-1)# exit
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# switchport mode trunk
OS10(conf-if-eth1/1/1)# switchport trunk allowed vlan 3000
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# switchport mode trunk
OS10(conf-if-eth1/1/2)# switchport trunk allowed vlan 3000
OS10(conf-if-eth1/1/2)# exit
```

```
OS10(config)# configure terminal
OS10(config)# nve
OS10(conf-nve)# source-interface loopback 1
OS10(conf-nve)# exit
OS10(config)# virtual-network 5
OS10(conf-vn-5)# vxlan-vni 1000
OS10(conf-vn-vxlan-vni)# remote-vtep 2.2.2.2
OS10(conf-vn-vxlan-vni-remote-vtep)# exit
OS10(conf-vn-vxlan-vni)# exit
OS10(conf-vn-5)# exit
OS10(config)# interface vlan 200
OS10(conf-if-vl-200)# virtual-network 5
OS10(conf-if-vl-200)# end
OS10#
OS10# configure terminal
OS10(config)# interface ethernet 1/1/3
OS10(conf-if-eth1/1/3)# switchport mode trunk
OS10(conf-if-eth1/1/3)# switchport trunk allowed vlan 200
OS10(conf-if-eth1/1/3)# end
```

PFC configuration — SW1

```
OS10# configure terminal
OS10(config)# trust dot1p-map t1
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0
OS10(config-tmap-dot1p-map)# qos-group 1 dot1p 1
OS10(config-tmap-dot1p-map)# qos-group 2 dot1p 2
OS10(config-tmap-dot1p-map)# qos-group 3 dot1p 3
OS10(config-tmap-dot1p-map)# qos-group 4 dot1p 4
OS10(config-tmap-dot1p-map)# qos-group 5 dot1p 5
OS10(config-tmap-dot1p-map)# qos-group 6 dot1p 6
OS10(config-tmap-dot1p-map)# qos-group 7 dot1p 7
OS10(config-tmap-dot1p-map)# end
OS10# configure terminal
OS10(config)# class-map type network-qos c5
OS10(config-cmap-nqos)# match qos-group 5
OS10(config-cmap-nqos)# exit
OS10(config)# policy-map type network-qos p5
OS10(config-pmap-network-qos)# class c5
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 5
OS10(config-pmap-c-nqos)# end
OS10# configure terminal
OS10(config)# interface range ethernet 1/1/3,1/1/1,1/1/2
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# flowcontrol receive off
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# priority-flow-control mode on
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# ets mode on
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# service-policy input type network-qos p5
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# trust-map dot1p t1
```

LLFC configuration — SW1

Instead of PFC, you can configure LLFC as follows:

```
OS10(config)# configure terminal
OS10(config)# class-map type network-qos llfc
OS10(config-cmap-nqos)# match qos-group 0-7
OS10(config-cmap-nqos)# exit
OS10(config)# policy-map type network-qos llfc
OS10(config-pmap-network-qos)# class llfc
OS10(config-pmap-c-nqos)# pause buffer-size 100 pause-threshold 50 resume-threshold 10
OS10(config-pmap-c-nqos)# end
OS10#
OS10# configure terminal
OS10(config)# interface range ethernet 1/1/1,1/1/2,1/1/3
OS10(conf-range-eth1/1/1,1/1/2,1/1/3)# flowcontrol transmit on
OS10(conf-range-eth1/1/1,1/1/2,1/1/3)# flowcontrol receive on
OS10(conf-range-eth1/1/1,1/1/2,1/1/3)# service-policy input type network-qos llfc
OS10(conf-range-eth1/1/1,1/1/2,1/1/3)# end
```

WRED and ECN configuration — SW1

```
OS10# configure terminal
OS10(config)# wred w1
OS10(config-wred)# random-detect ecn
OS10(config-wred)# random-detect color green minimum-threshold 100 maximum-threshold 500
drop-probability 100
OS10(config-wred)# random-detect color yellow minimum-threshold 100 maximum-threshold
500 drop-probability 100
OS10(config-wred)# random-detect color red minimum-threshold 100 maximum-threshold 500
drop-probability 100
OS10(config-wred)# exit
OS10(config)# class-map type queuing cq
OS10(config-cmap-queuing)# match queue 5
OS10(config-cmap-queuing)# exit
OS10(config)# policy-map type queuing pq
OS10(config-pmap-queuing)# class cq
OS10(config-pmap-c-que)# random-detect w1
OS10(config-pmap-c-que)# end
OS10# configure terminal
OS10(config)# interface range ethernet 1/1/3,1/1/1,1/1/2
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# flowcontrol receive off
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# priority-flow-control mode on
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# ets mode on
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# service-policy input type network-qos p5
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# service-policy output type queuing pq
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# trust-map dot1p t1
OS10(conf-range-eth1/1/3,1/1/1,1/1/2)# end
```

Enable DCBx — SW1

```
OS10# configure terminal
OS10(config)# dcbx enable
```

Configuration on VLT peer 1

VLT configuration — VLT peer 1

```
OS10# configure terminal
OS10(config)# interface range ethernet 1/1/12,1/1/11
OS10(conf-range-eth1/1/12,1/1/11)# no switchport mode

```

Enable DCBx — ToR device

```
OS10# configure terminal
OS10(config)# dcbx enable
```

Buffer statistics tracking

OS10 offers the Buffer Statistics Tracking (BST) feature to observe buffer usage across the switch without any impact to performance. This feature maintains separate sets of counters for buffer usage accounting:

- Ingress priority-group
- Ingress service-pool
- Ingress shared-headroom-pool
- Egress queue
- Egress service-pool

You can obtain a snapshot of the buffer statistics for the different buffer objects, such as a snapshot of all ingress priority-groups associated to a port, all egress unicast queues bound to a port, and so on.

You can enable BST at the global level. OS10 tracks buffer utilization and provides the maximum peak statistics value over a period of time and the current value of the monitored BST counter.

Use the `buffer-statistics-tracking` command in SYSTEM-QOS mode to enable BST:

```
OS10# configure terminal
OS10(config)# system-qos
OS10(config-sys-qos)# buffer-statistics-tracking
```

Clear the counter

You can choose to reset the peak buffer utilization value and determine a new peak buffer utilization value. Use the `clear qos statistics type buffer-statistics-tracking` command to clear the tracked value and to refresh this counter.

BST tracks peak buffer utilization over a period of time. At any given point in time, the peak buffer usage from the past is displayed.

For example, if you enable BST at time T0 and use the `show` command to view the peak buffer utilization value at time T1, the peak usage between T0 and T1 is displayed. If you view the peak buffer utilization again at time T2, the peak usage between T0 and T2 is displayed. However, if you clear the counter using the `clear qos statistics type buffer-statistics-tracking` command at time T3 and view the peak buffer utilization at time T4, the peak usage between T3 and T4 is displayed.

NOTE: When BST is enabled, if you make any configuration changes that affect the priority group or priority mapping configuration, such as removal of class map, addition of class map to policy map (nqos), and so on, be sure to clear the buffer statistics using the `clear qos statistics type buffer-statistics-tracking` command to view the actual peak buffer utilization for the current configuration.

Advantages of BST include:

- Detecting microburst congestions
- Monitoring buffer utilization and historical trends
- Determining optimal sizes and thresholds for the ingress or egress shared buffers and headroom on a given port or queue based on real-time data

NOTE: BST is not supported on the S4248F-ON platforms.

After you disable BST, be sure to clear the counter using the `clear qos statistics type buffer-statistics-tracking` command.

Port to port-pipe and MMU mapping

A port pipe handles network traffic to and from a set of front-end I/O ports. On the Z9100–ON and Z9264F–ON platforms, interfaces are shared across port pipes and port pipes are shared across Memory Management Units (MMUs).

As interfaces span across port pipes, Dell Technologies recommends spreading ingress and egress interfaces across different port pipes for optimal performance. To find the port to port-pipe and MMU mapping, use the show qos port-map details command.

Z9100–ON output example:

```
OS10# show qos port-map details

------------------------------------------------------------------------------

Interface        Port Pipe       Ingress MMU     Egress MMU      Oper Status

------------------------------------------------------------------------------

Eth 1/1/1        1               2, 3            0, 2            up

```

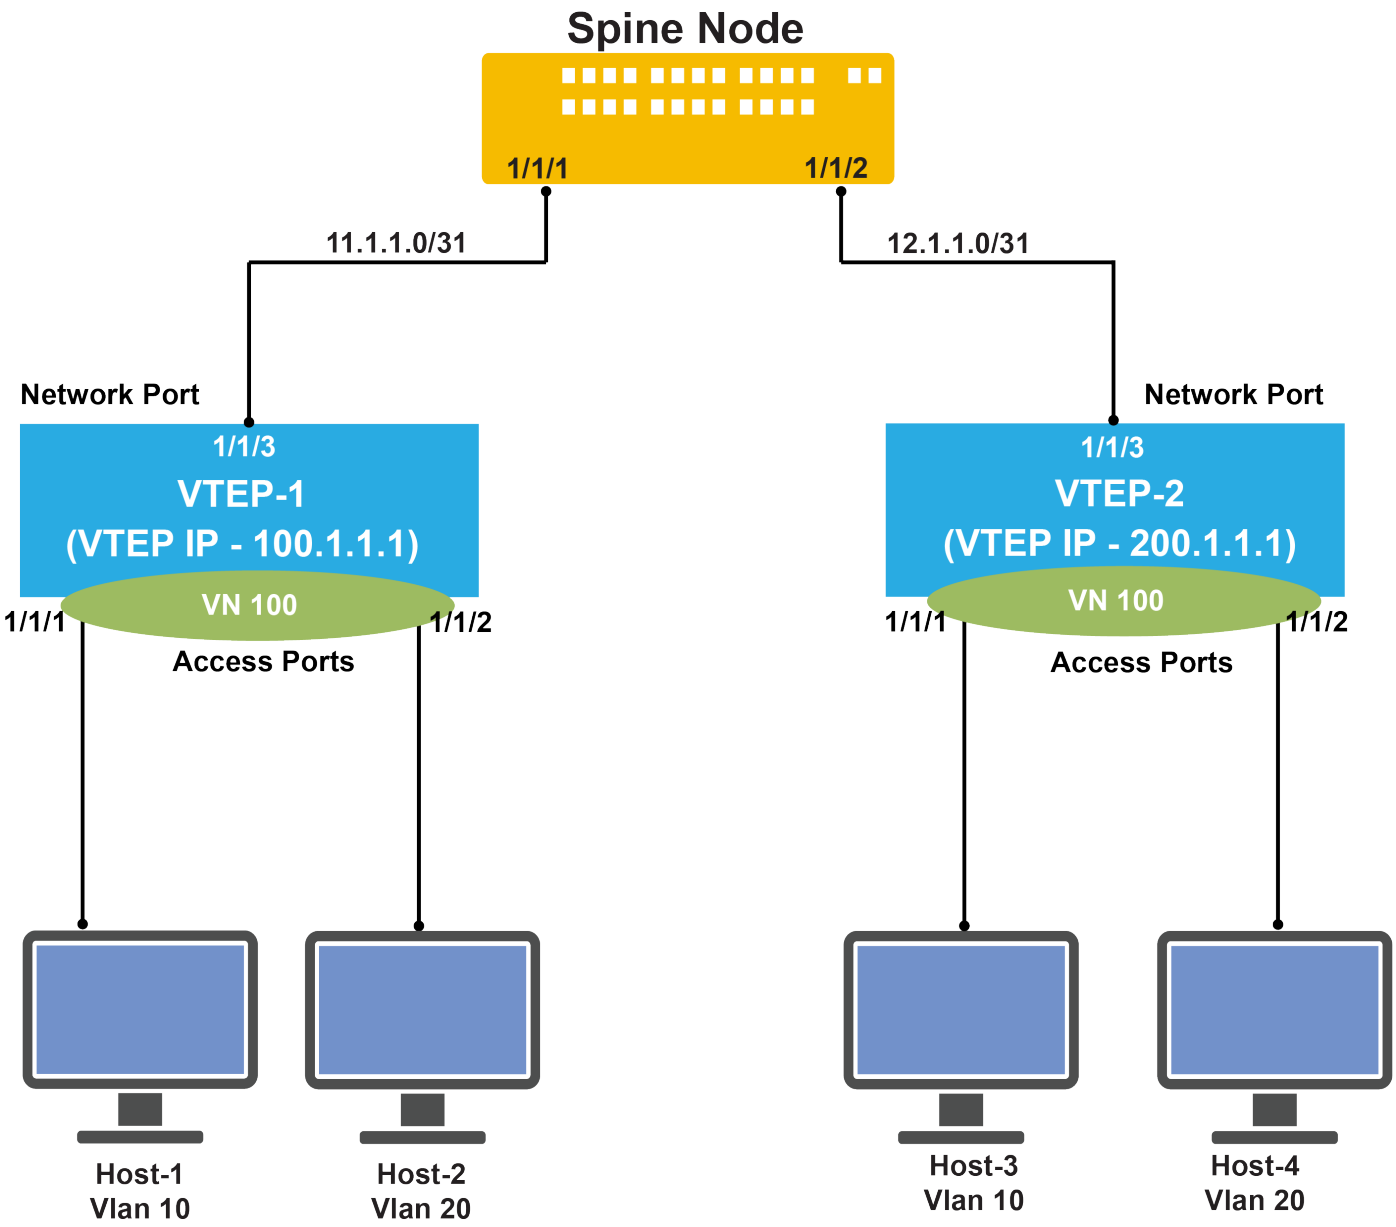
QoS VXLAN usecases

The section provides an overview of the QoS Use cases in a VxLAN environment.

The following topology is used for explaining the various use cases:



The topology consists of two VTEPs with VTEP IPs 100.1.1.1 and 200.1.1.1 respectively. The VTEPs are connected with the Spine node via L3 direct uplinks. Each VTEP has two hosts connected to the access ports, which are part of VLAN 10 and 20 respectively. These two access ports are configured to be part of virtual-network 100 in the VTEP.

Virtual Network Configuration:

```
virtual-network 100
!
member-interface ethernet1/1/1 vlan-tag 10

member-interface ethernet1/1/2 vlan-tag 20
!
vxlan-vni 100
```

QoS in VxLAN Access Ports (Traffic from Access ports to Access and Network ports)

Use Case 1: Default Behavior

Consider the incoming traffic in port 1/1/1 of VTEP-1 consists of dot1p priority of 3 and DSCP value of 3.

The below behavior will be seen in the encapsulated traffic flowing out of Port 1/1/3 and the other access port 1/1/2.

The Encapsulated traffic flowing out of port 1/1/3 will have DSCP value of 3 and do not have the dot1p priority value.

The Traffic egress out of port 1/1/2 will have VLAN 20, dot1p priority 3 and DSCP value of 3.

Use Case 2: QoS Policy to match incoming vlan and set dot1p priority

Create a Class Map to match the vlan in the incoming traffic and a Policy Map to set dot1p priority of 5 and apply the same on the incoming access ports.

```
Dell# show running-config class-map
!
class-map type qos match_vlan_set_dot1p

match vlan 10

Dell# show running-config policy-map
!
policy-map type qos match_vlan_set_dot1p
!
class match_vlan_set_dot1p

set cos 5

Dell# show running-config interface ethernet1/1/1
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos match_vlan_set_dot1p
```

The incoming traffic in port 1/1/1 has VLAN 10 and dot1p 3. The Policy map match_vlan_set_dot1p is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 do not have the dot1p priority set as the network ports links are L3 physical ports.

The traffic flowing out of port 1/1/2 will have VLAN 20 and dot1p priority set as 5.

Use Case 3: QoS Policy to match incoming VLAN and set DSCP

Create a Class Map to match the vlan in the incoming traffic and a Policy Map to set DSCP value of 30 and apply the same on the incoming access ports.

```
Dell# show running-config class-map
!
class-map type qos match_vlan_set_dscp

match vlan 10

Dell# show running-config policy-map
!
policy-map type qos match_vlan_set_dscp
!
class match_vlan_set_dscp

set dscp 30

Dell# show running-config interface ethernet1/1/1
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos match_vlan_set_dscp
```

The incoming traffic in port 1/1/1 is an IP traffic with VLAN 10 and dot1p 3 part of the VLAN header and DSCP value of 3 in the IP header. The Policy map match_vlan_set_dscp is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 has DSCP value of 30.

The traffic flowing out of port 1/1/2 will have VLAN 20, dot1p priority 3 and DSCP value of 30.

Use Case 4: QoS Policy to match incoming VLAN and set DSCP and outgoing Queue

Create a Class Map to match the vlan in the incoming traffic and a Policy Map to set DSCP value of 30 and the desired outgoing Queue number and apply the same on the incoming access ports. This usecase describes Access to network flow.

```
Dell# show running-config class-map
!
class-map type qos match_vlan_set_dscp_queue

match vlan 10

Dell# show running-config policy-map
!
policy-map type qos match_vlan_set_dscp_queue
!
class match_vlan_set_dscp_queue

set dscp 30

set qos-group 4

Dell# show running-config interface ethernet1/1/1
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos match_vlan_set_dscp_queue
```

The incoming traffic in port 1/1/1 is an IP traffic with VLAN 10 and dot1p 3 part of the VLAN header and DSCP value of 3 in the IP header. The Policy map match_vlan_set_dscp_queue is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 has DSCP value of 30 and flowing out of Queue 4.

The traffic flowing out of port 1/1/2 will have VLAN 20, dot1p priority 3 and DSCP value of 30 and flowing out of Queue 4.

Use Case 5: QoS Policy to match incoming dot1p and set DSCP and outgoing Queue

Create a Class Map to match the dot1p priority in the incoming traffic and a Policy Map to set DSCP value of 30 and the desired outgoing Queue number and apply the same on the incoming access ports.

```
Dell# show running-config class-map
!
class-map type qos match_dot1p_set_dscp_queue

match cos 3

Dell# show running-config policy-map
!
policy-map type qos match_dot1p_set_dscp_queue
!
class match_dot1p_set_dscp

set dscp 30

set qos-group 5

Dell# show running-config interface ethernet1/1/1
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos match_dot1p_set_dscp_queue
```

The incoming traffic in port 1/1/1 is an IP traffic with VLAN 10 and dot1p 3 part of the VLAN header and DSCP value of 3 in the IP header. The Policy map match_dot1p_set_dscp_queue is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 has DSCP value of 30 and flowing out of Queue 5.

The traffic flowing out of port 1/1/2 will have VLAN 20, dot1p priority 3 and DSCP value of 30 and flowing out of Queue 5.

Use Case 6: QoS Policy to match incoming DSCP and set new DSCP and outgoing Queue

Create a Class Map to match the DSCP value in the incoming traffic and a Policy Map to set a new DSCP value of 30, dot1p value of 6 and the desired outgoing Queue number 6 and apply the same on the incoming access ports.

```
Dell# show running-config class-map
!
class-map type qos match_dscp_set_dscp_queue

match dscp 3

Dell# show running-config policy-map
!
policy-map type qos match_dscp_set_dscp_queue
!
class match_dscp_set_dscp_queue

set dscp 30

set cos 6

set qos-group 6

Dell# show running-config interface ethernet1/1/1
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos match_dscp_set_dscp_queue
```

The incoming traffic in port 1/1/1 is an IP traffic with VLAN 10 and dot1p 3 part of the VLAN header and DSCP value of 3 in the IP header. The Policy map match_dscp_set_dscp_queue is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 has DSCP value of 30 and flowing out of Queue 6.

The traffic flowing out of port 1/1/2 will have VLAN 20, dot1p priority 6 and DSCP value of 30 and flowing out of Queue 6.

Use Case 7: QoS Policy applied on VLAN Tagged ports with Untagged access ports part of VN

Virtual Network Configuration with untagged member port

```
virtual-network 100
!
member-interface ethernet1/1/1 vlan-tag 10

member-interface ethernet1/1/2 untagged
!
vxlan-vni 100
```

Create a Class Map to match the DSCP value in the incoming traffic and a Policy Map to set a new DSCP value of 30, dot1p value of 6 and the desired outgoing Queue number 6 and apply the same on the incoming access port.

```
Dell# show running-config class-map
!
class-map type qos match_dscp_set_dscp_queue

match dscp 3

Dell# show running-config policy-map
!
policy-map type qos match_dscp_set_dscp_queue
!
class match_dscp_set_dscp_queue

set dscp 30

set cos 6

set qos-group 6
```

```
Dell# show running-config interface ethernet1/1/1
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos match_dscp_set_dscp_queue
```

The incoming traffic in port 1/1/1 is an IP traffic with VLAN 10 and dot1p 3 part of the VLAN header and DSCP value of 3 in the IP header. The Policy map match_dscp_set_dscp_queue is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 has DSCP value of 30 and flowing out of Queue 6. The traffic flowing out of port 1/1/2 will have DSCP value of 30 and flowing out of Queue 6 and do not have VLAN header since it is an untagged port.

Use Case 8: QoS Policy applied on Untagged access ports part of Virtual Networks

Create a Class Map to match the DSCP value in the incoming traffic and a Policy Map to set a new DSCP value of 30, dot1p value of 6 and the desired outgoing Queue number 6 and apply the same on the incoming untagged VxLAN access port.

```
Dell# show running-config class-map
!
class-map type qos untag_match_dscp_set_dot1p

match dscp 3

Dell# show running-config policy-map
!
policy-map type qos untag_match_dscp_set_dot1p
!
class untag_match_dscp_set_dot1p

set dscp 30

set cos 7

set qos-group 7

Dell# show running-config interface ethernet1/1/2
!
interface ethernet1/1/1

no shutdown

switchport mode trunk

service-policy input type qos untag_match_dscp_set_dot1p
```

The incoming traffic in port 1/1/2 is an IP traffic DSCP value of 3 in the IP header. The Policy map untag_match_dscp_set_dot1p is applied on the interface. This results in the following:

The Encapsulated traffic flowing out of Port 1/1/3 has DSCP value of 30 and flowing out of Queue 7.

The traffic flowing out of port 1/1/1 will have VLAN 10, dot1p priority 7 and DSCP value of 30 flowing out of Queue 7.

QoS in VxLAN Network Ports (Traffic from Network ports to Access ports)

Use Case 1: QoS Policy to match incoming DSCP and set new DSCP, dot1p and outgoing Queue

Create a Class Map to match the DSCP value in the incoming traffic on the Network port and a Policy Map to set a new DSCP value of 30 and the desired outgoing Queue number 6 and apply the same on the network port. The qos-group configured sets the outgoing dot1p priority in the egress traffic.

```
Dell# show running-config class-map
!
class-map type qos match_dscp_set_dscp_queue

match dscp 30

Dell# show running-config policy-map
!
policy-map type qos match_dscp_set_dscp_queue
!
```

```
class match_dscp_set_dscp_queue

set dscp 3

set cos 6

set qos-group 6

Dell# show running-config interface ethernet1/1/3
!
interface ethernet1/1/3

no shutdown

switchport mode trunk

service-policy input type qos match_dscp_set_dscp_queue
```

The incoming encapsulated traffic arriving in port 1/1/3 has a DSCP value of 30 in the Outer IP header. This DSCP value is matched in the Class Map. The Policy map match_dscp_set_dscp_queue is applied on the network port. This results in the following:

The traffic flowing out of Port 1/1/1 has DSCP value of 30, VLAN 10 and dot1p priority 6 in the packet and flows out of Queue 6.

The traffic flowing out of port 1/1/2 will have DSCP value of 3 flowing out of Queue 6. The traffic will not have any VLAN header as it is an untagged port. If port 1/1/2 is configured as a trunk port, the outgoing traffic will have the VLAN header with VLAN 20 and dot1p priority 6 in addition to the DSCP value of 6.

QoS in VTEPs if Network ports are L3 VLANs

In the previous sections, the Network ports on the VTEPs towards the Spine nodes are physical L3 uplinks. These network ports can also be L3 VLANs. If L3 VLANs are configured as network ports, the encapsulated packets will have the following and below actions can be performed.

1. The configured VLAN in the encapsulated VxLAN outer header.
2. The dot1p priority in the outer header can be modified using the Policy maps configured.

Similarly on the incoming packets on the network ports, the matching can be done based on the incoming dot1p priority and VLAN in addition to the DSCP value on the outer header of the encapsulated VxLAN packets.

QoS in Spine Node

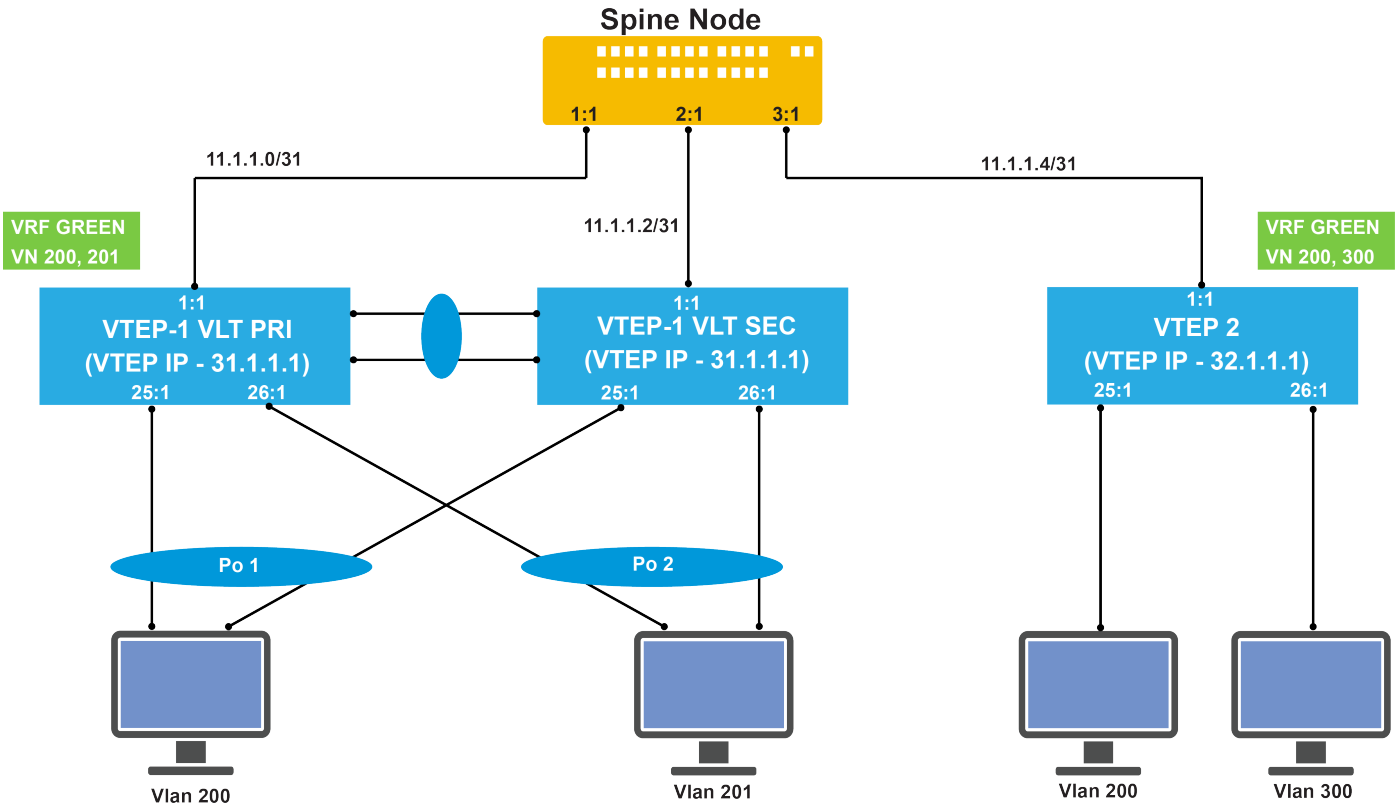
The QoS policy maps can be created in the Spine nodes. When policy maps are applied on the Spine interfaces, the packet matching and action both happens on the outer header of the VxLAN encapsulated packets. The below classification and remarking can be configured on the Spine nodes.

1. Match VLAN and set dot1p, set DSCP and set Queue.
2. Match DSCP and set dot1p, set DSCP and set Queue.
3. Match dot1p and set dot1p, set DSCP and set Queue.

QoS VXLAN examples

This section provides an overview of various QoS configurations in a VXLAN environment.

The following topology is used to explain various QoS configurations in a VXLAN environment:



Topology Description

This topology consists of two VTEPs and a spine node to which the VTEP nodes are connected. The two VTEPs are as follows:

- VTEP 1 – VLT VTEP consisting of a primary node and secondary node with VTEP IP as 31.1.1.1.
- VTEP 2 – Standalone node with VTEP IP as 32.1.1.1.

Each VTEP consists of a VRF (VRF GREEN) with two VNs in the VRF. Each VN is mapped to a corresponding Port-VLAN combination in the VTEP. In case of VTEP1, hosts are connected to the corresponding VLAN through the VLT port-channel. In case of VTEP-2, hosts are directly connected.

The VRF GREEN consists of VNs in symmetric IRB mode of routing over an EVPN VRF-VNI of 4001. Each virtual network has the corresponding IP addresses with anycast IP addresses and the Port-VLAN (P, V) configurations part of the Virtual Network.

The connectivity between the VTEP nodes and spine node are direct physical Layer 3 links.

Supported configurations

This section describes various QoS-VXLAN configurations.

Virtual network configuration

Virtual Network is an L2 Bridge domain in the overlay network. Each virtual network is configured with the access ports that are part of the virtual network and the VxLAN Network Identifier (VNI).

```
VTEP-1-VLT-PRI# show running-configuration virtual-network
!
virtual-network 200
 member-interface port-channel1 vlan-tag 200
 vlti-vlan 200
 !
 vxlan-vni 200
!
```

IRB configurations

To enable Routing between virtual networks over a VxLAN domain, each virtual network needs to be configured with an IRB interface. This IRB interface consists of the IP address and the anycast addresses. These addresses correspond to the virtual-network and the VRF on which the virtual network is a part. Both IPv4 and IPv6 addresses are supported for virtual-network interfaces.

In addition to the IRB interface configurations, you must configure the same anycast MAC address globally in all VTEPs using the ip virtual-router mac-address command.

```
VTEP-1-VLT-PRI# show running-configuration | grep mac
!
ip virtual-router mac-address 00:11:22:33:44:55
!

VTEP-1-VLT-PRI# show running-configuration interface virtual-network 200
!
interface virtual-network200
 no shutdown
 ip vrf forwarding green
 ip address 20.1.1.1/24
 ip virtual-router address 20.1.1.32
 ipv6 address 20::1/64
 ipv6 virtual-router address 20::32
```

EVPN configurations

You must map each virtual network to an EVPN Instance (EVI). Both auto-evi and manual-evi are supported.

Auto EVI configuration automatically creates an EVI and maps it to the VNI and assigns the RD and RT automatically to each of the EVI.

In case of manual configuration, you must create an EVI and map the VNI and add RD and RT for each EVI manually.

```
VTEP-1-VLT-PRI# show running-configuration evpn
!
evpn
 auto-evi
!
VTEP-1-VLT-PRI# show evpn evi 200

EVI : 200, State : up
  Bridge-Domain       : Virtual-Network 200, VNI 200
  Route-Distinguisher : 1:31.1.1.1:200(auto)
  Route-Targets       : 0:65000:268435656(auto) both
  Inclusive Multicast : 32.1.1.1
  IRB                 : Enabled(green)
```

Symmetric IRB specific configurations

To enable symmetric IRB over a VRF, you must configure a router MAC address in each VTEP and the VRF has to be configured with its own VRF-VNI, RD and RT.

```
VTEP-1-VLT-PRI# show running-configuration evpn
!
evpn
 auto-evi
 router-mac 00:aa:aa:aa:aa:aa
 !
 vrf green
  vni 4001
  route-target auto
!
VTEP-1-VLT-PRI# show evpn vrf l3-vni

VRF : green, State : up
  L3-VNI              : 4001
  Route-Distinguisher : 1:31.1.1.1.1:4001(auto)
  Route-Targets       : 0:65000:268439457(auto) both
  Remote VTEP         :
        32.1.1.1
VTEP-1-VLT-PRI# show evpn router-mac

Local Router MAC : 00:aa:aa:aa:aa:aa
```

```
Remote-VTEP                                Router's-MAC
32.1.1.1                                   00:bb:bb:bb:bb:bb

VTEP-1-VLT-PRI#
```

QoS configurations

The below section describes the QoS configurations. The example considers to match a dot1p priority 3 from the incoming traffic and set a DSCP value of 5 for the mapped traffic.

VTEP 1 to VTEP2

VTEP-1 (VLT Primary)- ACCESS to Network - Match dot1p set Dscp

Create a class map and add a match rule to map dot1p priority 3.

```
VTEP-1-VLT-PRI(config)# class-map type qos CMAP1
VTEP-1-VLT-PRI(config-cmap-qos)# match cos 3
```

Create a Policy MAP to set DSCP value of 5 for the traffic matched by class map CMAP1.

```
VTEP-1-VLT-PRI(config)# policy-map type qos PMAP1
VTEP-1-VLT-PRI(config-pmap-qos)# class CMAP1
VTEP-1-VLT-PRI(config-pmap-c-qos)# set dscp 5
```

Apply the policy map to the ingress interface.

```
VTEP-1-VLT-PRI(config)# interface ethernet 1/1/25:1
VTEP-1-VLT-PRI(conf-if-eth1/1/25:1)# service-policy input type qos PMAP1
```

Verify the configuration.

```
VTEP-1-VLT-PRI# show running-configuration class-map
!
class-map type qos CMAP1
 match cos 3

VTEP-1-VLT-PRI# show running-configuration policy-map
!
policy-map type qos PMAP1
 !
 class CMAP1
  set dscp 5

VTEP-1-VLT-PRI# show running-configuration interface ethernet 1/1/25:1
!
interface ethernet1/1/25:1
 no shutdown
 channel-group 1 mode active
 flowcontrol receive on
 mtu 9216
 service-policy input type qos PMAP1
```

VTEP-1 (VLT Secondary)- ACCESS to Network - Match dot1p set Dscp

You must also configure VLT Secondary node with the class map, policy map and apply it over the access interface.

Create a class map and add a match rule to map dot1p priority 3.

```
VTEP-1-VLT-SEC(config)# class-map type qos CMAP1
VTEP-1-VLT-SEC(config-cmap-qos)# match cos 3
```

Create a policy map to set DSCP value of 5 for the traffic matched by class map CMAP1.

```
VTEP-1-VLT-SEC(config)# policy-map type qos PMAP1
VTEP-1-VLT-SEC(config-pmap-qos)# class CMAP1
VTEP-1-VLT-SEC(config-pmap-c-qos)# set dscp 5
VTEP-1-VLT-SECI(config-pmap-c-qos)#
```

Apply the policy map to the ingress interface.

```
VTEP-1-VLT-SEC(config)# interface ethernet 1/1/25:1
VTEP-1-VLT-SEC(conf-if-eth1/1/25:1)# service-policy input type qos PMAP1
VTEP-1-VLT-SEC(conf-if-eth1/1/25:1)#
```

Verify the configurations.

```
VTEP-1-VLT-SEC# show running-configuration class-map
!
class-map type qos CMAP1
 match cos 3

VTEP-1-VLT-SEC# show running-configuration policy-map
!
policy-map type qos PMAP1
 !
 class CMAP1
  set dscp 5

VTEP-1-VLT-SEC# show running-configuration interface ethernet 1/1/25
!
interface ethernet1/1/25
 no shutdown
 channel-group 1 mode active
 flowcontrol receive on
 mtu 9216
 service-policy input type qos PMAP1
```

VTEP-2 Network Port to Access Port - Match DSCP Set dot1p

In VTEP 2, the incoming packet at the network port will have the DSCP configured in the VTEP-1. This example shows to set a dot1p priority for a traffic with a match dscp value.

Create a Class MAP and add a match rule to map DSCP value of 5.

```
VTEP-2(config)# class-map type qos CMAP1
VTEP-2(config-cmap-qos)# match ip dscp 5
```

Create a policy map to set dot1p value of 3 for the traffic matched by Class Map CMAP1.

```
VTEP-2(config)# policy-map type qos PMAP1
VTEP-2(config-pmap-qos)# class CMAP1
VTEP-2(config-pmap-c-qos)# set cos 3
VTEP-2(config-pmap-c-qos)# set qos-group 3
VTEP-2(config-pmap-c-qos)#
```

Apply the policy map to the network port of VTEP-2 so that it matches the incoming traffic from Spine node with the class map CMAP1 and apply the Policy MAP PMAP1 to the matched traffic.

```
VTEP-2(config)# interface ethernet 1/1/1:1
VTEP-2(conf-if-eth1/1/1:1)# service-policy input type qos PMAP1
VTEP-2(conf-if-eth1/1/1:1)#
```

Verify the configurations.

```
VTEP-2# show running-configuration class-map
!
class-map type qos CMAP1
 match ip dscp 5

VTEP-2# show running-configuration policy-map
!
policy-map type qos PMAP1
 !
 class CMAP1
  set cos 3
  set qos-group 3

VTEP-2# show running-configuration interface ethernet 1/1/1:1
!
```

```
interface ethernet1/1/1:1
 no shutdown
 no switchport
 ip address 11.1.1.4/31
 flowcontrol receive on
 mtu 9216
service-policy input type qos PMAP1
```

VTEP 2 to VTEP1

In the reverse direction traffic from VTEP-2 to VTEP-1, the below example matches one DSCP value and sets another DSCP value to the traffic in the Ingress VTEP VTEP-2 and then matches the incoming DSCP value and set a dot1p value in the Egress VTEP VTEP-1.

VTEP-2 Access to Network - Match DSCP Set DSCP

```
VTEP-2(config)# do show running-configuration class-map
!
class-map type qos CMAP2
 match ip dscp 5

VTEP-2(config)# do show running-configuration policy-map
!
policy-map type qos PMAP2
 !
 class CMAP2
  set dscp 7

VTEP-2(config)# do show running-configuration interface ethernet 1/1/3:1
!
interface ethernet1/1/3:1
 no shutdown
 switchport mode trunk
 switchport trunk allowed vlan 200
 mtu 9216
 flowcontrol receive off
 service-policy input type qos PMAP2
VTEP-2(config)#
```

VTEP-1 (VLT Secondary & Primary) Network to Access - Match dscp set dot1p

The below configuration matches a DSCP value and set a dot1p value. The configurations are common to both the devices in VLT.

```
VTEP-1-VLT-PRI(conf)# do show running-config class-map
!
class-map type qos CMAP2
 match ip dscp 7

VTEP-1-VLT-PRI(conf)# do show running-config policy-map
!
policy-map type qos PMAP2
!
 class CMAP2
  set cos 5
  set qos-group 5

VTEP-1-VLT-PRI(conf)#do show running-config ethernet 1/1/1:1
!
interface ethernet 1/1/1:1
 no shutdown
 no switchport
 ip address 11.1.1.0/31
 mtu 9216
 flowcontrol receive off
 service-policy input type qos PMAP2
```

QoS commands

bandwidth

Assigns a percentage of weight to the queue.

Syntax	`bandwidth percent` *value*
Parameters	`percent` *value* — Enter the percentage assignment of bandwidth to the queue, from 1 to 100.
Default	Not configured
Command Mode	POLICY-MAP CLASS-MAP
Usage Information	If you configure this command, you cannot use the `priority` command for the class.
Example	`OS10(config-pmap-c-que)# bandwidth percent 70`
Supported Releases	10.2.0E or later

buffer-statistics-tracking

Enables or disables buffer statistics tracking feature globally.

Syntax	`buffer-statistics-tracking`
Parameters	None
Default	Disabled
Command Mode	SYSTEM-QOS
Usage Information	The `no` form of the command disables buffer statistics tracking feature globally. After you disable BST, be sure to clear the counter using the `clear qos statistics type buffer-statistics-tracking` command.

Example	`OS10# configure terminal`
	`OS10(config)# system qos`
	`OS10(config-sys-qos)# buffer-statistics-tracking`

Supported Releases	10.4.3.0 or later

class

Creates a QoS class for a type of policy-map.

Syntax	`class` *class–name*
Parameters	*class-name* — Enter a name for the class-map. A maximum of 32 characters.
Default	Not configured
Command Mode	POLICY-MAP-QUEUEING POLICY-MAP-QOS POLICY-MAP-NQOS POLICY-MAP-CP POLICY-MAP-APPLICATION

Usage Information	If you define a class-map under a policy-map, the `qos`, `queuing`, or `control-plane` type is the same as the policy-map. You must create this map in advance. The only exception to this rule is when the policy-map type is `trust`, where the class type must be `qos`.
Example	`OS10(conf-pmap-qos)# class c1`
Supported Releases	10.2.0E or later

class-map

Creates a QoS class-map that filters traffic to match packets to the corresponding policy created for your network.

Syntax	`class-map [type {qos | queuing | control-plane}] [{match-any | match-all}] class-map-name`
Parameters	• `type` — Enter a class-map type. • `qos` — Enter a `qos` type class-map. • `queuing` — Enter a `queueing` type class-map. • `control-plane` — Enter a `control-plane` type class-map. • `match-all` — Determines how packets are evaluated when multiple match criteria exist. Enter the keyword to determine that all packets must meet the match criteria to be assigned to a class. • `match-any` — Determines how packets are evaluated when multiple match criteria exist. Enter the keyword to determine that packets must meet at least one of the match criteria to be assigned to a class. • *`class-map-name`* — Enter a class-map name. A maximum of 32 characters.
Defaults	• `qos` — class-map type • `match-any` — class-map filter
Command Mode	CLASS-MAP-QOS
Usage Information	Apply `match-any` or `match-all` class-map filters to `control-plane`, `qos`, and `queuing` type class-maps.
Example	`OS10(config)# class-map type qos match-all c1` `OS10(conf-cmap-qos)#`
Command History	10.2.0E or later

clear qos statistics

Clears all QoS-related statistics in the system, including PFC counters.

Syntax	`clear qos statistics`
Parameters	None
Default	Not configured
Command Mode	EXEC
Usage Information	None
Example	`OS10# clear qos statistics`
Supported Releases	10.2.0E or later

clear qos statistics type

Clears all queue counters, including PFC, for control-plane, qos, and queueing.

Syntax

```
clear qos statistics type {{qos | queuing | control-plane | buffer-statistics-tracking} [interface ethernet node/slot/port[:subport]]}
```

Parameters

- `qos`—Clears `qos` type statistics.
- `queuing`—Clears `queueing` type statistics.
- `control-plane`—Clears `control-plane` type statistics.
- `buffer-statistics-tracking`—Clears the peak buffer usage count statistics on all interfaces and service pools.

  NOTE: This command does not clear the ingress service-pool statistics on the Z9100-ON platform.
- `interface ethernet` *node-id/slot/port-id [:subport]* — Clears QoS statistics for an Ethernet interface configured for `qos`, `queuing`, or `control-plane`.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# clear qos statistics type qos interface ethernet 1/1/5
```

Example (control-plane)

```
OS10# clear qos statistics type control-plane interface ethernet 1/1/7
```

Example (queuing)

```
OS10# clear qos statistics type queuing interface ethernet 1/1/2
```

Example (BST)

```
OS10# clear qos statistics type buffer-statistics-tracking
```

Supported Releases 10.2.0E or later

control-plane

Enters CONTROL-PLANE mode.

Syntax

```
control-plane
```

Parameters None

Default Not configured

Command Mode CONTROL-PLANE

Usage Information If you attach an access-list to the `class-map` type of control-plane, the access-list ignores the `permit` and `deny` keywords.

Example (class-map)

```
OS10(config)# class-map type control-plane c1
OS10(config-cmap-control-plane)#
```

Example (policy-map)

```
OS10(config)# policy-map type control-plane p1
OS10(config-pmap-control-plane)#
```

Supported Releases 10.2.0E or later

control-plane-buffer-size

Configures the buffer size for the CPU pool.

Syntax `control-plane-buffer-size size-of-buffer-pool`

Parameters *size-of-buffer-pool*—Enter the buffer size in KB, from 620 KB to 900 KB.

Default None

Command Mode SYSTEM-QOS

Usage Information This command configures the buffer size of the CPU pool. The system allocates a buffer size for the CPU pool from the total system buffer. A minimum guaranteed buffer is allocated for each of the CPU queues and the rest is available for shared usage. The size of the buffer pool varies based on the number of CPU queues and buffer usage by each queue, but it cannot be less than the aggregate of the minimum guaranteed buffer allocated for each of the CPU queues. The `no` version of this command removes the buffer size configured for the CPU pool and returns the buffer size to the default value, 620 KB.

Example

```
OS10(config-sys-qos)# control-plane-buffer-size 900
```

Supported Releases 10.4.2.0 and later

flowcontrol

Enables or disables link-level flow control on an interface.

Syntax `flowcontrol [receive | transmit] [on | off]`

Parameters

- `receive` — (Optional) Indicates the port can receive flow control packets from a remote device.
- `transmit` — (Optional) Indicates the local port can send flow control packets to a remote device.
- `on` — (Optional) When used with `receive`, allows the local port to receive flow control traffic. When used with `transmit`, allows the local port to send flow control traffic to the remote device.
- `off` — (Optional) When used with `receive`, ignores the flow control traffic sent to the local port. When used with `transmit`, disables the local port from sending flow control traffic to the remote device.

Default Disabled (`off`)

Command Mode INTERFACE

Usage Information The `no` version of this command returns the value to the default.

Example

```
OS10(conf-if-eth1/1/2)# flowcontrol transmit on
```

Supported Releases 10.3.0E or later

hardware deep-buffer-mode

Configures Deep Buffer mode.

Syntax `hardware deep-buffer-mode`

Parameters None

Defaults Disabled

Command Modes CONFIGURATION

Usage Information

Applicable only for the S4200-ON series switches. Deep Buffer mode configuration takes effect only after you save it in the startup configuration and reboot the switch. The `no` version of this command disables Deep Buffer mode.

Example

```
OS10(config)# hardware deep-buffer-mode
```

Supported Releases

10.4.3.0 or later

match

Configures match criteria for the QoS policy.

Syntax

```
match {cos cos-number | ip [access-group name name | dscp dscp-value [ecn
ecn-value] | precedence value] | ip-any [dscp dscp-value [ecn ecn-value]
| precedence value] | ipv6 [access-group name name | dscp dscp-value [ecn
ecn-value] | precedence value] | mac access-group acl-name | not [cos | ip
| ip-any | ipv6] | vlan vlan-id | protocol-or-application-name}
```

Parameters

- `cos` *cos—number* — Enter a queue number for the CoS match criteria, from 0 to 7.
- `ip` — Enter the IPv4 match criteria.
- `access-group name` *name* — (Optional) Enter the IPv4 access-group name.
- `dscp` *dscp-value* — (Optional) Enter a DSCP value for L3 DSCP match criteria, from 0 to 63.
- `ecn` *ecn-value* — (Optional) Enter a ECN value for ECN bit match criteria, from 0 to 3.
- `precedence` *value* — (Optional) Enter a precedence value for L3 precedence match criteria, from 0 to 7.
- `ip-any` — Enter the IPv4 or IPv6 match criteria.
- `dscp` *dscp-value* — (Optional) Enter a DSCP value for L3 DSCP match criteria, from 0 to 63.
- `ecn` *ecn-value* — (Optional) Enter a ECN value for ECN bit match criteria, from 0 to 3.
- `precedence` *value* — (Optional) Enter a precedence value for L3 precedence match criteria, from 0 to 7.
- `ipv6` — Enter the IPv6 match criteria.
- `access-group name` *name* — (Optional) Enter the IPv6 access-group name.
- `dscp` *dscp-value* — (Optional) Configure a DSCP value for L3 DSCP match criteria, from 0 to 63.
- `ecn` *ecn-value* — (Optional) Enter a ECN value for ECN bit match criteria, from 0 to 3.
- `mac access-group name` *name* — Enter an access-group name for the MAC access-list match criteria. A maximum of 140 characters.
- `dscp` *dscp-value* — Enter a DSCP value for marking the DSCP packets, from 0 to 63.
- `not` — Enter the IP or CoS to negate the match criteria.
- `vlan` *vlan-id* — Enter a VLAN number for VLAN match criteria, from 1 to 4093.
- *protocol-or-application-name* — Enter the name of the protocol or application that you want to move from one queue to another.

Default

Not configured

Command Mode

CLASS-MAP

Usage Information

In a `match-any` class, you can enter multiple match criteria. In a `match-all` class, if the match case is `access-group`, no other match criteria is allowed. If you attach the access-list to `class-map type control—plane` or `qos`, the access-list (IPv4, IPv6) ignores the `permit` and `deny` keywords.

Example 1

```
OS10(conf-cmap-qos)# match ip access-group name ag1
OS10(config-cmap-qos)# match ipv6 access-group name ACLv6
```

Example 2

```
OS10(config)# class-map type control-plane example-queue-remap
OS10(config-cmap-control-plane)# match vrrp
```

Supported Releases	10.2.0E or later

match cos

Matches a cost of service (CoS) value to L2 dot1p packets.

Syntax	`match [not] cos cos-value`
Parameters	• *cos-value* — Enter a CoS value, from 0 to 7. • `not` — Enter `not` to cancel the match criteria.
Default	Not configured
Command Modes	CLASS-MAP
Usage Information	You cannot have two match statements with the same filter-type. If you enter two match statements with the same filter-type, the second statement overwrites the first statement.
Example	`OS10(conf-cmap-qos)# match cos 3`
Supported Releases	10.2.0E or later

match dscp

Configures a DSCP value as a match criteria for a class-map.

Syntax	`match [not] {ip | ipv6 | ip-any } dscp [dscp-value] [ecn ecn-value]`
Parameters	• `not` — (Optional) Enter to cancel a previously applied match criteria. • `ip` — Enter to use IPv4 as the match protocol. • `ipv6` — Enter to use IPv6 as the match protocol. • `ip-any` — Enter to use both IPv4 and IPv6 as the match protocol. • `dscp dscp-value` — Enter a DSCP value in single numbers, comma separated, or a hyphenated range, from 0 to 63. • `ecn ecn-value` — (Optional) Enter a ECN value for ECN bit match criteria, from 0 to 3.
Default	Not configured
Command Mode	CLASS-MAP
Usage Information	You cannot enter two match statements with the same filter-type. If you enter two match statements with the same filter-type, the second statement overwrites the first statement. The `match-all` option in a class-map does not support `ip-any`. Select either `ip` or `IPv6` for the `match-all` criteria. If you select `ip-any`, you cannot select `ip` or `ipv6` for the same filter type.
Example	`OS10(conf-cmap-qos)# match ip-any dscp 17-20`
Supported Releases	10.2.0E or later

match precedence

Configures IP precedence values as a match criteria.

Syntax	`match [not] {ip | ipv6 | ip-any} precedence precedence-list`
Parameters	• `not` — Enter to cancel a previously applied match precedence rule. • `ip` — Enter to use IPv4 as the match precedence rule.

- `ipv6` — Enter to use IPv6 as the match precedence rule.
- `ip-any` — Enter to use both IPv4 and IPv6 as the match precedence rule.
- `precedence` *`precedence-list`* — Enter a precedence-list value, from 0 to 7.

Default	Not configured
Command Mode	CLASS-MAP
Usage Information	You cannot enter two match statements with the same filter-type. If you enter two match statements with the same filter-type, the second statement overwrites the first statement.
Example	`OS10(conf-cmap-qos)# match not ipv6 precedence 3`
Supported Releases	10.2.0E or later

match queue

Configures a match criteria for a queue.

Syntax	`match queue` *`queue-number`*
Parameters	*`queue-number`* — Enter a queue number, from 0 to 7.
Default	Not configured
Command Mode	CLASS-MAP
Usage Information	You can configure this command only when the class-map type is `queuing`. You cannot enter two match statements with the same filter-type. If you enter two match statements with the same filter-type, the second statement overwrites the first statement.
Example	`OS10(conf-cmap-queuing)# match queue 1`
Supported Releases	10.2.0E or later

match vlan

Configures a match criteria based on the VLAN ID number.

Syntax	`match vlan` *`vlan-id`*
Parameters	*`vlan-id`* — Enter a VLAN ID number, from 1 to 4093.
Default	Not configured
Command Mode	CLASS-MAP
Usage Information	You cannot enter two match statements with the same filter-type. If you enter two match statements with the same filter-type, the second statement overwrites the first statement.
Example	`OS10(conf-cmap-qos)# match vlan 100`
Supported Releases	10.2.0E or later

mtu

Calculates the buffer size allocation for matched flows.

Syntax	`mtu` *`size`*

Parameters *size* — Enter the size of the buffer (1500 to 9216).

Default 9216

Command Mode POLICY-MAP-CLASS-MAP

Usage Information The `no` version of this command returns the value to the default.

Example

```
OS10(conf-pmap-nqos-c)# mtu 2500
```

Supported Releases 10.3.0E or later

pause

Enables a pause based on buffer limits for the port to start or stop communication to the peer.

Syntax `pause [buffer-size size pause-threshold xoff-size resume-threshold xon-size]`

Parameters

- `buffer-size size` — (Optional) Enter the ingress buffer size used as a guaranteed buffer in KB, default values: 10G–45KB, 40G–93KB.
- `pause-threshold xoff-size` — (Optional) Enter the buffer limit for the port to start or initiate a `pause` to the peer in KB, default values: 10G–9KB, 40G–18KB.
- `resume-threshold xon-size` — (Optional) Enter the buffer limit for the port to stop or cancel sending a `pause` to the peer in KB (defaults 10G–9KB, 40G–9KB).

Default See parameter values

Command Mode POLICY-MAP-CLASS-MAP

Usage Information Only use this command under the `network-qos` policy type. Buffer-size, pause-thresholds, and resume-thresholds vary based on platform. Add the policy-map with `pause` to system-qos to service an input to enable `pause` on all ports, based on a per-port link-level Flow-Control or Priority Flow-Control enable mode. The `xoff` and `xon` threshold settings for link-level flow-control are applied on ports where all traffic classes must be mapped to a single PG. Platform-specific default values are based on MTU sizes of 9216 and cable length of 100 meters. The `no` version of this command returns the value to the default.

Example

```
OS10(conf-pmap-c-nqos)# pause buffer-size 45 pause-threshold 25 resume-threshold 10
```

Example (global and shared buffer)

```
OS10(config)# policy-map type network-qos nqGlobalpolicy1
OS10(conf-cmap-nqos)# class CLASS-NAME
OS10(conf-cmap-nqos-c)# pause buffer-size 45 pause-threshold 30 resume-threshold 30
```

```
OS10(config)# policy-map type network-qos nqGlobalpolicy1
OS10(conf-cmap-nqos)# class type network-qos nqclass1
OS10(conf-cmap-nqos-c)# pause buffer-size 45 pause-threshold 30 resume-threshold 10
```

Supported Releases 10.3.0E or later

pfc-cos

Configures priority flow-control for cost of service (CoS).

Syntax `pfc-cos cos-value`

Parameters	*cos-value* — Enter a single, comma-delimited, or hyphenated range of CoS values for priority flow-control to enable, from 0 to 7. **NOTE:** The range 0-7 is invalid. All other ranges, including 0-6 and 1-7 are valid.
Default	Not configured
Command Mode	POLICY-MAP-CLASS-MAP
Usage Information	To configure link-level flow-control, do not configure `pfc-cos` for the matched class for this policy. Add the policy-map with the `pfc-cos` configuration to `system-qos` to service an input to enable priority flow-control behavior on all ports, based on a per-port Priority Flow-Control Enable mode. Add the policy-map with the `pfc-cos` configuration to interface configurations to service at input and enable Priority Flow-Control on that particular port, based on the port's Priority Flow-Control Enable mode. If you configure 40G to 10G mode on interfaces and `pause` (no drop) is enabled on `system-qos`, all queues may or may not drop traffic based on the availability of buffers. The `no` version of this command returns the value to the default.
Example	`OS10(conf-pmap-c-nqos)# pfc-cos 0-2`

Example (global buffer/shared buffer)	`OS10(config)# policy-map type network-qos nqGlobalpolicy1`
	`OS10(conf-cmap-nqos)# class CLASS-NAME`
	`OS10(conf-cmap-nqos-c)# pause buffer-size 45 pause-threshold 25 resume-threshold 10`
	`OS10(conf-cmap-nqos-c)# pfc-cos 0-2`
	`OS10(conf-cmap-nqos-c)# queue-limit 140`

Supported Releases	10.3.0E or later

pfc-max-buffer-size

Configures the maximum buffer size for priority flow-control enabled flows.

Syntax	`pfc-max-buffer-size` *max-buffer-size*
Parameters	*max-buffer-size* — Enter the maximum buffer size in KB.
Default	None
Command Mode	SYSTEM-QOS
Usage Information	This command configures the maximum size of the lossless buffer pool. The `no` version of this command removes the maximum buffer size limit.
Example	`OS10(config-sys-qos)# pfc-max-buffer-size 2000`
Supported Releases	10.4.0E(R1) or later

pfc-shared-buffer-size

Changes the shared buffers size limit for priority flow-control enabled flows.

Syntax	`pfc-shared-buffer-size` *buffer-size*
Parameters	*buffer-size* — Enter the size of the priority flow-control buffer in KB, from 0 to 8911.
Default	832 KB
Command Mode	SYSTEM-QOS
Usage Information	The `no` version of this command returns the value to the default.

Example

```
OS10(conf-sys-qos)# pfc-shared-buffer-size 2000
```

Supported Releases 10.3.0E or later

pfc-shared-headroom-buffer-size

Configures the shared headroom size for absorbing the packets after pause frames generate.

NOTE: This command is available only on the following platforms:

- S5212F-ON, S5224F-ON, S5232F-ON, S5248F-ON, S5296F-ON
- Z9100-ON
- Z9264F-ON

Syntax `pfc-shared-headroom-buffer-size headroom-buffer-size`

Parameters *headroom-buffer-size* — Enter the size of the priority flow-control headroom buffer in KB, from 1 to 3399.

Default 1024 KB

Command Mode SYSTEM-QOS

Usage Information All PFC-enabled priority groups can use the shared headroom space. Headroom is the buffer space that absorbs the incoming packets after the PFC frames reach the sender. After the threshold is reached, PFC frames generate towards the sender. The packets sent by the sender after the PFC frames generate are absorbed into the Headroom buffer. The `no` version of this command returns the value to the default.

Example

```
OS10(conf-sys-qos)# pfc-shared-headroom-buffer-size 2000
```

Supported Releases 10.4.0E(R1) or later

police

Configures traffic policing on incoming traffic.

Syntax `police {cir committed-rate [bc committed-burst-size]} {pir peak-rate [be peak-burst-size]}`

Parameters

- `cir committed-rate` — Enter a committed rate value in kilo bits per second, from 0 to 4000000.
- `bc committed-burst-size` — (Optional) Enter the committed burst size in packets for control plane policing and in KB for data packets, from 16 to 200000.
- `pir peak-rate` — Enter a peak-rate value in kilo bits per second, from 0 to 40000000.
- `be peak-burst-size` — (Optional) Enter a peak burst size in kilo bytes, from 16 to 200000.

Defaults

- `bc committed-burst-size` value is 200 KB for `control plane` and 100 KB for all other class-map types
- `be peak-burst-size` value is 200 KB for `control plane` and 100 KB for all other class-map types

Command Mode POLICY-MAP-CLASS-MAP

Usage Information If you do not provide the peak-rate `pir` values, the committed-rate `cir` values are taken as the `pir` values. Only the ingress QoS policy type supports this command. For control-plane policing, the rate values are in pps.

Example

```
OS10(conf-pmap-c-qos)# police cir 5 bc 30 pir 20 be 40
```

Supported Releases 10.2.0E or later

policy-map

Enters QoS POLICY-MAP mode and creates or modifies a QoS policy-map.

Syntax

```
policy-map policy-map-name [type {qos | queuing | control-plane | application | network-qos }]
```

Parameters

- *policy-map-name* — Enter a class name for the policy-map. A maximum of 32 characters.
- type — Enter the policy-map type.
  - qos — Create a qos policy-map type.
  - queuing — Create a queueing policy-map type.
  - control-plane — Create a control-plane policy-map type.
  - application — Create an application policy-map type.
  - network-qos — Create a network-qos policy-map type.

Defaults qos = class-map type and match-any = class-map filter

Command Mode CONFIGURATION

Usage Information The no version of this command deletes a policy-map.

Example

```
OS10(config)# policy-map p1
```

Example (Queuing)

```
OS10(config)# policy-map type queuing p1
```

Supported Releases 10.2.0E or later

priority

Sets the scheduler as a strict priority.

Syntax

```
priority
```

Parameters None

Default WDRR — when priority is mentioned, it moves to SP with default level 1.

Command Mode POLICY-MAP-CLASS-MAP

Usage Information If you use this command, bandwidth is not allowed. Only the egress QoS policy type supports this command.

Example

```
OS10(config-pmap-c-que)# priority
```

Supported Releases 10.2.0E or later

priority-flow-control mode

Enables or disables Priority Flow-Control mode on an interface.

Syntax

```
priority-flow-control mode [on]
```

Parameters

- on — (Optional) Enables Priority Flow-Control mode.

Default Disabled

Command Mode INTERFACE

Usage Information Before enabling priority flow-control on a interface, verify a matching network-qos type policy is configured with the pfc-cos value for an interface. Use this command to disable priority flow-control if

	you are not using a `network-qos` type policy for an interface. The `no` version of this command returns the value to the default.
Example	`OS10(conf-if-eth1/1/2)# priority-flow-control mode on`
Supported Releases	10.3.0E or later

qos-group dot1p

Configures a dot1p trust map to the traffic class.

Syntax	`qos-group tc-list [dot1p values]`
Parameters	• `qos-group tc-list` — Enter the traffic single value class ID, from 0 to 7. • `dot1p values` — (Optional) Enter either single, comma-delimited, or a hyphenated range of dot1p values, from 0 to 7.
Default	0
Command Mode	TRUST-MAP
Usage Information	If the trust map does not define dot1p values to any traffic class, those flows map to the default traffic class `0`. If some of the dot1p values are already mapped to an existing traffic class, you see an error. You must have a 1:1 dot1p-to-traffic class mapping for PFC-enabled CoS values. You must also have a common dot1p trust map for all interfaces using DCB. The `no` version of this command returns the value to the default.
Example	`OS10(conf-tmap-dot1p-qos)# qos-group 5 dot1p 5`
Supported Releases	10.3.0E or later

qos-group dscp

Configures a DSCP trust map to the traffic class.

Syntax	`qos-group tc-list [dscp values]`
Parameters	• `qos-group tc-list` — Enter the traffic single value class ID, from 0 to 7. • `dscp values` — (Optional) Enter either single, comma-delimited, or a hyphenated range of DSCP values, from 0 to 63.
Default	0
Command Mode	TRUST-MAP
Usage Information	If the trust map does not define DSCP values to any traffic class, those flows map to the default traffic class `0`. If some of the DSCP values are already mapped to an existing traffic class, you will see an error. The `no` version of this command returns the value to the default.
Example	`OS10(conf-tmap-dscp-qos)# qos-group 5 dscp 42`
Supported Releases	10.3.0E or later

qos-map traffic-class

Creates a user-defined trust map for queue mapping.

Syntax	`qos-map traffic-class map-name`

Parameters *map-name* — Enter the name of the queue trust map. A maximum of 32 characters.

Default Not configured

Command Mode CONFIGURATION

Usage Information If applied on the interface or system level, the traffic class routes all traffic to the mapped queue. The `no` version of this command returns the value to the default.

Example

```
OS10(config)# qos-map traffic-class queue-map1
OS10(config-qos-map)# queue 1 qos-group 5
OS10(config-qos-map)# queue 2 qos-group 6
OS10(config-qos-map)# queue 3 qos-group 7
```

NOTE: For the Z9332F-ON platform, you must specify the type of queue. For example:

```
OS10(config)# qos-map traffic-class queue-map1
OS10(config-qos-map)# queue 1 qos-group 5 type ucast
OS10(config-qos-map)# queue 2 qos-group 6 type mcast
OS10(config-qos-map)# queue 3 qos-group 7 type mcast
```

Supported Releases 10.3.0E or later

qos-rate-adjust

Configures additional number of data bytes to add to overhead fields per frame for rate calculations.

Syntax `qos-rate-adjust [value-of-adjust]`

Parameters *value-of-adjust*—Number of bytes to add to overhead fields in each frame, from 1 to 31.

Default 0

Command Mode CONFIGURATION

Usage Information The `no` form of this command removes the rate adjustment configuration and is the same as using the `qos-rate-adjust 0` command.

Example

```
OS10(config)# qos-rate-adjust 10
```

Supported Releases 10.4.3.0 or later

queue-limit

Configures static or dynamic shared buffer thresholds.

Syntax `queue-limit {queue-len value | thresh-mode [dynamic threshold-alpha-value | static threshold-value]}`

Parameters

- `queue-len value` — Enter the guaranteed size for the queue, from 0 to 8911.
  - 45 KB (10G)/111 KB (40G) if the queue is priority flow control enabled
  - 2 KB (10G)/8 KB (40G) if the queue is lossy/link-level flow control
  - If this is a priority flow-control queue, this configuration is invalid
  - Only supported for POLICY-MAP-CLASS-MAP (`pmap-c-queue`) mode
- `thresh-mode` — (Optional) Buffer threshold mode.
- `dynamic thresh-alpha-value` — (Optional) Enter the value indexes to calculate the shared threshold to the enabled dynamic shared buffer threshold, from 0 to 10. Defaults:
  - 0 = 1/128
  - 1 = 1/64
  - 2 = 1/32

- 3 = 1/16
- 4 = 1/8
- 5 = 1/4
- 6 = 1/2
- 7 = 1
- 8 = 2
- 9 = 4
- 10 = 8

- `static` *`thresh-value`* — (Optional) Enter the static shared buffer threshold value in Bytes, from 1 to 65535.

Default Not configured

Command Mode POLICY-MAP-CLASS-MAP

Usage Information Use the `queue-len` *`value`* parameter to set the minimum guaranteed queue length for a queue. The `no` version of this command returns the value to the default.

Example

```
OS10(config)# policy-map type network-qos nqGlobalpolicy1
OS10(conf-cmap-nqos)# class type network-qos nqclass1
OS10(conf-cmap-nqos-c)# pause buffer-size 45 pause-threshold 30 resume-
threshold 10
OS10(conf-cmap-nqos-c)# queue-limit 150
```

Example (queue)

```
OS10(config)# policy-map type queuing pmap1
OS10(config-pmap-queuing)# class cmap1
OS10(config-pmap-c-que)# queue-limit queue-len 100
OS10(config-pmap-c-que)# queue-limit thresh-mode static 50
```

Supported Releases 10.3.0E or later

queue bandwidth

Configures a bandwidth for a given queue on interface.

Syntax `queue` *`queue-number`* `bandwidth` *`bandwidth-percentage`*

Parameters

- *`queue-number`* — Enter the queue number.
- *`bandwidth-percentage`* — Enter the percentage of bandwidth.

Default Not configured

Command Mode POLICY-MAP-CLASS-MAP

Usage Information The `no` version of this command removes the bandwidth from the queue.

Example None

Supported Releases 10.4.0E(R1) or later

queue qos-group

Configures a dot1p traffic class to a queue.

Syntax `queue` *`number`* `[qos-group` *`dot1p-values]`*

Parameters

- `queue` *`number`* — Enter the traffic single value queue ID, from 0 to 7.
- `qos-group` *`dot1p-values`* — (Optional) Enter either single, comma-delimited, or a hyphenated range of dot1p values, from 0 to 7.

Default	0
Command Mode	TRUST-MAP
Usage Information	If the trust map does not define traffic class values to a queue, those flows map to the default queue `0`. If some of the traffic class values are already mapped to an existing queue, you see an error. The `no` version of this command returns the value to the default.
Example	`OS10(conf-tmap-tc-queue-qos)# queue 2 qos-group 5`
Supported Releases	10.3.0E or later

queue qos-group (Z9332F-ON)

Configure mapping for different traffic class types to different queues.

Syntax	`queue` *`number`* `qos-group` *`traffic-class-number`*`type {unicast | multicast}`
Parameters	• `queue` *`number`* — Enter the traffic single value queue ID, from 0 to 7. Multicast Queue ranges from 0 to 2. • `qos-group` *`traffic-class-number`* — Enter the traffic class number, either single, comma-delimited, or hyphenated-range • `type`*`unicast | multicast`* — Select either a unicast or multicast queue type
Default	NA
Command Mode	CONFIGURATION (config-qos-map)
Usage Information	The command applies to Z9332F-ON. The `no` version of this command returns the value to the default.
Example	`OS10(config-qos-map)# queue 2 qos-group 2-5 type unicast`
Supported Releases	10.5.0 or later

random-detect (interface)

Assigns a WRED profile to the specified interface.

Syntax	`random-detect` *`wred-profile`*
Parameters	*`wred-profile`* — Enter the name of an existing WRED profile.
Default	Not configured
Command Mode	INTERFACE
Usage Information	The `no` version of this command removes the WRED profile from the interface.
Example	`OS10(config)# interface ethernet 1/1/1` `OS10(conf-if-eth1/1/1)# random-detect test_wred`
Supported Releases	10.4.0E(R1) or later

random-detect (queue)

Assigns a WRED profile to the specified queue.

Syntax `random-detect wred-profile-name`

Parameters *wred-profile-name* — Enter the name of an existing WRED profile.

Default Not configured

Command Mode PMAP-C-QUE

Usage Information The `no` version of this command removes the WRED profile from the queue.

Example

```
OS10(config)# policy-map type queuing p1
OS10(config-pmap-queuing)# class c1
OS10(config-pmap-c-que)# random-detect test_wred
```

Supported Releases 10.4.0E(R1) or later

random-detect color

Configures the threshold of WRED profile for available colors.

Syntax `random-detect color color-name minimum-threshold minimum-value maximum-threshold maximum-value drop-probability drop-rate`

Parameters

- *color-name* — Enter the color of drop precedence for the WRED profile. The available options are green, yellow, and red.
- *minimum-value* — Enter the minimum threshold value for the specified color, from 1 to 12480.
- *maximum-value* — Enter the maximum threshold value for the specified color, from 1 to 12480.
- *drop-rate* — Enter the rate of drop precedence in percentage, from 0 to 100.

Default Not configured

Command Mode WRED CONFIGURATION

Usage Information The `no` version of this command removes the WRED profile.

Example

```
OS10(config)# wred test_wred
OS10(config-wred)# random-detect color green minimum-threshold 100
maximum-threshold 300 drop-probability 40
```

Supported Releases 10.4.0E(R1) or later

random-detect ecn

Enables explicit congestion notification (ECN) for the WRED profile.

Syntax `random-detect ecn`

Parameters None

Default Not configured

Command Mode WRED CONFIGURATION

Usage Information The `no` version of this command disables ECN.

Example

```
OS10(config)# wred test_wred
OS10(config-wred)# random-detect ecn
```

Supported Releases 10.4.0E(R1) or later

random-detect ecn

Enables ECN for the system globally.

Syntax `random-detect ecn`

Default Not configured

Command Mode SYSTEM QOS

Usage Information The `no` version of this command disables ECN globally.

NOTE: This command enables ECN globally and is supported only on the S4200–ON Series platform. In the SYSTEM QOS mode, this command is not available on other platforms. Also, you can configure ECN only per queue; you cannot configure ECN on an interface or service pool on the S4200–ON Series platform.

Example

```
applicableOS10(config)# system-qos
OS10(config-sys-qos)# random-detect ecn
```

Supported Releases 10.4.1.0 or later

random-detect pool

Assigns a WRED profile to the specified global buffer pool.

Syntax `random-detect pool` *`pool-value wred-profile-name`*

Parameters

- *`pool-value`* — Enter the pool value, from 0 to 1.
- *`wred-profile-name`* — Enter the name of an existing WRED profile.

Default Not configured

Command Mode SYSTEM-QOS

Usage Information The `no` version of this command removes the WRED profile from the interface.

Example

```
OS10(config)# system qos
OS10(config-sys-qos)# random-detect pool 0 test_wred
```

Supported Releases 10.4.0E(R1) or later

random-detect weight

Configures the exponential weight value used to calculate the average queue depth for the WRED profile.

Syntax `random-detect weight` *`weight-value`*

Parameters *`weight-value`* — Enter a value for the weight, from 1 to 15.

Default Not configured

Command Mode WRED CONFIGURATION

Usage Information	The `no` version of this command removes the weight factor from the WRED profile.
Example	`OS10(config)# wred test_wred` `OS10(config-wred)# random-detect weight 10`
Supported Releases	10.4.0E(R1) or later

service-policy

Configures the input and output service policies.

Syntax	`service-policy {input | output} [type {qos | queuing | network-qos}] policy-map-name`
Parameters	• `input`—Enter to assign a QoS policy to the interface input. • `output`—Enter to assign a QoS policy to the interface output. • `qos`—Enter to assign a `qos` type policy-map. • `queuing`—Enter to assign the `queuing` type policy-map. • `network-qos`—Enter to assign the `network-qos` type policy-map. • *`policy-map-name`*—Enter the policy-map name up to a maximum of 32 characters.
Default	Not configured
Command Mode	INTERFACE
Usage Information	Attach only one policy-map to the interface input and output for each `qos` and `queuing` policy-map type. You can attach four service-policies to the system QoS—one each for `qos`, `queueing`, and `network-qos` type policy-maps. When you configure interface-level policies and system-level policies, the interface-level policy takes precedence over the system-level policy. To apply the network-QoS policy to a single interface or a range of interfaces, perform the following steps: 1. Run the `interface ethernet` or `interface range ethernet` command to select a single or a range of upstream and downstream interfaces, respectively. 2. Run the `service-policy input type network-qos` command to apply the network-QoS policy only to the selected interfaces. Ensure you do not apply the policy in the global SYSTEM-QoS mode because it might cause CRC errors on the remote-end fiber channel devices.
Example	`OS10(conf-if-eth1/1/7)# service-policy input type qos p1`
Supported Releases	10.2.0E or later

set cos

Sets a cost of service (CoS) value to mark L2 802.1p (dot1p) packets.

Syntax	`set cos` *`cos-value`*
Parameters	*`cos-value`* — Enter a CoS value, from 0 to 7.
Default	Not configured
Command Mode	POLICY-MAP-CLASS-MAP
Usage Information	You cannot enter two set statements with the same action-type. If you enter two set statements with the same action-type, the second statement overwrites the first. When class-map type is `qos`, the qos-group corresponds to data queues 0 to 7.

Example

```
OS10(conf-pmap-c-qos)# set cos 6
```

Supported Releases 10.2.0E or later

set dscp

Sets the drop precedence for incoming packets based on their DSCP value and color map profile.

Syntax `set dscp dscp-value [color {red | yellow}]`

Parameters

- *dscp-value* — Enter a DSCP value, from 0 to 63.
- `color` — (Optional) — Enter to apply a color map profile.
- `red` — (Optional) Enter to mark the packets to drop.
- `yellow` — (Optional) Enter to mark the packets to deliver to the egress queue.

Default Not configured

Command Mode POLICY-MAP-CLASS-MAP

Usage Information This command supports only `QoS` ingress policy type. Packets marked as `color yellow` deliver to the egress queue, then the egress queue transmits the packets with the available bandwidth. If bandwidth is not available, the packets drop. All packets marked as `color red` drop. When class-map type is `qos`, the qos-group corresponds to data queues 0 to 7.

Example

```
OS10(conf-pmap-c-qos)# set dscp 10
```

Supported Releases 10.2.0E or later

set qos-group

Configures marking for the QoS-group queues.

Syntax `set qos-group queue-number`

Parameters *queue-number* — Enter a queue number, from 0 to 7.

Default Not configured

Command Mode POLICY-MAP-CLASS-MAP

Usage Information This command supports only the `qos` or `control-plane` ingress policy type. When the class-map type is `control-plane`, the qos-group corresponds to CPU queues 0 to 11. When the class-map type is `qos`, the qos-group corresponds to data queues 0 to 7.

Example

```
OS10(conf-pmap-c-qos)# set qos-group 7
```

Supported Releases 10.2.0E or later

shape

Shapes the outgoing traffic rate.

Syntax `shape {min {kbps | mbps | pps} min-value [burst-size]} {max {kbps | mbps | pps} max-value [max-burst-size]}`

Parameters

- `min` — Enter the minimum committed rate in unit in kbps, mbps, or pps.
- `kbps` — Enter the committed rate unit in kilobits per second, from 0 to 40000000.

- `mbps` — Enter the committed rate unit in megabits per second, from 0 to 40000.
- `pps` — Enter the committed rate unit in packets per second, from 1 to 268000000.
- *`burst-size`* — Enter the burst size in kilobites per packet, from 0 to 10000 or 1 to 1073000.
- `max` — Enter the maximum peak rate in kbps, mbps, or pps.
- *`max-burst-size`* — Enter the burst size in kilobites per packets, from 0 to 10000 or 1 to 1073000.

Default Maximum burst size is 50 kb or 200 packets

Command Mode POLICY-MAP-CLASS-MAP

Usage Information This command only supports the ingress QoS policy type. You must enter both the minimum and maximum values. If you enter the rate value in pps, the burst provided is in packets. If you enter the rate in kbps or mbps, the burst is provided in kb. If you enter the minimum rate in pps, you must also enter the maximum rate in pps.

Example

```
OS10(conf-pmap-c-que)# shape min kbps 11 max kbps 44
```

Supported Releases 10.2.0E or later

show class-map

Displays configuration details of all existing class-maps.

Syntax `show class-map [type {control-plane | qos | queuing | network-qos} class-map-name]`

Parameters

- `type` — Enter the policy-map type — `qos`, `queuing`, or `control-plane`.
- `qos` — Displays all policy-maps of `qos` type.
- `queuing` — Displays all policy-maps of `queuing` type.
- `network-qos` — Displays all policy-maps of `network-qos` type.
- `control-plane` — Displays all policy-maps of `control-plane` type.
- *`class-map-name`* — Displays the QoS class-map name.

Default Not configured

Command Mode EXEC

Usage Information This command displays all class-maps of `qos`, `queuing`, `network-qos`, or `control-plane` type. The *`class-map-name`* parameter displays all details of a configured class-map name.

Example

```
OS10# show class-map type qos c1
    Class-map (qos):  c1 (match-all)
      Match(not): ip-any dscp 10
```

Supported Releases 10.2.0E or later

show control-plane buffers

Displays the pool type, reserved buffer size, and the maximum threshold value for each of the CPU queues.

Syntax `show control-plane buffers`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show control-plane buffers
queue-number pool-type   rsvd-buf-size   threshold-mode     threshold-value
-------------------------------------------------------------------------
0            lossy            1664            static           20800
1            lossy            1664            static           20800

7            lossy            1664            static           48880
8            lossy            1664            static           48880
9            lossy            9216            static           48880
10           lossy            1664            static           48880
11           lossy            1664            static           48880
12           lossy            1664            static           48880
13           lossy            9216            static           48880
14           lossy            1664            static           48880
15           lossy            9216            static           48880
16           lossy            1664            static           48880
17           lossy            1664            static           48880
18           lossy            1664            static           48880
19           lossy            1664            static           48880
20           lossy            1664            static           20800
21           lossy            1664            static           20800
22           lossy            1664            static           20800
```

Supported Releases 10.4.2 and later

show control-plane buffer-stats

Displays the control plane buffer statistics for each of the CPU queues.

Syntax `show control-plane buffer-stats`

Parameters None

Default A predefined default profile exists.

Command Mode EXEC

Usage Information None

Example

```
OS10# show control-plane buffer-stats
Queue    TX              TX                  Used reserved    Used shared
         pckts           bytes               buffers           buffers
--------------------------------------------------------------------------
0          0               0                   0                 0
1          0               0                   0                 0
2          0               0                   0                 0
3          0               0                   0                 0
4          0               0                   0                 0
5          0               0                   0                 0
6          3               204                 0                 0
7          6               408                 0                 0
8          0               0                   0                 0
9          0               0                   0                 0
10         0               0                   0                 0
11         0               0                   0                 0
12         0               0                   0                 0
13         0               0                   0                 0
14         0               0                   0                 0
15         0               0                   0                 0
16         0               0                   0                 0
17         0               0                   0                 0
18         0               0                   0                 0
19         0               0                   0                 0
20         0               0                   0                 0
21         0               0                   0                 0
22         0               0                   0                 0
```

Supported Releases 10.4.2 and later

show control-plane info

Displays control-plane queue mapping and rate limits.

Syntax `show control-plane info [default]`

Parameters `default`—Enter the keyword `default` to view the default protocol-to-queue mapping and default rate limits for the particular platform.

Default Not configured

Command Mode EXEC

Usage Information Monitors statistics for the control-plane and to troubleshoot CoPP.

Example

```
OS10# show control-plane info
Queue   Min Rate Limit(in pps)   Max Rate Limit(in pps)   Protocols
0       600                     600                      ISCSIUNKNOWN
UNICAST
1       1000                    1000                     SFLOW

```

Supported Releases 10.2.0E or later

show control-plane statistics

Displays counters of all the CPU queue statistics.

Syntax `show control-plane statistics`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show control-plane statistics
Queue   Packets   Bytes    Dropped Packets   Dropped Bytes
0       0         0        0                 0
1       0         0        0                 0
2       0         0        0                 0
3       0         0        0                 0
4       0         0        0                 0
5       0         0        0                 0
6       3         204      0                 0
7       6         408      0                 0
```

```
8       0          0         0                   0
9       0          0         0                   0
10      0          0         0                   0
11      0          0         0                   0
12      0          0         0                   0
13      0          0         0                   0
14      0          0         0                   0
15      0          0         0                   0
16      0          0         0                   0
17      0          0         0                   0
18      0          0         0                   0
19      0          0         0                   0
20      0          0         0                   0
21      0          0         0                   0
22      0          0         0                   0
OS10#
```

Supported Releases 10.2.0E or later

show hardware deep-buffer-mode

Displays the status of Deep buffer mode in the current and next boot of the switch.

Syntax `show hardware deep-buffer-mode`

Parameters None

Defaults Not configured

Command Modes EXEC

Usage Information Applicable only for the S4200-ON series switches.

Example Example: default setting

```
OS10# show hardware deep-buffer-mode
  Deep Buffer Mode Configuration Status
-----------------------------------------
    Current-boot Settings : Disabled

    Next-boot Settings    : Disabled
```

Example: saved to startup configuration

```
OS10# show hardware deep-buffer-mode
  Deep Buffer Mode Configuration Status
-----------------------------------------
    Current-boot Settings : Disabled

    Next-boot Settings    : Enabled
```

Example: switch reloaded

```
OS10# show hardware deep-buffer-mode
  Deep Buffer Mode Configuration Status
-----------------------------------------
    Current-boot Settings : Enabled

    Next-boot Settings    : Enabled
```

Supported Releases 10.4.3.0 or later

show interface priority-flow-control

Displays the priority flow-control, operational status, CoS bitmap, and statistics per port.

Syntax `show interface ethernet node/slot/port[:subport] priority-flow-control [details]`

Parameters `details` — (Optional) Displays all priority flow control information for an interface.

Default Not configured

Command Mode EXEC

Usage Information None

Example (Details)

```
OS10# show interface ethernet 1/1/14 priority-flow-control details

ethernet1/1/14
Admin Mode: On
Operstatus: On
PFC Priorites: 0,4,7
Total Rx PFC Frames: 300
Total Tx PFC Frames: 200
Cos     Rx      Tx
-----------------------
0       0       0
1       0       0
2       0       0
3       300     200
4       0       0
5       0       0
6       0       0
7       0       0
```

Supported Releases 10.3.0E or later

show qos interface

Displays the QoS configuration applied to a specific interface.

Syntax `show qos interface ethernet node/slot/port[:subport]`

Parameters *node/slot/port[:subport]* — Enter the Ethernet interface information.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos interface ethernet 1/1/10
Ethernet 1/1/10
    unknown-unicast-storm-control : 100 pps
    multicast-storm-control : 200 pps
    broadcast-storm-control : Disabled
    flow-control-rx: Enabled
    flow-control-tx: Disabled
      Service-policy (Input)(qos): p1
```

Supported Releases 10.2.0E or later

show policy-map

Displays information on all existing policy-maps.

Syntax

```
show policy-map type {control-plane | qos | queuing | network-qos}]
[policy-map-name]
```

Parameters

- `type` — Enter the policy-map type — `qos`, `queuing`, or `control-plane`.
- `qos` — Displays all policy-maps of `qos` type.
- `queuing` — Displays all policy-maps configured of `queuing` type.
- `network-qos` — Displays all policy-maps configured of `network-qos` type.
- `control-plane` — Displays all policy-maps of `control-plane` type.
- *`policy-map-name`* — Displays the QoS policy-map name details.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show policy-map
 Service-policy(qos) input: p1
   Class-map (qos): c1
     set qos-group 1
 Service-policy(qos) input: p2
   Class-map (qos): c2
     set qos-group 2
```

Supported Releases 10.2.0E or later

show qos control-plane

Displays the QoS configuration applied to the control-plane.

Syntax

```
show qos control-plane
```

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Monitors statistics for the control-plane and troubleshoots CoPP.

Example

```
OS10# show qos control-plane
     Service-policy (Input): p1
```

Supported Releases 10.2.0E or later

show qos egress buffers interface

Displays egress buffer configurations.

Syntax

```
show qos egress buffers interface [interface node/slot/port[:subport]]
```

Parameters

- *`interface`* — (Optional) Enter the interface type.
- *`node/slot/port[:subport]`* — (Optional) Enter the port information.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos egress buffers interface ethernet 1/1/1
Interface : ethernet1/1/1
Speed : 0
queue-number  pool-type   rsvd-buf-size  threshold-mode  threshold-value
------------------------------------------------------------------------
0             lossy       1664           dynamic         8
1             lossy       1664           dynamic         8
2             lossy       1664           dynamic         8
3             lossless    0              static          12479488
4             lossy       1664           dynamic         8
5             lossy       1664           dynamic         8
6             lossy       1664           dynamic         8
7             lossy       1664           dynamic         8
```

Supported Releases 10.3.0E or later

show qos egress buffer-statistics-tracking

Displays egress queue-level peak buffer usage count in bytes for queues on a given interface.

Syntax `show qos egress buffer-statistics-tracking interface ethernet [node/slot/port] [[mcast | ucast] queue {all | [0-7]}] [detail]`

Parameters

- *node/slot/port*—Enter the port information.
- `[[mcast | ucast] queue {all | [0-7]}]`—Enter the `mcast` or `ucast` keyword to view the egress queue peak buffer utilization for multicast or unicast queues respectively. Enter the `all` keyword to specify all queues, or enter the queue number.
- `detail`—Displays per MMU instance-level statistics in platforms with multiple MMU instances such as the Z9100-ON series, Z9200-ON series.

Default Not applicable

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos egress buffer-statistics-tracking interface ethernet 1/1/1
Interface : ethernet1/1/1
Speed : 0
QType       Queue     Total buffers
                       peak count
--------------------------------------------------------------------------------
Unicast        0          0
Unicast        1          0
Unicast        2          0
Unicast        3          0
Unicast        4          0
Unicast        5          0
Unicast        6          0
Unicast        7          0
Multicast      0          0
Multicast      1          0
Multicast      2          0
Multicast      3          0
Multicast      4          0
Multicast      5          0
Multicast      6          0
Multicast      7          0
```

Supported Releases 10.4.3.0 or later

show qos egress buffer-stats interface

Displays the buffers statistics for the egress interface.

Syntax

```
show qos egress buffer-stats interface [interface node/slot/port[:subport]]
[detail]
```

Parameters

- *interface* — (Optional) Enter the interface type.
- *node/slot/port[:subport]* — (Optional) Enter the port information.
- detail — Displays per MMU egress buffer statistics in platforms with multiple MMU instances such as Z9100-ON, Z9264F-ON.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos egress buffer-stats interface ethernet 1/1/1
Interface : ethernet1/1/1
Speed : 0
Queue    TX         TX          Used reserved     Used shared
         pckts      bytes       buffers           buffers
-----------------------------------------------------------
0        0          0           0                 0
1        0          0           0                 0
2        0          0           0                 0
3        0          0           0                 0
4        0          0           0                 0
5        0          0           0                 0
6        0          0           0                 0
7        0          0           0                 0
OS10#
```

Supported Releases 10.3.0E or later

show qos headroom-pool buffer-statistics-tracking

Displays headroom-pool level peak buffer usage count in bytes.

Syntax

```
show qos headroom-pool buffer-statistics-tracking [detail]
```

Parameters detail—Displays headroom-pool statistics per memory management unit (MMU) instance in platforms with multiple MMU instances such as the Z9100-ON, Z9264F-ON.

Default Not configured

Command Mode EXEC

Usage Information Supported platforms include Z9100-ON series, Z9200-ON series, and S5200-ON series.

Example

```
OS10# show qos headroom-pool buffer-statistics-tracking
Headroom Pool     Buffers-Usage
---------------------------------
    0                 0
    1                 0
    2                 0
    3                 0
```

Supported Releases 10.4.3.0 or later

show qos ingress buffers interface

Displays interface buffer configurations.

Syntax `show qos ingress buffers interface [interface node/slot/port[:subport]]`

Parameters
- *interface* — (Optional) Enter the interface type.
- *node/slot/port[:subport]* — (Optional) Enter the port information.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10(config)# show qos ingress buffer interface ethernet 1/1/1
Interface ethernet 1/1/1
Speed 40G
------------------------------------------------------------------------
PG# PRIORITIES qos                                  ALLOTED (Kb)
                group    Reserved Shared buffer     XOFF      XON
shared buffer
                id       buffers     MODE           threshold threshold
 threshold
------------------------------------------------------------------------
0       4          4          35          DYNAMIC          9            9
   8
1       3          3          35          DYNAMIC          9            9
   8
2       -          -           0          STATIC           0            0
   0
3       -          -           0          STATIC           0            0
   0
4       -          -           0          STATIC           0            0
   0
5       -          -           0          STATIC           0            0
   0
6       -          -           0          STATIC           0            0
   0
7       -          0-2,5-7     8          STATIC           0            0
   0
```

Supported Releases 10.3.0E or later

show qos ingress buffer-statistics-tracking

Displays ingress priority group level peak buffer usage count in bytes for the given priority group on a given interface.

Syntax `show qos ingress buffer-statistics-tracking interface ethernet [node/slot/port] [priority-group {0-7}] [detail]`

Parameters
- *node/slot/port*—Enter the port information.
- `[priority-group {0-7}]`—Enter the `priority-group` keyword, followed by the group number.
- `detail`—Displays per MMU instance-level statistics in platforms with multiple MMU instances such as the Z9100-ON series, Z9200-ON series.

Default Not applicable

Command Mode EXEC

Usage Information When BST is enabled, if you make any configuration changes that affect the priority group or priority mapping configuration, such as removal of class map, addition of class map to policy map (nqos), and so on, be sure to clear the buffer statistics using the `clear qos statistics type`

`buffer-statistics-tracking` command to view the actual peak buffer utilization for the current configuration.

Example

```
OS10# show qos ingress buffer-statistics-tracking interface ethernet
1/1/1
Interface : ethernet1/1/1
Speed : 0
Priority Peak shared  Peak HDRM
 Group   buffers      buffers
-------------------------------------------------
0          0             0
1          0             0
2          0             0
3          0             0
4          0             0
5          0             0
6          0             0
7          0             0
```

Supported Releases 10.4.3.0 or later

show qos ingress buffer-stats interface

Displays the buffers statistics for the ingress interface.

Syntax `show qos ingress buffer-stats interface [interface node/slot/port[:subport]] [detail]`

Parameters

- *interface* — (Optional) Enter the interface type.
- *node/slot/port[:subport]* — (Optional) Enter the port information.
- `detail` — (Optional) Displays per MMU instance level statistics in platforms with multiple MMU instances such as the Z9100-ON series, Z9200-ON series.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10(config)# show qos ingress buffer-stats interface ethernet 1/1/15
Interface : ethernet1/1/15
Speed : 10G
Priority Used reserved     Used shared  Used HDRM
 Group   buffers           buffers      buffers
-------------------------------------------------
0          9360             681824       35984
1          0                0            0
2          0                0            0
3          0                0            0
4          0                0            0
5          0                0            0
6          0                0            0
7          0                0            0
```

Supported Releases 10.3.0E or later

show qos maps

Displays the active system trust map.

Syntax `show qos maps type {tc-queue | trust-map-dot1p | trust-map dscp} trust-map-name`

Parameters

- `dot1p` — Enter to view the dot1p trust map.
- `dscp` — Enter to view the DSCP trust map.
- `tc-queue`—Enter to view the traffic class to queue map.
- *`trust-map`* — Enter the name of the trust map.

Default Not configured

Command Mode EXEC

Usage Information None

Example (dot1p)

```
OS10# show qos maps type tc-queue queue-map1
Traffic-Class to Queue Map: queue-map1
Queue        Traffic-Class
--------------------------
1              5
2              6
3              7
OS10# show qos maps type trust-map-dot1p dot1p-trustmap1
DOT1P Priority to Traffic-Class Map : dot1p-trustmap1
Traffic-Class    DOT1P Priority
-------------------------------
0                  2
1                  3
2                  4
3                  5
4                  6
5                  7
6                  1
OS10# show qos maps type trust-map-dscp dscp-trustmap1
DSCP Priority to Traffic-Class Map  : dscp-trustmap1
Traffic-Class    DSCP Priority
-------------------------------
0                  8-15
2                  16-23
1                  0-7
OS10# show qos maps
Traffic-Class to Queue Map: queue-map1
Queue        Traffic-Class
--------------------------
1              5
2              6
3              7

1                  3
2                  4
3                  5
4                  6
5                  7
6                  1
DSCP Priority to Traffic-Class Map  : dscp-trustmap1
Traffic-Class    DSCP Priority
-------------------------------
0                  8-15
2                  16-23
1                  0-7
```

```
Default Dot1p Priority to Traffic-Class Map
Traffic-Class    DOT1P Priority
--------------------------------
0                    1
1                    0
2                    2
3                    3
4                    4
5                    5
6                    6
7                    7
Default Dscp Priority to Traffic-Class Map
Traffic-Class    DSCP Priority
--------------------------------
0                    0-7
1                    8-15
2                    16-23
3                    24-31
4                    32-39
5                    40-47
6                    48-55
7                    56-63
Default Traffic-Class to Queue Map
Traffic-Class    Queue number
--------------------------------
0                    0
1                    1
2                    2
3                    3
4                    4
5                    5
6                    6
7                    7
OS10#
```

Example (dscp)

```
OS10# show qos trust-map dscp new-dscp-map

new-dscp-map
qos-group   Dscp
   Id
-------------------
0           0-7
1           8-15
2          16-23
3          24-31
4          32-39
5          40-47
6          48-55
7          56-63
```

Supported Releases 10.3.0E or later

show qos maps (Z9332F-ON)

Displays the QoS maps configuration of the dot1p-to-traffic class, DSCP-to-traffic class, and traffic-class to queue mapping in the device.

Syntax `show qos maps type tc-queue`

Parameters

- `qos` — Enter to view either an ingress or egress QoS configuration
- `maps` — Enter to view QoS mapping information
- `type`— (Optional)Enter to view Qos map types
- `tc-queue` — Enter to view the traffic class-to-queue map

Default NA

Command Mode EXEC

Usage Information The command applies to the Z9332F-ON only. The command provides priority-to-traffic-class and traffic-class-to-queue mapping, both default and user configured. The `Type` column displays the queue type corresponding to the traffic-class-to-queue map entry. For platforms other than Z9332F-ON, the `Both` displays in the `Type` column to indicate that the mapping applies to both unicast and multicast queues.

Example

```
show qos maps type tc-queue
Traffic-Class to Queue Map: sundar
Queue        Traffic-Class  Type
-----------------------------------------
2            2-5            Unicast
0-2          0              Multicast
```

Supported Releases 10.5.0 or later

show qos port-map details

Displays port to port pipe and MMU mapping.

Syntax `show qos port-map details [interface interface-type]`

Parameters `interface interface-type` — (Optional) Enter the keyword `interface` and the interface type.

Default Not configured

Command Mode EXEC

Usage Information On the Z9100–ON and Z9264F–ON platforms, interfaces are shared across port pipes and port pipes are shared across Memory Management Units (MMUs). As interfaces span port pipes, Dell Technologies recommends using interfaces from same port pipes for both ingress and egress for optimal performance. To find the port to port-pipe and MMU mapping, use the `show qos port-map details` command.

Example Z9100–ON switch:

```
OS10# show qos port-map details

-------------------------------------------------------------------------

Interface       Port Pipe       Ingress MMU     Egress MMU      Oper Status

-------------------------------------------------------------------------

Eth 1/1/1       1               2, 3            0, 2            up

Eth 1/1/2       1               2, 3            0, 2            up

Eth 1/1/3       1               2, 3            0, 2            up

Eth 1/1/4       1               2, 3            0, 2            up

Eth 1/1/5       2               2, 3            1, 3            up

Eth 1/1/59       2                2, 3             1, 3             down
Eth 1/1/60       2                2, 3             1, 3             down
Eth 1/1/61       2                2, 3             1, 3             down
Eth 1/1/62       2                2, 3             1, 3             down
Eth 1/1/63       3                0, 1             1, 3             down
Eth 1/1/64       3                0, 1             1, 3             down
Eth 1/1/65       2                2, 3             1, 3             down
Eth 1/1/66       1                2, 3             0, 2             down
```

View information for a single interface:

```
OS10# show qos port-map details interface ethernet 1/1/1

--------------------------------------------------------------------------------
Interface        Port Pipe        Ingress MMU      Egress MMU       Oper Status
--------------------------------------------------------------------------------
Eth 1/1/1:1      0                0, 1             0, 2             up
```

View information for a single interface:

```
OS10# show qos port-map details interface ethernet 1/1/1

--------------------------------------------------------------------------------
Interface        Port Pipe        Ingress MMU      Egress MMU       Oper Status
--------------------------------------------------------------------------------
Eth 1/1/1        3                0, 1             1, 3             down
```

Supported Releases 10.5.0 or later

show qos-rate-adjust

Displays the status of the rate adjust limit for policing and shaping.

Syntax `show qos-rate-adjust`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Not applicable for the S4200-ON series switches.

Example

```
OS10# show qos-rate-adjust

QoS Rate adjust configured for Policer and Shaper (in bytes) : 10
```

Supported Releases 10.4.3.0 or later

show qos service-pool buffer-statistics-tracking

Displays service-pool level peak buffer usage count in bytes.

Syntax `show qos service-pool buffer-statistics-tracking [detail]`

Parameters detail—Displays service-pool level peak buffer utilization per memory management unit (MMU) instance in platforms with multiple MMU instances such as the Z9100-ON, Z9264F-ON.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos service-pool buffer-statistics-tracking
Service Pool     Ingress Buffers     Egress Buffers
-------------------------------------------------
    0                 0                 0
    1                 0                 0
    2                 0                 0
    3                 0                 0
```

Supported Releases 10.4.3.0 or later

show qos system

Displays the QoS configuration applied to the system.

Syntax `show qos system`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information View and verify system-level service-policy configuration information.

Example

```
show qos system
 ETS Mode : off
 ECN Mode : off
 buffer-statistics-tracking : off
```

Supported Releases 10.4.1.0 or later

show qos system buffers

Displays the system buffer configurations and utilization.

Syntax `show qos system {ingress | egress} buffers [detail]`

Parameters `detail` — Displays system buffers per MMU level in platforms that support multiple MMU instances such as the Z9100-ON, Z9264F-ON.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos system ingress buffer
All values are in kb
Total buffers                                  - 12187
    Total lossless buffers                     - 0
      Maximum lossless buffers                 - 5512
      Total shared lossless buffers            - 0
      Total used shared lossless buffers       -
    Total lossy buffers                        - 11567
      Total shared lossy buffers               - 11192
      Total used shared lossy buffers          - 0
```

The following command is supported on platforms such as the Z9100-ON, Z9264F-ON:

```
OS10# show qos system ingress buffer detail
All values are in kb
Total buffers                                  - 43008
    Total lossless buffers                     - 0
      Maximum lossless buffers                 - 23312
      Total shared lossless buffers            - 0
      Total used shared lossless buffers       -
    Total lossy buffers                        - 42388
      Total shared lossy buffers               - 39974
      Total used shared lossy buffers          - 0
      MMU 0
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 10012
          Total used shared lossy buffers       - 0
      MMU 1
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 10012
          Total used shared lossy buffers       - 0
      MMU 2
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 9993
          Total used shared lossy buffers       - 0
      MMU 3
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 9993
          Total used shared lossy buffers       - 0
```

```
OS10# show qos system egress buffer
All values are in kb
Total buffers                                - 12187
    Total lossless buffers                   - 0
      Total shared lossless buffers          - 0
      Total used shared lossless buffers     -
    Total lossy buffers                      - 11567
      Total shared lossy buffers             - 9812
      Total used shared lossy buffers        - 0
    Total CPU buffers                      - 620
      Total shared CPU buffers             - 558
      Total used shared CPU buffers          - 0
```

The following command is supported on platforms such as the Z9100-ON, Z9264F-ON:

```
OS10# show qos system egress buffer detail
All values are in kb
Total buffers                                - 43008
    Total lossless buffers                   - 0
      Total shared lossless buffers          - 0
      Total used shared lossless buffers     -
    Total lossy buffers                      - 42388
      Total shared lossy buffers             - 33938
      Total used shared lossy buffers        - 0
      MMU 0
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 8484
          Total used shared lossy buffers       - 0
      MMU 1
```

```
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 8484
          Total used shared lossy buffers       - 0
      MMU 2
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 8484
          Total used shared lossy buffers       - 0
      MMU 3
        Total lossy buffers                     - 10597
          Total shared lossy buffers            - 8484
          Total used shared lossy buffers       - 0
```

Supported Releases 10.3.0E or later

show qos wred-profile

Displays the details of WRED profile configuration.

Syntax `show qos wred—profile [wred-profile-name]`

Parameters *wred-profile-name* — (Optional) Enter the Ethernet interface information.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show qos wred-profile
Profile Name   |               Green      |       Yellow          |        Red              |        |
               |--------------------------|-----------------------|-------------------------|--------|
               | MIN      MAX    DROP-RATE| MIN    MAX   DROP-RATE| MIN     MAX   DROP-RATE| WEIGHT|
               | KB       KB             %| KB     KB            %| KB      KB            %|        |

Supported Releases

show queuing statistics

Displays QoS queuing statistics information.

Syntax

```
show queuing statistics interface ethernet node/slot/port[:subport] [wred | queue number]
```

Parameters

- *node/slot/port[:subport]* — Enter the Ethernet interface information.
- queue *number* — Enter the QoS queue number, from 0 to 7.

Default

Not configured

Command Mode

EXEC

Usage Information

Use this command to view all queuing counters. WRED counters are available only at the port level.

Example

```
OS10# show queuing statistics interface ethernet 1/1/1
Interface ethernet1/1/1
Queue Packets                   Bytes                     Dropped-Packets
        Dropped-Bytes
0     0                         0                         0
        0
1     0                         0                         0
        0
2     0                         0                         0
        0
3     0                         0                         0
        0
4     0                         0                         0
        0
5     0                         0                         0
        0
6     0                         0                         0
        0
7     0                         0                         0
        0
```

Example (wred)

```
OS10# show queuing statistics interface ethernet 1/1/1 wred
Interface ethernet1/1/1 (All queues)
Description              Packets                  Bytes

Output                   0                        0

Dropped                  0                        0

Green Drop               0                        0

Yellow Drop              0                        0

Red Drop                 0                        0

ECN marked count         0                        0
```

Example (queue)

```
OS10# show queuing statistics interface ethernet 1/1/1 queue 3
Interface ethernet1/1/1
Queue Packets                   Bytes                     Dropped-Packets
        Dropped-Bytes
3     0                         0                         0
        0
```

Supported Releases

10.2.0E or later

system qos

Enters SYSTEM-QOS mode to configure system-level QoS configurations.

Syntax	`system qos`
Parameters	None
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	None
Example	`OS10(config)# system qos` `OS10(config-sys-qos)#`
Supported Releases	10.2.0E or later

trust dot1p-map

Creates a user-defined trust map for dot1p flows.

Syntax	`trust dot1p-map` *`map-name`*
Parameters	*`map-name`* — Enter the name of the dot1p trust map. A maximum of 32 characters.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	If you enable trust, traffic obeys the dot1p map. `default-dot1p-trust` is a reserved trust-map name. The `no` version of this command returns the value to the default.
Example	`OS10(config)# trust dot1p-map map1` `OS10(config-tmap-dot1p-map)# qos-group 4 dot1p 5`
Supported Releases	10.3.0E or later

trust dscp-map

Creates a user-defined trust map for DSCP flows.

Syntax	`trust dscp-map` *`map-name`*
Parameters	*`map-name`* — Enter the name of the DSCP trust map. A maximum of 32 characters.
Default	Not configured
Command Mode	CONFIGURATION
Usage Information	If you enable trust, traffic obeys this trust map. `default-dscp-trust` is a reserved trust-map name. The `no` version of this command returns the value to the default.
Example	`OS10(config)# trust dscp-map dscp-trust1`
Supported Releases	10.3.0E or later

trust-map

Configures trust map on an interface or on a system QoS.

Syntax `trust-map {dot1p | dscp} {default | trust-map-name}`

Parameters

- `dot1p` — Apply dot1p trust map.
- `dscp` — Apply dscp trust map.
- `default` — Apply default dot1p or dscp trust map.
- *`trust-map-name`* — Enter the name of trust map.

Default Disabled

Command Mode INTERFACE

SYSTEM-QoS

Usage Information Use the `show qos maps type [tc-queue | trust-map-dot1p | trust-map-dscp] [trust-map-name]` command to view the current trust mapping. You must change the trust map only during no traffic flow. Verify the correct policy maps are applied. The `no` version of this command returns the value to the default. The `no` version of this command removes the applied trust map from the interface or system QoS.

Example

```
OS10(config)# interface ethernet 1/1/10
OS10(conf-if-eth1/1/10)# trust-map dot1p default
OS10(conf-if-eth1/1/10)# trust-map dot1p d1

OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# trust-map dscp default
OS10(conf-if-eth1/1/2)# trust-map dscp d2
```

```
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p default
OS10(config-sys-qos)# trust-map dscp d2
```

Supported Releases 10.4.1.0 or later

wred

Configures a weighted random early detection (WRED) profile.

Syntax `wred wred-profile-name`

Parameters *`wred-profile-name`* — Enter a name for the WRED profile.

Default Not configured

Command Mode CONFIGURATION

Usage Information The `no` version of this command removes the WRED profile.

Example

```
OS10(config)# wred test_wred
OS10(config-wred)#
```

Supported Releases 10.4.0E(R1) or later

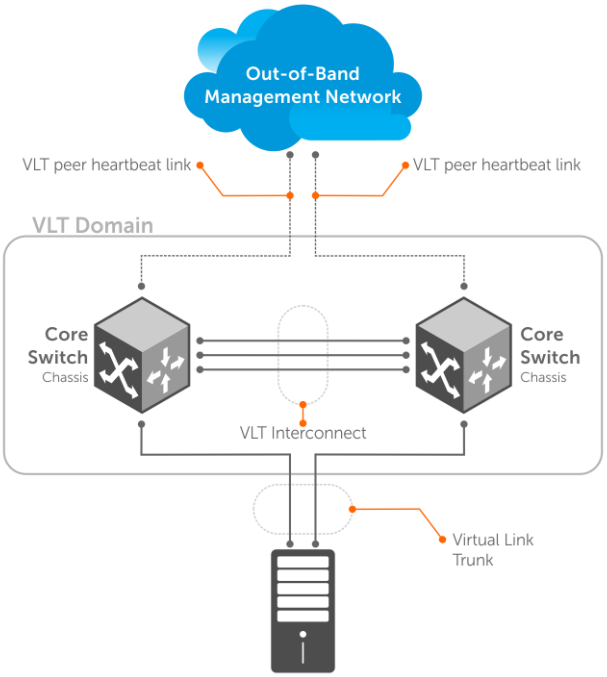
20

Virtual Link Trunking

Virtual Link Trunking (VLT) is a Layer 2 aggregation protocol used between an end device such as a server and two or more connected network devices. VLT helps to aggregate ports terminating on multiple switches. OS10 currently supports VLT port channel terminations on two different switches.

VLT:

- Provides node-level redundancy by using the same port channel terminating on multiple upstream nodes.
- Provides a loop-free topology
- Eliminates STP-blocked ports
- Optimizes bandwidth utilization by using all available uplink bandwidth
- Guarantees fast convergence if either a link or device fails
- Enhances optimized forwarding with Virtual Router Redundancy Protocol (VRRP)
- Optimizes routing with VLT peer routing for Layer-3 VLANs
- Provides link-level resiliency
- Assures high availability



Switch or Server that supports LACP (802.3ad)

VLT presents a single logical L2 domain from the perspective of attached devices that have a virtual link trunk terminating on separate nodes in the VLT domain. The two VLT nodes are independent Layer2/ Layer3 (L2/L3) switches for devices in the upstream network. L2/L3 control plane protocols and system management features function normally in both the VLT nodes.

External switches or servers supporting LACP see the two VLT switches as a single virtual switch. Hence, VLT configurations must be identical on both the switches in the VLT domain.

VLT physical ports	802.1p, 802.1q, LLDP, flow control, port monitoring, and jumbo frames are supported on VLT physical ports.
System management protocols	All system management protocols are supported on VLT ports—SNMP, AAA, ACL, DNS, FTP, SSH, system log, NTP, RADIUS, SCP, and LLDP.
L3 VLAN connectivity	Enable L3 VLAN connectivity, VLANs assigned with an IP address, on VLT peers by configuring a VLAN interface for the same VLAN on both devices.

Optimized forwarding with VRRP	To ensure the same behavior on both sides of the VLT nodes, VRRP requires state information coordination. VRRP Active-Active mode optimizes L3 forwarding over VLT. By default, VRRP Active-Active mode is enabled on all the VLAN interfaces. VRRP Active-Active mode enables each peer to locally forward L3 packets, resulting in reduced traffic flow between peers over the VLTi link.
Spanning-Tree Protocol	VLT ports support RSTP, RPVST+, and MSTP.
Multicast	IGMP snooping and MLD snooping are supported on VLT ports.

NOTE:

- 802.1x and DHCP snooping are not supported on VLT ports.
- If a VLT switch is being rebooted while VLT interconnect (VLTi) links are down, the VLT peers become split-brain even when backup links are available because initial synchronization over backup link is not possible.

.

Terminology

VLT domain	The domain includes VLT peer devices, VLT interconnects, and all port channels in the VLT connected to the attached devices. It is also the configuration mode that you must use to assign VLT global parameters.
VLT interconnect (VLTi)	The link between VLT peer switches used to synchronize operating states.
VLT peer device	A pair of devices connected using a dedicated port channel—the VLTi. You must configure VLT peers separately.
Discovery interface	Interfaces on VLT peers in the VLT interconnect (VLTi) link.
VLT MAC address	Unique MAC address that you assign to the VLT domain. A VLT MAC address is a common address in both VLT peers. If you do not configure a VLT MAC address, the MAC address of the primary peer is used as the VLT MAC address across both peers.
VLT node priority	The priority based on which the primary and secondary VLT nodes are determined. If priority is not configured, the VLT node with the lowest MAC address is elected as the primary VLT node.
VLT port channel	A combined port channel between an attached device and VLT peer switches.
VLT port channel ID	Groups port channel interfaces on VLT peers into a single virtual-link trunk connected to an attached device. Assign the same port channel ID to port channel interfaces on both peers that you bundle together.
Orphan ports	Ports that are not part of the VLT port channel but members of the spanned VLANs. The term spanned VLAN refers to a VLAN that is configured on both the VLT peers.

VLT domain

A VLT domain includes the VLT peer devices, VLTi, and all VLT port channels that connect to the attached devices. It is also the configuration mode that you must use to assign VLT global parameters.

NOTE: OS10 switches that belong to the same group and have the same port media type can be part of the same VLT domain. For example, you can have S5224F-ON and S5248F-ON as part of the same domain. However, switches that belong to the same group with different port media types cannot be part of the same VLT domain. For example, S4148F-ON and S4148T-ON cannot be part of the same domain.

- Each VLT domain must have a unique MAC address that you create or that VLT creates automatically.
- VLAN ID 4094 is reserved as an internal control VLAN for the VLT domain. IPv6 addressing is used on this control VLAN for VLT peer-to-peer communication.
- ARP, IPv6 neighbors, and MAC tables synchronize between the VLT peer nodes.
- VLT peer devices operate as separate nodes with independent control and data planes for devices that attach to non-VLT ports.

- One node in the VLT domain takes a primary role, and the other node takes the secondary role. In a VLT domain with two nodes, the VLT assigns the primary node role to the node with the lowest MAC address by default. You can override the default primary election mechanism by assigning priorities to each node using the `primary-priority` command.
- If the primary peer fails, the secondary peer takes the primary role. If the primary peer (with the lower priority) later comes back online, it is assigned the secondary role (there is no preemption).
- In a VLT domain, the peer network devices must run the same OS10 software version.

  NOTE: A temporary exception is allowed during the upgrade process. See the *SmartFabric OS10 10.5.0.x Release Notes* for more information.
- Configure the same VLT domain ID on peer devices. If a VLT domain ID mismatch occurs on VLT peers, the VLTi does not activate.
- In a VLT domain, VLT peers support connections to network devices that connect to only one peer.
- When you configure a VLT domain, the system generates a VLT Unit-ID. You cannot change the VLT Unit-ID. To identify the VLT node in a VLT domain, use the `show vlt` command.

VLT interconnect

A VLT interconnect (VLTi) synchronizes states between VLT peers. OS10 automatically adds VLTi ports to VLANs spanned across VLT peers, but does not add VLTi ports to VLANs configured on only one peer.

- VLAN ID 4094 is reserved as an internal control VLAN for the VLT domain, and it is not user configurable.
- Port-channel 1000 is reserved for the VLTi link and is not user configurable.
- The VLTi synchronizes L2 and L3 control-plane information across the two nodes. The VLTi is used for data traffic only when there is a link failure that requires VLTi to reach the final destination.
- Traffic with an unknown destination MAC address, multicast, or broadcast traffic can cause flooding across the VLTi.
- MAC, ARP, IPv6 neighbors that are learnt over VLANs on VLT peer nodes synchronize using the VLTi.
- LLDP, flow control, port monitoring, and jumbo frame features are supported on a VLTi. By default, VLTi ports are set to the maximum supported MTU value.

Graceful LACP with VLT

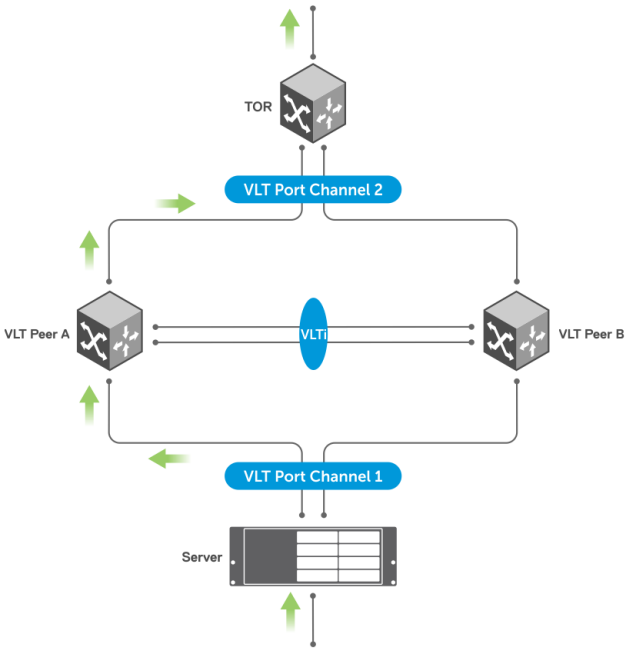
When a VLT node is reloaded, all its interfaces including VLT port channel interfaces go down. Top-of-Rack (ToR) devices that are connected at the other end of the VLT port channel interfaces could take a considerable amount of time to detect the interface status change and switch the traffic towards the other active VLT node. Using LACP PDUs, the graceful LACP feature enables VLT nodes to inform ToR devices ahead of taking down the member ports of its VLT port channel interfaces. Thus, the graceful LACP feature enables the ToR devices to switch the traffic to the other active VLT node.

Graceful LACP is supported in these scenarios:

- When a VLT node is reloaded
- When the secondary VLT node detects that the VLTi link is down but the heartbeat is functional

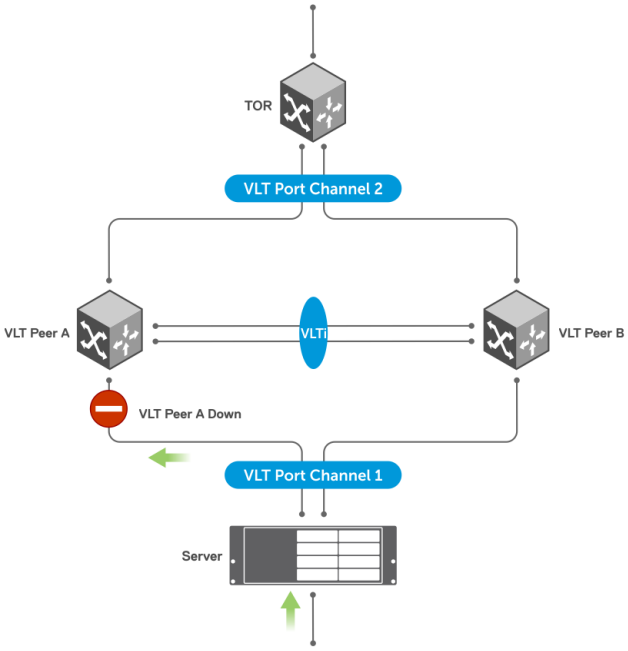
Graceful LACP is enabled by default and you cannot disable it.

The following shows the normal behavior of a VLT setup where data flows through the optimal path to its destination:

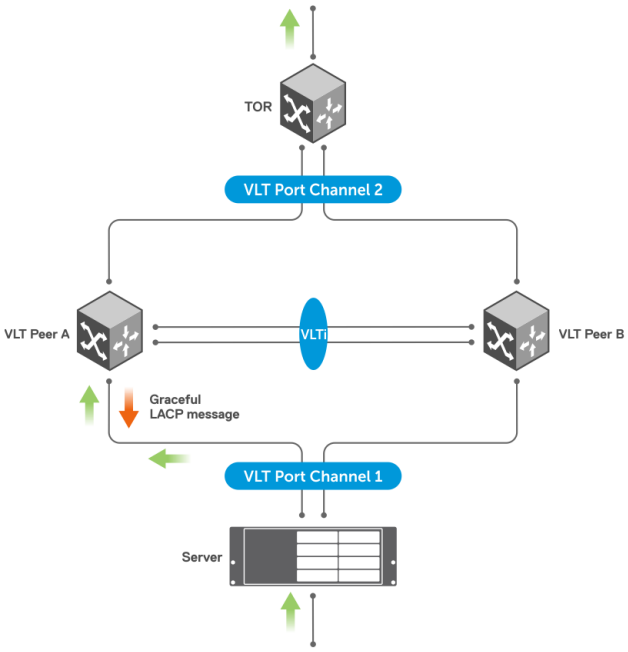


The following shows a scenario where VLT Peer A is being reloaded or going down:

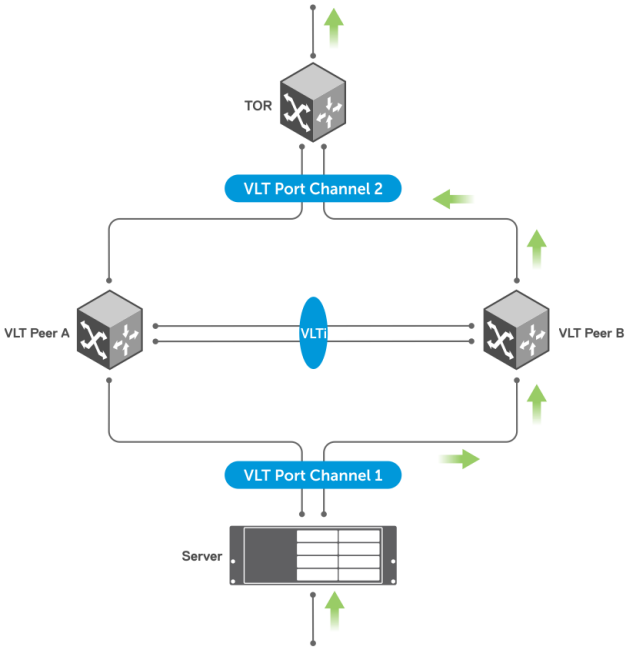
Until LACP convergence happens, the server continues to forward traffic to VLT Peer A resulting in traffic loss for a longer time interval.



With graceful LACP, VLT Peer A sends graceful LACP PDUs out to all VLT member ports, as shown:



These PDUs notify the server to direct the traffic to VLT Peer B hence minimizing traffic loss.



Configure VLT

Verify that both VLT peer devices are running the same operating system version. For VRRP operation, configure VRRP groups and L3 routing on each VLT peer.

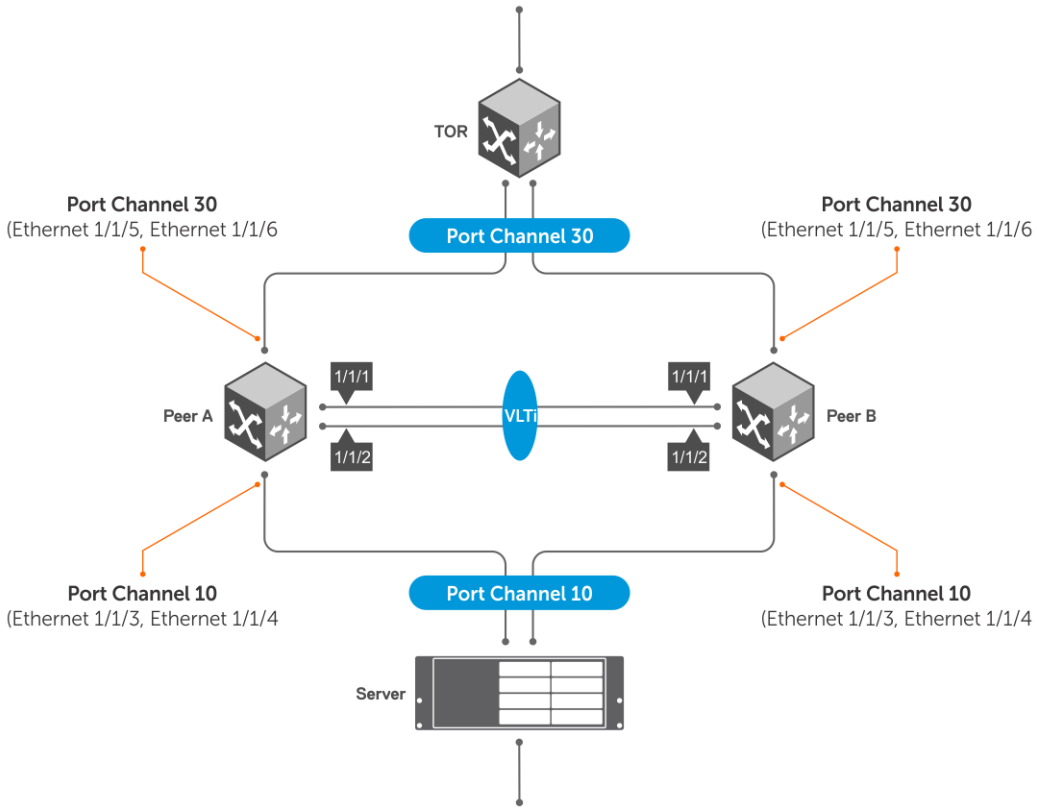
Configure the following settings on each VLT peer device separately:

1. To prevent loops in a VLT domain, Dell Technologies recommends enabling STP globally using the `spanning-tree mode` command. Enabling STP prevents accidental loops that faulty wiring causes.
2. Create a VLT domain by configuring the same domain ID on each peer using the `vlt-domain` command.
3. (Optional) To override the default VLT primary election mechanism based on the system MAC addresses of the VLT nodes, configure a VLT node priority for each of the VLT nodes using the `primary-priority` command. Enter a lower priority value for the desired primary VLT peer and a higher priority value for the desired secondary VLT peer.

NOTE: If a VLT peer is reloaded, it automatically becomes the secondary peer regardless of the VLT primary-priority setting.

4. Configure VLTi interfaces with the `no switchport` command.
5. Configure the VLTi interfaces on each peer using the `discovery-interface` command. After you configure both sides of the VLTi, the primary and secondary roles in the VLT domain are automatically assigned if primary priority is not configured.

   NOTE: Dell Technologies recommends that you disable flow-control on discovery interfaces. Use the `no flowcontrol receive` and `no flowcontrol transmit` commands to disable flow-control.
6. (Optional) Manually reconfigure the default VLT MAC address. Configure the same VLT MAC address in both VLT peers. The manual configuration minimizes the time required to synchronize the default MAC address of the VLT domain on both peer devices when one peer switch reboots.
7. (Optional) Configure a nondefault time interval to delay bringing up VLT ports in the secondary VLT peer after reload or when VLTi comes up after a shutdown or failure. The default time interval is 90 seconds.
8. Configure the VLT heartbeat backup link using the `backup destination {ip-address | ipv6 ipv6-address } [vrf management] [interval interval-time]` command.
9. Configure VLT port channels between VLT peers and an attached device using the `vlt-port-channel` command. Assign the same VLT port channel ID (from 1 to 999 or 1001 to 2000) to interfaces on different peers that you bundle together. The peer interfaces appear as a single VLT port channel to downstream devices.
10. Connect peer devices in a VLT domain to an attached access device or server.



Configure a Spanning Tree Protocol

Dell Technologies recommends configuring one of the supported spanning tree protocols (MSTP, RSTP, or RPVST+) on both VLT peers.

Use a spanning tree protocol for initial loop prevention during the VLT startup phase and for orphan ports. Configure the spanning tree protocol in the network before you configure VLT on peer switches.

NOTE: RPVST+ is enabled by default.

RPVST+ configuration

Configure RPVST+ on both the VLT peers. This creates an RPVST+ instance for every VLAN configured in the system. With RPVST+ configured on both VLT nodes, OS10 supports a maximum of 128 VLANs. The RPVST+ instances in the primary VLT peer control the VLT port channels on both the primary and secondary peers.

NOTE: RPVST+ is the default STP mode running on the switch. Use the following command only if you have another variant of the STP running on the switch.

- Enable RPVST+ on each peer node in CONFIGURATION mode.

```
spanning-tree mode rapid-pvst
```

Configure RPVST+ — peer 1

```
OS10(config)# spanning-tree mode rapid-pvst
```

Configure RPVST+ — peer 2

```
OS10(config)# spanning-tree mode rapid-pvst
```

View RPVST+ information on VLTi

```
OS10# show spanning-tree virtual-interface

```

MSTP configuration

When you enable Multiple Spanning Tree Protocol (MSTP) on VLT nodes, configure both VLT peer nodes in the same MST region to avoid network loops. Ensure that the VLAN-to-instance mappings, region name, and revision ID are the same on both VLT peer nodes.

NOTE: OS10 supports a maximum of 64 MST instances.

To configure MSTP over VLT, follow these steps on both VLT peer nodes:

1. Enable MSTP.
   CONFIGURATION mode
   `spanning-tree mode mst`
2. Enter MST configuration mode.
   CONFIGURATION mode
   `spanning tree mst configuration`
3. Create an MST instance and add multiple VLANs as required.
   MULTIPLE-SPANNING-TREE

`instance instance-number vlan from-vlan-id – to-vlan-id`

4. Configure the MST revision number, from 0 to 65535.
   MULTIPLE-SPANNING-TREE
   `revision revision-number`
5. Configure the MST region name.
   MULTIPLE-SPANNING-TREE
   name *name-string*

The following example shows that both VLT nodes are configured with the same MST VLAN-to-instance mapping.

VLT Peer 1 confoguration

```
OS10(config)# spanning-tree mode mst
OS10(config)# spanning-tree mst configuration
OS10(conf-mst)# instance 1 vlan 2-10
OS10(conf-mst)# revision 10
OS10(conf-mst)# name ExampleMSTregion
```

VLT Peer 2 confoguration

```
OS10(config)# spanning-tree mode mst
OS10(config)# spanning-tree mst configuration
OS10(conf-mst)# instance 1 vlan 2-10
OS10(conf-mst)# revision 10
OS10(conf-mst)# name ExampleMSTregion
```

The following example shows MSTP information on VLTi:

NOTE: To view all the other ports, use the show `spanning-tree active` or `show spanning-tree msti` command.

```
OS10# show spanning-tree virtual-interface

Edge port: No (default)
Link Type: Point-to-Point
BPDU Sent: 2714, Received: 1234
```

Create the VLT domain

A VLT domain requires an ID number. Configure the same VLT domain ID on both peers. For more information, see the VLT domain section. The `no vlt-domain` command disables VLT. Disabling VLT can cause loops in the network. Hence, use the `no` form of the command cautiously.

1. Configure a VLT domain and enter VLT-DOMAIN mode. Configure the same VLT domain ID on each peer, from 1 to 255.

   ```
   vlt-domain domain-id
   ```

2. Repeat the steps on the VLT peer to create the VLT domain.

Peer 1

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)#
```

Peer 2

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)#
```

Configure the VLTi

Before you configure the VLTi on peer interfaces, remove each interface from L2 mode with the `no switchport` command. For more information, see the VLT interconnect section.

1. Enter the VLT domain ID to enter from CONFIGURATION mode.

   ```
   vlt-domain domain-id
   ```

2. Configure one or a hyphen-separated range of VLT peer interfaces to become a member of the VLTi in INTERFACE mode.

   ```
   discovery-interface {ethernet node/slot/port[:subport] | ethernet node/slot/
   port[:subport] -node/slot/port[:subport]}
   ```

3. Repeat the steps on the VLT peer.

Peer 1

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/2
```

Peer 2

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# no switchport
OS10(conf-if-eth1/1/1)# exit
OS10(config)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# no switchport
OS10(conf-if-eth1/1/2)# exit
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet1/1/1-1/1/2
```

Configure the VLT MAC address

You can manually configure the VLT MAC address.

Configure the same VLT MAC address on both the VLT peer switches to avoid any unpredictable behavior during a VLT failover. For example, when a unit is down or when the VLTi is reset. If you do not configure a VLT MAC address, the MAC address of the primary peer is used as the VLT MAC address across all peers.

Use the `vlt-mac` *`mac-address`* to configure the MAC address in both the VLT peers.

Example configuration:

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# vlt-mac 02:00:00:00:00:02
```

NOTE: Dell Technologies Networking recommends configuring the VLT MAC address manually on both the VLT peer switches. Use the same MAC address on both peers.

While configuring a VLT MAC address, if the 8th bit of the MAC address is a 1, then the MAC address is considered to be a multicast MAC address. There are locally defined MAC addresses. For these addresses, the second least significant bit in the first byte must be a 1, which signifies a locally defined address.

The correct MAC addresses must have `xxxxxx10` bits set in the first octet, such as x2, x6, xA, xE, and so on.

While manually configuring MAC addresses for VLT, make the 7th bit a 1 - to signify a locally assigned address - and the 8th bit a 0 - to signify a unicast address - which essentially means that you must use one of the following formulas:

- x2:xx:xx:xx:xx:xx
- x6:xx:xx:xx:xx:xx
- xA:xx:xx:xx:xx:xx
- xE:xx:xx:xx:xx:xx

Configure the delay restore timer

When the secondary VLT node boots, it waits for a pre-configured amount of time (delay restore) to restore the VLT port status. This delay enables VLT peers to complete the control data information exchange.

If the peer VLT device was up at the time the VLTi link failed, the system delays bringing up the VLT ports after reload or peer-link restoration between the VLT peer switches.

When both the VLT peers are up and running, and if the VLTi fails with the VLT heartbeat up, the secondary peer brings down the VLT ports. When the VLTi comes up, the secondary peer does not bring up its VLT ports immediately. The VLT ports are brought up only after the VLT port restoration timer expires. The delay restore timer enables both VLT peers to synchronize the control information with each other.

The default timer is 90 seconds. You can use the `delay-restore` *`seconds`* command to modify the duration of the timer.

Example:

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# delay-restore 100
```

Configure the VLT peer liveliness check

The VLT peer liveliness mechanism checks for the availability of the peer node. The system sends periodic keep-alive messages to detect the liveliness of the peer node. You must use a different link other than the VLTi for the peer liveliness check. This link is referred to as the VLT backup link.

NOTE: Dell Technologies recommends using the OOB management network connection for the VLT backup link.

If the VLTi goes down, the backup link helps to differentiate the VLTi link failure from a peer node failure. If all links in the VLTi fail, the VLT nodes exchange node liveliness information through the backup link.

Based on the node liveliness information:

- If only the VLTi link fails, but the peer is alive, the secondary VLT peer shuts down its VLT ports.
- If the primary VLT node fails, both the VLTi and heartbeat fail, and the current secondary peer takes over the primary role.

Configure the VLT backup link using the `backup destination {ip-address | ipv6 ipv6-address} [vrf management] [interval interval-time]`. The `interval` range is from 1 to 30 seconds. The default interval is 30 seconds. Irrespective of the interval that is configured, when the VLTi link fails, the system checks for the heartbeat connection without waiting for the timed intervals, thus allowing faster convergence.

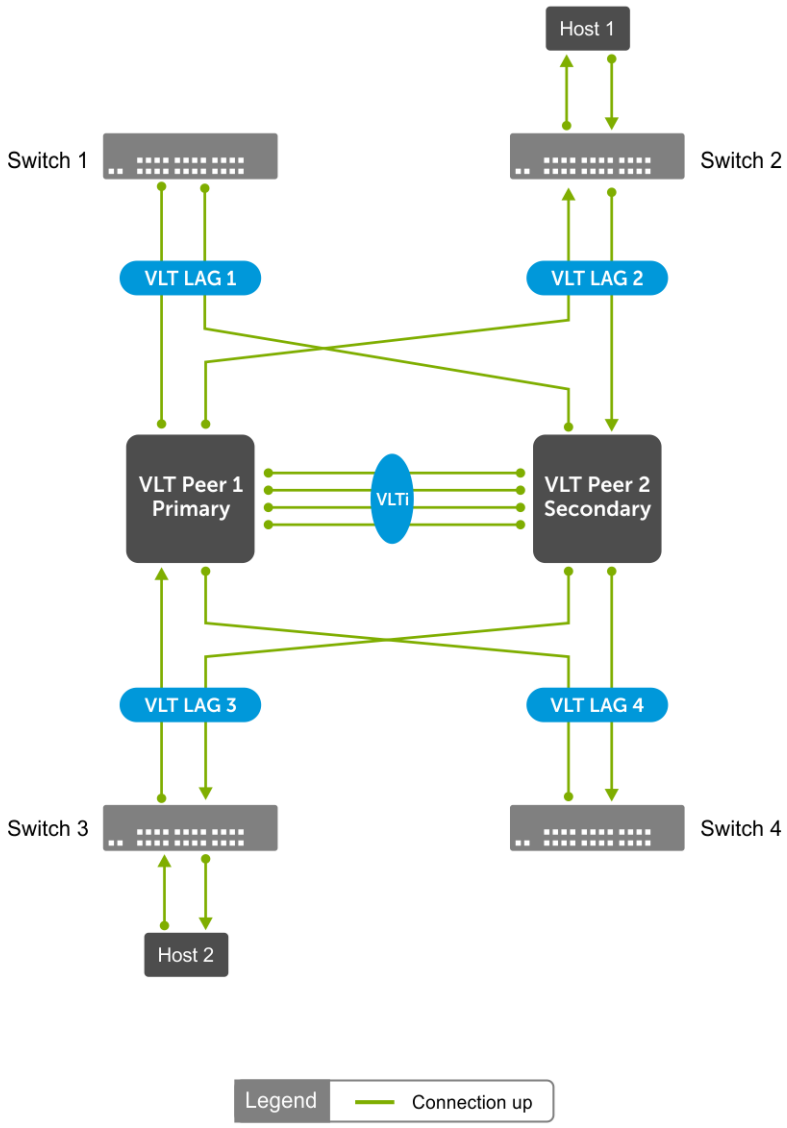
Example configuration:

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.151.110 vrf management interval 20

OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination ipv6 1::1 vrf management interval 20
```

The following examples describe different cases where the VLT backup link is used:

In the following figure, the backup link is not configured:

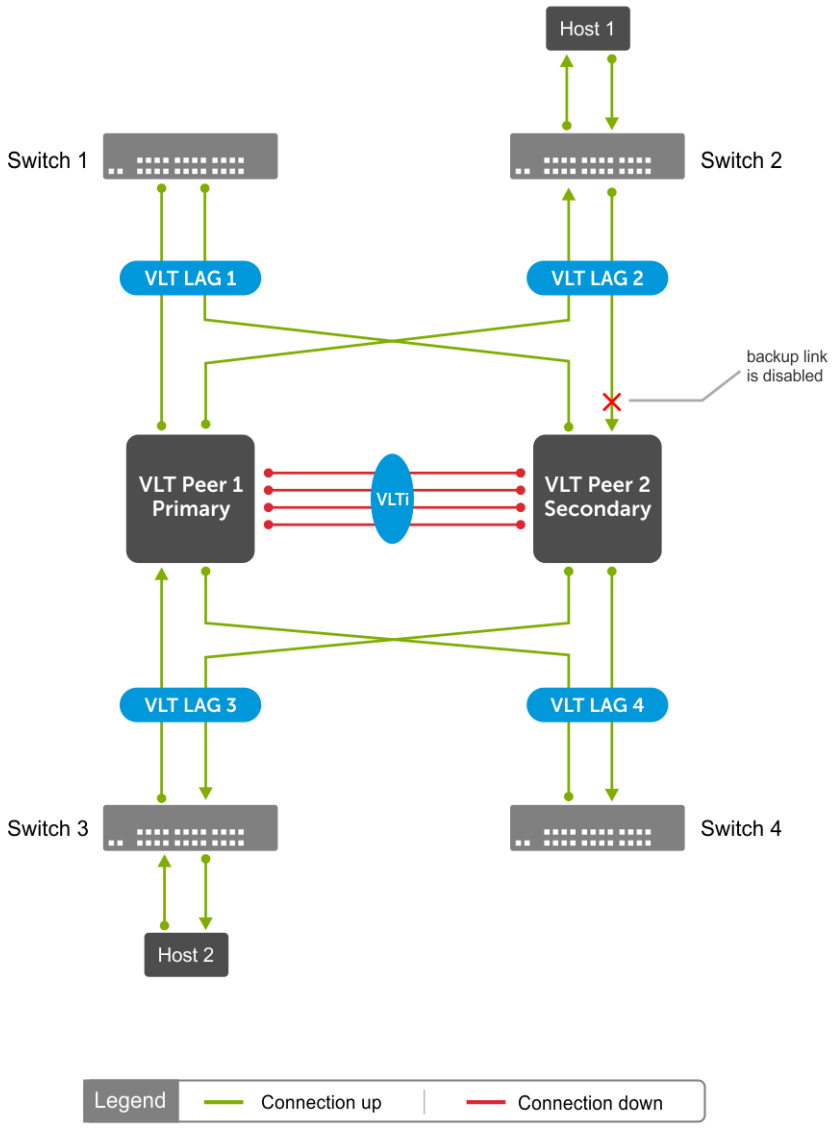


Support for new streams during VLTi failure

If the VLTi fails, MAC addresses that are learned after the failure are not synchronized with VLT peers. Thus, instead of unicast, the VLTi failure causes a continuous traffic flood.

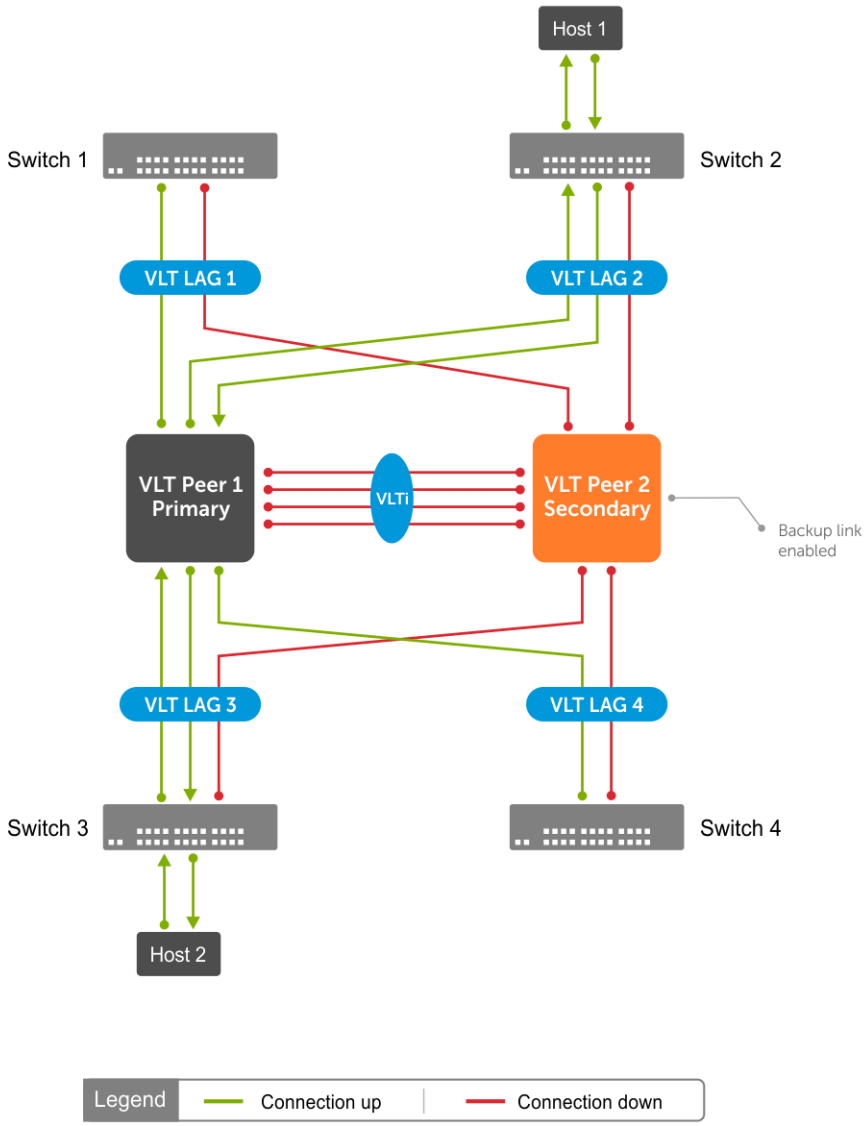
If the VLTi links fail, MAC and ARP synchronization does not happen, and it causes the system to flood L2 packets and drop L3 packets.

For example, as shown, after the VLTi is down, VLT peer1 learns the MAC address of Host 2:



VLT Peer 2 is not synchronized with the MAC address of Host 2 because the VLTi link is down. When traffic from Host 1 is sent to VLT Peer 2, VLT Peer 2 floods the traffic.

When the VLT backup link is enabled, the secondary VLT Peer 2 identifies the node liveliness through the backup link. If the primary is up, the secondary peer brings down VLT port channels. The traffic from Host 1 reaches VLT Peer 1 and then reaches the destination, Host 2. In this case, the traffic is unicasted instead of flooding, as shown:

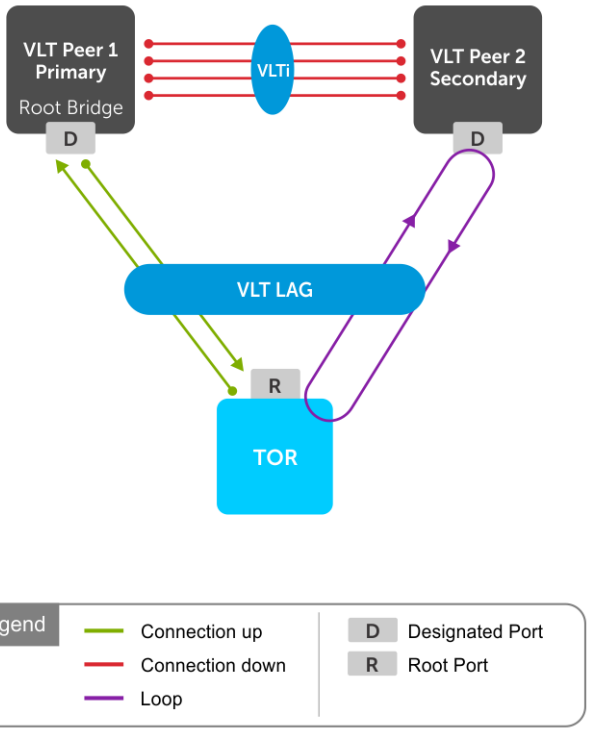


Role of VLT backup link in the prevention of loops during VLTi failure

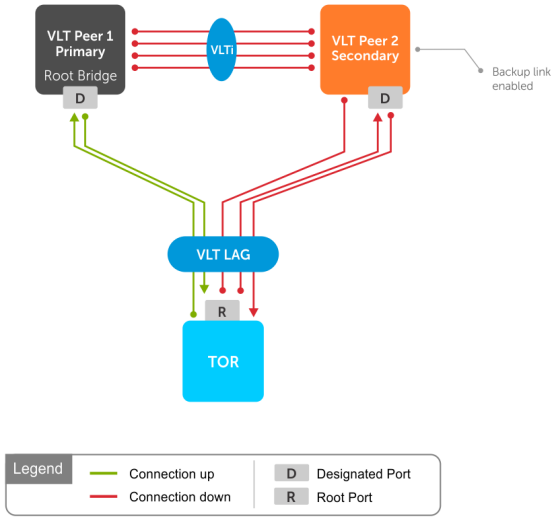
When the VLTi is down, STP may fail to detect any loops in the system. This failure creates a data loop in an L2 network.

As shown, STP is running in all three switches:

In the steady state, VLT Peer 1 is elected as the root bridge. When the VLTi is down, both the VLT nodes become primary. In this state, VLT Peer 2 sends STP BPDU to TOR assuming that TOR sends BPDU to VLT Peer 1. Due to this, VLT Peer 2 does not receive BPDU on the VLT port, but receives TOR BPDU from the orphan port. The STP in VLT Peer 2 assumes that there is no loop in the system and opens up both the VLT and the orphan ports. Opening up both the VLT and orphan ports creates a data loop and brings down the system.



When the VLT backup link is enabled, the secondary VLT peer identifies the node liveliness of primary through the backup link. If the primary VLT peer is up, the secondary VLT peer brings down the VLT port channels. In this scenario, the STP opens up the orphan port and there is no loop in the system, as shown:



Configure a VLT port channel

A VLT port channel, also known as a virtual link trunk, links an attached device and VLT peer switches. OS10 supports a maximum of 128 VLT port channels per node.

1. Enter the port channel ID number on the VLT peer in INTERFACE mode, from 1 to 999 or 1001 to 2000.

```
interface port-channel id-number
```

2. Assign the same ID to a VLT port channel on each VLT peer. The peers are seen as a single switch to downstream devices.

```
vlt-port-channel vlt-port-channel-id
```

3. Repeat the steps on the VLT peer.

Configure VLT port channel — peer 1

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# vlt-port-channel 20
```

Configure VLT port channel — peer 2

```
OS10(config)# interface port-channel 20
OS10(conf-if-po-20)# vlt-port-channel 20
```

Configure VLT peer routing

VLT peer routing enables optimized routing where packets destined for the L3 endpoint of the VLT peer are locally routed. VLT supports unicast routing of both IPv4 and IPv6 traffic.

To enable VLT unicast routing, both VLT peers must be in L3 mode. The VLAN configuration must be symmetrical on both peers. You cannot configure the same VLAN as L2 on one node and as L3 on the other node.

1. Enter the VLT domain ID in CONFIGURATION mode, from 1 to 255.

   ```
   vlt-domain domain-id
   ```

2. Enable peer-routing in VLT-DOMAIN mode.

   ```
   peer-routing
   ```

3. Repeat the steps on the VLT peer.

Configure unicast routing — peer 1

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# peer-routing
```

Configure unicast routing — peer 2

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# peer-routing
```

Configure VRRP Active-Active mode

To enable optimized L3 forwarding over VLT, use VRRP Active-Active mode. By default, VRRP Active-Active mode is enabled on the VLAN interfaces. In this mode, each peer locally forwards L3 traffic, eliminating traffic flow across the VLTi link. Configure the same static and dynamic L3 routing on each peer to ensure that L3 reachability and routing tables are the same on both peers.

1. Enable VRRP Active-Active mode in VLAN-INTERFACE mode.

   ```
   vrrp mode active-active
   ```

2. Configure VRRP on the L3 VLAN that spans both peers.
3. Repeat the steps on the VLT peer.

Configure VRRP active-active mode — peer 1

```
OS10(conf-if-vl-10)# vrrp mode active-active
```

NOTE: VRRP active-active is the default mode.

Configure VRRP active-active mode — peer 2

```
OS10(conf-if-vl-10)# vrrp mode active-active
```

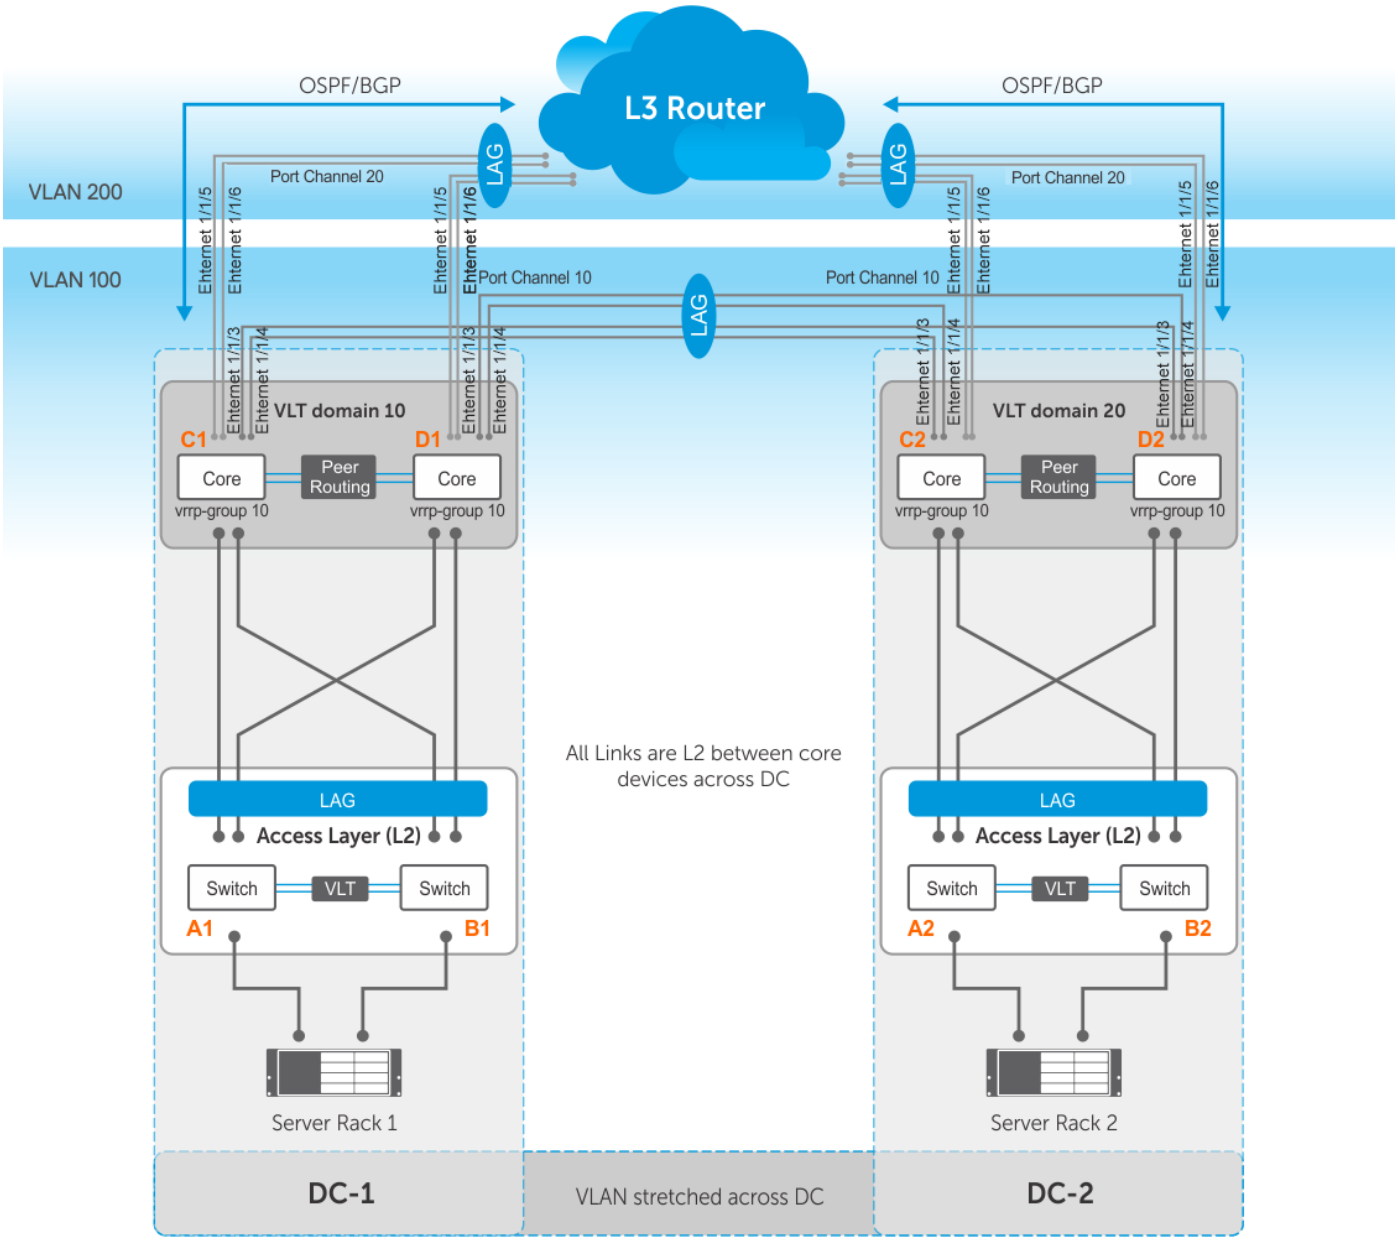
Migrate VMs across data centers with eVLT

OS10 switches support movement of virtual machines (VMs) across data centers using VRRP Active-Active mode.

Configure symmetric VRRP with the same VRRP group ID and virtual IP in VLANs stretched or spanned across data centers. VMs use the VRRP Virtual IP address of the VLAN as Gateway IP. As the VLAN configurations are symmetric across data centers, you can move the VMs from one data center to another.

You must assign the same VRRP group IDs to the VLANs in L3 mode, with VRRP in Active-Active mode.

The following figure shows a sample configuration with two data centers:



- Server racks, Rack 1 and Rack 2, are part of data centers DC1 and DC2, respectively.
- Rack 1 is connected to devices A1 and B1 in L2 network segment.
- Rack 2 is connected to devices A2 and B2 in L2 network segment.
- A VLT port channel is present between A1 and B1 as well as A2 and B2.
- A1 and B1 connect to core routers, C1 and D1 with VLT routing enabled.
- A2 and B2 connect to core routers, C2 and D2, with VLT routing enabled.
- The data centers are connected through a direct link or eVLT.

- The core routers C1 and D1 in the local VLT domain connect to the core routers C2 and D2 in the remote VLT domain using VLT links.
- The core routers C1 and D1 in local VLT domain along with C2 and D2 in the remote VLT domain are part of an L3 cloud.
- The core routers C1, D1, C2, D2 are in a VRRP group with the same vrrp-group ID.

When a virtual machine running in Server Rack 1 migrates to Server Rack 2, L3 packets for that VM are routed without interruption.

Sample configuration of C1:

- **Configure VRRP on L2 links between core routers:**

```
C1(config)# interface vlan 100
C1(conf-if-vl-100)# ip address 10.10.100.1/24
C1(conf-if-vl-100)# vrrp-group 10
C1(conf-vlan100-vrid-10)# priority 250
C1(conf-vlan100-vrid-10)# virtual-address 10.10.100.5
```

- **Configure VLT port channel for VLAN 100:**

```
C1(config)# interface port-channel 10
C1(conf-if-po-10)# vlt-port-channel 10
C1(conf-if-po-10)# switchport mode trunk
C1(conf-if-po-10)# switchport trunk allowed vlan 100
C1(conf-if-po-10)# exit
```

- **Add members to port channel 10:**

```
C1(config)# interface ethernet 1/1/3
C1(conf-if-eth1/1/3)# channel-group 10
C1(conf-if-eth1/1/3)# exit
C1(config)# interface ethernet 1/1/4
C1(conf-if-eth1/1/4)# channel-group 10
C1(conf-if-eth1/1/4)# exit
```

- **Configure OSPF on L3 side of core router:**

```
C1(config)# router ospf 100
C1(config-router-ospf-100)# redistribute connected
C1(conf-router-ospf-100)# exit
C1(config)# interface vlan 200
C1(conf-if-vl-200)# ip ospf 100 area 0.0.0.0
```

- **Configure VLT port channel for VLAN 200:**

```
C1(config)# interface port-channel 20
C1(conf-if-po-20)# vlt-port-channel 20
C1(conf-if-po-20)# switchport mode trunk
C1(conf-if-po-20)# switchport trunk allowed vlan 200
C1(conf-if-po-20)# exit
```

- **Add members to port channel 20:**

```
C1(config)# interface ethernet 1/1/5
C1(conf-if-eth1/1/5)# channel-group 20
C1(conf-if-eth1/1/5)# exit
C1(config)# interface ethernet 1/1/6
C1(conf-if-eth1/1/6)# channel-group 20
C1(conf-if-eth1/1/6)# exit
```

Sample configuration of D1:

- **Configure VRRP on L2 links between core routers:**

```
D1(config)# interface vlan 100
D1(conf-if-vl-100)# ip address 10.10.100.2/24
D1(conf-if-vl-100)# vrrp-group 10
D1(conf-vlan100-vrid-10)# virtual-address 10.10.100.5
```

- **Configure VLT port channel for VLAN 100:**

```
D1(config)# interface port-channel 10
D1(conf-if-po-10)# vlt-port-channel 10
D1(conf-if-po-10)# switchport mode trunk
D1(conf-if-po-10)# switchport trunk allowed vlan 100
D1(conf-if-po-10)# exit
```

- **Add members to port channel 10:**

```
D1(config)# interface ethernet 1/1/3
D1(conf-if-eth1/1/3)# channel-group 10
D1(conf-if-eth1/1/3)# exit
D1(config)# interface ethernet 1/1/4
D1(conf-if-eth1/1/4)# channel-group 10
D1(conf-if-eth1/1/4)# exit
```

- **Configure OSPF on L3 side of core router:**

```
D1(config)# router ospf 100
D1(config-router-ospf-100)# redistribute connected
D1(conf-router-ospf-100)# exit
D1(config)# interface vlan 200
D1(conf-if-vl-200)# ip ospf 100 area 0.0.0.0
```

- **Configure VLT port channel for VLAN 200:**

```
D1(config)# interface port-channel 20
D1(conf-if-po-20)# vlt-port-channel 20
D1(conf-if-po-20)# switchport mode trunk
D1(conf-if-po-20)# switchport trunk allowed vlan 200
D1(conf-if-po-20)# exit
```

- **Add members to port channel 20:**

```
D1(config)# interface ethernet 1/1/5
D1(conf-if-eth1/1/5)# channel-group 20
D1(conf-if-eth1/1/5)# exit
D1(config)# interface ethernet 1/1/6
D1(conf-if-eth1/1/6)# channel-group 20
D1(conf-if-eth1/1/6)# exit
```

Sample configuration of C2:

- **Configure VRRP on L2 links between core routers:**

```
C2(config)# interface vlan 100
C2(conf-if-vl-100)# ip address 10.10.100.3/24
C2(conf-if-vl-100)# vrrp-group 10
C2(conf-vlan100-vrid-10)# virtual-address 10.10.100.5
```

- **Configure VLT port channel for VLAN 100:**

```
C2(config)# interface port-channel 10
C2(conf-if-po-10)# vlt-port-channel 10
C2(conf-if-po-10)# switchport mode trunk
C2(conf-if-po-10)# switchport trunk allowed vlan 100
C2(conf-if-po-10)# exit
```

- **Add members to port channel 10:**

```
C2(config)# interface ethernet 1/1/3
C2(conf-if-eth1/1/3)# channel-group 10
C2(conf-if-eth1/1/3)# exit
C2(config)# interface ethernet 1/1/4
C2(conf-if-eth1/1/4)# channel-group 10
C2(conf-if-eth1/1/4)# exit
```

- **Configure OSPF on L3 side of core router:**

```
C2(config)# router ospf 100
C2(config-router-ospf-100)# redistribute connected
```

```
C2(conf-router-ospf-100)# exit
C2(config)# interface vlan 200
C2(conf-if-vl-200)# ip ospf 100 area 0.0.0.0
```

- **Configure VLT port channel for VLAN 200:**

```
C2(config)# interface port-channel 20
C2(conf-if-po-20)# vlt-port-channel 20
C2(conf-if-po-20)# switchport mode trunk
C2(conf-if-po-20)# switchport trunk allowed vlan 200
C2(conf-if-po-20)# exit
```

- **Add members to port channel 20:**

```
C2(config)# interface ethernet 1/1/5
C2(conf-if-eth1/1/5)# channel-group 20
C2(conf-if-eth1/1/5)# exit
C2(config)# interface ethernet 1/1/6
C2(conf-if-eth1/1/6)# channel-group 20
C2(conf-if-eth1/1/6)# exit
```

Sample configuration of D2:

- **Configure VRRP on L2 links between core routers:**

```
D2(config)# interface vlan 100
D2(conf-if-vl-100)# ip address 10.10.100.4/24
D2(conf-if-vl-100)# vrrp-group 10
D2(conf-vlan100-vrid-10)# virtual-address 10.10.100.5
```

- **Configure VLT port channel for VLAN 100:**

```
D2(config)# interface port-channel 10
D2(conf-if-po-10)# vlt-port-channel 10
D2(conf-if-po-10)# switchport mode trunk
D2(conf-if-po-10)# switchport trunk allowed vlan 100
D2(conf-if-po-10)# exit
```

- **Add members to port channel 10:**

```
D2(config)# interface ethernet 1/1/3
D2(conf-if-eth1/1/3)# channel-group 10
D2(conf-if-eth1/1/3)# exit
D2(config)# interface ethernet 1/1/4
D2(conf-if-eth1/1/4)# channel-group 10
D2(conf-if-eth1/1/4)# exit
```

- **Configure OSPF on L3 side of core router:**

```
D2(config)# router ospf 100
D2(config-router-ospf-100)# redistribute connected
D2(conf-router-ospf-100)# exit
D2(config)# interface vlan 200
D2(conf-if-vl-200)# ip ospf 100 area 0.0.0.0
```

- **Configure VLT port channel for VLAN 200:**

```
D2(config)# interface port-channel 20
D2(conf-if-po-20)# vlt-port-channel 20
D2(conf-if-po-20)# switchport mode trunk
D2(conf-if-po-20)# switchport trunk allowed vlan 200
D2(conf-if-po-20)# exit
```

- **Add members to port channel 20:**

```
D2(config)# interface ethernet 1/1/5
D2(conf-if-eth1/1/5)# channel-group 20
D2(conf-if-eth1/1/5)# exit
D2(config)# interface ethernet 1/1/6
D2(conf-if-eth1/1/6)# channel-group 20
D2(conf-if-eth1/1/6)# exit
```

View VLT information

To monitor the operation or verify the configuration of a VLT domain, use a VLT `show` command on primary and secondary peers.

- View detailed information about the VLT domain configuration in EXEC mode, including VLTi status, local and peer MAC addresses, peer-routing status, and VLT peer parameters.

  ```
  show vlt domain-id
  ```

- View the role of the local and remote VLT peer in EXEC mode.

  ```
  show vlt domain-id role
  ```

- View any mismatches in the VLT configuration in EXEC mode.

  ```
  show vlt domain-id mismatch
  ```

- View detailed information about VLT ports in EXEC mode.

  ```
  show vlt domain-id vlt-port-detail
  ```

- View the current configuration of all VLT domains in EXEC mode.

  ```
  show running-configuration vlt
  ```

Guidelines for VLT Hardware upgrade or replacement

This section provides guidelines to upgrade or replace VLT hardware.

To upgrade the OS version in an existing VLT configuration, upgrade the VLT peers one after the other. As the VLT and MAC addresses are already synced between the VLT peers, the primary VLT peer takes care of traffic.

During firmware upgrade, configure delay-restore to 120 seconds on orphan ports. Use the delay restore feature to reduce traffic loss during upgrade or reload.

During VLT hardware replacement, initial VLT or MAC address sync is required between the newly added VLT hardware peers. This synchronization is achieved only after both the newly added VLT peers are restarted.

Do not attempt to replace or connect one newly added VLT hardware node to an existing VLT pair with out the initial VLT and MAC address sync. Doing so could result in an erroneous VLT configuration and cause problems in the future.

Before adding the VLT pair to the network, boot up the newly added VLT hardware nodes in advance with pre loaded configurations. Also, turn up all the VLT and orphan ports to monitor their traffic flow.

Ensure that you plan a dedicated downtime to perform VLT hardware replacement and avoid doing it on a production setup.

Delay-restore for orphan ports

The delay-restore feature for non-VLT ports is used to delay the bring up of non-VLT ports; so that, there is enough time available for the protocols and features to converge. If there is no such mechanism available, then traffic may get blocked.

This feature is similar to VLT delay-restore mechanism for VLT port-channels, which is already supported. The delay-restore mechanism is applicable to the following two scenarios:

- VLT peer reload - When the reloaded node joins as a secondary node in the VLT domain or fabric, VLT port-channels are brought up only after delay-restore timer expires.
- VLTi link failure - When the VLT heart beat is configured and is up and running, if VLTi link goes down, the secondary VLT peer brings down its local VLT port-channels. All devices connected to the VLT port-channel interfaces are expected to send or receive traffic through the VLT primary device. When the VLTi link comes back up, the secondary VLT peer does not bring its VLT port-channel up immediately. They are brought up only after VLT delay-restore timer expires, assuming that heart-beat is up.

There are two sets of configurations, one for non-VLT deployments and the other for VLT deployments.

Delay-restore port (DRP for non-VLT deployments)

Delay-restore port is used for non-VLT deployments. The configured ports are kept down on system boot up (after a reload) and are brought up only after the configured delay-restore port timer expires. The VLT delay-restore timer that controls the VLT port-channels also controls the orphan ports.

Delay-restore orphan port (DROP for VLT deployments)

The delay-restore for orphan ports feature extends the support of delay-restore timer for the VLT port-channels to orphan ports. The timer corresponding to the VLT port-channel also control the orphan-ports. When delay-restore orphan port is configured, the orphan port is treated just like VLT port-channels during VLT peer reload and VLTi link failure scenarios.

Restrictions and Limitations

Both delay-restore port and delay-restore orphan port configurations are only supported on physical and port-channel interfaces with the following exceptions:

- VLT port-channels
- VLTi link (VLTi port-channel)
- VLT discovery interfaces (VLTi members)
- Port-channel member ports
- Management port
- FC ports

Configuring delay-restore port - non-VLT

Following table shows how to configure delay-restore ports on an interface and with a timer value:

Table 137. Configuring delay-restore port on an interface

Step	Command	Description
1	`OS10# configure terminal`	Enters Configuration mode.
2	`OS10(config)# interface ethernet 1/1/1`	Enters Interface configuration mode.
3	`OS10(conf-if-eth1/1/1)# delay-restore-port enable`	Enables delay-restore port.
4	`OS10(conf-if-eth1/1/1)# exit`	Exits Interface configuration mode and enters Configuration mode.
5	`OS10(conf)# delay-restore-port timeout 120`	Configures delay-restore port timer to 120s.

Consider this switch is reloaded. On boot up, ethernet1/1/1 is kept down. The delay-restore timer is started and is run for 120 seconds. After the timer expires, ethernet1/1/1 is brought up.

You can use the following show command to view the current state of configurations and the timer:

```
OS10# show delay-restore-port
Delay-Restore Port timer              : 90 seconds
Remaining time                        : 57 seconds
Delay-Restore Port enabled interfaces : Eth1/1/1
```

The following table lists the steps to disable delay-restore port on an interface and shows how to revert the timer value to default:

Table 138. Disable delay-restore port

Step	Command	Description
1	`OS10# configure terminal`	Enters Configuration mode.
2	`OS10(config)# interface ethernet 1/1/1`	Enters Interface configuration mode.
3	`OS10(conf-if-eth1/1/1)# no delay-restore-port enable`	Disables delay-restore port.
4	`OS10(conf-if-eth1/1/1)# exit`	Exits Interface configuration mode and enters Configuration mode.
5	`OS10(conf)# no delay-restore-port timeout`	Reverts delay-restore timer value to default 90s.

Configuring delay-restore orphan port in VLT domain

Perform the following steps to configure delay-restore orphan ports on ethernet1/1/1:

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
```

2. Enters INTERFACE CONFIGURATION mode.

```
OS10(config)# interface ethernet 1/1/1
```

3. Enable delay-restore orphan port.

```
OS10(conf-if-eth1/1/1)# vlt delay-restore orphan-port enable
```

4. Exit INTERFACE CONFIGURATION mode and enter CONFIGURATION mode.

```
OS10(conf-if-eth1/1/1)# exit
```

5. Enter VLT domain mode.

```
OS10(conf)# vlt-domain 1
```

6. Configure VLT delay-restore timer to 150 seconds. This command enables the VLT delay-restore timer to control the orphan ports.

```
OS10(conf-vlt-1)# delay-restore 150
```

After you configure delay-restore orphan ports on both the VLT peers, the behavior of the port in different scenarios are explained below:

Fresh VLT configuration

- If VLT is not configured earlier, the ethernet1/1/1 interface is up on both the nodes.
- When VLT is configured on both peers, VLT election occurs.
- In the primary VLT peer, ethernet1/1/1 remains up.
- In the secondary VLT peer, ethernet1/1/1 is brought down and delay-restore is started. A log indicating that the VLT delay-restore has started is thrown on console.
- The ports are brought up after delay-restore timer expires. A syslog indicating that the VLT delay-restore timer has stopped is thrown on the console.

NOTE: A fresh VLT configuration is treated the same way as a reload case. All configured orphan ports irrespective of the ignore vlti-failure configuration are brought down.

NOTE: If VLT and DROP are configured in a system for the first time (or being converted from DRP), DROP is configured after the VLT election and after the initial delay-restore timer expires. This configuration must be applied if you do not want the orphan ports to be brought down.

VLT peer reloads and joins as secondary (single VLT peer save and reload):

- During boot up, ethernet1/1/1 is kept down.
- After the VLT domain is created locally and the VLT peer joins the VLT fabric as the secondary node, the VLT delay-restore timer is started. A syslog indicating that the VLT delay-restore has started is thrown on console.
- After expiry, the ports are brought up. A syslog indicating that the VLT delay-restore timer has stopped is thrown on the console.

Reloading both Peers:

- During boot up, ethernet1/1/1 in both the nodes is kept down.
- VLT domain is created and election occurs.
- Ethernet1/1/1 is brought up immediately in the primary VLT peer.
- In the secondary VLT peer, ethernet1/1/1 remains down and delay-restore timer is started. A syslog indicating that the delay-restore timer has started is thrown on the console.
- After the delay-restore timer expires, a syslog is thrown on the console and the port is brought up.

VLTi fail with heart-beat configured and up:

- If VLTi fails and the VLT heart-beat is up, ethernet1/1/1 is brought down (since ignore vlti-failure configuration is disabled) immediately in the secondary VLT peer.
- When VLTi recovers, the delay-restore timer starts and a syslog is thrown indicating that the timer has started is thrown on the console.
- After the delay-restore timer expires, ethernet1/1/1 is brought up and a syslog is thrown on the console.
- Ethernet1/1/1 is up in the primary VLT peer.

VLTi fail with heart-beat not configured or down:

- When VLTi fails and the VLT heart-beat is down, both the VLT peers become primary (split brain).
- Ethernet1/1/1 in both the VLT peers are kept up.
- When VLTi recovers, election occurs.
- The port remains up in the peer elected as the primary node.
- In the secondary VLT peer, ethernet1/1/1 is brought down (since ignore vlti-failure configuration is disabled) and the delay-restore timer is started. A syslog indicating that the delay-restore timer has started is thrown on the console.
- After the delay-restore timer expires, ethernet1/1/1 is brought up and a syslog is thrown on the console.

On VLTi failure, DROP-enabled ports are treated the same way as VLT port-channels (when ignore vlti-failure configuration is disabled) in all scenarios; except in a scenario where VLT MAC (common MAC) is not configured and VLT heart-beat is down or not configured.

If VLT MAC is not configured on the VLT peers, the primary VLT peer's MAC is used as the system ID in the LACP BPDUs. When VLTi fails, the VLT peers become split-brain, as there is no VLT heart beat. Each VLT peer starts sending its own system MACs as the system ID in the LACP BPDUs. As a result of this mismatch, the VLT port-channel arm of the old secondary peer becomes operationally down (since it changed its system ID from the primary's MAC to its own MAC) due to LACP protocol behavior. In this scenario, the DROP configured orphan ports will not be brought down. Any incoming traffic from the orphan ports is black-holed as the VLT port-channel arm and VLTi are operationally down.

After VLTi recovers, both DROP-enabled ports and VLT port-channels are brought down in the peer elected as the secondary node for running delay-restore timer. After the timer expires, DROP-enabled ports and port-channels are brought up.

NOTE: It is recommended to always have VLT MAC and heart-beat configured.

Perform the following steps to configure orphan ports to ignore VLTi failures:

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
```

2. Enter INTERFACE CONFIGURATION mode.

```
OS10(config)# interface ethernet 1/1/1
```

3. Enable orphan port to ignore VLTi fail scenario.

```
OS10(conf-if-eth1/1/1)# vlt delay-restore orphan-port ignore-vlti-failure
```

4. Display the current status of the timer and delay-restore orphan-port configurations.

```
OS10# show vlt 1 delay-restore-orphan-port
VLT Delay-Restore timer                                    : 90 seconds
Remaining time                                             : 60 seconds
Delay-Restore Orphan-Port enabled interfaces               : Eth1/1/1
Delay-Restore Orphan-Port Ignore VLTi Fail enabled interfaces : Eth1/1/1
```

Perform the following steps to disable the delay-restore orphan ports:

1. Enter CONFIGURATION mode.

```
OS10# configure terminal
```

2. Enter INTERFACE CONFIGURATION mode.

```
OS10(config)# interface ethernet 1/1/1
```

3. Disable orphan port to ignore VLTi failures.

```
OS10(conf-if-eth1/1/1)# no vlt delay-restore orphan-port ignore-vlti-failure
```

4. Disable delay-restore orphan port.

```
OS10(conf-if-eth1/1/1)# no vlt delay-restore orphan-port enable
```

The following table provides the behavior of orphan ports with different DROP configurations and events:

Table 139. DROP Configurations and Events

	Reload and join primary	Reload and join as secondary	Primary node VLTi down or recover	Secondary node VLTi down with HB	Secondary node VLTi recovery with HB	Secondary node VLTi down without HB	Secondary node VLTi recovery without HB
None	No action	No action	No action	No action	No action	No action	No action
Ignore VLTi failure only (no action since DROP is not configured)	No action	No action	No action	No action	No action	No action	No action
DROP only	Up	Down. Brought up after delay-restore timer expires.	Up	Down	Brought up after delay-restore timer expires (Orphan ports were already brought down when VLTi failed).	Up	Down. Brought up after delay-restore expires.
DROP and ignore VLTi failure	Up	Down. Brought up after delay-restore	Up	Up	Up	Up	Up

Table 139. DROP Configurations and Events (continued)

	Reload and join primary	Reload and join as secondary	Primary node VLTi down or recover	Secondary node VLTi down with HB	Secondary node VLTi recovery with HB	Secondary node VLTi down without HB	Secondary node VLTi recovery without HB	
		timer expires.						

Changing configurations from delay-restore orphan port to delay-restore port and vice-versa

If you want to change configuration from delay-restore orphan port (VLT) to delay-restore port (non-VLT), the system would throw error even if the delay-restore port configuration is done on an interface where no delay-restore orphan port configurations are present. You must first remove all the delay-restore orphan port configurations from all interfaces and then configure delay-restore port. For changing configuration from delay-restore port to delay-restore orphan port, the same steps should be taken.

The configurations and behavior of this feature for VLT and non-VLT are different and mutually exclusive. Meaning, only one of the delay-restore port configurations or delay-restore orphan port configurations can be present in a system at a time. If delay-restore port is configured on few interfaces earlier and now delay-restore orphan port needs to be configured, delay-restore port configurations must be removed from all ports first. Otherwise, delay-restore orphan port configuration will be rejected with error message.

If delay-restore orphan ports are configured in the system and if VLT domain is removed, delay-restore orphan ports commands is considered to be inactive; the delay-restore timer is not applied for orphan ports. After the VLT domain is configured back, the command becomes active again on the configured interfaces.

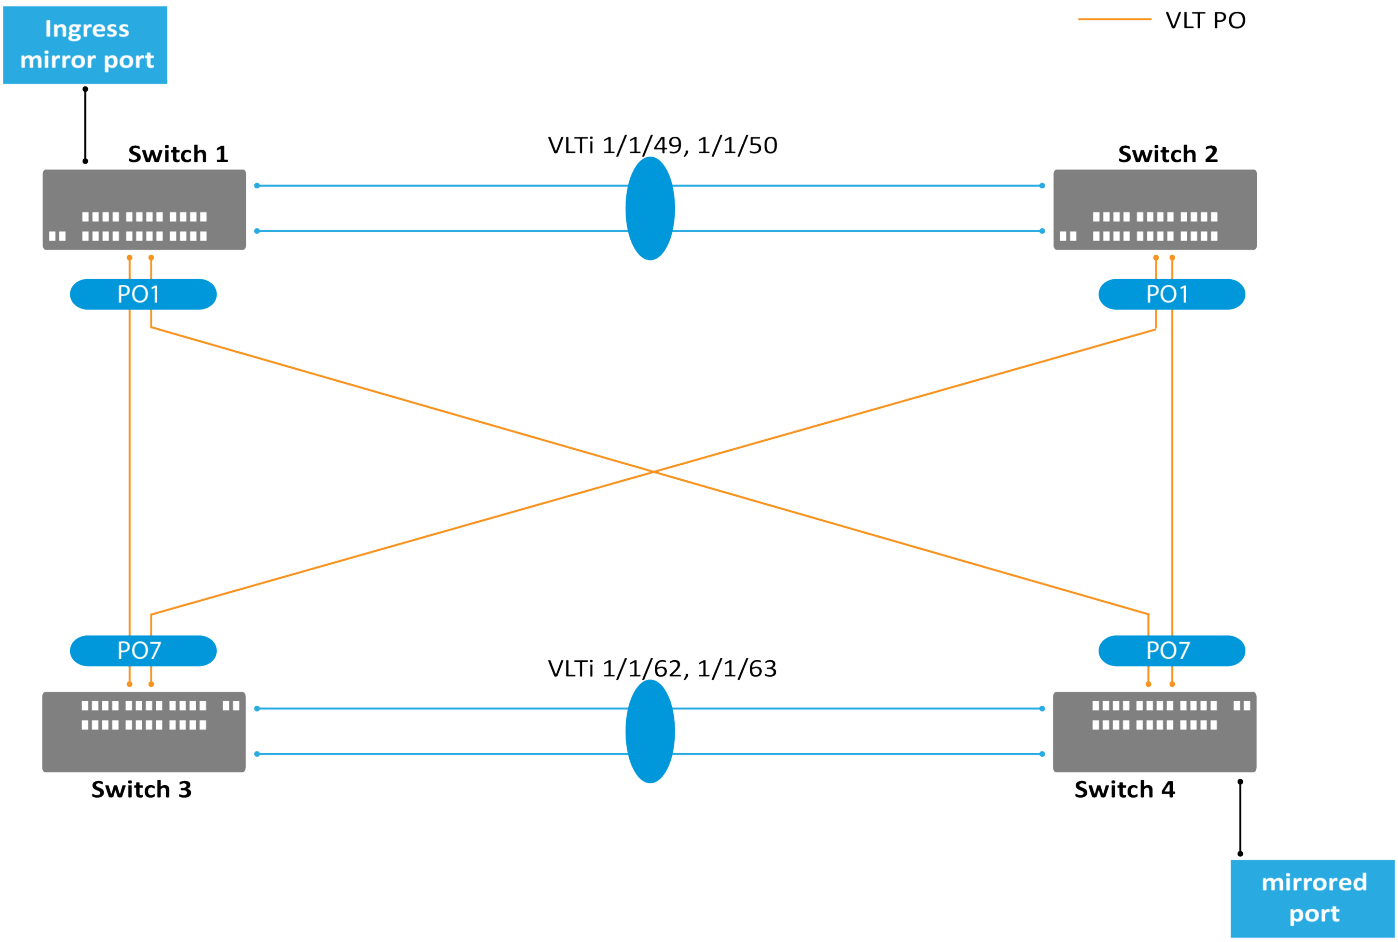
Configuring delay restore port or delay restore orphan port when delay restore timer is running

When delay-restore port or delay-restore orphan port is enabled on an interface and the respective delay-restore timer is running, the port is immediately brought down. This is done to comply with the behavior of VLT ports (When a normal port-channel is converted into a VLT port-channel when delay-restore timer is running, the port-channel is immediately brought down).

NOTE: If you want to enable delay-restore port or delay-restore orphan port on an interface, but do not want it to be brought down, you must ensure that delay-restore timer is not running or wait for the timer to expire if it has started already.

Example: Configure RSPAN in VLT network

This example shows how to configure Remote Switched Port Analyzer (RSPAN) in a VLT network.



Switch 1

```
Switch1# show running-configuration interface vlan 500
!
interface vlan500
no shutdown
remote-span

Switch1# show vlan 500
  Codes: * - Default VLAN, M - Management VLAN, R - Remote Port Mirroring VLANs,
         @ - Attached to Virtual Network, P - Primary, C - Community, I - Isolated
Q: A - Access (Untagged), T - Tagged
     NUM    Status    Description                    Q Ports

```

BFD in VLT Domain

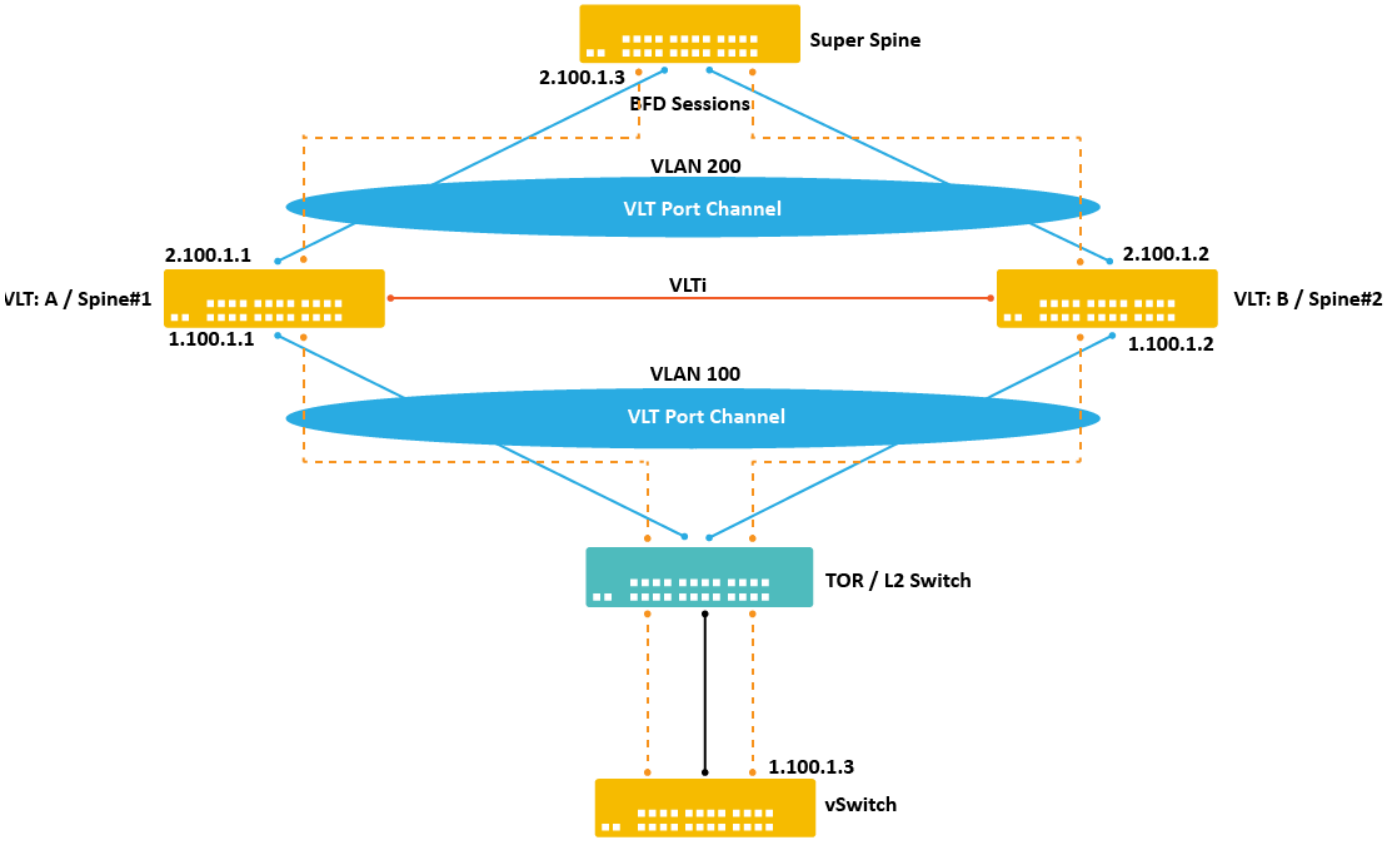
OS10 supports bidirectional forwarding detection (BFD) to detect communication failures on an interface that is a part of a VLT port-channel. BFD replaces link-state detection mechanisms in existing routing protocols. It also provides a failure detection solution for links with no routing protocols. For more information about BFD, see Bidirectional Forwarding Detection.

In a VLT domain, BFD provides a high-availability path when there are communication failures in any of the VLT port-channel links. The VLT nodes and top-of-rack (ToR) use the VLT port-channel links to carry the BFD packets. When any of the VLT port-channel links connected to the ToR is down, the BFD packets reach the VLT primary or secondary using the VLTi link. BFD is supported over VLT only when you enable peer routing on both peers.

NOTE: The BFD session with primary VLT peer could flap when VLTi goes down. BFD keepalive messages destined to the primary VLT peer could hash to the secondary VLT peer for a small interval before the secondary brings down its VLT port-channel after the VLTi went down, leading to the flap. As a workaround, use a higher BFD timer to avoid the flap or bring down the VLT port-channel on the secondary node before bringing down the VLTi in planned VLTi-down scenarios.

Sample BFD configuration in VLT domain

The following figure shows the sample configuration of a BFD implementation in a VLT environment:



VLT Primary

1. Enable BFD globally.

```
VLT_Primary(config)# bfd enable
```

2. Configure Layer 3 VLAN on VLT port-channel.

```
VLT_Primary(config)# interface vlan 100
VLT_Primary(conf-if-vl-100)# ip address 1.100.1.1/24
VLT_Primary(conf-if-vl-100)# ip ospf 10 area 0
VLT_Primary(conf-if-vl-100)# no shutdown
VLT_Primary(config)# interface port-channel 2
VLT_Primary(conf-if-po-2)# switchport mode trunk
VLT_Primary(conf-if-po-2)# switchport trunk allowed vlan 100
VLT_Primary(conf-if-po-2)# vlt-port-channel 2
VLT_Primary(conf-if-po-2)# exit
VLT_Primary(config)# interface ethernet 1/1/1
VLT_Primary(conf-if-eth1/1/1)# channel-group 2 mode active
```

VLT Secondary

1. Enable BFD globally.

```
VLT_Secondary(config)# bfd enable
```

2. Configure Layer 3 VLAN on VLT port-channel.

```
VLT_Secondary(config)# interface vlan 100
VLT_Secondary(conf-if-vl-100)# ip address 1.100.1.2/24
VLT_Secondary(conf-if-vl-100)# ip ospf 10 area 0
VLT_Secondary(conf-if-vl-100)# no shutdown
VLT_Secondary(config)# interface port-channel 2
VLT_Secondary(conf-if-po-2)# switchport mode trunk
VLT_Secondary(conf-if-po-2)# switchport trunk allowed vlan 100
VLT_Secondary(conf-if-po-2)# vlt-port-channel 2
VLT_Secondary(conf-if-po-2)# exit
VLT_Secondary(config)# interface ethernet 1/1/1
VLT_Secondary(conf-if-eth1/1/1)# channel-group 2 mode active
```

ToR

Configure a VLAN.

```
TOR(config)# interface vlan 100
TOR(conf-if-vl-100)# no shutdown
TOR(config)# interface port-channel 2
TOR(conf-if-po-2)# switchport mode trunk
TOR(conf-if-po-2)# switchport trunk allowed vlan 100
TOR(conf-if-po-2)# exit
TOR(config)# interface ethernet 1/1/1
TOR(conf-if-eth1/1/1)# channel-group 2 mode active
TOR(conf-if-eth1/1/1)# exit
TOR(config)# interface ethernet 1/1/2
TOR(conf-if-eth1/1/2)# channel-group 2 mode active
TOR(conf-if-eth1/1/2)# exit
TOR(config)# interface ethernet 1/1/3
TOR(conf-if-eth1/1/3)# switchport mode trunk
TOR(conf-if-eth1/1/3)# switchport trunk allowed vlan 100
```

vSwitch or Layer 3 Router

1. Enable BFD globally.

```
vSwitch(config)# bfd enable
```

2. Configure Layer 3 VLAN.

```
vSwitch(config)# interface vlan 100
vSwitch(conf-if-vl-100)# ip address 1.100.1.3/24
vSwitch(conf-if-vl-100)# ip ospf 10 area 0
vSwitch(conf-if-vl-100)# no shutdown
vSwitch(config)# interface ethernet 1/1/3
vSwitch(conf-if-eth1/1/3)# switchport mode trunk
vSwitch(conf-if-eth1/1/3)# switchport trunk allowed vlan 100
```

PBR in VLT Domain

Policy-based routing (PBR) provides a mechanism to redirect IPv4 and IPv6 data packets based on the policies defined to override the forwarding decisions of the switch based on the routing table. These packets can be routed to alternate destination or dropped based on the policies defined. PBR is enabled at ingress direction of Layer 3 interface. PBR is configured using policy route map with specific matching condition and action to be taken. When you configure PBR in a VLT setup, configure the same PBR rules on both VLT peers. For more information about PBR, see Policy-based routing.

Use the `[no] ip pbr disable` and `[no] ipv6 pbr disable` commands to disable or re-enable IPv4 PBR and IPv6 PBR on VLT domain, respectively. Use the `show vlt domain-id pbr` to view the PBR configuration status on VLT domain.

The following example shows PBR configuration on the VLT peers.

VLT Primary

```
OS10# show running-configuration vlt
!
vlt-domain 255
 backup destination <IP address>
 discovery-interface <VLTi links>
 peer-routing
 primary-priority 1
 vlt-mac <manually configured MAC>
 ip pbr disable
 ipv6 pbr disable
!
```

VLT Secondary

```
OS10# show running-configuration vlt
!
vlt-domain 255
 backup destination <IP address>
 discovery-interface <VLTi links>
 peer-routing
 primary-priority 2
 vlt-mac <manually configured MAC>
 ip pbr disable
 ipv6 pbr disable
!
```

VLT commands

backup destination

Configures the VLT backup link for heartbeat timers.

Syntax `backup destination {ip-address | ipv6 ipv6-address} [vrf management] [interval interval-time]`

Parameters

- *ip-address* — Enter the IPv4 address of the backup link.
- *ipv6-address* — Enter the IPv6 address of the backup link.

- `vrf management` — (Optional) Configure the management VRF instance for the backup IPv4 or IPv6 address.
- `interval` *`interval-time`* — (Optional) Enter the time in seconds to configure the heartbeat interval.

Default Not configured

Command Mode VLT-DOMAIN

Usage Information The `no` version of this command removes the IP address from the backup link.

Example

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination 10.16.151.110 vrf management
interval 30
```

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# backup destination ipv6 1::1 vrf management interval 30
```

Supported Releases 10.3.1E or later

delay-restore

Configures a time interval to delay bringing up the VLT ports after reload or peer-link restoration between the VLT peer switches.

Syntax `delay-restore` *`seconds`*

Parameters *`seconds`* — Enter a delay time, in seconds, to delay bringing up VLT ports after the VLTi link is detected, from 1 to 1200.

Default 90 seconds

Command Mode VLT-DOMAIN

Usage Information Use this command to delay the system from bringing up the VLT port for a brief period to allow the exchange of control information, such as, MAC and ARP tables between VLT peers. If the peer VLT device was up at the time the VLTi link failed, use this command after you reload a VLT device. The `no` version of this command resets the delay time to the default value.

Example

```
OS10(conf-vlt-1)# delay-restore 100
```

Supported Releases 10.3.0E or later

delay-restore-port enable

Enables or disables delay-restore configuration at interface level.

Syntax `delay-restore-port enable`

To disable the delay-restore configuration, enter the `no delay-restore-port enable` command.

Parameters None.

Default Disabled

Command Mode INTERFACE CONFIGURATION MODE

Usage Information Use the `range` command to enable delay-restore-port on all interfaces or a selected range of interfaces.

Example

```
ENABLE/DISABLE ON PHYSICAL INTERFACE:
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# delay-restore-port enable
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
switchport access vlan 1
delay-restore-port enable
OS10(conf-if-eth1/1/1)# no delay-restore-port enable

ENABLE/DISABLE ON PORT-CHANNEL INTERFACE:
OS10(config)#interface port-channel 1
OS10(conf-if-po-1)# delay-restore-port enable
OS10(conf-if-po-1)# no delay-restore-port enable

ENABLE ON RANGE OF ETHERNET INTERFACES AND PORT-CHANNELS:
OS10(config)# interface range ethernet 1/1/1-1/1/10
OS10(conf-range-eth1/1/1-1/1/10)# delay-restore-port enable
OS10(config)# interface range port-channel 1-10
OS10(conf-range-po-1-10)# delay-restore-port enable
```

Supported Releases 10.5.2 or later

delay-restore-port timeout

Configures delay-restore port timer value.

Syntax `delay-restore-port timeout` *`timeout-value`*

To remove configured timer value and return to default, enter the `no delay-restore-port timeout` command.

Parameters

- `timeout` *`timeout-value`* - Enter the keyword timeout followed by the timeout value. The range is from 1 to 1200.

Default 90 seconds

Command Mode CONFIGURATION MODE

Usage Information This command is used to configure the global delay-restore-port timer value for non-VLT scenarios. This timer value is different from the delay-restore timer configuration under VLT domain. The ports where delay-restore-port is enabled are kept down after boot up for the specified number of seconds.

Example

```
OS10(config)# delay-restore-port timeout 100
```

```
OS10(config)# no delay-restore-port timeout
```

Supported Releases 10.5.2 or later

discovery-interface

Configures the interface to discover and connect to a VLT peer in the VLT interconnect (VLTi) link between peers.

Syntax `discovery-interface {ethernet node/slot/port[:subport]}`

Parameters *ethernet* — Enter the Ethernet interface information for the port on a VLT peer. You can also enter a range of interfaces separated by hyphens and commas.

Default None

Command Mode VLT-DOMAIN

Usage Information The VLT node discovery service automatically connects the discovery port to its peer node port and creates VLTi interfaces. The `no` version of this command disables the discovery-interface configuration.

NOTE: Dell Technologies recommends that you disable flow-control on discovery interfaces. Use the `no flowcontrol receive` and `no flowcontrol transmit` commands to disable flow-control.

Example

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# discovery-interface ethernet 1/1/15

OS10(conf-if-eth1/1/15)# no flowcontrol receive
OS10(conf-if-eth1/1/15)# no flowcontrol transmit
```

Example (range)

```
OS10(config)# vlt-domain 2
OS10(conf-vlt-2)# discovery-interface ethernet 1/1/1-1/1/2

OS10(conf-if-eth1/1/1)# no flowcontrol receive
OS10(conf-if-eth1/1/1)# no flowcontrol transmit

OS10(conf-if-eth1/1/2)# no flowcontrol receive
OS10(conf-if-eth1/1/2)# no flowcontrol transmit
```

Supported Releases 10.2.0E or later

ip pbr disable

Disables or enables IPv4 policy-based routing (PBR) on VLT domain.

Syntax `[no] ip pbr disable`

Parameters None

Default PBR is enabled.

Command Mode VLT-DOMAIN

Usage Information Configuration takes effect only after creation of VLT interconnect (VLTi) link in the system. The `no` version of this command enables IPv4 PBR on VLT domain.

Example

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# ip pbr disable
```

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# no ip pbr disable
```

Supported Releases 10.5.3.2 or later

ipv6 pbr disable

Disables or enables IPv6 policy-based routing (PBR) on VLT domain.

Syntax `[no] ipv6 pbr disable`

Parameters None

Default PBR is enabled.

Command Mode VLT-DOMAIN

Usage Information Configuration takes effect only after creation of VLT interconnect (VLTi) link in the system. The `no` version of this command enables IPv6 PBR on VLT domain.

Example

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# ipv6 pbr disable
```

```
OS10(config)# vlt-domain 1
OS10(conf-vlt-1)# no ipv6 pbr disable
```

Supported Releases 10.5.3.2 or later

peer-routing

Enables optimized routing where packets destined for the L3 endpoint of the VLT peer are locally routed.

Syntax `peer-routing`

Parameters None

Default Disabled

Command Mode VLT-DOMAIN

Usage Information The `no` version of this command disables peer routing.

Example

```
OS10(conf-vlt-1)# peer-routing
```

Supported Releases 10.2.0E or later

peer-routing-timeout

Configures the delay after which, the system disables peer routing when the peer is not available. This command supports both IPv6 and IPv4 routing.

Syntax `peer-routing-timeout` *value*

Parameters *value* — Enter the timeout value in seconds, from 0 to 65535.

Default	0
Command Mode	VLT-DOMAIN
Usage Information	When the timer expires, the system checks to see if the VLT peer is available. If the VLT peer is not available, the system disables peer-routing on the peer. If you do not configure the timer, the system does not disable peer-routing even when the peer is unavailable.
Example	`OS10(conf-vlt-1)# peer-routing-timeout 120`
Supported Releases	10.3.0E or later

primary-priority

Configures the priority when selecting the primary and secondary VLT peers during the election.

Syntax	`primary-priority value`
Parameters	*value* — Enter a lower value than the priority value of the remote peer. The range is from 1 to 65535. The default value is 32768.
Default	32768.
Command Mode	VLT-DOMAIN
Usage Information	• After you configure a VLT domain on each peer switch and connect the two VLT peers on each side of the VLT interconnect, the system elects a primary and secondary VLT peer device. To configure the primary and secondary roles before the election process, use the `primary-priority` command. Enter a lower value on the primary peer and a higher value on the secondary peer. If the primary peer fails, the secondary peer (with the higher priority) takes the primary role. If the primary peer (with the lower priority) later comes back online, it is assigned the secondary role; there is no preemption. • If the priority values configured on the two VLT peers are equal, VLT uses the default primary election mechanism based on the values of the system MAC addresses of the two nodes. The VLT peer with the lowest system MAC address assumes the primary role. • If the heartbeat is up and the VLTi link goes down between the VLT peers, both the VLT peers retain their primary and secondary roles. However, the VLT port channel on the secondary VLT peer shuts down. **NOTE:** When you configure a priority for VLT peers using this command, the configuration does not take effect immediately. The primary priority configuration comes into effect the next time election is triggered.
Example	`OS10(conf-vlt-1)#primary-priority 2`
Supported Releases	10.4.1.0 or later

show running-configuration vlt

Displays current configuration of all VLT domains.

Syntax	`show running-configuration vlt`
Parameter	None
Default	Not configured
Command Mode	EXEC
Usage Information	None

Example

```
OS10# show running-configuration vlt
!
vlt domain 1
 peer-routing
 discovery-interface ethernet1/1/17
!
interface port-channel1
 vlt-port-channel 1
!
interface port-channel2
 vlt-port-channel 2
!
interface port-channel3
 vlt-port-channel 3
```

Supported Releases 10.2.0E or later

show spanning-tree virtual-interface

Displays STP, RPVST+, and MSTP information specific to the VLTi.

Syntax `show spanning-tree virtual-interface [detail]`

Parameters `detail`—(Optional) Displays detailed output.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show spanning-tree virtual-interface
VFP(VirtualFabricPort) of RSTP 1 is Designated Forwarding
Edge port: No (default)
Link type: point-to-point (auto)
Boundary: No, Bpdu-filter: Disable, Bpdu-Guard: Disable, Shutdown-on-Bpdu-Guard-
violation: No
Root-Guard: Disable, Loop-Guard: Disable
Bpdus (MRecords) Sent: 11, Received: 7
Interface                                                                  Designated
Name                    PortID    Prio    Cost    Sts    Cost  Bridge ID       PortID
-------------------------------------------------------------------------------------
VFP(VirtualFabricPort)  0.1       0       1       FWD    0     32768    0078.7614.6062  0.1
```

```
OS10# show spanning-tree virtual-interface

VFP(VirtualFabricPort) of vlan 100 is Designated Blocking
Edge port: No (default)
Link type: point-to-point (auto)
Boundary: No, Bpdu-filter: Disable, Bpdu-Guard: Disable, Shutdown-on-Bpdu-Guard-
violation: No
Root-Guard: Disable, Loop-Guard: Disable
Bpdus (MRecords) Sent: 7, Received: 9
Interface                                                          Designated

```

Example (MSTP information on VLT)

```
OS10# show spanning-tree virtual-interface detail
Port 1 (VFP(VirtualFabricPort)) of MSTI 0 is designated Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.1
Designated root priority: 32768, address: 34:17:44:55:66:7f
Designated bridge priority: 32768, address: 90:b1:1c:f4:a5:23
Designated port ID: 128.1, designated path cost: 0
Number of transitions to forwarding state: 1
Edge port: No (default)
Link Type: Point-to-Point
BPDU Sent: 2714, Received: 1234

Port 2001 (VLT-LAG -1(vlt-portid-1)) of MSTI 0 is designated Forwarding
Port path cost 200000, Port priority 128, Port Identifier 128.2001
Designated root priority: 32768, address: 34:17:44:55:66:7f
Designated bridge priority: 32768, address: 90:b1:1c:f4:a5:23
Designated port ID: 128.2001, designated path cost: 0
Number of transitions to forwarding state: 1
Edge port: No (default)
Link Type: Point-to-Point
BPDU Sent: 2714, Received: 1234
```

Supported Releases

10.3.0E or later

show delay-restore-port

Displays delay-restore port configuration and status.

Syntax `show delay-restore-port`

Parameters None.

Default None.

Command Mode EXEC Privilege Mode

Example

```
WHEN DELAY RESTORE IS RUNNING:

OS10# show delay-restore-port

Delay-Restore Port timer                        :  90 seconds

Remaining Restore time                          :  57 seconds

Delay-Restore Port enabled interfaces           :
Eth1/1/1-1/1/3,1/1/5,1/1/7

                                                   Po10-13,15,17

AFTER DELAY RESTORE EXPIRY:

OS10# show delay-restore-port

Delay-Restore Port timer                        :  100 seconds

Delay-Restore Port enabled interfaces           :
Eth1/1/1-1/1/3,1/1/5,1/1/7

                                                   Po10-13,15,17
```

Supported Releases 10.5.2.0 or later

show vlt

Displays information on a VLT domain.

Syntax `show vlt` *`domain-id`* `delay-restore-orphan-port`

Parameter

- *`domain-id`* — Enter a VLT domain ID, from 1 to 255.
- `delay-restore orphan-port` - Enter the `delay-restore orphan-port` keyword to display the delay-restore orphan-port status.

Default Not configured

Command Mode EXEC

Usage Information In the following example, the `status` of the VLT node should be `up`. If you see the `role` for this VLT node listed as `primary`, the `role` on the peer node should be listed as `secondary`.

Example

```
OS10# show vlt 255
Domain ID                  : 255
Unit ID                    : 1
Role                       : primary
Version                    : 2.0
Local System MAC address   : 34:17:eb:3a:bd:80
```

```
Role priority              : 1
VLT MAC address            : aa:bb:cc:dd:ee:ff
IP address                 : fda5:74c8:b79e:1::1
Delay-Restore timer        : 100 seconds
Peer-Routing               : Enabled
Peer-Routing-Timeout timer : 9999 seconds
VLTi Link Status
    port-channel1000       : up

VLT Peer Unit ID  System MAC Address  Status  IP Address           Version
--------------------------------------------------------------------------
  2               34:17:eb:3a:c2:80    up     fda5:74c8:b79e:1::2  2.0

WHEN VLT DELAY-RESTORE TIMER IS RUNNING:

OUTPUT1 - Configurations enabled on discontinuous interfaces

OS10# show vlt 1 delay-restore-orphan-port

VLT Delay-Restore timer                                    : 90 seconds

Remaining time                                             : 60 seconds

Delay-Restore Orphan-Port enabled interfaces               :
Eth1/1/10-1/1/15,1/1/17,1/1/20

Po10-15,17,20

Delay-Restore Orphan-Port Ignore VLTi Fail enabled interfaces :
Eth1/1/12-1/1/14,1/1/20

Po10-12,Po17

WHEN DELAY-RESTORE TIMER HAS EXPIRED/NOT-RUNNING:

OS10# show vlt 1 delay-restore-orphan-port

VLT Delay-Restore timer                                    : 90 seconds

Delay-Restore Orphan-Port enabled interfaces               : Eth1/1/8
                                                             Eth1/1/10
                                                             Po1
                                                             Po4

Delay-Restore Orphan-Port Ignore VLTi Fail enabled interfaces : Eth1/1/10
                                                                Po4
```

Supported Releases	10.2.0E or later

show vlt domain-id delay restore orphan port

Displays the delay restore orphan port information on a VLT domain.

Syntax	`show vlt` *`domain-id`* `delay-restore-orphan-port`
Parameter	• *`domain-id`* — Enter a VLT domain ID, from 1 to 255. • `delay-restore orphan-port` - Enter the `delay-restore orphan-port` keyword to display the delay-restore orphan-port status.
Default	Not configured
Command Mode	EXEC
Usage Information	None

Example

```
WHEN VLT DELAY-RESTORE TIMER IS RUNNING:

OS10# show vlt 1 delay-restore-orphan-port

VLT Delay-Restore timer                                          : 90
seconds

Remaining time                                                   : 60
seconds

Delay-Restore Orphan-Port enabled interfaces                     :
Eth1/1/10-1/1/15,1/1/17,1/1/20

Po10-15,17,20

Delay-Restore Orphan-Port Ignore VLTi Fail enabled interfaces :
Eth1/1/12-1/1/14,1/1/20

Po10-12,Po17

WHEN DELAY-RESTORE TIMER HAS EXPIRED/NOT-RUNNING:

OS10# show vlt 1 delay-restore-orphan-port

VLT Delay-Restore timer                                          : 90
seconds

Delay-Restore Orphan-Port enabled interfaces                     : Eth1/1/8

Eth1/1/10
                                                                   Po1

                                                                   Po4

Delay-Restore Orphan-Port Ignore VLTi Fail enabled interfaces : Eth1/1/10
                                                                   Po4
```

Supported Releases 10.5.2.0 or later

show vlt backup-link

Displays detailed status of the heartbeat

Syntax `show vlt domain-id backup-link`

Parameters *domain-id* — Enter the VLT domain ID.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show vlt 255 backup-link
VLT Backup Link
------------------------
Destination                    : 10.16.208.164
Peer Heartbeat status          : Up
```

```
Heartbeat interval              : 1
Heartbeat timeout               : 3
```

Supported Releases 10.3.1E or later

show vlt egress-mask-rule

Displays the egress mask rules that are installed in the hardware.

Syntax `show vlt id egress-mask-rule`

Parameters *id*—Enter the VLT domain ID, from 1 to 255.

Default Not configured

Command Mode EXEC

Usage Information Use this command to view the egress mask rules that are installed in the hardware.

Use this command to provide information to Technical Support for troubleshooting issues in your network. The output of the `show tech-support` command includes this command output as well.

Supported platforms include S3048-ON, S4048-ON, S4048T-ON, S4100-ON series, S5200-ON series, S6010-ON, Z9100-ON, Z9264F-ON, and Z9332F-ON switches.

Security and Access No restrictions

Example

```
OS10# show vlt 1 egress-mask-rule
Default egress Mask: Avoids loops before computing and applying the
actual egress mask
in the data plane.

Egress mask:
In-ports qualifier : ethernet1/1/1-1/1/2
Blocked ports      : ethernet1/1/1-1/1/2, 1/1/10-1/1/14, 1/1/16

Default egress mask:
In-ports qualifier : ethernet1/1/1-1/1/2
Blocked ports      : ethernet1/1/1-1/1/2, 1/1/10-1/1/14, 1/1/16
```

Supported Releases 10.5.2.1 or later

show vlt error-disabled-ports

Displays VLT ports that are in the error-disabled state.

Syntax `show vlt id error-disabled-ports`

Parameters *id*—Enter the VLT domain ID, from 1 to 255.

Default Not configured

Command Mode EXEC

Usage Information Use this command to view VLT ports that are in error-disabled state. If the egress mask modification in the remote VLT peer is delayed or has failed, the ports go in to the error-disabled state. After the error-disabled state timeout, the system attempts to install the egress mask in the remote VLT peer again.

Use this command and provide information to Technical Support for troubleshooting issues in your network. The output of the `show tech-support` command includes this command output as well.

On delay restore timer expiry, VLT port channels are brought up one by one. Hence, at any given point in time, only one port goes in to the error-disabled state.

This command also displays VLT port channels that will be brought up after recovery of the port that is in the error-disabled state.

Security and Access No restrictions

Example

```
OS10# show vlt 1 error-disabled-ports
vlt-port-channel ID    Port-Channel
-------------------------------------
10                     port-channel1

VLT LAG(s) to be brought up after recovery of the error-disabled VLT LAG
vlt-port-channel ID    Port-Channel
-------------------------------------
20                     port-channel2
30                     port-channel3
40                     port-channel4
```

Supported Releases 10.5.2.1 or later

show vlt mac-inconsistency

Displays inconsistencies in dynamic MAC addresses learned between VLT peers across spanned-VLANs.

Syntax `show vlt mac-inconsistency vlan`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Use this command to check for a mismatch of MAC address table entries between VLT peers. Use this command only when you observe network convergence issues. To verify VLT configuration mismatch issues on peer switches, use the `show vlt domain-name mismatch command`.

Use this command if there are traffic convergence issues.

This show command displays all the sticky mac inconsistencies along with other mac inconsistencies in all VLANs.

Example

```
OS10# show vlt-mac-inconsistency vlan
Checking Vlan 228 .. Found 7 inconsistencies .. Progress 100%
VLAN 128
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
VLAN 1
----------
MAC 00:a0:c9:00:00:18 is missing from Node(s) 2
MAC 00:a0:c9:00:00:20 is missing from Node(s) 2
VLAN 131
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
VLAN 132
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
VLAN 135
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2
VLAN 137
----------
MAC 00:00:00:00:00:02 is missing from Node(s) 2

Run "show vlt mismatch ..." commands to identify configuration issues
```

Example (VLAN)

Table 140. show vlt mac-inconsistencies vlan output

Supported Releases 10.2.0E or later

show vlt mismatch

Displays mismatches in a VLT domain configuration.

Syntax

```
show vlt domain-id mismatch [port-security |dhcp-snooping | peer-routing | pim | vlan | vlt-vlan vlt-port-id| virtual-network | private-vlan {mapping | port-mode | vlan-mode} | multicast-snooping | ra-guard | vlan-anycast| dhcp-relay | lacp-individual | evpn | nlb | vlan-stack | vlan-mac-learning]
```

Parameters

- `port-security`—Displays mismatches in global port-security configurations and all the VLT port-channel port-security configurations.
- *`domain-id`*—Enter the VLT domain ID, from 1 to 255.
- `dhcp-snooping`—Display mismatches in a DHCP snooping configuration in a VLT domain.
- `peer-routing`—Display mismatches in the peer-routing configuration.
- `pim`—Displays PIM mismatch in VLT peers.
- `vlan`—Display mismatches in a VLAN configuration in the VLT domain.
- `vlt-vlan` *`vlt-port-id`*—Display mismatches in the VLT port configuration, from 1 to 4095.
- `virtual-network`—Display mismatches in virtual network configurations between VLT peers.
- `private-vlan`—Displays mismatches in private VLAN mapping, port mode, or VLAN mode.
- `multicast-snooping`—Displays mismatches in IGMP and MLD snooping configuration.
- `ra-guard`—Displays mismatches in IPv6 RA guard configuration.
- `vlan-anycast`—Display mismatches in VLAN anycast IP configuration between VLT peers.
- `dhcp-relay` — Displays the mismatch (if any) between the VLT peers for DHCP relay options configuration on global level and VLANs spanned across the VLT peers.
- `lacp-individual`—Displays mismatches in the LACP individual ports between VLT peers.
- `evpn`—Displays the ARP-suppression global enabled or disabled mismatch configuration between VLT nodes.
- `nlb`—Displays the spanned NLB-cluster VLAN configuration mismatch.

- `vlan-stack`—Display the mismatch in stack VLAN configuration.
- `vlan-mac-learning`—Display the MAC learning configuration mismatch on VLT nodes for VLAN interfaces.

Default Not configured

Command Mode EXEC

Usage Information

The * in the mismatch output indicates a local node entry.

The `show vlt mismatch dhcp-relay` command displays the mismatch in the Global `ip dhcp-relay information-option` command.

The `show vlt mismatch dhcp-relay` command displays the presence or absence of Interface level `ip dhcp-relay information-option` configurations.

Example (no mismatch)

```
OS10# show vlt 1 mismatch
Peer-routing mismatch:
No mismatch

VLAN mismatch:
No mismatch

VLT VLAN mismatch:
No mismatch
```

Example (mismatch)

```
OS10# show vlt 1 mismatch
Peer-routing mismatch:
VLT Unit ID    Peer-routing
---------------------------------
* 1            Enabled
  2            Disabled

VLAN mismatch:
No mismatch

VLT VLAN mismatch:
VLT ID : 1
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              1
  2              2
VLT ID : 2
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              1
  2              2
```

Example (mismatch peer routing)

```
OS10# show vlt 1 mismatch peer-routing
Peer-routing mismatch:
VLT Unit ID    Peer-routing
----------------------------
* 1            Enabled
  2            Disabled
```

Example (mismatch VLAN)

```
OS10# show vlt 1 mismatch vlan
VLAN mismatch:
VLAN L2 mismatch:
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              103
  2              -

VLAN L3-IPv4 mismatch:
No mismatch

VLAN L3-IPv6 mismatch:
```

```
No mismatch

VLAN Local-Proxy-ARP enabled mismatch:
No mismatch

Private VLAN mode mismatch:
No mismatch
```

Example (mismatch VLT VLAN)

```
OS10# show vlt 1 mismatch vlt-vlan
VLT VLAN mismatch:
vlt-port-channel ID : 100
VLT Unit ID    Mismatch VLAN List
---------------------------------
* 1              1001
  2              -
```

Example (mismatch — Virtual Network (VN) name not available in the peer)

```
OS10# show vlt all mismatch virtual-network
Virtual Network Name Mismatch:
VLT Unit ID  Mismatch Virtual Network List
-----------------------------------------
  1            10,104
* 2            -
```

Example (mismatch of VLTi and VLAN)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 100
VLT Unit ID  Configured VLTi-Vlans
---------------------------------
  1             101
* 2             100
```

Example (mismatch of VN mode)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 102
VLT Unit ID  Configured Virtual Network Mode
-------------------------------------------
  1          PV
* 2          Attached
```

Example (mismatch of port and VLAN list)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 102
VLT Unit ID  Mismatch (VLT Port,Vlan) List
-----------------------------------------
  1          -
* 2          (vlt-port-channel10,vlan99)

Virtual Network: 103
VLT Unit ID  Mismatch (VLT Port,Vlan) List
-----------------------------------------
  1          (vlt-port-channel10,vlan103)
* 2          (vlt-port-channel10,vlan104)
```

Example (mismatch of untagged interfaces)

```
OS10# show vlt all mismatch virtual-network
Virtual Network: 104
VLT Unit ID  Mismatch Untagged VLT Port-channel List
-----------------------------------------------------
  1          10
* 2           -
```

Example (Anycast MAC address)

```
show vlt 1 mismatch virtual-network

Interface virtual-network Anycast-mac mismatch:
VLT Unit ID  Anycast-MAC
--------------------------------
```

```
  1           00:01:02:03:04:051
* 2           00:01:02:03:04:055
```

Example (Anycast MAC address not available on one of the peers)

```
show vlt 1 mismatch virtual-network

Interface virtual-network Anycast-mac mismatch:
VLT Unit ID  Anycast-MAC
-------------------------------
  1          00:01:02:03:04:051
* 2          -
```

Example (Virtual network interface anycast IP address)

```
show vlt 1 mismatch virtual-network

Interface virtual-network Anycast-IP mismatch:

Virtual-network: 10

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.25
* 2          10.16.128.20

Virtual-network: 20

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.26
* 2          10.16.128.30
```

Example (Anycast IP addresses not configured on one of the virtual networks on both peers)

```
show vlt 1 mismatch virtual-network
Interface virtual-network Anycast-IP mismatch:

Virtual-network: 10

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.25
* 2          ABSENT

Virtual-network: 20

VLT Unit ID  Anycast-IP
--------------------------
  1          ABSENT
* 2          10.16.128.30
```

Example (Virtual network mismatch and Anycast IP addresses mismatch)

```
Interface virtual-network Anycast-IP mismatch:

Virtual-network: 10

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.25
* 2          10.16.128.20

Virtual-network: 20

VLT Unit ID  Anycast-IP
--------------------------
  1          10.16.128.26
* 2          ABSENT

Virtual-network: 30

VLT Unit ID  Anycast-IP
--------------------------
```

```
  1          ABSENT
* 2          10.16.128.30
```

Example (Displays multicast routing mismatches)

```
OS10# show vlt mismatch

Multicast routing mismatches:

PIM spanned status

Vlan status V4 V6
VlanId Local Peer Local Peer
Vlan 5 Inactive Active Inactive Inactive
Vlan 25 Active Inactive Inactive Active
```

Example (mismatch VLAN anycast IP)

```
OS10# show vlt 1 mismatch vlan-anycast
VLAN anycast ip Mismatch:

VLAN: 2000

VLT Unit ID  Anycast-IPs
--------------------------------------
* 1          64::100, 64.6.7.88

  2          100::100, 100.101.102.100

VLAN: 3000

VLT Unit ID    Anycast-IPs
---------------------------------
* 1              100.101.102.100

  2              Not configured

VLAN: 4000

VLT Unit ID    Anycast-IPs
--------------------------------
* 1              Not configured

  2              8.7.6.5
```

Example (mismatch dhcp-relay)

```
OS10# show vlt 100 mismatch dhcp-relay

Global relay Configuration Mismatch
-------------------------------------------------------------
VLT Unit ID   Link-Selection   Server-Override    VSS
-------------------------------------------------------------
* 1           enabled               -             disabled
  2           disabled              -             enabled

VRF relay Configuration Mismatch
-------------------------------------------------------------
VRF : VRF_RED
VLT Unit ID   Source-Interface
-------------------------------------------------------------
* 1            Present
  2            Not Present

Interface Relay Configuration Mismatch
-------------------------------------------------------------
VLAN: 10

* 1            00:00:00:00:00:06         10
  2            00:00:00:00:00:07         20

IP: 3.1.1.1
VLT Unit ID    nlb-cluster mac      vlt-port-channel
-------------------------------------------------
* 1            00:00:00:00:00:08         -
  2            00:00:00:00:00:09         -

OS10-VLT-2# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 2.1.1.1
VLT Unit ID   nlb-cluster mac       vlt-port-channel
-------------------------------------------------
  1                 -                    -
* 2           00:00:00:00:00:01          -

IP: 3.1.1.1
VLT Unit ID   nlb-cluster mac      vlt-port-channel
-------------------------------------------------
  1                 -                   -
* 2           00:00:00:00:00:01         10

OS10-VLT-1# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 10.1.1.1
VLT Unit ID   nlb-cluster mac       vlt-port-channel
-------------------------------------------------
* 1           00:00:00:00:00:01          -
  2                 -                    -
```

```
Note:- If cluster IP is not configured in node-1, mismatch will not show in
node-1

OS10# show vlt 38 mismatch nlb
nlb-cluster VLAN configuration mismatch:
VLAN: 200
IP: 1.1.1.1
VLT Unit ID  nlb-cluster mac      vlt-port-channel
-------------------------------------------------
  1          03:bf:00:00:00:01          10
* 2          03:bf:00:00:00:02          10

OS10# show vlt 38 mismatch nlb-cluster-vlan
No mismatch
```

Example (mismatch vlan-stack)

```
OS10#show vlt 1 mismatch vlan-stack

VLAN Stack mismatch:
VLT Unit ID       Mismatch VLAN-Stack List
-------------------------------------------------------------------------------
  1               100-103,106
* 2               104

VLAN Stack VLT port TPID mismatch:
vlt-port-channel ID : 100
VLT Unit ID      Configured TPID
-------------------------------------
  1               0x9100
* 2               0x88A8

vlt-port-channel ID : 200
VLT Unit ID      Configured TPID
-------------------------------------
  1               0x8100
* 2               0x9100
```

Supported Releases 10.2.0E or later

show vlt pbr

Displays the policy-based routing (PBR) configuration status on VLT domain.

Syntax `show vlt domain-id pbr`

Parameters *domain-id*—Enter the VLT domain ID.

Default None

Command Mode EXEC

Usage Information None

Example (PBR disabled)

```
OS10# show vlt 1 pbr
PBR Configuration Status on VLT
--------------------------------
IPV4 PBR Status : Disabled
IPV6 PBR Status : Disabled
```

Example (PBR enabled)

```
OS10# show vlt 1 pbr
PBR Configuration Status on VLT
--------------------------------
```

```
IPV4 PBR Status : Enabled
IPV6 PBR Status : Enabled
```

Supported Releases 10.5.3.2 or later

show vlt role

Displays the VLT role of the local peer.

Syntax `show vlt id role`

Parameters `id` — Enter the VLT domain ID, from 1 to 255.

Default Not configured

Command Mode EXEC

Usage Information The * in the mismatch output indicates a local mismatch.

Example

```
OS10# show vlt 1 role
VLT Unit ID    Role
------------------------
* 1            primary
  2            secondary
```

Supported Releases 10.2.0E or later

show vlt vlt-port-detail

Displays detailed status information about the VLT ports.

Syntax `show vlt id vlt-port-detail`

Parameters *id* — Enter a VLT domain ID, from 1 to 255.

Default Not configured

Command Mode EXEC

Usage Information The * in the mismatch output indicates a local mismatch.

Example

```
OS10# show vlt 1 vlt-port-detail
Vlt-port-channel ID : 1
VLT Unit ID   Port-Channel    Status   Configured ports  Active ports
-------------------------------------------------------------------
* 1           port-channel1   down     2                 0
  2           port-channel1   down     2                 0
VLT ID : 2
VLT Unit ID   Port-Channel    Status   Configured ports  Active ports
-------------------------------------------------------------------
* 1           port-channel2   down     1                 0
  2           port-channel2   down     1                 0
VLT ID : 3
VLT Unit ID   Port-Channel    Status   Configured ports  Active ports
-------------------------------------------------------------------
  2           port-channel3   down     1                 0
```

Supported Releases 10.2.0E or later

vlt-domain

Creates a VLT domain.

Syntax	`vlt-domain` *domain-id*
Parameter	*domain-id* — Enter a VLT domain ID on each peer, from 1 to 255.
Default	None
Command Mode	CONFIGURATION
Usage Information	Configure the same VLT domain ID on each peer. If a VLT domain ID mismatch occurs on VLT peers, the VLTi link between peers does not activate. The `no` version of this command disables VLT.
Example	`OS10(config)# vlt-domain 1`
Supported Releases	10.2.0E or later

vlt delay-restore orphan-port enable

Enables or disables delay-restore orphan port on an interface.

Syntax	`vlt delay-restore orphan-port enable`
Parameters	None.
Default	Disabled
Command Mode	INTERFACE CONFIGURATION MODE
Usage Information	Use the `range` command to enable delay-restore orphan ports on all interfaces or on selected range of interfaces. To disable the delay-restore orphan port configuration, enter the `no delay-restore orphan-port enable` command.

Example

```
ENABLE/DISABLE ON PHYSICAL INTERFACE:
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# vlt delay-restore orphan-port enable
OS10(conf-if-eth1/1/1)# show configuration
!
interface ethernet1/1/1
no shutdown
switchport access vlan 1
delay-restore-orphan-port enable
OS10(conf-if-eth1/1/1)# no vlt delay-restore orphan-port enable

ENABLE/DISABLE ON PORT CHANNEL:
OS10(config)#interface port-channel 1
OS10(conf-if-po-1)# vlt delay-restore orphan-port enable
OS10(conf-if-po-1)# no vlt delay-restore orphan-port enable
```

```
ENABLE ON RANGE OF ETHERNET INTERFACES/PORT-CHANNELS:

OS10(config)# interface range ethernet 1/1/1-1/1/10

OS10(conf-range-eth1/1/1-1/1/10)# vlt delay-restore orphan-port enable

OS10(config)# interface range port-channel 1-10

OS10(conf-range-po-1-10)# vlt delay-restore orphan-port enable
```

Supported Releases 10.5.2 or later

vlt delay-restore orphan-port ignore vlti-failure

Considers or ignores VLTi failures for delay-restore orphan port.

Syntax `vlt delay-restore orphan-port ignore vlti-failure`

To disable the delay-restore orphan port configuration, enter the `no delay-restore orphan-port ignore vlti-failure` command.

Parameters None.

Default Disabled

Command Mode INTERFACE CONFIGURATION MODE

Usage Information Use the `range` command to enable delay-restore orphan ports on all interfaces or on selected range of interfaces.

Example

```
ENABLE/DISABLE ON PHYSICAL INTERFACE:

OS10(config)# interface ethernet 1/1/1

OS10(conf-if-eth1/1/1)# vlt delay-restore orphan-port ignore vlti-failure

OS10(conf-if-eth1/1/1)# no vlt delay-restore orphan-port ignore vlti-
failure

ENABLE/DISABLE ON PORT-CHANNEL:

OS10(config)# interface port-channel 1

OS10(conf-if-po-1)# vlt delay-restore orphan-port ignore-vlti-failure

OS10(conf-if-po-1)# no vlt delay-restore orphan-port ignore-vlti-failure

ENABLE ON RANGE OF ETHERNET INTERFACES/PORT-CHANNELS:

OS10(config)# interface range ethernet 1/1/1-1/1/10

OS10(conf-range-eth1/1/1-1/1/10)# vlt delay-restore orphan-port ignore-
vlti-failure

OS10(config)# interface range port-channel 1-10

OS10(conf-range-po-1-10)# vlt delay-restore orphan-port ignore-vlti-
failure
```

Supported Releases	10.5.2 or later

vlt-port-channel

Configures the ID used to map interfaces on VLT peers into a single VLT port-channel.

Syntax	`vlt-port-channel` *`vlt-port-channel-id`*
Parameters	*`vlt-port-channel-id`*—Enter a VLT port-channel ID, from 1 to 999 or 1001 to 2000.
Default	Not configured
Command Mode	PORT-CHANNEL INTERFACE
Usage Information	Assign the same VLT port-channel ID to interfaces on VLT peers to create a VLT port-channel. The `no` version of this command removes the VLT port-channel ID configuration.
Example (peer 1)	`OS10(conf-if-po-10)# vlt-port-channel 1`
Example (peer 2)	`OS10(conf-if-po-20)# vlt-port-channel 1`
Supported Releases	10.2.0E or later

vlt-mac

Configures a MAC address for all peer switches in a VLT domain.

Syntax	`vlt-mac` *`mac-address`*
Parameters	*`mac-address`* — Enter a MAC address for the topology in nn:nn:nn:nn:nn:nn format.
Default	Not configured
Command Mode	VLT-DOMAIN
Usage Information	Use this command to minimize the time required to synchronize the default MAC address of the VLT domain on both peer devices when one peer switch reboots. If you do not configure a VLT MAC address, the MAC address of the primary peer is used as the VLT MAC address across all peers. This configuration must be symmetrical in all the peer switches to avoid any unpredictable behavior. For example, unit down or VLTi reset. The `no` version of this command disables the VLT MAC address configuration. **NOTE:** Configure the VLT MAC address as symmetrical in all the VLT peer switches to avoid any unpredictable behavior when any unit is down or when VLTi is reset.
Example	`OS10(conf-vlt-1)# vlt-mac 02:00:00:00:00:02`
Supported Releases	10.2.0E or later

vrrp mode active-active

Enables the VRRP peers to locally forward L3 traffic in a VLAN interface.

Syntax	`vrrp mode active-active`
Parameters	None
Default	Enabled
Command Mode	VLAN INTERFACE

Usage Information

This command is applicable only for VLAN interfaces.

In a non-VLT network, the backup VRRP gateway forwards L3 traffic. If you want to use VRRP groups on VLANs without VLT topology, disable the Active-Active functionality, to ensure that only the active VRRP gateway forwards L3 traffic.

The `no` version of this command disables the configuration.

Example

```
OS10(conf-if-vl-10)# vrrp mode active-active
```

Supported Releases

10.2.0E or later

21

Uplink Failure Detection

Uplink failure detection (UFD) indicates the loss of upstream connectivity to servers connected to the switch.

A switch provides upstream connectivity for devices, such as servers. If the switch loses upstream connectivity, the downstream devices also lose connectivity. However, the downstream devices do not generally receive an indication that the upstream connectivity was lost because connectivity to the switch is still operational. To solve this issue, use UFD.

UFD associates downstream interfaces with upstream interfaces. When upstream connectivity fails, the switch operationally disables its downstream links. Failures on the downstream links allow downstream devices to recognize the loss of upstream connectivity. This allows the downstream servers to select alternate paths, if available, to send traffic to upstream devices.

UFD creates an association between upstream and downstream interfaces known as *uplink-state group*. An interface in an uplink-state group can be a physical Ethernet or fibre channel interface or a port-channel.

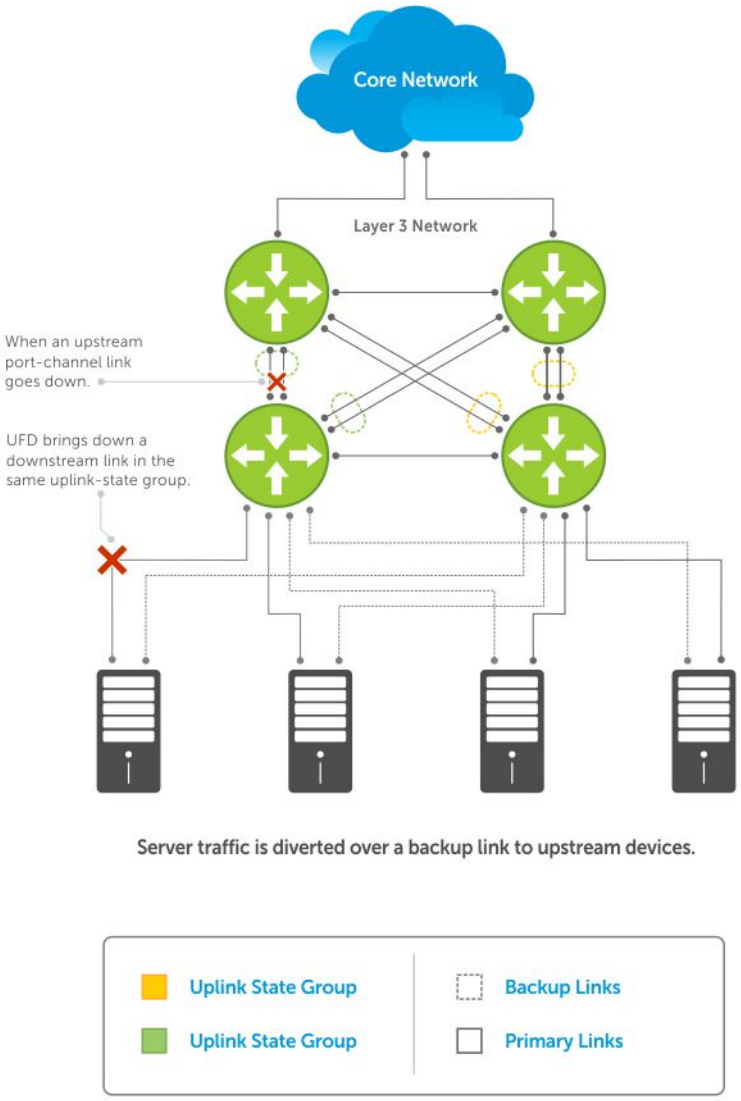
An enabled uplink-state group tracks the state of all assigned upstream interfaces. The failure of upstream interfaces results in automatic disabling of downstream interfaces in the uplink-state group, as shown in the following illustration. If only one of the upstream interfaces in an uplink-state group goes down, a specific number of downstream interfaces in the same uplink-state group go down. You can configure the number of downstream interfaces that go down based on the traffic conditions from the server to the upstream interfaces. This avoids overloading traffic on upstream ports.

By default, if all the upstream interfaces in an uplink-state group go down, all the downstream interfaces in the same uplink-state group are set into a link-down state.

In addition, in an uplink-state group, you can configure automatic recovery of downstream ports when there is a change in the link status of uplink interfaces.

You can also bring up downstream interfaces that are in an UFD-disabled error state manually.

UFD Topology



Configure uplink failure detection

Consider the following before configuring an uplink-state group:

- An uplink-state group is considered to be operationally up if it has at least one upstream interface in the Link-Up state.
- An uplink-state group is considered to be operationally down if it has no upstream interfaces in the Link-Up state.
- You can assign a physical port or a port channel to an uplink-state group.
- You can assign an interface to only one uplink-state group at a time.
- You can designate the uplink-state group as either an upstream or downstream interface, but not both.
- You can configure multiple uplink-state groups and operate them concurrently.
- You cannot assign both a port channel and its members to an uplink-state group, which would make the group inactive. The port channels and individual ports that are not part of any port channel can coexist as members of an uplink-state group.
- If one of the upstream interfaces in an uplink-state group goes down, you can set the downstream ports in an operationally down state with an *UFD Disabled error* status. You can configure the system to disable either a user-configurable set of downstream ports or all the downstream ports in the group.
- The downstream ports are disabled in order starting from the lowest numbered port to the highest numbered port.
- When an upstream interface in an uplink-state group that was down comes up, the set of UFD-disabled downstream ports that were down due to that particular upstream interface are brought up, and the *UFD Disabled error* clears in those downstream ports.

- If you disable an uplink-state group, the downstream interfaces are not disabled, regardless of the state of the upstream interfaces.
- If you do not assign upstream interfaces to an uplink-state group, the downstream interfaces are not disabled.

Configuration:

1. Create an uplink-state group in CONFIGURATION mode.

```
uplink-state-group group-id
```

2. Configure the upstream and downstream interfaces in UPLINK-STATE-GROUP mode.

```
upstream {interface-type | interface-range[ track-vlt-status ] | VLTi}
downstream {interface-type | interface-range}
```

3. (Optional) Disable uplink-state group tracking in UPLINK-STATE-GROUP mode.

```
no enable
```

4. (Optional) Provide a descriptive name for the uplink-state group in UPLINK-STATE-GROUP mode.

```
name string
```

5. Configure the number of downstream interfaces to disable, when an upstream interface goes down in UPLINK-STATE-GROUP mode.

```
downstream disable links{number | all}
```

6. (Optional) Enable auto-recovery of downstream interfaces that are disabled in UPLINK-STATE-GROUP mode.

```
downstream auto-recover
```

7. (Optional) Configure the timer to defer the UFD actions on downstream ports in UPLINK-STATE-GROUP mode. When you have configured to track the VLT status in a VLT network, if VLT port-channel is an upstream member of uplink-state group, then the defer timer triggers when the VLT status goes operationally down instead of the operational status of the peer port-channel.

```
defer-time timer
```

8. (Optional) Clear the UFD error disabled state of downstream interfaces in EXEC mode.

```
clear ufd-disable
```

Configure uplink state group

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# upstream ethernet 1/1/7:1
OS10(conf-uplink-state-group-1)# downstream ethernet 1/1/1-1/1/5
OS10(conf-uplink-state-group-1)# downstream ethernet 1/1/9:2-1/1/9:3
OS10(conf-uplink-state-group-1)# enable
OS10(conf-uplink-state-group-1)# name UFDGROUP1
OS10(conf-uplink-state-group-1)# defer-time 10
OS10(conf-uplink-state-group-1)# no downstream auto-recover
OS10(conf-uplink-state-group-1)# downstream disable links 2
```

View uplink state group configuration

```
OS10#show uplink-state-group 1

Uplink State Group: 1 Status: Enabled,down

```

Uplink failure detection on VLT

When you create uplink-state group in a switch operating in VLT mode, ensure that all the nodes in the VLT setup have same configuration for uplink state groups with VLT port-channel as member. If both the VLT peers do not have the same UFD configuration, the UFD does not work properly.

When you configure VLT port-channel as upstream member in the uplink state group and configure to track the VLT status, the system tracks the fabric Status of VLT. When the fabric status goes down, the uplink state group in each VLT node disables the downstream VLT port-channel local to the node.

When you configure to track the VLT status, the system places the downstream members of the Uplink State Group in error disabled state or clears them from the error disabled state based on the operational status of the VLT port-channel.

When you do not track the VLT status, the system tracks the operational status of port-channel.

Track the VLT status using the `upstream` *`interface-type`* `track-vlt-status` command in UPLINK-STATE-GROUP mode.

To configure VLTi link as member of Uplink State Group, use the `upstream VLTi` command in UPLINK-STATE-GROUP mode. You cannot configure VLTi Link as downstream member in an uplink-state group as UFD may disable the VLTi Link when the upstream members are operationally down. You cannot track the VLT status for an upstream VLTi member.

The following table describes various scenarios when you apply UFD on a VLT network:

Table 142. UFD on VLT network

Event	VLT action on primary node	VLT action on secondary node	UFD action
VLTi Link is operationally down with heartbeat up	No action	VLT module sends VLT port-channel disable request to Interface Manager (IFM) for both uplink and downlink.	UFD receives operationally down of upstream VLT port-channel and sends error-disable of downstream VLT port-channel to IFM.

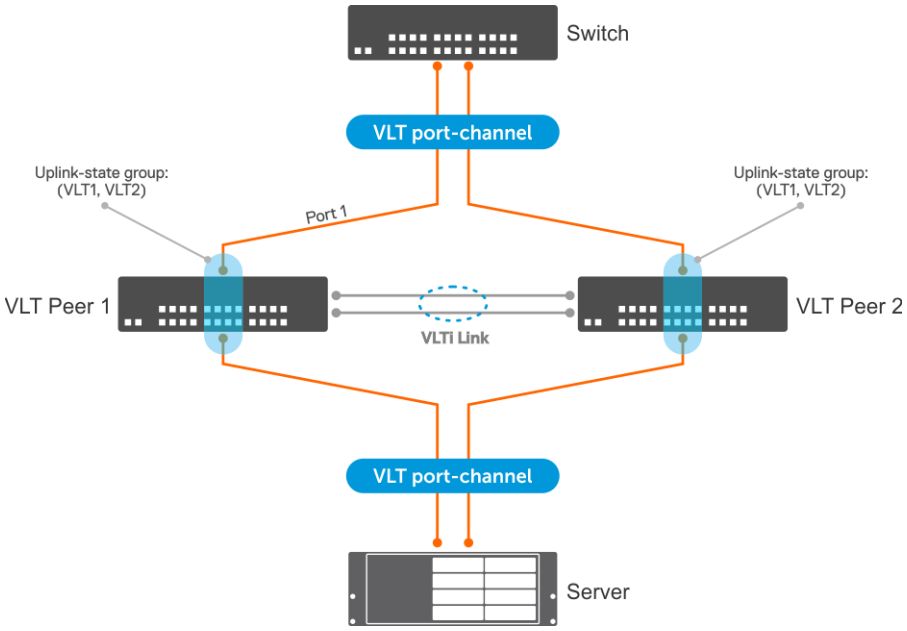
Table 142. UFD on VLT network (continued)

Event	VLT action on primary node	VLT action on secondary node	UFD action
VLTi Link is operationally up with heartbeat up	No action	VLT module sends VLT port-channel enable request to Interface Manager (IFM) for both uplink and downlink.	UFD receives operationally up of upstream VLT port-channel and sends clear error-disable of downstream VLT port-channel to IFM.
Reboot of VLT secondary peer	No action	After reboot, runs the delay restore timer. Both the upstream and downstream VLT port-channel remains disabled until the timer expires.	UFD `error-disables` the downstream VLT port-channel as the upstream VLT port-channel is operationally down. After the timer expires, UFD receives operationally up of upstream VLT port-channel and sends `clear error-disable` of downstream VLT port-channel to IFM.
Reboot of VLT primary peer	Primary becomes secondary peer and runs delay restore timer	Secondary becomes primary	UFD `error-disables` the downstream VLT port-channel as the upstream VLT port-channel is operationally down. After the timer expires, UFD receives operationally up of upstream VLT port-channel and sends `clear error-disable` of downstream VLT port-channel to IFM.
Discovery interface added to UFD group	Invalid configuration	Invalid configuration	Invalid configuration
UFD group member configured as discovery interface	Invalid configuration	Invalid configuration	Invalid configuration
UFD group member made as VLT port-channel	No action	No action	UFD uses fabric status to track the UFD group status.
VLT port-channel added as member of UFD group	No action	No action	UFD uses fabric status to track the UFD group status.
VLT port-channel configuration removed from the port-channel interface which is upstream member of UFD group	No action	No action	Stops tracking the fabric status for the UFD group. Starts tracking the local port-channel operational status, which is upstream member of the UFD group.
Fabric Status is operationally up	No action	No action	Enables the downstream members, that is clears the error-disabled state.
Fabric Status is operationally down	No action	No action	Disables the downstream members, that is sets the error-disabled state.

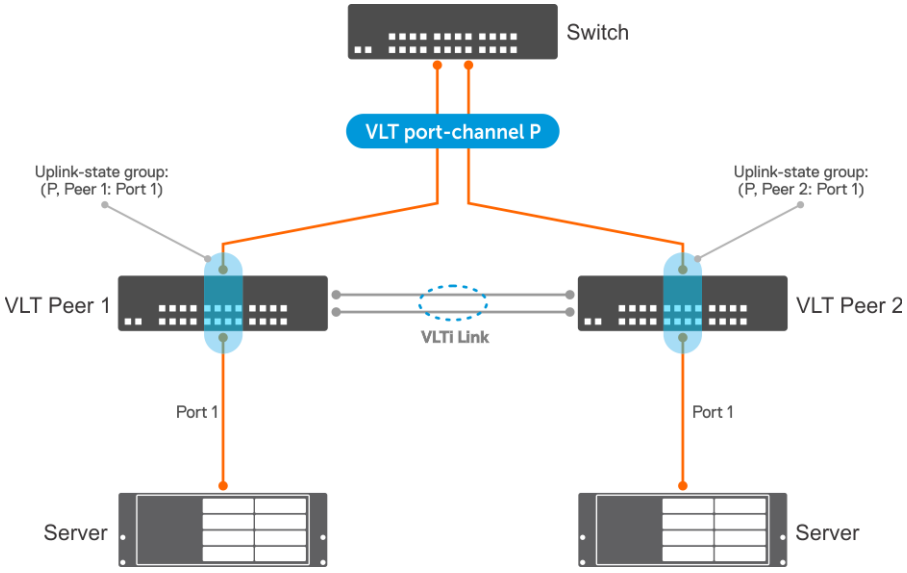
Sample configurations of UFD on VLT

The following examples show some of the uplink-state groups on VLT.

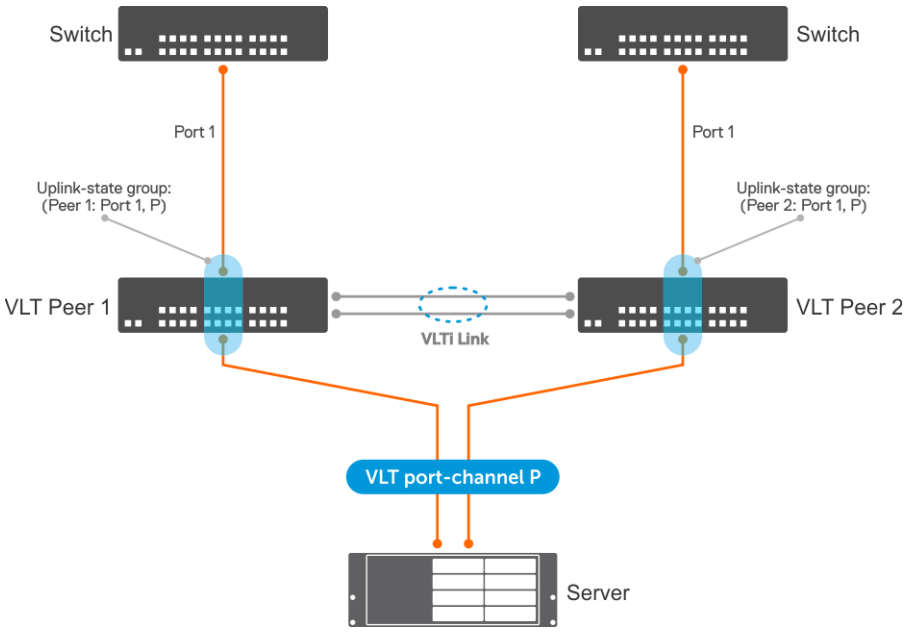
In the following illustration, both the upstream and downstream members are part of VLT port-channels. The uplink-state group includes both the VLT port-channels as members.



In the following example, the upstream member is part of VLT port-channel and the downstream member is an orphan port. The uplink-state group includes the VLT port-channel, VLT node, and the downstream port. The configuration is symmetric on both the VLT nodes.



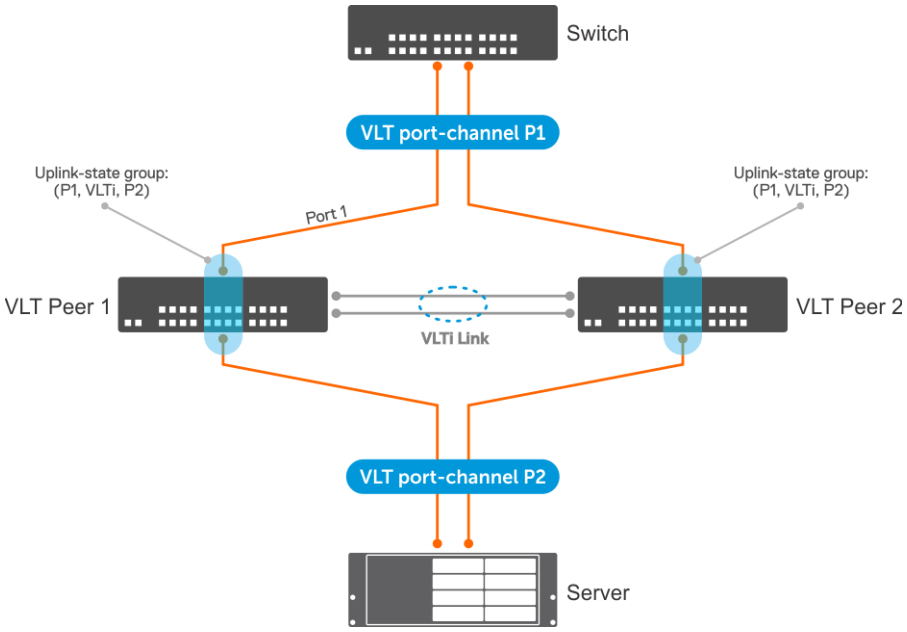
In the following example, the downstream member is part of VLT port-channel and the upstream member is an orphan port. The uplink-state group includes the VLT port-channel, VLT node, and the upstream port. The configuration is symmetric on both the VLT nodes.



OS10 does not support adding a VLTi link member to the uplink-state group. You can add the VLTi link as upstream member to an uplink-state group using the `upstream VLTi` command. If the VLTi link is not available in the system, OS10 allows adding the VLTi link as an upstream member. In this case, UFD starts tracking the operational status of the VLTi link when the link is available. Until the VLTi link is available, the `show uplink-state-group details` command displays the status of the link as `NA`.

In the following example, both the VLT port-channel connected to the switch and the VLTi Link are upstream members. The VLT port-channel connected to the server is a downstream member. The UFD tracks the operational status of the peer port-channel.

NOTE: You cannot configure a VLTi link as a downstream member in an uplink-state group. If you configure, UFD disables the VLTi link when the upstream members are operationally down, which affects the VLT functionality.



UFD commands

clear ufd-disable

Overrides the uplink-state group configuration and brings up the downstream interfaces.

Syntax `clear ufd-disable {interface interface-type | uplink-state-group group-id}`

Parameters
- *interface-type* — Enter the interface type.
- *group-id* — Enter the uplink state group ID, from 1 to 32.

Default None

Command Mode EXEC

Usage Information This command manually brings up a disabled downstream interface that is in an UFD-disabled error state. After the downstream interface is up, it is not disabled until there are changes in the upstream interfaces. This command does not affect downstream interfaces that are already up or interfaces that are not part of the UFD group.

Example

```
OS10# clear ufd-disable interface ethernet 1/1/2
OS10# clear ufd-disable uplink-state-group 1
```

Supported Releases 10.4.0E(R3) or later

defer-time

Configures the timer to defer UFD actions on downstream ports.

Syntax `defer-time timer`

Parameters *timer*— Enter the timer value in seconds, ranging from 1 to 120.

Default Disabled

Command Mode UPLINK-STATE-GROUP

Usage Information You can view configured timer details using the `show uplink-state-group [group-id] detail` command. The `no` version of this command disables the timer.

Example

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# defer-time 120
```

Supported Releases 10.4.1.0 or later

downstream

Adds an interface or a range of interfaces as a downstream interface to the uplink-state group.

Syntax `downstream {interface-type | interface-range}`

Parameters
- *interface-type* — Enter the interface type as Ethernet or port-channel.
- *interface-range* — Enter the range of interfaces.

Default None

Command Mode UPLINK-STATE-GROUP

Usage Information You cannot assign an interface that is already a member of an uplink-state group to another group. To configure UFD, you must configure both upstream and downstream interfaces in the Uplink State Group

Mode. See upstream CLI command for more information. The `no` version of this command removes the interface from the uplink-state group.

Example

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# downstream ethernet 1/1/1
```

Supported Releases 10.4.0E(R3) or later

downstream auto-recover

Enables auto-recovery of the disabled downstream interfaces.

Syntax `downstream auto-recover`

Parameters None

Default Enabled

Command Mode UPLINK-STATE-GROUP

Usage Information The `no` version of this command disables the auto-recovery of downstream interfaces.

Example

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# no downstream auto-recover
```

Supported Releases 10.4.1.0 or later

downstream disable links

Configures the number of downstream interfaces to disable when an upstream interface in the uplink-state group goes down.

Syntax `downstream disable links{`*`number`*` | all}`

Parameters

- *`number`*—Enter the number of downstream interfaces to disable, from 1 to 1024.
- `all`—Enter `all` to disable all the downstream interfaces.

Default Not configured

Command Mode UPLINK-STATE-GROUP

Usage Information The `no` version of this command reverts the settings to the default state.

Example

```
OS10(config)# uplink-state-group 1
OS10(conf-uplink-state-group-1)# downstream disable links 2
```

Supported Releases 10.4.1.0 or later

enable

Enables tracking of an uplink-state group.

Syntax `enable`

Parameters None

Default Disabled

Command Mode UPLINK-STATE-GROUP

Usage Information	The `no` version of this command disables tracking of an uplink-state group.
Example	`OS10(config)# uplink-state-group 1` `OS10(conf-uplink-state-group-1)# enable`
Supported Releases	10.4.0E(R3) or later

name

Configures a descriptive name for the uplink-state group.

Syntax	`name string`
Parameters	*string* — Enter a description for the uplink-state group. A maximum of 32 characters.
Default	Not configured
Command Mode	UPLINK-STATE-GROUP
Usage Information	The `no` version of this command removes the descriptive name.
Example	`OS10(config)# uplink-state-group 1` `OS10(conf-uplink-state-group-1)# name test_ufd_group`
Supported Releases	10.4.0E(R3) or later

show running-configuration uplink-state-group

Displays the running configuration specific to uplink-state groups.

Syntax	`show running-configuration uplink-state-group [group-id]`
Parameters	*group-id* — Enter the uplink group ID. The running configuration of the specified group ID displays.
Default	Not configured
Command Mode	EXEC
Usage Information	None

Example	`OS10# show running-configuration uplink-state-group`
	`!`
	`uplink-state-group 1`
	` downstream ethernet1/1/8:1-1/1/8:4`
	` upstream ethernet1/1/9:1-1/1/9:4`
	` upstream port-channel1-3`

Supported Releases	10.4.0E(R3) or later

show uplink-state-group

Displays the configured uplink-state status.

Syntax	`show uplink-state-group [group-id] [detail]`
Parameters	• *group-id* — Enter the uplink group ID. The status of the specified group ID displays.

- `detail` — Displays detailed information on the status of the uplink-state groups.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show uplink-state-group

Uplink State Group: 9, Status: Enabled,down
```

```
OS10# show uplink-state-group 9

Uplink State Group: 9, Status: Enabled,down
OS10#
```

Example (detail)

```
OS10# show uplink-state-group detail

(Up): Interface up   (Dwn): Interface down   (Dis): Interface disabled

Uplink State Group   :  1     Status   :  Enabled,up Name :  UFDGROUP1
Defer Time           :  10 second(s)
Upstream Interfaces  :  Eth 1/1/7:1(Up)
Downstream Interfaces:  Eth 1/1/1(Dwn)   Eth 1/1/2(Dwn)   Eth 1/1/3(Dwn)
  Eth 1/1/4(Dwn)
                        Eth 1/1/5(Dwn)   Eth 1/1/9:2(Dwn) Eth
1/1/9:3(Dwn)
```

```
OS10# show uplink-state-group 2 detail

(Up): Interface up   (Dwn): Interface down   (Dis): Interface disabled

Uplink State Group   :  2      Status  :  Enabled,down  Name:  UFDGROUP
Upstream Interfaces  :  Eth 1/1/6(Dwn)   Eth 1/1/10(Dwn)  Eth
1/1/11(Dwn)  Eth 1/1/12(Dwn)
                        Eth 1/1/13(Dwn)  Eth 1/1/14(Dwn)  Eth 1/1/15(Dwn)
Downstream Interfaces:  Eth 1/1/16(Dis)  Eth 1/1/17(Dis)  Eth
1/1/18(Dis)  Eth 1/1/19(Dis)
                        Eth 1/1/20(Dis)
```

Example (detail with VLTi and VLT status tracked)

```
OS10#show uplink-state-group 1 detail

(Up): Interface up (Dwn): Interface down (Dis): Interface disabled (NA):
Not Available

*: VLT port-channel, V: VLT status, P: Peer Operational status ^:
Tracking status

Uplink State Group : 1 Name: iscsi_group, Status: Enabled, Up
Upstream Interfaces : eth1/1/35(Up) *po10(V:Up, ^P:Dwn) VLTi(NA)
Downstream Interfaces : eth1/1/2(Up) *po20(V: Up,P: Up)
```

```
OS10#show uplink-state-group 2 detail

(Up): Interface up (Dwn): Interface down (Dis): Interface disabled (NA):
Not Available

*: VLT port-channel, V: VLT status, P: Peer Operational status ^:
Tracking status

Uplink State Group : 1 Name: iscsi_group, Status: Enabled, Up
Upstream Interfaces : eth1/1/36(Up) *po30(^V:Up, P:Dwn) VLTi(Up)
Downstream Interfaces : eth1/1/4(Up) *po20(V: Up,P: Up)
```

Supported Releases	10.4.0E(R3) or later

uplink-state-group

Creates an uplink-state group and enables upstream link tracking.

Syntax	`uplink-state-group group-id`
Parameters	*group-id* — Enter a unique ID for the uplink-state group, from 1 to 32.
Default	None
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the uplink-state group.
Example	`OS10(config)# uplink-state-group 1`
Supported Releases	10.4.0E(R3) or later

upstream

Adds an interface or a range of interfaces as an upstream interface to the uplink-state group.

Syntax	`upstream {interface-type | interface-range [ track-vlt-status ] | VLTi}`
Parameters	• *interface-type* — Enter the interface type as Ethernet or port-channel. • *interface-range* — Enter the range of interfaces. • `VLTi`—Configures VLTi Link as member of uplink state group. • `track-vlt-status`—(Optional) Tracks the VLT status for the upstream member. This option applies only for port-channel interfaces.
Default	When you add an upstream member without the `track-vlt-status` option, the operational status is tracked by default.
Command Mode	UPLINK-STATE-GROUP
Usage Information	You cannot assign an interface that is already a member of an uplink-state group to another group. To configure UFD, you must configure both upstream and downstream interfaces in the Uplink State Group Mode. See downstream CLI command for more information. The `no` version of this command removes the interface from the uplink-state group.

Example	`OS10(config)# uplink-state-group 1`
	`OS10(conf-uplink-state-group-1)# upstream ethernet 1/1/45-1/1/48`
	
	`OS10(conf-uplink-state-group-1)# upstream VLTi`
	
	`OS10(conf-uplink-state-group-1)# upstream port-channel 10 track-vlt-status`

Supported Releases	10.4.0E(R3) or later

22

Converged data center services

OS10 supports converged data center services, including IEEE 802.1 data center bridging (DCB) extensions to classic Ethernet. DCB provides I/O consolidation in a data center network. Each network device carries multiple traffic classes while ensuring lossless delivery of storage traffic with best-effort for local area network (LAN) traffic and latency-sensitive scheduling of service traffic.

- 802.1Qbb — Priority flow control
- 802.1Qaz — Enhanced transmission selection
- Data Center Bridging Exchange (DCBX) protocol

DCB enables the convergence of LAN and storage area network (SAN) traffic over a shared physical network in end-to-end links from servers to storage devices. In a converged network, all server, storage, and networking devices are DCB-enabled. DCB supports fibre channel over Ethernet (FCoE) and iSCSI transmission of storage data. DCB is not supported on interfaces with link-level flow control (LLFC) enabled.

NOTE: This feature is not supported on the E3224F-ON platform.

Priority flow control (PFC)	Use priority-based flow control to ensure lossless transmission of storage traffic, while transmitting other traffic classes that perform better without flow control, see Priority flow control.
Enhanced transmission selection (ETS)	Assign bandwidth to 802.1p class of service (CoS)-based traffic classes. Use ETS to increase preferred traffic-class throughput during network congestion, see Enhanced transmission selection.
Data Center Bridging Exchange protocol (DCBX)	Configure the DCBX protocol DCB neighbors use to discover and exchange configuration information for plug-and-play capability, see Data center bridging eXchange.
Internet small computer system interface (iSCSI)	Use iSCSI auto-configuration and detection of storage devices, monitor iSCSI sessions, and apply QoS policies on iSCSI traffic, see Internet small computer system interface.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

When you do not enable PFC on some of the port channel members between the FIP snooping bridge (FSB) and NPIV proxy gateway (NPG), FCoE sessions are not established. You should enable all the members of a port channel with PFC, for the FCoE sessions to establish.

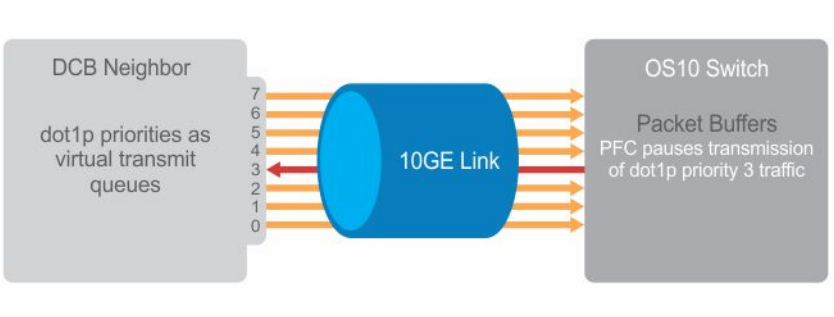
Priority flow control

In a converged data-center network, to ensure that no frames are lost due to congestion, use PFC. PFC uses the 802.1p priority in the Ethernet header to pause priority-specific traffic that is sent from a transmitting device. The 802.1p priority is also known as the class of service (CoS) or dot1p priority value.

When PFC detects congestion of a dot1p traffic class, it sends a pause frame for the priority traffic to the transmitting device. In this way, PFC ensures that the switch does not drop specified priority traffic.

PFC enhances the existing 802.3x pause capability to enable flow control based on 802.1p priorities. Instead of stopping all traffic on a link, as performed by the 802.3x pause mechanism, PFC pauses traffic for 802.1p traffic types. For example, when LAN traffic congestion occurs on an interface, PFC ensures lossless flows of storage and server traffic while allowing for lossy best-effort transmission of other traffic.

PFC handles traffic congestion by pausing prioritized dot1p traffic on an ingress interface and allowing other dot1p traffic best-effort, also known as lossy data transmission.



Configuration notes

Dell PowerSwitch S4200-ON Series:

- Provisioning PFC is not supported when deep buffer mode is enabled.
- Configure the traffic class ID to queue mapping policy on egress interfaces.
- You cannot enable PFC on all the physical interfaces, when you have split the ports to multiple breakout interfaces. For more information, see the 'PFC configuration notes' section in the Dell SmartFabric OS10 User Guide.
- When you add or remove the PFC configuration on an interface, the interface gets flapped. Stop the traffic before applying or modifying the PFC configuration.

PFC configuration notes

- PFC is supported for 802.1p, dot1p priority traffic, from 0 to 7. FCoE traffic traditionally uses dot1p priority 3 — iSCSI storage traffic uses dot1p priority 4.
- Configure PFC for ingress traffic by using network-qos class and policy maps. For more information, see Quality of service. PFC-enabled traffic queues are treated as lossless queues. Configure the same network-qos policy map on all PFC-enabled ports. Configure required bandwidth for lossless traffic using ETS queuing (output) policies on egress interfaces.
- In a network-qos policy-class map, use commands to generate PFC pause frames for matching class-map priorities:
  - Send pause frames for matching class-map traffic during congestion using the `pause` command.
  - (Optional) Enter user-defined values for the reserved ingress buffer-size of PFC class-map traffic, and the thresholds that are used to send XOFF and XON pause frames using the `pause [buffer-size` *`kilobytes`* `pause-threshold` *`kilobytes`* `resume-threshold` *`kilobytes`*`]` command.
  - Configure the matching dot1p values used to send pause frames using the `pfc-cos` command.
  - (Optional) Set the static and dynamic thresholds that determine the shared buffers available for PFC class-map traffic queues using the `queue-limit thresh-mode` command.
- By default, the lossy ingress buffer handles all ingress traffic. When you enable PFC, dot1p ingress traffic competes for shared buffers in the lossless pool instead of the shared lossy pool. The number of lossless queues that are supported on an interface depends on the amount of available free memory in the lossy pool.
- Use the `priority-flow-control mode on` command to enable PFC for FCoE and iSCSI traffic; for example, priority 3 and 4.
- Enable DCBX on interfaces to detect and autoconfigure PFC/ETS parameters from peers.
- PFC and 802.3x LLFC are disabled by default on an interface. You cannot enable PFC and LLFC simultaneously. LLFC ensures lossy traffic in best-effort transmission. Enable PFC to enable guarantee lossless FCoE and iSCSI traffic. PFC manages buffer congestion by pausing specified ingress dot1p traffic; LLFC pauses all data transmission on an interface. To enable LLFC, use the `flowcontrol [receive | transmit] [on | off]` command.
- SYSTEM-QOS mode applies a service policy globally on all interfaces:
  - Create and apply a 1-to-1 802.1p-priority-to-traffic-class mapping on an interface or all interfaces in INTERFACE or SYSTEM-QOS mode.
  - Create and apply a 1-to-1 traffic-class-to-queue mapping on an interface or all interfaces in INTERFACE or SYSTEM-QOS mode.

Configure dot1p priority to traffic class mapping

Decide if you want to use the default 802.1p priority-to-traffic class (`qos-group`) mapping or configure a new map. The default dot1p to traffic class map in OS10 is shown below.

```
Dot1p Priority : 0  1  2  3  4  5  6  7
 Traffic Class : 1  0  2  3  4  5  6  7
```

- Apply the default trust map specifying that dot1p values are trusted in SYSTEM-QOS or INTERFACE mode.

```
trust-map dot1p default
```

Configure a non-default dot1p-priority-to-traffic class mapping

1. Configure a trust map of dot1p traffic classes in CONFIGURATION mode. A trust map does not modify ingress dot1p values in output flows.

   Assign a `qos-group` to trusted dot1p values in TRUST mode using 1-to-1 mappings. Dot1p priorities are 0 to 7. For a PFC traffic class, map only one `dot1p` value to a `qos-group` number; for Broadcom-based NPU platforms, the `qos-group` number and the `dot1p` value must be the same. A `qos-group` number is used only internally to classify ingress traffic classes.

   ```
   trust dot1p-map dot1p-map-name
      qos-group {0-7} dot1p {0-7}
      exit
   ```

2. Apply the `trust dot1p-map` policy to ingress traffic in SYSTEM-QOS or INTERFACE mode.

   ```
   trust-map dot1p trust-policy—map-name
   ```

Configure traffic-class-queue mapping

NOTE: Z9332F-ON has different configurations for queue mapping. For more information, see *Configure traffic-class to queue mapping for Z9332F-ON*.

Decide if you want to use the default traffic-class-queue mapping or configure a nondefault traffic-class-to-queue mapping.

```
Traffic Class : 0  1  2  3  4  5  6  7
        Queue : 0  1  2  3  4  5  6  7
```

If you are using the default traffic-class-to-queue map, no further configuration steps are necessary.

1. Create a traffic-class-to-queue map in CONFIGURATION mode. Assign a traffic class (`qos-group`) to a queue in QOS-MAP mode using 1-to-1 mappings. For a PFC traffic class, map only one `qos-group` value to a `queue` number. A `qos-group` number is used only internally to classify ingress traffic.

   ```
   qos—map traffic-class tc-queue-map-name
      queue {0-7} qos-group {0-7}
      exit
   ```

2. Apply the traffic-class-queue map in SYSTEM-QOS or INTERFACE mode.

   ```
   qos-map traffic-class tc-queue-map-name
   ```

Configure traffic-class to queue mapping for Z9332F-ON

The Z9332F-ON supports 12 queues per Ingress Traffic Manager (ITM) in the front-panel ports. The 12 queues are divided into eight unicast (UC) and four multicast (MC) combinations. For multicast queues, MCQ index 0 to 2 are used for MC flows. MCQ index 3 sends control packets from the CPU.

By default, multicast traffic map in the following order:

TC0-TC2 : Q0

TC3-TC5 : Q1

TC6-TC7 : Q2

You can map different traffic classes of UC and MC traffics to different queues, based on the requirement.

Configure TC-to-queue mapping

```
OS10# show qos maps
Traffic-Class to Queue Map: sundar

Queue  Traffic Class  Type
------------------------------------
3      1-3                        Unicast
4      4,6,0          Unicast
```

Default TC-to-queue mapping format

The following is the format for Z9332F-ON:

```
Default Traffic-Class to Queue Map

Traffic Class  Queue Number                              Type
-------------------------------------------
0              0                                    Unicast
0-2            0                                    Multicast
1              1                                    Unicast
3-5            1                                    Multicast
2              2                                    Unicast
6-7            2                                    Multicast
3              3                                    Unicast
4              4                                    Unicast
5              5                                    Unicast
6              6                                    Unicast
7              7                                    Unicast
```

The following is the default TC-to-Queue Mapping format:

```
Default Traffic-Class to Queue Map

Traffic-Class    Queue number      Type
---------------------------------------
0                    0             Both
1                    1             Both
2                    2             Both
3                    3             Both
4                    4             Both
5                    5             Both
6                    6             Both
7                    7             Both
```

View the interface PFC configuration

```
OS10# show interface ethernet 1/1/1 priority-flow-control details
ethernet1/1/1
Admin Mode : true
Operstatus: true
PFC Priorities: 4
Total Rx PFC Frames: 0
Total Tx PFC frames: 0

Configure PFC

PFC provides a pause mechanism that is based on the 802.1p priorities in ingress traffic. PFC prevents frame loss due to network congestion. Configure PFC lossless buffers, and enable pause frames for dot1p traffic on a per-interface basis. Repeat the PFC configuration on each PFC-enabled interface. PFC is disabled by default.

Decide if you want to use the default dot1p-priority-to-traffic class mapping and the default traffic-class-to-queue mapping. To change the default settings, see PFC configuration notes.

Configuration steps:

1. Create PFC, dot1p traffic classes.
2. Configure ingress buffers for PFC traffic.
3. Apply a service policy and enable PFC.

4. (Optional) Configure the PFC shared buffer for lossless traffic.

Create PFC dot1p traffic classes

1. Create a `network-qos` class map to classify PFC traffic classes in CONFIGURATION mode, from 1 to 7. Specify the traffic classes using the `match qos-group` command. QoS-groups map 1:1 to traffic classes 1 to 7; for example, `qos-group 1` corresponds to traffic class 1. Enter a single value, a hyphen-separated range, or multiple `qos-group` values separated by commas in CLASS-MAP mode.

```
class—map type network-qos class—map-name
   match qos-group {1-7}
   exit
```

2. (Optional) Repeat Step 1 to configure additional PFC traffic-class class-maps.

Configure pause and ingress buffers for PFC traffic

For the default ingress queue settings and the default dot1p priority-queue mapping, see PFC configuration notes.

1. Create a `network-qos` policy map in CONFIGURATION mode.

```
policy-map type network-qos policy—map-name
```

2. Associate the policy-map with a `network-qos` class map in POLICY-MAP mode.

```
class class-map-name
```

3. Configure default values for ingress buffers used for the `network-qos` class maps in POLICY-CLASS-MAP mode.

```
pause
```

   (Optional) Change the default values for the ingress-buffer size that is reserved for the `network-qos` class-map traffic and the thresholds that are used to send XOFF and XON pause frames in kilobytes.

```
pause [buffer-size kilobytes {pause-threshold kilobytes | resume-threshold kilobytes}]
```

4. Enable the PFC pause function for dot1p traffic in POLICY-CLASS-MAP mode. The dot1p values must be the same as the `qos-group` traffic class numbers in the class-map in Step 2. Enter a single dot1p value, from 1 to 7, a hyphen-separated range, or multiple dot1p values separated by commas.

```
pfc-cos dot1p-priority
```

5. (Optional) Set the static and dynamic thresholds that are used to limit the shared buffers that are allocated to PFC traffic-class queues. Configure a static, fixed queue-limit (in kilobytes) or a dynamic threshold (weight 1-10; default 9) based on the available PFC shared buffers.

```
queue-limit thresh-mode {static kilobytes | dynamic weight}
```

6. (Optional) Repeat Steps 2–4 to configure PFC on additional traffic classes.

Apply service policy and enable PFC

1. Apply the PFC service policy on an ingress interface or interface range in INTERFACE mode.

```
interface ethernet node/slot/port:[subport]
   service-policy input type network-qos policy—map-name
```

```
interface range ethernet node/slot/port:[subport]-node/slot/port[:subport]
   service-policy input type network-qos policy—map-name
```

2. Enable PFC without DCBX for FCoE and iSCSI traffic in INTERFACE mode.

```
priority-flow-control mode on
```

Configure PFC

PFC is enabled on traffic classes with dot1p 3 and 4 traffic. The two traffic classes require different ingress queue processing. In the `network-qos pp1` policy map, class `cc1` uses customized PFC buffer size and pause frame settings; class `cc2` uses the default settings.

```

PFC commands

pause

Configures the ingress buffer size and buffer threshold limit for pause and resume operations.

Syntax `pause [buffer-size` *kilobytes* `pause-threshold` *kilobytes* `resume-threshold` *kilobytes*`]`

Parameters

- `buffer-size` *`kilobytes`* — Enter the reserved (guaranteed) ingress-buffer size in kilobytes for PFC dot1p traffic, from 0 to 7787.
- `pause-threshold` *`kilobytes`* — Enter the buffer threshold limit (in kilobytes) to send pause frames to a transmitting device to temporarily halt the data transmission, from 0 to 7787.
- `resume-threshold` *`kilobytes`* — Enter the threshold limit (in kilobytes) at which a request is sent to the transmitting device to resume sending traffic, from 0 to 7787.

Defaults

The default ingress-buffer size reserved for PFC traffic classes, and the pause and resume thresholds vary according to the interface type. The default egress buffer that is reserved for PFC traffic classes is 0 on all interface types.

Table 143. Port defaults

Port Speed	10G Port	25G Port	40G Port	50G Port	100G Port
PFC reserved ingress buffer	45 KB	54 KB	93 KB	111 KB	178 KB
PFC pause threshold	9 KB	9 KB	18 KB	18 KB	36 KB
PFC resume threshold	9 KB	9 KB	9 KB	9 KB	9 KB

Command Mode

POLICY-CLASS NETWORK-QOS

Usage Information

Use the `pause` command without optional parameters to apply the default ingress-buffer size, and pause (XON) and resume (XOFF) thresholds. Default values for the `buffer-size`, `pause-threshold` and `resume-threshold` parameters vary across interface types and port speeds. The default values are based on the default MTU size of 9216 bytes. Use the optional `queue-limit thresh-mode` command to change the number of shared buffers available to PFC traffic-class queues in the policy-class-map.

Example

```
OS10(config)# policy-map type network-qos pp1
OS10(conf-pmap-network-qos)# class cc1
OS10(conf-pmap-c-nqos)# pause buffer-size 30 pause-threshold 20 resume-
threshold 10
```

Supported Releases

10.3.0E or later

pfc-cos

Configures the matching dot1p values that are used to send PFC pause frames.

Syntax

`pfc-cos` *`dot1p-priority`*

Parameters

`dot1p-priority` — Enter the dot1p priority value for a PFC traffic class, from 1 to 7. Use a comma (,) to separate multiple values or a hyphen (-) to specify a range of values; for example, 0, 3, 7, or 3-6.

Default

Not configured

Command Mode

POLICY-CLASS NETWORK-QOS

Usage Information

When you enter PFC-enabled dot1p priorities with `pfc-cos`, the dot1p values must be the same as the `match qos-group` (traffic class) numbers in the network-qos class map that is used to define the PFC traffic class, see Configure PFC Example. A `qos-group` number is used only internally to classify ingress traffic classes. For the default dot1p-priority-to-traffic-class mapping and how to configure a nondefault mapping, see PFC configuration notes. A PFC traffic class requires a 1-to-1 mapping — only one `dot1p` value is mapped to a `qos-group` number.

Example

```
OS10(config)# class-map type network-qos cc1
OS10(conf-cmap-nqos)# match qos-group 3
OS10(conf-cmap-nqos)# exit
```

Example (policy-map)	`OS10(config)# policy-map type network-qos pp1`
	`OS10(conf-pmap-network-qos)# class cc1`
	`OS10(conf-pmap-c-nqos)# pfc-cos 3`

Supported Releases	10.3.0E or later

pfc-shared-buffer-size

Configures the number of shared buffers available for PFC-enabled traffic on the switch.

Syntax	`pfc-shared-buffer-size` *kilobytes*
Parameter	*kilobytes* — Enter the total amount of shared buffers available to PFC-enabled dot1p traffic in kilobytes, from 0 to 7787.
Default	832KB
Command Mode	SYSTEM-QOS
Usage Information	By default, the lossy ingress buffer handles all ingress traffic. When you enable PFC, dot1p ingress traffic competes for shared buffers in the lossless pool instead of the shared lossy pool. Use this command to increase or decrease the shared buffer that is allowed for PFC-enabled flows. The configured number of shared buffers is reserved for PFC flows only after you enable PFC on an interface using the `priority-flow-control mode on` command.
Example	`OS10(config)# system qos` `OS10(conf-sys-qos)# pfc-shared-buffer-size 1024`
Supported Releases	10.3.0E or later

priority-flow-control

Enables PFC on ingress interfaces.

Syntax	`priority-flow-control {mode on}`
Parameter	`mode on` — Enable PFC for FCoE and iSCSI traffic on an interface without enabling DCBX.
Default	Disabled
Command Mode	INTERFACE
Usage Information	Before you enable PFC, apply a network-qos policy-class map with the specific PFC dot1p priority values to the interface. In the PFC network-qos policy-class map, use the default `buffer-size` values if you are not sure about the `pause-threshold` and `resume-threshold` settings that you want to use. You cannot enable PFC and LLFC simultaneously on an interface. The `no` version of this command disables PFC on an interface. When you disable PFC, delete the PFC `network-qos` policy-class map applied to the interface.
Example	`OS10(conf-if-eth1/1/1)# priority-flow-control mode on`
Supported Releases	10.3.0E or later

queue-limit

Sets the static and dynamic thresholds that are used to limit the shared-buffer size of PFC traffic-class queues.

Syntax	`queue-limit {thresh-mode [static` *kilobytes* `|` `dynamic` *weight*`]}`

Parameters

- `thresh-mode` —Specifies the Buffer threshold mode.
- `static` *`kilobytes`* — Enter the static followed by the fixed shared-buffer limit available for PFC traffic-class queues in kilobytes, from 0 to 7787. The value of this parameter must be within the maximum amount tuned by the `pfc-shared-buffer-size` command.
- `dynamic` *`weight`* — Enter the dynamic followed by the weight value used to dynamically determine the shared-buffer limit available for PFC traffic-class queues, from 1 to 10.

Default Dynamic weight of 9 and static shared-buffer limit of 12,479,488 kilobytes.

Command Mode POLICY-CLASS NETWORK-QOS

Usage Information To tune the amount of shared buffers available for the static limit of PFC traffic-class queues on the switch, use the `pfc-shared-buffer-size` command. The current amount of available shared buffers determines the dynamic queue-limit.

Example

```
OS10(config)# policy-map type network-qos pp1
OS10(conf-pmap-network-qos)# class cc1
OS10(conf-pmap-c-nqos)# queue-limit thresh-mode static 1024
```

Supported Releases 10.3.0E or later

show interface priority-flow-control

Displays PFC operational status, configuration, and statistics on an interface.

Syntax `show interface [ethernet` *`node/slot/port`*`[:`*`subport`*`]] priority-flow-control [details]`

Parameters `etherent` *`node/slot/port`*`[:`*`subport`*`]`- Specifies the Ethernet interface along with the slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 999 or 1001 to 2000.

Default Not configured

Command Mode EXEC

Usage Information Use the `details` option to display PFC statistics on received/transmitted frames for each dot1p CoS value. Use the `clear qos statistics interface ethernet 1/1/1` command to delete PFC statistics and restart the counter.

Example (details)

```
OS10(config)# show interface ethernet 1/1/15 priority-flow-control
details

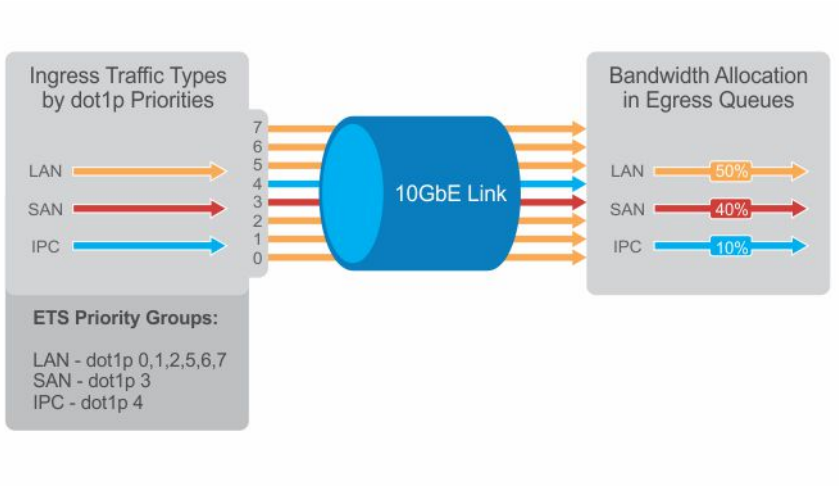
ethernet1/1/15
Admin Mode : true
Operstatus: true
PFC Priorities: 3
Total Rx PFC Frames: 0
Total Tx PFC frames: 587236
Cos    Rx        Tx
----------------------
0      0         0
1      0         0
2      0         0
3      0         587236
4      0         0
5      0         0
6      0         0
7      0         0
```

Supported Releases 10.3.0E or later

Enhanced transmission selection

ETS provides customized bandwidth allocation to 802.1p classes of traffic. Assign different amounts of bandwidth to Ethernet, FCoE, or iSCSI traffic classes that require different bandwidth, latency, and best-effort treatment during network congestion.

ETS divides traffic into different priority groups using their 802.1p priority value. To ensure that each traffic class is correctly prioritized and receives the required bandwidth, configure bandwidth and queue scheduling for each priority group. To prioritize low-latency storage and server-cluster traffic, allocate more bandwidth to a priority group. To rate-limit best-effort LAN traffic, allocate less bandwidth to a different priority group.



ETS configuration notes

- ETS is supported on Layer2 (L2) 802.1p priority (dot1p 0 to 7) and Layer 3 (L3) DSCP (0 to 63) traffic. FCoE traffic uses dot1p priority 3 — iSCSI storage traffic uses dot1p priority 4.
- Apply these maps and policies on interfaces:
  - Trust maps — OS10 interfaces do not honor the L2 and L3 priority fields in ingress traffic by default. Create a trust map to honor dot1p and DSCP classes of lossless traffic. A trust map does not change ingress dot1p and DSCP values in egress flows. In a trust map, assign a `qos-group` traffic class to trusted dot1p/DSCP values. A qos-group number is used only internally to schedule classes of ingress traffic.
  - QoS map — Create a QoS map to assign trusted dot1p and DSCP traffic classes to lossless queues.
  - Ingress trust policy — Configure a service policy to trust dot1p values in ingress traffic.
  - Egress queuing policy — Configure ETS for egress traffic by assigning bandwidth to match lossless queues in `queuing` class and policy maps.
- Apply both PFC network-qos (input) and ETS queuing (output) policies on an interface to ensure lossless transmission.
- An ETS-enabled interface operates with dynamic weighted round-robin (DWRR) or strict-priority scheduling.
- OS10 control traffic is sent to control queues, which have a strict-priority that is higher than data traffic queues. ETS-allocated bandwidth is not supported on a strict-priority queue. A strict priority queue receives bandwidth only from DCBX type, length, values (TLVs).
- The CEE/IEEE2.5 versions of ETS TLVs are supported. ETS configurations are received in a TLV from a peer.

Configure ETS

ETS provides traffic prioritization for lossless storage, latency-sensitive, and best-effort data traffic on the same link.

- Configure classes of dot1p and DSCP traffic, and assign them to lossless queues.
- Allocate guaranteed bandwidth to each lossless queue. If another queue does not use its share, an ETS queue can exceed the amount of allocated bandwidth.

ETS is disabled by default on all interfaces.

1. Configure trust maps of dot1p and DSCP values in CONFIGURATION mode. A trust map does not modify ingress values in output flows. Assign a `qos-group`, traffic class from 0 to 7, to trusted dot1p/DSCP values in TRUST mode. A `qos-group`

number is used only internally to schedule classes of ingress traffic. Enter multiple `dot1p` and `dscp` values in a hyphenated range or separated by commas.

```
trust dot1p-map dot1p-map-name
   qos-group {0-7} dot1p {0-7}
   exit
trust dscp-map dscp-map-name
   qos-group {0-7} dscp {0-63}
   exit
```

2. Configure a QoS map with trusted traffic-class (`qos-group`) to lossless-queue mapping in CONFIGURATION mode. Assign one or more qos-groups, from 0 to 7, to a specified queue in QOS-MAP mode. Enter multiple `qos-group` values in a hyphenated range or separated by commas. Enter multiple `queue qos-group` entries, if necessary.

```
qos-map traffic-class queue-map-name
   queue {0-7} qos-group {0-7}
   exit
```

3. Apply the default trust map specifying that dot1p and dscp values are trusted in SYSTEM-QOS or INTERFACE mode.

```
trust-map {dot1p | dscp} default
```

4. Create a `queuing` class map for each ETS queue in CONFIGURATION mode. Enter `match queue` criteria in CLASS-MAP mode.

```
class—map type queuing class—map-name
   match queue {0-7}
   exit
```

5. Create a `queuing` policy map in CONFIGURATION mode. Enter POLICY-CLASS-MAP mode and configure the percentage of bandwidth that is allocated to each traffic class-queue mapping. The sum of all DWRR-allocated bandwidth across ETS queues must be 100%, not including the strict-priority queue. Otherwise, QoS automatically adjusts bandwidth percentages so that ETS queues always receive 100% bandwidth. The remaining non-ETS queues receive 1% bandwidth each.

```
policy—map type queuing policy—map-name
   class class—map-name
      bandwidth percent {1-100}
```

(Optional) To configure a queue as strict-priority, use the `priority` command. Packets scheduled to a strict priority queue are transmitted before packets in nonpriority queues.

```
policy—map type queuing policy—map-name
   class class—map-name
      priority
```

6. Apply the trust maps for dot1p and DSCP values, and the traffic class-queue mapping globally on the switch in SYSTEM-QOS mode or on an interface or interface range in INTERFACE mode.

```
system qos
   trust-map dot1p dot1p-map-name
   trust-map dscp dscp-map-name
   qos-map traffic-class queue-map-name
```

Or

```
interface {ethernet node/slot/port[:subport] | range ethernet node/slot/
port[:subport]-node/slot/port[:subport]}
   trust-map dot1p dot1p-map-name
   trust-map dscp dscp-map-name
   qos-map traffic-class queue-map-name
```

7. Apply the `qos` trust policy to ingress traffic in SYSTEM-QOS or INTERFACE mode.

```
service-policy input type qos trust-policy—map-name
```

8. Apply the `queuing` policy to egress traffic in SYSTEM-QOS or INTERFACE mode.

```
service-policy output type queuing policy-map-name
```

9. Enable ETS globally in SYSTEM-QOS mode or on an interface/interface range in INTERFACE mode.

   NOTE: If you have not enabled PFC on all the interfaces, this configuration at the global level is not required. Enable ETS on the specific interfaces.

```
ets mode on
```

Configure ETS

```
OS10(config)# trust dot1p-map dot1p_map1
OS10(config-trust-dot1pmap)# qos-group 0 dot1p 0-3
OS10(config-trust-dot1pmap)# qos-group 1 dot1p 4-7
OS10(config-trust-dot1pmap)# exit

OS10(config)# trust dscp-map dscp_map1
OS10(config-trust-dscpmap)# qos-group 0 dscp 0-31
OS10(config-trust-dscpmap)# qos-group 1 dscp 32-63
OS10(config-trust-dscpmap)# exit

OS10(config)# qos-map traffic-class tc-q-map1
OS10(config-qos-tcmap)# queue 0 qos-group 0
OS10(config-qos-tcmap)# queue 1 qos-group 1

```

ETS commands

ets mode on

Enables ETS on an interface.

Syntax	`ets mode on`
Parameter	None
Default	Disabled
Command Mode	INTERFACE
Usage Information	Enable ETS on all switch interfaces in SYSTEM-QOS mode or on an interface or interface range in INTERFACE mode. The `no` version of this command disables ETS.
Example	`OS10(config-sys-qos)# ets mode on`
Supported Releases	10.3.0E or later

Data center bridging eXchange

Data center bridging eXchange (DCBX) allows a switch to:

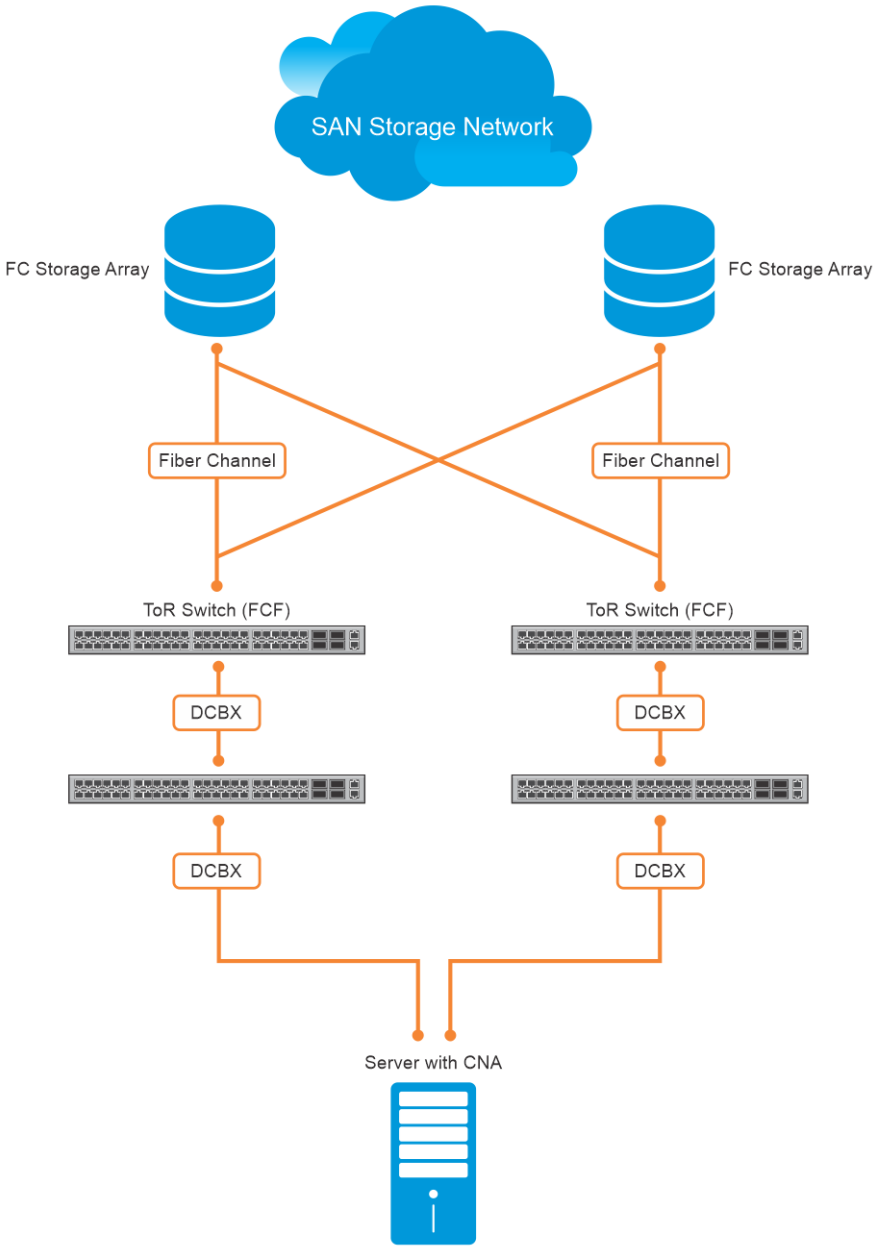
- Discover DCBX- enabled peers automatically.
- Detects misconfiguration in the DCBX-enabled peers.

In a converged data center network, DCBX provides plug-and-play capability for server, storage, and networking devices in an end-to-end solution. DCBX also ensures the consistent and efficient operation.

DCBX uses link layer discovery protocol (LLDP) to mediate automatic negotiation and device settings exchange, such as PFC and ETS. DCBX uses LLDP TLVs to perform DCB parameter exchange:

- PFC configuration and application-priority configuration
- ETS configuration and ETS recommendation

This sample DCBX topology shows two 40GbE ports on a switch that are used as uplinks to top-of-rack (ToR) switches. The ToR switches are part of a fiber channel storage network.



DCBX configuration notes

- DCBX is a prerequisite for using DCB features, such as PFC and ETS, to exchange link-level configurations in a converged network.
- DCBX, when deployed in topologies, enables lossless operation for FCoE or iSCSI traffic. In these scenarios, all network devices in the topology must have DCBX-enabled.
- DCBX uses LLDP to advertise and automatically negotiate the administrative state and PFC or ETS configuration with directly connected DCB peers. DCBX cannot run if LLDP is disabled on an interface. Enable LLDP on all the DCBX port. For more information about LLDP, see Link Layer Discovery Protocol.
- By default, DCBX is disabled globally. Enable DCBX globally on a switch to activate the exchange of DCBX TLV messages with PFC, ETS, and iSCSI configurations.
- By default, DCBX is enabled on the physical interfaces except on the management interface.
- You can manually reconfigure DCBX settings on an individual interface. For example, you can disable DCBX on an interface using the `no lldp tlv-select dcbxp` command or change the DCBX version using the `dcbx version` command.
- For DCBX to be operational, DCBX must be enabled both globally and on the interface. If the `show lldp dcbx interface` command returns the message DCBX feature not enabled, DCBX is not enabled at both levels.

- OS10 supports DCBX versions CEE and IEEE2.5.
- If ETS and PFC are enabled, DCBX advertises ETS configuration, ETS recommendation, and PFC configuration. When you configure application-specific parameters such as FCoE or iSCSI to be advertised, DCBX advertises the respective Application Priority TLVs.
- A DCBX-enabled port operates only in a manual role. In this mode, the port operates only with user-configured settings and does not autoconfigure with DCB settings that are received from a DCBX peer. When you enable DCBX, the port advertises its PFC and ETS configurations to peer devices but does not accept external, or propagate internal, DCB configurations.

  NOTE: OS10 does not support autoupstream and autodownstream DCBX port roles. Hence, DCBX-enabled port autoconfiguration is not supported.
- DCBX detects a misconfiguration on a peer device when DCB features are not compatibly configured with the local switch.

  NOTE: Misconfiguration detection is feature-specific because some DCB features support asymmetric (nonidentical) configurations.

Verify DCBX configuration

Verify the DCBX, PFC, and ETS configurations on an interface, using the appropriate commands.

DCBX commands

dcbx enable

Enables DCBX globally on all interfaces.

Syntax	`dcbx enable`
Parameters	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	DCBX is disabled at a global level and enabled at an interface level by default. For DCBX to be operational, DCBX must be enabled at both the global and interface levels. Enable DCBX globally using the `dcbx enable` command to activate the exchange of DCBX TLV messages with PFC, ETS, and iSCSI configurations. To configure the TLVs advertised by a DCBX-enabled port, change the DCBX version, or disable DCBX on an interface, use DCBX interface-level commands. DCBX allows peers to advertise a DCB configuration using LLDP and self-configure with compatible settings. If you disable DCBX globally on a switch, you can reenable it to ensure consistent operation of peers in a converged data center network.
Example	`OS10(config)# dcbx enable`
Supported Releases	10.3.0E or later

dcbx tlv-select

Configures the DCB TLVs advertised by a DCBX-enabled port.

Syntax	`dcbx tlv-select {[ets-conf] [ets-reco] [pfc]}`
Parameters	• `ets-conf` — Advertise ETS configuration TLVs. • `ets-reco` — Advertise ETS recommendation TLVs. • `pfc` — Advertise PFC TLVs.
Default	Enabled
Command Mode	INTERFACE
Usage Information	A DCBX-enabled port advertises all TLVs to DCBX peers by default. If PFC or ETS TLVs advertisement is disabled, enter the command to reenable the TLVs advertisements. You can enable multiple TLV options, such as ets-conf, ets-reco, and pfc with the same command.
Example	`OS10(conf-if-eth1/1/2)# dcbx tlv-select ets-conf pfc`
Supported Releases	10.3.0E or later

dcbx version

Configures the DCBX version that is used on a port interface.

Syntax	`dcbx version {auto | cee | ieee}`
Parameters	• `auto` — Select the DCBX version automatically based on the peer response. • `cee` — Set the DCBX version to CEE. • `ieee` — Set the DCBX version to IEEE 802.1Qaz.
Default	Auto

Command Mode	INTERFACE
Usage Information	In Auto mode, a DCBX-enabled port detects an incompatible DCBX version on a peer device port and automatically reconfigures a compatible version on the local port. The `no` version of this command disables the DCBX version.
Example	`OS10(conf-if-eth1/1/2)# dcbx version cee`
Supported Releases	10.3.0E or later

debug dcbx

Enables DCBX debugging.

Syntax	`debug dcbx {all | events | tlv} [interface ethernet node/slot/port]`
Parameters	• `all`—Enables all DCBX debugging logs. • `events`—Enables DCBX-event-related logs. • `tlv`—Enables DCBX TLV-related logs. • `interface ethernet node/slot/port`—Enter the interface information for which you want to collect the DCBX debug logs.
Defaults	Disabled
Command Mode	EXEC
Security and Access	`Netadmin` and `sysadmin`
Usage Information	Before you use the `debug dcbx` command, ensure that you run the following commands: • `logging enable` • `logging console enable` • `terminal monitor` OS10 does not support the interface range option with this command.
Example	`OS10# debug dcbx tlv`
Supported Releases	10.5.1.0 or later

lldp tlv-select dcbxp

Enables and disables DCBX on a port interface.

Syntax	`lldp tlv-select dcbxp`
Parameters	None
Default	Enabled interface level; disabled global level
Command Mode	INTERFACE
Usage Information	DCBX must be enabled at both the global and interface levels. Enable DCBX globally using the `dcbx enable` command to activate the exchange of DCBX TLV messages with PFC, ETS, and iSCSI configurations. To configure the TLVs advertised by a DCBX-enabled port, change the DCBX version, or disable DCBX on an interface, use DCBX interface-level commands. The `no` version of this command disables DCBX on an interface.
Example	`OS10(conf-if-eth1/1/1)# lldp tlv-select dcbxp`

Supported Releases	10.3.0E or later

show debug dcbx

Displays the list of debug options that are enabled for DCBX.

Syntax	`show debug dcbx`
Parameters	None
Command Mode	EXEC
Usage Information	None

Example

```
OS10# show debug dcbx
Dcbx debug settings:

debug dcbx all
    no debug dcbx events interface mgmt
    debug dcbx pdu in interface ethernet 1/1/1
```

Supported Releases	10.5.1.0 or later

show lldp dcbx

Displays the DCBX configuration and PFC or ETS TLV status on an interface.

Syntax

`show lldp dcbx {detail | ets detail | pfc detail | interface ethernet` *node/slot/port[:subport]* `[ets detail | pfc detail]`

Parameters

- `detail` — Display DCBX configuration information of all the interfaces in detail.
- `interface ethernet` *node/slot/port[:subport]* — Enter interface information.
- `ets detail` — Display the ETS TLV status and operation with DCBX peers.
- `pfc detail` — Display the PFC TLV status and operation with DCBX peers.

Default	Not configured
Command Mode	EXEC
Usage Information	Enable DCBX before using this command. DCBX advertises all TLVs — PFC, ETS Recommendation, ETS Configuration, DCBXP, and basic TLVs by default.

NOTE: In the command output, the `Is configuration source` parameter always displays `False`. `Configuration source` is the type of port role that is not supported.

Example (DCBX detail)

```
OS10# show lldp dcbx detail | no-more
E-ETS Configuration TLV enabled        e-ETS Configuration TLV disabled
R-ETS Recommendation TLV enabled       r-ETS Recommendation TLV disabled

Supported Releases

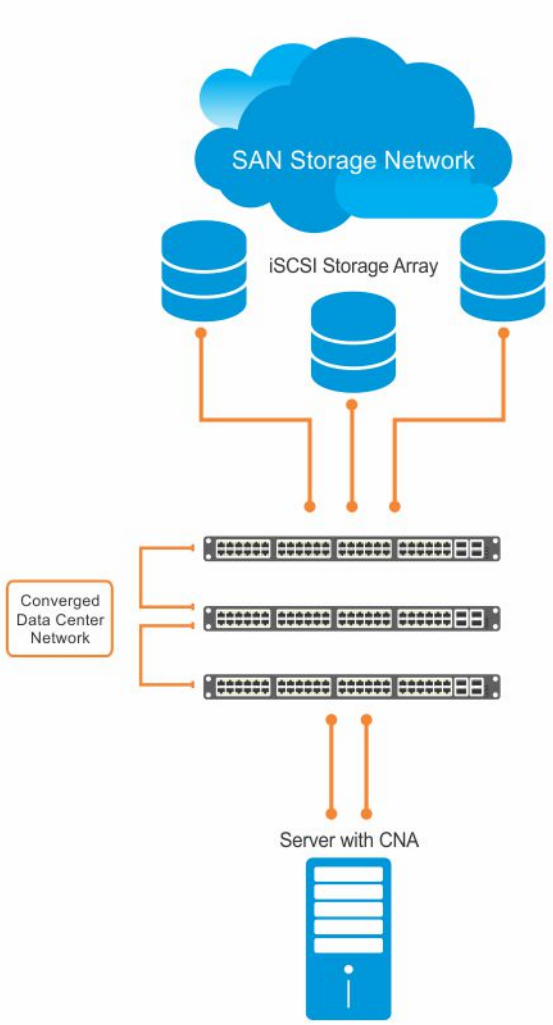
10.3.0E or later

Internet small computer system interface

iSCSI is a TCP/IP-based protocol that establishes and manages connections between servers and storage devices in a data center network. After you enable iSCSI, iSCSI optimization automatically detects Dell EqualLogic storage arrays that are directly attached to switch ports. To support storage arrays where autodetection is not supported, manually configure iSCSI optimization using the `iscsi profile-storage` *name* command.

iSCSI optimization enables a switch to autodetect Dell iSCSI storage arrays and autoconfigure switch ports to improve storage traffic throughput. The switch monitors iSCSI sessions and applies QoS policies on iSCSI traffic. iSCSI optimization operates with or without DCBX over an Ethernet network.

- iSCSI uses the current flow-control configuration by default. If you do not configure flow-control, iSCSI autoconfigures flow control settings so that receive-only is enabled and transmit-only is disabled.
- The switch monitors and tracks active iSCSI sessions, including port information and iSCSI session information.
- A user-configured iSCSI CoS profile applies to all iSCSI traffic. Use classifier rules to direct the iSCSI data traffic to queues with preferential QoS treatment over other data passing through the switch. Preferential treatment helps to avoid session interruptions during times of congestion that would otherwise cause dropped iSCSI packets.



In an iSCSI session, a switch connects CNA servers (iSCSI initiators) to a storage array (iSCSI targets) in a SAN or TCP/IP network. iSCSI optimization running on the switch uses dot1p priority-queue assignments to ensure that iSCSI traffic receives priority treatment.

iSCSI configuration notes

- Enable iSCSI optimization so the switch autodetects and autoconfigures Dell EqualLogic storage arrays that are directly connected to an interface. iSCSI automatically configures switch parameters after connection to a storage device is verified. Enable an interface to support a storage device that is directly connected to a port, but not automatically detected by iSCSI.
- Enable iSCSI session monitoring and the aging time for iSCSI sessions. iSCSI monitoring sessions listen on TCP ports 860 and 3260 by default.
- Configure the CoS/DSCP values applied to ingress iSCSI flows — create a `class-iscsi` class map in POLICY-CLASS-MAP mode.
- Enable LLDP to use iSCSI. The DCBX application TLV carries information about the dot1p priorities to use when sending iSCSI traffic. This informational TLV is packaged in LLDP PDUs. You can reconfigure the 802.1p priority bits advertised in the TLVs.

Configure iSCSI optimization

The iSCSI protocol provides storage traffic TCP/IP transport between servers and storage arrays in a network using iSCSI commands.

1. Configure an interface or interface range to detect a connected storage device.

```
interface ethernet node/slot/port:[subport]

interface range ethernet node/slot/port:[subport]-node/slot/port[:subport]
```

2. Enable the interface to support a storage device that is directly connected to the port and not automatically detected by iSCSI. Use this command for storage devices that do not support LLDP. The switch autodetects and autoconfigures Dell EqualLogic storage arrays that are directly connected to an interface when you enable iSCSI optimization.

```
iscsi profile-storage storage-device-name
```

3. Configure DCBX to use LLDP to send iSCSI application TLVs with dot1p priorities for iSCSI traffic in INTERFACE mode.

```
lldp tlv-select dcbxp-appln iscsi
```

4. Return to CONFIGURATION mode.

```
exit
```

5. (Optional) If necessary, reconfigure the iSCSI TCP ports and IP addresses of target storage devices in CONFIGURATION mode. Separate TCP port numbers with a comma, from 0 to 65535; default 860 and 3260.

```
iscsi target port tcp-port1 [tcp-port2, ..., tcp-port16] [ip-address ip-address]
```

6. Configure the QoS policy applied to ingress iSCSI flows. Apply the service policy to ingress interfaces in CONFIGURATION mode.

   (Optional) Reset the default CoS dot1p priority, the default is 4 and/or the trusted DCSP value that is used for iSCSI traffic. Assign an internal `qos-group` queue, from 0 to 7, to dot1p, from 0 to 7, and DSCP, from 0 to 63, values in POLICY-CLASS-MAP mode.

```
class-map type application class-iscsi
policy-map type application policy-iscsi
   class class-iscsi
      set qos-group traffic-class-number
      set cos dot1p-priority
      set dscp dscp-value
      end
service-policy type application policy-iscsi
```

7. Enable iSCSI monitoring sessions on TCP ports in CONFIGURATION mode.

```
iscsi session-monitoring enable
```

8. (Optional) Set the aging time for the length of iSCSI monitoring sessions in CONFIGURATION mode, 5 to 43,200 minutes; default 10.

```
iscsi aging time [minutes]
```

9. (Optional) Reconfigure the dot1p priority bits advertised in iSCSI application TLVs in CONFIGURATION mode. The default bitmap is `0x10` (dot1p 4). The default dot1p 4 value is sent in iSCSI application TLVs only if you enabled the PFC pause for dot1p 4 traffic using the `pfc-cos dot1p-priority` command.

   If you do not configure an `iscsi priority-bits` dot1p value and you configure a `set cos` value in Step 6, the `set cos` value is sent in iSCSI application TLVs. If you configure neither the `iscsi priority-bits` nor the `set cos` value, the default dot1p 4 advertises.

```
iscsi priority-bits dot1p-bitmap
```

10. Enable iSCSI auto-detection and autoconfiguration on the switch in CONFIGURATION mode.

```
iscsi enable
```

Configure iSCSI optimization

```
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# iscsi profile-storage compellent
OS10(conf-if-eth1/1/1)# lldp tlv-select dcbxp-appln iscsi
OS10(conf-if-eth1/1/1)# exit

OS10(config)# iscsi target port 3261 ip-address 10.1.1.1
OS10(config)# policy-map type application policy-iscsi

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

- Do not change the description of a Dell SC series storage device; for example, Storage Center 65849 SC9000 Version 07.02.01.138. If you change the description, the SC storage device is not detected by the iSCSI autoconfiguration.
- iSCSI auto-configuration on OS10 switch ports is not supported with Compellent storage arrays that use QLE4062 network adapters. To manually configure iSCSI, use the iscsi profile-storage storage-device-name command.
- Starting from release 10.4.1.1, when you perform a fresh installation of OS10, iSCSI autoconfig is enabled and flowcontrol receive is set to on. However, when you upgrade from an earlier release to release 10.4.1.1 or later, the existing iSCSI configuration is retained and the flowcontrol receive could be set to on or off, depending on the iSCSI configuration before the upgrade.
- When you re-configure the iSCSI TCP ports and IP addresses of target storage devices at the same time using the iscsi target port command, iSCSI optimization may fail on interfaces connected to the devices. To successfully enable iSSCI optimization, enter only the new TCP port number(s) in the command and do not specify an IP address
- On an S3048-ON switch, iSCSI auto-configuration is disabled, by default. You must manually enable iSCSI optimization on the switch using the iscsi enable command.

iSCSI synchronization on VLT

An iSCSI session is learned on a VLT port-channel during the following scenarios:

- If the iSCSI session receives control packets, as login-request or login-response, on the VLT port-channel.
- If the iSCSI session does not receive control packets but receives data packets on the VLT port-channel. This happens when you enable iSCSI session monitoring after the iSCSI session starts.

The information learned about iSCSI sessions on VLT port-channels synchronizes with the VLT peers.

iSCSI session synchronization happens based on various scenarios:

- If the iSCSI login request is received on an interface that belongs to a VLT port-channel, the information synchronizes with VLT peer and the connection associates with the interface.
- Any updates to connections, including aging updates that are learned on VLT port-channel members synchronize with the VLT peer.
- If the iSCSI login request is received on a non-VLT interface, followed by a response from a VLT interface, the connection is associated with the VLT port-channel interface and the information about the session synchronizes with the VLT peer.
- When a VLT interconnect comes up, information about iSCSI sessions learned on the VLT port-channel exchanges between the VLT-peers.

iSCSI commands

iscsi aging

Sets the aging time for monitored iSCSI sessions.

Syntax	`iscsi aging [time` *`minutes`*`]`
Parameters	`time` *`minutes`* — Enter the aging time in minutes allowed for monitoring iSCSI sessions, from 5 to 43,200.
Default	10 minutes
Command Mode	CONFIGURATION
Usage Information	Configure the aging time that is allowed for monitored iSCSI sessions on TCP ports before the session closes. The `no` version of this command disables the aging time.
Example	`OS10(config)# iscsi aging time 30`
Supported Releases	10.3.0E or later

iscsi enable

Enables iSCSI autodetection of attached storage arrays and switch autoconfiguration.

Syntax	`iscsi enable`
Parameter	None
Default	None
Command Mode	CONFIGURATION
Usage Information	iSCSI optimization automatically detects storage arrays and autoconfigures switch ports with the iSCSI parameters that are received from a connected device. The `no` version of this command disables iSCSI autodetection. Starting from release 10.4.1.1, when you perform a fresh installation of OS10, iSCSI autoconfig is enabled and flow control receive is set to on. However, when you upgrade from an earlier release to release 10.4.1.1 or later, the existing iSCSI configuration is retained and the flow control receive could be set to on or off, depending on the iSCSI configuration before upgrade.
Example	`OS10(config)# iscsi enable`
Supported Releases	10.3.0E or later

iscsi priority-bits

Resets the priority bitmap that is advertised in iSCSI application TLVs.

Syntax	`iscsi priority-bits {`*`priority-bitmap`*`}`
Parameter	*`priority-bitmap`* — Enter a bitmap value for the dot1p priority advertised for iSCSI traffic in iSCSI application TLVs (0x1 to 0xff).
Default	0x10 (dot1p 4)
Command Mode	CONFIGURATION
Usage Information	iSCSI traffic uses dot1p priority 4 in frame headers by default. Use this command to reconfigure the dot1p-priority bits advertised in iSCSI application TLVs. Enter only one dot1p-bitmap value — setting more than one bitmap value with this command is not supported. The default dot1p 4 value advertises only if you enabled PFC pause frames for dot1p 4 traffic using the `pfc-cos` *`dot1p-priority`* command. The `no` version of this command resets to the default value.
Example	`OS10(config)# iscsi priority-bits 0x20`
Supported Releases	10.3.0E or later

iscsi profile-storage

Configures a port for direct connection to a storage device that is not automatically detected by iSCSI.

Syntax	`iscsi profile-storage` *`storage-device-name`*
Parameter	*`storage-device-name`* — Enter a user-defined name of a storage array that iSCSI does not automatically detect.
Default	Not configured
Command Mode	INTERFACE

Usage Information	Configure directly attached storage arrays that iSCSI supports if they are not automatically detected. This command is required for storage devices that do not support LLDP. The `no` version of this command disables the connection.
Example	`OS10(conf-if-eth1/1/2)# iscsi profile-storage compellant`
Supported Releases	10.3.0E or later

iscsi session-monitoring enable

Enables iSCSI session monitoring.

Syntax	`iscsi session-monitoring enable`
Parameter	None
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	To configure the aging timeout in iSCSI monitoring sessions, use the `iscsi aging time` command. To configure the TCP ports that listen for connected storage devices in iSCSI monitoring sessions use the `iscsi target port` command. The `no` version of this command disables iSCSI session monitoring.
Example	`OS10(config)# iscsi session-monitoring enable`
Supported Releases	10.3.0E or later

iscsi target port

Configures the TCP ports that are used to monitor iSCSI sessions with target storage devices.

Syntax	`iscsi target port` *`tcp-port1`* `[`*`tcp-port2`*`, ..., `*`tcp-port16`*`] [ip-address` *`ip-address`*`]`
Parameters	• *`tcp-port`* — Enter one or more TCP port numbers, from 0 to 65535. Separate TCP port numbers with a comma. • `ip-address` *`ip-address`* — (Optional) Enter the IP address in A.B.C.D format of a storage array whose iSCSI traffic is monitored on the TCP port.
Default	3260,860
Command Mode	CONFIGURATION
Usage Information	You can configure a maximum of 16 TCP ports to monitor iSCSI traffic from target storage devices. The `no` version of this command including the IP address deletes a TCP port from iSCSI monitoring.
Example	`OS10(config)# iscsi target port 26,40`
Supported Releases	10.3.0E or later

lldp tlv-select dcbxp-appln iscsi

Enables a port to advertise iSCSI application TLVs to DCBX peers.

Syntax	`lldp tlv-select dcbxp-appln iscsi`
Parameter	None
Default	iSCSI application TLVs are advertised to DCBX peers.

Command Mode	INTERFACE
Usage Information	DCB devices use DCBX to exchange iSCSI configuration information with peers and self-configure. iSCSI parameters exchange in time, length, and value (TLV) messages. DCBX requires LLDP enabled to advertise iSCSI application TLVs. iSCSI application TLVs advertise the PFC dot1p priority-bitmap configured using the `iscsi priority-bits` command to DCBX peers. If you do not configure an iSCSI dot1p-bitmap value, iSCSI application TLVs advertise dot1p 4 by default only if you configure dot1p 4 as a PFC priority using the `pfc-cos` command. The `no` version of this command disables iSCSI TLV transmission.
Example	`OS10(conf-if-eth1/1/1)# lldp tlv-select dcbxp-appln iscsi`
Supported Releases	10.3.0E or later

show iscsi

Displays the current configured iSCSI settings.

Syntax	`show iscsi`
Parameters	None
Command Mode	EXEC
Usage Information	This command output displays global iSCSI configuration settings. To view target and initiator information use the `show iscsi session` command.

Example	`OS10# show iscsi`
	`iSCSI Auto configuration is Enabled`
	`iSCSI session monitoring is  Enabled`
	`iSCSI COS              qos-group 4 remark dot1p 4`
	`Session aging time     15`
	`Maximum number of connections is  256`
	`Port    IP Address`
	`------------------------`
	`3260`
	`860`
	`3261    10.1.1.1`

Supported Releases	10.3.0E or later

show iscsi session

Displays information about active iSCSI sessions.

Syntax	`show iscsi session [detailed]`
Parameter	`detailed` — Displays a detailed version of the active iSCSI sessions.
Command Mode	EXEC
Usage Information	In an iSCSI session, `Target` is the storage device, and `Initiator` is the server that is connected to the storage device.
Example	`OS10# show iscsi session`

Example (detailed)	`OS10# show iscsi session detailed`
	`Session 1`
	`------------------------------------------------`
	`Target:iqn.2001-05.com.equallogic:0-8a0906-00851a00c-98326939fba510a1-517`
	`Initiator:iqn.1991-05.com.microsoft:win-rlkpjo4jun2`

```
Up Time:00:00:18:12(DD:HH:MM:SS)
Time for aging out:29:23:59:35(DD:HH:MM:SS)
ISID:400001370000
Initiator      Initiator  Target       Target    Connection
IP Address     TCP Port   IP Address   TCP Port  ID
-----------------------------------------------------------
10.10.10.210   54748      10.10.10.40  3260      1

Session 2
-------------------------------------------------
Target:iqn.2001-05.com.equallogic:0-8a0906-01251a00c-8ab26939fbd510a1-518
Initiator:iqn.1991-05.com.microsoft:win-rlkpjo4jun2
Up Time:00:00:16:02(DD:HH:MM:SS)
Time for aging out:29:23:59:35(DD:HH:MM:SS)
ISID:400001370000
Initiator      Initiator  Target       Target    Connection
IP Address     TCP Port   IP Address   TCP Port  ID
-----------------------------------------------------------
10.10.10.210   54835      10.10.10.40  3260      1
```

Supported Releases 10.3.0E or later

show iscsi storage-devices

Displays information about the storage arrays directly attached to OS10 ports.

Syntax `show iscsi storage-devices`

Parameters None

Command Mode EXEC

Usage Information The command output displays the storage device connected to each switch port and whether iSCSI automatically detects it.

Example

```
OS10# show iscsi storage-devices
Interface Name   Storage Device Name   Auto Detected Status
-------------------------------------------------------------
ethernet1/1/23   EQL-MEM               true
```

Supported Releases 10.3.0E or later

Converged network DCB example

A converged data center network carries multiple SAN, server, and LAN traffic types that are sensitive to different aspects of data transmission. For example, storage traffic is sensitive to packet loss, while server traffic is latency-sensitive. In a single converged link, all traffic types coexist without imposing restrictions on other performances. DCB allows iSCSI and FCoE SAN traffic to coexist with server and LAN traffic on the same network. DCB features reduce or avoid dropped frames, retransmission, and network congestion.

DCB provides lossless transmission of FCoE and iSCSI storage traffic using:

- Separate traffic classes for the different service needs of network applications.
- PFC flow control to pause data transmission and avoid dropping packets during congestion.
- ETS bandwidth allocation to guarantee a percentage of shared bandwidth to bursty traffic, while allowing each traffic class to exceed its allocated bandwidth if another traffic class is not using its share.
- DCBX discovery of peers, including PFC, ETS, and other DCB settings parameter exchange, mismatch detection, and remote configuration of DCB parameters.
- iSCSI application protocol TLV information in DCBX advertisements to communicate iSCSI support to peer ports.

This example shows how to configure a DCB converged network in which:

- DCBx is enabled globally to ensure the exchange of DCBx, PFC, ETS, and ISCSI configurations between DCBx-enabled devices.

- PFC is configured to ensure lossless traffic for dot1p priority 4, 5, 6, and 7 traffic.
- ETS allocates 30% bandwidth for dot1p priority 0, 1, 2, and 3 traffic and 70% bandwidth for priority 4, 5, 6, and 7 traffic.
- iSCSI is configured to use dot1p priority 6 for iSCSI traffic, and advertise priority 6 in iSCSI application TLVs.

1. DCBX configuration (global)

Configure DCBX globally on a switch to enable the exchange of DCBX TLV messages with PFC, ETS, and iSCSI configurations.

```
OS10# configure terminal
OS10(config)# dcbx enable
```

2. PFC configuration (global)

PFC is enabled on traffic classes with dot1p 4, 5, 6, and 7 traffic. All the traffic classes use the default PFC pause settings for shared buffer size and pause frames in ingress queue processing in the network-qos policy map. The `trust-map dot1p default` honors (trusts) all dot1p ingress traffic.

```
OS10(config)# class-map type network-qos test4
OS10(config-cmap-nqos)# match qos-group 4
OS10(config-cmap-nqos)# exit
OS10(config)# class-map type network-qos test5
OS10(config-cmap-nqos)# match qos-group 5
OS10(config-cmap-nqos)# exit
OS10(config)# class-map type network-qos test6
OS10(config-cmap-nqos)# match qos-group 6
OS10(config-cmap-nqos)# exit
OS10(config)# class-map type network-qos test7
OS10(config-cmap-nqos)# match qos-group 7
OS10(config-cmap-nqos)# exit

OS10(config)# policy-map type network-qos test
OS10(config-pmap-network-qos)# class test4
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 4
OS10(config-pmap-c-nqos)# exit
OS10(config-pmap-network-qos)# class test5
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 5
OS10(config-pmap-c-nqos)# exit
OS10(config-pmap-network-qos)# class test6
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 6
OS10(config-pmap-c-nqos)# exit
OS10(config-pmap-network-qos)# class test7
OS10(config-pmap-c-nqos)# pause
OS10(config-pmap-c-nqos)# pfc-cos 7
OS10(config-pmap-c-nqos)# exit
OS10(config-pmap-network-qos)# exit

OS10(config)# system qos
OS10(config-sys-qos)# trust-map dscp default
```

3. PFC configuration (interface)

Apply the service policies with dot1p trust and PFC configurations to an interface.

```
OS10(config)# interface ethernet 1/1/53
OS10(conf-if-eth1/1/53)# no shutdown
OS10(conf-if-eth1/1/53)# service-policy input type network-qos test
OS10(conf-if-eth1/1/53)# trust-map dot1p default
OS10(conf-if-eth1/1/53)# priority-flow-control mode on
OS10(conf-if-eth1/1/53)# end
```

4. ETS configuration (global)

A trust dot1p-map assigns dot1p 0, 1, 2, and 3 traffic to qos-group 0, and dot1p 4, 5, 6, and 7 traffic to qos-group 1. A `qos-map traffic-class` map assigns the traffic class in qos-group 0 to queue 0, and qos-group 1 traffic to queue 1. A queuing policy map assigns 30% of interface bandwidth to queue 0, and 70% of bandwidth to queue 1.

```
OS10(config)# trust dot1p-map tmap1
OS10(config-tmap-dot1p-map)# qos-group 0 dot1p 0-3
```

```
OS10(config-tmap-dot1p-map)# qos-group 1 dot1p 4-7
OS10(config-tmap-dot1p-map)# exit

OS10(config)# qos-map traffic-class tmap2
OS10(config-qos-map)# queue 0 qos-group 0
OS10(config-qos-map)# queue 1 qos-group 1
OS10(config-qos-map)# exit

OS10(config)# class-map type queuing cmap1
OS10(config-cmap-queuing)# match queue 0
OS10(config-cmap-queuing)# exit
OS10(config)# class-map type queuing cmap2
OS10(config-cmap-queuing)# match queue 1
OS10(config-cmap-queuing)# exit

OS10(config)# policy-map type queuing pmap1
OS10(config-pmap-queuing)# class cmap1
OS10(config-pmap-c-que)# bandwidth percent 30
OS10(config-pmap-c-que)# exit
OS10(config-pmap-queuing)# class cmap2
OS10(config-pmap-c-que)# bandwidth percent 70
OS10(config-pmap-c-que)# end

OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p default
```

5. ETS configuration (interface and global)

Apply the service policies with dot1p trust and ETS configurations to an interface or on all switch interfaces. Only one `qos-map traffic-class` map is supported on a switch.

```
OS10(config)# interface ethernet 1/1/53
OS10(conf-if-eth1/1/53)# trust-map dot1p tmap1
OS10(conf-if-eth1/1/53)# qos-map traffic-class tmap2
OS10(conf-if-eth1/1/53)# trust-map dot1p default
OS10(conf-if-eth1/1/53)# service-policy output type queuing pmap1
OS10(conf-if-eth1/1/53)# ets mode on
OS10(conf-if-eth1/1/53)# end
```

```
OS10(config)# system qos
OS10(config-sys-qos)# trust-map dot1p tmap1
OS10(config-sys-qos)# qos-map traffic-class tmap2
OS10(config-sys-qos)# trust-map dot1p default
OS10(config-sys-qos)# service-policy output type queuing pmap1
OS10(config-sys-qos)# ets mode on
```

6. Verify DCB configuration

```
OS10(conf-if-eth1/1/53)# show configuration
!
interface ethernet1/1/53
 switchport access vlan 1
 no shutdown
 service-policy input type network-qos test
 trust-map dot1p default
 service-policy output type queuing pmap1
 ets mode on
 qos-map traffic-class tmap2
 trust-map dot1p tmap1
 priority-flow-control mode on
```

7. Verify DCBX operational status

```
OS10(conf-if-eth1/1/53)# do show lldp dcbx interface ethernet 1/1/53
E-ETS Configuration TLV enabled           e-ETS Configuration TLV disabled

2 Input Reco TLV Pkts, 27 Output Reco TLV Pkts, 0 Error Reco TLV Pkts
```

10. iSCSI optimization configuration (global)

This example accepts the default settings for aging time and TCP ports that are used in monitored iSCSi sessions. A Compellant storage array is connected to the port. The policy-iscsi policy map sets the CoS dot1p priority that is used for iSCSI traffic to `6` globally on the switch. By default, iSCSI traffic uses priority 4. The `iscsi priority-bits 0x40` command sets the advertised dot1p priority that is used by iSCSI traffic in application TLVs to `6`. Hexadecimal `0x40` is binary `0 1 0 0 0 0 0 0`.

```
OS10(conf-if-eth1/1/53)# iscsi profile-storage compellent
OS10(conf-if-eth1/1/53)# lldp tlv-select dcbxp-appln iscsi
OS10(conf-if-eth1/1/53)# exit

OS10(config)# iscsi target port 3261 ip-address 10.1.1.1
OS10(config)# policy-map type application policy-iscsi
OS10(config-pmap-application)# class class-iscsi
OS10(config-pmap-c-app)# set qos-group 6
OS10(config-pmap-c-app)# set cos 6
OS10(config-pmap-c-app)# exit
OS10(config-pmap-application)# exit

OS10(config)# system qos
OS10(config-sys-qos)# service-policy type application policy-iscsi
OS10(config-sys-qos)# exit

OS10(config)# iscsi session-monitoring enable
OS10(config)# iscsi priority-bits 0x40
OS10(config)# iscsi enable
```

11. Verify iSCSI optimization (global)

After you enable iSCSI optimization, the iSCSI application priority TLV parameters are added in the `show` command output to verify a PFC configuration.

```
OS10(conf-if-eth1/1/53)# do show lldp dcbx interface ethernet 1/1/53 pfc detail

Interface ethernet1/1/53
    Admin mode is on
    Admin is enabled, Priority list is 4,5,6,7
    Remote is enabled, Priority list is 4,5,6,7
    Remote Willing Status is disabled
```

```
    Local is enabled, Priority list is 4,5,6,7
    Oper status is init
    PFC DCBX Oper status is Up
    State Machine Type is Symmetric
    PFC TLV Tx Status is enabled
    Application Priority TLV  Parameters :
    -------------------------------------
    ISCSI TLV Tx Status is enabled
    Local ISCSI PriorityMap is 0x40
    Remote ISCSI PriorityMap is 0x10

    4 Input TLV pkts, 3 Output TLV pkts, 0 Error pkts
    4 Input Appln Priority TLV pkts, 3 Output Appln Priority TLV pkts, 0 Error Appln
Priority TLV Pkts
```

12. DCBX configuration (interface)

This example shows how to configure and verify different DCBX versions.

```
OS10(conf-if-eth1/1/53)# dcbx version cee
OS10(conf-if-eth1/1/53)# show configuration
!
interface ethernet1/1/53
 switchport access vlan 1

sFlow®

sFlow® is a standard-based sampling technology embedded within switches and routers that monitors network traffic. It provides traffic monitoring for high-speed networks with many switches and routers.

- OS10 supports sFlow® version 5
- Only data ports support sFlow® collector
- OS10 supports a maximum of two sFlow® collectors
- OS10 does not support sFlow® on SNMP, VLAN, tunnel interfaces, extended sFlow®, backoff mechanism, and egress sampling

sFlow® uses two types of sampling:

- Statistical packet-based sampling of switched or routed packet flows
- Time-based sampling of interface counters

NOTE: On the S4248FB-ON and the S4248FBL-ON platforms, sampling is performed based on the cumulative packet counts from all the sFlow® enabled ports.

sFlow® monitoring consists of an sFlow® agent embedded in the device and an sFlow® collector:

- The sFlow® agent resides anywhere within the path of the packet. The agent combines the flow samples and interface counters into sFlow® datagrams and forwards them to the sFlow® collector at regular intervals. The datagrams consist of information on, but not limited to, the packet header, ingress and egress interfaces, sampling parameters, and interface counters. Application-specific integrated circuits (ASICs) handle packet sampling.
- The sFlow® collector analyses the datagrams received from different devices and produces a network-wide view of traffic flows.

Configuration notes

Dell PowerSwitch S4200-ON Series:

Do not enable sFlow® on per-port basis.

Enable sFlow®

You can enable sFlow® either on all interfaces globally or on a specific set of interfaces. The system displays an error message if you try to enable sFlow® on both modes at one time.

If you configure sFlow® only on a set of interfaces, any further change to the sFlow®-enabled ports triggers the sFlow® agent to restart. This results in a gap in the polling counter statistics of 30 seconds and the sFlow® counters are reset on all sFlow®-enabled ports.

When you enable sFlow® on a port-channel:

- When in Per-Interface mode, the counter statistics of sFlow®-enabled ports reset to zero when you add a new member port or remove an existing member port from any sFlow® enabled port-channel group.
- sFlow® counter statistics that are individually reported for the port members of a port-channel data source are accurate. Counter statistics reported for the port-channel may not be accurate. To calculate the correct counters for a port-channel data source, add together the counter statistics of the individual port members.

Enable or disable sFlow® globally

sFlow® is disabled globally by default.

- Enable sFlow® globally on all interfaces in CONFIGURATION mode.

```
sflow enable all-interfaces
```

- Disable sFlow® in CONFIGURATION mode.

```
no sflow
```

Enable or disable sFlow® on a specific interface

- Enable sFlow® in CONFIGURATION mode.

```
sflow enable
```

- Disable sFlow® in CONFIGURATION mode.

```
no sflow enable
```

Enable sFlow® on a specific interface

```
OS10(config)# sflow enable
OS10(config)# interface ethernet 1/1/1
OS10(conf-if-eth1/1/1)# sflow enable
```

Enable sFlow® on a range of interfaces

```
OS10(config)# sflow enable
OS10(config)# interface range ethernet 1/1/1-1/1/10
OS10(conf-range-eth1/1/1-1/1/10)# sflow enable
```

Enable sFlow® on a port-channel

```
OS10(config)# sflow enable
OS10(config)# interface range port-channel 1-10
OS10(conf-range-po-1-10)# sflow enable
```

Max-header size configuration

- Set the packet maximum size in CONFIGURATION mode, from 64 to 256. The default is 128 bytes.

```
max-header-size header-size
```

- Disable the header size in CONFIGURATION mode.

```
no sflow max-header-size
```

- View the maximum packet header size in EXEC mode.

```
show sflow
```

Configure sFlow® maximum header size

```
OS10(config)# sflow max-header-size 80
```

View sFlow® information

```
OS10# show sflow
sFlow services are enabled
Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 20
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collector(s) configured
Collector IP addr:10.16.151.245 Agent IP addr:10.16.132.181 UDP port:6343 VRF:Default

0 UDP packets dropped
34026 sFlow samples collected
```

View sFlow® running configuration

```
OS10# show running-configuration sflow
sflow enable
sflow max-header-size 80
sflow polling-interval 30
sflow sample-rate 4096
```

```
sflow collector 10.16.150.1 agent-addr 10.16.132.67 6767 max-datagram-size 800
sflow collector 10.16.153.176 agent-addr 3.3.3.3 6666
!
interface ethernet1/1/1
sflow enable
!
```

Collector configuration

Configure the IPv4 or IPv6 address for the sFlow® collector. When you configure the collector, enter a valid and reachable IPv4 or IPv6 address. You can configure a maximum of two sFlow® collectors. If you specify two collectors, samples are sent to both. The agent IP address must be the same for both the collectors.

Collector configuration for default VRF

- Enter an IPv4 or IPv6 address for the sFlow® collector, IPv4 or IPv6 address for the agent, UDP collector port number, and maximum datagram size in CONFIGURATION mode.

```
sflow collector {ip-address | ipv6-address} agent-addr {ip-address | ipv6-address}
[collector-port-number] [max-datagram-size datagram-size-number]
```

The `no` form of the command disables sFlow® collectors in CONFIGURATION mode.

Collector configuration for nondefault VRF

If you configure a collector for a nondefault VRF, create the VRF first. If you do not specify the VRF instance, the system configures the collector for the default VRF instance.

The following are the steps to configure sFlow® collector with a nondefault VRF:

1. Create a nondefault VRF instance.

```
OS10(config)# ip vrf RED
```

2. Enable the sFlow® feature.

```
OS10(config)# sflow enable
```

3. Assign an IP address to an interface which you can use as the sFlow® agent and add it to the VRF instance.

```
OS10(conf-if-eth1/1/1)# sflow enable
OS10(conf-if-eth1/1/1)# ip vrf forwarding RED
OS10(conf-if-eth1/1/1)# ip address 1.1.1.1/24
OS10(conf-if-eth1/1/1)# no shutdown
```

4. Assign an IP address to an interface through which the sFlow® collector is reachable and add it to the VRF instance.

```
OS10(conf-if-eth1/1/1)# interface ethernet 1/1/2
OS10(conf-if-eth1/1/2)# sflow enable
OS10(conf-if-eth1/1/2)# ip vrf forwarding RED
OS10(conf-if-eth1/1/2)# ip address 4.4.4.4/24
OS10(conf-if-eth1/1/2)# no shutdown
```

5. Enter the IP addresses of the sFlow® collector and the agent and assign them to the VRF instance.

```
OS10(config)# sflow collector 4.4.4.1 agent-addr 1.1.1.1 vrf RED
```

View sFlow® information

```
OS10# show sflow
sFlow services are enabled
Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 10
```

```
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collector(s) configured
Collector IP addr:4.4.4.1 Agent IP addr:1.1.1.1 UDP port:6343 VRF:RED
0 UDP packets exported
0 UDP packets dropped
0 sFlow samples collected
```

Polling-interval configuration

The polling interval for an interface is the number of seconds between successive samples of counters sent to the collector. You can configure the duration for polled interface statistics. Unless there is a specific deployment need to configure a lower polling interval value, configure the polling interval to the maximum value.

- Change the default counter polling interval in CONFIGURATION mode, from 10 to 300. The default is 20.

  ```
  sflow polling-interval interval-size
  ```

- Disable the polling interval in CONFIGURATION mode.

  ```
  no sflow polling-interval
  ```

- View the polling interval in EXEC mode.

  ```
  show sflow
  ```

Configure sFlow® polling interval

```
OS10(config)# sflow polling-interval 200
```

View sFlow® information

```
OS10# show sflow
sFlow services are enabled
Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 200
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collector(s) configured
Collector IP addr:10.16.151.245 Agent IP addr:10.16.132.181 UDP port:6343 VRF:Default

0 UDP packets dropped
34026 sFlow samples collected
```

View sFlow® running configuration

```
OS10# show running-configuration sflow
sflow enable
sflow max-header-size 80
sflow polling-interval 200
sflow sample-rate 4096
sflow collector 10.16.150.1 agent-addr 10.16.132.67 6767 max-datagram-size 800
sflow collector 10.16.153.176 agent-addr 3.3.3.3 6666
!
interface ethernet1/1/1
sflow enable
!
```

Sample-rate configuration

Sampling rate is the number of packets skipped before the sample is taken. If the sampling rate is 4096, one sample generates for every 4096 packets observed.

- Set the sampling rate in CONFIGURATION mode, from 4096 to 65535. The default is 32768.

```
sflow sample-rate sampling-size
```

- Disable packet sampling in CONFIGURATION mode.

```
no sflow sample-rate
```

- View the sampling rate in EXEC mode.

```
show sflow
```

Configure sFlow® sampling rate

```
OS10(config)# sflow sample-rate 4096
```

View sFlow® packet header size

```
OS10# show sflow
sFlow services are enabled
Management Interface sFlow services are disabled
Global default sampling rate: 4096
Global default counter polling interval: 20
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collector(s) configured
Collector IP addr:10.16.151.245 Agent IP addr:10.16.132.181 UDP port:6343 VRF:Default
31722 UDP packets exported
0 UDP packets dropped
34026 sFlow samples collected
```

View sFlow® running configuration

```
OS10# show running-configuration sflow
sflow enable
sflow max-header-size 80
sflow polling-interval 20
sflow sample-rate 4096

sflow collector 10.16.153.176 agent-addr 3.3.3.3 6666
!
interface ethernet1/1/1
sflow enable
!
```

Source interface configuration

You can configure an interface as a source for sFlow®. The sFlow® agent uses the IP address of the configured source interface as the agent IP address.

- Configure the source interface in CONFIGURATION mode.

```
sflow source-interface {ethernet node/slot/port[:subport] | loopback loopback-ID|
port-channel port-channel-ID| vlan vlan-ID}
```

- View the interface details.

```
show running-configuration sflow
```

```
show sflow
```

Configure sFlow® source interface

```
OS10(config)# sflow source-interface ethernet 1/1/1

OS10(config)# sflow source-interface port-channel 1
```

```
OS10(config)# sflow source-interface loopback 1

OS10(config)# sflow source-interface vlan 10
```

View sFlow® running configuration

```
OS10# show running-configuration sflow
sflow enable all-interfaces
sflow source-interface vlan10
sflow collector 5.1.1.1 agent-addr 4.1.1.1 6343
sflow collector 6.1.1.1 agent-addr 4.1.1.1 6343

OS10(config)#show running-configuration interface vlan
!
interface vlan1
 no shutdown
!

sflow collector 10.16.153.176 agent-addr 3.3.3.3 6666
!
interface ethernet1/1/1
sflow enable
!
```

sFlow® commands

sflow collector

Configures an sFlow® collector IP address where sFlow® datagrams are forwarded. You can configure a maximum of two collectors.

Syntax

`sflow collector {`*`ipv4-address | ipv6-address`*`} agent-addr {`*`ipv4-address | ipv6-address`*`} [`*`collector-port-number`*`] [max-datagram-size `*`datagram-size-number`*`][vrf `*`vrf-name`*`]`

Parameters

- *`ipv4-address | ipv6-address`* — Enter an IPv4 or IPv6 address in A.B.C.D/A::B format.
- `agent-addr` *`ipv4-address | ipv6-address`* — Enter the sFlow® agent IP address. If you configure two collectors, the agent IP address must be the same for both the collectors.
- *`collector-port-number`* — (Optional) Enter the UDP port number, from 1 to 65535. The default is 6343.
- `max-datagram-size` *`datagram-size-number`* — (Optional) Enter `max-datagram-size` then the size number in bytes, from 400 to 1500. The default is 1400.
- `vrf` — (Optional) Enter the VRF instance to set the VRF context to the collector IP address. If you do not specify a VRF, the system uses the default VRF.

Defaults

Not configured

Command Modes

CONFIGURATION

Usage Information

You must enter a valid and reachable IPv4 or IPv6 address. If you configure two collectors, traffic samples are sent to both. The sFlow® agent address is the IPv4 or IPv6 address used to identify the agent to the collector. The `no` version of this command removes the configured sFlow® collector.

If you specify a nondefault VRF, create the VRF first.

Example

```
OS10(conf)# sflow collector 10.1.1.1 agent-addr 2.2.2.2 6343 max-
datagram-size 1500 vrf default
```

```
OS10(conf)# sflow collector 10.1.1.1 agent-addr 2.2.2.2 6343 max-
datagram-size 1500 vrf vrf-core
```

Supported Releases

10.3.0E or later. Updated the command to specify a nondefault VRF on OS10 release 10.4.3.0 or later

sflow enable

Enables sFlow® on a specific interface or globally on all interfaces.

Syntax	`sflow enable [all-interfaces]`
Parameters	`all-interfaces` — (Optional) Enter to enable sFlow® globally.
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command to disables sFlow®.

Example (interface)	`OS10(config)# sflow enable`
	`OS10(config)# interface ethernet 1/1/1`
	`OS10(conf-if-eth1/1/1)# sflow enable`

Example (interface range)	`OS10(config)# sflow enable`
	`OS10(config)# interface range ethernet 1/1/1-1/1/10`
	`OS10(conf-range-eth1/1/1-1/1/10)# sflow enable`

Example (port-channel)	`OS10(config)# sflow enable`
	`OS10(config)# interface range port-channel 1-10`
	`OS10(conf-range-po-1-10)# sflow enable`

Supported Releases	10.3.0E or later

sflow max-header-size

Sets the maximum header size of a packet.

Syntax	`sflow max-header-size` *`header-size`*
Parameter	*`header-size`* — Enter the header size in bytes, from 64 to 256. The default is 128.
Default	128 bytes
Command Mode	CONFIGURATION
Usage Information	Use the `no` version of the command to reset the header size to the default value.
Example	`OS10(conf)# sflow max-header-size 256`
Supported Releases	10.3.0E or later

sflow polling-interval

Sets the sFlow® polling interval.

Syntax	`sflow polling-interval` *`interval-value`*
Parameter	*`interval-value`* — Enter the interval value in sections, from 10 to 300. The default is 30.
Defaults	30
Command Mode	CONFIGURATION

Usage Information	The polling interval for an interface is the number of seconds between successive samples of counters sent to the collector. You can configure the duration for polled interface statistics. The `no` version of the command resets the interval time to the default value.
Example	`OS10(conf)# sflow polling-interval 200`
Supported Releases	10.3.0E or later

sflow sample-rate

Configures the sampling rate.

Syntax	`sflow sample-rate value`
Parameter	*value* — Enter the packet sample rate, from 4096 to 65535. The default is 32768.
Default	32768
Command Mode	CONFIGURATION
Usage Information	Sampling rate is the number of packets skipped before the sample is taken. For example, if the sampling rate is 4096, one sample generates for every 4096 packets observed. The `no` version of the command resets the sampling rate to the default value.
Example	`OS10(conf)# sflow sample-rate 4096`
Supported Releases	10.3.0E or later

sflow source-interface

Configures an interface as source for sFlow®. The sFlow® agent uses the IP address of the configured source interface as the agent IP address.

Syntax	`sflow source-interface {ethernet node/slot/port[:subport] | loopback loopback-ID | port-channel port-channel-ID | vlan vlan-ID}`
Parameters	• `ethernet node/slot/port[:subport]`—Enter the physical interface type details. • `loopback loopback-ID`—Enter the Loopback interface details. The Loopback ID range is from 0 to 16383. • `port-channel port-channel-ID`—Enter the port channel details. The port channel ID range is from 1 to 999 or 1001 to 2000. • `vlan vlan-ID`—Enter the VLAN details. The VLAN ID range is from 1 to 4093.
Default	Disabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command removes the configuration from the interface.
Example (Ethernet)	`OS10(config)# sflow source-interface ethernet 1/1/1`
Example (Loopback)	`OS10(config)# sflow source-interface loopback 1`
Example (port-channel)	`OS10(config)# sflow source-interface port-channel 1`

Example (VLAN)

```
OS10(config)# sflow source-interface vlan 10
```

Supported Releases 10.4.1.0 or later

show sflow

Displays the current sFlow® configuration for all interfaces or by a specific interface type.

Syntax `show sflow [interface type]`

Parameter `interface type` — (Optional) Enter either `ethernet` or `port-channel` for the interface type.

Command Mode EXEC

Usage Information OS10 does not support statistics for UDP packets dropped and samples received from the hardware.

Example

```
OS10# show sflow
sFlow services are enabled
Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 30
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collector(s) configured
Collector IP addr:10.16.151.245 Agent IP addr:10.16.132.181 UDP
port:6343 VRF:Default
31722 UDP packets exported
0 UDP packets dropped
34026 sFlow samples collected
```

```
OS10# show sflow
sFlow services are enabled
Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 30
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collector(s) configured
Collector IP addr:10.16.151.145 Agent IP addr:10.16.132.160 UDP
port:6343 VRF:RED
0 UDP packets exported
0 UDP packets dropped
0 sFlow samples collected
```

Example (port-channel)

```
OS10# show sflow interface port-channel 1
port-channel1
sFlow is enabled on port-channel1
Samples rcvd from h/w: 0
```

Supported Releases 10.3.0E or later

24

Telemetry

Network health relies on performance monitoring and data collection for analysis and troubleshooting. Network data is often collected with SNMP and CLI commands using the pull mode. In pull mode, a management device sends a get request and pulls data from a client. As the number of objects in the network and the metrics grow, traditional methods limit network scaling and efficiency. Using multiple management systems further limits network scaling. The pull model increases the processing load on a switch by collecting all data even when there is no change.

Streaming telemetry provides an alternative method where data is continuously transmitted from network devices with efficient, incremental updates. Operators subscribe to the specific data they need using well-defined sensor identifiers.

While SNMP management systems poll for data even if there is no change, streaming telemetry enables access to near real-time, model-driven, and analytics-ready data. It supports more effective network automation, traffic optimization, and preventative troubleshooting.

For example, streaming telemetry reports packet drops or high utilization on links in real time. A network automation application can use this information to provision new paths and optimize traffic transmission across the network. The data is encoded using Google Protocol Buffers (GPB) and streamed using Google Protocol RPC (gRPC) transport.

You can use OS10 telemetry to stream data to external collectors such as VMware vRNI.

Telemetry terminology

Dial-out mode	The switch initiates a session with one or more devices according to the sensor paths and destinations in a subscription.
Sensor path	The path used to collect data for streaming telemetry.
Sensor group	A reusable group of multiple sensor paths and exclude filters.
Destination group	The IP address and transport port on a destination server to which telemetry data is streamed. You can configure multiple destinations and reuse the destination group in subscription profiles.
Subscription profile	Data collector destinations and stream attributes that are associated with sensor paths. A subscription ties sensor paths and a destination group with a transport protocol, encoding format, and streaming interval. The telemetry agent in the switch attempts to establish a session with each collector in the subscription profile, and streams data to the collector. If a collector is not reachable, the telemetry agent continuously tries to establish the connection at one-minute intervals.

YANG-modeled telemetry data

This section describes the YANG containers from which telemetry data can be streamed to destinations with the recommended minimum sampling intervals.

BGP

Table 144. BGP

YANG Container	Minimum sampling interval (milliseconds)
bgp/bgp-oper/bgpPeerCount	15000
bgp/bgp-oper/bgpPrfxCntrsEntry	15000

BGP peers

Table 145. BGP peers

YANG Container	Minimum sampling interval (milliseconds)
infra-bgp/peer-state/peer-status	0

Buffer statistics

Table 146. Buffer statistics

YANG Container	Minimum sampling interval (milliseconds)
base-qos/queue-stat	15000
base-qos/priority-group-stat	15000
base-qos/buffer-pool-stat	15000
base-qos/buffer-pool	15000

Device information

Table 147. Device information

YANG Container	Minimum sampling interval (milliseconds)
base-pas/chassis	15000
base-pas/card	15000
base-switch/switching-entities/switch-stats	15000

Environmental statistics

Table 148. Environmental statistics

YANG Container	Minimum sampling interval (milliseconds)
base-pas/entity	15000
base-pas/psu	15000
base-pas/fan-try	15000
base-pas/fan	15000
base-pas/led	15000
base-pas/temperature	15000
base-pas/temp_threshold	15000
base-pas/media	15000
base-pas/media-channel	15000

Interface statistics

YANG Container	Minimum sampling interval (milliseconds)
system-status/current-status	15000

Configure telemetry

NOTE: To set up a streaming telemetry collector, download and use the OS10 telemetry .proto files from the Dell Technologies Support site.

To enable the streaming of telemetry data to destinations in a subscription profile:

1. Enable telemetry on the switch.
2. Configure a destination group.
3. Configure a subscription profile by associating one or more destination groups and pre-configured sensor groups.

After you complete Step 3, the telemetry agent starts streaming data to destination devices.

Configuration notes

- The telemetry agent collects data from OS10 applications and switch hardware. When you configure a sampling rate of 0, which is near real-time, telemetry collects data as soon as an event occurs. If you configure a sampling rate, telemetry performs periodic data collection. The recommended minimum sampling intervals are described in **Configure a sensor group**.
- OS10 telemetry supports:
  - Only one configured destination group, and only one destination address in the group.
  - Only one subscription profile.

Enable telemetry

1. Enter telemetry mode from CONFIGURATION mode.

```
OS10(config)# telemetry
```

2. Enable streaming telemetry in TELEMETRY mode.

```
OS10(conf-telemetry)# enable
```

Configure a sensor group

A sensor group defines the data that is collected and streamed to a destination. Use any of the pre-configured sensor groups to monitor system resources. To display the sensor paths for each group, use the `show telemetry sensor-group` command.

Table 152. Pre-configured sensor group

Pre-configured sensor group	Minimum sampling interval (milliseconds)
BGP	15000
BGP-peer	0
Buffer	15000
Device	15000
Environment	15000
Interface	15000
Port channel	0
System	15000

Configure a destination group

A destination group defines the destination servers to which streaming telemetry data is sent.

1. Enter the destination group name in TELEMETRY mode. A maximum of 32 characters.

```
OS10(conf-telemetry)# destination-group group-name
```

2. Enter the IPv4 or IPv6 address and transport-service port number in DESTINATION-GROUP mode. Only one destination is supported in the 10.4.3.0 release. You can enter a fully qualified domain name (FQDN) for *ip-address*. The destination domain name resolves to an IP address — see System domain name and list.

```
OS10(conf-telemetry-dg-dest)# destination ip-address port-number
```

The IP address that you specify here is the IP address of the telemetry collector. You can specify any port number between 0 and 65535. Ensure that this port number is configured on the telemetry collector.

3. Return to TELEMETRY mode.

```
OS10(conf-telemetry-dg-dest)# exit
```

Configure a subscription profile

A subscription profile associates destination groups and sensor groups, and specifies the data encoding format and transport protocol.

1. Enter the subscription profile name in TELEMETRY mode. A maximum of 32 characters.

```
OS10(conf-telemetry)# subscription-profile profile-name
```

2. Enter the name of a pre-configured sensor group and sampling interval in SUBSCRIPTION-PROFILE mode. Valid sensor-group names are: `bgp`, `bgp-peer`, `buffer`, `device`, `environment`, `interface`, `lag`, and `system`. To view the data contents of a pre-configured sensor group, use the `show telemetry sensor-group` command. The `interface` sensor group supports only physical and port channel interfaces.

The sampling interval is in milliseconds, from 0 (whenever an event occurs; near real-time) to 4294967295. The default is 15000. Repeat this step to add sensor groups to the subscription profile.

```
OS10(conf-telemetry-sp-subscription)# sensor-group group-name sampling-interval
```

3. Enter the name of a destination group in SUBSCRIPTION-PROFILE mode. Telemetry data is sent to the IP address and port specified in the destination group. Repeat this step to add destination groups to the subscription profile.

```
OS10(conf-telemetry-sp-subscription)# destination-group name
```

4. Enter the source interface in SUBSCRIPTION-PROFILE mode. The system uses the source interface to derive the VRF instance and IP address used to communicate with destination devices. For gRPC transport, source interface configuration is optional.

```
OS10(conf-telemetry-sp-subscription)# source-interface interface
```

Where *interface* is one of the following values:

- `ethernet node/slot/port[:subport]` — Enter a physical Ethernet interface.
- `loopback number` — Enter a Loopback interface, from 0 to 16383.
- `management 1/1/1` — Enter the management interface.
- `port-channel channel-id` — Enter a port-channel ID, from 1 to 28.
- `vlan vlan-id` — Enter a VLAN ID, from 1 to 4093.

5. Configure the `gpb` encoding format in which data is streamed in SUBSCRIPTION-PROFILE mode.

```
OS10(conf-telemetry-sp-subscription)# encoding format
```

6. Configure the `gRPC` transport protocol used to stream data to a destination in SUBSCRIPTION-PROFILE mode. gRPC with Transport Security Layer (TLS) certificates enabled is the default transport protocol. To disable TLS certificate exchange, use the `transport grpc no-tls` command.

```
OS10(conf-telemetry-sp-subscription)# transport protocol [no-tls]
```

After you configure a subscription profile, the telemetry agent starts collecting data and streaming it to destination devices.

View telemetry configuration

Use the following `show` commands to display telemetry configuration.

```
OS10# show telemetry

Telemetry Status             : enabled

  sensor-group device 300000
  sensor-group environment 300000
  sensor-group interface 180000
  sensor-group lag 0
  sensor-group system 300000
  encoding gpb
  transport grpc no-tls
  source-interface ethernet1/1/1
```

Telemetry client authentication using TLS

To configure telemetry client authentication using TLS:

1. Set up a streaming telemetry collector.
2. Configure the host and CA certificate on the OS10 switch.
3. Configure telemetry (see Configure telemetry).

Set up a streaming telemetry collector

1. In the `/etc/hosts` file, add the collector hostname (for example, `securesrc`).
2. Perform the following steps to generate an RSA private key:
   a. Generate a valid CA key and certificate.

```
openssl genrsa -passout pass:1234 -des3 -out ca.key 4096

openssl req -passin pass:1234 -new -x509 -days 365 -key ca.key -out ca.crt -subj
"/C=SP/ST=Spain/L=Valdepenias/O=Test/OU=Test/CN=Root CA"
```

   b. Generate a valid server key and certificate request.

```
openssl genrsa -passout pass:1234 -des3 -out server.key 4096

openssl req -passin pass:1234 -new -key server.key -out server.csr -subj "/C=SP/
ST=Spain/L=Valdepenias/O=Test/OU=Server/CN=securesrc"

openssl x509 -req -passin pass:1234 -days 365 -in server.csr -CA ca.crt -CAkey
ca.key -set_serial 01 -out server.crt
```

   c. Remove passphrase from the server key.

```
openssl rsa -passin pass:1234 -in server.key -out server.key
```

   d. Generate a valid client key and certificate request.

```
openssl genrsa -passout pass:1234 -des3 -out client.key 4096

openssl req -passin pass:1234 -new -key client.key -out client.csr -subj "/C=SP/
```

```
ST=Spain/L=Valdepenias/O=Test/OU=Client/CN=localhost"

openssl x509 -passin pass:1234 -req -days 365 -in client.csr -CA ca.crt -CAkey
ca.key -set_serial 01 -out client.crt
```

e. Remove passphrase from the client key.

```
openssl rsa -passin pass:1234 -in client.key -out client.key
```

NOTE: The collector hostname (`securesrc`) is added to the server key.

f. Rename the file `client.crt` to `os10host.crt`, and `client.key` to `os10host.key`. Then, copy the `ca.crt`, `os10host.crt` and `os10host.key` files to the OS10 switch.

g. Start the streaming telemetry collector in TLS mode.

Configure the host and CA certificate on the OS10 switch

1. Create an IP host entry for the collector IP on the switch. The hostname must be same as given in the streaming telemetry collector.

```
OS10(config)# ip host securesrc collector_ip
```

2. Configure CA certificate in the switch. Copy the `ca.crt` file from the collector machine to the `/home/admin` path.

```
OS10# crypto ca-cert install home://ca.crt
OS10#crypto cert install cert-file home://os10host.crt key-file home://os10host.key
```

3. Once the CA certificate is installed, configure telemetry as explained in the Configure telemetry section.

NOTE: For destination, do not specify IP, instead specify the hostname.

```
OS10(conf-telemetry)# show configuration
!
telemetry
enable
 !
 destination-group dg01
  destination securesrc 50000
 !
 subscription-profile sp01
  sensor-group bgp
  sensor-group interface
  destination-group dg01
  encoding gpb
  transport grpc
  source-interface ethernet1/1/1
OS10(conf-telemetry)#
```

Telemetry commands

debug telemetry

Starts data collection to troubleshoot telemetry operation.

Syntax	`debug telemetry`
Parameters	None
Default	Not configured
Command mode	EXEC
Usage information	Use the command to start a local telemetry collector. Connect to the local collector by configuring the destination with loopback ip (127.0.0.1) and port 50051. For example: • `destination-group local-collector` • `destination 127.0.0.1 50051` The local collector data logs will be stored in /var/log/grpc_server.log.

Example	`OS10# debug telemetry`
Supported releases	10.4.3.0 or later

telemetry

Enters Telemetry configuration mode to configure streaming telemetry.

Syntax	`telemetry`
Parameters	None
Default	Telemetry is disabled on the switch.
Command mode	CONFIGURATION
Usage information	Enable and disable streaming telemetry in Telemetry mode.
Example	`OS10(config)# telemetry` `OS10(conf-telemetry)#`
Supported releases	10.4.3.0 or later

enable

Enables telemetry on the switch.

Syntax	`enable`
Parameters	None
Default	Telemetry is disabled.
Command mode	TELEMETRY
Usage information	Enter the `no enable` command to disable telemetry.
Example	`OS10(conf-telemetry)# enable`
Supported releases	10.4.3.0 or later

destination-group (telemetry)

Configures a destination group for streaming telemetry.

Syntax	`destination-group` *`group-name`*
Parameters	*`group-name`* — Enter the name of the destination group. A maximum of 32 characters maximum.
Default	Not configured
Command mode	TELEMETRY
Usage information	A destination group defines the destination servers to which streaming telemetry data is sent. The `no` version of this command removes the configured group.

Example

```
OS10(conf-telemetry)# destination-group dest1
OS10(conf-telemetry-dg-dest1)#
```

Supported releases 10.4.3.0 or later

destination

Configures a destination management device that receives streaming telemetry.

Syntax `destination {ip-address | domain-name} port-number`

Parameters

- *ip-address* — Enter the IPv4 or IPv6 address of the destination device. You can enter a fully qualified domain name (FQDN). The destination domain name resolves to an IP address — see System domain name and list.
- *domain-name* — Enter the fully qualified domain name of the destination device. A maximum of 32 characters.
- *port-number* — Enter the transport-service port number to which telemetry data is sent on the destination device.

Default Not configured

Command mode DESTINATION-GROUP

Usage information When you associate a destination group with a subscription, telemetry data is sent to the IP address and port specified by the `destination` command. In the 10.4.3.0 release, only one destination is supported. The `no` version of this command removes the configured destination.

Example

```
OS10(conf-telemetry)# destination-group dest1
OS10(conf-telemetry-dg-dest1)# destination 10.11.56.204 40001
OS10(conf-telemetry-dg-dest1)#
```

Supported releases 10.4.3.0 or later

subscription-profile

Configures a subscription profile for streaming telemetry data.

Syntax `subscription-profile profile-name`

Parameters *profile-name* — Enter a profile name. A maximum of 32 characters.

Default Not configured

Command mode TELEMETRY

Usage information A subscription profile associates destination groups with sensor groups, and specifies the data encoding format and transport protocol. Telemetry data is sent to the IP address and port specified in the destination groups.

NOTE: The subscription profile can have either OS10 or Openconfig model sensor groups. Both cannot co-exist. If you try to configures both sensor groups, then a warning message appears.

Example

```
OS10(conf-telemetry)# subscription-profile subscription-1
OS10(conf-telemetry-sp-subscription-1)#
```

Supported releases 10.4.3.0 or later

destination-group (subscription-profile)

Assigns a destination group to a subscription profile for streaming telemetry.

Syntax `destination-group group-name`

Parameters *group-name* — Enter the name of the destination group. A maximum of 32 characters.

Default Not configured

Command mode SUBSCRIPTION-PROFILE

Usage information A subscription profile associates destination groups and sensor groups. A destination group defines the destination servers to which streaming telemetry data is sent. The `no` version of this command removes the configured group from the subscription profile.

Example

```
OS10(conf-telemetry)# subscription-profile subscription-1
OS10(conf-telemetry-sp-subscription-1)# destination-group dest1
```

Supported releases 10.4.3.0 or later

sensor-group (subscription-profile)

Assigns a sensor group with sampling interval to a subscription profile for streaming telemetry.

Syntax `sensor-group {bgp | bgp-peer | buffer | device | environment | interface | lag | system | oc-bfd | oc-bgp | oc-buffer | oc-device | oc-environment | oc-interface | oc-lacp | oc-lag | oc-lldp | oc-stp | oc-system | oc-vendor-ufd | oc-vendor-vxlan | oc-vlan | oc-vrrp} group-name sampling-interval`

Parameters

- *bgp*—Enter `bgp` to assign a BGP statistics sensor group to the subscription profile.
- *bgp-peer*—Enter `bgp-peer` to assign BGP peer statistics sensor group to the subscription profile.
- *buffer*—Enter `buffer` to assign buffer statistics sensor group to the subscription profile.
- *device*—Enter `device` to assign device statistics sensor group to the subscription profile.
- *environment*—Enter `environmnet` to assign environment statistics sensor group to the subscription profile.
- *interface*—Enter `interface` to assign interface statistics sensor group to the subscription profile.
- *lag*—Enter `lag` to assign port-channel statistics sensor group to the subscription profile.
- *system*—Enter `system` to assign system statistics sensor group to the subscription profile.
- *oc-bfd*—Enter `oc-bfd` to assign Openconfig BFD statistics sensor group to the subscription profile.
- *oc-bgp*—Enter `oc-bgp` to assign Openconfig BGP statistics sensor group to the subscription profile.
- *oc-buffer*—Enter `oc-buffer` to assign Openconfig buffer statistics sensor group to the subscription profile.
- *oc-device*—Enter `oc-device` to assign Openconfig device statistics sensor group to the subscription profile.
- *oc-environment*—Enter `oc-environment` to assign Openconfig environment statistics sensor group to the subscription profile.
- *oc-interface*—Enter `oc-interface` to assign Openconfig interface statistics sensor group to the subscription profile.
- *oc-lacp*—Enter `oc-lacp` to assign Openconfig LACP statistics sensor group to the subscription profile.
- *oc-lag*—Enter `oc-lag` to assign Openconfig port-channel statistics sensor group to the subscription profile.
- *oc-lldp*—Enter `oc-lldp` to assign Openconfig LLDP statistics sensor group to the subscription profile.
- *oc-stp*—Enter `oc-stp` to assign Openconfig STP statistics sensor group to the subscription profile.

- *oc-system*—Enter `oc-system` to assign Openconfig system statistics sensor group to the subscription profile.
- *oc-vendor-ufd*—Enter oc-vendor-ufd to assign vendor specific ufd statistics sensor group to the subscription profile.
- *oc-vendor-vxlan*—Enter oc-vendor-vxlan to assign vendor specific vxlan statistics sensor group to the subscription profile.
- *oc-vlan*—Enter `oc-vlan` to assign Openconfig VLAN statistics sensor group to the subscription profile.
- *oc-vrrp*—Enter `oc-vrrp` to assign Openconfig VRRP statistics sensor group to the subscription profile.
- *sampling-interval*—Enter the interval in milliseconds used to collect data samples. The range is 0 to 4294967295. The default is 15000.

Default Not configured

Command mode SUBSCRIPTION-PROFILE

Usage information This command assigns the sensors from which data is collected for streaming telemetry to a subscription profile and specifies the sampling rate. To add sensor groups to the subscription profile, reenter the command. The `interface` sensor group supports only physical and port channel interfaces. The `no` version of this command deletes the sensor group from the subscription profile.

NOTE: The subscription profile should contain either OS10 sensor groups or openconfig sensor groups. Both sensor groups cannot co-exist in a single subscription profile.

Example

```
OS10(conf-telemetry)# subscription-profile sp01
OS10(conf-telemetry-sp-sp01)#
OS10(conf-telemetry-sp-sp01)# sensor-group
  bgp              BGP statistics sensor group

  bgp-peer         BGP Peer statistics sensor group
  buffer           QOS Buffer statistics sensor group
  device           Device statistics sensor group
  environment      Switch peripheral statistics sensor group
  interface        Interface statistics sensor group
  lag              Lag statistics sensor group
  system           System statistics sensor group
  oc-bfd           Openconfig BFD statistics sensor group
  oc-bgp           Openconfig BGP statistics sensor group
  oc-buffer        Openconfig QOS Interface statistics sensor group
  oc-device        Openconfig Device statistics sensor group
  oc-environment   Openconfig Switch peripheral statistics sensor group
  oc-interface     Openconfig Interface statistics sensor group
  oc-lacp          Openconfig LACP statistics sensor group
  oc-lag           Openconfig LAG statistics sensor group
  oc-lldp          Openconfig LLDP statistics sensor group
  oc-stp           Openconfig STP statistics sensor group
  oc-system        Openconfig System statistics sensor group
  oc-vendor-ufd    Vendor UFD statistics sensor group
  oc-vendor-vxlan  Vendor VxLAN statistics sensor group
  oc-vlan          Openconfig VLAN statistics sensor group
  oc-vrrp          Openconfig VRRP statistics sensor group
```

```
OS10(conf-telemetry)# subscription-profile subscription-1
OS10(conf-telemetry-sp-subscription-1)# sensor-group bgp 30000
OS10(conf-telemetry-sp-subscription-1)# sensor-group environment 415000
```

Supported releases 10.4.3.0 or later

encoding

Configures the encoding format used to stream telemetry data to a destination device.

Syntax `encoding format`

Parameters *format* — Enter the `gpb` (Google protocol buffer) encoding format in which data is streamed.

Default None

Command mode SUBSCRIPTION-PROFILE

Usage information The `no` version of the command removes the configured encoding format from a subscription profile.

Example

```
OS10(conf-telemetry)# subscription-profile subscription-1
OS10(conf-telemetry-sp-subscription-1)# encoding gpb
```

Supported releases 10.4.3.0 or later

transport

Configures the transport protocol used to stream telemetry data to a remote management device.

Syntax `transport protocol [no-tls]`

Parameters

- *protocol* — Enter the `gRPC` (Google remote procedure call) transport protocol used for telemetry sessions.
- `no-tls` — (Optional) Disable Transport Security Layer (TLS) certificate exchange with gRPC transport.

Default OS10 telemetry uses the gRPC protocol for transport with TLS certificates enabled.

Command mode SUBSCRIPTION-PROFILE

Usage information gRPC with TLS transport is enabled by default. To use gRPC over TLS transport, you must install a X.509v3 certificate on the switch. To disable TLS certificate exchange, use the `transport grpc no-tls` command.

NOTE: gRPC with TLS transport does not support host certificates. To use a CA certificate, see Request and install host certificates.

The `no` version of the command removes the configured transport protocol from a subscription profile.

Example

```
OS10(conf-telemetry)# subscription-profile subscription-1
OS10(conf-telemetry-sp-subscription-1)# transport grpc
```

Supported releases 10.4.3.0 or later

source-interface

Configures the source interface used to stream telemetry data to a destination device.

Syntax `source-interface interface`

Parameters *interface* — One of the following values:

- `ethernet node/slot/port[:subport]` — Enter a physical Ethernet interface.
- `loopback number` — Enter a Loopback interface, from 0 to 16383.
- `management 1/1/1` — Enter the management interface.
- `port-channel channel-id` — Enter a port-channel ID, from 1 to 28.
- `vlan vlan-id` — Enter a VLAN ID, from 1 to 4093.

Default None

Command mode SUBSCRIPTION-PROFILE

Usage information The telemetry agent uses the source interface to derive the VRF instance and IP address used to communicate with destination devices. For gRPC transport, source interface configuration is optional. The `no` version of the command removes the configured source interface from a subscription profile.

Example

```
OS10(conf-telemetry)# subscription-profile subscription-1
OS10(conf-telemetry-sp-subscription-1)# source-interface ethernet 1/1/1
```

Supported releases 10.4.3.0 or later

show telemetry

Displays the configured destination-group, sensor-group, and subscription profiles for streaming telemetry.

Syntax

```
show telemetry [destination-group [group-name] | sensor-group [group-name]
| subscription-profile [profile-name]]
```

Parameters

- `destination-group` — Display only destination groups or a specified group.
- `sensor-group` — Display only sensor groups or a specified group.
- `subscription-profile` — Display only subscription profiles or a specified profile.

Default Display all destination-group, sensor-group, and subscription configurations.

Command mode EXEC

Usage information Use the `show telemetry` command to verify the configured destination devices, sensor data sources, and subscription profiles.

Examples

```
OS10# show telemetry

RESTCONF API

RESTCONF is a representational state transfer (REST)-like protocol that uses HTTPS connections. Use the OS10 RESTCONF API to set up the configuration parameters on OS10 switches using JavaScript Object Notation (JSON)-structured messages. Use any programming language to create and send JSON messages. The examples in this chapter use curl.

The OS10 RESTCONF implementation complies with RFC 8040. You can use the RESTCONF API to configure and monitor an OS10 switch.

The OS10 RESTCONF API uses HTTP with the Transport Layer Security (TLS) protocol over port 443. OS10 supports HTTP/1.1 transport as defined in RFC 7230. The RESTCONF API uses pluggable authentication modules (PAM)-based authentication.

On supported platforms, the OS10 RESTCONF API is disabled by default. To configure and enable the RESTCONF API, see the *Configure the RESTCONF API* section.

To configure and monitor an OS10 switch, use REST API client tools, such as Postman or Swagger, to execute web requests. REST API requests, such as GET, PUT, POST, DELETE, and PATCH, operate on OS10 RESTCONF resources, such as:

Table 153. OS10 RESTCONF resources

Resource	Description	URL
Data	Configuration and operational data the RESTCONF API client accesses	/restconf/data
Operations	Container for the protocol-specific data model operations OS10 advertises	/restconf/operations

To browse OS10 RESTCONF API end-points and operations, see the OpenAPI JSON files available on the OS10 Enterprise Edition Software page at the Dell Technologies Support site. Download the JSON files and import them to REST API client tools; for example, Swagger or Postman, to generate code, documentation, and test cases. For information about the OpenAPI specification, go to https://swagger.io/docs/specification/about/.

Configure RESTCONF API

To use the RESTCONF API on an OS10 interface, you must enable the RESTCONF API service using the `rest api restconf` command. You can also configure HTTPS access, including:

- Hostname required in a Secure Sockets Layer (SSL) self-signed server certificate
- Timeout for the HTTPS connection
- Cipher suites for encrypting data in an HTTPS connection

After you enable the RESTCONF API, you can send HTTPS requests from a remote device.

1. (Optional) Configure the hostname required in the SSL self-signed server certificate in a RESTCONF HTTPS connection in CONFIGURATION mode, using a maximum of 30 alphanumeric characters. Enter the IP address or domain name of the OS10 switch. By default, the domain name of the OS10 switch is used as the hostname.

   ```
   rest https server-certificate name hostname
   ```

2. (Optional) Configure the timeout that a RESTCONF HTTPS session uses in CONFIGURATION mode, from 30 to 65535 seconds; default 30.

   ```
   rest https session timeout seconds
   ```

3. (Optional) Limit the ciphers that the switch uses in a RESTCONF HTTPS session to encrypt and decrypt data in CONFIGURATION mode. By default, all cipher suites installed on OS10 are supported. Separate multiple entries with a blank space. Valid cipher-suite values are:
   - dhe-rsa-with-aes-128-gcm-SHA256
   - dhe-rsa-with-aes-256-gcm-SHA384
   - ecdhe-rsa-with-aes-128-gcm-SHA256

- ecdhe-rsa-with-aes-256-gcm-SHA384

```
rest https cipher-suite
```

4. Enable RESTCONF API in CONFIGURATION mode.

```
rest api restconf
```

RESTCONF API configuration

```
OS10(config)# rest https server-certificate name OS10.dell.com
OS10(config)# rest https session timeout 60
OS10(config)# rest https cipher-suite dhe-rsa-with-aes-128-gcm-SHA256
dhe-rsa-with-aes-256-gcm-SHA384 ecdhe-rsa-with-aes-256-gcm-SHA384
OS10(config)# rest api restconf
```

RESTCONF request of CLI command

OS10 enables you to find equivalent RESTCONF requests of the CLI commands. The `cli mode rest-translate` command enables the CLI-RESTCONF translation mode in the current session.

when the CLI commands run in the translation mode, the console displays the equivalent RESTCONF requests (CURL commands). You can use the CURL command with minimal modifications to the following:

- $USER_NAME - username of any CLI user account
- $PASSWORD - password of the CLI user account
- $MGMT_IP - management IP address

The CURL commands for the CLI commands are appended to the file.

The `show cli mode` command displays the file name and path, which stores the translated RESTCONF requests. The file is available only during active CLI session. The show command also displays the current CLI mode (netconf/REST-TRANSLATE). When the session is in the translation mode, the prompt changes to REST-TRANSLATE-<hostname>.

```
REST-TRANSLATE-OS10# show cli mode
Current CLI session mode : rest-translate
Translated requests are available as supportbundle://restconf_requests_4105.txt
REST-TRANSLATE-OS10#
```

You can use the standard copy command to download the translated RESTCONF requests from OS10.

```
copy supportbundle://restconf_requests.txt <remote-file>
```

Use the CLI batch mode to translate multiple CLI commands to their equivalent RESTCONF requests.

```
batch <batch options>
```

The `no cli mode` command disables the RESTCONF translation mode and changes the CLI session into a normal mode (including the CLI prompt).

PATCH to POST operation

NOTE: If a PATCH request fails with an **unknown-resource-instance** error message when a PATCH request is made to a non-existing object, perform POST. To configure the PATCH:

- Change the operation from PATCH to POST .
- Change the URI as /restconf/data.

The following is an example of a PATCH and POST request:

PATCH request

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/
json" -u $USER_NAME:$PASSWORD -d '{"dell-diffserv-classifier:classifier-entry":
[{"name":"test","mtype":"qos","match":"match-any"}]}' -X PATCH https://$MGMT_IP/restconf/
data/dell-diffserv-classifier:classifier-entry=test
```

Error

```
{"ietf-restconf:errors":{"error":[{"error-type":"rpc","error-tag":"invalid-value","error-app-tag":"data-invalid","error-path":"/classifier-entry","error-message":"unknown resource instance","error-info":{"bad-value":"/restconf/data/dell-diffserv-classifier:classifier-entry=test","error-number":388}}]}}
```

POST request

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u $USER_NAME:$PASSWORD -d '{"dell-diffserv-classifier:classifier-entry":[{"name":"test","mtype":"qos","match":"match-any"}]}' -X POST https://$MGMT_IP/restconf/data
```

PATCH failure case

You can perform a POST request if a PATCH request fails with a **require-instance test failed** error message when a PATCH request is made to a non-existing object. To configure the PATCH, change the operation from PATCH to POST.

The following is an example of a PATCH and POST request:

PATCH request

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u $USER_NAME:$PASSWORD -d '{"dell-bgp:bgp-router":{"vrf":[{"vrf-name":"default","local-as-number":"200"}]}}' -X PATCH https://$MGMT_IP/restconf/data/dell-bgp:bgp-router
```

Error

```
{"ietf-restconf:errors": {"error": [{"error-type":"rpc","error-tag":"data-missing","error-app-tag":"instance-required","error-message":"require-instance test failed","error-info": {"error-number":350}}]}
```

POST request

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u $USER_NAME:$PASSWORD -d '{"dell-bgp:bgp-router":{"vrf":[{"vrf-name":"default","local-as-number":"200"}]}}' -X POST https://$MGMT_IP/restconf/data/dell-bgp:bgp-router
```

Configuration notes

The "request-instance test failed" indicates that there is no target resource.

To create the target resource (dell-qos:trust-map-dot1p-to-tc-entry), use the POST request:

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u $USER_NAME:$PASSWORD -X POST -d '{}' https://$MGMT_IP/restconf/data/dell-qos:trust-map-dot1p-to-tc-entry
```

To check if a target resource is available, use the GET request .

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u $USER_NAME:$PASSWORD -X GET https://$MGMT_IP/restconf/data/dell-qos:trust-map-dot1p-to-tc-entry
```

Obtain RESTCONF API documentation from OS10

OAS files `(oas.tgz)` are available in the `support-bundle` directory in OS10. You can download the OAS files using the standard copy command.

```
copy supportbundle://oas.tgz <remote-file>
```

To view the JSON files, decompress and untar the `oas.tgz` file.

```
tar -zxvf oas.tgz
```

All the OAS JSON files are extracted inside the `html` folder. You can import the OAS files into RESTCONF tools (Swagger / Postman) to use it.

Translated RESTCONF requests example

Config command

```
 OS10# cli mode rest-translate
Commands executed in this mode will not alter current system state.
Do you want to proceed? [confirm yes/no]:yes
REST-TRANSLATE-OS10# configure terminal
```

```
CLI command:
configure terminal
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -u $USER_NAME:$PASSWORD -X GET https://$MGMT_IP/
restconf/data/dell-mgmt-cm:cms
```

```
REST-TRANSLATE-OS10(config)# interface ethernet 1/1/1
CLI command:
interface ethernet 1/1/1
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/
json" -u $USER_NAME:$PASSWORD -d '{"ietf-interfaces:interfaces":{"interface":
[{"name":"ethernet1/1/1","type":"iana-if-type:ethernetCsmacd"}]}}' -X PATCH https://
$MGMT_IP/restconf/data/ietf-interfaces:interfaces
```

```
REST-TRANSLATE-OS10(conf-if-eth1/1/1)# description "ethernet 1/1/1"
```

CLI command:

```
description "ethernet 1/1/1"
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/
json" -u $USER_NAME:$PASSWORD -d '{"ietf-interfaces:interfaces":{"interface":
[{"name":"ethernet1/1/1","description":"ethernet 1/1/1"}]}}' -X PATCH https://$MGMT_IP/
restconf/data/ietf-interfaces:interfaces
```

```
REST-TRANSLATE-OS10(conf-if-eth1/1/1)# no description
```

CLI command:

```
no description
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u
$USER_NAME:$PASSWORD -X DELETE https://$MGMT_IP/restconf/data/ietf-interfaces:interfaces/
interface=ethernet1%2F1%2F1/description

curl -i -k -H "Accept: application/json" -H "Content-Type:
application/json" -u $USER_NAME:$PASSWORD -d '{"ietf-interfaces:interfaces":
{"interface":[{"name":"ethernet1/1/1"}]}}' -X PATCH https://$MGMT_IP/restconf/data/ietf-
interfaces:interfaces
```

```
REST-TRANSLATE-OS10(conf-if-eth1/1/1)# exit
```

Show command

```
REST-TRANSLATE-OS10# show version
```

CLI command:

```
show version
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -u $USER_NAME:$PASSWORD -X GET https://$MGMT_IP/
restconf/data/dell-system-software:system-sw-state/sw-version

curl -i -k -H "Accept: application/json" -u $USER_NAME:$PASSWORD -X GET https://$MGMT_IP/
restconf/data/dell-system:system-state/system-status
```

Action/RPC based command

```
 OS10# cli mode rest-translate
Commands executed in this mode will not alter current system state.
Do you want to proceed? [confirm yes/no]:yes
REST-TRANSLATE-OS10# configure terminal
```

CLI command:

```
ztd cancel
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json"
-u $USER_NAME:$PASSWORD -d '{"input":{"action":"cancel"}}' -X POST https://$MGMT_IP/
restconf/operations/dell-ztd:ztd-action
```

```
REST-TRANSLATE-OS10#
```

CLI commands generate Multiple RESTCONF requests:

- If the command updates multiple objects (within same module or across modules), the command translates into multiple RESTCONF requests. It is because the target resource in the URI can only be a single object.
- If the command performs multiple operations in a single request (merge and delete on leafs), the CLI first generates a DELETE request and then PATCH with the remaining objects.

Certain CLI commands require user confirmation (yes or no). Enter **Yes** to view the RESTCONF translation for the commands.

Some CLI commands generate multiple RESTCONF requests. Use certain requests according to the Notes information displayed along with the translation. For example, `reload` command generates request for both save running to start up config and reload operation. The Notes information provides meaningful messages to the user to use the translated RESTCONF messages.

```
 OS10# cli mode rest-translate
Commands executed in this mode will not alter current system state.
Do you want to proceed? [confirm yes/no]:no
OS10# reload
```

CLI command:

```
reload
```

Restconf request(s):

```
curl -i -k -H"Accept: application/json"-H"Content-Type: application/json"-u $USER_NAME:
$PASSWORD -d'{"dell-ztd:input":{"action":"disable"}}'-X POST https://$MGMT_IP/restconf/
operations/dell-ztd:ztd-action

curl -i -k -H"Accept: application/json"-H"Content-Type: application/json"-u $USER_NAME:
$PASSWORD -d'{"input":{"target":"startup", "source":"running"}}'-X POST https://$MGMT_IP/
restconf/operations/copy-config

curl -i -k -H"Accept: application/json"-H"Content-Type: application/json"-u $USER_NAME:
$PASSWORD -d'{"dell-node-management:input":{"reboot":"cold","reboot-reason":"CLI
reload"}}'-X POST https://$MGMT_IP/restconf/operations/dell-node-management:reload-system
```

NOTE: Before triggering reload, disable ZTD and save running to start up.

The following is another example with Notes information for the requests. The last RESTCONF request is applicable on certain available conditions.

```
 OS10# cli mode rest-translate
Commands executed in this mode will not alter current system state.
```

```
Do you want to proceed? [confirm yes/no]:yes
REST-TRANSLATE-OS10# configure terminal
```

CLI command:

```
configure terminal
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -u $USER_NAME:$PASSWORD -X GET https://$MGMT_IP/
restconf/data/dell-mgmt-cm:cms
```

```
REST-TRANSLATE-OS10(config)# interface ethernet 1/1/1
```

CLI command:

```
interface ethernet 1/1/1
```

Restconf request(s):

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/
json" -u $USER_NAME:$PASSWORD -d '{"ietf-interfaces:interfaces":{"interface":
[{"name":"ethernet1/1/1","type":"iana-if-type:ethernetCsmacd"}]}}' -X PATCH https://
$MGMT_IP/restconf/data/ietf-interfaces:interfaces
```

```
REST-TRANSLATE-OS10(conf-if)# no ip ospf 1 area 100"
```

CLI command:

```
no ip ospf 1 area 100
```

Restconf request(s):

```
curl -i -k -H"Accept: application/json"-H"Content-Type: application/json"-u $USER_NAME:
$PASSWORD -X DELETE https://$MGMT_IP/restconf/data/ietf-interfaces:interfaces/interface/
dell-ospf-v2:ospf-info/dell-ospf-v2:proc-id

curl -i -k -H"Accept: application/json"-H"Content-Type: application/json"-u $USER_NAME:
$PASSWORD -X DELETE https://$MGMT_IP/restconf/data/ietf-interfaces:interfaces/interface/
dell-ospf-v2:ospf-info/dell-ospf-v2:area-id

curl -i -k -H"Accept: application/json"-H"Content-Type: application/json"-u $USER_NAME:
$PASSWORD -X DELETE https://$MGMT_IP/restconf/data/ietf-interfaces:interfaces/interface/
dell-ospf-v2:ospf-info
```

NOTE: Container removal is valid only when it is empty.

REST Token-Based Authentication

The REST Token-Based Authentication feature uses token-based authentication. Every OS10 REST API call requires basic authentication over HTTPs (with HTTP header `'Authorization: Basic <credentials>'`). Instead a token is obtained first by calling the Login REST API using the basic authentication. You can use this token in further REST requests using HTTP Bearer Authentication (with HTTP header 'Authorization: Bearer <token>').

NOTE: Token-based authentication is optional, and the user can use the basic authentication for each REST API request.

Sample response from login API:

```
{
    "access_token": <access token>,
    "token_type": "bearer",
    "refresh_token": <refresh token>
}
```

Access token is valid for the configured amount of time, from the time token is issued.

Refresh can be done only for the configured number of times. After that new set of tokens needs to be acquired using basic authentication.

Refresh token is valid for the configured validity time of access token that is multiplied by the configured refresh limit.

REST Token-Based Authentication Limitations

The following limitations are applicable in 10.5.1:

- REST token authentication is disabled when FIPS mode is enabled.

Acquire new token

You can acquire a new token by calling the Login REST API. A successful Login API call using the basic authentication generates a new set of token.

```
$ curl -X GET -k -u admin:admin -H "Content-Type: application/json" https://$TARGET/
login
{
    "access_token": "abc.123.xyz",
    "token_type": "bearer",
    "refresh_token": "efg.456.uvw"
}
```

On successful login, JSON data returns 'access_token' and 'refresh_token' as keys. You can parse the data and save the token values for subsequent requests.

```
$ export ACCESS_TOKEN="abc.123.xyz"
$ export REFRESH_TOKEN="efg.456.uvw"
```

The following is an example of a RS256 signed token:

```
"eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCJ9.eyJ1c2VybmFtZSI6ImFkbWluIiwiZXhwIjoxNTUzNjcyMjcxfQ.
nDydDFFjLju6jYuR9waxmvVZ6iVHoJZSrqey2p3S_0B_fD5U2GU8tOjTr3paJ3Wvs1a3TQpKQ_xAp-9zxBwUoJFTC
2qjKH6uMgTgfWxltrfcb3_9JF1SIsyGHaT-oUzcdCmC47TlXRIRLzcZ9w4Q5vFqxKYv1sRA47T9sSnAZac"
```

Access token

You can use the HTTP Bearer Authentication to pass the access token to subsequent REST API requests. You can do this using the HTTP Authorization header with syntax 'Authorization: Bearer <TOKEN>' .

The following is the output of the command:

```
$ curl -X GET -k -H "Authorization: Bearer $ACCESS_TOKEN" -H "Content-
Type: application/json" https://$TARGET/restconf/data/dell-system:system/hostname {"dell-
system:hostname":"OS10"}
```

Refresh token

You can use the HTTP Bearer Authentication with the same Login REST API to acquire a new access token. Place the same refresh token available in the authorization header in the 'refresh_token' key of output data.

```
$ curl -X GET -k -H "Authorization: Bearer $REFRESH_TOKEN" -H "Content-Type: application/
json" https://$TARGET/login
{
    "access_token": "ijk.978.rst",
    "token_type": "bearer",
    "refresh_token": "efg.456.uvw"
}
```

The validity of the refresh token is equal to the validity of the access token multiplied by the refresh limit.

CLI commands for RESTCONF API

rest api restconf

Enables the RESTCONF API service on the switch.

Syntax	`rest api restconf`
Parameters	None
Default	RESTCONF API is disabled.
Command Mode	CONFIGURATION
Usage Information	• After you enable the RESTCONF API, you can send curl commands in HTTPS requests from a remote device. • The `no` version of the command disables the RESTCONF API.
Example	`OS10(config)# rest api restconf`
Supported Releases	10.4.1.0 or later

rest https cipher-suite

Limits the ciphers to encrypt and decrypt REST HTTPS data.

Syntax	`rest https cipher-suite` *`cipher-list`*
Parameters	*`cipher-list`* — Enter the ciphers supported in a REST API HTTPS session. Separate multiple entries with a blank space. Valid cipher suites are: • dhe-rsa-with-aes-128-gcm-SHA256 • dhe-rsa-with-aes-256-gcm-SHA384 • ecdhe-rsa-with-aes-128-gcm-SHA256 • ecdhe-rsa-with-aes-256-gcm-SHA384
Default	All cipher suites installed with OS10 are supported.
Command Mode	CONFIGURATION
Usage Information	• Use the `rest https cipher-suite` command to restrict the ciphers that a RESTCONF HTTPS session uses. • The `no` version of the command removes the cipher list and restores the default value.
Example	`OS10(config)# rest https cipher-suite dhe-rsa-with-aes-128-gcm-SHA256 dhe-rsa-with-aes-256-gcm-SHA384 ecdhe-rsa-with-aes-256-gcm-SHA384`
Supported Releases	10.4.1.0 or later

rest https server-certificate

Creates the SSL self-signed server certificate a RESTCONF HTTPS connection uses.

Syntax	`rest https server-certificate name` *`hostname`*
Parameters	`name` *`hostname`* — Enter the IP address or domain name of the OS10 switch.
Default	The OS10 switch domain name is used as the *`hostname`*.
Command Mode	CONFIGURATION

Usage Information	The `no` version of the command removes the host name from the SSL server certificate.
Example	`OS10(config)# rest https server-certificate name 10.10.10.10`
Supported Releases	10.4.1.0 or later

rest https session timeout

Configures the timeout a RESTCONF HTTPS connection uses.

Syntax	`rest https session timeout` *`seconds`*
Parameters	*`seconds`* — Enter the switch timeout for an HTTPS request from a RESTCONF client, from 30 to 65535 seconds.
Default	30 seconds
Command Mode	CONFIGURATION
Usage Information	• If no HTTPS request is received within the configured time, the switch closes the RESTCONF HTTPS session. • The `no` version of the command removes the configured RESTCONF HTTPS session timeout.
Example	`OS10(config)# rest https session timeout 60`
Supported Releases	10.4.1.0 or later

cli mode rest-translate

Enable RESTCONF translation mode in CLI session.

Syntax	`cli mode rest-translate`
Parameters	None
Default	None
Command Mode	Exec
Usage Information	This command enables translation of CLI command into equivalent RESTCONF requests in the current session.
Example	`OS10# cli mode rest-translate`
Supported Releases	10.5.1.0 or later

no cli mode

Disable RESTCONF translation mode in CLI session.

Syntax	`no cli mode`
Parameters	None
Default	None
Command Mode	Exec

Usage Information	This command disables translation of CLI command into equivalent RESTCONF requests in the current session.
Example	`REST-TRANSLATE-OS10# no cli mode`
Supported Releases	10.5.1.0 or later

show cli mode

Display the current CLI session mode.

Syntax	`show cli mode`
Parameters	None
Default	None
Command Mode	Exec
Usage Information	This command displays the active mode of the current CLI session and also the file name where the RESTCONF requests are stored.

Example	`OS10# show cli mode`
	`Current CLI session mode : rest-translate`
	`Translated requests are available as supportbundle:// restconf_requests_1132.txt`
	`OS10#`

Supported Releases	10.5.1.0 or later

rest authentication token validity

Configures the validity duration for the tokens.

Syntax	`rest authentication token validity` *`minutes`*
Parameters	*`minutes`* — Enter the validity duration (0 to 1200 minutes) for the REST Access Token. 0 indicates that the token has no expiry.
Default	120 minutes
Command Mode	CONFIGURATION
Usage Information	This command updates the validity duration for the REST Access Tokens. The `no` version of the command resets the validity duration to the default value.
Example	`OS10(config)# rest authentication token validity 10` `OS10(config)# rest authentication token validity 0`
Supported Releases	10.4.1.0 or later

rest authentication token max-refresh

Configures the maximum refresh time.

Syntax	`rest authentication token max-refresh count`
Parameters	*count* — Enter the refresh count limit, from 0 to 10. The count indicates the maximum number of times the tokens refresh. If you do not want to refresh, enter 0.
Default	3
Command Mode	CONFIGURATION
Usage Information	This command updates the maximum number of times the tokens refresh. The `no` version of the command resets the count to the default value.
Example	`OS10(config)# rest authentication token max-refresh 10` `OS10(config)# rest authentication token max-refresh 0`
Supported Releases	10.4.1.0 or later

rest authentication token algorithm

Configures the token signing algorithm.

Syntax	`rest authentication token algorithm[HS256 | RS256 | ES256]`
Parameters	*hs256, rs256, es256* — Enter the algorithm standard to be used to sign the tokens.
Default	RS256
Command Mode	CONFIGURATION
Usage Information	This command updates the token signing algorithm. The `no` version of the command resets to the default value.
Example	`OS10(config)# rest authentication token algorithm es256` `OS10(config)# rest authentication token algorithm rs256`
Supported Releases	10.4.1.0 or later

RESTCONF API tasks

Using the RESTCONF API, you can provision OS10 switches using HTTPS requests. The examples in this section show how to access the OS10 RESTCONF API using `curl` commands. curl is a Linux shell command that generates HTTPS requests and is executed on an external server.

curl Commands

curl command options include:

- `-X` specifies the HTTPS request type; for example, `POST` , `PATCH`, or `GET`.

- `-u` specifies the user name and password to use for server authentication.
- `-k` specifies a text file to read curl arguments from. The command line arguments found in the text file will be used as if they were provided on the command line. Use the IP address or URL of the OS10 switch when you access the OS10 RESTCONF API from a remote orchestration system.
- `-H` specifies an extra header to include in the request when sending HTTPS to a server. You can enter multiple extra headers.
- `-d` sends the specified data in an HTTPS request.

In curl commands, use `%2F` to represent a backslash (`/`); for example, enter `ethernet1/2/3` as `ethernet1%2F1%2F3`.

Usage Information

Consider the following when accessing OS10 RESTCONF API using `curl` commands:

- Dell Technologies recommends using a specific URI of the target resource for GET queries in a scaled system. For example, `curl -X GET -k -u admin:admin -H "accept:application/json" https://$TARGET/restconf/data/interfaces/interface/port-channel10`

  OS10 does not support REST queries on the root resource of the RESTCONF datastore. For example, the GET query, `curl -X GET -k -u admin:admin https://$TARGET/restconf/data` returns an error.

- When a RESTCONF query is in progress, you cannot configure any CLI commands until a RESTCONF query is complete.
- Dell Technologies recommends using `POST` request instead of `PUT`, to replace the target data resources.

View XML structure of CLI commands

To use the RESTCONF API to configure and monitor an OS10 switch, create an HTTPS request with data parameters in JSON format. The JSON data parameters correspond to the same parameters in the XML structure of an OS10 command.

To display the parameter values in the XML code of an OS10 command as reference, use the `debug cli netconf` command in EXEC mode. In CONFIGURATION mode, use the `do debug cli netconf` command.

This command enables a CLI-to-XML display. At the prompt, enter the OS10 command of the XML request and the reply you need. To exit the CLI-to-XML display, use the `no debug cli netconf` command.

Locate the XML parameters values for the same JSON data arguments. For example, to configure VLAN 20 on an OS10 switch, enter the RESTCONF endpoint and JSON contents in the curl command. Note how the JSON `type` and `name` parameters are displayed in the XML structure of the `interface vlan` command.

- RESTCONF endpoint: `/restconf/data/interfaces`
- JSON data content:

```
{
    "interface": [{
        "type": "iana-if-type:l2vlan",
        "enabled": true,
        "description": "vlan20",
        "name": "vlan20"
    }]
}
```

- curl command:

```
curl -X POST -u admin:admin -k "https://10.11.86.113/restconf/data/interfaces"
-H "accept: application/json" -H "Content-Type: application/json"
-d '{ "interface": [{ "type": "iana-if-type:l2vlan", "enabled": true,
"description":"vlan20",  "name":"vlan20"}]}'
```

To display values for the `type` and `name` parameters in the curl command, display the XML structure of the `interface vlan 20` configuration command:

```
OS10(config)# do debug cli netconf
OS10(config)# interface vlan 10

Request:
<?xml version="1.0" encoding="UTF-8"?>
```

```
<rpc xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <edit-config>
    <target>
      <candidate/>
    </target>
    <default-operation>merge</default-operation>
    <error-option>stop-on-error</error-option>
    <test-option>set</test-option>
    <config>
      <interfaces xmlns="urn:ietf:params:xml:ns:yang:ietf-
interfaces" xmlns:ianaift="urn:ietf:params:xml:ns:yang:iana-if-type" xmlns:dell-
if="http://www.dellemc.com/networking/os10/dell-interface" xmlns:dell-eth="http://

networking/os10/dell-lag">
        <interface>
          <type>ianaift:l2vlan</type>
     <name>vlan10</name>
        </interface>
      </interfaces>
    </config>
  </edit-config>
</rpc>

Reply:
<?xml version="1.0" encoding="UTF-8"?>
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0" message-id="10">
  <ok/>
</rpc-reply>
OS10(config)# do no debug cli netconf
```

RESTCONF API Examples

Some common RESTCONF API operations include configuring system hostname, and interfaces such as loopback interface. The examples in this section use `curl` commands to send the HTTPS request.

System

Configure system hostname

RESTCONF endpoint	`/restconf/data/dell-system:system/hostname`
JSON content	`{ "hostname":"MyHost" }`
Parameters	• `hostname` *`string`* —Enter the hostname of the system. The default is OS10.
Example	`curl -X PATCH -k -u admin:admin -H "Content-Type: application/json" https://10.11.86.113/restconf/data/dell-system:system/hostname -d '{"hostname":"MyHost"}'`

Interface

Configure a loopback interface

RESTCONF endpoint	`/restconf/data/interfaces`

JSON content

```
{
  "interface": [{
    "type": "iana-if-type:softwareLoopback",
    "enabled": true,
    "description":"loopback interface",
    "name":"loopback1"}]
}
```

Parameters

- `type` *`string`* —Enter `iana-if-type:softwareLoopback` for a loopback interface.
- `enabled` *`bool`*— Enter `true` to enable the interface; enter `false` to disable.
- `description` *`string`* — Enter a text string to describe the interface. A maximum of 80 alphanumeric characters.
- `name` *`string`* — Enter `loopback` *`loopback-id`* of the interface, `loopback-id` is from 0 to 16383.

Example

```
curl -X POST  -k -u admin:admin "https://10.11.86.113/restconf/data/
interfaces"
-H "accept: application/json" -H "Content-Type: application/json"
-d '{"interface": [{"type": "iana-if-type:softwareLoopback", "enabled":
true,
"description":"loopback interface", "name":"loopback1"}]}'
```

Configure a loopback interface IP address

RESTCONF endpoint

```
/restconf/data/interfaces/interface/loopback1
```

JSON content

```
{
  "dell-ip:ipv4":{
    "address": {
      "primary-addr":"6.6.6.6/24"
    }
  }
}
```

Parameters

- `primary-addr` *`ip-address/prefix-length`* — Enter the loopback IP address in dotted-decimal A.B.C.D/x format.

Example

```
curl -X POST  -k -u admin:admin "https://10.11.86.113/restconf/data/
interfaces/interface/loopback1"
-H "accept: application/json" -H "Content-Type: application/json"
-d '{"dell-ip:ipv4":{"address": {"primary-addr":"6.6.6.6/24"}}}'
```

Troubleshoot Dell SmartFabric OS10

Critical workloads and applications require constant availability. Dell Technologies offers tools to help you monitor and troubleshoot problems before they happen.

Packet and flow capture	Manages packet and traffic
Metrics measurement	Pings, round-trip times, jitter, response times, and so on
Analysis and reporting	Metrics and packet capturing
Alerting	Triggers problem reporting
Logging	Captures system history
Performance monitoring	Establishes baselines and defines triggers for detecting performance problems
Mapping and representation	Defines device locations and status

Dell Technologies recommends the following best practices:

- View traffic end-to-end from the application's view point.
- Deploy network management infrastructure rapidly, where needed, when needed, and on-demand.
- Extend analysis beyond the network and watch traffic to and from your host.
- Focus on real-time assessment and use trend analysis to backup your conclusions.
- Emphasize *effective* over *absolute* — leverage management solutions that resolve your most common, most expensive problem quickly.
- Address networking performance issues before you focus on the application performance.
- Use methodologies and technologies that fit your network and needs.
- Continuously monitor performance and availability as a baseline for system performance and system up time to quickly separate network issues from application issues.

Diagnostic tools

This section contains information about advanced software and hardware commands to debug, monitor, and troubleshoot network devices.

NOTE: Output examples are for reference purposes only and may not apply to your specific system.

View inventory

Use the `show inventory` command to view the module IDs of the device.

```
OS10# show inventory

LED settings

Beacon LEDs identify the location of ports and system status with blinking or solid LEDs.

NOTE: This feature is not supported on the Z9332F-ON platform.

Change current state of the location LED of the system or interface using the following commands:

```
location-led system {node-id | node-id/unit-id} {on | off}
```

```
location-led interface ethernet {chassis/slot/port[:subport]} {on | off}
```

Change the state of system location LED

```
OS10# location-led system 1 on
OS10# location-led system 1 off
```

Change the state of interface location LED

```
OS10# location-led interface ethernet 1/1/1 on
OS10# location-led interface ethernet 1/1/1 off
```

NOTE: This feature is not supported on the N3248-TE platform although the CLI would be available.

Packet analysis

Use the Linux `tcpdump` command to analyze network packets. Use filters to limit packet collection and output. You must be logged into the Linux shell to use this command. For more information, see Log into OS10 Device.

Use the Linux `tcpdump` command without parameters to view packets that flow through all interfaces. To write captured packets to a file, use the `-w` parameter. To read the captured file output offline, you can use open source software packages such as wireshark.

Capture packets from Ethernet interface

```
$ tcpdump -i e101-003-0
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on e101-003-0, link-type EN10MB (Ethernet), capture size 262144 bytes
01:39:22.457185 IP 3.3.3.1 > 3.3.3.4: ICMP echo request, id 5320, seq 26, length 64
01:39:22.457281 IP 3.3.3.1 > 3.3.3.4: ICMP echo reply, id 5320, seq 26, length 64
```

Capture two packets from interface

```
$ tcpdump -c 2 -i e101-003-0
listening on e101-003-0, link-type EN10MB (Ethernet), capture size 96 bytes
01:39:22.457185 IP 3.3.3.1 > 3.3.3.4: ICMP echo request, id 5320, seq 26, length 64
01:39:22.457281 IP 3.3.3.1 > 3.3.3.4: ICMP echo reply, id 5320, seq 26, length 64
2 packets captured
13 packets received by filter
0 packets dropped by kernel
```

Capture packets and write to file

```
$ tcpdump -w 06102016.pcap -i e101-003-0
listening on e101-003-0, link-type EN10MB (Ethernet), capture size 96 bytes
32 packets captured
32 packets received by filter
0 packets dropped by kernel
```

Port adapters and modules

Use the `show diag` command to view diagnostics information for OS10 port adapters and hardware modules.

View diagnostic hardware information

```
OS10# show diag

```

Test network connectivity

Use the `ping` and `traceroute` commands to test network connectivity. When you ping an IP address, you send packets to a destination and wait for a response. If there is no response, the destination is not active. The `ping` command is useful during configuration if you have problems connecting to a hostname or IP address.

When you execute a *traceroute*, the output shows the path a packet takes from your device to the destination IP address. It also lists all intermediate hops (routers) that the packet traverses to reach its destination, including the total number of hops traversed.

Check IPv4 connectivity

```
OS10# ping 172.31.1.255

Type Ctrl-C to abort.

Sending 5, 100-byte ICMP Echos to 172.31.1.255, timeout is 2 seconds:
Reply to request 1 from 172.31.1.208 0 ms
Reply to request 1 from 172.31.1.216 0 ms
Reply to request 1 from 172.31.1.205 16 ms
::
Reply to request 5 from 172.31.1.209 0 ms
Reply to request 5 from 172.31.1.66 0 ms
Reply to request 5 from 172.31.1.87 0 ms
```

Check IPv6 connectivity

```
OS10# ping6 20::1
PING 20::1(20::1) 56 data bytes
64 bytes from 20::1: icmp_seq=1 ttl=64 time=2.07 ms
64 bytes from 20::1: icmp_seq=2 ttl=64 time=2.21 ms
64 bytes from 20::1: icmp_seq=3 ttl=64 time=2.37 ms
64 bytes from 20::1: icmp_seq=4 ttl=64 time=2.10 ms
^C
--- 20::1 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3005ms
rtt min/avg/max/mdev = 2.078/2.194/2.379/0.127 ms
```

Trace IPv4 network route

```
OS10# traceroute www.Dell Networking.com

Translating "www.Dell Networking.com"...domain server (10.11.0.1) [OK]
Type Ctrl-C to abort.

------------------------------------------------
Tracing the route to www.Dell Networking.com (10.11.84.18),
30 hops max, 40 byte packets
------------------------------------------------

TTL Hostname      Probe1     Probe2     Probe3

```

Faulty media

This section describes the behavior of pluggable media that OS10 cannot read because of some hardware or mechanical fault.

Detect faulty media

If the pluggable media that you insert into an interface is faulty, you will see a message similar to the following one on the console:

```
Nov 09 15:03:23 OS10 dn_alm[997]: Node.1-Unit.1:PRI [event],
Dell EMC (OS10) %EQM_MEDIA_PRESENT: Media inserted . Media FAULT MEDIA
in slot:1 port:47 serial number: is not qualified
```

Use the `show inventory media` command to check for faulty media. This command lists all the optical modules installed in switch ports. Optical modules that are listed as `FAULT MEDIA` cannot be read and the `show` commands do not display all the information for such modules.

```
OS10# show inventory media
--------------------------------------------------------------------------
System Inventory Media
--------------------------------------------------------------------------
Node/Slot/Port Category Media                  Serial         Dell EMC
                                               Number         Qualified

1/1/7          QSFP+    QSFP+ 40GBASE-CR4-5.0M APF121800248D4 true
1/1/8          QSFP+    QSFP+ 40GBASE-CR4-5.0M APF121800248D4 true
1/1/9          Not Present
1/1/10         UNKNOWN  FAULT MEDIA                           false
1/1/11         UNKNOWN  FAULT MEDIA                           false
1/1/12         UNKNOWN  FAULT MEDIA                           false
--------------------------------------------------------------------------
```

Troubleshoot faulty media

NOTE: For normal operations, you must replace any faulty media inserted in the switch.

1. Check whether the optical module is inserted properly by performing an online insertion and removal (OIR) on the faulty media.
2. If the issue persists, use the Return Material Authorization (RMA) process and replace the faulty media.

View solution ID

Dell networking switches that are part of a larger solution require a solution identifier (ID).

To view the solution ID including the product base, product serial number, and product part number, use the following `show` commands:

Diagnostic commands

location-led interface

Changes the location LED of the interface.

Syntax `location-led interface ethernet {chassis/slot/port[:subport]} {on | off}`

Parameters
- *chassis/slot/port[:subport]* — Enter the ethernet interface number.
- `on | off` — Set the interface LED to be on or off.

Default Not configured

Command Mode EXEC

Usage Information Use this command to change the location LED for the specified interface.

NOTE: This command is not supported on the N3248-TE platform.

Example

```
OS10# location-led interface ethernet 1/1/1 on
OS10# location-led interface ethernet 1/1/1 off
```

Supported Releases 10.3.0E or later

location-led system

Changes the location LED of the system.

Syntax `location-led system {node-id | node-id/unit-id} {on | off}`

Parameters
- *node-id | node-id/unit-id* — Enter the system ID.
- `on | off` — Set the system LED to be on or off.

Default Not configured

Command Mode EXEC

Usage Information Use this command to change the location LED for the specified system ID.

Example

```
OS10# location-led system 1 on
OS10# location-led system 1 off
```

Supported Releases 10.3.0E or later

show boot

Displays boot-related information.

Syntax `show boot [detail]`

Parameters `detail` — (Optional) Enter to display detailed information.

Default Not configured

Command Mode EXEC

Usage Information Use the `boot system` command to set the boot image for the next reboot.

Example

```
OS10# show boot
Current system image information:
==================================
Type      Boot Type   Active        Standby       Next-Boot
------------------------------------------------------------

  ---
Node-id 1 Flash Boot  [A] 10.5.0.4  [B] 10.5.1.0  [B] standby
```

Example (Detail)

```
OS10# show boot detail
Current system image information detail:
=========================================
Type:                     Node-id 1
Boot Type:                Flash Boot
Active Partition:         A
Active SW Version:        10.5.0.4
Active SW Build Version:  10.5.0.4.650
Active Kernel Version:    Linux 4.9.189
Active Build Date/Time:   2020-02-11T11:13:08Z
Standby Partition:        B
Standby SW Version:       10.5.1.0
Standby SW Build Version: 10.5.1.0.123
Standby Build Date/Time:  2020-02-12T02:34:02Z
Next-Boot:                standby[B]
```

Supported Releases 10.2.0E or later

show diag

Displays diagnostic information for port adapters and modules.

Syntax `show diag`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show diag

Supported Releases 10.2.0E or later

show environment

Displays information about environmental system components, such as temperature, fan, and voltage.

Syntax `show environment`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show environment

Unit    State              Temperature
-------------------------------------
1       up                 43

Thermal sensors
Unit   Sensor-Id        Sensor-name                                  Temperature
-------------------------------------------------------------------------------
1       1           CPU On-Board temp sensor                           32

1       4           System Inlet Ambient-2 temp sensor               25
1       5           System Inlet Ambient-3 temp sensor               26
1       6           Switch board 2 temp sensor                       31
1       7           Switch board 3 temp sensor                       41
1       8           NPU temp sensor                                  43
```

Supported Releases 10.2.0E or later

show hash-algorithm

Displays hash algorithm information.

Syntax `show hash-algorithm`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show hash-algorithm
   LagAlgo - CRC EcmpAlgo - CRC
```

Supported Releases 10.2.0E or later

show inventory

Displays system inventory information.

Syntax `show inventory`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show inventory

```

Supported Releases 10.2.0E or later

show processes

View process CPU utilization information.

Syntax `show processes node-id` *node-id-number* `[pid` *process-id*`]`

Parameters

- *node-id-number* — Enter the Node ID number as 1.
- *process-id* — (Optional) Enter the process ID number, from 1 to 2147483647.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show processes node-id 1

Supported Releases 10.3.0E or later

show system

Displays system information.

Syntax `show system [brief | node-id]`

Parameters

- `brief`—View an abbreviated list of the system information.
- `node-id`—View the node ID number.

Default Not configured

Command Mode EXEC

Usage Information Starting from Release 10.5.4.0, this command displays the following additional information:

- Firmware details of the switch such as ONIE version, ONIE firmware updater version, SSD version, DIAG OS vers version.
- Input power, average input power, and average power start time per power supply unit (PSU).

Example

```
OS10# show system

Node Id              : 1
MAC                  : 54:0f:64:bd:00:00
Number of MACs       : 384
Up Time              : 00:03:58
DiagOS               : 3.00.3.41-2

- Unit 1 -
Status                     : up

```

Supported Releases 10.2.0E or later

traceroute

Displays the routes that packets take to travel to an IP address.

Syntax

```
traceroute [vrf {management | vrf-name}] host [-46dFITnreAUDV] [-f
first_ttl] [-g gate,...] [-i device] [-m max_ttl] [-N squeries] [-p port]
[-t tos] [-l flow_label] [-w waittime] [-q nqueries] [-s src_addr] [-z
sendwait] [--fwmark=num] host [packetlen]
```

Parameters

- `vrf management`— (Optional) Traces the route to an IP address in the management VRF instance.
- `vrf vrf-name` — (Optional) Traces the route to an IP address in the specified VRF instance.
- *host* — Enter the host to trace packets from.
- `-i interface` — (Optional) Enter the IP address of the interface through which traceroute sends packets. By default, the interface is selected according to the routing table.
- `-m max_ttl` — (Optional) Enter the maximum number of hops for the maximum time-to-live value that traceroute probes. The default is 30.
- `-p port` — (Optional) Enter a destination port:

- For UDP tracing, enter the destination port base that traceroute uses. The destination port number is incremented by each probe.
- For ICMP tracing, enter the initial ICMP sequence value, incremented by each probe.
- For TCP tracing, enter the constant destination port to connect.
- `-P protocol` — (Optional) Use a raw packet of the specified protocol for traceroute. The default protocol is 253 (RFC 3692).
- `-s source_address` — (Optional) Enter an alternative source address of one of the interfaces. By default, the address of the outgoing interface is used.
- `-q nqueries` — (Optional) Enter the number of probe packets per hop. The default is 3.
- `-N squeries` — (Optional) Enter the number of probe packets sent out simultaneously to accelerate traceroute. The default is 16.
- `-t tos` — (Optional) For IPv4, enter the type of service (ToS) and precedence values to use. `16` sets a low delay; `8` sets a high throughput.
- `-UL` — (Optional) Use UDPLITE for tracerouting. The default port is 53.
- `-w waittime` — (Optional) Enter the time in seconds to wait for a response to a probe. The default is 5 seconds.
- `-z sendwait` — (Optional) Enter the minimal time interval to wait between probes. The default is 0. A value greater than 10 specifies a number in milliseconds, otherwise it specifies a number of seconds. This option is useful when routers rate-limit ICMP messages.
- `--mtu` — (Optional) Discovers the maximum transmission unit (MTU) from the path being traced.
- `--back` — (Optional) Prints the number of backward hops when different from the forward direction.
- `host` — (Required) Enter the name or IP address of the destination device.
- `packet_len` — (Optional) Enter the total size of the probing packet. The default is 60 bytes for IPv4 and 80 for IPv6.

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# traceroute www.dell.com
traceroute to www.dell.com (23.73.112.54), 30 hops max, 60 byte packets

```

Supported Releases 10.2.0E or later

Recover Linux password

If you lose or forget your Linux administrator password, you can reconfigure it from the CLI using the `system-user linuxadmin password {clear-text-password | hashed-password}` command in CONFIGURATION mode. Save the password using the `write memory` command. For example:

```
OS10(config)# system-user linuxadmin password Dell@Force10!@
OS10(config)# exit
OS10# write memory
```

For more information, see Linuxadmin user configuration.

If you lose both OS10 user and Linux admin passwords so that you cannot log in to the CLI, you must recover the `linuxadmin` password from GRUB:

1. Connect to the serial console port. The serial settings are 115,200 baud, 8 data bits, and no parity.
2. Reboot or power up the system.
3. Press **ESC** at the Grub prompt to view the boot menu. The OS10-A partition is selected by default.

```
+-------------------------------------+
|*OS10-A                              |
| OS10-B                              |
| ONIE                                |
+-------------------------------------+
```

4. Press **e** to open the OS10 GRUB editor.
   a. Use the arrow keys to navigate to the end of the line that has `set os_debug_args=` and then add `init=/bin/bash`.

```
+------------------------------------------------------------+
|setparams 'OS10-A'                                          |
|                                                            |
| set os_debug_args="init=/bin/bash"                         |
| select_image A                                             |
| boot_os                                                    |
|                                                            |
+------------------------------------------------------------+
```

5. Press **Ctrl + x** to reboot your system. If **Ctrl + x** does not cause the system to reboot, press **Alt + 0**. The system boots to a root shell without a password.
6. At the root prompt, enter `usermod -s /bin/bash linuxadmin` to enable the `linuxadmin` user.

```
root@OS10: /# usermod -s /bin/bash linuxadmin
```

7. Verify the `linuxadmin` password status by entering the `passwd -S linuxadmin` command.

   If the password is locked, `L` is displayed following `linuxadmin` in the command output. Unlock the password by entering the `passwd -u linuxadmin` command.

```
root@OS10:~# passwd -S linuxadmin
linuxadmin L 10/01/2018 0 99999 7 -1

root@OS10:~# passwd -u linuxadmin
passwd: password expiry information changed.
```

8. If the OS10 version is 10.5.1.0, then run the following command.

```
root@OS10: /# sed -ibak '31,41s/^/#/g' /opt/dell/os10/
bin/recover_linuxadmin_password.sh
```

9. Configure the password by using the `/opt/dell/os10/bin/recover_linuxadmin_password.sh` *`plain-password`* command. Enter the `linuxadmin` password in plain text.

```
root@OS10: /# /opt/dell/os10/bin/recover_linuxadmin_password.sh Dell@admin0!@
```

10. Enter the `sync` command to save the new password.

```
root@OS10: /# sync
```

11. Reboot the system, and then enter your new password.

```
root@OS10: /# reboot -f
Rebooting.[  822.327073] sd 0:0:0:0: [sda] Synchronizing SCSI cache

[  822.340656] reboot: Restarting system

[  822.344339] reboot: machine restart
BIOS (Dell Inc) Boot Selector
S6010-ON (SI) 3.20.0.3 (32-port TE/FG)
```

Recover OS10 user name password

If you lose or forget an OS10 user name password, including the `admin` password, you can recover it by following this procedure.

1. Connect to the serial console port. The serial settings are 115200 baud, 8 data bits, and no parity.
2. Reboot or power up the system.
3. Accept the selected, default boot partition: `OS10-A` or `OS10-B`.

```
+--------------------------------------------+
|*OS10-A                                     |
| OS10-B                                     |
| ONIE                                       |
+--------------------------------------------+
```

4. At the login prompt, enter the `linuxadmin` user name and password. You enter `linuxadmin` mode; for example:

```
s4048t-1 login: linuxadmin
Password:
Last login: Thu May  2 05:03:40 UTC 2019 on ttyS0
Linux s4048t-1 4.9.82 #1 SMP Debian 4.9.82-1+deb9u3 x86_64

linuxadmin@s4048t-1:~$
```

5. At the `linuxadmin` prompt, enter `sudo -i` and the `linuxadmin` password to enter root mode.

```
linuxadmin@s4048t-1:~$ sudo -i
[sudo] password for linuxadmin:
root@s4048t-1:~#
```

6. At the root mode prompt, enter the `passwd` *`username`* command to recover the password for the specified user name. Enter the new password twice; for example:

```
root@s4048t-1:~# passwd admin
New password:
Retype new password:
passwd: password updated successfully
```

7. Exit and log out from root mode and `linuxadmin` mode.

```
root@s4048t-1:~# exit
logout
linuxadmin@s4048t-1:~$ exit
logout

s4048t-1# configure terminal
s4048t-1(config)#
```

9. Configure the recovered password for the user name using the `username password role` command in CONFIGURATION mode; for example:

```
s4048t-1(config)# username admin password admin12345 role sysadmin
```

Restore factory defaults

To restore your system factory defaults, reboot the system to `ONIE: Uninstall OS` mode.

⚠ **CAUTION: Restoring factory defaults erases any installed operating system and requires a long time to erase storage.**

If it is not possible to restore your factory defaults with the installed OS, reboot the system from the Grub menu and select `ONIE: Rescue`. ONIE Rescue bypasses the installed operating system and boots the system into ONIE until you reboot the system. After ONIE Rescue completes, the system resets and boots to the ONIE console.

1. Restore the factory defaults on your system from the Grub menu using the `ONIE: Uninstall OS` command. To select which entry is highlighted, use the up and down arrow keys.

```
 +--------------------------------------+
 | ONIE: Install OS                     |
 | ONIE: Rescue                         |
 |*ONIE: Uninstall OS                   |
 | ONIE: Update ONIE                    |
 | ONIE: Embed ONIE                     |
 | ONIE: Diag ONIE                      |
 +--------------------------------------+
```

2. Press **Enter** to activate the console.
3. Return to the default ONIE settings using the `onie-uninstaller` command.

```
ONIE:/ # onie-uninstaller
uninstallerErasing internal mass storage device: /dev/sda4 (32MB)

SupportAssist

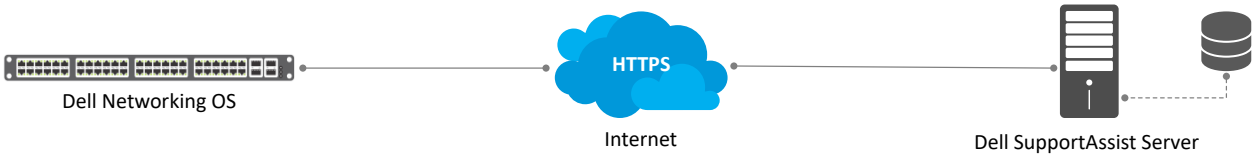
The SupportAssist feature monitors the devices in your network that run the Dell Networking Operating System. This feature offers an extra layer of service to your IT support capabilities by:

- Identifying issues and helping you resolve them quickly.
- Proactively monitoring the network and minimizing the risk of downtime.

SupportAssist periodically collects information about configuration, inventory, logs, and so on, from the network devices. It sends this information securely to a centralized Dell SupportAssist infrastructure server, referred to as the SupportAssist server. The Dell SupportAssist infrastructure service specifies a structured format to collect the data.

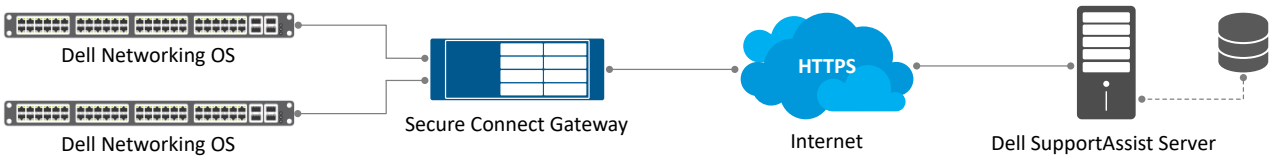
SupportAssist collects and sends data to the SupportAssist server in one of the following methods:

- **Direct connect**—SupportAssist communicates with the SupportAssist server through the Internet and uploads troubleshooting information at scheduled intervals.



- **Secure connect gateway**—Secure Connect Gateway (SCG) is installed on the virtual machine, referred to as the support-assist gateway. For more information about SCG, go to Secure Connect Gateway. SupportAssist connects to the Internet and uploads troubleshooting information to the SupportAssist server at scheduled intervals through SCG.

  NOTE: SCG 5.1 or later is required to support this feature.



NOTE: When you upgrade from an earlier release (before Release 10.5.3.0), the switch retains the SupportAssist configuration except the EULA consent. After the upgrade is complete, you have to accept the EULA consent again.

Important notes

- Configuring SupportAssist on the OS10 switch requires Internet connectivity to the SupportAssist server. If there is network outage, SupportAssist ignores the information that is collected during the downtime.
- Before you configure SupportAssist, you must accept the SupportAssist End User License Agreement (EULA).
- If the SupportAssist server is configured using a domain name, ensure that the network device has access to a domain name server (DNS). This release supports only IPv4 addressing.
- This feature uses `show` commands to collect debug information. The use of `show` commands may impact CPU usage.
- The system stores the `show` commands output in a .zip file. The size of the .zip file depends on the `show` command output.

Configure SupportAssist

NOTE: When configuring SupportAssist, you must set the time zone in advance using the `clock timezone standard-timezone` *`standard-timezone-name`* command.

If the OS10 switch resides behind a firewall, open port 443 on the firewall for an outbound connection to the following SupportAssist servers:

- https://esrs3-core.emc.com

1. Enter the configuration mode.

```
OS10# configure terminal
OS10(config)#
```

2. Accept the EULA.

```
OS10(config)# eula-consent support-assist accept
```

3. Enter SupportAssist mode from CONFIGURATION mode.

```
OS10(config)# support-assist
OS10(conf-support-assist)#
```

4. Configure the interface to connect to the SupportAssist server in SUPPORT-ASSIST mode.

```
OS10(conf-support-assist)# source-interface interface
```

5. (Optional) Configure VRF.

```
OS10(conf-support-assist)# vrf management
```

6. Enter `default` to specify the SupportAssist server URL (https://esrs3-core.emc.com).

```
OS10(conf-support-assist)# server url { default | <url> }
```

Or

```
OS10(conf-support-assist)# server url https://domain
```

NOTE: When you enter the server URL, it may take 30 seconds for configuration.

7. (Optional) Perform the following steps when you configure SCG, these steps are not required for direct connect configuration.

a. Enable the support-assist gateway.

```
OS10(conf-support-assist)# server gateway enable
  <cr>
```

NOTE: When you enable the server gateway, it may take 10 seconds for configuration.

b. Enter the support-assist gateway URL.

```
OS10(conf-support-assist)# server gateway https://10.241.211.235:9443
  <cr>
```

Or

```
OS10(conf-support-assist)# server gateway https://test.gateway.com:9443
  <cr>
```

NOTE:

- Ensure that the port number is always 9443.
- When you enter the server gateway URL, it may take 10 seconds for configuration.

8. Generate universal key from access-key and pin. Check these KB Article for generating access-key and pin.

```
OS10# support-assist generate universal-key <access-key> <pin>
```

9. (Optional) Configure the contact information for your company in SUPPORT-ASSIST mode.

```
OS10(conf-support-assist)# contact-company name ExampleCompanyName
OS10(conf-support-assist-ExampleCompanyName)#
```

10. Trigger an activity immediately or at a scheduled time in EXEC mode.

```
OS10# support-assist-activity full-transfer {start—now | schedule [hourly | daily |
weekly | monthly | yearly]}
```

Remove SupportAssist schedule

```
OS10# no support-assist-activity full-transfer schedule
```

Set company name

Configure the name, address, and territory information. Dell Technologies Technical Support uses this information to identify which company owns the device.

NOTE: This is an optional configuration.

1. Configure contact information in SUPPORT-ASSIST mode.

   ```
   OS10(conf-support-assist)# contact-company name example-company-name
   ```

2. Configure address information in SUPPORT-ASSIST mode. Use double quotes to add spaces within the city or state name. Use the `no address` command to remove the configuration. Enter `?` to view a list of supported country names and codes. You can also find this information at the following location: Country names and codes.

   ```
   OS10(conf-support-assist-example-company-name)# address city city-name state state-
   name country country-code zipcode number
   ```

3. Configure street address information in SUPPORT-ASSIST mode. Use double quotes to add spaces within an address. Use the `no street-address` command to remove the configuration.

   ```
   OS10(conf-support-assist-example-company-name)# street-address {address-line-1}
   [address-line-2 address-line-3]
   ```

4. Configure the territory in SUPPORT-ASSIST mode. Use the `no territory` command to remove the configuration.

   ```
   OS10(conf-support-assist-example-company-name)# territory company-territory
   ```

Configure SupportAssist company

```
OS10(conf-support-assist)# contact-company name ExampleCompanyName
OS10(conf-support-assist-ExampleCompanyName)# address city San Jose state California
country USA zipcode 95125
OS10(conf-support-assist-ExampleCompanyName)# street-address "123 Example Street" "Bldg
999"
OS10(conf-support-assist-ExampleCompanyName)# territory Sales
```

Set contact information

Configure contact details in SUPPORT-ASSIST mode. You can set the name, email addresses, phone, and preferred contact method.

NOTE: This is an optional configuration.

1. Enter the contact name in SUPPORT-ASSIST mode.

   ```
   OS10(config)# support-assist
   OS10(conf-support-assist)# contact-company name ExampleCompanyName
   OS10(conf-support-assist-ExampleCompanyName)# contact-person first firstname last
   lastname
   ```

2. Enter the email addresses in SUPPORT-ASSIST mode.

   ```
   OS10(conf-support-assist-ExampleCompanyName)# email-address primary email-address
   [alternate alternate-email-address]
   ```

   You can optionally configure an alternate email address.

3. Enter the preferred contact method in SUPPORT-ASSIST mode.

```
OS10(conf-support-assist-ExampleCompanyName-firstnamelastname)# preferred-method
{email | phone | no-contact}
```

4. Enter a contact phone number in SUPPORT-ASSIST mode. Minimum length of phone number is nine digits.

```
OS10(conf-support-assist-ExampleCompanyName)# phone primary number [alternate number]
```

You can optionally configure an alternate phone number.

Configure contact details

```
OS10(config)# support-assist
OS10(conf-support-assist)# contact-company name ExampleCompanyName
OS10(conf-support-assist-ExampleCompanyName)# contact-person first Firstname last
Lastname
OS10(conf-support-assist-ExampleCompanyName)# email-address primary
youremail@example.com alternate alternate_email@example.com
OS10(conf-support-assist-ExampleCompanyName-FirstnameLastname)# preferred-method email
OS10(conf-support-assist-ExampleCompanyName)# phone primary 000-123-4567 alternate
123-456-7890
```

Schedule activity

Schedule a time for a full data transfer.

NOTE: When a full data transfer starts, SupportAssist opens an SSH session with the user `mgmt_evt_user` to collect data. When you run the `show sessions` command to view a list of active user sessions, the system displays the `mgmt_evt_user` session as well. SupportAssist requires this session to be active to collect data. Killing this session halts data collection.

- Configure full-transfer or log-transfer activities in EXEC mode.

```
OS10# support-assist-activity {full—transfer} schedule {hourly | daily | weekly |
monthly | yearly}
```

  - `hourly min number`—Enter the time to schedule an hourly task, from 0 to 59.
  - `daily hour number min number`—Enter the time to schedule a daily task, from 0 to 23 hours and 0 to 59 minutes.
  - `weekly day-of—week number hour number min number`—Enter the time to schedule a weekly task, from 0 to 6 days, 0 to 23 hours, and 0 to 59 minutes.
  - `monthly day number hour number min number`—Enter the time to schedule a monthly task, from 1 to 31 days, 0 to 23 hours, and 0 to 59 minutes.
  - `yearly month number day number hour number min number`—Enter the time to schedule a yearly task, from 1 to 12 months, 1 to 31 days, 0 to 23 hours, and 0 to 59 minutes.

Configure activity schedule for full transfer

```
OS10# support-assist-activity full-transfer schedule daily hour 22 min 50
OS10# support-assist-activity full-transfer schedule weekly day-of-week 6 hour 22 min 30
OS10# support-assist-activity full-transfer schedule monthly day 15 hour 12 min 30
```

Remove activity schedule

```
OS10# no support-assist-activity full-transfer schedule
```

View status

View the SupportAssist configuration status, details, and EULA information using the following `show` commands:

1. View the SupportAssist activity in EXEC mode.

```
show support-assist status
```

2. View the EULA license agreement in EXEC mode.

```
show support-assist eula
```

View SupportAssist status

INFRASTRUCTURE TELEMETRY NOTICE
If you are acting on behalf of a U.S. Federal Government agency or if Customer has an
express written agreement in place stating thatno remote support shall be performed for
this machine, please stop attempting to enable the telemetry Collector and contact your
sales account representative.
By continuing to enable this Collector, you acknowledge that you understand the
```

```
information stated below and accept it.
Privacy
Dell, Inc and its group of companies may collect, use and share information, including
limited personal information from our customers in connection with the deployment of
this telemetry collector ("Collector"). We will collect limited personal data when you
register the product or Collector and provide us with your contact details such as
name, contact details and the company you work for. For more information on how we use
your personal information, including how to exercise your data subject rights, please
refer to our DellPrivacy Statement which is available online at https://www.dell.com/
learn/us/en/uscorp1/policies-privacy-country-specific-privacy-policy.

Telemetry Collector
This Collector gathers system information related to this machine, such as
diagnostics, configurations, usage characteristics, performance, and deployment location
(collectively, "System Data"), and it manages the remote access and the exchange of
the System Data with Dell Inc. or its applicable subsidiaries (together, "Dell"). This
Collector is Dell Confidential Information and you may not provide or share it with
others. Other than enabling the Collector to run, you do not have a license to use it.
By enabling the Collector,Customer consents to Dell’s connection to and remote access of
the product containing the Collector and acknowledges that Dell will use the System Data
transmitted to Dell via the Collector as follows ("Permitted Purposes"):
    • remotely access the product and Collector to install, maintain, monitor, remotely
support, receive alerts and notifications
      from, and change certain internal system parameters of this product and the
Customer's environment, in fulfillment of applicable warranty and support obligations;
    • provide Customer with visibility to its actual usage and consumption patterns of
the product;
    • utilize the System Data in connection with predictive analytics and usage
intelligence to consult with and assist Customer, directly or through a reseller, to
optimize Customer’s future planning activities
      and requirements; and
    • "anonymize" (i.e., remove any reference to a specific Customer) and aggregate
System Data with that from products of other Customers and use such data to develop and
improve products.
      Customer may disable the Collector at any time, in which case all the above
activities will stop. Customer acknowledges that thiswill limit Dell's ability and
obligations (if any) to support the product.
      The Collector does not enable Dell or their service personnel to access, view,
process, copy, modify, or handle Customer's business data stored on or in this product.
System Data does not include
      personally identifiable data relating to any individuals.
```

View warranty information

The Dell TechDirect server manages the warranty information for OS10 switches and the relevant service contracts. You can obtain warranty information for the OS10 switch using the following two-step process:

NOTE: You must accept the EULA before you can view the warranty information. See eula-consent for more information.

1. Obtain the warranty information from the TechDirect server:

   ```
   OS10# support-assist-activity warranty refresh
   ```

   The OS10 switch retrieves the warranty information.

2. View the warranty information.

   ```
   OS10# show support-assist warranty

   EULA support-assist : Accepted
   Warranty details last received on: 2019-08-18T05:00:00Z
   Service Tag: CARV007 Ship Date: February 08, 2017 Country: United States

   Service                                  Startdate              Warranty expiration
   date
   ------------------------------------------------------------------------------------
   -
   ProSupport Flex for Client               February 08, 2017      February 07, 2018
   ProSupport Plus for PCs and Tablets      February 08, 2017      February 07, 2018
   ```

```
Onsite Service After Remote Diagnosis   February 08, 2017      February 07, 2018
Next Business Day + Onsite Resolution   February 08, 2017      February 07, 2018
```

This command displays warranty information including when this information was last obtained from the server.

View SupportAssist logs

To view a list of SupportAssist activities with the SupportAssist server and TechDirect servers, use the following `show` command:

```
OS10# show support-assist logs
1   Mon Nov 8 04:14:48 2021: Support Assist Initializing
2   Mon Nov 8 04:22:08 2021: Failed to generate universal key due to connectivity failure
3   Mon Nov 8 04:22:13 2021: Failed to generate universal key due to connectivity failure
4   Mon Nov 8 04:23:27 2021: Failed to generate universal key due to connectivity failure
5   Mon Nov 8 04:25:06 2021: Failed to generate universal key due to connectivity failure
6   Mon Nov 8 04:59:06 2021: Support Assist Initializing
7   Mon Nov 8 05:00:34 2021: Authenticating with TechDirect server
8   Mon Nov 8 05:00:35 2021: Authenticated with TechDirect server
9   Mon Nov 8 05:00:35 2021: Querying warranty information from TechDirect server
10  Mon Nov 8 05:00:37 2021: Successfully received warranty information from TechDirect
server
11  Tue Nov 9 04:42:49 2021: Sending bundle file to ESE Agent is done
```

List of country names and codes

Connect to SupportAssist server

To establish the connection between the OS10 and SupportAssist server:

1. Manually generate the access-key. See the KB article for more information.
2. Generate the universal key in OS10 using the CLI or RESTCONF from the access-key and PIN values. This is a one-time activity, and the universal key is maintained persistently across subsequent reloads and upgrades.

See configure support-assist for more information.

Restrictions and limitations

Access key limitations

- The validity of access-key and PIN values are only 7 days. If the validity expires, regenerate the access-key and PIN.
- You can generate the access-key only manually.
- You can manually generate access-key only for one OS10 device at a time.

Modify server (staging to production and vice versa)

When you move from one SupportAssist server to another, obtain access-key and PIN values from the connectivity portal and regenerate the universal key.

NOTE: The staging server is used for the development and test activities.

To update the server:

1. Remove the old server using `no server` command.
2. Configure the new server using `server url <>` command.
3. Obtain access-key and PIN values for the new server.
4. Generate the universal key with new access-key and PIN values using `support-assist generate universal-key <access-key> <pin>` command.

Source interface configuration

The support-assist feature requires IP address to be set on the interface before configuring that interface as source interface for OS10 to SupportAssist server communication.

vrf management

Enables the SupportAssist option on the management VRF.

Syntax `vrf management`

Parameters	None
Default	None
Command Mode	SUPPORT-ASSIST
Security and Access	`sysadmin`
Usage Information	Use this command to run the SupportAssist feature on the management VRF.
Examples	`OS10(conf-support-assist)# vrf management`
Supported Releases	10.5.3.0 or later

Upgrade SupportAssist from earlier versions to 10.5.3

Username and password vs access-key and PIN

The support-assist feature now uses the universal key to communicate with the new SupportAssist server. You can generate the universal key using the access key and PIN values.

The support-assist feature in previous releases use username and password to establish connectivity with the old SupportAssist server, which are no longer valid. Hence the username and password configurations will be removed during the upgrade. You can also use the new CLI command / RESTCONF API to generate universal key (after obtaining the access key) to establish communication with the new SupportAssist server.

EULA support

The EULA of ISG Telemetry Notice is updated when migrating from earlier versions to 10.5.3 onwards in OS10. Hence, the EULA license of support-assist is updated in OS10 that mandates you to reaccept the license even though it was already accepted in the previous release. The CLI commands `show support-assist eula` and `eula-consent support-assist accept` is used to view and accept the new EULA.

Source interface

The support-assist requires IP address to be set on the interface before configuring it as source interface for OS10 to SupportAssist server communication.

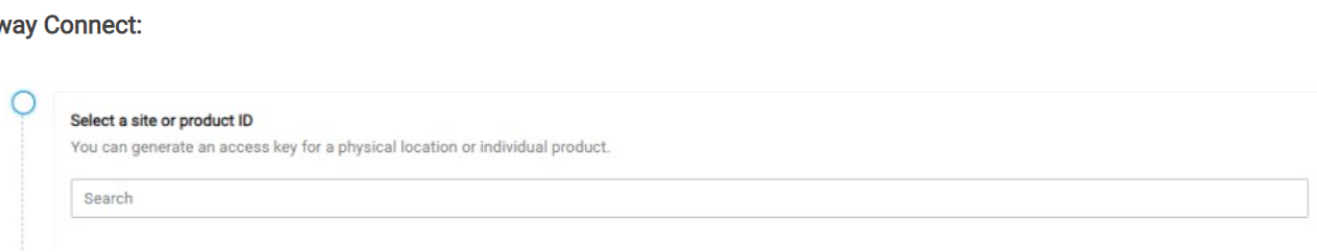
Generate access key and PIN

OS10 only supports the Direct connectivity to SupportAssist Server. An access key and PIN are required to configure connectivity securely.

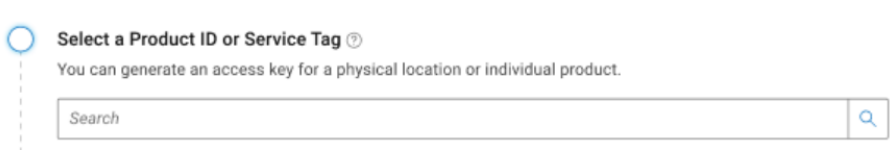
On the **Generate Access Key** page, perform the following steps:

1. Enter search criteria in the search box and select the correct Service Tag.

Gateway Connect:

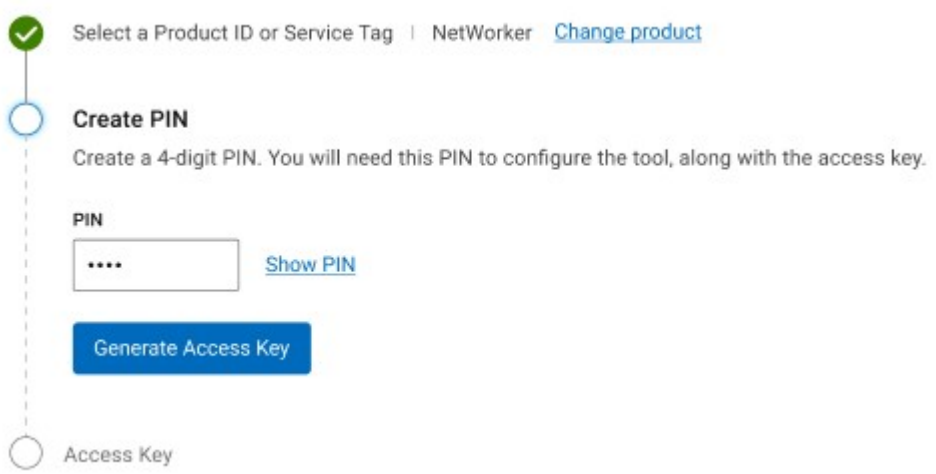


Direct Connect:

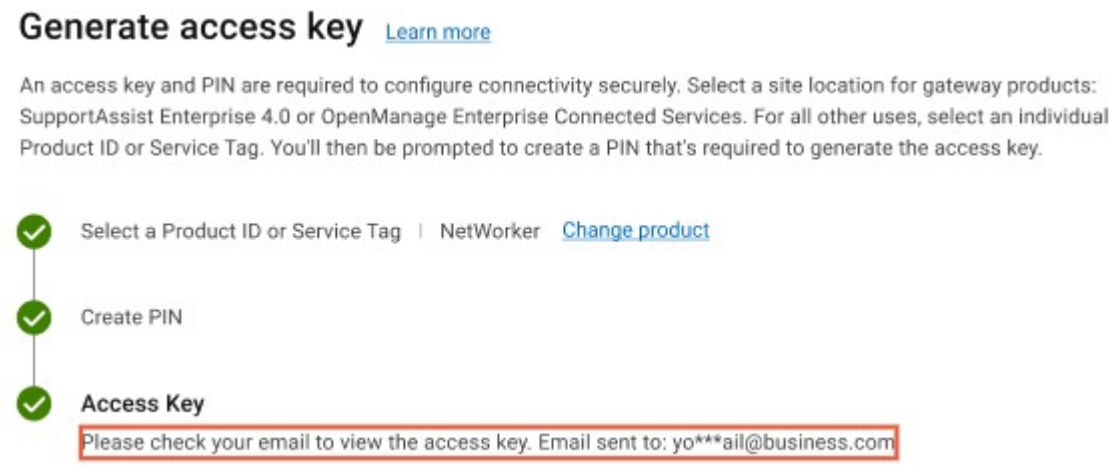


NOTE: You can search by full or partial Site ID, Site Name, or Site Location. If you are having issues with locating Site information, see the section below - Additional information to find site details.

2. Enter a random four-digit PIN in the **Create PIN** field. Make note of the PIN. This is required to configure the tool after obtaining the Access Key.



3. Click **Generate Access Key** to create the Access Key. Both the Access Key and PIN is sent to the email address tied to your account.



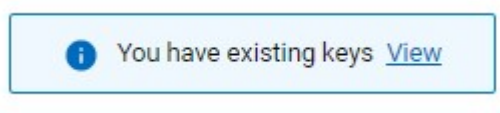
4. Click **Done**.

NOTE: The access key is valid only for seven days.

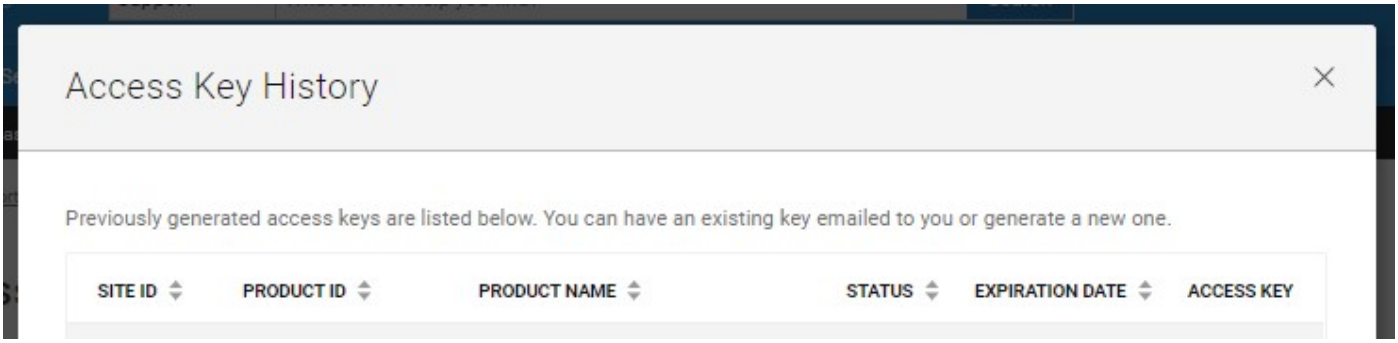
View the previously generated Access Key

Follow the steps to view your access key and PIN history or have active keys resent to your email address.

1. Click the **View** link in the top-right corner of the Generate Access Key page.



2. The **Access Key History** window displays the Site ID, Product ID, Product Name, Status, and Expiration Date of previously generated Access Keys.

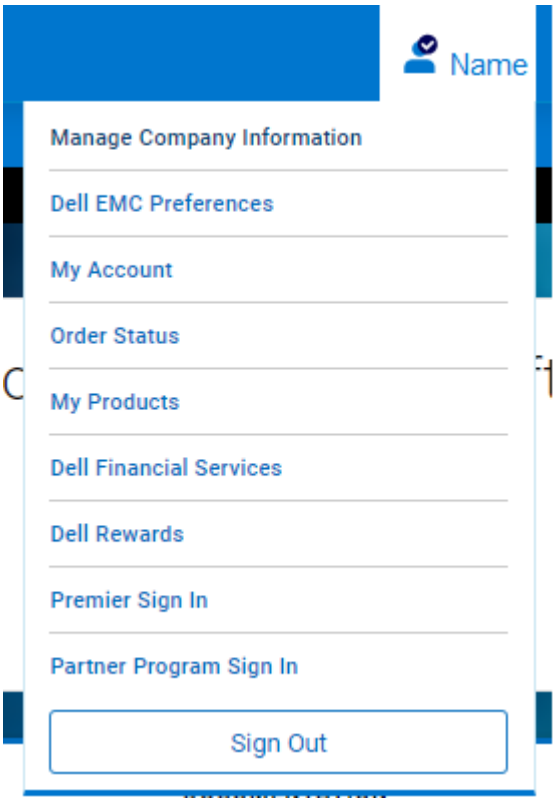


3. To receive the access key information for a specific Site ID, click in the Access Key column.

Additional information to find site details

There are additional resources that can be used to determine site information details that can be used to submit the Access Key request.

1. After logging in and accessing the Generate Access Key page, click your username and Manage Company Information. From here, you may view the Sites that you have access to.



2. If you do not have access to any Sites, you can use the **Company Administration Portal** to view local company administrators and account contacts. Your local administrator can help with additional information.
3. If the above two options do not provide the necessary site information, you can submit a request to support@emc.com.

Generate universal key using RESTCONF

Introduce a new endpoint to generate universal key from access-key and PIN values.

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json"
-u <USER_NAME>:<PASSWORD> -d '{"input":{"access-key":"<access-key-value>","pin":"<pin-
value>"}}' -X POST https://<MGMT_IP>/restconf/operations/dell-dreamcatcher:generate-
universal-key
```

Example

```
curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u
<USER_NAME>:<PASSWORD> -d '{"input":{"access-key":"ABE3C977","pin":"2874"}}' -X POST
https://<MGMT_IP>/restconf/operations/dell-dreamcatcher:generate-universal-key

curl -i -k -H "Accept: application/json" -H "Content-Type: application/json" -u
<USER_NAME>:<PASSWORD> -d '{"input":{"access-key":"944BE1F9","pin":"9148"}}' -X POST
https://<MGMT_IP>/restconf/operations/dell-dreamcatcher:generate-universal-key
```

SupportAssist commands

eula-consent

Accepts or rejects the SupportAssist end-user license agreement (EULA).

Syntax `eula–consent {support-assist} {accept | reject}`

Parameters

- `support-assist` — Enter to accept or reject the EULA for the service.
- `accept` — Enter to accept the EULA-consent.
- `reject` — Enter to reject EULA-consent.

Default Not configured

Command Mode CONFIGURATION

Usage Information If you reject the end-user license agreement, you cannot access the SupportAssist Configuration submode. If there is an existing SupportAssist configuration, the configuration including the universal key is removed and the feature is disabled.

Example (Accept)

```
OS10(config)# eula-consent support-assist accept
```

Example (Reject)

```
OS10(config)# eula-consent support-assist reject

This action will disable Support Assist and erase all configured data.Do
you want to proceed ? [Y/N]:Y
```

Supported Releases 10.2.0E or later

show eula-consent support-assist

Displays the status of the SupportAssist End User License Agreement, whether it is accepted or rejected.

Syntax `show eula-consent support-assist`

Parameters None

Default Rejected

Command Mode EXEC

Usage Information Use this command to view the status of the SupportAssist EULA.

Example

```
OS10# show eula-consent support-assist
EULA support-assist : Accepted
```

Supported Releases 10.2.0E or later

show support-assist warranty

Displays warranty information for the OS10 switch and the relevant service contracts.

Syntax `show support-assist warranty`

Parameters None

Default None

Command Mode EXEC

Usage Information This command displays the warranty information for the OS10 switch and the relevant service contracts.

Example

```
OS10# show support-assist warranty

Warranty details last received on: 2019-08-18T05:00:00Z
Service Tag: CARV007 Ship Date: February 08, 2017 Country: United States

Service                                  Startdate          Warranty expiration date
-----------------------------------------------------------------------------------
ProSupport Flex for Client               February 08, 2017  February 07, 2018
ProSupport Plus for PCs and Tablets      February 08, 2017  February 07, 2018
Onsite Service After Remote Diagnosis    February 08, 2017  February 07, 2018
Next Business Day + Onsite Resolution    February 08, 2017  February 07, 2018
```

Supported Releases 10.5.1.0 or later

show support-assist logs

Displays high-level logs of SupportAssist activities.

Syntax `show support-assist logs`

Parameters None

Default None

Command Mode EXEC

Usage Information This command displays a list of SupportAssist activities with the SupportAssist server and TechDirect servers.

Example

```
OS10# show support-assist logs
1   Mon Nov 8 04:14:48 2021: Support Assist Initializing
2   Mon Nov 8 04:22:08 2021: Failed to generate universal key due to
connectivity failure
3   Mon Nov 8 04:22:13 2021: Failed to generate universal key due to
connectivity failure
4   Mon Nov 8 04:23:27 2021: Failed to generate universal key due to
connectivity failure
5   Mon Nov 8 04:25:06 2021: Failed to generate universal key due to
connectivity failure
6   Mon Nov 8 04:59:06 2021: Support Assist Initializing
7   Mon Nov 8 05:00:34 2021: Authenticating with TechDirect server
8   Mon Nov 8 05:00:35 2021: Authenticated with TechDirect server
9   Mon Nov 8 05:00:35 2021: Querying warranty information from
TechDirect server
10  Mon Nov 8 05:00:37 2021: Successfully received warranty information
from TechDirect server
11  Tue Nov 9 04:42:49 2021: Sending bundle file to ESE Agent is done
```

Supported Releases 10.5.1.0 or later

support-assist

Enters SupportAssist subconfiguration mode.

Syntax `support-assist`

Parameters None

Default Not applicable

Command Mode CONFIGURATION

Usage Information

Example

```
OS10(config)# support-assist
OS10(conf-support-assist)#
```

Supported Releases 10.2.0E or later

support-assist-activity

Schedules a time for data collection and transfer activity or performs on-demand data collection and managed file transfer.

Syntax `support-assist-activity full-transfer {start-now | [schedule {hourly` *minute* `| daily hour` *number* `min` *number* `| weekly day-of-week` *number* `hour` *number* `min` *number* `| monthly day` *number* `hour` *number* `min` *number* `| yearly month` *number* `day` *number* `hour` *number* `min` *number*`]}`

Parameters

- `start-now`—Schedules the transfer to start immediately.
- `hourly` *minute*—Enter the keyword and specify the minute to schedule the task, 0–59.
- `daily`—Schedules a daily task:
  - `hour` *number*—Enter the keyword and specify the hour to schedule the task, 0–23.
  - `min` *number*—Enter the keyword and specify the minute to schedule the task, 0–59.
- `weekly`—Schedules a weekly task:
  - `day-of-week` *number*—Enter the keyword and number for the day of the week to schedule the task, 0–6.
  - `hour` *number*—Enter the keyword and specify the hour to schedule the task, 0–23.
  - `min` *number*—Enter the keyword and specify the minute to schedule the task, 0–59.
- `monthly`—Schedules a monthly task:
  - `day` *number*—Enter the keyword and number for the day of the month to schedule the task, 1–31.
  - `hour` *number*—Enter the keyword and specify the hour to schedule the task, 0–23.
  - `min` *number*—Enter the keyword and specify the minute to schedule the task, 0–59.
- `yearly`—Schedules a yearly task:
  - `month` *number*—Enter the keyword and specify the month in which to schedule the task, 1–12.
  - `day` *number*—Enter the keyword and number for the day of the month to schedule the task, 1–31.
  - `hour` *number*—Enter the keyword and specify the hour to schedule the task, 0–23.
  - `min` *number*—Enter the keyword and specify the minute to schedule the task, 0–59.

Default None

Command Mode EXEC

Usage Information The `no` version of this command removes the configuration. You must have a standard time zone configured using the "clock timezone standard-timezone" CLI.

Examples

```
OS10# support-assist-activity full-transfer start-now
```

```
OS10# support-assist-activity full-transfer schedule hourly min 59
```

```
OS10# support-assist-activity full-transfer schedule daily hour 23 min 59
```

```
OS10# support-assist-activity full-transfer schedule weekly day-of-week
1 hour 23 min 59
```

```
OS10# support-assist-activity full-transfer schedule monthly day 30 hour
23 min 59
```

```
OS10# support-assist-activity full-transfer schedule yearly month 12 day
31 hour 23 min 59
```

Supported Releases 10.2.0E or later

support-assist-activity warranty refresh

Obtains warranty information from the Dell TechDirect servers and refreshes the warranty information stored in the OS10 switch.

Syntax `support-assist-activity warranty refresh`

Parameters None

Default Not applicable

Command Mode EXEC

Usage Information This command obtains the information from the Dell TechDirect servers. It does not display results on the CLI. Use the `show support-assist warranty detailed` command to view the warranty information.

Example

```
OS10# support-assist-activity warranty refresh
OS10#
```

Supported Releases 10.5.1.0 or later

SupportAssist configuration commands

activity

Enables data collection activity for full transfer, performance transfer or event notification.

Syntax `activity {event-notification | full-transfer | performance-transfer} enable`

Parameters None

Default Enabled

Command Mode SUPPORT-ASSIST

Usage Information This command enables data collection for the specified activity. The `no` version of this command disables the activity.

Examples

```
OS10(conf-support-assist)# activity event-notification enable
```

```
OS10(conf-support-assist)# activity full-transfer enable
```

```
OS10(conf-support-assist)# activity performance-transfer enable
```

Supported Releases 10.2.0E or later

contact-company

Configures the company contact information.

Syntax `contact-company name company-name`

Parameters *company-name*—Enter the contact company name.

Default Not configured

Command Mode SUPPORT-ASSIST

Usage Information You can enter only one contact company. This command takes you to a submode where you can provide more company contact information. The `no` version of this command removes the configuration.

Example

```
OS10(conf-support-assist)# contact-company name ExampleCompanyName
OS10(conf-support-assist-ExampleCompanyName)#
```

Supported Releases 10.2.0E or later

support-assist generate universal key

Generates a universal key from the access-key and PIN values.

Syntax `support-assist generate universal-key < access-key> <pin>`

Parameters

- *access-key*—A key used to generate the Universal Key.
- *pin*—A random value used to generate the Universal Key.

Default Not configured

Command Mode EXEC

Security and Access `sysadmin`

Usage Information You can generate the universal key using the access-key and PIN value from the connectivity portal.

Example

```
OS10# support-assist generate universal-key ABE3C977 2874

OS10# support-assist generate universal-key 944BE1F9 9148
```

Supported Releases 10.5.3.0 or later

server gateway

Configures the URL and port of the support-assist gateway.

Syntax `server gateway {gateway-url-string}`

Parameters	*gateway-url-string*—Enter the domain name or IP address of the support-assist gateway.
Default	None
Command Mode	SUPPORT-ASSIST
Security and Access	sysadmin
Usage Information	Use this command to configure the URL of the support-assist gateway. You can configure only one gateway at a time. Use the `show support-assist status` command to view the connection mode and gateway URL. The `no` version of this command removes the configuration. **NOTE:** • Ensure that the port number is always 9443. • When you enter the server gateway URL, it may take 10 seconds for configuration.

Example	`OS10(conf-support-assist)# server gateway https://10.241.211.235:9443`
	`  <cr>`
	
	`OS10(conf-support-assist)# server gateway https://gateway.url.com:9443`
	`  <cr>`
	
	`OS10(conf-support-assist)# no server gateway https://10.241.211.235:9443`
	`  <cr>`
	
	`OS10(conf-support-assist)# no server gateway https://gateway.url.com:9443`
	`  <cr>`

Supported Releases	10.5.3.2 or later

server gateway enable

Enables support-assist gateway for data transfer activity.

Syntax	`server gateway enable`
Parameters	None
Default	Disable
Command Mode	SUPPORT-ASSIST
Security and Access	sysadmin
Usage Information	This command enables support-assist gateway. The no version of this command disables the gateway. **NOTE:** When you enable the server gateway, it may take 10 seconds for configuration.

Example	`OS10(conf-support-assist)# server gateway enable`
	`  <cr>`
	
	`OS10(conf-support-assist)# no server gateway enable`
	`  <cr>>`

Supported Releases	10.5.3.2 or later

server url

Configures the URL and port of the SupportAssist server.

Syntax	`server url {default | server-url-string}`

Parameters	• `default`—Enter the default to connect to the production SupportAssist server (https://esrs3-core.emc.com). • *`server-url-string`*—Enter the domain name or IP address of the SupportAssist server.
Default	None
Command Mode	SUPPORT-ASSIST
Security and Access	`sysadmin`
Usage Information	Use this command to configure the URL of the support-assist server. Use the `default` value to configure the production URL. You can configure only one SupportAssist server. Use the `show support-assist status` command to view the server configuration. The `no` version of this command removes the configuration. **NOTE:** When you enter the server URL, it may take 30 seconds for configuration.

Example	`OS10(conf-support-assist)# server url default`
	`  <cr>`
	
	`OS10(conf-support-assist)# server url https://test-esrs-server.com:443`
	`  <cr>`
	
	`OS10(conf-support-assist)# server url https://esrs3stg.emc.com:443`
	`  <cr>`

Supported Releases	10.5.3.0 or later

show configuration

Displays the SupportAssist configuration currently running on the device.

Syntax	`show configuration`
Parameters	None
Default	Not configured
Command Mode	SUPPORT-ASSIST

Example	`OS10# configure terminal`
	`OS10(config)# support-assist`
	`OS10(conf-support-assist)# show configuration`
	`!`
	`support-assist`
	`  server url default`
	`OS10(conf-support-assist)#`

Supported Releases	10.2.0E or later

show running-configuration support-assist

Displays the SupportAssist configuration currently running on the device.

Syntax	`show running-configuration support-assist`
Parameters	None
Default	Not configured
Command Mode	EXEC

Example

```
OS10# show running-configuration support-assist
!
support-assist
 server url default
OS10#
```

Supported Releases 10.2.0E or later

show support-assist eula

Displays the EULA for SupportAssist.

Syntax `show support-assist eula`

Parameters None

Default None

Command Mode EXEC

Usage Information Use this command to view the EULA for SupportAssist.

Example

```
INFRASTRUCTURE TELEMETRY NOTICE
If you are acting on behalf of a U.S. Federal Government agency or if
Customer has an express written agreement in place stating thatno remote
support shall be performed for this machine, please stop attempting
to enable the telemetry Collector and contact your sales account
representative.
By continuing to enable this Collector, you acknowledge that you
understand the information stated below and accept it.
Privacy
Dell, Inc and its group of companies may collect, use and share
information, including limited personal information from our customers
in connection with the deployment of this telemetry collector
("Collector"). We will collect limited personal data when you register
the product or Collector and provide us with your contact details
such as name, contact details and the company you work for. For more
information on how we use your personal information, including how
to exercise your data subject rights, please refer to our DellPrivacy
Statement which is available online at https://www.dell.com/learn/us/en/
uscorp1/policies-privacy-country-specific-privacy-policy.
Telemetry Collector
This Collector gathers system information related to this machine, such
as diagnostics, configurations, usage characteristics, performance, and
deployment location (collectively, "System Data"), and it manages the
remote access and the exchange of the System Data with Dell Inc. or
its applicable subsidiaries (together, "Dell"). This Collector is Dell
Confidential Information and you may not provide or share it with
others. Other than enabling the Collector to run, you do not have a
license to use it. By enabling the Collector,Customer consents to Dell's
connection to and remote access of the product containing the Collector
and acknowledges that Dell will use the System Data transmitted to Dell
via the Collector as follows ("Permitted Purposes"):
    • remotely access the product and Collector to install, maintain,
monitor, remotely support, receive alerts and notifications
      from, and change certain internal system parameters of this
product and the Customer's environment, in fulfillment of applicable
warranty and support obligations;
    • provide Customer with visibility to its actual usage and
consumption patterns of the product;
    • utilize the System Data in connection with predictive analytics
and usage intelligence to consult with and assist Customer, directly or
through a reseller, to optimize Customer's future planning activities
      and requirements; and
    • "anonymize" (i.e., remove any reference to a specific Customer)
and aggregate System Data with that from products of other Customers and
use such data to develop and improve products.
```

```
      Customer may disable the Collector at any time, in which case
all the above activities will stop. Customer acknowledges that thiswill
limit Dell's ability and obligations (if any) to support the product.
      The Collector does not enable Dell or their service personnel to
access, view, process, copy, modify, or handle Customer's business data
stored on or in this product. System Data does not include
      personally identifiable data relating to any individuals.
OS10#
```

Supported Releases 10.5.3.0 or later

show support-assist status

Displays the support-assist status information, including activities and events, and the keep-alive statistics.

Syntax `show support-assist status`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information Use this command to view the SupportAssist status.

Example

```
OS10# show support-assist status

Supported Releases 10.5.3.0 or later

source-interface

Configures the source interface to establish outgoing connectivity to the SupportAssist server.

Syntax `source-interface interface`

Parameters *interface*:

- `ethernet node/slot/port[:subport]`—Enter a physical Ethernet interface.
- `loopback number`—Enter a Loopback interface, from 0 to 16383.
- `management 1/1/1`—Enter the management interface.
- `port-channel channel-id`—Enter a port channel interface, from 1 to 999 or 1001 to 2000.
- `vlan vlan-id`—Enter a VLAN ID, from 1 to 4093.

Default Not configured.

Command Mode SUPPORT-ASSIST

Usage Information The `no` version of this command removes the configuration.

Examples

```
OS10(conf-support-assist)# source-interface ethernet 1/1/4
```

```
OS10(conf-support-assist)# source-interface loopback 1
```

```
OS10(conf-support-assist)# source-interface mgmt 1/1/1
```

```
OS10(conf-support-assist)# source-interface port-channel 10
```

```
OS10(conf-support-assist)# source-interface vlan 100
```

Supported Releases 10.4.0E(R1) or later

SupportAssist company commands

address

Configures the company address.

Syntax `address city name state name country name zipcode number`

Parameters

- `city name`—Enter the keyword and the city name.

- `state name`—Enter the keyword and the state name.
- `country name`—Enter the keyword and the country code.
- `zipcode number`—Enter the keyword and the zip code.

Default Not configured

Command Mode SUPPORT-ASSIST contact company sub-mode

Usage Information Enter `?` to view a list of supported country names and codes. You can also find this information at the following location: Country names and codes. The `no` version of this command removes the configuration.

Example

```
OS10(conf-support-assist-ExampleCompanyName)# address city SanJose state
California country USA zipcode 95123
```

Supported Releases 10.2.0E or later

contact-person

Configures the contact name for an individual.

Syntax `contact-person {first firstname last lastname}`

Parameters

- `first firstname` — Enter the keyword and the first name of the contact person. Use double quotes for more than one first name.
- `last lastname` — Enter the keyword and the last name of the contact person.

Default Not configured

Command Mode SUPPORT-ASSIST

Usage Information The `no` version of this command removes the configuration.

Example

```
OS10(conf-support-assist-ExampleCompanyName)# contact-person first
Firstname last Lastname
```

Supported Releases 10.2.0E or later

street-address

Configures the street address of the company.

Syntax `street-address {line-1} [line-2] [line-3]`

Parameters `line-1 line-2 line-3` — Enter the address of the company, from 1 to 3 lines. Enclose the text within double quotes. Insert a space after each line of text.

Default Not configured

Command Mode

- SUPPORT-ASSIST

Usage Information The `no` version of this command removes the configuration.

Example

```
OS10(conf-support-assist-ExampleCompanyName)# street-address "One Dell
Way" "Suite 100" "Santa Clara"
```

Supported Releases 10.2.0E or later

territory

Configures the place where the company is located.

Syntax	`territory territory-name`
Parameters	*territory-name*—Enter the territory where the company is located.
Default	Not configured
Command Mode	CONF-SUPPORT-ASSIST
Usage Information	The `no` version of this command removes the configuration.
Example	`OS10(conf-support-assist)# contact-company name ExampleCompanyName` `OS10(conf-support-assist-ExampleCompanyName)# territory West`
Supported Releases	10.2.0E or later

SupportAssist person commands

email-address

Configures the email address of the contact person.

Syntax	`email—address primary email-id [alternate email-id]`
Parameters	*email-id*—Enter the email address of the contact person.
Default	Not configured
Command Mode	SUPPORT-ASSIST
Usage Information	The `no` version of this command removes the configuration.
Example	`OS10(conf-support-assist-ExampleCompanyName-FirstnameLastname)# email-address primary youremail@example.com alternate emailid@example.com`
Supported Releases	10.2.0E or later

phone

Configures the phone number of the contact person.

Syntax	`phone primary string [alternate string]`
Parameters	*string*—Enter the phone number of the contact person. Minimum length of phone number is nine digits.
Default	None
Command Mode	SUPPORT-ASSIST
Usage Information	The `no` version of this command removes the configuration.
Example	`OS10(conf-support-assist-ExampleCompanyName-FirstnameLastname)# phone primary 000-123-4567`
Supported Releases	10.2.0E or later

preferred-method

Configures a preferred method to contact an individual.

Syntax	`preferred-method {email | phone | no-contact}`
Parameters	• `email`—Enter to select email as the preferred contact method. • `phone`—Enter to select phone as the preferred contact method. • `no-contact`—Enter to specify that the individual does not want to be contacted through email or phone.
Default	No-contact
Command Mode	SUPPORT-ASSIST
Usage Information	The `no` version of this command removes the configuration.

Examples	`OS10(conf-support-assist-ExampleCompanyName-FirstnameLastname)# preferred-method email`
	`OS10(conf-support-assist-ExampleCompanyName-FirstnameLastname)# preferred-method phone`
	`OS10(conf-support-assist-ExampleCompanyName-FirstnameLastname)# preferred-method no-contact`

Supported Releases	10.2.0E or later

Support bundle

The Support Bundle is based on the `sosreport` tool. Use the Support Bundle to generate an `sosreport` tar file that collects Linux system configuration, diagnostics information, and the `show` command output to send to Dell Technologies Technical Support.

To send Technical Support troubleshooting details about the Linux system configuration and OS10 diagnostics, generate an `sosreport` tar file.

1. Generate the tar file in EXEC mode.

   ```
   generate support-bundle
   ```

2. Verify the generated file in EXEC mode.

   ```
   dir supportbundle
   ```

3. Send the support bundle using FTP, SFTP, SCP, or TFTP in EXEC mode.

   ```
   copy supportbundle://sosreport-filename.tar.gz tftp://server-address/path
   ```

Use the `generate support-bundle scp://userid:passwd@hostip/directory-path` command to generate the support bundle and copy the generated `sosreport` and MD5 files as a tar file to the specified remote server directory through SCP.

Use the `delete supportbundle://sosreport-filename.tar.gz` command to delete a generated support bundle.

Event notifications

Event notifications for the `generate support-bundle` command process at the start and end of the bundle they support, and reports either success or failure.

Support bundle generation start event

```
Apr 19 16:57:55: %Node.1-Unit.1:PRI:OS10 %log-notice:SUPPORT_BUNDLE_STARTED: generate
support-bundle execution has started successfully:All Plugin options disabled
Apr 19 16:57:55: %Node.1-Unit.1:PRI:OS10 %log-notice:SUPPORT_BUNDLE_STARTED: generate
support-bundle execution has started successfully:All Plugin options enabled
```

sosreport generation start event

```
May 11 22:9:43: %Node.1-Unit.1:PRI:OS10 %log-notice:SOSREPORT_GEN_STARTED: CLI output
collection task completed; sosreport execution task started:All Plugin options disabled
May 11 22:9:43: %Node.1-Unit.1:PRI:OS10 %log-notice:SOSREPORT_GEN_STARTED: CLI output
collection task completed; sosreport execution task started:All Plugin options enabled
```

Support bundle generation successful event

```
Apr 19 17:0:9: %Node.1-Unit.1:PRI:OS10 %log-notice:SUPPORT_BUNDLE_COMPLETED: generate
support-bundle execution has completed successfully:All Plugin options disabled
Apr 19 17:0:9: %Node.1-Unit.1:PRI:OS10 %log-notice:SUPPORT_BUNDLE_COMPLETED: generate
support-bundle execution has completed successfully:All Plugin options enabled
```

Support bundle generation failure

```
Apr 19 17:0:14: %Node.1-Unit.1:PRI:OS10 %log-notice:SUPPORT_BUNDLE_FAILURE: Failure in
generate support-bundle execution:All Plugin options disabled
Apr 19 17:0:14: %Node.1-Unit.1:PRI:OS10 %log-notice:SUPPORT_BUNDLE_FAILURE: Failure in
generate support-bundle execution:All Plugin options enabled
```

generate support-bundle

Generates an `sosreport` tar file that collects configuration and diagnostic information about Linux systems.

Syntax

`generate support-bundle [disable-all-plugin-options] [scp://`*`userid:passwd@hostip/directory-path`*`]`

Parameters

- `disable-all-plugin-options`—(Optional) Generate a full support bundle with all plug-in options disabled.
- `scp://`*`userid:passwd@hostip/directory-path`*—(Optional) Generate a full support bundle and copy the generated `sosreport` and MD5 files as a tar file to the specified remote server through SCP. The IPv6 *`hostip`* address must be specified within square braces.

Defaults

Generates a full support bundle with all plug-in options enabled.

Command Mode

EXEC

Usage Information

Running this command without any parameters enables all plug-in options. In Release 10.5.1.x, you must specify the optional parameter, `enable-all-plugin-options` to generate full support bundle with all plug-in options enabled.

To send the tar file to Dell Technical Support, use the `dir supportbundle` and `copy supportbundle://sosreport-OS10-`*`file-number`*`.tar.gz tftp://`*`server-address/path`* commands.

Example

```
OS10# generate support-bundle
```

Example (Enable Options) - Release 10.5.1.x

```
OS10# generate support-bundle enable-all-plugin-options
```

Example (Disable Options - IPv4)

```
OS10# generate support-bundle disable-all-plugin-options scp://
xyz:pwd@10.1.1.1//home/user/xyz/
```

Example (Disable Options - IPv6)

```
OS10# generate support-bundle disable-all-plugin-options scp://
xyz:pwd@[10::1]//home/user/xyz/
```

Example (Copy SoS report using SCP)	`OS10# generate support-bundle scp://xyz:pwd@10.1.1.1//home/user/xyz/` `OS10# generate support-bundle scp://xyz:pwd@[10::1]//home/user/xyz/`
Supported Releases	10.2.0E or later

show support-bundle status

Displays the support bundle generation status and file transfer status.

Syntax	`show support-bundle status`
Parameters	None
Default	None
Command Mode	EXEC
Security and Access	Sysadmin, secadmin, and netadmin

Example	`OS10# show support-bundle status`
	`Support bundle generation status  : support-bundle-generation-success`
	`Transfer State Detail             : in-progress`
	`Transfer Progress                 : 10 %`
	`Transfer Bytes                    : 769 bytes`
	`File Size                          : 7690 bytes`

Supported Releases	10.5.2.3 or later

System monitoring

Monitor OS10 using system alarms and log information.

Configuration notes

All Dell PowerSwitches except S4200-Series, S5200 Series, and Z9332F-ON:

Logging is enabled by default on a terminal emulator that is connected to the console serial port. However, in an SSH or Telnet terminal session, logging is disabled by default. To enable logging on a remote terminal in an SSH or Telnet session, use the terminal monitor command in EXEC mode. To disable logging in a remote or directly connected terminal, use the no terminal monitor command.

System events and alarms

An event notifies you of a change or situation in the system that you might be interested in. An alarm indicates that the system has entered an abnormal state and may require immediate action.

Events are classified as follows:

- **Stateless events**—One-time notifications about the system condition, for example, ACL updates, firewall policy update, and so on.
- **Stateful events**—Events that are raised when the abnormal situation arises, and cleared when the situation returns to normal. These types of events are called alarms.

Events can have one of the following severities:

- **CRITICAL**—A critical condition exists and requires immediate action. A critical event may trigger if one or more hardware components fail, or one or more hardware components exceed temperature thresholds.
- **MAJOR**—A major error had occurred and requires escalation or notification. For example, a major alarm may trigger if an interface failure occurs, such as a port channel being down.

- **MINOR**—A minor error or noncritical condition occurred that, if left unchecked, might cause system service interruption or performance degradation. A minor alarm requires monitoring or maintenance.
- **WARNING**—A warning condition was observed, but it may or may not result in an error condition.
- **INFORMATIONAL**—An informational event had occurred, but it does not impact performance.

Out of memory, temperature crossing a critical point, and so on, are examples of conditions when the system triggers an alarm. After the system recovers from the condition, the alarms are cleared.

All stateful events of severity level CRITICAL, MAJOR, MINOR, or WARNING trigger alarms. However, you can customize the severity of events or turn off event notification using Severity profiles.

Triggered alarms are in one of these states:

- **Active**—Alarm is raised and is currently active.
- **Acknowledged**—Alarm is raised; the user is aware of the situation and acknowledged the alarm. This alarm does not impact the overall health of the system or the system LED.

Some alarms go directly from active to cleared state and require little-to-no administrative effort. You must acknowledge or investigate alarms with a high severity.

OS10 stores all Active and Acknowledged alarms in the Current Alarm List (CAL), and archives all past events in the Event History List (EHL).

Alarms in the CAL are cleared after a reload.

The EHL is persistent and retains the archived events after a reload, reboot, or upgrade. The EHL can store a maximum of 86,000 events or 30 days of events, whichever is earlier.

The system LED that indicates the status of the switch is based on the severity of the alarms in the CAL and it turns:

- Red—For CRITICAL or MAJOR alarms
- Amber—For MINOR or WARNING alarms
- Green—No alarms

Severity profiles

OS10 allows you to change the severity of events using severity profiles. A severity profile is a .xml file that defines the effective severity of events or disables the notification of events.

OS10 comes with a default severity profile. You cannot modify or delete the default profile. However, OS10 allows you to define custom severity profiles.

- Default severity profile—All events are defined in the default profile. The default profile classifies the events as CRITICAL, WARNING, or INFORMATIONAL in severity.
- Custom severity profile—Contains events that you modify. You can classify events as CRITICAL, MAJOR, MINOR, WARNING, or INFORMATIONAL in severity.

Events and their characteristics that are defined in the custom profile take precedence over the default profile.

To create a custom severity profile, copy the default severity profile to a remote host and modify it. After the custom profile is created, copy it from the remote host to the OS10 switch and apply it. The custom profile takes effect after a system restart.

NOTE:

- To customize severity profiles, your user account must have any one of the following privileges: System admin (`sysadmin`), security admin (`secadmin`), or network admin (`netadmin`).
- You cannot edit an active custom profile. To edit an active custom severity profile, select another severity profile and apply it.

The *severity-profile://* partition contains all the defined severity profiles. To view a list of severity profiles, use the `dir severity-profile` command.

To delete a severity profile, use the `delete` command. You can delete all severity profiles except the default and active profiles.

Configure custom severity profile

To modify the severity of events or disable event notification:

Your user account must have any one of the following privileges: System admin (`sysadmin`), security admin (`secadmin`), or network admin (`netadmin`).

1. Use the `dir` command to view the list of available severity profiles in the *severity-profile://* partition.

```
OS10# dir severity-profile
Date (modified)       Size (bytes)  Name
--------------------- ------------  ---------------
2019-03-27T15:24:06Z  46741         default.xml
2019-04-01T11:22:33Z  456           custom.xml
```

2. Copy one of the available severity profiles to a remote host.

```
OS10# copy severity-profile://default.xml scp://username:password@a.b.c.d/dir-path/
mySevProf.xml
```

3. Modify the .xml file with changes as required.

NOTE: When you modify the xml file, you must select one of the following severities:

- CRITICAL
- MAJOR
- MINOR
- WARNING
- INFORMATIONAL

Following is a sample of the .xml file. you can use Notepad++ to make modifications to his .xml file:

```
<?xml version="1.0" encoding="UTF-8"?>

<events>
<event
name="L2_SERV_LACP_CMS_CPS_SEND_FAIL"
severity="INFORMATIONAL"
enable="true"
/>
<event
name="L2_SERV_LACP_STACK_CPS_SEND_FAIL"
severity="INFORMATIONAL"
enable="true"
/>
<event
name="L2_SERV_LACP_CMS_CPS_RECV_FAIL"
severity="INFORMATIONAL"
enable="true"
/>
<event
name="L2_SERV_LACP_STACK_CPS_RECV_FAIL"
severity="INFORMATIONAL"
```

If you want OS10 to generate the event, set the Enable flag to `true`. To turn off event notification, set the Enable flag to `false`.

If you enter invalid values, the `event severity-profile` command fails.

4. Copy the custom profile to the OS10 switch.

```
OS10# copy scp://username:password@a.b.c.d/dir-path/mySevProf.xml severity-profile://
mySevProf_1.xml
```

When you copy the custom profile, you must update the name of the custom profile. You cannot use the same name as the default profile (default.xml) or the active profile *(mySevProf.xml)*.

5. Apply the custom severity profile on the switch.

```
OS10# event severity-profile mySevProf_1.xml
```

NOTE: You must restart the switch for the changes to take effect.

6. Restart the switch.

```
OS10# reload
```

7. Use the `show event severity-profile` command to view the custom profile that is active.

```
OS10# show event severity-profile
Severity Profile Details
------------------------------------------
Currently Active     : default
Active after restart : mySevProf_1.xml
```

Delete custom severity profile

You can delete custom severity profiles that you no longer need. However, you cannot delete the default or active severity profile.

To delete a custom severity profile, use the `delete severity-profile://profile-name` command. For example:

```
OS10# delete severity-profile://mySevProf_1.xml
```

System logging

You can change the system logging default settings using the severity level to control the type of system messages that log. The range of logging severities are:

- `log-emerg`—System is unstable.
- `log-alert`—Immediate action is needed.
- `log-crit`—Critical conditions
- `log-err`—Error conditions
- `log-warning`—Warning conditions
- `log-notice`—Normal, but significant conditions (default)
- `log-info`—Informational messages
- `log-debug`—Debug messages

NOTE: The system rate-limits syslog messages to a maximum of 10 per second on the console.

- Enter the minimum severity level for logging to the console in CONFIGURATION mode.

```
logging console severity
```

- Enter the minimum severity level for logging to the system log file in CONFIGURATION mode.

```
logging log-file severity
```

- Enter the minimum severity level for logging to terminal lines in CONFIGURATION mode.

```
logging monitor severity
```

- Configure the remote syslog server in CONFIGURATION mode.

```
logging server {ipv4-address | ipv6-address} [tcp | udp | tls] [port-number]
[severity severity-level] [vrf {management | vrf-name]
```

Note: The switch might temporarily stop printing the system messages for a time period after the following sequence of events:

1. Change the system clock to a future date and wait for the system messages to print.
2. Revert the date to the present date and wait for the system messages to print.
3. Reload the switch.

The switch starts printing system messages after the previously configured future date is reached. This is the system behavior of the syslog-ng service on Linux.

Disable system logging

You can use the `no` version of any logging command to disable system logging.

- Disable console logging, and reset the minimum logging severity to the default in CONFIGURATION mode.

```
no logging console severity
```

- Disable log-file logging, and reset the minimum logging severity to the default in CONFIGURATION mode.

```
no logging log-file severity
```

- Disable monitor logging, and reset the minimum logging severity to the default in CONFIGURATION mode.

```
no logging monitor severity
```

- Disable server logging, and reset the minimum logging severity to the default in CONFIGURATION mode.

```
no logging server severity
```

- Reenable any logging command in CONFIGURATION mode.

```
no logging enable
```

Enable server logging for log notice

```
OS10(config)# logging server 10.11.86.139 severity log-notice
```

System logging over TLS

To provide enhanced security and privacy in the logged system messages sent to a syslog server, you can use the Transport Layer Security (TLS) protocol. System logging over TLS encrypts communication between an OS10 switch and a configured remote logging sever, including:

- Performing mutual authentication of a client and server using public key infrastructure (PKI) certificates
- Encrypting the entire authentication exchange so that neither user ID nor password is vulnerable to discovery, and that the data is not modified during transport

Confguration notes

System logging over TLS requires that:

- X.509v3 PKI certificates are configured on a certification authority (CA) and installed on the switch. Both the switch and syslog server exchange a public key in a signed X.509v3 certificate to authenticate each other.
- You configure a security profile for system logging.

Configure system logging over TLS

1. Copy an X.509v3 certificate created by a CA server using a secure method, such as SCP or HTTPS. Then install the trusted CA certificate in EXEC mode.

```
crypto ca-cert install ca-cert-filepath [filename]
```

   - *ca-cert-filepath* specifies the local path to the downloaded certificate; for example, `home://CAcert.pem` or `usb://CA-cert.pem`.
   - *filename* specifies an optional filename that the certificate is stored under in the OS10 trust-store directory. Enter the filename in the *filename*`.crt` format.

2. Obtain an X.509v3 host certificate from the CA server:
   a. Create a private key and generate a certificate signing request for the switch.

b. Copy the CSR file to the CA server for signing.
c. Copy the CA-signed certificate to the home directory on the switch.
d. Install the host certificate:

```
crypto cert install cert-file home://cert-filepath key-file {key-path | private}
[password passphrase] [fips]
```

When you install an X.509v3 certificate-key pair:

- Both take the name of the certificate. For example, if you install a certificate using:

```
OS10# crypto cert install cert-file home://Dell_host1.pem key-file home://abcd.key
```

The certificate-key pair is installed as `Dell_host1.pem` and `Dell_host1.key`. In configuration commands, refer to the pair as `Dell_host1`. When you configure a security profile, you would enter `Dell_host1` in the `certificate certificate-name` command.

- For security reasons, because the key file contains private key information, it copied to a secure location in the OS10 file system and deleted from its original location specified in the `key-file key-path` parameter.

NOTE: `fips` installs the certificate-key pair as FIPS-compliant. Enter `fips` to install a certificate-key pair that is used by a FIPS-aware application, such as Syslog over TLS. If you do not enter `fips`, the certificate-key pair is stored as a non-FIPS-compliant pair.

You determine if the certificate-key pair is generated as FIPS-compliant. Do not use FIPS-compliant certificate-key pairs outside of FIPS mode. When FIPS mode is enabled, you can still generate CSRs for non-FIPS certificates for use with non-FIPS applications. Be sure to install these certificates as non-FIPS with the `crypto cert install` command.

3. Configure a security profile for system logging over TLS using an X.509v3 certificate.
   a. Create a Syslog security profile in CONFIGURATION mode.

```
crypto security-profile profile-name
```

   b. Assign an X.509v3 certificate and private key pair to the security profile in SECURITY-PROFILE mode. For *certificate-name*, enter the name of the certificate-key pair as it appears in the `show crypto certs` output without the `.pem` extension.

```
certificate certificate-name
exit
```

   c. Create a system logging-specific profile in CONFIGURATION mode.

```
logging security-profile profile-name
```

   Where *profile-name* is the name of the Syslog security profile created in Step 2a with the `crypto security-profile profile-name` command. You cannot delete a crypto server profile if it is configured for a logging server.

   If you reconfigure crypto security `profile-name`, configured Syslog TLS servers are automatically updated to use the new certificate-key pair used by the new profile.

   If you reconfigure the certificate assigned to a crypto security profile, Syslog TLS servers are automatically updated to use new certificate-key pair.

   If you delete a certificate from a configured crypto security profile, system logging over TLS fails. A host certificate is required for the protocol exchange with an external device.

4. Configure a remote TLS server to receive system messages in CONFIGURATION mode.

```
logging server {ipv4-address | ipv6-address} tls [port-number]
[severity severity-level] [vrf {management | vrf-name]
```

Example: Configure Syslog over TLS

```
OS10# copy tftp://CAadmin:secret@172.11.222.1/cacert.pem home://cacert.pem

OS10# crypto ca-cert install home://cacert.pem
Processing certificate ...
Installed Root CA certificate

View system logs

The system log-file contains system event and alarm logs.

Use the `show trace` command to view the current syslog file. All event and alarm information is sent to the syslog server, if one is configured.

The `show logging` command accepts the following parameters:

- `log-file` — Provides a detailed log including both software and hardware saved to a file.
- `process-names` — Provides a list of all processes currently running which can be filtered based on the process-name.

View logging log-file

```
OS10# show logging log-file

```

Link-bundle monitoring

Monitoring port-channel bundles allows the traffic distribution amounts in a link to look for unfair distribution at any given time. A threshold of 60% is an acceptable amount of traffic on a member link.

Links are monitored in 15-second intervals for three consecutive instances. Any deviation within that time sends syslog and an alarm event generates. When the deviation clears, another syslog sends and a clear alarm event generates.

Link-bundle utilization calculates the total bandwidth of all links divided by the total bytes-per-second of all links. If you enable monitoring, the utilization calculation performs when the utilization of the link-bundle (not a link within a bundle) exceeds 60%.

Configure Threshold level for link-bundle monitoring

```
OS10(config)# link-bundle-trigger-threshold 10
```

View link-bundle monitoring threshold configuration

```
OS10(config)# do show running-configuration
link-bundle-trigger-threshold 10
!
...
```

Show link-bundle utilization

```
OS10(config)# do show link-bundle-utilization

Link-bundle trigger threshold - 10
```

Alarm commands

alarm acknowledge

Acknowledges an active alarm.

Syntax	`alarm acknowledge` *`sequence-number`*
Parameters	• *`sequence-number`* — Acknowledge the alarm corresponding to the sequence number.
Default	Not configured
Command Mode	EXEC
Usage Information	Use the `show alarm` command to view all active alarms. Use active alarm sequence numbers to acknowledge specific alarms.
Example	`OS10# alarm acknowledge 1`
Supported Releases	10.4.3 or later

event severity-profile

Configures a severity profile to change the severity of events, or turn off event notifications.

Syntax	`event severity-profile {default |` *`profile-name`*`}`
Parameters	*`profile-name`*—Name of the custom severity profile, a maximum of 64 characters. The file extension, .xml is optional.
Default	Default.xml
Command Mode	EXEC
Usage Information	Configures a severity profile to change the characteristics of events. If you configure a custom profile, the profile applies on top of the default profile. Restart the system for the changes to take effect. The system restart ensures that the existing stateful events are tagged appropriately based on the newly applied severity profile. Severity profiles are stored in the *severity-profile://* partition. This partition includes a factory default severity profile, *default.xml*. You cannot edit or delete the default and active severity profiles.

Example

```
OS10# event severity-profile MySevPro_1
%Notice: Severity profile will be active after system restart
```

Supported Releases 10.5.0 or later

show alarms

Displays all current active alarms in the system.

Syntax `show alarms`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
OS10# show alarms

Sq No      Severity    Name                                Timestamp
           Source
-----      --------    --------------------------------
---------------------------- ------
  7563     critical    EQM_MORE_PSU_FAULT                  Fri Jul 26
19:26:16 2019    /pus/1
  7566     warning     EQM_TML_MINOR_CROSSED               Fri Jul 26
19:30:22 2019    /pus/1
  7569     information L2_SERV_LACP_CMS_CPS_SEND_FAIL      Fri Jul 26
19:55:40 2019    /pus/1
```

Supported Releases 10.2.0E or later

show alarms acknowledged

Displays all acknowledged alarms.

Syntax `show alarms acknowledged`

Parameters None

Default None

Command Mode EXEC

Usage Information None

Example

```
show alarms acknowledged

Sq No      Severity   Name                                  Timestamp
          Source
-----      --------   --------------------------------
-------------------------- ---------------
100071  warning    EQM_FAN_FAULT_MINOR              Tue Jul 23 13:53:47
2019    /psu/1/fan/1
100072  critical   EQM_FAN_FAULT_MAJOR              Tue Jul 23 13:53:47
2019    /psu/1
```

Supported Releases 10.2.0E or later

show alarms details

Displays details about active alarms.

Syntax `show alarms details`

Parameters None

Default None

Command Mode EXEC

Usage Information The output of the `show alarms details` command indicates if an alarm is acknowledged or not. If an alarm is not acknowledged, the `Acknowledged` field is set to `false` and the `Ack-time` value is empty. If an alarm is acknowledged, the `Acknowledged` field is set to `true` and the system displays the time the alarm was acknowledged.

Example

Alarm is not acknowledged:

```
OS10# show alarms details

Active-alarm details - 732
-------------------------------------------
Sequence Number:    732
Severity:           critical
Source:             /psu/2
Name:               EQM_MORE_PSU_FAULT
Description:        psu 2 is not working correctly
Raise-time:         Mon Jul 29 06:12:30 2019
Ack-time:
New:                true
Acknowledged:       false
-------------------------------------------
```

Alarm is acknowledged:

```
OS10# show alarms details

Active-alarm details - 732
-------------------------------------------
Sequence Number:    732
Severity:           critical
Source:             /psu/2
Name:               EQM_MORE_PSU_FAULT
Description:        psu 2 is not working correctly
Raise-time:         Mon Jul 29 06:12:30 2019
Ack-time:           Mon Jul 29 06:16:35 2019
New:                true
Acknowledged:       true
-------------------------------------------
```

Supported Releases 10.2.0E or later

show alarms sequence

Displays information corresponding to the active alarm based on the sequence number that you specify.

Syntax `show alarms sequence` *`sequence-number`*

Parameters

- `sequence-number` — Enter the sequence number corresponding to the active alarm.

Default None

Command Mode EXEC

Usage Information Use the show alarms command to view all active alarms. Use an active alarm sequence number to view detailed information about that alarm.

Example

```
NOS# show alarms sequence 3
Active-alarm details - 1
-----------------------------------------
Sequence Number:   3
Severity:          major
Type:              1081375
Source:            /psu/2
Name:              EQM_MORE_PSU_FAULT
Description:       psu 2 is not working correctly
Raise-time:        Sun 10-07-2018 18:39:47
Ack-time:
State:             raised
-----------------------------------------
```

Supported Releases 10.4.3E or later

show alarms severity

Displays all active alarms corresponding to a specific severity level.

Syntax `show alarms severity` *severity*

Parameters *severity* — Set the alarm severity:

- `critical` — Critical alarm severity.
- `major` — Major alarm severity.
- `minor` — Minor alarm severity.
- `warning` — Warning alarm severity.

Default Not configured

Command Mode EXEC

Usage Information None

Example (Warning)

```
OS10# show alarms severity warning

Active-alarm details - 1
-----------------------------------------
Sequence Number:   5
Severity:          warning
Type:              1081364
Source:            Node.1-Unit.1
Name:              EQM_THERMAL_WARN_CROSSED
Description:
Raise-time:        Sat 10-06-2018 0:1:5
Ack-time:          Sun 10-07-2018 20:39:47
New:               true
State:             raised
```

Example (Critical)

```
OS10# show alarms severity critical

Active-alarm details - 0
-----------------------------------------
Sequence Number:   1
Severity:          critical
Type:              1081367
Source:            Node.1-Unit.1
Name:              EQM_THERMAL_CRIT_CROSSED
Description:
Raise-time:        Sat 10-06-2018 0:1:5
Ack-time:          Sun 10-07-2018 20:39:47
New:               true
State:             raised
```

Example (Minor)

```
NOS# show alarms severity minor
Active-alarm details - 1
-----------------------------------------
Sequence Number:   4
Severity:          minor
Type:              1081375
Source:            /psu/1
Name:              EQM_MORE_PSU_FAULT
Description:       psu 2 is not working correctly
Raise-time:        Sun 10-07-2018 18:39:47
Ack-time:          Sun 10-07-2018 20:39:47
New:               true
State:             acknowledged
-----------------------------------------
```

Supported Releases 10.4.3 or later

show alarms summary

Displays the summary of all active alarms.

Syntax `show alarms summary`

Parameters None

Default Not configured

Command Mode EXEC

Usage Information None

Example

```
OS10# show alarms summary
Active-alarm Summary
-----------------------------------------
Total-count:      2
Critical-count:   0
Major-count:      1
Minor-count:      1
Warning-count:    0
-----------------------------------------
```

Supported Releases 10.2.0E or later

show event history

Displays the history of all events with the latest at the top of the output.

Syntax `show event history [summary] [reverse] [severity` *`severity-name`*`] [details] [sequence` *`sequence-number`*`]`

Parameters

- `summary`—Displays a summary of the event history.
- `reverse`—Displays a summary of the event history from the beginning, with the oldest event listed at the top of the output.
- `severity`—Displays event history for a given severity: CRITICAL, MAJOR, MINOR, WARNING, INFORMATIONAL.
- `details`—Displays event history in details.
- `sequence` *`sequence-number`*—Displays event details for a given sequence number.

Default None

Command Mode EXEC

Usage Information

Displays event logs in the OS10 switch.

Example

```
OS10# show event history
Sq No State     Name                Timestamp                Source
----- --------  ------------------ ---------------------- ------
6     Cleared   EQM_FANTRAY_FAULT  Sun 10-07-2018 22:39:50 /fantray/3
5     Ack       EQM_MORE_PSU_FAULT Sun 10-07-2018 20:39:49 /psu/1
4     Raised    EQM_MORE_PSU_FAULT Sun 10-07-2018 18:39:47 /psu/1
3     Raised    EQM_MORE_PSU_FAULT Sun 10-07-2018 18:39:44 /psu/2
2     Raised    EQM_FANTRAY_FAULT  Sun 10-07-2018 16:39:42 /fantray/3
1     Stateless SYSTEM_REBOOT      Sun 10-07-2018 15:39:41    -
```

Example (severity)

```
OS10# show event history severity critical
Sq No State     Name                Timestamp                Source
----- --------  ------------------ ---------------------- ------
4     Raised    EQM_MORE_PSU_FAULT Sun 10-07-2018 18:39:47 /psu/1
3     Raised    EQM_MORE_PSU_FAULT Sun 10-07-2018 18:39:44 /psu/2
2     Raised    EQM_FANTRAY_FAULT  Sun 10-07-2018 16:39:42 /fantray/3
```

Example (reverse)

```
OS10# show event history reverse
Sq No State     Name                Timestamp                Source
----- --------  ------------------ ---------------------- ------
1     Stateless SYSTEM_REBOOT      Sun 10-07-2018 15:39:41    -
2     Raised    EQM_FANTRAY_FAULT  Sun 10-07-2018 16:39:42 /fantray/3
3     Raised    EQM_MORE_PSU_FAULT Sun 10-07-2018 18:39:44 /psu/2
4     Raised    EQM_MORE_PSU_FAULT Sun 10-07-2018 18:39:47 /psu/1
5     Ack       EQM_MORE_PSU_FAULT Sun 10-07-2018 20:39:49 /psu/1
6     Cleared   EQM_FANTRAY_FAULT  Sun 10-07-2018 22:39:50 /fantray/3
```

Example (sequence)

```
OS10# show event history sequence 2
Event History Details - 2
-----------------------------------------
Sequence Number: 2
Severity: informational
Name: IFM_ASTATE_UP
Description: Dummy Event
Timestamp: Fri May 03 18:13:07 2019
Source: -
State: stateless
-----------------------------------------
```

Example (details)

```
OS10# show event history details
Event History Details - 2
-----------------------------------------
Sequence Number: 2
Severity: informational
Name: IFM_ASTATE_UP
Description: Dummy Event
Timestamp: Fri May 03 18:13:07 2019
Source: -
State: stateless
-----------------------------------------
Event History Details - 1
-----------------------------------------
Sequence Number: 1
Severity: informational
Name: IFM_ASTATE_UP
Description: Dummy Event
Timestamp: Fri May 03 18:13:05 2019
Source: -
State: stateless
-----------------------------------------
```

Example (summary)

If the sequence number counter is not rolled over, the Last Rollover Time value is empty.

```
OS10# show event history summary

Event History Summary
-----------------------------------------
Total-count:             583
Raised-count:            4
Ack-count:               0
Cleared-count:           0
Stateless-count:         579
Next Sequence Number:    584
Last Rollover Time:
-----------------------------------------
```

Supported Releases

10.5.0 or later

show event severity-profile

Displays the active severity profile and the profile that becomes active after a system restart.

Syntax

```
show event severity-profile
```

Parameters

None

Default

None

Command Mode

EXEC

Usage Information

None

Example

```
OS10# show event severity-profile
Severity Profile Details
------------------------
Currently Active     : default
Active after restart : mySevProf.xml
```

Supported Releases

10.5.0 or later

Logging commands

clear logging

Clears messages in the logging buffer.

Syntax

```
clear logging log-file
```

Parameters

None

Default

Not configured

Command Mode

EXEC

Usage Information

Example

```
OS10# clear logging log-file

Proceed to clear the log file [confirm yes/no(default)]:
```

Supported Releases	10.2.0E or later

logging console

Disables, enables, or configures the minimum severity level for logging to the console.

Syntax	`logging console {disable | enable | severity}`
Parameters	*severity*—Set the minimum logging severity level: • `log-emerg`—Set to unusable. • `log-alert`—Set to immediate action is needed. • `log-crit`—Set to critical conditions. • `log-err`—Set to error conditions. • `log-warning`—Set to warning conditions. • `log-notice`—Set to normal but significant conditions, the default. • `log-info`—Set to informational messages. • `log-debug`—Set to debug messages.
Default	Log-notice
Command Mode	CONFIGURATION
Usage Information	To set the severity to the default level, use the `no logging console severity` command. The default severity level is `log-notice`. **NOTE:** The system rate-limits syslog messages to a maximum of 10 per second on the console.
Example	`OS10(config)# logging console disable`
Example (Enable)	`OS10(config)# logging console enable`
Example (Severity)	`OS10(config)# logging console severity log-warning`
Supported Releases	10.2.0E or later

logging enable

Enables system logging.

Syntax	`logging enable`
Parameters	None
Default	Enabled
Command Mode	CONFIGURATION
Usage Information	The `no` version of this command disables all logging.
Example	`OS10(config)# logging enable`
Supported Releases	10.2.0E or later

logging log-file

Disables, enables, or sets the minimum severity level for logging to the log file.

Syntax `logging log-file {disable | enable | severity}`

Parameters *severity* — Set the minimum logging severity level:
- `log-emerg` — Set the system as unusable.
- `log-alert` — Set to immediate action is needed.
- `log-crit` — Set to critical conditions.
- `log-err` — Set to error conditions.
- `log-warning` — Set to warning conditions.
- `log-notice` — Set to normal but significant conditions, the default.
- `log-info` — Set to informational messages.
- `log-debug` — Set to debug messages.

Default Log-notice

Command Mode CONFIGURATION

Usage Information To reset the log-file severity to the default level, use the `no logging log-file severity` command. The default severity level is `log-notice`.

Example
```
OS10(config)# logging log-file disable
```

Example (Enable)
```
OS10(config)# logging log-file enable
```

Example (Severity)
```
OS10(config)# logging log-file severity log-notice
```

Supported Releases 10.2.0E or later

logging monitor

Set the minimum severity level for logging to the terminal lines.

Syntax `logging monitor severity severity-level`

Parameters *severity-level* — Set the minimum logging severity level:
- `log-emerg` — Set the system as unusable.
- `log-alert` — Set to immediate action is needed.
- `log-crit` — Set to critical conditions.
- `log-err` — Set to error conditions.
- `log-warning` — Set to warning conditions.
- `log-notice` — Set to normal but significant conditions, the default.
- `log-info` — Set to informational messages.
- `log-debug` — Set to debug messages.

Default Log-notice

Command Mode CONFIGURATION

Usage Information To reset the monitor severity to the default level, use the `no logging monitor severity` command. The default severity level is `log-notice`.

Example
```
OS10(config)# logging monitor severity log-info
```

Supported Releases 10.2.0E or later

logging security-profile

Creates a TLS security profile for system logging.

Syntax `logging security-profile profile-name`

Parameters *profile-name* — Enter the name of the Syslog over TLS security profile created with the `crypto security-profile profile-name` command; a maximum of 32 characters.

Default Not configured

Command mode CONFIGURATION

Usage information Use this command to specify the configured crypto security profile to use to send system messages to a remote server over TLS. TLS requires an X.509v3 certificate-key pair installed on the switch.

Example

```
OS10(config)# logging security-profile prof1
```

Supported releases 10.5.0 or later

logging server

Configures a remote syslog server.

Syntax `logging server {ipv4-address | ipv6-address} [tcp | udp | tls] [port-number] [severity severity-level] [vrf {management | vrf-name]`

Parameters

- *ipv4-address* | *ipv6-address* — (Optional) Enter the IPv4 or IPv6 address of the logging server.
- `tcp | udp | tls` *port-number* — (Optional) Send syslog messages using TCP, UDP, or TLS transport to a specified port on a remote logging server, from 1 to 65535.
- *severity-level* — (Optional) Set the logging threshold severity:
  - `log-emerg` — System is unusable.
  - `log-alert` — Immediate action is needed.
  - `log-crit` — Critical conditions
  - `log-err` — Error conditions
  - `log-warning` — Warning conditions
  - `log-notice` — Normal, but significant conditions (default)
  - `log-info` — Informational messages
  - `log-debug` — Debug messages
- `vrf {management | vrf-name}` — (Optional) Configure the logging server for the management or a specified VRF instance.

Defaults System logging to a remote server is not configured. When configured, system messages are sent over UDP to port 514 on a remote logging server by default. System messages of severity-level `log-notice` and lower are sent.

Command Mode CONFIGURATION

Usage Information Use the `logging server` command to forward log messages to syslog servers for storage.

The `tls` option requires that a valid security profile is already configured with the `logging security-profile` command. If you delete the logging security profile, system messages are sent using UDP (default) to a remote syslog server.

The `no` version of this command deletes the syslog server.

Example

```
OS10(config)# logging server 10.11.86.139 severity log-info
```

```
OS10(config)# logging server fda8:6c3:ce53:a890::2 tcp 1468
```

```
OS10(config)# logging server 10.11.86.139 vrf management severity log-
debug
```

Supported Releases 10.5.0 or later

show logging

Displays system logging messages by log file, process-names, or summary.

Syntax `show logging {log-file [process-name | line-numbers] | process-names}`

Parameters

- *process-name* — (Optional) Enter the process-name to use as a filter in syslog messages.
- *line-numbers* — (Optional) Enter the number of lines to include in the logging messages, from 1 to 65535.

Default None

Command Mode EXEC

Usage Information The output from this command is the */var/log/eventlog* file.

NOTE: Debug logs are not displayed when you issue the `show logging log-file command`. To access or see the journal log file, enter the Linux prompt and type the following command: `root@OS10:~# journalctl`.

Example (Log File)

```
OS10# show logging log-file process-name dn_qos
```

Example (Process-Names)

```
OS10# show logging process-names
dn_pas_svc
dn_system_mgmt_
dn_env_tmpctl
dn_pm
dn_eth_drv
dn_etl
dn_eqa
dn_alm
dn_eqm
dn_issu
dn_swupgrade
dn_ifm
dn_ppm
dn_l2_services

dn_l3_core_serv
dn_policy
dn_qos
dn_switch_res_m
dn_ospfv3
dn_lacp
dn_i3
dn_supportassis
--More--
```

Supported Releases 10.2.0E or later

show trace

Displays trace messages.

Syntax `show trace [number-lines]`

Parameters *number-lines* — (Optional) Enter the number of lines to include in log messages, from 1 to 65535.

Default Enabled

Command Mode EXEC

Usage Information The output from this command is the */var/log/syslog* file.

Example

```
OS10# show trace
May 23 17:10:03 OS10 base_nas: [NETLINK:NH-
EVENT]:ds_api_linux_neigh.c:nl_to_nei

Supported Releases 10.2.0E or later

Monitor CPU Utilization

You can set CPU thresholds so that alarms are triggered when CPU utilization reaches the high or low threshold level. CPU utilization is monitored as a running average percentage over predefined intervals of five seconds, one minute, and five minutes. By default, this feature is enabled with a higher threshold value so that alarms do not generate frequently.

When CPU utilization crosses the high threshold, a critical alarm triggers. A warning alarm triggers when CPU utilization crosses the low threshold. The alarms clear when CPU utilization goes below the corresponding threshold. To view the current active alarms in the system, use the `show alarms` command.

The `util-threshold cpu` command allows you to configure the high and low threshold values. Before configuring the threshold values, configure a syslog server to collect and store the syslog messages. To view the configured CPU utilization thresholds, use the `show util-threshold cpu` command.

NOTE: During image installation, upgrade, or reload with default threshold values, CPU utilization might cross the threshold values and therefore trigger alarms. These alarms eventually clear after the installation, upgrade, or reload is completed.

Example of configuring CPU utilization threshold values

```
OS10# configure terminal
OS10(config)# logging server 10.10.10.11
OS10(config)# util-threshold cpu 1min high 10 low 5
OS10(config)# util-threshold cpu 5min high 80 low 70
OS10(config)# exit
OS10# show util-threshold cpu

Processor      5Sec(%)        1Min(%)      5Min(%)
             High    Low     High  Low     High    Low
================================================
Overall       0       0       10    5       80      70
```

CPU Utilization commands

show processes cpu

Displays information about CPU usage for processes running in the system.

Syntax `show processes cpu {summary | num-of-tasks}`

Parameters

- `summary`—Display a summary of CPU usage.
- *`num-of-tasks`*—Specify the number of tasks to display in order of the highest CPU usage in the past 5 seconds, 1 minute, and 5 minutes. The valid values are from 1 to 99.

Defaults None

Command Mode EXEC

Usage Information None

Example (summary)

```
OS10# show processes cpu summary

CPU Utilization    5Sec(%)       1Min(%)       5Min(%)
-----------------------------------------------------
UNIT1              7.79          7.61          7.79
```

Example (number of tasks)

```
OS10# show processes cpu 4

CPU Statistics of Unit 1
========================
CPUID      5Sec(%)       1Min(%)      5Min(%)
-----------------------------------------
Overall    9.09          8.58         9.09

PID      Process        Runtime(s)      5sec(%)      1min(%)      5min(%)
1387     dn_sm          243346          1.4          1.4          1.4
955      dn_pas_svc     243354          0.6          0.6          0.6
959      dn_dot1x       243354          0.2          0.2          0.2
1374     dn_lacp        243346          0.2          0.2          0.2
```

Supported Releases 10.5.2.0 or later

show util-threshold cpu

Displays the configured CPU utilization threshold values.

Syntax `show util-threshold cpu`

Parameters None

Defaults None

Command Mode EXEC

Usage Information This command displays the CPU utilization thresholds that trigger alarms. When the CPU utilization percentage across different time durations crosses the threshold values, an alarm generates. To reconfigure the threshold values, use the `util-threshold cpu` command.

Example

```
OS10# show util-threshold cpu
Processor     5Sec(%)         1Min(%)         5Min(%)
             High    Low     High    Low      High    Low
=================================================
Overall       0       0       10      5        80      70
```

Supported Releases 10.5.2.0 or later

util-threshold cpu

Sets the CPU utilization threshold values.

Syntax `util—threshold cpu` *`cpu-utilization-time threshold threshold-percentage`*

Parameters

- *`cpu-utilization-time`*—Set the CPU threshold time:
  - `1min`—Set threshold to 1-minute CPU utilization.
  - `5min`—Set the threshold to 5-minute CPU utilization.
  - `5sec`—Set the threshold to 5-second CPU utilization.
- *`threshold`*—Set the high and low threshold:
  - `high`—Set the threshold to high.
  - `low`—Set the threshold to low.
- *`threshold-percentage`*—Enter the threshold percentage, from 0 to 100.

Default

- High CPU utilization threshold: `1min` = 85%, `5min` = 80%
- Low CPU utilization threshold: `1min` = 75%, `5min` = 70%

Command Mode CONFIGURATION

Usage Information The system triggers an alarm each time the configured CPU threshold is crossed. Setting both high and low thresholds to 0 disables CPU utilization monitoring.

The `no` version of this command returns the CPU thresholds to the default values.

Example

```
OS10(config)# util-threshold cpu 5min high 80 low 60
```

Supported Releases 10.5.2.0 or later

Monitor Memory Utilization

You can set memory thresholds so that an alarm triggers when the system memory utilization reaches the high or low threshold level. By default, this feature is enabled with a higher threshold value so that alarms do not generate frequently.

Memory utilization is monitored as a percentage of memory consumed in the overall system memory. When the total memory utilization crosses the high threshold, a critical alarm triggers. When the total memory utilization crosses the low threshold, a

warning alarm triggers. The alarms clear when memory utilization goes below the corresponding thresholds. To view the current active alarms in the system, use the `show alarms` command.

To configure the high or low memory utilization threshold values, use the `util-threshold memory` command. Before configuring the threshold values, configure a syslog server to collect and store the syslog messages. To display the configured utilization thresholds, use the `show util-threshold memory` command.

Example of configuring memory utilization threshold

```
OS10# configure terminal
OS10(config)# logging server 10.10.10.11
OS10(config)# util-threshold memory high 80 low 60
OS10(config)# exit
OS10# show util-threshold memory

Processor     High      Low
==========================
Overall       80        60
```

Memory Utilization commands

show processes memory

Displays information about memory usage for processes running in the system.

Syntax `show processes memory [num-of-tasks]`

Parameters *num-of-tasks*—(Optional) Specify the number of tasks to display with highest memory usage, from 1 to 99.

Defaults None

Command Mode EXEC

Usage Information None

Example

```
OS10# show processes memory 5

Memory Statistics of Unit 1 (kilobytes)
=======================================
Total: 2042432, CurrentUsed:399980, CurrentFree:1642452

PID           Process            Total-used
1738          python             55145.664
1785          base_nas           55145.664
1383          python             51060.8
2710          python             51060.8
984           python             49018.368
```

Supported Releases 10.5.2.0 or later

show util-threshold memory

Displays the configured memory utilization threshold values.

Syntax `show util-threshold memory`

Parameters None

Defaults None

Command Mode EXEC

Usage Information	This command displays the memory utilization thresholds that trigger alarms. When the memory exceeds the high or low configured threshold values, an alarm generated. To reconfigure the threshold values, use the `util-threshold memory` command.

Example	`OS10# show util-threshold memory`
	
	`Processor High Low`
	`==========`
	`Overall 80 60`

Supported Releases	10.5.2.0 or later

util-threshold memory

Configures the high or low memory utilization thresholds for SNMP traps.

Syntax	`util—threshold memory` *`threshold threshold-percentage`*

Parameters	• *`threshold`*—Set the threshold value:
	  ○ `high`—High threshold. The default is 92.
	  ○ `low`—Low threshold.
	• *`threshold-percentage`*—Set the threshold percentage, from 0 to 100.

Default	• High threshold: 92% • Low threshold: 82%
Command Mode	CONFIGURATION
Usage Information	When the total memory utilization for a CPU exceeds the configured high or low threshold for a given time, the system triggers an alarm. Setting both high and low thresholds to 0 disables monitoring of memory utilization. The `no` version of this command returns the memory thresholds to the default values.
Example	`OS10(config)# util-threshold memory high 80 low 60`
Supported Releases	10.5.2.0 or later

Log into OS10 device

Linux shell access is available for troubleshooting and diagnostic purposes only. Use `linuxadmin` for both the default user name and password. For security reasons, you must use the `system-user` command to change the default `linuxadmin` password from the command-line interface.

If you change the password in the Linux shell, configure the same password from the CLI to avoid inconsistent behavior. To save the new password for future logins, enter the `write memory` command.

CAUTION: Changing the system state from the Linux shell can result in undesired and unpredictable system behavior. Only use Linux shell commands to display system state and variables, or as instructed by Dell Support.

```
OS10 login: linuxadmin
Password: linuxadmin      >> only for first-time login

Linux OS10 3.16.7-ckt20 #1 SMP Debian 3.16.7-ckt20-1+deb8u4 (2017-05-01) x86_64

Frequently asked questions

This section contains answers to frequently asked questions for ONIE-enabled devices.

- Installation contains information about how to enter ONIE: Install mode after a reboot, find information about your specific switch, how to log into the OS10 shell, and so on.
- Hardware contains information about how to view default console settings, how to view hardware alarms and events, how to view LED status, and so on.
- Configuration contains information about how to enter CONFIGURATION mode, how to modify the candidate configuration, and so on.
- Security contains information about how to add users, troubleshoot RADIUS, how to view current DHCP information, and so on.
- Layer 2 contains information about how to configure routing information including 802.1X, LACP, LLDP, MAC, and so on.
- Layer 3 contains information about how to troubleshoot BCP, ECMP, OSPF, and so on.
- System management contains information about how to view current interface configuration information, how to view a list of all system devices, how to view the software version, and so on.
- Quality of service contains information about quality of service including classification and marking, congestion management, policing and shaping, and so on.
- Monitoring contains information about how to view alarms, events, logs, and so on.

Installation

How do I configure a default management route?

Although the default management route was configured during installation, you can use the `route add default gw` command from the Linux shell to configure the default management IP address for routing. SupportAssist requires the default management route is configured to work properly, as well as DNS configured and a route to a proxy server.

How do I log into the OS10 shell as the system administration?

Use `linuxadmin` as the username and password to enter OS10 at root level.

Where can I find additional installation information for my specific device?

See the *Setup Guide* shipped with your device or the platform-specific *Installation Guide* on the Dell Support page at dell.com/support.

Hardware

What are the default console settings for ON-Series devices?

- Set the data rate to 115200 baud
- Set the data format to 8 bits, stop bits to 1, and no parity
- Set flow control to none

How do I view the hardware inventory?

Use the `show inventory` command to view complete system inventory.

How do I view the process-related information?

Use the `show processes node-id` *`node-id-number`* `[pid` *`process-id`*`]` command to view the process CPU utilization information.

Configuration

How do I enter CONFIGURATION mode?

Use the `configure terminal` command to change from EXEC mode to CONFIGURATION mode.

I made changes to the running configuration file but the updates are not showing. How do I view my changes?

Use the `show running-configuration` command to view changes that you have made to the running-configuration file. Here are the differences between the available configuration files:

- startup-configuration contains the configuration applied at device startup
- running-configuration contains the current configuration of the device
- candidate-configuration is an intermediate temporary buffer that stores configuration changes prior to applying them to the running-configuration

Security

How do I add new users?

Use the `username` commands to add new users. Use the `show users` command to view a list of current users.

How do I view RADIUS transactions to troubleshoot problems?

Use the `debug radius` command.

How do I view the current DHCP binding information?

Use the `show ip dhcp binding` command.

Layer 2

How do I view the VLAN running configuration?

Use the `show vlan` command to view all configured VLANs.

Layer 3

How do I view IPv6 interface information?

Use the `show ipv6 route summary` command.

How do I view summary information for all IP routes?

Use the `show running-configuration` command.

How do I view summary information for the OSPF database?

Use the `show ip ospf database` command.

How do I view configuration of OSPF neighbors connected to the local router?

Use the `show ip ospf neighbor` command.

System management

How can I view the current interface configuration?

Use the `show running-configuration` command to view all currently configured interfaces.

How can I view a list of all system devices?

Use the `show inventory` command to view a complete list.

How can I view the software version?

Use the `show version` command to view the currently running software version.

Access control lists

How do I setup filters to deny or permit packets from an IPv4 or IPv6 address?

Use the `deny` or `permit` commands to create ACL filters.

How do I clear access-list counters?

Use the `clear ip access-list counters`, `clear ipv6 access-list counters`, or `clear mac access-list counters` commands.

How do I setup filters to automatically assign sequencer numbers for specific addresses?

Use the `seq deny` or `seq permit` commands for specific packet filtering.

How do I view access-list and access-group information?

Use the `show {ip | mac | ipv6} access-group` and `show {ip | mac | ipv6} access-list` commands.

Quality of service

What are the QoS error messages?

Flow control error messages:

- `Error: priority-flow-control mode is on, disable pfc mode to enable LLFC`
- `% Warning: Make sure all qos-groups are matched in a single class in attached policy-map`

Priority flow control mode error message:

```
% Error: LLFC flowcontrol is on, disable LLFC to enable PFC
```

PFC shared-buffer size error message:

```
% Error: Hardware update failed.
```

Pause error message:

```
% Error: Buffer-size should be greater than Pause threshold and Pause threshold should be greater than equal to Resume threshold.
```

PFC cost of service error messages:

- `% Error: Not enough buffers are available, to enable system-qos wide pause for all pfc-cos values in the policymap`
- `% Error: Not enough buffers are available, to enable system-qos wide pause for the pfc-cos values in the policymap`
- `% Error: Not enough buffers are available, to enable pause for all pfc-cos values in the policymap for this interface`
- `% Warning: Not enough buffers are available, for lossy traffic. Expect lossy traffic drops, else reconfigure the pause buffers`

Monitoring

How can I check if SupportAssist is enabled?

Use the `show support-assist status` command to view current configuration information.

How can I view a list of alarms?

Use the `show alarms details` to view a list of all system alarms.

How do I enable or disable system logging?

Use the `logging enable` command or the `logging disable` command.

How do I view system logging messages?

Use the `show logging` command to view messages by log file or process name.

Support resources

The Dell Technologies support site provides a range of documents and tools to assist you with effectively using Dell devices. Through the support site you can obtain technical information regarding Dell products, access software upgrades and patches, download available management software, and manage your open cases. The support site provides integrated, secure access to these services.

To access the support site, go to www.dell.com/support/. To display information in your language, scroll down to the bottom of the page and select your country from the drop-down menu.

- To obtain product-specific information, enter the 7-character service tag or 11-digit express service code of your switch and click **Submit**.

  To view the service tag or express service code, pull out the luggage tag on the chassis or enter the `show license status` command from the CLI.

- To receive additional kinds of technical support, click **Contact Us**, then click **Technical Support**.

To access system documentation, see www.dell.com/manuals/.

To search for drivers and downloads, see www.dell.com/drivers/.

To participate in Dell Technologies community blogs and forums, see www.dell.com/community.
