		• (Optional) The **retry period** keyword and *minutes* argument specifies the period, in minutes, in which the router waits before sending the CA another certificate request. Valid values are from 1 to 60. The default is 1.
		• (Optional) The **retry count** keyword and *number* argument specifies the number of times a router will resend a certificate request when it does not receive a response from the previous request. Valid values are from 1 to 100. The default is 10.
		• The *url* argument is the URL of the CA to which your router should send certificate requests.

	Command or Action	Purpose
		Note With the introduction of Cisco IOS Release 15.2(1)T, an IPv6 address can be added to the **http:** enrolment method. For example: http://[ipv6-address]:80. The IPv6 address must be enclosed in brackets in the URL. See the Command Reference document for more information on the other enrollment methods that can be used. • (Optional) The **pem** keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request.
Step 7	revocation-check method **Example:** `Router (ca-trustpoint)# revocation-check crl`	(Optional) Checks the revocation status of a certificate.
Step 8	**exit** **Example:** `Router (ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode and returns to global configuration mode.
Step 9	**authorization username subjectname** *subjectname* **Example:** `Router (config)# authorization username subjectname serialnumber`	Sets parameters for the different certificate fields that are used to build the AAA username. The *subjectname* argument can be any of the following: • **all** --Entire distinguished name (subject name) of the certificate. • **commonname** --Certification common name. • **country** --Certificate country. • **email** --Certificate e-mail. • **ipaddress** --Certificate IP address. • **locality** --Certificate locality. • **organization** --Certificate organization. • **organizationalunit** --Certificate organizational unit. • **postalcode** --Certificate postal code. • **serialnumber** --Certificate serial number. • **state** --Certificate state field. • **streetaddress** --Certificate street address. • **title** --Certificate title.

	Command or Action	Purpose
		• **unstructuredname** --Certificate unstructured name.
Step 10	**authorization list** *listname* **Example:** `Route (config)# authorization list maxaaa`	Specifies the AAA authorization list.

Step 11	**tacacs-server host** hostname [**key** string]
	Example:
	`Router(config)# tacacs-server host 192.0.2.2 key a_secret_key`
	Example:
	`radius-server host hostname [key string]`
	Example:
	`Router(config)# radius-server host 192.0.2.1 key another_secret_key`
		Specifies a TACACS+ host.
		or
		Specifies a RADIUS host.

Troubleshooting Tips

To display debug messages for the trace of interaction (message type) between the CA and the router, use the **debug crypto pki transactions**command. (See the sample output, which shows a successful PKI integration with AAA server exchange and a failed PKI integration with AAA server exchange.)

Successful Exchange

```
Router# debug crypto pki transactions
Apr 22 23:15:03.695: CRYPTO_PKI: Found a issuer match
Apr 22 23:15:03.955: CRYPTO_PKI: cert revocation status unknown.
Apr 22 23:15:03.955: CRYPTO_PKI: Certificate validated without revocation check
```

Each line that shows “CRYPTO_PKI_AAA” indicates the state of the AAA authorization checks. Each of the AAA AV pairs is indicated, and then the results of the authorization check are shown.

```
Apr 22 23:15:04.019: CRYPTO_PKI_AAA: checking AAA authorization (ipsecca_script_aaalist,
PKIAAA-L, <all>)
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute ("cert-application" = "all")
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute ("cert-trustpoint" = "CA1")
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: reply attribute ("cert-serial" = "15DE")
Apr 22 23:15:04.503: CRYPTO_PKI_AAA: authorization passed
Apr 22 23:12:30.327: CRYPTO_PKI: Found a issuer match
```

Failed Exchange

```
Router# debug crypto pki transactions
Apr 22 23:11:13.703: CRYPTO_PKI_AAA: checking AAA authorization =
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute ("cert-application" = "all")
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute ("cert-trustpoint"= "CA1")
```

```
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: reply attribute ("cert-serial" = "233D")
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: parsed cert-lifetime-end as: 21:30:00
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: timezone specific extended
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: cert-lifetime-end is expired
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: cert-lifetime-end check failed.
Apr 22 23:11:14.203: CRYPTO_PKI_AAA: authorization failed
```

In the above failed exchange, the certificate has expired.

Configuring a Revocation Mechanism for PKI Certificate Status Checking

Perform this task to set up a CRL as the certificate revocation mechanism--CRLs or OCSP--that is used to check the status of certificates in a PKI.

The revocation-check Command

Use the **revocation-check** command to specify at least one method (OCSP, CRL, or skip the revocation check) that is to be used to ensure that the certificate of a peer has not been revoked. For multiple methods, the order in which the methods are applied is determined by the order specified via this command.

If your router does not have the applicable CRL and is unable to obtain one or if the OCSP server returns an error, your router will reject the peer's certificate--unless you include the **none** keyword in your configuration. If the **none** keyword is configured, a revocation check will not be performed and the certificate will always be accepted.

Note When the revocation check is changed to 'none' under a trustpoint, the CRL cache associated with the CA certificate of the trustpoint will be cleared.

Nonces and Peer Communications with OCSP Servers

When using OCSP, nonces, unique identifiers for OCSP requests, are sent by default during peer communications with your OCSP server. The use of nonces offers a more secure and reliable communication channel between the peer and OCSP server.

If your OCSP server does not support nonces, you may disable the sending of nonces. For more information, check your OCSP server documentation.

Before you begin

- Before issuing any client certificates, the appropriate settings on the server (such as setting the CDP) should be configured.
- When configuring an OCSP server to return the revocation status for a CA server, the OCSP server must be configured with an OCSP response signing certificate that is issued by that CA server. Ensure that the signing certificate is in the correct format, or the router will not accept the OCSP response. See your OCSP manual for additional information.

Note

- OCSP transports messages over HTTP, so there may be a time delay when you access the OCSP server.
- If the OCSP server depends on normal CRL processing to check revocation status, the same time delay that affects CRLs will also apply to OCSP.

>

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. crypto pki trustpoint *name*
4. **ocsp url** *url*
5. **revocation-check** *method1* [*method2 method3*]]
6. **ocsp disable-nonce**
7. **exit**
8. **exit**
9. **show crypto pki certificates**
10. **show crypto pki trustpoints** [**status** | *label* [**status**]]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	crypto pki trustpoint *name* **Example:** `Router(config)# crypto pki trustpoint hazel`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.

Step 4	**ocsp url** *url*
	Example:
	`Router(ca-trustpoint)# ocsp url http://ocsp-server`
	- or -
	`Router(ca-trustpoint)# ocsp url http://10.10.10.1:80`
		The *url* argument specifies the URL of an OCSP server so that the trustpoint can check the certificate status. This URL overrides the URL of the OCSP server (if one exists) in the Authority Info Access (AIA) extension of the certificate. All certificates associated with a configured trustpoint are checked by the OCSP server. The URL can be a hostname, IPv4 address, or an IPv6 address.

	Command or Action	Purpose
	- or - `Router(ca-trustpoint)# ocsp url http://[2001DB8:1:1::2]:80`	
Step 5	**revocation-check** *method1* [*method2 method3*]] **Example:** `Router(ca-trustpoint)# revocation-check ocsp none`	Checks the revocation status of a certificate. • **crl** --Certificate checking is performed by a CRL. This is the default option. • **none** --Certificate checking is ignored. • **ocsp** --Certificate checking is performed by an OCSP server. If a second and third method are specified, each method will be used only if the previous method returns an error, such as a server being down.
Step 6	**ocsp disable-nonce** **Example:** `Router(ca-trustpoint)# ocsp disable-nonce`	(Optional) Specifies that a nonce, or an OCSP request unique identifier, will not be sent during peer communications with the OCSP server.
Step 7	**exit** **Example:** `Router(ca-trustpoint)# exit`	Returns to global configuration mode.
Step 8	**exit** **Example:** `Router(config)# exit`	Returns to privileged EXEC mode.
Step 9	**show crypto pki certificates** **Example:** `Router# show crypto pki certificates`	(Optional) Displays information about your certificates.
Step 10	**show crypto pki trustpoints** [**status** | *label* [**status**]] **Example:** `Router# show crypto pki trustpoints`	Displays information about the trustpoint configured in router.

Configuring Certificate Authorization and Revocation Settings

Perform this task to specify a certificate-based ACL, to ignore revocation checks or expired certificates, to manually override the default CDP location, to manually override the OCSP server setting, to configure CRL caching, or to set session acceptance or rejection based on a certificate serial number, as appropriate.

Configuring Certificate-Based ACLs to Ignore Revocation Checks

To configure your router to use certificate-based ACLs to ignore revocation checks and expired certificates, perform the following steps:

- Identify an existing trustpoint or create a new trustpoint to be used when verifying the certificate of the peer. Authenticate the trustpoint if it has not already been authenticated. The router may enroll with this trustpoint if you want. Do not set optional CRLs for the trustpoint if you plan to use the **match certificate** command and **skip revocation-check** keyword.
- Determine the unique characteristics of the certificates that should not have their CRL checked and of the expired certificates that should be allowed.
- Define a certificate map to match the characteristics identified in the prior step.
- You can add the **match certificate** command and **skip revocation-check** keyword and the **match certificate command** and **allow expired-certificate** keyword to the trustpoint that was created or identified in the first step.

Note Certificate maps are checked even if the peer's public key is cached. For example, when the public key is cached by the peer, and a certificate map is added to the trustpoint to ban a certificate, the certificate map is effective. This prevents a client with the banned certificate, which was once connected in the past, from reconnecting.

Manually Overriding CDPs in a Certificate

Users can override the CDPs in a certificate with a manually configured CDP. Manually overriding the CDPs in a certificate can be advantageous when a particular server is unavailable for an extended period of time. The certificate's CDPs can be replaced with a URL or directory specification without reissuing all of the certificates that contain the original CDP.

Manually Overriding the OCSP Server Setting in a Certificate

Administrators can override the OCSP server setting specified in the Authority Information Access (AIA) field of the client certificate or set by the issuing the **ocsp url** command. One or more OCSP servers may be manually specified, either per client certificate or per group of client certificates by the **match certificate override ocsp** command. The **match certificate override ocsp**command overrides the client certificate AIA field or the **ocsp url**command setting if a client certificate is successfully matched to a certificate map during the revocation check.

Note Only one OCSP server can be specified per client certificate.

Configuring CRL Cache Control

By default, a new CRL will be downloaded after the currently cached CRL expires. Administrators can either configure the maximum amount of time in minutes a CRL remains in the cache by issuing the **crl cache delete-after** command or disable CRL caching by issuing the **crl cache none** command. Only the **crl-cache**

delete-aftercommand or the **crl-cache none** command may be specified. If both commands are entered for a trustpoint, the last command executed will take effect and a message will be displayed.

Neither the **crl-cache none** command nor the **crl-cache delete-after** command affects the currently cached CRL. If you configure the **crl-cache none** command, all CRLs downloaded after this command is issued will not be cached. If you configure the **crl-cache delete-after** command, the configured lifetime will only affect CRLs downloaded after this command is issued.

This functionality is useful is when a CA issues CRLs with no expiration date or with expiration dates days or weeks ahead.

Configuring Certificate Serial Number Session Control

A certificate serial number can be specified to allow a certificate validation request to be accepted or rejected by the trustpoint for a session. A session may be rejected, depending on certificate serial number session control, even if a certificate is still valid. Certificate serial number session control may be configured by using either a certificate map with the **serial-number** field or an AAA attribute, with the **cert-serial-not** command.

Using certificate maps for session control allows an administrator to specify a single certificate serial number. Using the AAA attribute allows an administrator to specify one or more certificate serial numbers for session control.

Before you begin

- The trustpoint should be defined and authenticated before attaching certificate maps to the trustpoint.
- The certificate map must be configured before the CDP override feature can be enabled or the **serial-number** command is issued.
- The PKI and AAA server integration must be successfully completed to use AAA attributes as described in "PKI and AAA Server Integration for Certificate Status."

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. crypto pki certificate map label sequence-number
4. *field-name match-criteria match-value*
5. **exit**
6. **crypto pki trustpoint** *name*
7. Do one of the following:
   - **crl-cache none**
   - **crl-cache delete-after** *time*
8. **match certificate** *certificate-map-label* [**allow expired-certificate** | **skip revocation-check** | **skip authorization-check**
9. **match certificate** *certificate-map-label* **override cdp** {**url** | **directory**} *string*
10. **match certificate** *certificate-map-label* **override ocsp** [**trustpoint** *trustpoint-label*] *sequence-number* **url** *ocsp-url*
11. **exit**
12. **aaa new-model**

13. **aaa attribute list** *list-name*
14. **attribute type** {*name*} {*value*}
15. **exit**
16. **exit**
17. **show crypto pki certificates**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	crypto pki certificate map label sequence-number **Example:** `Router(config)# crypto pki certificate map Group 10`	Defines values in a certificate that should be matched or not matched and enters ca-certificate-map configuration mode.
Step 4	*field-name match-criteria match-value* **Example:** `Router(ca-certificate-map)# subject-name co MyExample`	Specifies one or more certificate fields together with their matching criteria and the value to match. The *field-name* is one of the following case-insensitive name strings or a date: • **alt-subject-name** • **expires-on** • **issuer-name** • **name** • **serial-number** • **subject-name** • **unstructured-subject-name** • **valid-start** **Note** Date field format is dd mm yyyy hh:mm:ss or mmm dd yyyy hh:mm:ss. The *match-criteria* is one of the following logical operators:

	Command or Action	Purpose
		• **co** --contains (valid only for name fields and serial number field) • **eq** --equal (valid for name, serial number, and date fields) • **ge** --greater than or equal (valid only for date fields) • **lt** --less than (valid only for date fields) • **nc** --does not contain (valid only for name fields and serial number field) • **ne** --not equal (valid for name, serial number, and date fields) The *match-value*is the name or date to test with the logical operator assigned by match-criteria. **Note** Use this command only when setting up a certificate-based ACL--not when setting up a certificate-based ACL to ignore revocation checks or expired certificates.
Step 5	**exit** **Example:** `Router(ca-certificate-map)# exit`	Returns to global configuration mode.
Step 6	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint Access2`	Declares the trustpoint, given name and enters ca-trustpoint configuration mode.

Step 7	Do one of the following:
	• **crl-cache none**
	• **crl-cache delete-after** *time*
	Example:
	`Router(ca-trustpoint)# crl-cache none`
	Example:
	`Router(ca-trustpoint)# crl-cache delete-after 20`
		(Optional) Disables CRL caching completely for all CRLs associated with the trustpoint.
		The **crl-cache none** command does not affect any currently cached CRLs. All CRLs downloaded after this command is configured will not be cached.
		(Optional) Specifies the maximum time CRLs will remain in the cache for all CRLs associated with the trustpoint.
		• *time* --The amount of time in minutes before the CRL is deleted.
		The **crl-cache delete-after** command does not affect any currently cached CRLs. The configured lifetime will only affect CRLs downloaded after this command is configured.

	Command or Action	Purpose
Step 8	**match certificate** *certificate-map-label* [**allow expired-certificate** | **skip revocation-check** | **skip authorization-check** **Example:** `Router(ca-trustpoint)# match certificate Group skip revocation-check`	(Optional) Associates the certificate-based ACL (that was defined via the **crypto pki certificate map** command) to a trustpoint. • *certificate-map-label* --Must match the *label* argument specified via the **crypto pki certificate map** command. • **allow expired-certificate** --Ignores expired certificates. • **skip revocation-check** --Allows a trustpoint to enforce CRLs except for specific certificates. • **skip authorization-check** --Skips the AAA check of a certificate when PKI integration with an AAA server is configured.
Step 9	**match certificate** *certificate-map-label* **override cdp** {**url** | **directory**} *string* **Example:** `Router(ca-trustpoint)# match certificate Group1 override cdp url http://server.cisco.com`	(Optional) Manually overrides the existing CDP entries for a certificate with a URL or directory specification. • *certificate-map-label* --A user-specified label that must match the *label* argument specified in a previously defined **crypto pki certificate map** command. • **url** --Specifies that the certificate's CDPs will be overridden with an HTTP or LDAP URL. • **directory** --Specifies that the certificate's CDPs will be overridden with an LDAP directory specification. • *string* --The URL or directory specification. **Note** Some applications may time out before all CDPs have been tried and will report an error message. The error message will not affect the router, and the Cisco IOS software will continue attempting to retrieve a CRL until all CDPs have been tried.
Step 10	**match certificate** *certificate-map-label* **override ocsp** [**trustpoint** *trustpoint-label*] *sequence-number* **url** *ocsp-url* **Example:** `Router(ca-trustpoint)# match certificate mycertmapname override ocsp trustpoint mytp 15 url http://192.0.2.2`	(Optional) Specifies an OCSP server, either per client certificate or per group of client certificates, and may be issued more than once to specify additional OCSP servers and client certificate settings including alternative PKI hierarchies. • *certificate-map-label* --The name of an existing certificate map. • **trustpoint** --The trustpoint to be used when validating the OCSP server certificate.

	Command or Action	Purpose
		• *sequence-number* --The order the **match certificate override ocsp** command statements apply to the certificate being verified. Matches are performed from the lowest sequence number to the highest sequence number. If more than one command is issued with the same sequence number, it overwrites the previous OCSP server override setting. • **url** --The URL of the OCSP server. When the certificate matches a configured certificate map, the AIA field of the client certificate and any previously issued **ocsp url** command settings are overwritten with the specified OCSP server. If no map-based match occurs, one of the following two cases will continue to apply to the client certificate. • If OCSP is specified as the revocation method, the AIA field value will continue to apply to the client certificate. • If the **ocsp url** configuration exists, the **ocsp url** configuration settings will continue to apply to the client certificates.
Step 11	**exit** **Example:** `Router(ca-trustpoint)# exit`	Returns to global configuration mode.
Step 12	**aaa new-model** **Example:** `Router(config)# aaa new-model`	(Optional) Enables the AAA access control model.
Step 13	**aaa attribute list** *list-name* **Example:** `Router(config)# aaa attribute list crl`	(Optional) Defines an AAA attribute list locally on a router and enters config-attr-list configuration mode.
Step 14	**attribute type** {*name*} {*value*} **Example:** `Router(config-attr-list)# attribute type cert-serial-not 6C4A`	(Optional) Defines an AAA attribute type that is to be added to an AAA attribute list locally on a router. To configure certificate serial number session control, an administrator may specify a specific certificate in the *value* field to be accepted or rejected based on its serial number where *name* is set to **cert-serial-not**. If the serial number of the certificate matches the serial number specified by the attribute type setting, the certificate will be rejected.

	Command or Action	Purpose
		For a full list of available AAA attribute types, execute the **show aaa attributes** command.

Step 15	**exit**
	Example:
	`Router(ca-trustpoint)# exit`
	Example:
	`Router(config-attr-list)# exit`
		Returns to global configuration mode.

Step 16	**exit** **Example:** `Router(config)# exit`	Returns to privileged EXEC mode.
Step 17	**show crypto pki certificates** **Example:** `Router# show crypto pki certificates`	(Optional) Displays the components of the certificates installed on the router if the CA certificate has been authenticated.

Example

The following is a sample certificate. The OCSP-related extensions are shown using exclamation points.

```
Certificate:
        Data:
            Version: v3
            Serial Number:0x14
            Signature Algorithm:SHAwithRSA - 1.2.840.113549.1.1.4
            Issuer:CN=CA server,OU=PKI,O=Cisco Systems
            Validity:
                Not Before:Thursday, August 8, 2002 4:38:05 PM PST
                Not After:Tuesday, August 7, 2003 4:38:05 PM PST
            Subject:CN=OCSP server,OU=PKI,O=Cisco Systems
            Subject Public Key Info:
                Algorithm:RSA - 1.2.840.113549.1.1.1
                Public Key:
                    Exponent:65537
                    Public Key Modulus:(2048 bits) :
                        <snip>
            Extensions:
                Identifier:Subject Key Identifier - 2.5.29.14
                    Critical:no
                    Key Identifier:
                        <snip>

                    Critical:no
                    Key Identifier:
                        <snip>
!                Identifier:OCSP NoCheck:- 1.3.6.1.5.5.7.48.1.5
                     Critical:no
```

```
                Identifier:Extended Key Usage:- 2.5.29.37
                     Critical:no
                     Extended Key Usage:
                     OCSPSigning
!
                Identifier:CRL Distribution Points - 2.5.29.31
                    Critical:no
                    Number of Points:1
                    Point 0
                        Distribution Point:
[URIName:ldap://CA-server/CN=CA server,OU=PKI,O=Cisco Systems]
        Signature:
            Algorithm:SHAwithRSA - 1.2.840.113549.1.1.4
            Signature:
            <snip>
```

The following example shows an excerpt of the running configuration output when adding a **match certificate override ocsp** command to the beginning of an existing sequence:

```
match certificate map3 override ocsp 5 url http://192.0.2.3/
show running-configuration
.
.
.
        match certificate map3 override ocsp 5 url http://192.0.2.3/
        match certificate map1 override ocsp 10 url http://192.0.2.1/
        match certificate map2 override ocsp 15 url http://192.0.2.2/
```

The following example shows an excerpt of the running configuration output when an existing **match certificate override ocsp** command is replaced and a trustpoint is specified to use an alternative PKI hierarchy:

```
match certificate map4 override ocsp trustpoint tp4 10 url http://192.0.2.4/newvalue
show running-configuration
.
.
.
        match certificate map3 override ocsp trustpoint tp3 5 url http://192.0.2.3/
        match certificate map1 override ocsp trustpoint tp1 10 url http://192.0.2.1/
        match certificate map4 override ocsp trustpoint tp4 10 url
http://192.0.2.4/newvalue
        match certificate map2 override ocsp trustpoint tp2 15 url http://192.0.2.2/
```

Troubleshooting Tips

If you ignored revocation check or expired certificates, you should carefully check your configuration. Verify that the certificate map properly matches either the certificate or certificates that should be allowed or the AAA checks that should be skipped. In a controlled environment, try modifying the certificate map and determine what is not working as expected.

Configuring Certificate Chain Validation

Perform this task to configure the processing level for the certificate chain path of your peer certificates.

Before you begin

- The device must be enrolled in your PKI hierarchy.

- The appropriate key pair must be associated with the certificate.

Note

- A trustpoint associated with the root CA cannot be configured to be validated to the next level.

The **chain-validation** command is configured with the **continue** keyword for the trustpoint associated with the root CA, an error message will be displayed and the chain validation will revert to the default **chain-validation**command setting.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. crypto pki trustpoint *name*
4. **chain-validation** [{**stop** | **continue**} [*parent-trustpoint*]]
5. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	crypto pki trustpoint *name* **Example:** `Router(config)# crypto pki trustpoint ca-sub1`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.
Step 4	**chain-validation** [{**stop**	**continue**} [*parent-trustpoint*]] **Example:** `Router(ca-trustpoint)# chain-validation continue ca-sub1`	Configures the level to which a certificate chain is processed on all certificates including subordinate CA certificates. • Use the **stop**keyword to specify that the certificate is already trusted. This is the default setting. • Use the **continue** keyword to specify that the that the subordinate CA certificate associated with the trustpoint must be validated. • The *parent-trustpoint* argument specifies the name of the parent trustpoint the certificate must be validated against.

	Command or Action	Purpose
Step 5	**exit** **Example:** `Router(ca-trustpoint)# exit`	Returns to global configuration mode

Configuring CRL Autodownload

Perform this step to configure the certificate revocation list (CRL) autodownload.

Improper configuration of this feature can enable excessive CRL downloads for CRLs already cached by the device thereby halting validations because the CRL download and CRL validation cannot be executed in parallel. If a CRL is already downloaded, the downloaded CRL can be used for certificate validation without downloading additional CRLs.

If you configure the **crl-cache none** command, you cannot auto download a CRL for a trustpoint. To download the CRL, execute the **no crl cache none** command to remove the CRL cache from trustpoint. Similarly, when a CRL download is configured, you cannot enable the **crl-cache none** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki crl download url** *url* [**source-interface** *interface-name* | **vrf** *vrf-name*]
4. **crypto pki crl download trustpoint** *trustpoint-label*
5. **crypto pki crl download schedule time** *day hh*:*ss*
6. **crypto pki crl download schedule prepublish** *minutes*
7. **crypto pki crl download schedule retries** *number* **crypto pki crl download schedule retries interval** *minutes*
8. **end**
9. **crypto pki crl refresh-cache**
10. **show crypto pki crl download**
11. **show crypto pki timers**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**crypto pki crl download url** *url* [**source-interface** *interface-name* | **vrf** *vrf-name*] **Example:** `Device(config)# crypto pki crl download url www.abc.com source-interface GigabitEthernet 1`	Specifies that the CRL auto download must fetch the CRL through the source interface or the VRF or both.
Step 4	**crypto pki crl download trustpoint** *trustpoint-label* **Example:** `Device(config)# crypto pki crl download trustpoint trp1`	Specifies that the CRL auto download must fetch the CRL distribution point (CDP) from the device certificate associated with that trustpoint.
Step 5	**crypto pki crl download schedule time** *day hh*:*ss* **Example:** `Device(config)# crypto pki crl download schedule time Monday 00:00`	Specifies the day and time when the CRL auto download must be triggered. • *time*—Indicates the exact time of the day to download the CRL, if no CRL is found. Must be specified in hour and minute format (*mm*:*ss*).
Step 6	**crypto pki crl download schedule prepublish** *minutes* **Example:** `Device(config)# crypto pki crl download schedule prepublish 720`	Time interval, in minutes, to download the CRL before the CRL expires. the default value is 0.
Step 7	**crypto pki crl download schedule retries** *number* **crypto pki crl download schedule retries interval** *minutes* **Example:** `Device(config)# crypto pki crl download schedule retries 15 interval 15 crypto pki crl download schedule retries 15 interval 15`	Specifies the time interval, in minutes, for a device to retry downloading a CRL from a CDP location if previous download attempts fail. The default number of retries is 5. • **interval** *minutes*—Time interval between retry attempts, in minutes. The default retry interval is 30 minutes.
Step 8	**end** **Example:** `Device(config)# end`	Exits global configuration mode and returns to privileged EXEC mode.
Step 9	**crypto pki crl refresh-cache** **Example:** `Device# crypto pki crl refresh-cache`	Refreshes the CRL entries in the cache.
Step 10	**show crypto pki crl download** **Example:** `Device# show crypto pki crl download`	Displays auto download configurations.
Step 11	**show crypto pki timers** **Example:** `Device(config)# show crypto pki timers`	Displays information about the timers set for Cisco IOS for public key infrastructure.

Example

The following is a sample output from the **show crypto pki crl download** command.

```
Device# show crypto pki crl download

CRL Issuer Name:
    cn=ios
    LastUpdate: 10:38:23 IST Sep 18 2013
    NextUpdate: 16:38:23 IST Sep 18 2013

    Valid after expiry till: 16:58:23 IST Sep 18 2013

    CRL Downloaded at 12:38:23 IST Sep 18 2013

    Retrieved from CRL Distribution Point:
      ** CDP Not Published - Retrieved via SCEP

 CRL DER is 213 bytes
 CRL is stored in parsed CRL cache

CRL prepublish timer interval: 10

Parsed CRL cache current size is 213 bytes
Parsed CRL cache maximum size is 65536 bytes
```

- The field Valid after expiry till: indicates the duration for which the CRL is valid after expiry when crl cache extend is configured.
- The field CRL Downloaded at denotes the time when the CRL is downloaded.

The following is a sample output from the **show crypto pki timer** command.

```
Device# show crypto pki timers

PKI Timers
  |       13:42.564
  |       13:42.564  SESSION CLEANUP
  |       11:44.111
  |       11:44.111  CRL UPDATE cn=IOS-CA
  |       21:44.111  CRL EXPIRE cn=IOS-CA
  |    7:59:56.917  STATIC CRL DOWNLOAD
CS Timers
  |        1:44.071
  |        1:44.071  CS DB CLEANUP
  |       11:43.999  CS SHADOW CERT GENERATION
  |       21:43.883  CS CERT EXPIRE
```

The field CRL UPDATE denotes the updated timer based on the prepublish time.

Configuration Examples for Setting Up Authorization and Revocation of Certificates

Configuring and Verifying PKI AAA Authorization Examples

This section provides configuration examples of PKI AAA authorizations:

Router Configuration Example

The following **show running-config**command output shows the working configuration of a router that is set up to authorize VPN connections using the PKI Integration with AAA Server feature:

```
Router# show running-config

Debugs of a Failed PKI AAA Authorization Example

The following **show debugging** command output shows that the router is not authorized to connect using VPN. The messages are typical of those that you might see in such a situation.

In this example, the peer username was configured as not authorized, by moving the username to a Cisco Secure ACS group called VPN_Router_Disabled in Cisco Secure ACS. The router, router7200.example.com, has been configured to check with a Cisco Secure ACS AAA server prior to establishing a VPN connection to any peer.

```
Router# show debugging
General OS:

Configuring a Revocation Mechanism Examples

This section contains the following configuration examples that can be used when specifying a revocation mechanism for your PKI:

Configuring an OCSP Server Example

The following example shows how to configure the router to use the OCSP server that is specified in the AIA extension of the certificate:

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# revocation-check ocsp
```

Specifying a CRL and Then an OCSP Server Example

The following example shows how to configure the router to download the CRL from the CDP. If the CRL is unavailable, the OCSP server that is specified in the AIA extension of the certificate will be used. If both options fail, certificate verification will also fail.

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# revocation-check crl ocsp
```

Specifying an OCSP Server Example

The following example shows how to configure your router to use the OCSP server at the HTTP URL “http://myocspserver:81.” If the server is down, the revocation check will be ignored.

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# ocsp url http://myocspserver:81
Router(ca-trustpoint)# revocation-check ocsp none
```

Disabling Nonces in Communications with the OCSP Server Example

The following example shows communications when a nonce, or a unique identifier for the OCSP request, is disabled for communications with the OCSP server:

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# ocsp url http://myocspserver:81
Router(ca-trustpoint)# revocation-check ocsp none
Router(ca-trustpoint)# ocsp disable-nonce
```

Configuring a Hub Router at a Central Site for Certificate Revocation Checks Example

The following example shows a hub router at a central site that is providing connectivity for several branch offices to the central site.

The branch offices are also able to communicate directly with each other using additional IPSec tunnels between the branch offices.

The CA publishes CRLs on an HTTP server at the central site. The central site checks CRLs for each peer when setting up an IPSec tunnel with that peer.

The example does not show the IPSec configuration--only the PKI-related configuration is shown.

Home Office Hub Configuration

```
crypto pki trustpoint VPN-GW
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Central VPN Gateway
 revocation-check crl
```

Central Site Hub Router

```
Router# show crypto ca certificate
Certificate
  Status: Available
  Certificate Serial Number: 2F62BE14000000000CA0
  Certificate Usage: General Purpose
  Issuer:
    cn=Central Certificate Authority
    o=Home Office Inc
  Subject:
    Name: Central VPN Gateway
    cn=Central VPN Gateway
    o=Home Office Inc
  CRL Distribution Points:
    http://ca.home-office.com/CertEnroll/home-office.crl
  Validity Date:
    start date: 00:43:26 GMT Sep 26 2003
    end   date: 00:53:26 GMT Sep 26 2004
    renew date: 00:00:00 GMT Jan 1 1970
  Associated Trustpoints: VPN-GW
CA Certificate
  Status: Available
  Certificate Serial Number: 1244325DE0369880465F977A18F61CA8
  Certificate Usage: Signature
  Issuer:
    cn=Central Certificate Authority
    o=Home Office Inc
  Subject:
    cn=Central Certificate Authority
    o=Home Office Inc
  CRL Distribution Points:
    http://ca.home-office.com/CertEnroll/home-office.crl
  Validity Date:
    start date: 22:19:29 GMT Oct 31 2002
    end   date: 22:27:27 GMT Oct 31 2017
  Associated Trustpoints: VPN-GW
```

Trustpoint on the Branch Office Router

```
crypto pki trustpoint home-office
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
```

```
ip-address none
 subject-name o=Home Office Inc,cn=Branch 1
 revocation-check crl
```

A certificate map is entered on the branch office router.

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
branch1(config)# crypto pki certificate map central-site 10
branch1(ca-certificate-map)#
```

The output from the **show certificate** command on the central site hub router shows that the certificate was issued by the following:

```
cn=Central Certificate Authority
o=Home Office Inc
```

These two lines are combined into one line using a comma (,) to separate them, and the original lines are added as the first criteria for a match.

```
Router (ca-certificate-map)# issuer-name co cn=Central Certificate Authority, ou=Home Office
 Inc
!The above line wrapped but should be shown on one line with the line above it.
```

The same combination is done for the subject name from the certificate on the central site router (note that the line that begins with “Name:” is not part of the subject name and must be ignored when creating the certificate map criteria). This is the subject name to be used in the certificate map.

cn=Central VPN Gateway

o=Home Office Inc

```
Router (ca-certificate-map)# subject-name eq cn=central vpn gateway, o=home office inc
```

Now the certificate map is added to the trustpoint that was configured earlier.

```
Router (ca-certificate-map)# crypto pki trustpoint home-office
Router (ca-trustpoint)# match certificate central-site skip revocation-check
Router (ca-trustpoint)# exit
Router (config)# exit
```

The configuration is checked (most of configuration is not shown).

```
Router# write term
!Many lines left out
.
.
.
crypto pki trustpoint home-office
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Branch 1
 revocation-check crl
 match certificate central-site skip revocation-check
!
!
crypto pki certificate map central-site 10
 issuer-name co cn = Central Certificate Authority, ou = Home Office Inc
```

```
 subject-name eq cn = central vpn gateway, o = home office inc
!many lines left out
```

Note that the issuer-name and subject-name lines have been reformatted to make them consistent for later matching with the certificate of the peer.

If the branch office is checking the AAA, the trustpoint will have lines similar to the following:

```
crypto pki trustpoint home-office
 auth list allow_list
 auth user subj commonname
```

After the certificate map has been defined as was done above, the following command is added to the trustpoint to skip AAA checking for the central site hub.

```
match certificate central-site skip authorization-check
```

In both cases, the branch site router has to establish an IPSec tunnel to the central site to check CRLs or to contact the AAA server. However, without the **match certificate**command and **central-site skip authorization-check (argument and keyword)**, the branch office cannot establish the tunnel until it has checked the CRL or the AAA server. (The tunnel will not be established unless the **match certificate**command and **central-site skip authorization-check** argument and keyword are used.)

The **match certificate** command and **allow expired-certificate** keyword would be used at the central site if the router at a branch site had an expired certificate and it had to establish a tunnel to the central site to renew its certificate.

Trustpoint on the Central Site Router

```
crypto pki trustpoint VPN-GW
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Central VPN Gateway
 revocation-check crl
```

Trustpoint on the Branch 1 Site Router

```
Router# show crypto ca certificate
Certificate
  Status: Available
  Certificate Serial Number: 2F62BE14000000000CA0
  Certificate Usage: General Purpose
  Issuer:
    cn=Central Certificate Authority
    o=Home Office Inc
  Subject:
    Name: Branch 1 Site
    cn=Branch 1 Site
    o=Home Office Inc
  CRL Distribution Points:
    http://ca.home-office.com/CertEnroll/home-office.crl
  Validity Date:
    start date: 00:43:26 GMT Sep 26 2003
    end   date: 00:53:26 GMT Oct 3 2003
    renew date: 00:00:00 GMT Jan 1 1970
  Associated Trustpoints: home-office
CA Certificate
```

```
  Status: Available
  Certificate Serial Number: 1244325DE0369880465F977A18F61CA8
  Certificate Usage: Signature
  Issuer:
    cn=Central Certificate Authority
    o=Home Office Inc
  Subject:
    cn=Central Certificate Authority
    o=Home Office Inc
  CRL Distribution Points:
    http://ca.home-office.com/CertEnroll/home-office.crl
  Validity Date:
    start date: 22:19:29 GMT Oct 31 2002
    end   date: 22:27:27 GMT Oct 31 2017
  Associated Trustpoints: home-office
```

A certificate map is entered on the central site router.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router (config)# crypto pki certificate map branch1 10
Router (ca-certificate-map)# issuer-name co cn=Central Certificate Authority, ou=Home Office
 Inc
!The above line wrapped but should be part of the line above it.
Router (ca-certificate-map)# subject-name eq cn=Brahcn 1 Site,o=home office inc
```

The certificate map is added to the trustpoint.

```
Router (ca-certificate-map)# crypto pki trustpoint VPN-GW
Router (ca-trustpoint)# match certificate branch1 allow expired-certificate
Router (ca-trustpoint)# exit
Router (config) #exit
```

The configuration should be checked (most of the configuration is not shown).

```
Router# write term
!many lines left out
crypto pki trustpoint VPN-GW
 enrollment url http://ca.home-office.com:80/certsrv/mscep/mscep.dll
 serial-number none
 fqdn none
 ip-address none
 subject-name o=Home Office Inc,cn=Central VPN Gateway
 revocation-check crl
 match certificate branch1 allow expired-certificate
!
!
crypto pki certificate map central-site 10
 issuer-name co cn = Central Certificate Authority, ou = Home Office Inc
 subject-name eq cn = central vpn gateway, o = home office inc
! many lines left out
```

The **match certificate**command and **branch1 allow expired-certificate** (argument and keyword) and the certificate map should be removed as soon as the branch router has a new certificate.

Configuring Certificate Authorization and Revocation Settings Examples

This section contains the following configuration examples that can be used when specifying a CRL cache control setting or certificate serial number session control:

Configuring CRL Cache Control

The following example shows how to disable CRL caching for all CRLs associated with the CA1 trustpoint:

```
crypto pki trustpoint CA1
 enrollment url http://CA1:80
 ip-address FastEthernet0/0
 crl query ldap://ldap_CA1
 revocation-check crl
 crl-cache none
```

The current CRL is still cached immediately after executing the example configuration shown above:

Router# **show crypto pki crls**

```
CRL Issuer Name:
    cn=name Cert Manager,ou=pki,o=example.com,c=US
    LastUpdate: 18:57:42 GMT Nov 26 2005
    NextUpdate: 22:57:42 GMT Nov 26 2005
    Retrieved from CRL Distribution Point:
      ldap://ldap.example.com/CN=name Cert Manager,O=example.com
```

When the current CRL expires, a new CRL is then downloaded to the router at the next update. The **crl-cache none**command takes effect and all CRLs for the trustpoint are no longer cached; caching is disabled. You can verify that no CRL is cached by executing the **show crypto pki crls** command. No output will be shown because there are no CRLs cached.

The following example shows how to configure the maximum lifetime of 2 minutes for all CRLs associated with the CA1 trustpoint:

```
crypto pki trustpoint CA1
 enrollment url http://CA1:80
 ip-address FastEthernet0/0
 crl query ldap://ldap_CA1
 revocation-check crl
 crl-cache delete-after 2
```

The current CRL is still cached immediately after executing the example configuration above for setting the maximum lifetime of a CRL:

Router# **show crypto pki crls**

```
CRL Issuer Name:
    cn=name Cert Manager,ou=pki,o=example.com,c=US
    LastUpdate: 18:57:42 GMT Nov 26 2005
    NextUpdate: 22:57:42 GMT Nov 26 2005
    Retrieved from CRL Distribution Point:
      ldap://ldap.example.com/CN=name Cert Manager,O=example.com
When the current CRL expires, a new CRL is downloaded to the router at the next update and
 the crl-cache delete-after
command takes effect. This newly cached CRL and all subsequent CRLs will be deleted after
a maximum lifetime of 2 minutes.
You can verify that the CRL will be cached for 2 minutes by executing the show crypto pki
crls
 command. Note that the NextUpdate time is 2 minutes after the LastUpdate time.
```

Router# **show crypto pki crls**

```
CRL Issuer Name:
    cn=name Cert Manager,ou=pki,o=example.com,c=US
```

```
    LastUpdate: 22:57:42 GMT Nov 26 2005

    NextUpdate: 22:59:42 GMT Nov 26 2005
    Retrieved from CRL Distribution Point:
```

ldap://ldap.example.com/CN=name Cert Manager,O=example.com

Configuring Certificate Serial Number Session Control

The following example shows the configuration of certificate serial number session control using a certificate map for the CA1 trustpoint:

```
crypto pki trustpoint CA1
 enrollment url http://CA1
 chain-validation stop
 crl query ldap://ldap_server
 revocation-check crl
 match certificate crl
!
crypto pki certificate map crl 10
 serial-number co 279d
```

Note If the *match-criteria* value is set to **eq** (equal) instead of **co** (contains), the serial number must match the certificate map serial number exactly, including any spaces.

The following example shows the configuration of certificate serial number session control using AAA attributes. In this case, all valid certificates will be accepted if the certificate does not have the serial number "4ACA."

```
crypto pki trustpoint CA1
 enrollment url http://CA1
 ip-address FastEthernet0/0
 crl query ldap://ldap_CA1
 revocation-check crl
 aaa new-model
!
aaa attribute list crl
attribute-type aaa-cert-serial-not 4ACA
```

The server log shows that the certificate with the serial number "4ACA" was rejected. The certificate rejection is shown using exclamation points.

Configuring Certificate Chain Validation Examples

This section contains the following configuration examples that can be used to specify the level of certificate chain processing for your device certificates:

Configuring Certificate Chain Validation from Peer to Root CA

In the following configuration example, all of the certificates will be validated--the peer, SubCA11, SubCA1, and RootCA certificates.

```
crypto pki trustpoint RootCA
 enrollment terminal
 chain-validation stop
 revocation-check none
 rsakeypair RootCA
crypto pki trustpoint SubCA1
 enrollment terminal
 chain-validation continue RootCA
 revocation-check none
 rsakeypair SubCA1
crypto pki trustpoint SubCA11
 enrollment terminal
 chain-validation continue SubCA1
 revocation-check none
 rsakeypair SubCA11
```

Configuring Certificate Chain Validation from Peer to Subordinate CA

In the following configuration example, the following certificates will be validated--the peer and SubCA1 certificates.

```
crypto pki trustpoint RootCA
 enrollment terminal
 chain-validation stop
```

```
 revocation-check none
 rsakeypair RootCA
crypto pki trustpoint SubCA1
 enrollment terminal
 chain-validation continue RootCA
 revocation-check none
 rsakeypair SubCA1
crypto pki trustpoint SubCA11
 enrollment terminal
 chain-validation continue SubCA1
 revocation-check none
 rsakeypair SubCA11
```

Configuring Certificate Chain Validation Through a Gap

In the following configuration example, SubCA1 is not in the configured Cisco IOS hierarchy but is expected to have been supplied in the certificate chain presented by the peer.

If the peer supplies the SubCA1 certificate in the presented certificate chain, the following certificates will be validated--the peer, SubCA11, and SubCA1 certificates.

If the peer does not supply the SubCA1 certificate in the presented certificate chain, the chain validation will fail.

```
crypto pki trustpoint RootCA
 enrollment terminal
 chain-validation stop
 revocation-check none
 rsakeypair RootCA
crypto pki trustpoint SubCA11
 enrollment terminal
 chain-validation continue RootCA
 revocation-check none
 rsakeypair SubCA11
```

IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.

CHAPTER 111

Configuring Certificate Enrollment for a PKI

This module describes the different methods available for certificate enrollment and how to set up each method for a participating PKI peer. Certificate enrollment, which is the process of obtaining a certificate from a certification authority (CA), occurs between the end host that requests the certificate and the CA. Each peer that participates in the public key infrastructure (PKI) must enroll with a CA.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Prerequisites for PKI Certificate Enrollment

Before configuring peers for certificate enrollment, you should have the following items:

- A generated Rivest, Shamir, and Adelman (RSA) key pair to enroll and a PKI in which to enroll.
- An authenticated CA.
- Familiarity with the module "Cisco IOS PKI Overview: Understanding and Planning a PKI."
- Enable NTP on the device so that the PKI services such as auto enrollment and certificate rollover may function correctly.

Note As of Cisco IOS Release 12.3(7)T, all commands that begin with "**crypto ca**" have been changed to begin with "**crypto pki**." Although the router will still accept **crypto ca** commands, all output will be be displayed **crypto pki**.

Information About Certificate Enrollment for a PKI

What Are CAs

A CA is an entity that issues digital certificates that other parties can use. It is an example of a trusted third party. CAs are characteristic of many PKI schemes.

A CA manages certificate requests and issues certificates to participating network devices. These services provide centralized key management for the participating devices to validate identities and to create digital certificates. Before any PKI operations can begin, the CA generates its own public key pair and creates a self-signed CA certificate; thereafter, the CA can sign certificate requests and begin peer enrollment for the PKI.

You can use the Cisco IOS certificate server or a CA provided by a third-party CA vendor.

Framework for Multiple CAs

A PKI can be set up in a hierarchical framework to support multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. The subordinate CAs within the hierarchy can be enrolled with either the root CA or with another subordinate CA. Multiple tiers of CAs are configured by either the root CA or with another subordinate CA. Within a hierarchical PKI, all enrolled peers can validate the certificate of one another if the peers share a trusted root CA certificate or a common subordinate CA.

When to Use Multiple CAs

Multiple CAs provide users with added flexibility and reliability. For example, subordinate CAs can be placed in branch offices while the root CA is at the office headquarters. Also, different granting policies can be implemented per CA, so you can set up one CA to automatically grant certificate requests while another CA within the hierarchy requires each certificate request to be manually granted.

Scenarios in which at least a two-tier CA is recommended are as follows:

- Large and very active networks in which a large number of certificates are revoked and reissued. A multiple tier CA helps to control the size of the certificate revocation lists (CRLs).
- When online enrollment protocols are used, the root CA can be kept offline except to issue subordinate CA certificates. This scenario provides added security for the root CA.

Authentication of the CA

The certificate of the CA must be authenticated before the device will be issued its own certificate and before certificate enrollment can occur. Authentication of the CA typically occurs only when you initially configure PKI support at your router. To authenticate the CA, issue the **crypto pki authenticate** command, which authenticates the CA to your router by obtaining the self-signed certificate of the CA that contains the public key of the CA.

Note PKI does not support certificate with lifetime validity greater than the year 2099. So, It is recommended to choose a life time validity fewer than the value 2099.

Authentication via the fingerprint Command

Cisco IOS Release 12.3(12) and later releases allow you to issue the **fingerprint** command t o preenter a fingerprint that can be matched against the fingerprint of a CA certificate during authentication.

If a fingerprint is not preentered for a trustpoint, and if the authentication request is interactive, you must verify the fingerprint that is displayed during authentication of the CA certificate. If the authentication request is noninteractive, the certificate will be rejected without a preentered fingerprint.

Note If the authentication request is made using the command-line interface (CLI), the request is an interactive request. If the authentication request is made using HTTP or another management tool, the request is a noninteractive request.

Supported Certificate Enrollment Methods

Cisco IOS software supports the following methods to obtain a certificate from a CA:

- Simple Certificate Enrollment Protocol (SCEP)--A Cisco-developed enrollment protocol that uses HTTP to communicate with the CA or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

Note To take advantage of automated certificate and key rollover functionality, you must be running a CA that supports rollover and SCEP must be used as your client enrollment method. If you are running a Cisco IOS CA, you must be running Cisco IOS Release 12.4(2)T or a later release for rollover support.

- PKCS12--The router imports certificates in PKCS12 format from an external server.
- IOS File System (IFS)--The router uses any file system that is supported by Cisco IOS software (such as TFTP, FTP, flash, and NVRAM) to send a certificate request and to receive the issued certificate. Users may enable IFS certificate enrollment when their CA does not support SCEP.

Note Prior to Cisco IOS Release 12.3(4)T, only the TFTP file system was supported within IFS.

- Manual cut-and-paste--The router displays the certificate request on the console terminal, allowing the user to enter the issued certificate on the console terminal. A user may manually cut-and-paste certificate requests and certificates when there is no network connection between the router and CA.
- Enrollment profiles-- Enrollment profiles are primarily used for EST or terminal based enrollment. In case that the CA server does not support SCEP, the recommended methods for enrollment are EST based enrollment or terminal based enrollment.

- Self-signed certificate enrollment for a trustpoint--The secure HTTP (HTTPS) server generates a self-signed certificate that is to be used during the secure socket layer (SSL) handshake, establishing a secure connection between the HTTPS server and the client. The self-signed certificate is then saved in the router's startup configuration (NVRAM). The saved, self-signed certificate can then be used for future SSL handshakes, eliminating the user intervention that was necessary to accept the certificate every time the router reloaded.

Note To take advantage of autoenrollment and autoreenrollment, do not use either TFTP or manual cut-and-paste enrollment as your enrollment method. Both TFTP and manual cut-and-paste enrollment methods are manual enrollment processes, requiring user input.

Cisco IOS Suite-B Support for Certificate Enrollment for a PKI

Suite-B requirements comprise of four user interface suites of cryptographic algorithms for use with IKE and IPSec that are described in RFC 4869. Each suite consists of an encryption algorithm, a digital signature algorithm, a key agreement algorithm, and a hash or message digest algorithm.

Suite-B adds the following support for the certificate enrollment for a PKI:

- Elliptic Curve Digital Signature Algorithm (ECDSA) (256-bit and 384-bit curves) is used for the signature operation within X.509 certificates.
- PKI support for validation of for X.509 certificates using ECDSA signatures.
- PKI support for generating certificate requests using ECDSA signatures and for importing the issued certificates into IOS.

See the Configuring Security for VPNs with IPsec feature module for more detailed information about Cisco IOS Suite-B support.

Registration Authorities

A Cisco IOS certificate server can be configured to run in RA mode. An RA offloads authentication and authorization responsibilities from a CA. When the RA receives a SCEP or manual enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it will be forwarded to the issuing CA, and the CA can be configured to automatically generate the certificate and return it to the RA. The client can later retrieve the granted certificate from the RA.

Automatic Certificate Enrollment

Automatic certificate enrollment allows the CA client to automatically request a certificate from its CA sever. This automatic router request eliminates the need for operator intervention when the enrollment request is sent to the CA server. Automatic enrollment is performed on startup for any trustpoint CA that is configured and that does not have a valid client certificate. When the certificate expires, a new certificate is automatically requested.

Note When automatic enrollment is configured, clients automatically request client certificates. The CA server performs its own authorization checks; if these checks include a policy to automatically issue certificates, all clients will automatically receive certificates, which is not very secure. Thus, automatic certificate enrollment should be combined with additional authentication and authorization mechanisms (such as Secure Device Provisioning (SDP), leveraging existing certificates, and one-time passwords).

Automated Client Certificate and Key Rollover

By default, the automatic certificate enrollment function requests a new client certificate and keys from the CS before the client's current certificate expires. Certificate and key rollover allows the certificate renewal rollover request to be made before the certificate expires by retaining the current key and certificate until the new, or rollover, certificate is available. After a specified amount of time, the rollover certificate and keys will become the active certificate and keys. The expired certificate and keys are immediately deleted upon rollover and removed from the certificate chain and CRL.

The setup for automatic rollover is twofold: CA clients must be automatically enrolled and the client's CAs must be automatically enrolled and have the **auto-rollover** command enabled. For more information on configuring your CA servers for automatic certificate rollover see the section "Automatic CA Certificate and Key Rollover" in the chapter "Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment " of the *Public Key Infrastructure Configuration Guide*.

An optional renewal percentage parameter can be used with the **auto-enroll** command to allow a new certificate to be requested when a specified percentage of the lifetime of the certificate has passed. For example, if the renewal percentage is configured as 90 and the certificate has a lifetime of one year, a new certificate is requested 36.5 days before the old certificate expires. In order for automatic rollover to occur, the renewal percentage must be less than 100.The specified percent value must not be less than 10. If a client certificate is issued for less than the configured validity period due to the impending expiration of the CA certificate, the rollover certificate will be issued for the balance of that period. A minimum of 10 percent of the configured validity period, with an absolute minimum of 3 minutes, is required to allow rollover enough time to function.

Tip If CA autoenrollment is not enabled, you may manually initiate rollover on an existing client with the **crypto pki enroll** command if the expiration time of the current client certificate is equal to or greater than the expiration time of the corresponding CA certificate. The client will initiate the rollover process, which occurs only if the server is configured for automated rollover and has an available rollover server certificate.

Note A key pair is also sent if configured by the **auto-enroll re-generate** command and keyword. It is recommended that a new key pair be issued for security reasons.

Certificate Enrollment Profiles

Certificate enrollment profiles allow users to specify certificate authentication, enrollment, and reenrollment parameters when prompted. The values for these parameters are referenced by two templates that make up the profile. One template contains parameters for the HTTP request that is sent to the CA server to obtain the certificate of the CA (also known as certificate authentication); the other template contains parameters for the HTTP request that is sent to the CA for certificate enrollment.

Configuring two templates enables users to specify different URLs or methods for certificate authentication and enrollment; for example, authentication (getting the certificate of the CA) can be performed via TFTP (using the **authentication url** command) and enrollment can be performed manually (using the **enrollment terminal** command).

Prior to Cisco IOS Release 12.3(11)T, certificate requests could be sent only in a PKCS10 format; however, an additional parameter was added to the profile, allowing users to specify the PKCS7 format for certificate renewal requests.

Note A single enrollment profile can have up to three separate sections for each task--certificate authentication, enrollment, and reenrollment.

How to Configure Certificate Enrollment for a PKI

This section contains the following enrollment option procedures. If you configure enrollment or autoenrollment (the first task), you cannot configure manual certificate enrollment. Also, if you configure TFTP or manual cut-and-paste certificate enrollment, you cannot configure autoenrollment, autoreenrollment, an enrollment profile, nor can you utilize the automated CA certificate rollover capability.

Configuring Certificate Enrollment or Autoenrollment

Perform this task to configure certificate enrollment or autoenrollment for clients participating in your PKI.

Before you begin

Before configuring automatic certificate enrollment requests, you should ensure that all necessary enrollment information is configured.

Prerequisites for Enabling Automated Client Certificate and Key Rollover

CA client support for certificate rollover is automatically enabled when using autoenrollment. For automatic CA certificate rollover to run successfully, the following prerequisites are applicable:

- Your network devices must support shadow PKI.
- Your clients must be running Cisco IOS Release 12.4(2)T or a later release.
- The client's CS must support automatic rollover. See the section "Automatic CA Certificate and Key Rollover" in the chapter "Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment " of the *Public Key Infrastructure Configuration Guide* for more information on CA server automatic rollover configuration.

Prerequisites for Specifying Autoenrollment Initial Key Generation Location

To specify the location of the autoenrollment initial key generation, you must be running Cisco IOS Release 12.4(11)T or a later release.

RSA Key Pair Restriction for Autoenrollment

Trustpoints configured to generate a new key pair using the **regenerate** command or the **regenerate** keyword of the **auto-enroll** command must not share key pairs with other trustpoints. To give each trustpoint its own

key pair, use the **rsakeypair** command in ca-trustpoint configuration mode. Sharing key pairs among regenerating trustpoints is not supported and will cause loss of service on some of the trustpoints because of key and certificate mismatches.

Certificate renewal with regenerate option does not work with key label starting from zero ('0'), for example, '0test'. CLI allows configuring such name under trustpoint, and allows hostname starting from zero, but certificate regenerate will fail.

Restrictions for Automated Client Certificate and Key Rollover

In order for clients to run automatic CA certificate rollover successfully, the following restrictions are applicable:

- SCEP must be used to support rollover. Any device that enrolls with the PKI using an alternative to SCEP as the certificate management protocol or mechanism (such as enrollment profiles, manual enrollment, or TFTP enrollment) will not be able to take advantage of the rollover functionality provided by SCEP.
- If the configuration cannot be saved to the startup configuration after a shadow certificate is generated, rollover will not occur.
- Rollover with key regenerate does not work when keypair name starts from zero ('0') (for example, '0test'). When configuring **rsakeypair** *name* under a trustpoint, do not configure name starting from zero. When keypair name is not configured and the default keypair is used, make sure the router hostname does not start from zero. If it does so, configure "**rsakeypair** *name* explicitly under the trustpoint with a different name.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment** [**mode** | **retry period** *minutes* | **retry count** *number*] **url** *url* [**pem**]
5. **eckeypair** *label*
6. **subject-name** [*x.500-name*]
7. **vrf** *vrf-name*
8. **ip-address** {*ip-address* | *interface* | **none**}
9. serial-number [none]
10. **auto-enroll** [*percent*] [**regenerate**]
11. **usage** *method1* [*method2* [*method3*]]
12. **password** *string*
13. **rsakeypair** *key-label key-size encryption-key-size*]]
14. **fingerprint** *ca-fingerprint*
15. **on** *devicename* **:**
16. **exit**
17. **crypto pki authenticate** *name*

18. **exit**
19. **copy system:running-config nvram:startup-config**
20. **show crypto pki certificates**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint mytp`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.
Step 4	**enrollment** [**mode** | **retry period** *minutes* | **retry count** *number*] **url** *url* [**pem**] **Example:** `Router(ca-trustpoint)# enrollment url http://cat.example.com`	Specifies the URL of the CA on which your router should send certificate requests. • **mode** --Specifies RA mode if your CA system provides an RA. • **retry period** *minutes* --Specifies the wait period between certificate request retries. The default is 1 minute between retries. • **retry count** *number* -- Specifies the number of times a router will resend a certificate request when it does not receive a response from the previous request. (Specify from 1 to 100 retries.) • **url** *url* -- URL of the file system where your router should send certificate requests. An IPv6 address can be added in the URL enclosed in brackets. For example: http:// [2001:DB8:1:1::1]:80. • **pem** -- Adds privacy-enhanced mail (PEM) boundaries to the certificate request. **Note** An enrollment method other than TFTP or manual cut-and-paste must be configured to support autoenrollment.
Step 5	**eckeypair** *label* **Example:**	(Optional) Configures the trustpoint to use an Elliptic Curve (EC) key on which certificate requests are generated

	Command or Action	Purpose
	`Router(ca-trustpoint)# eckeypair Router_1_Key`	using ECDSA signatures. The *label* argument specifies the EC key label that is configured using the **crypto key generate rsa** or **crypto key generate ec keysize** command in global configuration mode. See the Configuring Internet Key Exchange for IPsec VPNs feature module for more information. **Note** If an ECDSA signed certificate is imported without a trustpoint configuration, then the label defaults to the FQDN value.
Step 6	**subject-name** [*x.500-name*] **Example:** `Router(ca-trustpoint)# subject-name cat`	(Optional) Specifies the requested subject name that will be used in the certificate request. • *x.500-name* --If it is not specified, the fully qualified domain name (FQDN), which is the default subject name, will be used.
Step 7	**vrf** *vrf-name* **Example:** `Router(ca-trustpoint)# vrf myvrf`	(Optional) Specifies the the VRF instance in the public key infrastructure (PKI) trustpoint to be used for enrollment, certificate revocation list (CRL) retrieval, and online certificate status protocol (OCSP) status.
Step 8	**ip-address** {*ip-address* | *interface* | **none**} **Example:** `Router(ca-trustpoint)# ip address 192.168.1.66`	(Optional) Includes the IP address of the specified interface in the certificate request. • Issue the *ip-address* argument to specify either an IPv4 or IPv6 address. • Issue the *interface* argument to specify an interface on the router. • Issue the **none** keyword if no IP address should be included. **Note** If this command is enabled, you will not be prompted for an IP address during enrollment for this trustpoint.
Step 9	serial-number [none] **Example:** `Router(ca-trustpoint)# serial-number`	(Optional) Specifies the router serial number in the certificate request, unless the **none** keyword is issued. • Issue the **none** keyword to specify that a serial number will not be included in the certificate request.
Step 10	**auto-enroll** [*percent*] [**regenerate**] **Example:** `Router(ca-trustpoint)# auto-enroll regenerate`	(Optional) Enables autoenrollment, allowing the client to automatically request a rollover certificate from the CA. • If autoenrollment is not enabled, the client must be manually re-enrolled in your PKI upon certificate expiration.

	Command or Action	Purpose
		• By default, only t he Domain Name System (DNS) name of the router is included in the certificate. • Use the *percent* argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached. • Use the **regenerate** keyword to generate a new key for the certificate even if a named key already exists. **Note** If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: "! RSA key pair associated with trustpoint is exportable." **Note** It is recommended that a new key pair be generated for security reasons.
Step 11	**usage** *method1* [*method2* [*method3*]] **Example:** `Router(ca-trustpoint)# usage ssl-client`	(Optional) Specifies the intended use for the certificate. • Available options are **ike**, **ssl-client**, and **ssl-server**; the default is **ike**.
Step 12	**password** *string* **Example:** `Router(ca-trustpoint)# password string1`	(Optional) Specifies the revocation password for the certificate. • If this command is enabled, you will not be prompted for a password during enrollment for this trustpoint. **Note** When SCEP is used, this password can be used to authorize the certificate request--often via a one-time password or similar mechanism.
Step 13	**rsakeypair** *key-label key-size encryption-key-size*]] **Example:** `Router(ca-trustpoint)# rsakeypair key-label 2048 2048`	(Optional) Specifies which key pair to associate with the certificate. • A key pair with the *key-label* argument will be generated during enrollment if it does not already exist or if the **auto-enroll regenerate** command was issued. • Specify the *key-size* argument for generating the key, and specify the *encryption-key-size* argument to request separate encryption, signature keys, and certificates. The key-size and encryption-key-size must be the same size. Length of less than 2048 is not recommended.

	Command or Action	Purpose
		Note If this command is not enabled, the FQDN key pair is used.
Step 14	**fingerprint** *ca-fingerprint* **Example:** `Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E`	(Optional) Specifies a fingerprint that can be matched against the fingerprint of a CA certificate during authentication. **Note** If the fingerprint is not provided and authentication of the CA certificate is interactive, the fingerprint will be displayed for verification.
Step 15	**on** *devicename* **:** **Example:** `Router(ca-trustpoint)# on usbtoken0:`	(Optional) Specifies that RSA keys will be created on the specified device upon autoenrollment initial key generation. • Devices that may be specified include NVRAM, local disks, and Universal Serial Bus (USB) tokens. USB tokens may be used as cryptographic devices in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.
Step 16	**exit** **Example:** `Router(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode and returns to global configuration mode.
Step 17	**crypto pki authenticate** *name* **Example:** `Router(config)# crypto pki authenticate mytp`	Retrieves the CA certificate and authenticates it. Check the certificate fingerprint if prompted. **Note** This command is optional if the CA certificate is already loaded into the configuration.
Step 18	**exit** **Example:** `Router(config)# exit`	Exits global configuration mode.

Step 19	**copy system:running-config nvram:startup-config**
	Example:
	`Router#`
	`copy system:running-config nvram:startup-config`
		(Optional) Copies the running configuration to the NVRAM startup configuration.
		Note Autoenrollment will not update NVRAM if the running configuration has been modified but not written to NVRAM.

Step 20	**show crypto pki certificates** **Example:**	(Optional) Displays information about your certificates, including any rollover certificates.

	Command or Action	Purpose
	`Router# show crypto pki certificates`	

Configuring Manual Certificate Enrollment

Manual certificate enrollment can be set up via TFTP or the manual cut-and-paste method. Both options can be used if your CA does not support SCEP or if a network connection between the router and CA is not possible. Perform one of the following tasks to set up manual certificate enrollment:

PEM-Formatted Files for Certificate Enrollment Request

Using PEM-formatted files for certificate requests can be helpful for customers who are using terminal or profile-based enrollment to request certificates from their CA server. Customers using PEM-formatted files can directly use existing certificates on their routers.

Restrictions for Manual Certificate Enrollment

SCEP Restriction

We do not recommend switching URLs if SCEP is used; that is, if the enrollment URL is “http://myca,” do not change the enrollment URL after getting the CA certificate and before enrolling the certificate. A user can switch between TFTP and manual cut-and-paste.

Key Regeneration Restriction

Do not regenerate the keys manually using the **crypto key generate** command; key regeneration will occur when the **crypto pki enroll**command is issued if the **regenerate** keyword is specified.

Configuring Cut-and-Paste Certificate Enrollment

Perform this task to configure cut-and-paste certificate enrollment. This task helps you to configure manual certificate enrollment via the cut-and-paste method for peers participating in your PKI.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment terminal pem**
5. **fingerprint** *ca-fingerprint*
6. **exit**
7. **crypto pki authenticate** *name*
8. crypto pki enroll name
9. crypto pki import name certificate
10. **exit**
11. **show crypto pki certificates**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint mytp`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.
Step 4	**enrollment terminal pem** **Example:** `Router(ca-trustpoint)# enrollment terminal`	Specifies the manual cut-and-paste certificate enrollment method. • The certificate request will be displayed on the console terminal so that it may be manually copied (or cut). • **pem** --Configures the trustpoint to generate PEM-formatted certificate requests to the console terminal.
Step 5	**fingerprint** *ca-fingerprint* **Example:** `Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E`	(Optional) Specifies a fingerprint that can be matched against the fingerprint of a CA certificate during authentication. **Note** If the fingerprint is not provided, it will be displayed for verification.
Step 6	**exit** **Example:** `Router(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode and returns to global configuration mode.
Step 7	**crypto pki authenticate** *name* **Example:** `Router(config)# crypto pki authenticate mytp`	Retrieves the CA certificate and authenticates it.
Step 8	crypto pki enroll name **Example:** `Router(config)# crypto pki enroll mytp`	Generates certificate request and displays the request for copying and pasting into the certificate server. • You are prompted for enrollment information, such as whether to include the router FQDN and IP address

	Command or Action	Purpose
		in the certificate request. You are also given the choice about displaying the certificate request to the console terminal. • The base-64 encoded certificate with or without PEM headers as requested is displayed.
Step 9	crypto pki import name certificate **Example:** `Router(config)# crypto pki import mytp certificate`	Imports a certificate manually at the console terminal (pasting). • The base-64 encoded certificate is accepted from the console terminal and inserted into the internal certificate database. **Note** You must enter this command twice if usage keys, a signature key, and an encryption key are used. The first time the command is entered, one of the certificates is pasted into the router. The second time the command is entered, the other certificate is pasted into the router. It does not matter which certificate is pasted first. **Note** Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If this applies to the certificate authority you are using, import the general purpose certificate. The router will not use one of the two key pairs generated.
Step 10	**exit** **Example:** `Router(config)# exit`	Exits global configuration mode.
Step 11	**show crypto pki certificates** **Example:** `Router# show crypto pki certificates`	(Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.

Configuring TFTP Certificate Enrollment

Perform this task to configure TFTP certificate enrollment. This task helps you to configure manual certificate enrollment using a TFTP server.

Before you begin

- You must know the correct URL to use if you are configuring certificate enrollment via TFTP.

- The router must be able to write a file to the TFTP server for the **crypto pki enroll** command.
- If you are using a file specification with the **enrollment** command, the file must contain the CA certificate either in binary format or be base-64 encoded.
- You must know if your CA ignores key usage information in a certificate request and issues only a general purpose usage certificate.

Caution Some TFTP servers require that the file must exist on the server before it can be written. Most TFTP servers require files that can be written over. This requirement may pose a risk because any router or other device may write or overwrite the certificate request; thus, the replacement certificate request will not be used by the CA administrator, who must first check the enrollment request fingerprint before granting the certificate request.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment** [**mode**] [**retry period** minutes] [**retry count** number] **url** url [**pem**]
5. **fingerprint** *ca-fingerprint*
6. **exit**
7. **crypto pki authenticate** *name*
8. crypto pki enroll name
9. crypto pki import name certificate
10. **exit**
11. **show crypto pki certificates**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint mytp`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.

	Command or Action	Purpose
Step 4	**enrollment** [**mode**] [**retry period** minutes] [**retry count** number] **url** url [**pem**] **Example:** `Router(ca-trustpoint)# enrollment url tftp://certserver/file_specification`	Specifies TFTP as the enrollment method to send the enrollment request and to retrieve the CA certificate and router certificate and any optional parameters. **Note** For TFTP enrollment, the URL must be configured as a TFTP URL, tftp://example_tftp_url. • An optional file specification filename may be included in the TFTP URL. If the file specification is not included, the FQDN will be used. If the file specification is included, the router will append the extension ".ca" to the specified filename.
Step 5	**fingerprint** *ca-fingerprint* **Example:** `Router(ca-trustpoint)# fingerprint 12EF53FA 355CD23E 12EF53FA 355CD23E`	(Optional) Specifies the fingerprint of the CA certificate received via an out-of-band method from the CA administrator. **Note** If the fingerprint is not provided, it will be displayed for verification.
Step 6	**exit** **Example:** `Router(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode and returns to global configuration mode.
Step 7	**crypto pki authenticate** *name* **Example:** `Router(config)# crypto pki authenticate mytp`	Retrieves the CA certificate and authenticates it from the specified TFTP server.
Step 8	crypto pki enroll name **Example:** `Router(config)# crypto pki enroll mytp`	Generates certificate request and writes the request out to the TFTP server. • You are prompted for enrollment information, such as whether to include the router FQDN and IP address in the certificate request. You are queried about whether to display the certificate request to the console terminal. • The filename to be written is appended with the extension ".req". For usage keys, a signature key and an encryption key, two requests are generated and sent. The usage key request filenames are appended with the extensions "-sign.req" and "-encr.req", respectively.
Step 9	crypto pki import name certificate **Example:**	Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate.

	Command or Action	Purpose
	`Router(config)# crypto pki import mytp certificate`	• The router will attempt to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from ".req" to ".crt". For usage key certificates, the extensions "-sign.crt" and "-encr.crt" are used. • The router will parse the received files, verify the certificates, and insert the certificates into the internal certificate database on the router. **Note** Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two key pairs generated.
Step 10	**exit** **Example:** `Router(config)# exit`	Exits global configuration mode.
Step 11	**show crypto pki certificates** **Example:** `Router# show crypto pki certificates`	(Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.

Certifying a URL Link for Secure Communication with a Trend Micro Server

Perform this task to certify a link used in URL filtering that allows secure communication with a Trend Micro Server.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the *Next Generation Encryption* (NGE) white paper.

SUMMARY STEPS

1. **enable**
2. **clock set** *hh* **:** *mm* **:** *ss date month year*
3. **configure terminal**
4. **clock timezone** *zone hours-offset* [*minutes-offset*]
5. **ip http server**
6. **hostname** *name*
7. **ip domain-name** *name*

8. **crypto key generate rsa general-keys modulus** *modulus-size*
9. **crypto pki trustpoint** *name*
10. **enrollment terminal**
11. **crypto ca authenticate** *name*
12. Copy the following block of text containing the base 64 encoded CA certificate and paste it at the prompt.
13. Enter **yes** to accept this certificate.
14. **serial-number**
15. **revocation-check none**
16. **end**
17. **trm register**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**clock set** *hh* **:** *mm* **:** *ss date month year* **Example:** `Router# clock set 23:22:00 22 Dec 2009`	Sets the clock on the router.
Step 3	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 4	**clock timezone** *zone hours-offset* [*minutes-offset*] **Example:** `Router(config)# clock timezone PST -08`	Sets the time zone. • The *zone* argument is the name of the time zone (typically a standard acronym). The *hours-offset* argument is the number of hours the time zone is different from Universal Time Coordinated (UTC). The *minutes-offset* argument is the number of minutes the time zone is different from UTC. **Note** The *minutes-offset*argument of the **clock timezone** command is available for those cases where a local time zone is a percentage of an hour different from UTC or Greenwich Mean Time (GMT). For example, the time zone for some sections of Atlantic Canada (AST) is UTC-3.5. In this case, the necessary command would be **clock timezone AST -3 30**.

	Command or Action	Purpose
Step 5	**ip http server** **Example:** `Router(config)# ip http server`	Enables the HTTP server.
Step 6	**hostname** *name* **Example:** `Router(config)# hostname hostname1`	Configures the hostname of the router.
Step 7	**ip domain-name** *name* **Example:** `Router(config)# ip domain-name example.com`	Defines the domain name for the router.
Step 8	**crypto key generate rsa general-keys modulus** *modulus-size* **Example:** `Router(config)# crypto key generate rsa general-keys modulus general`	Generates the crypto keys. • The **general-keys** keyword specifies that a general purpose key pair is generated, which is the default. • The **modulus** keyword and *modulus-size* argument specify the IP size of the key modulus. By default, the modulus of a CA key is 1024 bits. When generating RSA keys, you will be prompted to enter a modulus length. A longer modulus could offer stronger security but takes longer to generate and to use. A length of less than 2048 is not recommended. **Note** The name for the general keys that are generated are based on the domain name that is configured in Step 7. For example, the keys will be called "example.com."
Step 9	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint mytp`	Declares the CA that your router should use and enters ca-trustpoint configuration mode. **Note** Effective with Cisco IOS Release 12.3(8)T, the **crypto pki trustpoint** command replaced the **crypto ca trustpoint** command.
Step 10	**enrollment terminal** **Example:** `Router(ca-trustpoint)# enrollment terminal`	Specifies the manual cut-and-paste certificate enrollment method. • The certificate request will be displayed on the console terminal so that you may manually copy (or cut).
Step 11	**crypto ca authenticate** *name* **Example:**	Takes the name of the CA as the argument and authenticates it.

	Command or Action	Purpose

	`Router(ca-trustpoint)# crypto ca authenticate mytp`	• The following command output displays:
		`Enter the base 64 encoded CA certificate.`
		`End with a blank line or the word "quit" on a line by itself.`

Step 12	Copy the following block of text containing the base 64 encoded CA certificate and paste it at the prompt.	`MIIDIDCCAcmgAwIBAgIENd70zzANBgkqhkiG9w0BAQUFADBOMQswCQYDVQQGEwJV`
		`UzEQMA4GA1UEChMHRXF1aWZheDEtMCsGA1UECxMkRXF1aWZheCBTZWN1cmUgQ2Vy`
		`dGlmaWNhdGUgQXV0aG9yaXR5MB4XDTk4MDgyMjE2NDE1MVoXDTE4MDgyMjE2NDE1`
		`MVowTjELMAkGA1UEBhMCVVMxEDAOBgNVBAoTB0VxdWlmYXgxLTArBgNVBAsTJEVx`
		`dWlmYXggU2VjdXJlIENlcnRpZmljYXRlIEF1dGhvcml0eTCBnzANBgkqhkiG9w0B`

		The following command output displays:
		`Certificate has the following attributes:`
		`Fingerprint MD5: 67CB9DC0 13248A82 9BB2171E D11BECD4`

	Command or Action	Purpose
		`Fingerprint SHA1: D23209AD 23D31423 2174E40D 7F9D6213 9786633A`

Step 13	Enter **yes** to accept this certificate.	`% Do you accept this certificate? [yes/no]: yes`
		The following command output displays:
		`Trustpoint CA certificate accepted.`
		`% Certificate successfully imported`

Step 14	**serial-number** **Example:** `hostname1(ca-trustpoint)# serial-number`	Specifies the router serial number in the certificate request.
Step 15	**revocation-check none** **Example:** `hostname1(ca-trustpoint)# revocation-check none` **Example:**	Specifies that certificate checking is ignored.
Step 16	**end** **Example:** `hostname1(ca-trustpoint)# end`	Exits ca-trustpoint configuration mode and returns to privileged EXEC mode.
Step 17	**trm register** **Example:** `hostname1# trm register`	Manually starts the Trend Micro Server registration process.

Configuring a Persistent Self-Signed Certificate for Enrollment via SSL

This section contains the following tasks:

Note These tasks are optional because if you enable the HTTPS server, it generates a self-signed certificate automatically using default values.

Persistent Self-Signed Certificates Overview

The SSL protocol can be used to establish a secure connection between an HTTPS server and a client (web browser). During the SSL handshake, the client expects the SSL server's certificate to be verifiable using a certificate the client already possesses.

If Cisco IOS software does not have a certificate that the HTTPS server can use, the server generates a self-signed certificate by calling a PKI application programming interface (API). When the client receives this self-signed certificate and is unable to verify it, intervention is needed. The client asks you if the certificate should be accepted and saved for future use. If you accept the certificate, the SSL handshake continues.

Future SSL handshakes between the same client and the server use the same certificate. However, if the router is reloaded, the self-signed certificate is lost. The HTTPS server must then create a new self-signed certificate. This new self-signed certificate does not match the previous certificate, so you are once again asked to accept it.

Requesting acceptance of the router's certificate each time that the router reloads may present an opportunity for an attacker to substitute an unauthorized certificate when you are being asked to accept the certificate. Persistent self-signed certificates overcome all these limitations by saving a certificate in the router's startup configuration.

Restrictions

- You can configure only one trustpoint for a persistent self-signed certificate.
- The maximum lifetime of a self-signed certificate is 00:00:00 GMT Jan 1, 2030.

Note Do not change the IP domain name or the hostname of the router after creating the self-signed certificate. Changing either name triggers the regeneration of the self-signed certificate and overrides the configured trustpoint. WebVPN ties the SSL trustpoint name to the WebVPN gateway configuration. If a new self-signed certificate is triggered, then the new trustpoint name does not match the WebVPN configuration, causing the WebVPN connections to fail.

Configuring a Trustpoint and Specifying Self-Signed Certificate Parameters

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the *Next Generation Encryption* (NGE) white paper.

Perform the following task to configure a trustpoint and specify self-signed certificate parameters.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** name
4. **enrollment selfsigned**
5. **subject-name** [*x.500-name*]

6. **rsakeypair** *key-label* [key-size [encryption-key-size]]
7. **crypto pki enroll** name
8. **end**
9. **show crypto pki certificates** [*trustpoint-name*[**verbose**]]
10. **show crypto pki trustpoints** [**status** | *label* [**status**]]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** name **Example:** `Router(config)# crypto pki trustpoint local`	Declares the CA that your router should use and enters ca-trustpoint configuration mode. **Note** Effective with Cisco IOS Release 12.3(8)T, the **crypto pki trustpoint** command replaced the **crypto ca trustpoint** command.
Step 4	**enrollment selfsigned** **Example:** `Router(ca-trustpoint)# enrollment selfsigned`	Specifies self-signed enrollment.
Step 5	**subject-name** [*x.500-name*] **Example:** `Router(ca-trustpoint)# subject-name`	(Optional) Specifies the requested subject name to be used in the certificate request. • If no value for the *x-500-name* argument is specified, the FQDN, which is the default subject name, is used.
Step 6	**rsakeypair** *key-label* [key-size [encryption-key-size]] **Example:** `Router(ca-trustpoint)# rsakeypair examplekey 2048`	(Optional) Specifies which key pair to associate with the certificate. • The value for the *key-label* argument will be generated during enrollment if it does not already exist or if the **auto-enroll regenerate** command was issued. • Specify a value for the *key-size* argument for generating the key, and specify a value for the *encryption-key-size* argument to request separate encryption, signature keys, and certificates. The key-size and encryption-key-size must be the same size. Length of less than 2048 is no recommended.

	Command or Action	Purpose
		Note If this command is not enabled, the FQDN key pair is used.
Step 7	**crypto pki enroll** name **Example:** `Router(config)# crypto pki enroll local`	Tells the router to generate the persistent self-signed certificate.
Step 8	**end** **Example:** `Router(ca-trustpoint)# end`	(Optional) Exits ca-trustpoint configuration mode. • Enter this command a second time to exit global configuration mode.
Step 9	**show crypto pki certificates** [*trustpoint-name*[**verbose**]] **Example:** `Router# show crypto pki certificates local verbose`	Displays information about your certificate, the certification authority certificate, and any registration authority certificates.
Step 10	**show crypto pki trustpoints** [**status** | *label* [**status**]] **Example:** `Router# show crypto pki trustpoints status`	Displays the trustpoints that are configured in the router.

Enabling the HTTPS Server

Perform the following task to enable the HTTPS server.

Before you begin

To specify parameters, you must create a trustpoint and configure it. To use default values, delete any existing self-signed trustpoints. Deleting all self-signed trustpoints causes the HTTPS server to generate a persistent self-signed certificate using default values as soon as the server is enabled.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http secure-server**
4. **end**
5. **copy system:running-config nvram: startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:**	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	`Router> enable`	
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ip http secure-server** **Example:** `Router(config)# ip http secure-server`	Enables the HTTPS web server. **Note** A key pair (modulus 1024) and a self-signed certificate are automatically generated.
Step 4	**end** **Example:** `Router(config)# end`	Exits global configuration mode.
Step 5	**copy system:running-config nvram: startup-config** **Example:** `Router# copy system:running-config nvram: startup-config`	Saves the self-signed certificate and the HTTPS server in enabled mode.

Configuring a Certificate Enrollment Profile for Enrollment or Reenrollment

Perform this task to configure a certificate enrollment profile for enrollment or reenrollment. This task helps you to configure an enrollment profile for certificate enrollment or reenrollment of a router with a Cisco IOS CA that is already enrolled with a third-party vendor CA.

Enable a router that is enrolled with a third-party vendor CA to use its existing certificate to enroll with the Cisco IOS certificate server so the enrollment request is automatically granted. To enable this functionality, you must issue the **enrollment credential** command. Also, you cannot configure manual certificate enrollment.

Before you begin

Perform the following tasks at the client router before configuring a certificate enrollment profile for the client router that is already enrolled with a third-party vendor CA so that the router can reenroll with a Cisco IOS certificate server:

- Defined a trustpoint that points to the third-party vendor CA.
- Authenticated and enrolled the client router with the third-party vendor CA.

Note

- To use certificate profiles, your network must have an HTTP interface to the CA.
- If an enrollment profile is specified, an enrollment URL may not be specified in the trustpoint configuration. Although both commands are supported, only one command can be used at a time in a trustpoint.
- Because there is no standard for the HTTP commands used by various CAs, the user is required to enter the command that is appropriate to the CA that is being used.

>

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. enrollment profile label
5. **exit**
6. **crypto pki profile enrollment** *label*
7. Do one of the following:
   - **authentication url** *url*
   - **authentication terminal**
8. **authentication command**
9. Do one of the following:
   - **enrollment url** *url*
   -
   - **enrollment terminal**
10. **enrollment credential** *label*
11. **enrollment command**
12. **parameter** *number* {**value** *value* | **prompt** *string*}
13. **exit**
14. **show crypto pki certificates**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint Entrust`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.
Step 4	enrollment profile label **Example:** `Router(ca-trustpoint)# enrollment profile E`	Specifies that an enrollment profile is to be used for certificate authentication and enrollment.
Step 5	**exit** **Example:** `Router(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode.
Step 6	**crypto pki profile enrollment** *label* **Example:** `Router(config)# crypto pki profile enrollment E`	Defines an enrollment profile and enters ca-profile-enroll configuration mode. • *label* --Name for the enrollment profile; the enrollment profile name must match the name specified in the **enrollment profile** command.

Step 7	Do one of the following:
	• **authentication url** *url*
	• **authentication terminal**
	Example:
	`Router(ca-profile-enroll)# authentication url http://entrust:81`
	Example:
	`Router(ca-profile-enroll)# authentication terminal`
		Specifies the URL of the CA server to which to send certificate authentication requests.
		• *url* --URL of the CA server to which your router should send authentication requests. If you are using HTTP, the URL should read "http://CA_name," where CA_name is the host DNS name or IP address of the CA. If you are using TFTP, the URL should read "tftp://certserver/file_specification." (If the URL does not include a file specification, the FQDN of the router will be used.)
		Specifies manual cut-and-paste certificate authentication.

Step 8	**authentication command** **Example:** `Router(ca-profile-enroll)# authentication command`	(Optional) Specifies the HTTP command that is sent to the CA for authentication.
Step 9	Do one of the following: • **enrollment url** *url* • • **enrollment terminal** **Example:**	Specifies the URL of the CA server to which to send certificate enrollment requests via HTTP or TFTP. Specifies manual cut-and-paste certificate enrollment.

	Command or Action	Purpose

	`Router(ca-profile-enroll)# enrollment url http://entrust:81/cda-cgi/clientcgi.exe`
	Example:
	Example:
	`Router(ca-profile-enroll)# enrollment terminal`	

Step 10	**enrollment credential** *label* **Example:** `Router(ca-profile-enroll)# enrollment credential Entrust`	(Optional) Specifies the third-party vendor CA trustpoint that is to be enrolled with the Cisco IOS CA. **Note** This command cannot be issued if manual certificate enrollment is being used.
Step 11	**enrollment command** **Example:** `Router(ca-profile-enroll)# enrollment command`	(Optional) Specifies the HTTP command that is sent to the CA for enrollment.
Step 12	**parameter** *number* {**value** *value* | **prompt** *string*} **Example:** `Router(ca-profile-enroll)# parameter 1 value aaaa-bbbb-cccc`	(Optional) Specifies parameters for an enrollment profile. • This command can be used multiple times to specify multiple values.
Step 13	**exit** **Example:** `Router(ca-profile-enroll)# exit`	(Optional) Exits ca-profile-enroll configuration mode. • Enter this command a second time to exit global configuration mode.
Step 14	**show crypto pki certificates** **Example:** `Router# show crypto pki certificates`	(Optional) Displays information about your certificates, the certificates of the CA, and RA certificates.

What to Do Next

If you configured the router to reenroll with a Cisco IOS CA, you should configure the Cisco IOS certificate server to accept enrollment requests only from clients already enrolled with the specified third-party vendor CA trustpoint to take advantage of this functionality. For more information, see the module " Configuring and Managing a Cisco IOS Certificate Server for PKI Deployment."

Configuring Certificate Enrollment in a Two-Tier PKI Environment

The feature enables sub-CAs to issue certificates to their clients when a root CA is offline. The root certificate can be imported through the CLI first, and then it is used to validate the issuing sub CA certificate configured under the trustpoint.

Note Enable revocation checking as per your environment before performing the following tasks.

For importing the ROOT-CA through terminal, perform the following steps:

```
enable
!
configure terminal
!
crypto pki trustpoint ROOT-CA
revocation-check none
enrollment terminal
!
crypto pki authenticate ROOT-CA
!
exit
```

For authenticating SUB-CA without specifying or accepting the fingerprint.

```
enable
!
configure terminal
!
crypto pki trustpoint SUB-CA
revocation-check none
enrollment url url
chain-validation continue ROOT-CA
exit
!
crypto pki authenticate SUB-CA
exit
```

Configuring Certificate Renewal by Enabling Multiple Trustpoints

Starting from the Cisco IOS XE 17.4.1 release, you can enable the registration authority to use multiple trustpoints to validate router credentials for initial certificate enrollment and certificate renewal. This enhancement enables automated validation of multiple trustpoints while maintaining zero-touch certificate enrollment through the SCEP enrollment protocol.

When you enroll a router for the first time, an SCEP request is initiated and this request is signed by using the SUDI credentials. The request is then sent to a registration authority which validates the SUDI certificate through a local trustpoint. The local trustpoint validates the router SCEP credentials. If the validation is successful, the registration authority uses the SUDI certificate to decrypt the signature and validate the hash. After the hash validation is also successful, the registration authority forwards the SCEP request to the certificate authority (CA). The CA then signs the request and sends the certificate back to the registration authority which in turn forwards the certificate to the router. At this point, the SCEP enrollment is complete.

In the case of a certificate renewal, when the same process is followed, the renewal fails. This is because the registration authority cannot validate the renewal request since the router uses the current certificate as the

credentials. Since the registration authority can use only one trustpoint to validate the router identity, the certificate renewal fails.

To overcome this challenge, you can now configure the registration authority to use multiple trustpoints to validate the router credentials. In this manner, the initial enrollment as well as the renewal works seamlessly.

To configure multiple trustpoints, use the **grant auto <tp-list>** command. You can configure from upto 5 trustpoints by using this command. For example:

```
grant auto tp-list <tp1 tp2>
grant auto tp-list <tp1 tp2 tp3>
grant auto tp-list <tp1 tp2 tp3 tp4>
grant auto tp-list <tp1 tp2 tp3 tp4 tp5>
```

After you configure the trustpoints, the registration authority validates the certificates that are received by using one of the configured trustpoints. The validation starts from the first trustpoint. If the validation is successful, the certificate is renewed. Else, the authority validates using the next available trustpoint.

Sample Configuration

```
crypto pki server FANRSACA
no database archive
grant auto <tp-list> ACT2_SUDI_CA <CA_TRUSTPOINT>
hash sha256
mode ra transparent
!
crypto pki trustpoint FANRSACA
enrollment url http://10.4.1.117:8080/ejbca/publicweb/apply/scep/FANRSACA
serial-number none
fqdn none
ip-address none
subject-name serialNumber=PID:ISR4451-X/K9 SN:FOC23231CRY, CN=ISR4k-1-ra
revocation-check none
rsakeypair FANRSACA_Key 4096
!
crypto pki trustpoint ACT2_SUDI_CA
enrollment profile ACT2_SUDI_CA
revocation-check none
!
crypto pki trustpool policy
revocation-check none
```

Note **Grant auto trustpoint** and **grant auto tp-list** are mutually exclusive. You cannot run the **grant auto tp-list** command if you have already configured grant auto trustpoint.

Configuration Examples for PKI Certificate Enrollment Requests

Configuring Certificate Enrollment or Autoenrollment Example

The following example shows the configuration for the “mytp-A” certificate server and its associated trustpoint, where RSA keys generated by the initial autoenrollment for the trustpoint will be stored on a USB token, “usbtoken0”:

```
crypto pki server mytp-A
```

```
   database level complete
   issuer-name CN=company, L=city, C=country
   grant auto
! Specifies that certificate requests will be granted automatically.
!
crypto pki trustpoint mytp-A
   revocation-check none
   rsakeypair myTP-A
   storage usbtoken0:
! Specifies that keys will be stored on usbtoken0:.
   on usbtoken0:
```

! Specifies that keys generated on initial auto enroll will be generated on and stored o**n !** usbtoken0:

Configuring Autoenrollment Example

The following example shows how to configure the router to automatically enroll with a CA on startup, enabling automatic rollover, and how to specify all necessary enrollment information in the configuration:

```
crypto pki trustpoint trustpt1
 enrollment url http://trustpt1.example.com//
 subject-name OU=Spiral Dept., O=example.com
 ip-address ethernet-0
 serial-number none
 usage ike
 auto-enroll regenerate
 password password1
 rsa-key trustpt1 2048
!
crypto pki certificate chain trustpt1
certificate pki 0B

quit
```

Note In this example, keys are neither regenerated nor rolled over.

Configuring Certificate Autoenrollment with Key Regeneration Example

The following example shows how to configure the router to automatically enroll with the CA named "trustme1" on startup and enable automatic rollover. The **regenerate** keyword is issued, so a new key will be generated for the certificate and reissued when the automatic rollover process is initiated. The renewal percentage is configured as 90 so if the certificate has a lifetime of one year, a new certificate is requested 36.5 days before the old certificate expires. The changes made to the running configuration are saved to the NVRAM startup configuration because autoenrollment will not update NVRAM if the running configuration has been modified but not written to NVRAM.

```
crypto pki trustpoint trustme1
 enrollment url http://trustme1.example.com/
 subject-name OU=Spiral Dept., O=example.com
 ip-address ethernet0
 serial-number none
 auto-enroll 90 regenerate
 password password1
 rsakeypair trustme1 2048
 exit
crypto pki authenticate trustme1
copy system:running-config nvram:startup-config
```

Configuring Cut-and-Paste Certificate Enrollment Example

The following example shows how to configure certificate enrollment using the manual cut-and-paste enrollment method:

```
Router(config)#
crypto pki trustpoint TP
Router(ca-trustpoint)#
enrollment terminal
Router(ca-trustpoint)#
crypto pki authenticate TP
Enter the base 64 encoded CA certificate.
End with a blank line or the word "quit" on a line by itself

```

Configuring Manual Certificate Enrollment with Key Regeneration Example

The following example shows how to regenerate new keys with a manual certificate enrollment from the CA named “trustme2”:

```
crypto pki trustpoint trustme2
 enrollment url http://trustme2.example.com/
 subject-name OU=Spiral Dept., O=example.com
 ip-address ethernet0
 serial-number none
 regenerate
 password password1
 rsakeypair trustme2 2048
 exit
crypto pki authenticate trustme2
crypto pki enroll trustme2
```

Creating and Verifying a Persistent Self-Signed Certificate Example

The following example shows how to declare and enroll a trustpoint named “local” and generate a self-signed certificate with an IP address:

```
crypto pki trustpoint local
 enrollment selfsigned
 end
configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
crypto pki enroll local
Nov 29 20:51:13.067: %SSH-5-ENABLED: SSH 1.99 has been enabled
Nov 29 20:51:13.267: %CRYPTO-6-AUTOGEN: Generated new 512 bit key pair
% Include the router serial number in the subject name? [yes/no]: yes
% Include an IP address in the subject name? [no]: yes
Enter Interface name or IP Address[]: ethernet 0
Generate Self Signed Router Certificate? [yes/no]: yes
Router Self Signed Certificate successfully created
```

Note A router can have only one self-signed certificate. If you attempt to enroll a trustpoint configured for a self-signed certificate and one already exists, you receive a notification and are asked if you want to replace it. If so, a new self-signed certificate is generated to replace the existing one.

Enabling the HTTPS Server Example

The following example shows how to enable the HTTPS server and generate a default trustpoint because one was not previously configured:

```
configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
ip http secure-server
% Generating 1024 bit RSA keys ...[OK]
*Dec 21 19:14:15.421:%PKI-4-NOAUTOSAVE:Configuration was modified.  Issue "write memory"
to save new certificate
Router(config)#
```

Note You need to save the configuration to NVRAM if you want to keep the self-signed certificate and have the HTTPS server enabled following router reloads.

The following message also appears:

```
*Dec 21 19:14:10.441:%SSH-5-ENABLED:SSH 1.99 has been enabled
```

Note Creation of the key pair used with the self-signed certificate causes the Secure Shell (SSH) server to start. This behavior cannot be suppressed. You may want to modify your Access Control Lists (ACLs) to permit or deny SSH access to the router. You can use the **ip ssh rsa keypair-name** *unexisting-key-pair-name* command to disable the SSH server.

Verifying the Self-Signed Certificate Configuration Example

The following example displays information about the self-signed certificate that you just created:

```
Router# show crypto pki certificates
Router Self-Signed Certificate
  Status: Available
  Certificate Serial Number: 01
  Certificate Usage: General Purpose
  Issuer:
    cn=IOS-Self-Signed-Certificate-3326000105
  Subject:
    Name: IOS-Self-Signed-Certificate-3326000105
    cn=IOS-Self-Signed-Certificate-3326000105
  Validity Date:
    start date: 19:14:14 GMT Dec 21 2004
    end   date: 00:00:00 GMT Jan 1 2020
  Associated Trustpoints: TP-self-signed-3326000105
```

Note The number 3326000105 is the router's serial number and varies depending on the router's actual serial number.

The following example displays information about the key pair corresponding to the self-signed certificate:

```
Router# show crypto key mypubkey rsa
% Key pair was generated at: 19:14:10 GMT Dec 21 2004
Key name: TP-self-signed-3326000105
 Usage: General Purpose Key
 Key is not exportable.
 Key Data:
  30819F30 0D06092A 864886F7 0D010101 05000381 8D003081 89028181 00B88F70
  6BC78B6D 67D6CFF3 135C1D91 8F360292 CA44A032 5AC1A8FD 095E4865 F8C95A2B
  BFD1C2B7 E64A3804 9BBD7326 207BD456 19BAB78B D075E78E 00D2560C B09289AE
  6DECB8B0 6672FB3A 5CDAEE92 9D4C4F71 F3BCB269 214F6293 4BA8FABF 9486BCFC
  2B941BCA 550999A7 2EFE12A5 6B7B669A 2D88AB77 39B38E0E AA23CB8C B7020301 0001
% Key pair was generated at: 19:14:13 GMT Dec 21 2004
Key name: TP-self-signed-3326000105.server
 Usage: Encryption Key
 Key is not exportable.
 Key Data:
  307C300D 06092A86 4886F70D 01010105 00036B00 30680261 00C5680E 89777B42
  463E5783 FE96EA9E F446DC7B 70499AF3 EA266651 56EE29F4 5B003D93 2FC9F81D
  8A46E12F 3FBAC2F3 046ED9DD C5F27C20 1BBA6B9B 08F16E45 C34D6337 F863D605
  34E30F0E B4921BC5 DAC9EBBA 50C54AA0 BF551BDD 88453F50 61020301 0001
```

Note The second key pair with the name TP-self-signed-3326000105.server is the SSH key pair and is generated when any key pair is created on the router and SSH starts up.

The following example displays information about the trustpoint named "local":

```
Router# show crypto pki trustpoints
Trustpoint local:
    Subject Name:
    serialNumber=C63EBBE9+ipaddress=10.3.0.18+hostname=test.example.com
          Serial Number: 01
    Persistent self-signed certificate trust point
```

Configuring Direct HTTP Enrollment Example

The following example show how to configure an enrollment profile for direct HTTP enrollment with a CA server:

```
crypto pki trustpoint Entrust
 enrollment profile E
 serial
crypto pki profile enrollment E
 authentication url http://entrust:81
 authentication command GET /certs/cacert.der
 enrollment url http://entrust:81/cda-cgi/clientcgi.exe
 enrollment command POST reference_number=$P2&authcode=$P1
 &retrievedAs=rawDER&action=getServerCert&pkcs10Request=$REQ
```

```
 parameter 1 value aaaa-bbbb-cccc
 parameter 2 value 5001
```

Configuring Certificate Enrollment in a Two-Tier PKI Environment Example

Example of importing the ROOT-CA via terminal.

```
(config)#crypto pki trustpoint ROOT-CA
(ca-trustpoint)#revocation-check none
(ca-trustpoint)#enrollment terminal

(config)#crypto pki authenticate ROOT-CA

Enter the base 64 encoded CA certificate.
End with a blank line or the word "quit" on a line by itself

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Overview of Cisco TrustSec

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 149: Feature Information for Overview of Cisco TrustSec

Feature Name	Releases	Feature Information
IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.

CHAPTER 112

Setting Up Secure Device Provisioning for Enrollment in a PKI

This module describes how to use Secure Device Provisioning (SDP) in a public key infrastructure (PKI). SDP is a web-based certificate enrollment interface that can be used to easily deploy PKI between two end devices, such as a Cisco IOS client and a Cisco IOS certificate server. The end devices may or may not be directly connected to the network at the time of deployment or provisioning. SDP provides a solution for users deploying a large number of peer devices (including certificates and configurations).

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Prerequisites for Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

Setting Up SDP for Enrollment in a PKI

Before you set up SDP, your environment should meet the following requirements:

- The petitioner device and the server must have IP connectivity between each other.
- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.

- A Cisco IOS Release 12.3(8)T PKI-enabled image or a later image.

Setting Up SDP for Enrollment in a PKI Using USB Tokens

To leverage USB tokens to provision devices with SDP, your environment should meet the following requirements:

- Both the petitioner device and the server must have IP connectivity between each other.
- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- The introducer must have access to a petitioner device.
- The introducer must have access to the USB token and PIN, if configured.
- A Cisco IOS Release 12.4(15)T PKI-enabled image or a later image.

Note Cisco IOS Release 12.4(15)T or a later release provides the flexibility to move credentials stored on the USB token. However, the device used to configure the USB token may run any Cisco IOS Release 12.3(14)T PKI-enabled image or a later image.

Using SDP to Configure a Device for an Internet Connection Through a Service Provider

To leverage SDP to configure a device that is not connected to the Internet, your environment should meet the following requirements:

- The introducer must have a web browser that supports JavaScript.
- The introducer must have enable privileges on the client device.
- A Cisco router that supports a DHCP client and a PPPoE client and has a configured LAN or WAN interface.
- A Cisco IOS Release 12.4(20)T PKI-enabled image or a later image. If a previous Cisco IOS release is used on one of the devices, the SDP functionality defaults to the earlier Cisco IOS version.

Information About Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

SDP Overview

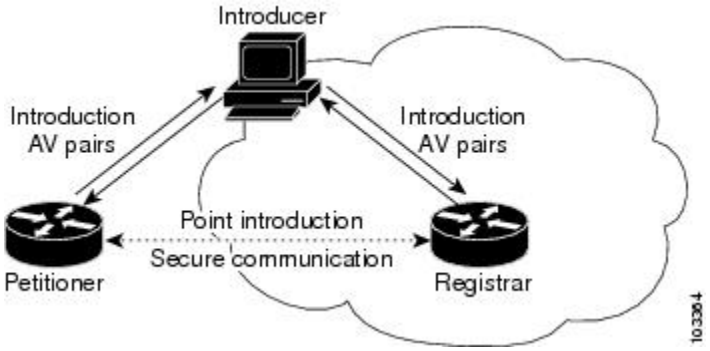
SDP (also refer red to as Trusted Transitive Introduction [TTI]) is a communication protocol that provides a bidirectional introduction between two end entities, such as a new network device and a Virtual Private Network (VPN). SDP involves the following three entities (see the figure below):

- Introducer--A mutually trusted device that introduces the petitioner to the registrar. The introducer can be a device user, such as a system administrator.

- An introducer can be configured as an administrative introducer, which allows an administrator performing the introduction to supply the name for the device being introduced. The supplied device name is used as if it were the name of an introducer in the normal SDP mechanisms, preserving the existing functionality of the SDP configuration. For more information on function of the administrative introducer, see the section Authentication and Authorization Lists for an Administrative Introducer, on page 1251.

- Petitioner--A client, or new device, to be introduced to the secure network.
- Registrar--A server that authorizes the petitioner. The registrar can be a certificate server.

Figure 37: Post-Introduction Secure Communication



As of Cisco IOS Release 12.4(20)T or a later release, the introducer can start the SDP process without establishing prior Internet connectivity on the petitioner. The use of the prep-connect phase and the connect phase provides the ability to configure a petitioner for Internet connectivity through a service provider. See the How SDP Works, on page 1241 for more information on the prep-connect phase and the connect phase.

The registrar communicates directly with an external authentication, authorization, and accounting (AAA) server to verify petitioner credentials, permit or deny enrollment, and retrieve specific petitioner configuration information. The petitioner and registrar serve web pages to the introducer, the end user. The petitioner receives the bootstrap configuration from a remote management system through the introducer's web browser.

SDP is implemented over a web browser with six possible phases--prep-connect (optional), connect, start (optional), welcome, introduction, and completion. Each phase is shown to the user through a web page. See the How SDP Works, on page 1241 for more information on each phase.

How SDP Works

The following sections describe how SDP deploys PKI between two devices:

The SDP process starts with one of three entry pages being loaded into the web browser by the introducer: the SDP prep-connect phase received from the administrator; the start phase loaded from the registrar; or the welcome phase loaded from the petitioner.

The sample figures show how to introduce the local device (the petitioner) to the secure domain of the registrar. The “introducer” is referred to as the end user.

SDP Prep-Connect Phase

The prep-connect page is optional. Without the prep-connect page, the petitioner must have IP connectivity established.

The administrator must configure the prep-connect template and send the prep-connect page to the introducer. See the Default Prep-Connect Template, on page 1256 for more information.

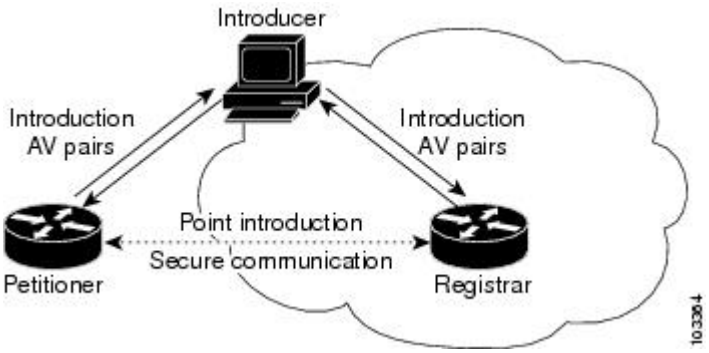
The administrator must also obtain and communicate the username and password for the secure network to the introducer by a telephone call, an e-mail, a secure e-mail, a CD, or a USB token. The registrar may be configured to authenticate the introducer using an existing AAA infrastructure (for example, an existing username and password database that is part of the existing corporate domain). The SDP prep-connect phase supports a challenge password mechanism as is used by common AAA infrastructures. See the How SDP Uses an External AAA Database, on page 1250 for more information.

After receiving the prep-connect page, the introducer must load the page onto the computer where the HTTP browser operates. The introducer then loads the prep-connect page into the HTTP browser as a local file and then the prep-connect page is displayed (see the figure below).

Figure 38: Sample SDP Prep-Connect Page

After the introducer clicks the Log onto Cisco Device button, the login dialog box is displayed (see the figure below). The introducer enters the factory default username (cisco) and password (cisco) of the Cisco device.

Figure 39: Sample Petitioner Login Dialog Box



The introducer authenticates with the petitioner and then Internet connectivity is tested by attempting to access a known URL. Access to www.cisco.com (198.133.219.25) is tested by default. The administrator can modify the URL to be used for testing connectivity by modifying the default prep-connect template. For more information about modifying the default test URL and other fields that the administrator may configure for the prep-connect page, see the section Default Prep-Connect Template, on page 1256.

Note To mitigate the possibility that the prep-connect page could be modified to contain an IP address of an untrusted registrar or that a prep-connect page might be e-mailed from an untrusted source, use a secure method, such as secure e-mail, to send the prep-connect page.

If Internet connectivity is established either the start page or welcome page is displayed, depending on the prep-connect template setting as defined by the administrator. If Internet connectivity is not established, the connect page is displayed.

SDP Connect Phase

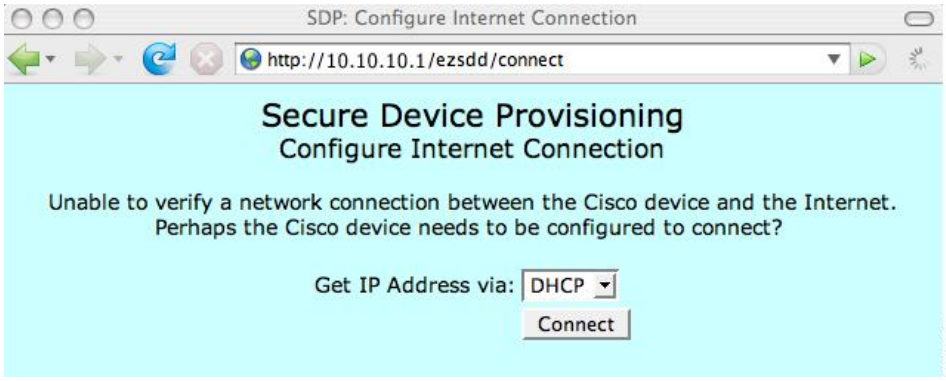
The connect page is displayed only if the prep-connect page is used and there is no IP connectivity for the petitioner at the completion of the prep-connect phase. The connect page has three IP address assignment methods to allow flexibility for your Cisco IOS platform: Dynamic Host Configuration Protocol (DHCP), Point to Point Protocol over Ethernet (PPPoE), or static IP address assignment.

Note SDP functionality is not used with the Cisco IOS configuration to establish Internet connectivity. SDP functionality includes a signature on the Cisco IOS configuration, guaranteeing that the values have not changed in transit.

DHCP IP Address Assignment Method

If the introducer chooses DHCP, the default method, for the IP address assignment method option (see the figure below), clicking the Connect button causes the petitioner to be configured for Internet connectivity.

Figure 40: Sample Connect Page for DHCP IP Address Assignment Method



PPPoE IP Address Assignment Method

If the introducer chooses PPPoE, input fields for PPPoE username and password are displayed (see the figure below). The introducer must enter the username and password as supplied by the Internet service provider (ISP) and then click the Connect button, which causes petitioner to be configured for Internet connectivity.

Figure 41: Sample Connect Page for PPPoE IP Address Assignment Method

Static IP Address Assignment Method

If the introducer chooses static, input fields for the IP address, netmask, and the default gateway are displayed (see the figure below). The introducer must enter the configuration values as supplied by the ISP and then click the Connect button, which causes petitioner to be configured for Internet connectivity.

Figure 42: Connect Page for Static IP Address Assignment Method

Connect Page IP Address Configuration

After IP address configuration, Internet connectivity is tested again by attempting to access a known URL configured by the administrator in the prep-connect template (www.cisco.com by default). If Internet connectivity is now established either the start page or welcome page is displayed, depending on the

prep-connect template setting as defined by the administrator. If Internet connectivity is not established, the introducer should verify the settings entered or contact their administrator.

SDP Start Phase

The start page is optional. Without the start page, during the SDP exchange, the user clicks the Next button on the welcome page and is sent to the registrar's introduction page. Because the user has not previously connected to the registrar, he or she is required to log in to the registrar using available credentials (per the registrar configuration). Some browsers fail to reconnect to the registrar after the user has entered the login data. As of Cisco IOS Release 12.4(4)T, users may configure their browsers to begin the SDP exchange by contacting the registrar's introduction URL through a start page. Thereafter, the registrar can direct the user to the welcome page, which is on the petitioner device. The SDP transaction continues through the welcome, introduction, and completion phases as described in this document.

To begin the SDP transaction from the registrar, the user must configure the browser through the **template http start** command; otherwise, the SDP transaction must begin from the welcome page on the petitioner. See the How Custom Templates Work with SDP, on page 1252.

Before the welcome page is displayed, the user must direct his or her browser to the start page through the URL http://registrar/ezsdd/intro. A login dialog box is then displayed, and the end user can log into the registrar through a username and password supplied by the administrator to access the secure network (see the figure below).

Figure 43: Registrar Remote Login Dialog Box

After entering a valid username and password, the start page is displayed (see the figure below).

Figure 44: Sample SDP Start Page

The user must log into the petitioner through the URL http://10.10.10.1/ezsdd/welcome. The welcome phase begins when the user clicks the Next button on the start page.

SDP Welcome Phase

The local login dialog box is then displayed (see the figure below), and the end user can log into the local device through the factory default username (cisco) and password (cisco). The welcome page is then displayed.

Figure 45: Petitioner Local Login Dialog Box

After the password is successfully entered, the welcome web page is displayed (see the figure below), which is served by the petitioner.

Figure 46: Sample SDP Welcome Page

After entering the URL of the registrar (for example, http://192.0.2.155/ezsdd/intro) and clicking the Next button on the welcome web page, the SDP introduction phase begins and the introduction page, which is served by the registrar, is displayed.

SDP Introduction Phase

Before the introduction page is displayed, the end user must log into the registrar if the user has not already done so from the start page (see "SDP Start Phase, on page 1245"), which utilizes the external AAA database.

With an external AAA database, the introducer can use an account on the database to perform the introduction without requiring knowledge of the enable password of the registrar. Without an external AAA database, the introducer may use the enable password of the registrar for authentication.

Note Using the enable password of the registrar exposes the password to end users; therefore, it is recommended that the enable password be used for administrative testing only.

The administrative introducer is identified by the HTTP authentication for the introduction page (or the start page), with the AAA database query returning administrative privilege for the user. If the introducer has

administrator privilege, the device name is that which was entered in the administrative introduction page. If the introducer does not have administrative privileges, the device name is the introducer name. The existing device certificate is the current certificate on the petitioner, which may be the manufacturing identification certificate (MIC). This certificate may or may not exist. For more information on the function of the external AAA database, see the section "How SDP Uses an External AAA Database, on page 1250."

After the end user successfully enters his or her password, the introduction web page is displayed (see the figure below).

Figure 47: Sample SDP Introduction Page

At this point, the registrar passes device information to the external management system to obtain a bootstrap configuration file. For more information on options available to identify a customized bootstrap configuration file, see the section Custom HTML Template Expansion Rules, on page 1253.

After the end user clicks the Next button on the introduction page, the end user enters the completion phase and automatically returns to his or her local device.

SDP Completion Phase

Now that the end user has enrolled the petitioner with the registrar, the petitioner serves the completion page (see the figure below).

Figure 48: Sample SDP Completion Page

The SDP exchange is now complete. The petitioner has received configuration information from the registrar and should receive a certificate from the registrar shortly.

SDP Leveraging USB Tokens

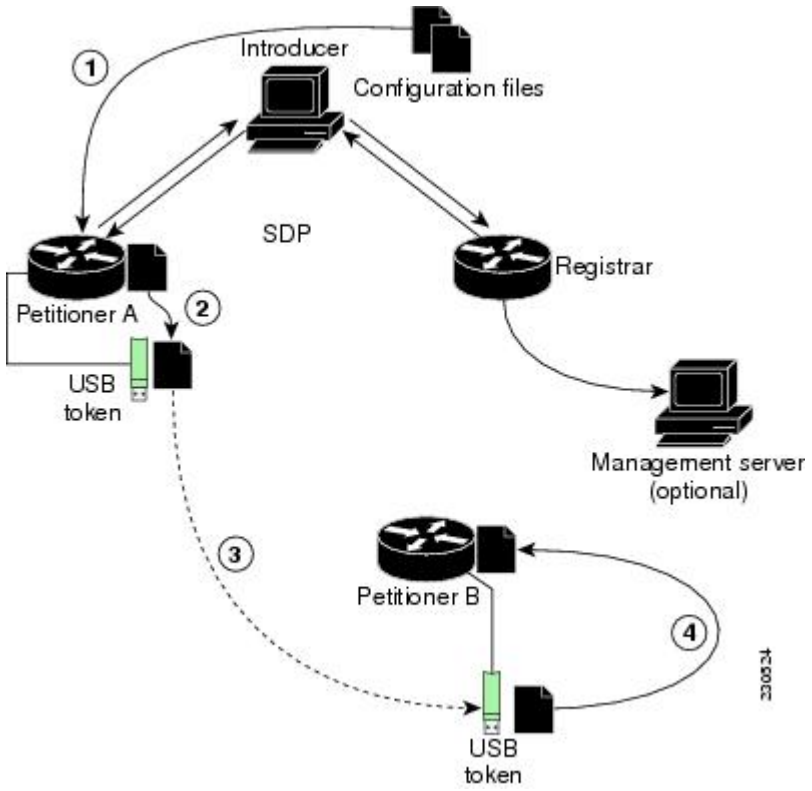
SDP provides for highly scalable deployments and streamlines the deployment of an individual device or multiple devices. USB tokens provide for secure storage and configuration distribution.

As of Cisco IOS Release 12.4(15)T or a later release, USB tokens may be utilized to transfer PKI credentials using SDP to a remote device, and SDP may be used to configure the USB token. The USB token may then be used to provision a device at the same location, or the USB token may be transported to another location where it may be used to provision a remote device.

An example SDP deployment using a USB token to transfer PKI credentials is shown in the figure below. The required devices include the USB token and the SDP entities required to provision a device. These SDP entities are the introducer, the registrar, a petitioner at the local location, Petitioner A, and a petitioner at the remote location, Petitioner B. Optionally, a management server may be used.

Note An optional configuration would be to configure one device as both the registrar and a petitioner, which may be beneficial when the USB token is transported to a remote location. The remote location would not require a separate petitioner device.

Figure 49: Example SDP Environment Using USB Tokens to Transfer Credentials



Use of SDP to Configure the USB Token

Prior to initiating an SDP introduction a USB token is inserted into the petitioner device. In the example configuration shown in the figure, the USB token would be inserted into Petitioner A. The petitioner may be configured to ignore any existing information on the USB token. As in regular SDP operations, for a scalable configuration of USB tokens, an initial template configuration has to be prepared and placed onto each SDP device with appropriate target configuration information.

Files used to provision a device are moved in the following sequence.

1. One petitioner, Petitioner A, is at the local location. petitioner A engages directly with the SDP exchange to perform the initial configuration of the USB token. Files used to configure the USB token, binary files and template files, are retrieved from the registrar and moved to Petitioner A.

The URL for the binary file location is expanded on the registrar. Binary files are not processed through the template expansion functions. The template expansion occurs on the registrar for both the source URL and destination URL.

By default, binary files and template files are retrieved from and stored to NVRAM on the registrar and petitioner respectively. The binary file location on the registrar and the destination binary file location on Petitioner A may be specified with the **binary file**command. The template file location on the registrar and the destination template file location on Petitioner A may be specified with the **template file**command.

1. The Rivest, Shamir, and Adelman (RSA) keys and certificate chain information are moved from Petitioner A to the USB token.
2. The USB token is transported to the remote location where it is inserted into Petitioner B.
3. The configuration files on the USB token are used to provision the local device. Files from the USB token may be moved to a storage location on Petitioner B with the **crypto key move rsa** command.

SDP Phases with a USB Token

The same SDP phase concepts introduced in the "SDP Overview" section are used, with the following distinctions in the SDP welcome phase, the SDP introduction phase, and the SDP completion phase.

SDP Welcome Phase with a USB Token

The SDP welcome phase begins as usual, when an introduction is initiated by connecting to the welcome user interface. If there is an existing certificate on the USB token, it is used for signing the SDP exchange. Instead of a local RSA key pair, a new RSA key pair on the token is used.

Note The RSA key pair generation may take a substantial length of time, anywhere from 5 to 10 minutes if the key is generated on the token. The length of time is dependent on hardware key generation routines available on the USB token. An informative web page is presented to the introducer, indicating that RSA key pair generation is occurring.

The new key pair generated by Petitioner A is added to the USB token without removing any existing RSA key pairs. SDP AV pairs indicate both that a token is being used and if there is any token secondary configuration information. If an optional management server is in use, the AV pair information is used to determine if any special configuration commands are needed.

SDP Introduction Phase with a USB Token

The SDP Introduction phase begins with AV pairs being transferred to the registrar. When the registrar detects USB token related AV pairs, the registrar, if previously configured, may prepare configuration information destined for the USB token. Currently configuration commands are sent as a specific configuration files that are subsequently merged with the running configuration.

The administrator can leverage normal SDP configuration commands to configure the USB token. USB token information that should be configured includes the certificate, the bootstrap configuration, and the PIN number configuration.

SDP Completion Phase with a USB Token

At the beginning of the completion phase, the introduction proceeds with AV pairs being transferred to the petitioner. The various files are stored in the specified file system locations and then the existing configuration file processing proceeds. This ordering allows the configuration to take advantage of the new files that have been transferred.

Use of the Configured USB Token

After the USB token is configured by Petitioner A, it is transported from its current location to the remote location, where the second petitioner, Petitioner B is located. The USB token is inserted into the target device, Petitioner B, which then inherits the USB token configuration and cryptographic material from the USB token. The end user at the remote location must have the PIN number on the USB token. The PIN number is either the default factory PIN or the PIN number the administrator configured during the introduction phase.

How SDP Uses an External AAA Database

The external AAA database is accessed twice during the SDP exchange. The first time the AAA database is accessed, the introducer is authenticated; that is, when the registrar receives an introduction request through the secure HTTP (HTTPS) server, the registrar does an AAA lookup based on the introducer's username and password to authorize the request. The second time the AAA database is accessed, authorization information is obtained and applied to the configuration and certificates that are issued to the petitioner device; that is, the registrar checks the integrity of the request by verifying the request signature using the petitioner-signing certificate. The certificate subject name may be specified in the AAA database, and up to nine configuration template variables may be specified and expanded into the template configuration.

Use of a Self-Signed Certificate Versus a Certificate Issued by Another CA Server

By default, the SDP exchange results in only one certificate being issued to the petitioner device. Although just one certificate is issued, the introducer is not restricted from introducing multiple devices and thus obtaining multiple certificates. By specifying the subject name in the certificate that is issued, you can be assured that all certificates that are issued in this way are associated with the introducer. You can use PKI AAA integration to further restrict the use of these certificates. Additionally, the AAA database can be configured to accept only one authentication and authorization request per user.

Because the petitioner certificate is self-signed, it is just used to convey the public key of the petitioner. No verification or authorization check is performed on the certificate; thus, authorization is per-user based and no per-device information is used.

There are some scenarios when per-device authorization is preferred. Therefore, if the petitioner is able to use certificates issued by other certification authority (CA) servers for SDP transactions, the existing PKI can be used and authorization can be achieved over the certificate attributes.

Configuring the petitioner and the registrar for certificate-based authorization provides authorization of the specific device being deployed. Previously, introducer-to-petitioner device communication was secured only using physical security between the introducer and the petitioner device. SDP certificate-based authorization gives the registrar an opportunity to validate the current device identity before accepting the introduction.

Authentication and Authorization Lists for SDP

When you are configuring your SDP registrar, if you specify an authentication list and an authorization list, the registrar uses the specified lists for all introducer requests. The authentication list is used when authenticating the introducer (the AAA server checks for a valid account by looking at the username and password). The

authorization list is used to receive the appropriate authorized fields for the certificate subject name and a list of template variables to be expanded into the Cisco IOS command-line interface (CLI) snippet that is sent back to the petitioner. The authentication and authorization lists are usually point to the same AAA server list, but it is possible to use a different database for authentication and authorization. (Storing files on different databases is not recommended.)

When a petitioner makes an introduction request, multiple queries are sent to the AAA list database on the RADIUS or TACACS+ server. The queries search for entries of the following form:

```
user Password <userpassword>
   cisco-avpair="ttti:subjectname=<<DN subjectname>>"
   cisco-avpair="tti:iosconfig#<<value>>"
   cisco-avpair="tti:iosconfig#<<value>>"
   cisco-avpair="tti:iosconfig#=<<value>>"
```

Note The existence of a valid AAA username record is enough to pass the authentication check. The "cisco-avpair=tti" information is necessary only for the authorization check.

If a subject name was received in the authorization response, the SDP registrar stores it in the enrollment database, and that "subjectname" overrides the subject name that is supplied in the subsequent certificate request (PKCS10) from the petitioner device.

The numbered "tti:iosconfig" values are expanded into the SDP Cisco IOS snippet that is sent to the petitioner. The configurations replace any numbered ($1 through $9) template variable. Because the default Cisco IOS snippet template does not include the variables $1 through $9, these variables are ignored unless you configure an external Cisco IOS snippet template. To specify an external configuration, use the **template config** command.

Note The template configuration location may include a variable "$n," which is expanded to the name with which the user is logged in.

Authentication and Authorization Lists for an Administrative Introducer

The SDP mechanisms assume a permanent relationship between the introducer and the device. As a result, the introducer username is used to define the device name.

In some SDP deployment scenarios, the introducer is an administrator doing the introduction for many devices. However, using the introducer (the administrator) name to define the device name results in multiple devices being incorrectly deployed with the same device name. Instead, an administrative introducer allows the administrator to specify the correct device name during the introduction.

More generally stated, the introducer username is used as the database record locator to determine all other information about the device including the Cisco IOS configuration template, various template variables (pulled from an AAA database and expanded into the template), and the appropriate subject name for PKI certificates issued to the device. For simplicity, this database record locator is called the user/device name.

The administrative introducer provides a device name. In that way, an administrator can provide the appropriate record locator when doing an introduction. For example, if an administrator is trying to introduce a device for username "user1," the administrator introduces the device into the PKI network and provides user1 as the record locator after logging into the registrar using the administrator's own credentials. The record locator,

user1, becomes the device name. All other template and PKI certificate subject name information specific to the introduction is then provided by the user1 username records instead of by the administrator's record.

The registrar device uses the supplied username information with a user introducer name. The username allows the existing mechanisms for determining a user's authorization, template, and PKI certificate information to be supported without modification.

How Custom Templates Work with SDP

You may use custom templates to streamline the SDP process.

- Custom templates allow you to complete the web pages with the required start information, so the introducer is no longer required to contact the registrar and can immediately begin the SDP transaction.
- Custom templates allow customized deployment information to be displayed on the web pages, thereby tailoring the user experience.

An easy way to define a custom template is to modify the default template. Without custom templates, the introducer must contact the registrar for information to begin the SDP transaction. For a list of the default templates, see the sectionDefault Templates for SDP Transaction Web Pages, on page 1256.

Note It is recommended that only advanced SDP users configure custom templates because problems can result from modifying templates incorrectly before the templates are displayed in the introducer's browser.

Custom Template Variable Expansion

There are expansion variables in the templates that are replaced by the Cisco IOS SDP registrar or petitioner. These variables are expanded as follows:

- $$--"$"
- $a--attribute-value (AV) pairs
- $c--Trusted certificate
- $d--Dump AV pairs in browser
- $h--Hostname
- $k--Keylabel or "tti"
- $l--Trustpoint label = "tti"
- $n--HTTP client's username
- $s--Default TTI key size
- $t--Trustpoint configuration
- $u--Completion URL
- $1 to $9--Variables retrieved from AAA server during user authentication

Custom Template Variable Expansion Rules

Configuration and templates are used during an SDP exchange. Prior to use and after distribution, these templates are expanded using the following rules based in the SDP communication stage.

Custom HTML Template Expansion Rules

HTML templates are expanded immediately before being served to the HTTP client. The HTTP templates are expanded as follows:

- $u--Completion url, which is be populated with the SDP completion URL (for example: http://10.10.10.1/ezsdd/completion). This variable is used internally by SDP as the internal “wizard” state. It is expected that the SDP introduction page include something similar to the following text: “<FORM action=\“$u\”method=\“post\”>” for normal wizard processing.
- $n--introducer name or the device name entered by the administrative introducer.
- $$--$
- $h--Hostname
- $a--All AV pairs with or without a specified template character are written in the following HTML form format. (Because these AV pairs are not “INPUT type=hidden,” they are directly displayed on the web page for debugging templates or the SDP process.)

<INPUT type=hidden NAME=“attribute string here”

value=“variable string here”>

all HTML templates should have this!

$d = dump all av pairs in: attribute = value

URL Template Expansion Rules

There are URLs for the configuration template source, the file template source, and the file destination. These variables are expanded when the registrar prepares the URL, just before retrieving the configuration or file. For the file destination, these variables are expanded just before the petitioner copies the file to the file destination.

- $$--$
- $h--Hostname

URL Template Expansion Rules for iPhone Deployment

The following template expansion variables are introduced for iPhone deployment:

- $o - challenge password. This template character is expanded by the SDP registrar after it obtains the challenge password from the Simple Certificate Enrollment Protocol (SCEP) server, before the configuration profile is sent to the iPhone in the START phase.
- $i - unique device identifier (UDID) of the iPhone. This template character is expanded by the SDP registrar into the CN field of the Subject Name, before the configuration profile is sent to the iPhone in the INTRODUCTION phase.
- $p - subject name differentiator. This template character is expanded by the SDP registrar using the value configured through the CLI. Seethe Configuring the SDP Registrar to Deploy Apple iPhones, on page

1272 for more information. This value can be used to differentiate the two certificates issued by the SCEP server to the iPhone, one in the COMPLETION phase and one in the VPN establishment phase. You determine part and field of the Subject Name into which this value goes.

See the How SDP Deploys Apple iPhones in a PKI, on page 1259 for more information.

Custom Configuration and File Template Variable Expansion Rules

Custom configuration and file template variables are expanded both when the registrar prepares the configuration or file template and when the petitioner receives the configuration or file template.

Custom Configuration and File Template Variable Expansion Rules at the Registrar

When the registrar expands the configuration or file template, the following variables are used by the Cisco IOS CA. These variables are expanded before being sent through the SDP wizard.

- $$--$
- $h--Hostname
- $t--A simple default trustpoint configuration that includes $l, $k, and $s to be expanded at the client
- $1 to $9--Variables retrieved from AAA server during user authentication (not applicable to the file template)

Custom Configuration and File Template Variable Expansion Rules at the Petitioner

When the petitioner expands the configuration or file template, the following variables are expanded:

- $$--$
- $h--Hostname
- $k--Keylabel
- $l--Trustpoint label
- $s--Key size
- $c--Expanded to certificate chain
- $n--Expanded to username (not applicable to the file template)

Custom Configuration HTTP Template Variable Expansion Rules

Custom configuration HTTP templates provide flexibility for backend Common Gateway Interface (CGI) scripts and integration with external management systems. Template URLs run through the HTTP template expansions before registrar retrieves the bootstrap configuration from the external management system. The device name ($n) is expanded into the URL and passed to the external management system so that a specific bootstrap configuration file can be located based on the device information.

Note You should only modify the HTML text that is displayed. The existing expansion variables, Javascript, and forms in the default templates should not be removed when customizing the templates. They are required for SDP to function properly.

The HTTP template expansion and **template config** command allow you to specify either of the following file types to obtain a customized bootstrap configuration file:

- A configuration file based on the device name (for example, template config http://myserver/$n-config-file.conf)
- A CGI script based on the device name (for example, template config http://myserver/cgi-bin/mysdpcgi post)

As of Cisco IOS Release 12.4(6)T, the CGI support has been expanded so that the bootstrap configuration can be identified by not only the device name, but also the type, current Cisco IOS version information, and current configuration. This functionality expands the **template config** command with the **post** keyword, which tells the registrar to send this additional device information to the external management system through a CGI script with the HTTP or HTTPS protocol only.

The registrar passes the device information through AV pairs ($a) to the external management system. Using the AV pair information, the management system identifies the appropriate bootstrap configuration file and sends it back to the registrar. The additional AV pairs that are sent with the expanded CGI support for identification of the customized bootstrap configuration file are shown in the table below.

Table 150: AV Pairs Sent During HTTP Post to External Management System

AV Pair	Description
TTIFixSubjectName	AAA_AT_TTI_SUBJECTNAME (sent only if the realm authentication user is not the root user on the registrar)
TTIIosRunningConfig	Output of **show running-config brief**
TTIKeyHash	Digest calculated over the device public key
TTIPrivilege	AAA_AT_TTI_PRIVILEGE--”admin” is sent if the user is an administrator, “user” is sent if the user is not an administrator (sent only if the realm authentication user is an administrator and the information is available from the AAA server)
TTISignature	Digest calculated over all AV pairs except UserDeviceName and TTISignCert
TTISignCert	Device current certificate (sent only if the device currently has a certificate)
TTITemplateVar	AAA_AT_TTI_IOSCONFIG(1-9) (sent only if the realm authentication user is not the root user on the registrar)
TTIUserName	Device name
TTIVersion	TTI version of the registrar
UserDeviceName	Device name as entered by the administrative introducer (sent only if the realm authentication user is an administrator)

Note The registrar must be running Cisco IOS Release 12.4(6)T, the **template config** command must be issued with the **post** keyword, and the *url* argument must include either HTTP or HTTPS. No other protocol is supported for the expanded CGI template functionality (for example, FTP).

Default Templates for SDP Transaction Web Pages

The following default templates exist for each SDP transaction web page:

Default Prep-Connect Template

The prep-connect template may be modified by the administrator to contain values that are appropriate for their environment. The format of the prep-connect page may also be modified by the settings contained in the template.

Except for the registrar IP address, which the administrator must customize, the prep-connect template may be used as shown below.

```
<html><head><title>
SDP: Test Internet Connection</title></head>
<noscript><b>
If you see this message, your browser is not running JavaScript,<br>
which is required by Cisco Secure Device Provisioning.<br>
If you cannot enable JavaScript, please contact your system administrator.
<br><br></b></noscript>
<body style="background-color: rgb(204, 255, 255);">
<div style="text-align: center;"><big><big>
Secure Device Provisioning</big><br>
Test Internet Connection</big><br><br>
<form action="http://10.10.10.1/ezsdd/connect" method="post">
<input type="submit" value="Log onto Cisco Device"><br><br>
Default username/password is cisco/cisco.
<input type="hidden" name="TTIAfterConnectURL"
value="http://10.10.10.1/ezsdd/welcome">
<!-- Note, that for the below, 198.133.219.25 = www.cisco.com. -->
<input type="hidden" name="TTIConnectTestURL" value="http://198.133.219.25">
<input type="hidden" name="TTIInsideAddr" value="10.10.10.1">
<input type="hidden" name="TTIlanport" value="Vlan1">
<input type="hidden" name="TTIwanport" value="FastEthernet4">
</form></div></body></html>
```

Hidden HTML Form Fields

The hidden HTML form fields communicate initial configuration information to the browser as set by the administrator and are not signed.

Note The term “hidden” refers to the fact that these HTML form fields are not displayed on the prep-connect page to reduce potential confusion to the introducer.

The administrator can set hidden HTML form fields in the prep-connect template as shown in the table below.

Table 151: Administrator Defined AV Pairs Sent During Prep-Connect Phase

AV Pair	Description
TTIAfterConnectURL	The administrator may set the TTIAfterConnectURL field to either the welcome page URL or the start page URL. The welcome page URL is specified with the factory default petitioner IP address. The connect after URL may be any valid URL if SDP is not going to be used after establishing Internet connectivity.
TTIConnectTestURL	The administrator may set the TTIConnectTestURL field to a valid URL that should be accessible when Internet connectivity is established. The default prep-connect template value is www.cisco.com (198.133.219.25).
TTIInsideAddr	The administrator may set the TTIInsideAddr field to the factory default IP address of the petitioner. For the Cisco 871 ISR, the IP address is 10.10.10.1.
TTIlanportx	The administrator may set the TTIlanportx field to the LAN interface name of the petitioner platform. This field is used to apply the Cisco IOS connect configuration. For the Cisco 871, the field value is “Vlan1.”
TTIwanport	The administrator may set the TTIwanport field to the WAN interface name of the petitioner. This field is used to apply the Cisco IOS connect configuration. For the Cisco 871, the field value is “FastEthernet4.”

Note The connect template cannot be customized.

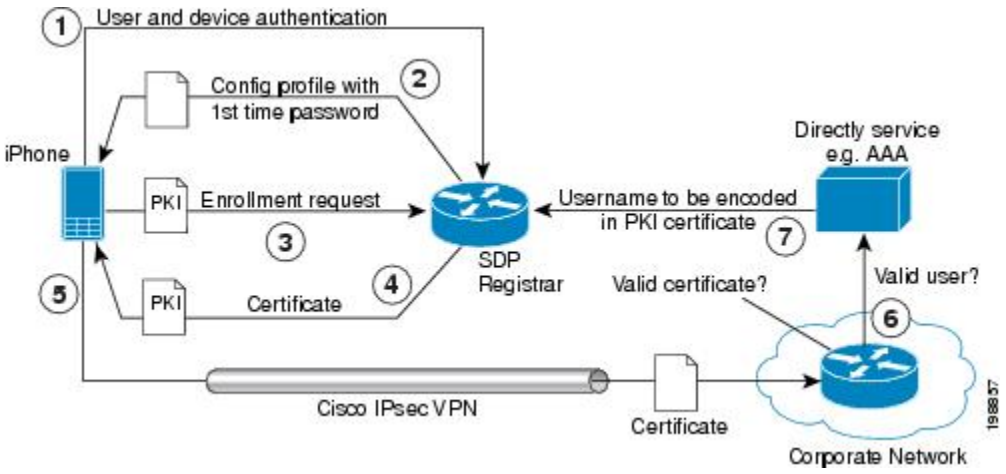
How SDP Deploys Apple iPhones in a PKI

With the introduction of the Cisco IOS 15.1(2)T and Apple iPhone OS 3.0 releases, Apple iPhones are supported on Cisco IOS network devices. Cisco IOS routers use the SDP registrar to deploy iPhones so that network applications can be accessed securely through an IPSec VPN, SCEP server, and PKI certificate deployment technologies.

The Apple iPhone combines the distribution of its XML-based "Configuration Profiles" with the initial deployment of certificates. SDP uses these initial certificates to authenticate access to enterprise applications and encrypt subsequent profile distribution. SDP uses this enrollment solution for distributing digital certificates to the iPhone.

Figure 50: SDP Registrar Deployment of the iPhone in a PKI



SDP Registrar Deployment Phases of the Apple iPhone in a PKI

The following sections describe each phase of the SDP registrar deployment of the iPhone in a PKI:

Start SDP Deployment Phase

The following steps describe the Start SDP deployment phase:

Note The Start SDP deployment phase is equivalent to the "Begin Enrollment" phase (or Phase 1) discussed in the http://manuals.info.apple.com/en_US/Enterprise_Deployment_Guide.pdf Apple iPhone Enterprise Deployment Guide .

SUMMARY STEPS

1. The iPhone user opens the Safari browser and types the start page HTTPS URL. For example, this HTTPS URL may be an internal corporate network address. The SDP registrar HTTPS page initiates the process.
2. The user starts authentication with the Cisco router, which acts as the SDP registrar by providing a username and password.

3. The SDP registrar contacts the SCEP server to obtain a challenge password.
4. The SDP registrar constructs a configuration profile in XML format that consists of the challenge password, SCEP server URL, and a request for iPhone attributes. The SCEP server URL is used to send the enrollment request and the iPhone device attributes are used by the iPhone to generate the RSA keys.
5. The iPhone user installs the configuration profile on the iPhone to complete the Start SDP phase.

DETAILED STEPS

Step 1 The iPhone user opens the Safari browser and types the start page HTTPS URL. For example, this HTTPS URL may be an internal corporate network address. The SDP registrar HTTPS page initiates the process.

Step 2 The user starts authentication with the Cisco router, which acts as the SDP registrar by providing a username and password.

Step 3 The SDP registrar contacts the SCEP server to obtain a challenge password.

Step 4 The SDP registrar constructs a configuration profile in XML format that consists of the challenge password, SCEP server URL, and a request for iPhone attributes. The SCEP server URL is used to send the enrollment request and the iPhone device attributes are used by the iPhone to generate the RSA keys.

The following example shows a configuration profile sent by the SDP registrar to the iPhone in the Start SDP deployment phase:

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Inc//DTD PLIST 1.0//EN" "http://
www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
<key>PayloadContent</key>
<dict>
<key>URL</key>
<string>https://profileserver.example.com/iphone</string>
<key>DeviceAttributes</key>
<array>
<string>UDID</string>
<string>IMEI</string>
<string>ICCID</string>
<string>VERSION</string>
<string>PRODUCT</string>
</array>
<key>Challenge</key>
<string>optional challenge</string>
```

Step 5 The iPhone user installs the configuration profile on the iPhone to complete the Start SDP phase.

Welcome SDP Deployment Phase

The Welcome SDP deployment phase is not applicable for the iPhone because the Introducer (for example, Safari web browser) is run on the SDP petitioner (iPhone).

Introduction SDP Deployment Phase

The following steps describe the Introduction SDP deployment phase:

Note The Introduction SDP deployment phase is equivalent to the “Device Authentication” phase .

SUMMARY STEPS

1. The iPhone triggers an HTTPS post containing the requested device attribute information and the challenge password as a configuration profile. The HTTPS post is directed to the HTTPS URL specified in the configuration profile obtained in the Start SDP deployment phase, which must be the Introduction SDP deployment phase URL. The post data is signed by the iPhone using an Apple-issued certificate (built-in identity) and this signature may be verified, the identify confirmed, and the device attributes checked.
2. The UDID sent by the iPhone is captured by the SDP registrar and included in the Subject Name. Going forward, the device attributes obtained by the SDP registrar are used to determine if this was exactly the type of device that would be accepted. For example, the network administrator would only let 3GS iPhones onto the network because they have hardware encrypted storage. The device attributes obtained would enable the SDP registrar to distinguish 3GS iPhones from 3G iPhones.
3. The SDP registrar responds by building a configuration profile that consists of the following: HTTP URL of the SCEP server, Subject Name (contains the UDID) that is sent in the enrollment request, key size, key type, key usage, and challenge password. If the START phase had been skipped, the SDP registrar would contact the SCEP server to obtain a challenge password. See the URL Template Expansion Rules for iPhone Deployment, on page 1253 for more information about how the SDP registrar obtains the Subject Name and the challenge password.

DETAILED STEPS

Step 1 The iPhone triggers an HTTPS post containing the requested device attribute information and the challenge password as a configuration profile. The HTTPS post is directed to the HTTPS URL specified in the configuration profile obtained in the Start SDP deployment phase, which must be the Introduction SDP deployment phase URL. The post data is signed by the iPhone using an Apple-issued certificate (built-in identity) and this signature may be verified, the identify confirmed, and the device attributes checked.

Step 2 The UDID sent by the iPhone is captured by the SDP registrar and included in the Subject Name. Going forward, the device attributes obtained by the SDP registrar are used to determine if this was exactly the type of device that would be accepted. For example, the network administrator would only let 3GS iPhones onto the network because they have hardware encrypted storage. The device attributes obtained would enable the SDP registrar to distinguish 3GS iPhones from 3G iPhones.

The following example shows a configuration profile sent by the iPhone in the Introduction SDP deployment phase:

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/
  DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
<key>UDID</key>
<string></string>
<key>VERSION</key>
<string>7A182</string>
<key>MAC_ADDRESS_EN0</key>
<string>00:00:00:00:00:00</string>
<key>CHALLENGE</key>
```

```
either:
    <string>String</string>
or:
    <data>"base64 encoded data"</data>
</dict>
</plist>
```

Step 3 The SDP registrar responds by building a configuration profile that consists of the following: HTTP URL of the SCEP server, Subject Name (contains the UDID) that is sent in the enrollment request, key size, key type, key usage, and challenge password. If the START phase had been skipped, the SDP registrar would contact the SCEP server to obtain a challenge password. See the URL Template Expansion Rules for iPhone Deployment, on page 1253 for more information about how the SDP registrar obtains the Subject Name and the challenge password.

Note The SDP registrar supports the RSA key type only.

The following example shows a configuration profile sent by the SDP registrar in the Introduction SDP deployment phase:

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Inc//DTD PLIST 1.0//EN" "http://
www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
<key>PayloadContent</key>
<dict>
<key>URL</key>
<string>https://iphone.vpn.apple.com/pkifoobar.exe</string>
<key>Name</key>
<string>instance_for_getcacert_call</string>
<key>Subject</key>
<array>
<array>
<array>
<string>O</string>
<string>Apple Inc.</string>
</array>
</array>
<array>
<array>
<string>CN</string>
<string>Foo</string>
</array>
</array>
</array>
<key>Challenge</key>
<string>CHALLENGE</string>
<key>Keysize</key>
<integer>1024</integer>
<key>Key Type</key>
<string>RSA</string>
<key>Key Usage</key>
<integer>5</integer>
</dict>
<key>PayloadDescription</key>
<string>Provides device encryption identity</string>
<key>PayloadUUID</key>
<string>fd8a6b9e-0fed-406f-9571-8ec98722b713</string>
<key>PayloadType</key>
<string>com.apple.security.scep</string>
```

```
<key>PayloadDisplayName</key>
<string>Encryption Identity</string>
<key>PayloadVersion</key>
<integer>1</integer>
<key>PayloadOrganization</key>
<string>Apple Inc.</string>
<key>PayloadIdentifier</key>
<string>com.apple.encrypted-profile-service</string>
</dict>
</plist>
```

Post-Introduction SDP Deployment Phase

The following steps describe the Post-introduction SDP deployment phase.

Note The Post-introduction SDP deployment phase is equivalent to the "Certificate Installation" phase (or Phase 3) discussed in the http://manuals.info.apple.com/en_US/Enterprise_Deployment_Guide.pdf Apple iPhone Enterprise Deployment guide .

SUMMARY STEPS

1. The iPhone installs the configuration profile specification containing SCEP information obtained from the SDP registrar in the Introduction SDP deployment phase.
2. The iPhone generates the keys with the instructions in the profile specification and sends the enrollment request to the SCEP server whose HTTP URL is specified in the profile, along with the challenge password.
3. The SCEP server verifies the challenge password and issues the digital certificate to the iPhone.
4. The user can install this certificate on the iPhone and use the Cisco IPsec VPN to connect to the corporate network.

DETAILED STEPS

Step 1 The iPhone installs the configuration profile specification containing SCEP information obtained from the SDP registrar in the Introduction SDP deployment phase.

Step 2 The iPhone generates the keys with the instructions in the profile specification and sends the enrollment request to the SCEP server whose HTTP URL is specified in the profile, along with the challenge password.

Step 3 The SCEP server verifies the challenge password and issues the digital certificate to the iPhone.

Step 4 The user can install this certificate on the iPhone and use the Cisco IPsec VPN to connect to the corporate network.

Note This certificate can also be used to download other enterprise settings, such as VPN settings, and Wi-Fi settings.

Second-Introduction SDP Deployment Phase

The following steps describe the Second-introduction SDP deployment phase:

Note The Second-introduction SDP deployment phase is equivalent to the "Device Configuration" phase (or Phase 4) discussed in the http://manuals.info.apple.com/en_US/Enterprise_Deployment_Guide.pdf Apple iPhone Enterprise Deployment guide .

SUMMARY STEPS

1. The iPhone repeats the Introduction SDP deployment phase with the following exceptions:
2. The SDP registrar responds with a configuration profile that includes the general enterprise settings such as VPN settings, Wi-Fi settings, and email settings. and in addition includes SCEP settings for a second certificate to be used for establishing a VPN.

DETAILED STEPS

Step 1 The iPhone repeats the Introduction SDP deployment phase with the following exceptions:

- The iPhone does not include the challenge password as part of the post data .
- The iPhone signs the post data using the certificate obtained from the SCEP server in the Post-introduction SDP deployment phase.

Step 2 The SDP registrar responds with a configuration profile that includes the general enterprise settings such as VPN settings, Wi-Fi settings, and email settings. and in addition includes SCEP settings for a second certificate to be used for establishing a VPN.

Second Post-Introduction SDP Deployment Phase

The Second Post-introduction SDP phase is identical to the Post-introduction SDP deployment phase. The iPhone generates a certificate request based on the SCEP settings provided by the SDP registrar in the Second-introduction SDP deployment phase and enrolls with the SCEP server.

Completion SDP Deployment Phase

The Completion SDP deployment phase is not applicable for the iPhone because the Introducer (for example, the Safari web browser) is run on the SDP petitioner (iPhone).

How to Set Up Secure Device Provisioning (SDP) for Enrollment in a PKI

This section contains the following procedures that should be followed when setting up SDP for your PKI. You can configure the registrar according to only one of the registrar configuration tasks.

Enabling the SDP Petitioner

Perform this task to enable or disable the petitioner and associate a trustpoint with the SDP exchange.

You can also use this task to configure the petitioner to use a certificate and the RSA keys associated with a specific trustpoint.

Note The petitioner is enabled by default on a Cisco device that contains a crypto image; thus, you have only to issue the **crypto provisioning petitioner** command if you have previously disabled the petitioner or if you want to use an existing trustpoint instead of the automatically generated trustpoint.

Note By default, the SDP petitioner device uses an existing certificate. If multiple certificates and one specific certificate exist, use this task to make a choice. However, this task is not necessary to enable the default behavior.

Before you begin

- The HTTP server must be enabled through the **ip http server**command. (The HTTP server is typically enabled by default in many default Cisco IOS configurations.)
- If you are configuring the petitioner to use a certificate and RSA keys, your SDP petitioner device must have an existing manufacturer's certificate or a third-party certificate.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning petitioner**
4. Do one of the following:
   - **trustpoint** *trustpoint-label*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto provisioning petitioner** **Example:**	Allows SDP petitioner device behavior to be modified and enters tti-petitioner configuration mode.

	Command or Action	Purpose
	`Router(config)# crypto provisioning petitioner`	**Note** Effective with Cisco IOS Release 12.3(14)T, the **crypto provisioning petitioner**command replaced the **crypto wui tti petitioner**command.

Step 4	Do one of the following:
	• **trustpoint** *trustpoint-label*
	Example:
	`Router(tti-petitioner)# trustpoint mytrust`
	Example:
	Example:
	Example:
	trustpoint signing
	trustpoint-label
	Example:
	`Router(tti-petitioner)# trustpoint signing mytrust`
		(Optional) Specifies the trustpoint that is to be associated with the SDP exchange between the petitioner and the registrar.
		Note If this command is not issued, the *trustpoint-label*argument is aut omatically labeled "tti."
		(Optional) Specifies the trustpoint and associated certificate that are used when signing all introduction data during the SDP exchange.

Step 5	**end** **Example:** `Router(tti-petitioner)# end`	(Optional) Exits tti-petitioner configuration mode.

Troubleshooting Tips

After the SDP exchange is complete, a new trustpoint-label named "tti" exists. The trustpoint is automatically enrolled with the certificate server (the registrar). To verify that the trustpoint is really there, use the **show running-config** command.

What to Do Next

If you set up the petitioner to use a certificate and the RSA keys associated with the specified trustpoint, you should configure the registrar as shown in the task "Enabling the SDP Registrar for Certificate-Based Authorization."

Enabling the SDP Registrar and Adding AAA Lists to the Server

Perform this task to enable the registrar and associate a certificate server with the SDP exchange.

You can also use this task if you want to add an authentication list and an authorization list to the RADIUS or TACACS+ server.

Prerequisites

Before configuring a registrar, perform the following tasks:

- Enable the HTTP server or the HTTPS server.

Note Before you enable an HTTPS server, you must disable the standard HTTP server if it is configured. Use the the **no ip http server** command to disable an HTTP server. To enable an HTTPS server, you should issue the **ip http secure-server** command followed by the **ip http secure-trustpoint** command. The specified trustpoint is a registrar local trustpoint appropriate for HTTPS communication between the registrar and the user's browser.

- Configure the Cisco IOS certificate server through the **crypto pki server** command.

If you are configuring AAA lists, you should complete the prerequisites required for the registrar in addition to completing the following tasks:

- Add user information to the AAA server database. To configure a RADIUS or TACACS+ AAA server, see the "Configuring RADIUS" and "Configuring TACACS+ " chapters of t he *Cisco IOS Security Configuration Guide* .
- Configure new AAA lists. To configure AAA lists, see the following chapters in the *Cisco IOS Security Configuration Guide* : "Configuring RADIUS," "Configuring TACACS+," "Configuring Authentication," and "Configuring Authorization ."

Restrictions

Cisco IOS CA Device Requirement

During the SDP process, a Cisco IOS CA certificate is automatically issued to the peer device. If an SDP registrar is configured on a third-party vendor's CA device, the SDP process does not work.

The template config Command

There are nine Cisco IOS configuration variables. If you require more configuration flexibility, the **template config** command can be used to reference a configuration template that is specific to the introducer. For more information on configuration flexibility, see the "Custom Configuration and File Template Variable Expansion Rules, on page 1254" section.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **crypto provisioning registrar**
4. **pki-server** *label*
5. **authentication list** *list-name*
6. **authorization list** *list-name*
7. **template username** *name* **password** *password*
8. **template config** *url* [**post**]
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto provisioning registrar** **Example:** `Router(config)# crypto provisioning registrar`	Configures a device to become a registrar for the SDP exchange and enters tti-registrar configuration mode. **Note** Effective with Cisco IOS Release 12.3(14)T, the **crypto provisioning registrar**command replaced the **crypto wui tti registrar**command.
Step 4	**pki-server** *label* **Example:** `Router(tti-registrar)# pki-server mycs`	Specifies the certificate server that is to be associated with the SDP exchange between the petitioner and the registrar.
Step 5	**authentication list** *list-name* **Example:** `Router (tti-registrar)# authentication list authen-tac`	(Optional) Authenticates the introducer in an SDP exchange.
Step 6	**authorization list** *list-name* **Example:** `Router (tti-registrar)# authorization list author-rad`	(Optional) Receives the appropriate authorized fields for the certificate subject name and list of template variables to be expanded into the Cisco IOS CLI snippet that is sent back to the petitioner.
Step 7	**template username** *name* **password** *password* **Example:**	(Optional) Establishes a username and password in which to access the configuration template on the file system.

	Command or Action	Purpose
	`Router(tti-registrar)# template username ftpuser password ftppwd`	
Step 8	**template config** *url* [**post**] **Example:** `Router(tti-registrar)# template config http://myserver/cgi-bin/mycgi post`	(Optional) Specifies a remote URL for the Cisco IOS CLI configuration template. The *url* argument can reference a configuration file that allows you to specify the device name ($n) to identify a bootstrap configuration. CGI support allows you to reference a CGI script through either HTTP or HTTPS and identify the bootstrap configuration by not only the device name, but also by the type, current Cisco IOS version and current configuration. The **post** keyword must be used for CGI support. **Note** The registrar must be running Cisco IOS Release 12.4(6)T or later to utilize expanded CGI support. If the registrar is running an earlier version of Cisco IOS, the additional device identification information is ignored.
Step 9	**end** **Example:** `Router(tti-registrar)# end`	(Optional) Exits tti-registrar configuration mode.

Examples

To help troubleshoot the SDP transaction, you can issue the **debug crypto provisioning**command, which displays output from the petitioner and registrar devices.

The following is output for the **debug crypto provisioning**command. The output from the petitioner and registrar devices are shown below.

```
Petitioner device
! The user starts the Welcome phase.
Nov  7 03:15:48.171: CRYPTO_PROVISIONING: received welcome get request.
! The router generates a Rivest, Shamir, and Adelman (RSA) keypair for future enrollment.
Nov  7 03:15:48.279: CRYPTO_PROVISIONING: keyhash 'A506BE3B83C6F4B4A6EFCEB3D584AACA'
! The TTI transaction is completed.
Nov  7 03:16:10.607: CRYPTO_PROVISIONING: received completion post request.
Registrar device
!. During the introduction phase, the browser prompts for login information.
06:39:18: CRYPTO_PROVISIONING: received introduction post request.
06:39:18: CRYPTO_PROVISIONING: checking AAA authentication (ipsecca_script_aaalist, ttiuser)
! This happens if the user types in the wrong username or password.
06:39:19: CRYPTO_PROVISIONING: authentication declined by AAA, or AAA server not found -
0x3
06:39:19: CRYPTO_PROVISIONING: aaa query fails!
! The user re-enters login information.
06:39:19: CRYPTO_PROVISIONING: received introduction post request.
06:39:19: CRYPTO_PROVISIONING: checking AAA authentication (ipsecca_script_aaalist, ttiuser)
```

```
06:39:20: CRYPTO_PROVISIONING: checking AAA authorization (ipsecca_script_aaalist, ttiuser)
! The login attempt succeeds and authorization information is retrieved from the AAA database.
06:39:21: CRYPTO_PROVISIONING: aaa query ok!
! These attributes are inserted into the configuration template.
06:39:21: CRYPTO_PROVISIONING: building TTI av pairs from AAA attributes
06:39:21: CRYPTO_PROVISIONING: "subjectname" = "CN=user1, O=company, C=US"
06:39:21: CRYPTO_PROVISIONING: "$1" = "ntp server 10.3.0.1"
06:39:21: CRYPTO_PROVISIONING: "$2" = "hostname user1-vpn"
! The registrar stores this subject name and overrides the subject name in the subsequent
enrollment request.
06:39:21: CRYPTO_PROVISIONING: subjectname=CN=user1, O=company, C=US
! The registrar stores this key information so that it may be used to automatically grant
the subsequent enrollment request.
06:39:21: CRYPTO_PROVISIONING: key_hash=A506BE3B83C6F4B4A6EFCEB3D584AACA
```

Enabling the SDP Registrar for Certificate-Based Authorization

Perform this task to enable the SDP registrar to verify the petitioner-signing certificate using either a specified trustpoint or any configured trustpoint and initiate authorization lookups using the introducer username and the certificate name field.

Before you begin

You must also configure the SDP petitioner to use a certificate and RSA keys associated with a specific trustpoint. To complete this task, use the trustpoint signing command as shown in the task "Enabling the SDP Petitioner, on page 1264."

Note Because RADIUS does not differentiate between authentication and authorization, you need to use the default password, cisco, for certificate authorization.

>

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning registrar**
4. **template file** *sourceURL destinationURL*
5. **binary file** *sourceURL destinationURL*
6. **authentication trustpoint** {**trustpoint-label| use-any }**
7. **authorization {login | certificate | login certificate}**
8. **authorization username subjectname** *subjectname*
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:**	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	`Router> enable`	
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto provisioning registrar** **Example:** `Router(config)# crypto provisioning registrar`	Configures a device to become an SDP registrar and enters tti-registrar configuration mode.
Step 4	**template file** *sourceURL destinationURL* **Example:** `Router(tti-registrar)# template file http://myserver/registrar_file_r1 http://myserver/petitioner_file_p1`	(Optional) Specifies the source template file location on the registrar and the destination template file location on the petitioner. **Note** This command is useful when using a USB token to provision a device. The template expansion occurs on the registrar for both the source URL and file content. The destination URL is expanded on the petitioner.
Step 5	**binary file** *sourceURL destinationURL* **Example:** `Router(tti-registrar)# binary file http://myserver/registrar_file_a1 http://myserver/petitioner_file_b1`	(Optional) Specifies the binary file location on the registrar and the destination binary file location on the petitioner. **Note** This command is useful when using a USB token to provision a device. Both the source and destination URL are expanded on the registrar. Also, the destination URL and file content are expanded on the petitioner. Binary files are not processed through the template expansion functions.
Step 6	**authentication trustpoint** {**trustpoint-label**| **use-any** } **Example:** `Router(tti-registrar)# authentication trustpoint mytrust`	(Optional) Specifies the trustpoint used to authenticate the SDP petitioner device's existing certificate. • *trustpoint-label* --Specifies a specific trustpoint. • **use-any** --Specifies any configured trustpoint. **Note** If you do not use this command to specify a trustpoint, the existing petitioner certificate is not validated. (This functionality provides compatibility with self-signed petitioner certificates.)
Step 7	**authorization {login | certificate | login certificate}** **Example:**	(Optional) Enables AAA authorization for an introducer or a certificate.

	Command or Action	Purpose
	`Router(tti-registrar)# authorization login certificate`	• Use the **login** keyword for authorization based on the introducer's username. • Use the **certificate** keyword for authorization based on the petitioner's certificate. • Use the **login certificate** keyword for authorization based on the introducer's username and the petitioner's certificate.
Step 8	**authorization username subjectname** *subjectname* **Example:** `Router(tti-registrar)# authorization username subjectname all`	Sets parameters for the different certificate fields that are used to build the AAA username. • The **all** keyword specifies that the entire subject name if the certificate is used as the authorization username.
Step 9	**end** **Example:** `Router(tti-registrar)# end`	(Optional) Exits tti-registrar configuration mode.

Configuring the SDP Registrar to Deploy Apple iPhones

Perform this task to configure the SDP registrar to run HTTPS in order to deploy Apple iPhones on a corporate network.

Before you begin

Ensure that the SDP Registrar is enabled to run HTTPS. See the Enabling the SDP Registrar and Adding AAA Lists to the Server section for more information.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http secure-server**
4. **crypto provisioning registrar**
5. **url-profile start** *profile-name*
6. **url-profile intro** *profile-name*
7. **match url** *url*
8. **match authentication trustpoint** *trustpoint-name*
9. **match certificate** *certificate-map*
10. **mime-type** *mime-type*
11. **template location** *location*
12. **template variable p** *value*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ip http secure-server** **Example:** `Router(config)# ip http secure-server`	Enables the HTTPS web server.
Step 4	**crypto provisioning registrar** **Example:** `Router(config)# crypto provisioning registrar`	Configures a device to become a registrar for the SDP exchange and enters tti-registrar configuration mode. **Note** Effective with Cisco IOS Release 12.3(14)T, the **crypto provisioning registrar**command replaced the **crypto wui tti registrar**command.
Step 5	**url-profile start** *profile-name* **Example:** `Router(tti-registrar)# url-profile start START`	Specifies the **start** keyword to indicate that a URL profile is to be associated with the Start SDP deployment phase. The *profile-name* argument specifies the name of a unique URL profile. **Note** Both the Introduction SDP deployment phase and the Start SDP deployment phase can use different profiles or use the same URL profile.
Step 6	**url-profile intro** *profile-name* **Example:** `Router(tti-registrar)# url-profile intro INTRO`	Specifies the **intro** keyword to indicate that a URL profile is to be associated with the Introduction SDP deployment phase. The *profile-name* argument specifies the name of a unique URL profile. **Note** Both the Introduction SDP deployment phase and the Start SDP deployment phase can use different profiles or use the same URL profile.
Step 7	**match url** *url* **Example:** `Router(tti-registrar)# match url /sdp/intro`	Specifies the URL to be associated with the URL profile.

	Command or Action	Purpose
Step 8	**match authentication trustpoint** *trustpoint-name* **Example:** `Router(tti-registrar)# match authentication trustpoint apple-tp`	(Optional) Specifies the trustpoint name that should be used to authenticate the peer's certificate. If the trustpoint name is not specified, then the trustpoint configured using the **authentication trustpoint command**in tti-registrar configuration mode is used to authenticate the peer's certificate. See the Enabling the SDP Registrar for Certificate-Based Authorization section for more information.
Step 9	**match certificate** *certificate-map* **Example:** `Router(tti-registrar)# match certificate cat 10`	(Optional) Specifies the name of the certificate map used to authorize the peer's certificate.
Step 10	**mime-type** *mime-type* **Example:** `Router(tti-registrar)# mime-type application/x-apple-aspen-config`	Specifies the Multipurpose Internet Mail Extensions (MIME) type that the SDP registrar should use to respond to a request received through this URL profile.
Step 11	**template location** *location* **Example:** `Router(tti-registrar)# template location flash:intro.mobileconfig`	Specifies the location of the template that the SDP Registrar should use while responding to a request received through this URL profile.
Step 12	**template variable p** *value* **Example:** `Router(tti-registrar)# template variable p iphone-vpn`	(Optional) Specifies the value that goes into the Organizational Unit (OU) field of the subject name in the trustpoint certificate to be issued by the SDP Registrar. See this field in the certificate presented in the Apple CA Server Trustpoint Certificate Configuration Example section below.

Apple CA Server Trustpoint Certificate Configuration

The SDP Registrar must verify the signature generated from the iPhone's trustpoint certificate in order to trust the Apple CA server certificate. The iPhone signs its messages using the trustpoint certificate, which is issued by Apple's CA server during the Introduction SDP deployment phase.

The following example shows how to configure certificate enrollment using the manual cut-and-paste enrollment method of the Apple CA certificate:

Note See also the "How to Configure Certificate Enrollment for a PKI" section in the Configuring Certificate Enrollment for a PKI feature module for more detailed information about configuring a trustpoint certificate.

SUMMARY STEPS

1. The**crypto pki trustpoint** command is entered in global configuration mode to declare the trustpoint and a given name and enters ca-trustpoint configuration mode:
2. The **enrollment terminal** command is entered to specify manual cut-and-paste certificate enrollment
3. The **crypto pki authenticate** command retrieves the CA certificate and authenticates it from the specified TFTP server.
4. Copy the following block of text containing the base 64 encoded Apple CA trust certificate and paste it at the prompt.
5. The **exit** command is used to exit ca-trustpoint configuration mode and enter global configuration mode.
6. The **crypto provisioning registrar** command is entered in global configuration mode to specify the router to become a registrar for the SDP exchange and enters tti-registrar configuration mode.
7. The **url-profile command with the intro** keyword is entered in tti-registrar configuration mode to specify the unique URL profile name that is associated with the Introduction SDP deployment phase.
8. The **match authentication trustpoint**command is entered in tti-registrar configuration mode to specify the trustpoint name that should be used to authenticate the peer's certificate.

DETAILED STEPS

Step 1 The**crypto pki trustpoint** command is entered in global configuration mode to declare the trustpoint and a given name and enters ca-trustpoint configuration mode:

Example:

```
Router(config)# crypto pki trustpoint apple-tp
```

Step 2 The **enrollment terminal** command is entered to specify manual cut-and-paste certificate enrollment

Example:

```
Router(ca-trustpoint)# enrollment terminal
```

Step 3 The **crypto pki authenticate** command retrieves the CA certificate and authenticates it from the specified TFTP server.

Example:

```
Router(ca-trustpoint)# crypto pki authenticate apple-tp
```

Step 4 Copy the following block of text containing the base 64 encoded Apple CA trust certificate and paste it at the prompt.

Example:

```
I Bag Attributes
    localKeyID: 7C 29 15 15 12 C9 CF F6 15 2B 5B 25 70 3D A7 9A 98 14 36 06

pyQPbp8orlXe+tA8JA==
-----END CERTIFICATE-----
```

Step 5 The **exit** command is used to exit ca-trustpoint configuration mode and enter global configuration mode.

Example:

```
Router(ca-trustpoint)# exit
```

Step 6 The **crypto provisioning registrar** command is entered in global configuration mode to specify the router to become a registrar for the SDP exchange and enters tti-registrar configuration mode.

Example:

```
Router(config)# crypto provisioning registrar
```

Step 7 The **url-profile command with the intro** keyword is entered in tti-registrar configuration mode to specify the unique URL profile name that is associated with the Introduction SDP deployment phase.

Example:

```
Router(tti-registrar)# url-profile intro INTRO
```

Step 8 The **match authentication trustpoint**command is entered in tti-registrar configuration mode to specify the trustpoint name that should be used to authenticate the peer's certificate.

Example:

```
Router(tti-registrar)# match authentication trustpoint apple-tp
```

The SDP Registrar can now use the Apple CA trustpoint certificate called "apple-tp" for verifying the signature of the iphone.

Configuring an Administrative Introducer

Perform the following task to configure an administrative introducer using administrator authentication and authorization lists.

Before you begin

The administrative introducer must have enable privileges on the client device and administrator privileges on the server.

Note When using RADIUS, a user/device that needs to be introduced by the administrative introducer must always use cisco as its own password. TACACS+ does not have this limitation; a user/device can have any password and be introduced by the administrative introducer.

>

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning registrar**
4. **administrator authentication list** *list-name*
5. **administrator authorization list** *list-name*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto provisioning registrar** **Example:** `Router(config)# crypto provisioning registrar`	Configures a device to become an SDP registrar and enters tti-registrar configuration mode.
Step 4	**administrator authentication list** *list-name* **Example:** `Router(tti-registrar)# administrator authentication list authen-tac`	Configures the AAA list used to authenticate an administrator during an introduction.
Step 5	**administrator authorization list** *list-name* **Example:** `Router(tti-registrar)# administrator authorization list author-tac`	Configures the AAA list used to obtain authorization information for an administrator during an introduction. Information that can be obtained includes the certificate subject name and/or the list of template variables to be expanded into the Cisco IOS CLI snippet that is sent back to the petitioner.

	Command or Action	Purpose
Step 6	**end** **Example:** `Router(tti-registrar)# end`	(Optional) Exits tti-registrar configuration mode.

Example

The following example from the **show running-config**command allows you to verify that an administrative introducer using administrator authentication and authorization lists have been created:

```
Router# show running-config

Configuring Custom Templates

Perform this task to create and configure custom templates.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto provisioning registrar**
4. **template http start** *URL*
5. **template http welcome** *URL*
6. **template http introduction** *URL*
7. **template http admin-introduction** *URL*
8. **template http completion** *URL*
9. **template http error** *URL*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto provisioning registrar** **Example:** `Router(config)# crypto provisioning registrar`	Configures a device to become an SDP registrar and enters tti-registrar configuration mode.
Step 4	**template http start** *URL* **Example:** `Router(tti-registrar)# template http start tftp://registrar.company.com/start.html`	Directs the TTI registrar to use the custom start page template. **Note** This command is required to use the start page functionality. If this command is not issued, the welcome page is the initial communication between the introducer and the petitioner.
Step 5	**template http welcome** *URL* **Example:** `Router(tti-registrar)# template http welcome tftp://registrar.company.com/welcome.html`	(Optional) Uses a custom welcome template rather than the default template.
Step 6	**template http introduction** *URL* **Example:** `Router(tti-registrar)# template http introduction tftp://registrar.company.com/intro.html`	(Optional) Uses a custom introduction template rather than the default template.
Step 7	**template http admin-introduction** *URL* **Example:** `Router(tti-registrar)# template http admin-introduction tftp://registrar.company.com/admin-intro.html`	(Optional) Uses a custom admin-introduction template rather than the default template.
Step 8	**template http completion** *URL* **Example:**	(Optional) Uses a custom completion template rather than the default template.

	Command or Action	Purpose
	`Router(tti-registrar)# template http completion tftp://registrar.company.com/completion.html`	
Step 9	**template http error** *URL* **Example:** `Router(tti-registrar)# template http error tftp://registrar.company.com/error.html`	(Optional) Uses a custom error template rather than the default template.
Step 10	**end** **Example:** `Router(tti-registrar)# end`	(Optional) Exits tti-registrar configuration mode.

Example

The following example shows the use of custom start, introduction, and completion templates:

template http start tftp://registrar.company.com/start.html

template http introduction tftp://registrar.company.com/intro.html

template http completion tftp://registrar.company.com/completion.html

Configuration Examples for Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

Verifying the SDP Registrar Example

The following sample output from the **show running-config**command verifies that the certificate server "cs1" was configured and associated with the SDP exchange between the registrar and petitioner:

```

Verifying the SDP Petitioner Example

After the SDP exchange is complete, the petitioner automatically enrolls with the registrar and obtain a certificate. The following sample output through the **show running-config** command shows the automatically generated configuration, which verifies that the trustpoint is really there:

```

Adding AAA Lists to a RADIUS or TACACS+ Server Examples

This section contains the following configuration examples:

TACACS+ AAA Server Database Example

In the following example, user information has been added to a TACACS+ AAA database. The username is "user1." The password is "cisco." Two Cisco IOS configuration template variables are configured for "user1": iosconfig1 and iosconfig2. The variables replace $1 and $2 in the configuration template file. The subject name "CN=user1, O=company, C=US" is also configured. This subject name replaces the subject name field in the subsequent enrollment request (PKCS10) that is received from the petitioner device.

```
user = user1
    password = clear "pswd"
    service=tti
        ! The certificate server inserts the following subject name to the certificate.
        set subjectname="CN=user1, O=company, C=US"
        ! Up to nine template variables may be added.
        set iosconfig1="ntp server 10.3.0.1"
        set iosconfig2="hostname user1-vpn"
```

RADIUS AAA Server Database Example

User information has been added to the RADIUS AAA server database in the following example. The username is "user1." The password is "cisco." Two Cisco IOS configuration template variables are configured for "user1": iosconfig1 and iosconfig2. The variables replace $1 and $2 in the configuration template file. The subject name "CN=user1, O=company, C=US" is also configured. This subject name replaces the subject name field in the subsequent enrollment request (PKCS10) that is received from the petitioner device.

```
user = user1
    password = clear "pswd"
    radius=company
    reply_attributes=9,1="tti:subjectname=CN=user1, O=company, C=US"
    ! Up to nine template variables may be added.
    9,1="tti:iosconfig1=ntp server 10.3.0.5"
    9,1="tti:iosconfig2=hostname user1-vpn"
```

AAA List on a TACACS+ and a RADIUS AAA Server Example

The following is a configuration example showing that AAA authentication has been configured on a TACACS+ server and that AAA authorization has been configured on a RADIUS server.

Note Authentication and authorization usually point to the same server.

```
Router(config)# tacacs-server host 10.0.0.48 key cisco
Router(config)# aaa authentication login authen-tac group tacacs+
Router(config)# radius-server host 10.0.1.49 key cisco
Router(config)# aaa authorization network author-rad group radius
```

UsingaConfigurationTemplateFile Example

You can use a different configuration template file on the basis of the introducer name. For example, if you have multiple template files for different users, each with the username in the filename, configure the following under the registrar:

```
Router(config)# crypto provisioning registrar
Router (tti-registrar)# pki-server cs1
Router (tti-registrar)# template config tftp://server/config-$n.txt
```

In this example, the default configuration file shown in the section "Default Template for the Configuration File, on page 1258" is used because the **template config** command does not reference a CGI script.

CGI Script Example

The following example would execute a CGI script named "mysdpcgi":

```
Router(config)# crypto provisioning registrar
Router (tti-registrar)# pki-server cs1
Router (tti-registrar)# template config tftp://server/cgi-bin/mysdpcgi post
```

The following is an example CGI script, named "mysdpcgi", that would be executed with the example **template config** command above:

```
#!/usr/bin/perl -w
# for debugging use the -debug form
# use CGI (-debug);
use CGI;
# base64 decoding is being used.
use MIME::Base64;
# The following has been commented out, but left for your information.
#
# Reading everything that has been received from stdin and writing it to the debug log to
#see what has been sent from the registrar.
#
# Remember to reset the STDIN pointer so that the normal CGI processing can get the input.
#
# print STDERR "mysdpcgi.cgi dump of stdin:\n";
# if($ENV{'REQUEST_METHOD'} eq "GET"){
#    $input_data = $ENV{'QUERY_STRING'};
# }
```

```
# else {
#    $data_length = $ENV{'CONTENT_LENGTH'};
#    $bytes_read = read(STDIN, $input_data, $data_length);
# }
# print STDERR $input_data,"\n";
# exit;

$query = new CGI;
my %av_table;
# A basic configuration file is being sent back, therefore it is being indicated as plain
# text in the command below.
print $query->header ("text/plain");
print "\n";
# For testing, parameters can be passed in so that the test applications can
# see what has been received.
#
# print STDERR "The following are the raw AV pairs mysdpcgi.cgi received:\n";
# for each $key ($query->param) {
#    print STDERR "! $key is: \n";
#    $value = $query->param($key);
#    print STDERR "! ",$value;
#    print STDERR "! \n";
#}
# The post process AV pairs are identical to those in Cisco IOS and may be used to produce
 # AV pair specific configurations as needed.
%av_table = &postprocessavpairs($query->param);
# Decoded values may be written out.
# WARNING: Some error_logs cannot handle the amount of data and will freeze.
# print STDERR "The following are the decoded AV pairs mysdpcgi.cgi received:\n";
# now write the values out
# while ( ($a, $v) = each(%av_table) ) {
#    print STDERR "$a = $v\n";
# }
# Identifying the AV pairs and specifying them in the config.
while ( ($a, $v) = each(%av_table) ) {
    if ($a eq "TTIIosRunningConfig") {
        $search = "hostname ";
        $begin = index($v, $search) + length($search);
        $end = index($v, "\n", $begin);
        $hostname = substr($v, $begin, $end - $begin);
    }
    if ($a eq "TTIIosVersion") {
        $search = "Version ";
        $begin = index($v, $search) + length($search);
        $end = index($v, "(", $begin);
        $version = substr($v, $begin, $end - $begin);
    }
}
print <<END_CONFIG;
!
! Config auto-generated by sdp.cgi
! This is for SDP testing only and is not a real config
!
!
\$t
!
\$c
!
cry pki trust Version-$version-$hostname
! NOTE: The last line of the config must be 'end' with a blank line after the end
# statement.
END_CONFIG
;
# Emulate IOS tti_postprocessavpairs functionality
```

```
sub postprocessavpairs {
    @attributes = @_;
    # Combine any AV pairs that were split apart
    $n = 0; #element index counter
    while ($attributes[$n]) {
 # see if we are at the start of a set
 if ($attributes[$n] =~ m/_0/) {
     # determine base attribute name
     $a = (split /_0/, $attributes[$n])[0];
     # set initial (partial) value
     $v = $query->param($attributes[$n]);

     # loop and pull the rest of the matching
     # attributes's values into v (would be
     # faster if we stop at first non-match)
     $c = $n+1;
     while ($attributes[$c]) {
  if ($attributes[$c] =~ m/$a/) {
      $v = $v.$query->param($attributes[$c]);
  }
  $c++;
     }

     # store in the av hash table
     $av_table{$a} = $v;
 } else {
     # store in hash table if not part of a set
     if ($attributes[$n] !~ m/_\d/) {
  $av_table{$attributes[$n]} = $query->param($attributes[$n]);
     }
 }
 $n++;
    }
    # de-base64 decode all AV pairs except userdevicename
    while ( ($a, $v) = each(%av_table) ) {
        if ($a ne "userdevicename") {
            $av_table{$a} = decode_base64($av_table{$a});
        }
    }
    return %av_table;
}
```

Note A CGI script cannot be executed without using the **post** keyword with the **template config**commandin Cisco IOS Release 12.4(6)T or a later release.

Configuring the Petitioner and Registrar for Certificate-Based Authentication Example

The following examples shows how to configure a petitioner to use the certificate issued by the trustpoint named mytrust:

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# crypto provisioning petitioner

Router(tti-petitioner)# trustpoint signing mytrust
```

```
Router(tti-petitioner)# end
```

The following example shows how to configure a registrar to verify the petitioner-signing certificate and to perform authorization lookups:

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# crypto provisioning registrar

Router(tti-registrar)# authentication trustpoint mytrust

Router(tti-registrar)# authorization login certificate

Router(tti-registrar)# authorization username subjectname all

Router(tti-registrar)# end
```

Configuring an Administrative Introducer Using Authentication and Authorization Lists Example

The following example shows how to configure an administrative introducer with the authentication list "authen-tac" and the authorization list "author-tac":

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# crypto provisioning registrar
Router(tti-registrar)# administrator
 authentication list authen-tac
Router(tti-registrar)# administrator
 authorization list author-tac
Router(tti-registrar)# end
```

Feature Information for Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 152: Feature Information for SDP in a PKI

Feature Name	Releases	Feature Information
Secure Device Provisioning (SDP) Connect Template	12.4(20)T	This feature provides the ability to configure a device for Internet connectivity through a service provider.
USB Token and Secure Device Provisioning (SDP) Integration	12.4(15)T	This feature provides the ability to provision remote devices using a USB token as a mechanism to transfer credentials from one network device to a remote device through SDP. The following commands were introduced: **binary file**, **crypto key move rsa**, **template file**.
SDP Expanded Template CGI Support	12.4(6)T	This feature allows users to configure the SDP registrar to send a bootstrap configuration to the SDP petitioner based on not only the device name, but also its current Cisco IOS version and current configuration. The following command was modified by this feature: **template config.**
Secure Device Provisioning (SDP) Start Page	12.4(4)T	This feature allows users to configure their browsers to begin the TTI transaction by contacting the registrar's introduction URL through a start page. Thus, users no longer have to begin the TTI transaction from the welcome page on the petitioner. The following commands were introduced by this feature: **template http admin-introduction**, **template http completion**, **template http error**, **template http introduction**, **template http start**, **template http welcome.**
Administrative Secure Device Provisioning Introducer	12.3(14)T	This feature allows you to act as an administrative introducer to introduce a device into a PKI network and then provide a username as the device name for the record locator in the AAA database. The following commands were introduced by this feature: **administrator authentication list**, **administrator authorization list.**
Easy Secure Device Deployment	12.3(8)T	This feature introduces support for SDP, which offers a web-based enrollment interface that enables network administrators to deploy new devices in large networks. The following commands were introduced or modified: **crypto wui tti petitioner**, **crypto wui tti registrar**, **pki-server**, **template config**, **template username**, **trustpoint (tti-petitioner).**
Easy Secure Device Deployment AAA Integration	12.3(8)T	This feature integrates an external AAA database, allowing the SDP introducer to be authenticated against a AAA database instead of having to use the enable password of the local Cisco certificate server. The following commands were introduced or modified: **authentication list (tti-registrar)**, **authorization list (tti-registrar)**, **debug crypto wui template config**, **template username**.

Feature Name	Releases	Feature Information
Secure Device Provisioning (SDP) Certificate-Based Authorization	12.3(14)T	This feature allows certificates issued by other authority (CA) servers to be used for SDP introductions. The following commands were introduced by this feature: **administrator authentication list**, **administrator authorization list**
iPhone SDP	15.1(2)T	With the introduction of the Cisco IOS 15.1(2)T and Apple iPhone OS 3.0 releases, Apple iPhones are supported on Cisco IOS network devices. Cisco IOS routers use the SDP registrar to deploy iPhones so that network applications can be accessed securely through an IPSec VPN, SCEP server, and PKI certificate deployment technologies. The following commands were introduced by this feature: **match authentication trustpoint, match certificate** , **match url, mime-type**, **template location, template variable p, url-profile.**

CHAPTER 113

PKI Credentials Expiry Alerts

The PKI Credentials Expiry Alerts feature provides a warning mechanism in the form of an alert notification when a CA certificate is on the verge of expiry.

Restrictions for PKI Credentials Expiry Alerts

Alerts are not sent for the following certificates:

- Persistent or temporary self-signed certificates.
- Secure Unique Device Identifier (SUDI) certificates.
- Certificates that belong to a trustpool. Trustpools have their own expiry alerts mechanism.
- Trustpoint clones.

Information About PKI Alerts Notification

Overview of Alerts Notification

The Cisco IOS Certificate Authority (CA) server allows autoenrollment of certificates before a certificate expires to ensure the availability of certificates for applications during authentication. However, network outages, clock update problems, and overloaded CAs can impede certificate renewal, thereby resulting in subsystems going offline because no valid certificates can be used for authentication. The PKI Credentials Expiry Alerts feature provides a mechanism by which a CA client sends a notification to a syslog server when certificates are on the verge of expiry.

The notifications are sent at the following intervals:

- First notification—This is sent 60 days before the expiry of the certificate.

- Repeated notifications—After the first notification, subsequent notifications are sent every week until a week before the expiry of the certificate. In the last week, notifications are sent every day until the certificate expiry date.

The notifications are in a *warning* mode when the certificate is valid for more than a week. The notifications are in an *alert* mode when a certificate's validity is less than a week. The notifications include the following information:

- Truspoint the certificate is associated with
- Certificate type
- Serial number of the certificate
- Certificate issuer name
- Number of days remaining for the certificate to expire
- Whether the certificate is enabled with autoenrollment
- Whether a shadow certificate is available for the corresponding certificate

Note Alert notifications are sent either via the syslog server or Simple Network Management Protocol (SNMP) traps. Notifications stop when a trustpoint is configured with autoenrollment and the corresponding shadow or rollover certificate is present, and the shadow or rollover certificate's start time is either the same or earlier than the certificate's end time.

This feature cannot be disabled and requires no additional configuration tasks. The **show crypto pki timers** command is enhanced to display the timer expiry information. The following is a sample output from the **show crypto pki timers detail** command that displays the timer when a certificate is about to expire. When this timer expires, a notification is sent to the syslog server.

```
Device# show crypto pki timers detail

PKI Timers
|       14:36.150  (2019-10-30T11:33:30Z)
  |       14:36.150  (2019-10-30T11:33:30Z) SESSION CLEANUP
  |2569d23:56:19.461  (2026-11-12T11:15:13Z) SHADOW test

Expiry Alert Timers
|659d 5:56:19.599  (2021-08-19T17:15:13Z)
  |659d 5:56:19.599  (2021-08-19T17:15:13Z) ID(test)
  |2875d 4:45:18.562  (2027-09-13T16:04:12Z) CA(test)

Trustpool Timers
|3464d 9:06:48.463  (2029-04-24T20:25:42Z)
  |3464d 9:06:48.463  (2029-04-24T20:25:42Z) TRUSTPOOL
```

The following is a syslog message that is displayed on the device:

```
Device#

Dec 16 10:24:13.533: %PKI-4-CERT_EXPIRY_WARNING: ID Certificate belonging to trustpoint tp
 will expire in 60 Days 0 hours 0 mins 0 secs.
Issuer-name cn=CA
Subject-name hostname=Router
```

```
Serial-number 02
Auto-Renewal: Not Enabled
```

PKI Traps

PKI trap ease the monitoring and operations of a PKI deployment by retrieving certificate information of the devices in the network. The root device sends SNMP traps at regular intervals to the network management system (NMS) based on the threshold configured in the device. The traps are sent in the following scenarios:

- A new certificate is installed—An SNMP trap (new certificate notification) is sent to the SNMP server containing information about the certificate, such as, certificate serial number, certificate issuer name, certificate subject name, trustpoint name, certificate type, and certificate start and end date.
- A certificate is about to expire—An SNMP trap (certificate expiry notification) is sent to the SNMP server at regular intervals starting from 60 days to one week before the certificate's end date. In the week leading up to the expiration of the certificate, the trap is sent everyday. The trap contains certificate information, such as, certificate serial number, certificate issuer name, trustpoint name, certificate type, and certificate's remaining lifetime.

To enable PKI traps, use the **snmp-server enable traps pki** command.

Note If the shadow or rollover certificate's start time is later than the certificate's end time, traps are sent stating that the shadow certificate is not yet valid. However, no traps are sent if a shadow certificate available for the same trustpoint, and the shadow certificate becomes active.

IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.

CHAPTER 114

Configuring and Managing a Certificate Server for PKI Deployment

This module describes how to set up and manage a Cisco IOS certificate server for public key infrastructure (PKI) deployment. A certificate server embeds a simple certificate server, with limited certification authority (CA) functionality, into the Cisco software. Thus, the following benefits are provided to the user:

- Easier PKI deployment by defining default behavior. The user interface is simpler because default behaviors are predefined. That is, you can leverage the scaling advantages of PKI without all of the certificate extensions that a CA provides, thereby allowing you to easily enable a basic PKI-secured network.
- Direct integration with Cisco software.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the *Next Generation Encryption* (NGE) white paper.

During copy, if running-config has both CA and ID certificates, if CA certificate is same as running-config, CA and ID are not replaced. Whereas, if CA certificate is different, then both ID and CA certificates gets cleared and new CA is re-inserted.

Prerequisites for Configuring a Certificate Server

Planning Your PKI Before Configuring the Certificate Server

Before configuring a certificate server, it is important that you have planned for and chosen appropriate values for the settings you intend to use within your PKI (such as certificate lifetimes and certificate revocation list (CRL) lifetimes). After the settings have been configured in the certificate server and certificates have been granted, settings cannot be changed without having to reconfigure the certificate server and reenrolling the peers. For information on certificate server default settings and recommended settings, see section "*Certificate Server Default Values and Recommended Values*."

Enabling an HTTP Server

The certificate server supports Simple Certificate Enrollment Protocol (SCEP) over HTTP. The HTTP server must be enabled on the router for the certificate server to use SCEP. (To enable the HTTP server, use the **ip http server** command.) The certificate server automatically enables or disables SCEP services after the HTTP server is enabled or disabled. If the HTTP server is not enabled, only manual PKCS10 enrollment is supported.

Note To take advantage of automatic CA certificate and key pair rollover functionality for all types of certificate servers, SCEP must be used as the enrollment method.

Configuring Reliable Time Services

Time services must be running on the router because the certificate server must have reliable time knowledge. If a hardware clock is unavailable, the certificate server depends on manually configured clock settings, such as Network Time Protocol (NTP). If there is not a hardware clock or the clock is invalid, the following message is displayed at bootup:

```
% Time has not been set. Cannot start the Certificate server.
```

After the clock has been set, the certificate server automatically switches to running status.

For information on manually configuring clock settings, see the module .

Restrictions for Configuring a Certificate Server

- The certificate server does not provide a mechanism for modifying the certificate request that is received from the client; that is, the certificate that is issued from the certificate server matches the requested certificate without modifications. If a specific certificate policy, such as name constraints, must be issued, the policy must be reflected in the certificate request.
-
- For validating the HTTP connection using 3rd party open SSL, the complete ISE certificate chain is sent to the device. These certificates include the ISE certificate and its issuer CA certificate. The environment data lists these certificates.

  Cisco ISE running versions 2.7.0.310 and earlier put the certificate chain in the incoming certificate list as part of environment data. In Cisco IOS XE Release 17.1.1 and earlier releases, Cisco routers do not

support multi-chain certificate downloads from ISE. Due to this, the device does not receive the ISE certificate and a TLS handshake error is displayed.

Information About Certificate Servers

RSA Key Pair and Certificate of the Certificate Server

The certificate server automatically generates a 1024-bit Rivest, Shamir, and Adelman (RSA) key pair. You must manually generate an RSA key pair if you prefer a different key pair modulus. For information on completing this task, see the section "*Generating a Certificate Server RSA Key Pair* ."

Note The recommended modulus for a certificate server RSA key pair is 2048 bits.

The certificate server uses a regular RSA key pair as its CA key. This key pair must have the same name as the certificate server. If you do not generate the key pair before the certificate server is created on the router, a general-purpose key pair is automatically generated during the configuration of the certificate server.

The CA certificate and CA key can be backed up automatically one time after they are generated by the certificate server. As a result, it is not necessary to generate an exportable CA key for backup purposes.

What to Do with Automatically Generated Key Pairs

If the key pair is automatically generated, it is not marked as exportable. Thus, you must manually generate the key pair as exportable if you want to back up the CA key. For information on how to complete this task, see the section "*Generating a Certificate Server RSA Key Pair* ."

How the CA Certificate and CA Key Are Automatically Archived

At initial certificate server setup, you can enable the CA certificate and the CA key to be automatically archived so that they may be restored later if either the original copy or the original configuration is lost.

When the certificate server is turned on the first time, the CA certificate and CA key is generated. If automatic archive is also enabled, the CA certificate and the CA key is exported (archived) to the server database. The archive can be in PKCS12 or privacy-enhanced mail (PEM) format.

Note This CA key backup file is extremely important and should be moved immediately to another secured place.

- This archiving action occurs only one time. Only the CA key that is (1) manually generated and marked exportable or (2) automatically generated by the certificate server is archived (this key is marked nonexportable).
- Autoarchiving does not occur if you generate the CA key manually and mark it "nonexportable."
- In addition to the CA certificate and CA key archive file, you should also regularly back up the serial number file (.ser) and the CRL file (.crl). The serial file and the CRL file are both critical for CA operation if you need to restore your certificate server.

- It is not possible to manually back up a server that uses nonexportable RSA keys or manually generated, nonexportable RSA keys. Although automatically generated RSA keys are marked as nonexportable, they are automatically archived once.

Certificate Server Database

The certificate server stores files for its own use and may publish files for other processes to use. Critical files generated by the certificate server that are needed for its ongoing operation are stored to only one location per file type for its exclusive use. The certificate server reads from and writes to these files. The critical certificate server files are the serial number file (.ser) and the CRL storage location file (.crl). Files that the certificate server writes to, but does not read from again, may be published and available for use by other processes. An example of a file that may be published is the issued certificates file (.crt).

Performance of your certificate server may be affected by the following factors, which should be considered when you choose storage options and publication options for your certificate server files.

- The storage or publish locations you choose may affect your certificate server performance. Reading from a network location takes more time than reading directly from a router's local storage device.
- The number of files you choose to store or publish to a specific location may affect your certificate server performance. The local file system may not always be suitable for a large number of files.
- The file types you choose to store or publish may affect your certificate server performance. Certain files, such as the .crl files, can become very large.

Note It is recommended that you store .ser and .crl files to your local file system and publish your .crt files to a remote file system.

Certificate Server Database File Storage

The certificate server allows the flexibility to store different critical file types to different storage locations depending on the database level set (see the **database level** command for more information). When choosing storage locations, consider the file security needed and server performance. For instance, serial number files and archive files (.p12 or .pem) might have greater security restrictions than the issued certificates file storage location (.crt) or the name file storage location (.cnm).

The table below shows the critical certificate server file types by file extension that may be stored to a specific location.

Table 154: Certificate Server Storage Critical File Types

File Extension	File Type
.ser	The main certificate server database file.
.crl	The CRL storage location.
.crt	The issued certificates storage location.
.cnm	The certificate name and expiration file storage location.

File Extension	File Type
.p12	The certificate server certificate archive file location in PKCS12 format.
.pem	The certificate server certificate archive file location in PEM format.

certificate server files may be stored to three levels of specificity:

- Default location, NVRAM
- Specified primary storage location for all critical files
- Specified storage location for specific critical file(s).

A more specific storage location setting overrides a more general storage location setting. For instance, if you have not specified any certificate server file storage locations, all certificate server files are stored to NVRAM. If you specify a storage location for the name file, only the name file is stored there; all other files continue to be stored to NVRAM. If you then specify a primary location, all files except the name file is now stored to this location, instead of NVRAM.

Note You may specify either .p12 or .pem; you cannot specify both types of archive files.

Certificate Server Database File Publication

A publish file is a copy of the original file and is available for other processes to use or for your use. If the certificate server fails to publish a file, it does cause the server to shut down. You may specify one publish location for the issued certificates file and name file and multiple publish locations for the CRL file. See the table below for files types available for publication. You may publish files regardless of the database level that is set.

Table 155: Certificate Server Publish File Types

File Extension	File Type
.crl	The CRL publish location.
.crt	The issued certificates publish location.
.cnm	The certificate name and expiration file publish location.

Trustpoint of the Certificate Server

If the certificate server also has an automatically generated trustpoint of the same name, then the trustpoint stores the certificate of the certificate server. After the router detects that a trustpoint is being used to store the certificate of the certificate server, the trustpoint is locked so that it cannot be modified.

Before configuring the certificate server you can perform the following:

- Manually create and set up this trustpoint (using the **crypto pki trustpoint**command), which allows you to specify an alternative RSA key pair (using the **rsakeypair** command).

- Specify that the initial autoenrollment key pair is generated on a specific device, such as a configured and available USB token, using the **on** command.

Note The automatically generated trustpoint and the certificate server certificate are not available for the certificate server device identity. Thus, any command-line interface (CLI) (such as the **ip http secure-trustpoint** command) that is used to specify the CA trustpoint to obtain certificates and authenticate the connecting client's certificate must point to an additional trustpoint configured on the certificate server device.

If the server is a root certificate server, it uses the RSA key pairs and several other attributes to generate a self-signed certificate. The associated CA certificate has the following key usage extensions--Digital Signature, Certificate Sign, and CRL Sign.

After the CA certificate is generated, attributes can be changed only if the certificate server is destroyed.

Note A certificate server trustpoint must not be automatically enrolled using the **auto-enroll** command. Initial enrollment of the certificate server must be initiated manually and ongoing automatic rollover functionality may be configured with the **auto-rollover** command.

Certificate Revocation Lists (CRLs)

By default, CRLs are issued once every 168 hours (1 calendar week). To specify a value other than the default value for issuing the CRL, execute the **lifetime crl** command. After the CRL is issued, it is written to the specified database location as *ca-label*.crl, where *ca-label* is the name of the certificate server.

CRLs can be distributed through SCEP, which is the default method, or a CRL distribution point (CDP), if configured and available. If you set up a CDP, use the **cdp-url** command to specify the CDP location. If the **cdp-url** command is not specified, the CDP certificate extension is not included in the certificates that are issued by the certificate server. If the CDP location is not specified, Cisco IOS PKI clients automatically request a CRL from the certificate server with a SCEP GetCRL message. The CA then returns the CRL in a SCEP CertRep message to the client. Because all SCEP messages are enveloped and signed PKCS#7 data, the SCEP retrieval of the CRL from the certificate server is costly and not highly scalable. In very large networks, an HTTP CDP provides better scalability and is recommended if you have many peer devices that check CRLs. You may specify the CDP location by a simple HTTP URL string for example,

cdp-url http://my-cdp.company.com/filename.crl

The certificate server supports only one CDP; thus, all certificates that are issued include the same CDP.

If you have PKI clients that are not running Cisco IOS software and that do not support a SCEP GetCRL request and wish to use a CDP you may set up an external server to distribute CRLs and configure the CDP to point to that server. Or, you can specify a non-SCEP request for the retrieval of the CRL from the certificate server by specifying the **cdp-url** command with the URL in the following format where *cs-addr* is the location of the certificate server:

cdp-url http://*cs-addr*/cgi-bin/pkiclient.exe?operation=GetCRL

Note If your CA is also configured as your HTTP CDP server, specify your CDP with the **cdp-url** http://*cs-addr*/cgi-bin/pkiclient.exe?operation=GetCRL command syntax.

It is the responsibility of the network administrator to ensure that the CRL is available from the location that is specified through the **cdp-url** command.

In order to force the parser to retain the embedded question mark within the specified location, enter Ctrl-v prior to the question mark. If this action is not taken, CRL retrieval through HTTP returns an error message.

The CDP location may be changed after the certificate server is running through the **cdp-url** command. New certificates contain the updated CDP location, but existing certificates are not reissued with the newly specified CDP location. When a new CRL is issued, the certificate server uses its current cached CRL to generate a new CRL. (When the certificate server is rebooted, it reloads the current CRL from the database.) A new CRL cannot be issued unless the current CRL has expired. After the current CRL expires, a new CRL is issued only after a certificate is revoked from the CLI.

Certificate Server Error Conditions

At startup, the certificate server checks the current configuration before issuing any certificates. It reports the last known error conditions through the**show crypto pki server** command output. Example errors can include any of the following conditions:

- Storage inaccessible
- Waiting for HTTP server
- Waiting for time setting

If the certificate server experiences a critical failure at any time, such as failing to publish a CRL, the certificate server automatically enters a disabled state. This state allows the network administrator to fix the condition; thereafter, the certificate server returns to the previous normal state.

Certificate Enrollment Using a Certificate Server

A certificate enrollment request functions as follows:

- The certificate server receives the enrollment request from an end user, and the following actions occur:
  - A request entry is created in the enrollment request database with the initial state. (See the table below for a complete list of certificate enrollment request states.)
  - The certificate server refers to the CLI configuration (or the default behavior any time a parameter is not specified) to determine the authorization of the request. Thereafter, the state of the enrollment request is updated in the enrollment request database.
- At each SCEP query for a response, the certificate server examines the current request and performs one of the following actions:
  - Responds to the end user with a “pending” or “denied” state.
  - Generates and signs the appropriate certificate and stores the certificate in the enrollment request database.

If the connection of the client has closed, the certificate server waits for the client to request another certificate.

All enrollment requests transition through the certificate enrollment states that are defined in the table below. To see current enrollment requests, use the **crypto pki server request pkcs10** command.

Table 156: Certificate Enrollment Request State Descriptions

Certificate Enrollment State	Description
authorized	The certificate server has authorized the request.
denied	The certificate server has denied the request for policy reasons.
granted	The CA core has generated the appropriate certificate for the certificate request.
initial	The request has been created by the SCEP server.
malformed	The certificate server has determined that the request is invalid for cryptographic reasons.
pending	The enrollment request must be manually accepted by the network administrator.

SCEP Enrollment

All SCEP requests are treated as new certificate enrollment requests, even if the request specifies a duplicate subject name or public key pair as a previous certificate request.

Types of CA Servers Subordinate and Registration Authorities (RAs)

CA servers have the flexibility to be configured as a subordinate certificate server or an RA-mode certificate server.

Why Configure a Subordinate CA?

A subordinate certificate server provides all the same features as a root certificate server. The root RSA key pairs are extremely important in a PKI hierarchy, and it is often advantageous to keep them offline or archived. To support this requirement, PKI hierarchies allow for subordinate CAs that have been signed by the root authority. In this way, the root authority can be kept offline (except to issue occasional CRL updates), and the subordinate CA can be used during normal operation.

Why Configure an RA-Mode Certificate Server?

A certificate server can be configured to run in RA mode. An RA offloads authentication and authorization responsibilities from a CA. When the RA receives a SCEP or manual enrollment request, the administrator can either reject or grant it on the basis of local policy. If the request is granted, it is forwarded to the issuing CA, and the CA automatically generates the certificate and return it to the RA. The client can later retrieve the granted certificate from the RA.

An RA is the authority charged with recording or verifying some or all of the data required for the CA to issue certificates. In many cases the CA undertakes all of the RA functions itself, but where a CA operates over a wide geographical area or when there is security concern over exposing the CA to direct network access, it may be administratively advisable to delegate some of the tasks to an RA and leave the CA to concentrate on its primary tasks of signing certificates and CRLs.

CA Server Compatibility

The CA server compatibility allows the IOS CA server in RA mode to interoperate with more than one type of CA server. For more information, see "*Configuring a Certificate Server to Run in RA Mode*."

Automatic CA Certificate and Key Rollover

CAs--root CAs, subordinate CAs, and RA-mode CAs--like their clients, have certificates and key pairs with expiration dates that need to be reissued when the current certificate and key pair are about to expire. When a root CA's certificate and key pair are expiring it must generate a self-signed rollover certificate and key pair. If a subordinate CA or an RA-mode CA's certificate and key pair are expiring, it requests a rollover certificate and key pair from its superior CA, obtaining the superior CA's new self-signed rollover certificates at the same time. The CA must distribute the new CA rollover certificate and keys too all its peers. This process, called rollover, allows for continuous operation of the network while the CAs and their clients are switching from an expiring CA certificate and key pair to a new CA certificate and key pair.

Rollover relies on the PKI infrastructure requirements of trust relationships and synchronized clocks. The PKI trust relationships allow (1) the new CA certificate to be authenticated, and (2) the rollover to be accomplished automatically without the loss of security. Synchronized clocks allow the rollover to be coordinated throughout your network.

Automatic CA Certificate Rollover How It Works

The CA server must have rollover configured. All levels of CAs must be automatically enrolled and have **auto-rollover** enabled. CA clients support rollover automatically when automatically enrolled. For more information about clients and automatic rollover, see the section " Automatic Certificate Enrollment " in the chapter "Configuring Certificate Enrollment for a PKI".

After CAs have rollover enabled and their clients are automatically enrolled, there are three stages to the automatic CA certificate rollover process.

Stage One: Active CA Certificate and Key Pair Only

In stage one, there is an active CA certificate and key pair only.

Stage Two: Rollover CA Certificate and Key Pair Generation and Distribution

In stage two, the rollover CA certificate and key pair are generated and distributed. The superior CA generates a rollover certificate and key pair. After the CA successfully saves its active configuration, the CA is ready to respond to client requests for the rollover certificate and key pair. When the superior CA receives a request for the new CA certificate and key pair from a client, the CA responds by sending the new rollover CA certificate and key pair to the requesting client. The clients store the rollover CA certificate and key pair.

Note When a CA generates its rollover certificate and key pair, it must be able to save its active configuration. If the current configuration has been altered, saving of the rollover certificate and key pair does not happen automatically. In this case, the administrator must save the configuration manually or rollover information is lost.

Stage Three: Rollover CA Certificate and Key Pair Become the Active CA Certificate and Key Pair

In stage three, the rollover CA certificate and key pair become the active CA certificate and key pair. All devices that have stored a valid rollover CA certificate rename the rollover certificate to the active certificate and the once-active certificate and key pair are deleted.

After the CA certificate rollover, you may observe the following deviation from usual certificate lifetime and renewal time:

- The lifetime of the certificates issued during rollover is lower than the preconfigured value.
- In specific conditions, the renew time may be inferior to the configured percentage of the actual lifetime. The difference observed can be of up to 20% in cases where the certificate lifetime is less than one hour.

These differences are normal, and result from **jitter** (random time fluctuation) introduced by the algorithm on the Certificate server. This task is performed to avoid the hosts participating to the PKI synchronize their enrollment timer, which could result in congestion on the Certificate Server.

Note The lifetime fluctuations that occur do not affect proper functionning of the PKI, since the differences always result in a shorter lifetime, thus remaining within maximum configured lifetime for certificates.

Support for Specifying a Cryptographic Hash Function

Secure Hash Algorithm (SHA) support allows a user to specify a cryptographic hash function for Cisco IOS XE certificate servers and clients. The cryptographic hash functions that can be specified are Message Digest algorithm 5 (MD5), SHA-1, SHA-256, SHA-384, or SHA-512.

Note Cisco no longer recommends using MD5; instead, you should use SHA-256 where supported. For more information about the latest Cisco cryptographic recommendations, see the *Next Generation Encryption* (NGE) white paper.

See the "*Configuring a Subordinate Certificate Server*" task for more information on specifying the **hash** (ca-trustpoint) and **hash** (cs-server) commands that are used to implement this feature.

How to Set Up and Deploy a Certificate Server

Generating a Certificate Server RSA Key Pair

Perform this task to manually generate an RSA key pair for the certificate server. Manually generating a certificate server RSA key pair allows you to specify the type of key pair you want to generate, to create an exportable key pair for backup purposes, to specify the key pair storage location, or to specify the key generation location.

Note You may want to create an exportable certificate server key pair for backup, or archive purposes. If this task is not performed, the certificate server automatically generates a key pair, which is not marked as exportable.

If your device has a USB token configured and available, the USB token can be used as cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication of credentials to be performed on a USB token. The private key never leaves the USB token and is not exportable. The public key is exportable. For titles of specific documents about configuring a USB token and making it available to use as a cryptographic device, see the "Related Documents" section.

Note It is recommended that the private key be kept in a secure location and that you regularly archive the certificate server database.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the *Next Generation Encryption* (NGE) white paper.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*] [**storage** *devicename:*] [**on** *devicename:*]
4. **crypto key export rsa** *key-label* **pem** {**terminal** | **url** *url*} {**3des** | **des**} *passphrase*
5. **crypto key import rsa** *key-label* **pem** [**usage-keys** | **signature** | **encryption**] {**terminal** | **url** *url*} [**exportable**] [**on** *devicename:*] *passphrase*
6. **exit**
7. **show crypto key mypubkey rsa**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**]	Generates the RSA key pair for the certificate server.

	Command or Action	Purpose
	[**modulus** *modulus-size*] [**storage** *devicename:*] [**on** *devicename:*] **Example:** `Device(config)# crypto key generate rsa label mycs exportable modulus 2048`	• The **storage** keyword specifies the key storage location. • When specifying a label name by specifying the *key-label* argument, you must use the same name for the label that you plan to use for the certificate server (through the **crypto pki server** *cs-label*command). If a *key-label* argument is not specified, the default value, which is the fully qualified domain name (FQDN) of the router, is used. If the exportable RSA key pair is manually generated after the CA certificate has been generated, and before issuing the **no shutdown** command, then use the **crypto ca export pkcs12** command to export a PKCS12 file that contains the certificate server certificate and the private key. • By default, the modulus size of a CA RSA key is 1024 bits. The recommended modulus for a CA RSA key is 2048 bits. The range for a modulus size of a CA RSA key is from 350 to 4096 bits. • The **on** keyword specifies that the RSA key pair is created on the specified device, including a Universal Serial Bus (USB) token, local disk, or NVRAM. The name of the device is followed by a colon (:). **Note** Keys created on a USB token must be 2048 bits or less.
Step 4	**crypto key export rsa** *key-label* **pem** {**terminal** | **url** *url*} {**3des** | **des**} *passphrase* **Example:** `Device(config)# crypto key export rsa mycs pem url nvram: 3des PASSWORD`	(Optional) Exports the generated RSA key pair. Allows you to export the generated keys.
Step 5	**crypto key import rsa** *key-label* **pem** [**usage-keys** | **signature** | **encryption**] {**terminal** | **url** *url*} [**exportable**] [**on** *devicename:*] *passphrase* **Example:** `Device(config)# crypto key import rsa mycs2 pem url nvram:mycs PASSWORD`	(Optional) Imports RSA key pair. To create the imported keys on a USB token, use the **on** keyword and specify the appropriate device location. If you exported the RSA keys using the **exportable** keyword and you want to change the RSA key pair to nonexportable , import the key back to the certificate server without the **exportable** keyword. The key cannot be exported again.
Step 6	**exit** **Example:** `Device(config)# exit`	Exits global configuration.

	Command or Action	Purpose
Step 7	**show crypto key mypubkey rsa** **Example:** `Device# show crypto key mypubkey rsa`	Displays the RSA public keys of your router.

Example

The following example generates a general usage 1024-bit RSA key pair on a USB token with the label "ms2" with crypto engine debugging messages shown:

```
Device(config)# crypto key generate rsa on usbtoken0 label ms2 modulus 2048
The name for the keys will be: ms2
% The key modulus size is 2048 bits
% Generating 2048 bit RSA keys, keys will be on-token, non-exportable...
Jan 7 02:41:40.895: crypto_engine: Generate public/private keypair [OK]
Jan 7 02:44:09.623: crypto_engine: Create signature
Jan 7 02:44:10.467: crypto_engine: Verify signature
Jan 7 02:44:10.467: CryptoEngine0: CRYPTO_ISA_RSA_CREATE_PUBKEY(hw)(ipsec)
Jan 7 02:44:10.467: CryptoEngine0: CRYPTO_ISA_RSA_PUB_DECRYPT(hw)(ipsec)
```

Now, the on-token keys labeled "ms2" may be used for enrollment.

The following example shows the successful import of an encryption key to a configured and available USB tokens:

```
Device# configure terminal

Enter configuration commands, one per line. End with CNTL/Z.

Device(config)# crypto key import rsa encryption on usbtoken0 url nvram:e password

% Importing public Encryption key or certificate PEM file...
filename [e-encr.pub]?
Reading file from nvram:e-encr.pub
% Importing private Encryption key PEM file...
Source filename [e-encr.prv]?
Reading file from nvram:e-encr.prv
% Key pair import succeeded.
```

Configuring Certificate Servers

Prerequisites for Automatic CA Certificate Rollover

When configuring a certificate server, for automatic CA certificate rollover to run successfully, the following prerequisites are applicable for your CA servers:

- Your CA server must be enabled and fully configured with a reliable time of day, an available key pair, a self-signed, valid CA certificate associated with the key pair, a CRL, an accessible storage device, and an active HTTP/SCEP server.
- CA clients must have successfully completed automatic enrollment and have autoenrollment enabled with the same certificate server.

Restrictions for Automatic CA Certificate Rollover

When configuring a certificate server, in order for automatic CA certificate rollover to run successfully, the following restrictions are applicable:

- SCEP must be used to support rollover. Any device that enrolls with the PKI using an alternative to SCEP as the certificate management protocol or mechanism (such as enrollment profiles, manual enrollment, or TFTP enrollment) is not be able to take advantage of the rollover functionality provided by SCEP.
- If you have automatic archive configured on your network and the archive fails, rollover does not occur because the certificate server does not enter the rollover state, and the rollover certificate and key pair is not automatically saved.

Configuring a Certificate Server

Perform this task to configure a certificate server and enable automatic rollover.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **crypto pki server** *cs-label*
5. **no shutdown**
6. **auto-rollover** [*time-period*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ip http server** **Example:** `Device(config)# ip http server`	Enables the HTTP server on your system.
Step 4	**crypto pki server** *cs-label* **Example:** `Device(config)# crypto pki server server-pki`	Defines a label for the certificate server and enters certificate server configuration mode. **Note** If you manually generated an RSA key pair, the *cs-label* argument must match the name of the key pair.
Step 5	**no shutdown**	(Optional) Enables the certificate server.

	Command or Action	Purpose
	Example: `Device(cs-server)# no shutdown`	**Note** Only use this command at this point if you want to use the preconfigured default functionality. That is, do not issue this command just yet if you plan to change any of the default settings as shown in the task "Configuring Certificate Server Functionality."
Step 6	**auto-rollover** [*time-period*] **Example:** `Device(cs-server)# auto-rollover 90`	(Optional) Enables the automated CA certificate rollover functionality. • *time-period*—default is 30 days.

Examples

The following example shows how to configure the certificate server "ms2" where ms2 is the label of a 2048-bit RSA key pair:

```
Device(config)# crypto pki server ms2
Device(cs-server)# no shutdown

% Once you start the server, you can no longer change some of
% the configuration.
Are you sure you want to do this? [yes/no]:
yes
% Certificate Server enabled.
Device(cs-server)# end
!
Device# show crypto pki server ms2
Certificate Server ms2:
    Status: enabled, configured
    CA cert fingerprint: 5A856122 4051347F 55E8C246 866D0AC3
    Granting mode is: manual
    Last certificate issued serial number: 0x1
    CA certificate expiration timer: 19:44:57 GMT Oct 14 2006

CRL NextUpdate timer: 19:45:25 GMT Oct 22 2003
    Current storage dir: nvram:
    Database Level: Complete - all issued certs written as <serialnum>.cer
```

The following example shows how to enable automated CA certificate rollover on the server ms2 with the **auto-rollover** command. The **show crypto pki server**command shows that the automatic rollover has been configured on the server mycs with an overlap period of 25 days.

```
Device(config)# crypto pki server ms2
Device(cs-server)# auto-rollover 25
Device(cs-server)# no shutdown
%Some server settings cannot be changed after CA certificate generation.
% Exporting Certificate Server signing certificate and keys...
% Certificate Server enabled.
Device(cs-server)#
Device# show crypto pki server ms2
Certificate Server ms2:
    Status:enabled
    Server's configuration is locked  (enter "shut" to unlock it)
    Issuer name:CN=mycs
```

```
CA cert fingerprint:70AFECA9 211CDDCC 6AA9D7FF 3ADB03AE
Granting mode is:manual
Last certificate issued serial number:0x1
CA certificate expiration timer:00:49:26 PDT Jun 20 2008
CRL NextUpdate timer:00:49:29 PDT Jun 28 2005
Current storage dir:nvram:
Database Level:Minimum - no cert data written to storage
Auto-Rollover configured, overlap period 25 days
Autorollover timer:00:49:26 PDT May 26 2008
```

Configuring a Subordinate Certificate Server

Perform this task to configure a subordinate certificate server to grant all or certain SCEP or manual certificate requests and to enable automatic rollover.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the *Next Generation Encryption* (NGE) white paper.

Before you begin

- The root certificate server should be a Cisco IOS XE certificate server.
- For a subordinate certificate authority (CA), enrollment to the root CA or upstream CA is possible only through SCEP. The upstream CA must be online for the enrollment to the upstream CA to complete. Manual enrollment of subordinate CA to the root CA or upstream CA is not possible.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment** [**mode**] [**retry period** *minutes*] [**retry count** *number*] **url** *url* [**pem**]
5. **hash** {**md5** | **sha1** | **sha256** | **sha384** | **sha512**}
6. **exit**
7. **crypto pki server** *cs-label*
8. **issuer name** *DN-string*
9. **mode sub-cs**
10. **auto-rollover** [*time-period*]
11. **grant auto rollover** {**ca-cert** | **ra-cert**}
12. **hash** {**md5** | **sha1** | **sha256** | **sha384** | **sha512**}
13. **no shutdown**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:**	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	`Device> enable`	
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Device(config)# crypto pki trustpoint sub`	Declares the trustpoint that your subordinate certificate server should use and enters ca-trustpoint configuration mode.

Step 4	**enrollment** [**mode**] [**retry period** *minutes*] [**retry count** *number*] **url** *url* [**pem**]
	Example:
	`Device(ca-trustpoint)# enrollment url http://caserver.myexample.com`
	- or-
	`Device(ca-trustpoint)# enrollment url http://[2001:DB8:1:1::1]:80`
		Specifies the following enrollment parameters of the CA:
		• (Optional) The **mode** keyword specifies the registration authority (RA) mode, if your CA system provides an RA. By default, RA mode is disabled.
		• (Optional) The **retry period** keyword and *minutes* argument specifies the period, in minutes, in which the router waits before sending the CA another certificate request. Valid values are from 1 to 60. The default is 1.
		• (Optional) The **retry count** keyword and *number* argument specifies the number of times a router will resend a certificate request when it does not receive a response from the previous request. Valid values are from 1 to 100. The default is 10.
		• The *url* argument is the URL of the CA to which your router should send certificate requests.
		Note An IPv6 address can be added to the **http:** enrollment method. For example: http://[ipv6-address]:80. The IPv6 address must be enclosed in brackets in the URL. See the *enrollment url (ca-trustpoint)* command page for more information on the other enrollment methods that can be used.
		• (Optional) The **pem** keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request.

Step 5	**hash** {**md5** | **sha1** | **sha256** | **sha384** | **sha512**} **Example:** `Device(ca-trustpoint)# hash sha384`	(Optional) Specifies the hash function for the signature that the Cisco IOS XE client uses to sign its self-signed certificates. The Cisco IOS XE client uses the MD5 cryptographic hash function for self-signed certificates by default. Any of the following command algorithm keyword options can be specified to over-ride the default setting for the

	Command or Action	Purpose
		trustpoint. This setting then becomes the default cryptographic hash algorithm function for self-signed certificates by default. • **md5** —Specifies that MD5, the default hash function, is used. (No longer recommended). • **sha1** —Specifies that the SHA-1 hash function is used as the default hash algorithm for RSA keys. (No longer recommended). • **sha256** —Specifies that the SHA-256 hash function is used as the hash algorithm for Elliptic Curve (EC) 256 bit keys. • **sha384** —Specifies that the SHA-384 hash function is used as the hash algorithm for EC 384 bit keys. • **sha512** —Specifies that the SHA-512 hash function is used as the hash algorithm for EC 512 bit keys.
Step 6	**exit** **Example:** `Device(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode.
Step 7	**crypto pki server** *cs-label* **Example:** `Device(config)# crypto pki server sub`	Enables a Cisco IOS XE certificate server and enters cs-server configuration mode. **Note** The subordinate server must have the same name as the trustpoint that was created in Step 3 above.
Step 8	**issuer name** *DN-string* **Example:** `Device(cs-server)# issuer-name CN=sub CA, O=Cisco, C=us`	(Optional) Specifies the DN as the CA issuer name for the certificate server.
Step 9	**mode sub-cs** **Example:** `Device(cs-server)# mode sub-cs`	Places the PKI server into sub-certificate server mode. • Sub CA and CA relationship is supported only when all the devices on the network are of Cisco IOS XE device type. Hence a Cisco IOS XE sub CA cannot enroll to a third party CA server.
Step 10	**auto-rollover** [*time-period*] **Example:** `Device(cs-server)# auto-rollover 90`	(Optional) Enables the automated CA certificate rollover functionality. • *time-period* --default is 30 days.

	Command or Action	Purpose
Step 11	**grant auto rollover** {**ca-cert** | **ra-cert**} **Example:** `Device(cs-server)# grant auto rollover ca-cert`	(Optional) Automatically grants reenrollment requests for subordinate CAs and RA-mode CAs without operator intervention. • **ca-cert** --Specifies that the subordinate CA rollover certificate is automatically granted. • **ra-cert** --Specifies that the RA-mode CA rollover certificate is automatically granted. **Note** If this is the first time that a subordinate certificate server is enabled and enrolled, the certificate request must be manually granted.
Step 12	**hash** {**md5** | **sha1** | **sha256** | **sha384** | **sha512**} **Example:** `Device(cs-server)# hash sha384`	(Optional) Sets the hash function for the signature that the Cisco IOS XE certificate authority (CA) uses to sign all of the certificates issued by the server. • **md5** —Specifies that MD5, the default hash function, is used. (No longer recommended). • **sha1** —Specifies that the SHA-1 hash function is used. (No longer recommended). • **sha256** —Specifies that the SHA-256 hash function is used. • **sha384** —Specifies that the SHA-384 hash function is used. • **sha512** —Specifies that the SHA-512 hash function is used.
Step 13	**no shutdown** **Example:** `Device(cs-server)# no shutdown`	Enables or reenables the certificate server. If this is the first time that a subordinate certificate server is enabled, the certificate server generates the key and obtain its signing certificate from the root certificate server.

Examples

If the certificate server fails to enable or if the certificate server has trouble handling the request that has been configured, you can use the **debug crypto pki server** command to troubleshoot your configuration as shown in the following below (Clock Not Set and Trustpoint Not Configured). Here, "ms2" refers to the label of a 2048-bit RSA key pair.

```
Router# debug crypto pki server
```

Clock Not Set

```
Router(config)# crypto pki server ms2
Router(cs-server)# mode sub-cs
```

```
Router(cs-server)# no shutdown
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key % or type Return to exit
Password:
*Jan  6 20:57:37.667: CRYPTO_CS: enter FSM: input state initial, input signal no shut
Re-enter password:
*Jan  6 20:57:45.303: CRYPTO_CS: starting enabling checks
*Jan  6 20:57:45.303: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]
% Time has not been set. Cannot start the Certificate server
```

Trustpoint Not Configured

```
Router(config)# crypto pki server ms2
Router(cs-server)# mode sub-cs
Router(cs-server)# no shutdown
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key or type Return to exit
Password:
Jan  6 21:00:15.961: CRYPTO_CS: enter FSM: input state initial, input signal no shut.
Jan  6 21:03:34.309: CRYPTO_CS: enter FSM: input state initial, input signal time set.
Jan  6 21:03:34.313: CRYPTO_CS: exit FSM: new state initial.
Jan  6 21:03:34.313: CRYPTO_CS: cs config has been unlocked
Re-enter password:
Jan  6 21:03:44.413: CRYPTO_CS: starting enabling checks
Jan  6 21:03:44.413: CRYPTO_CS: associated trust point 'sub' does not exist; generated
automatically
Jan  6 21:03:44.417: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]
Jan  6 21:04:03.993: CRYPTO_CS: nvram filesystem
Jan  6 21:04:04.077: CRYPTO_CS: serial number 0x1 written.
You must specify an enrollment URL for this CA before you can authenticate it.
% Failed to authenticate the Certificate Authority
```

If the certificate server fails to obtain its signing certificate from the root certificate server, you can use the **debug crypto pki transactions**command to troubleshoot your configuration as shown in the following example:

```
Router# debug crypto pki transactions
Jan  6 21:07:00.311: CRYPTO_CS: enter FSM: input state initial, input signal time set
Jan  6 21:07:00.311: CRYPTO_CS: exit FSM: new state initial
Jan  6 21:07:00.311: CRYPTO_CS: cs config has been unlocked no sh
%Some server settings cannot be changed after CA certificate generation.
% Please enter a passphrase to protect the private key % or type Return to exit
Password:
Jan  6 21:07:03.535: CRYPTO_CS: enter FSM: input state initial, input signal no shut
Re-enter password:
Jan  6 21:07:10.619: CRYPTO_CS: starting enabling checks
Jan  6 21:07:10.619: CRYPTO_CS: key 'sub' does not exist; generated automatically[OK]
Jan  6 21:07:20.535: %SSH-5-ENABLED: SSH 1.99 has been enabled
Jan  6 21:07:25.883: CRYPTO_CS: nvram filesystem
Jan  6 21:07:25.991: CRYPTO_CS: serial number 0x1 written.
Jan  6 21:07:27.863: CRYPTO_CS: created a new serial file.
Jan  6 21:07:27.863: CRYPTO_CS: authenticating the CA 'sub'

```

If the certificate server fails to enable or if the certificate server has trouble handling the request that has been configured, you can use the **debug crypto pki server** command to troubleshoot the progress of an enrollment. This command can also be used to debug the root CA (turn it on at the root CA).

Configuring a Certificate Server to Run in RA Mode

The certificate server can act as an RA for a CA or another third party CA. Read the details in Step 8 for more information about the **transparent** keyword option if a third-party CA is used.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment url** *url*
5. **subject-name** *x.500-name*
6. **exit**
7. **crypto pki server** *cs-label*
8. **mode ra** [**transparent**]
9. **auto-rollover** [*time-period*]
10. **grant auto rollover** {**ca-cert** | **ra-cert**}
11. **no shutdown**
12. **no shutdown**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Device(config)# crypto pki trustpoint ra-server`	Declares the trustpoint that your RA mode certificate server should use and enters ca-trustpoint configuration mode.
Step 4	**enrollment url** *url* **Example:** `Device(ca-trustpoint)# enrollment url http://ca-server.company.com`	Specifies the enrollment URL of the issuing CA certificate server (root certificate server).
Step 5	**subject-name** *x.500-name* **Example:** `Device(ca-trustpoint)# subject-name cn=ioscs RA`	Specifies the subject name the RA uses. **Note** Include "cn=ioscs RA" or "ou=ioscs RA" in the subject name so that the issuing CA certificate server can recognize the RA (see Step 7 below).

	Command or Action	Purpose
Step 6	**exit** **Example:** `Device(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode.
Step 7	**crypto pki server** *cs-label* **Example:** `Device(config)# crypto pki server ra-server`	Enables a certificate server and enters cs-server configuration mode. **Note** The certificate server must have the same name as the trustpoint that was created in Step 3 above.
Step 8	**mode ra** [**transparent**] **Example:** `Device(cs-server)# mode ra`	Places the PKI server into RA certificate server mode. Use the **transparent** keyword to allow the CA server in RA mode to interoperate with more than one type of CA server. When the **transparent** keyword is used, the original PKCS#10 enrollment message is not re-signed and is forwarded unchanged. This enrollment message makes the IOS RA certificate server work with CA servers like the Microsoft CA server.
Step 9	**auto-rollover** [*time-period*] **Example:** `Device(cs-server)# auto-rollover 90`	(Optional) Enables the automatic CA certificate rollover functionality. • *time-period* --default is 30 days.
Step 10	**grant auto rollover** {**ca-cert** | **ra-cert**} **Example:** `Device(cs-server)# grant auto rollover ra-cert`	(Optional) Automatically grants reenrollment requests for subordinate CAs and RA-mode CAs without operator intervention. • **ca-cert** --Specifies that the subordinate CA rollover certificate is automatically granted. • **ra-cert** --Specifies that the RA-mode CA rollover certificate is automatically granted. If this is the first time that a subordinate certificate server is enabled and enrolled, the certificate request must be manually granted.
Step 11	**no shutdown** **Example:** `Device(cs-server)# no shutdown`	Enables the certificate server. **Note** After this command is issued, the RA automatically enrolls with the root certificate server. After the RA certificate has been successfully received, you must issue the **no shutdown** command again, which reenables the certificate server.
Step 12	**no shutdown** **Example:**	Reenables the certificate server.

	Command or Action	Purpose
	`Device(cs-server)# no shutdown`	

Configuring the Root Certificate Server to Delegate Enrollment Tasks to the RA Mode Certificate Server

Perform the following steps on the router that is running the issuing certificate server; that is, configure the root certificate server that is delegating enrollment tasks to the RA mode certificate server.

Note Granting enrollment requests for an RA is essentially the same process as granting enrollment requests for client devices--except that enrollment requests for an RA are displayed in the section "RA certificate requests" of the command output for the **crypto pki server info-requests** command.

SUMMARY STEPS

1. **enable**
2. **crypto pki server** *cs-label* **info requests**
3. **crypto pki server** *cs-label* **grant** *req-id*
4. **configure terminal**
5. **crypto pki server** *cs-label*
6. **grant ra-auto**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**crypto pki server** *cs-label* **info requests** **Example:** `Device# crypto pki server root-server info requests`	Displays the outstanding RA certificate request. **Note** This command is issued on the router that is running the issuing certificate server.
Step 3	**crypto pki server** *cs-label* **grant** *req-id* **Example:** `Device# crypto pki server root-server grant 9`	Grants the pending RA certificate request. **Note** Because the issuing certificate server delegates the enrollment request verification task to the RA, you must pay extra attention to the RA certificate request before granting it.
Step 4	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 5	**crypto pki server** *cs-label* **Example:** `Device(config)# crypto pki server root-server`	Enables a certificate server and enters cs-server configuration mode.
Step 6	**grant ra-auto** **Example:** `Device(cs-server)# grant ra-auto`	(Optional) Specifies that all enrollment requests from an RA are to be granted automatically. **Note** For the **grant ra-auto** command to work, you have to include "cn=ioscs RA" or "ou=ioscs RA" in the subject name of the RA certificate. (See Step 2 above.)

What to Do Next

After you have configured a certificate server, you can use the preconfigured default values or specify values through the CLI for the functionality of the certificate server. If you choose to specify values other than the defaults, see the following section, "*Configuring Certificate Server Functionality* ."

Configuring Certificate Server Functionality

After you have enabled a certificate server and are in certificate server configuration mode, use any of the steps in this task to configure basic certificate server functionality values other than the default values.

Certificate Server Default Values and Recommended Values

The default values for a certificate server are intended to address a relatively small network (of about ten devices). For example, the database settings are minimal (through the **database level minimal**command) and the certificate server handles all CRL requests through SCEP. For larger networks, it is recommended that you use either the database setting "names" or "complete" (as described in the **database level** command) for possible audit and revocation purposes. Depending on the CRL checking policy, you should also use an external CDP in a larger network.

Certificate Server File Storage and Publication Locations

You have the flexibility to store file types to different storage and publication locations.

SUMMARY STEPS

1. **database url** *root-url*
2. **database url** {**cnm** | **crl** | **crt** | **p12** | **pem** | **ser**} *root-url*
3. **database url** {**cnm** | **crl** | **crt**} **publish** *root-url*
4. **database level** {**minimal** | **names** | **complete**}
5. **database username** *username* [**password** [*encr-type*] *password*]
6. **database archive** {**pkcs12** | **pem**}[**password** *encr-type*] *password*]
7. **issuer-name** *DN-string*
8. **lifetime** {**ca-certificate** | **certificate**} *time*
9. **lifetime crl** *time*

10. **lifetime enrollment-request** *time*
11. **cdp-url** *url*
12. **no shutdown**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**database url** *root-url* **Example:** `Device(cs-server)# database url tftp://cert-svr-db.company.com`	Specifies the primary location where database entries for the certificate server are written. If this command is not specified, all database entries are written to NVRAM.
Step 2	**database url** {**cnm** | **crl** | **crt** | **p12** | **pem** | **ser**} *root-url* **Example:** `Device(cs-server)# database url ser nvram:`	Specifies certificate server critical file storage location by file type. **Note** If this command is not specified, all critical files are stored to the primary location if specified. If the primary location is not specified, all critical files are stored to NVRAM.
Step 3	**database url** {**cnm** | **crl** | **crt**} **publish** *root-url* **Example:** `Device(cs-server)# database url crl publish tftp://csdb_specific_crl_files.company.com`	Specifies certificate server publish location by file type. **Note** If this command is not specified, all publish files are stored to the primary location if specified. If the primary location is not specified, all publish files are stored to NVRAM.
Step 4	**database level** {**minimal** | **names** | **complete**} **Example:** `Device(cs-server)# database level complete`	Controls what type of data is stored in the certificate enrollment database. • **minimal** --Enough information is stored only to continue issuing new certificates without conflict; the default value. • **names** --In addition to the information given in the minimal level, the serial number and subject name of each certificate. • **complete** --In addition to the information given in the minimal and names levels, each issued certificate is written to the database. **Note** The **complete** keyword produces a large amount of information; if it is issued, you should also specify an external TFTP server in which to store the data through the **database url** command.

	Command or Action	Purpose
Step 5	**database username** *username* [**password** [*encr-type*] *password*] **Example:** `Device(cs-server)# database username user password PASSWORD`	(Optional) Sets a username and password when a user is required to access a primary certificate enrollment database storage location.
Step 6	**database archive** {**pkcs12** | **pem**}[**password** *encr-type*] *password*] **Example:** `Device(cs-server)# database archive pem`	(Optional) Sets the CA key and CA certificate archive format and password to encrypt the file. The default value is **pkcs12**, so if this subcommand is not configured, autoarchiving continues, and the PKCS12 format is used. • The password is optional. If it is not configured, you are prompted for the password when the server is turned on for the first time. **Note** It is recommended that you remove the password from the configuration after the archive is finished.
Step 7	**issuer-name** *DN-string* **Example:** `Device(cs-server)# issuer-name my-server`	(Optional) Sets the CA issuer name to the specified distinguished name (*DN-string*). The default value is as follows: **issuer-name cn**={*cs-label* }.
Step 8	**lifetime** {**ca-certificate** | **certificate**} *time* **Example:** `Device(cs-server)# lifetime certificate 888`	(Optional) Specifies the lifetime, in days, of a CA certificate or a certificate. Valid values range from 1 day to 1825 days. The default CA certificate lifetime is 3 years; the default certificate lifetime is 1 year. The maximum certificate lifetime is 1 month less than the lifetime of the CA certificate.
Step 9	**lifetime crl** *time* **Example:** `Device(cs-server)# lifetime crl 333`	(Optional) Defines the lifetime, in hours, of the CRL that is used by the certificate server. Maximum lifetime value is 336 hours (2 weeks). The default value is 168 hours (1 week).
Step 10	**lifetime enrollment-request** *time* **Example:** `Device(cs-server)# lifetime enrollment-request 888`	(Optional) Specifies how long an enrollment request should stay in the enrollment database before being removed. Maximum lifetime is 1000 hours.
Step 11	**cdp-url** *url* **Example:** `Device(cs-server)# cdp-url http://my-cdp.company.com`	(Optional) Defines the CDP location to be used in the certificates that are issued by the certificate server. • The URL must be an HTTP URL.

	Command or Action	Purpose
		If you have PKI clients that are not running Cisco IOS software and that do not support a SCEP GetCRL request, use the following URL format: http://server.company.com/certEnroll/filename.crl Or, if your Cisco IOS certificate server is also configured as your CDP, use the following URL format http://cs-addr/cgi-bin/pkiclient.exe?operation=GetCRL where *cs-addr* is the location of the certificate server. In order to force the parser to retain the embedded question mark within the specified location, enter Ctrl-v prior to the question mark. If this action is not taken, CRL retrieval through HTTP returns an error message. **Note** Although this command is optional, it is strongly recommended for any deployment scenario.
Step 12	**no shutdown** **Example:** `Device(cs-server)# no shutdown`	Enables the certificate server. You should issue this command only after you have completely configured your certificate server.

Examples

The following example shows how to configure a CDP location where the PKI clients do not support SCEP GetCRL requests:

```
Device(config)# crypto pki server aaa
Device(cs-server)# database level minimum
Device(cs-server)# database url tftp://10.1.1.1/username1/
Device(cs-server)# issuer-name CN=aaa
Device(cs-server)# cdp-url http://server.company.com/certEnroll/aaa.crl
```

After a certificate server has been enabled on a router, the **show crypto pki server**command displays the following output:

```
Device# show crypto pki server

    Certificate Server status:enabled, configured
    Granting mode is:manual
    Last certificate issued serial number:0x1
    CA certificate expiration timer:19:31:15 PST Nov 17 2006
    CRL NextUpdate timer:19:31:15 PST Nov 25 2003
    Current storage dir:nvram:
    Database Level:Minimum - no cert data written to storage
```

Working with Automatic CA Certificate Rollover

Starting Automated CA Certificate Rollover Immediately

Use this task to initiate the automated CA certificate rollover process immediately on your root CA server.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki server** *cs-label* **rollover** [**cancel**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki server** *cs-label* **rollover** [**cancel**] **Example:** `Device(config)# crypto pki server mycs rollover`	Immediately starts the CA certificate rollover process by generating a shadow CA certificate. To delete the CA certificate rollover certificate and keys, use the **cancel** keyword.

Requesting a Certificate Server Client Rollover Certificate

Use this task to request a certificate server client's rollover certificate.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki server** *cs-label* **rollover request pkcs10 terminal**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:**	Enters global configuration mode.

	Command or Action	Purpose
	`Device# configure terminal`	
Step 3	**crypto pki server** *cs-label* **rollover request pkcs10 terminal** **Example:** `Device(config)# crypto pki server mycs rollover request pkcs10 terminal`	Requests a client rollover certificate from the server.

Example

The following example shows a rollover certificate request being inputted into the server:

```
Device# crypto pki server mycs rollover request pkcs10 terminal

% Enter Base64 encoded or PEM formatted PKCS10 enrollment request.
% End with a blank line or "quit" on a line by itself.
-----BEGIN CERTIFICATE REQUEST-----
MIIBUTCBuwIBADASMRAwDgYDVQQDEwdOZXdSb290MIGfMA0GCSqGSIb3DQEBAQUA

eW3tyCo=
-----END CERTIFICATE REQUEST-----
```

Exporting a CA Rollover Certificate

Use this task to export a CA rollover certificate.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki export** *trustpoint* **pem** {**terminal** | **url** *url*} [**rollover**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki export** *trustpoint* **pem** {**terminal** | **url** *url*} [**rollover**]	Exports a CA shadow certificate.

	Command or Action	Purpose
	Example: `Device(config)# crypto pki export mycs pem terminal rollover`	

Maintaining Verifying and Troubleshooting the Certificate Server Certificates and the CA

Managing the Enrollment Request Database

SCEP supports two client authentication mechanisms--manual and preshared key. Manual enrollment requires the administrator at the CA server to specifically authorize the enrollment requests; enrollment using preshared keys allows the administrator to preauthorize enrollment requests by generating a one-time password (OTP).

Use any of the optional steps within this task to help manage the enrollment request database by performing functions such as specifying enrollment processing parameters that are to be used by SCEP and by controlling the run-time behavior or the certificate server.

SUMMARY STEPS

1. **enable**
2. **crypto pki server** *cs-label* **grant** {**all** | *req-id*}
3. **crypto pki server** *cs-label* **reject** {**all** | *req-id*}
4. **crypto pki server** *cs-label* **password generate** *minutes*
5. **crypto pki server** *cs-label* **revoke** *certificate-serial-number*
6. **crypto pki server** *cs-label* **request pkcs10** {*url* | **terminal**} [**base64**| **pem**
7. **show crypto pki server** *cs-label* **crl**
8. **show crypto pki server** *cs-label* **requests**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**crypto pki server** *cs-label* **grant** {**all**	*req-id*} **Example:** `Device# crypto pki server mycs grant all`	Grants all or specific SCEP requests.
Step 3	**crypto pki server** *cs-label* **reject** {**all**	*req-id*} **Example:** `Device# crypto pki server mycs reject all`	Rejects all or specific SCEP requests.
Step 4	**crypto pki server** *cs-label* **password generate** *minutes* **Example:**	Generates a OTP for SCEP requests.

	Command or Action	Purpose
	`Device# crypto pki server mycs password generate 75`	• *minutes* --Length of time, in minutes, that the password is valid. Valid values range from 1 to 1440 minutes. The default is 60 minutes. **Note** Only one OTP is valid at a time; if a second OTP is generated, the previous OTP is no longer valid.
Step 5	**crypto pki server** *cs-label* **revoke** *certificate-serial-number* **Example:** `Device# crypto pki server mycs revoke 3`	Revokes a certificate on the basis of its serial number. • *certificate-serial-number* --One of the following options: • A string with a leading 0x, which is treated as a hexadecimal value • A string with a leading 0 and no x, which is treated as octal • All other strings, which are treated as decimal
Step 6	**crypto pki server** *cs-label* **request pkcs10** {*url* | **terminal**} [**base64**| **pem** **Example:** `Device# crypto pki server mycs request pkcs10 terminal pem`	Manually adds either a base64-encoded or PEM-formatted PKCS10 certificate enrollment request to the request database. After the certificate is granted, it is displayed on the console terminal using base64 encoding. • **pem** --Specifies the certificate that is returned with PEM headers automatically added to the certificate after the certificate is granted, regardless of whether PEM headers were used in the request. • **base64** --Specifies the certificate that is returned without privacy-enhanced mail (PEM) headers, regardless of whether PEM headers were used in the request.
Step 7	**show crypto pki server** *cs-label* **crl** **Example:** `Device# show crypto pki server mycs crl`	Displays information regarding the status of the current CRL.
Step 8	**show crypto pki server** *cs-label* **requests** **Example:** `Device# show crypto pki server mycs requests`	Displays all outstanding certificate enrollment requests.

Removing Requests from the Enrollment Request Database

After the certificate server receives an enrollment request, the server can leave the request in a pending state, reject it, or grant it. The request stays in the enrollment request database for 1 week until the client polls the certificate server for the result of the request. If the client exits and never polls the certificate server, you can remove either individual requests or all requests from the database.

Use this task to remove requests from the database and allow the server to be returned to a clean slate with respect to the keys and transaction IDs. Also, you can use this task to help troubleshoot a SCEP client that may not be behaving properly.

SUMMARY STEPS

1. **enable**
2. **crypto pki server** *cs-label* **remove** {**all** | *req-id*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**crypto pki server** *cs-label* **remove** {**all**	*req-id*} **Example:** `Device# crypto pki server mycs remove 15`	Removes enrollment requests from the enrollment request database.

Deleting a Certificate Server

Users can delete a certificate server from the PKI configuration if they no longer want it on the configuration. Typically, a subordinate certificate server or an RA is being deleted. However, users may delete a root certificate server if they are moving it to another device through the archived RSA keys.

Perform this task to delete a certificate server from your PKI configuration.

Note When a certificate server is deleted, the associated trustpoint and key are also deleted.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no crypto pki server** *cs-label*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**no crypto pki server** *cs-label* **Example:** `Device(config)# no crypto pki server mycs`	Deletes a certificate server and associated trustpoint and key.

Verifying and Troubleshooting Certificate Server and CA Status

Use any of the following optional steps to verify the status of the certificate server or the CA.

SUMMARY STEPS

1. **enable**
2. **debug crypto pki server**
3. **dir** *filesystem* :

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**debug crypto pki server** **Example:** `Device# debug crypto pki server`	Enables debugging for a crypto PKI certificate server. • This command can be used for monitoring the progress of an enrollment and for troubleshooting if the certificate server fails to respond or if the certificate server has trouble handling the request that has been configured.
Step 3	**dir** *filesystem* : **Example:** `Device# dir slot0:`	Displays a list of files on a file system. • This command can be used to verify the certificate server autoarchived file if the **database url** command was entered to point to a local file system. You should be able to at least see "*cs-label* .ser" and "*cs-label* .crl" files in the database.

Verifying CA Certificate Information

To obtain information relating to the CA certificates including the certificate server rollover process, rollover certificates, and timers, you may use any of the following commands.

Note These commands are not exclusive to shadow certificate information. If no shadow certificate exists, the following commands display the active certificate information.

SUMMARY STEPS

1. **crypto pki certificate chain**
2. **crypto pki server info requests**
3. **show crypto pki certificates**
4. **show crypto pki server**
5. **show crypto pki trustpoints**

DETAILED STEPS

Step 1 crypto pki certificate chain

Example:

```
Device(config)# crypto pki certificate chain mica

certificate 06
certificate ca 01
! This is the peer's shadow PKI certificate.
certificate rollover 0B
! This is the CA shadow PKI certificate
certificate rollover ca 0A
```

Displays the certificate chain details and to distinguish the current active certificate from the rollover certificate in the certificate chain. The following example shows a certificate chain with an active CA certificate and a shadow, or rollover, certificate:

Step 2 crypto pki server info requests

Example:

```
Device# crypto pki server myca info requests

Enrollment Request Database:
RA certificate requests:
  ReqID  State      Fingerprint                      SubjectName
--------------------------------------------------------------
RA rollover certificate requests:
  ReqID  State      Fingerprint                      SubjectName
  --------------------------------------------------------------
Router certificates requests:
  ReqID  State      Fingerprint                      SubjectName
--------------------------------------------------------------
1      pending    A426AF07FE3A4BB69062E0E47198E5BF hostname=client
  Router rollover certificates requests:
  ReqID  State      Fingerprint                      SubjectName
  --------------------------------------------------------------
  2      pending    B69062E0E47198E5BFA426AF07FE3A4B hostname=client
```

Displays all outstanding certificate enrollment requests. The following example shows the output for shadow PKI certificate information requests:

Step 3 show crypto pki certificates

Example:

```
Device# show crypto pki certificates

Certificate
  Subject Name
    Name: myrouter.example.com
```

```
    IP Address: 192.0.2.1
    Serial Number: 04806682
  Status: Pending
  Key Usage: General Purpose
    Fingerprint: 428125BD A3419600 3F6C7831 6CD8FA95 00000000
CA Certificate
  Status: Available
  Certificate Serial Number: 3051DF7123BEE31B8341DFE4B3A338E5F
  Key Usage: Not Set
```

Displays information about the certificate, the certification authority certificate, shadow certificates, and any registration authority certificates. The following example displays the certificate of the router and the certificate of the CA. There is no shadow certificate available. A single, general-purpose RSA key pair was previously generated, and a certificate was requested but not received for that key pair. Note that the certificate status of the router shows "Pending." After the router receives its certificate from the CA, the Status field changes to "Available" in the **show** output.

Step 4 **show crypto pki server**

Example:

```
Device# show crypto pki server

Certificate Server routercs:
   Status: enabled, configured
   Issuer name: CN=walnutcs
   CA cert fingerprint: 800F5944 74337E5B C2DF6C52 9A7B1BDB
   Granting mode is: auto
   Last certificate issued serial number: 0x7
   CA certificate expiration timer: 22:10:29 GMT Jan 29 2007
   CRL NextUpdate timer: 21:50:56 GMT Mar 5 2004
   Current storage dir: nvram:
   Database Level: Minimum - no cert data written to storage
Rollover status: available for rollover
    Rollover CA cert fingerprint: 6AAF5944 74227A5B 23DF3E52 9A7F1FEF
    Rollover CA certificate expiration timer: 22:10:29 GMT Jan 29 2017
```

Displays the current state and configuration of the certificate server. The following example shows that the certificate server "routercs" has rollover configured. The CA auto-rollover time has occurred and the rollover, or shadow, PKI certificate is available. The status shows the rollover certificate fingerprint and rollover CA certificate expiration timer information.

Step 5 **show crypto pki trustpoints**

Example:

```
Device# show crypto pki trustpoints

Trustpoint vpn:
   Subject Name:
   cn=Cisco SSL CA
   o=Cisco Systems
   Serial Number: 0FFEBBDC1B6F6D9D0EA7875875E4C695
   Certificate configured.
   Rollover certificate configured.
   Enrollment Protocol:
   SCEPv1, PKI Rollover
```

Displays the trustpoints that are configured in the device. The following output shows that a shadow CA certificate is available and shows the SCEP capabilities reported during the last enrollment operation:

Configuration Examples for Using a Certificate Server

Example: Configuring Specific Storage and Publication Locations

The following example shows the configuration of a minimal local file system, so that the certificate server can respond quickly to certificate requests. The .ser and .crl files are stored on the local system for fast access, and a copy of all of the .crt files are published to a remote location for long-term logging.

```
crypto pki server myserver
     !Pick your database level.
     database level minimum
     !Specify a location for the .crt files that is different than the default local
!Cisco IOS file system.
     database url crt publish http://url username user1 password secret
```

Note Free space on the local file system should be monitored, in case the .crl file becomes too large.

The following example shows the configuration of a primary storage location for critical files, a specific storage location for the critical file serial number file, the main certificate server database file, and a password protected file publication location for the CRL file:

```
Device(config)# crypto pki server mycs
Device(cs-server)# database url ftp://cs-db.company.com

!
% Server database url was changed. You need to move the
% existing database to the new location.
!
Device(cs-server)# database url ser nvram:
Device(cs-server)# database url crl publish ftp://crl.company.com username myname password
 mypassword
Device(cs-server)# end
```

The following output displays the specified primary storage location and critical file storage locations specified:

```
Device# show

Sep  3 20:19:34.216: %SYS-5-CONFIG_I: Configured from console by user on console
Device# show crypto pki server

Certificate Server mycs:
     Status: disabled
     Server's configuration is unlocked  (enter "no shut" to lock it)
     Issuer name: CN=mycs
     CA cert fingerprint: -Not found-
     Granting mode is: manual
     Last certificate issued serial number: 0x0
     CA certificate expiration timer: 00:00:00 GMT Jan 1 1970
     CRL not present.
     Current primary storage dir: ftp://cs-db.company.com
     Current storage dir for .ser files: nvram:
    Database Level: Minimum - no cert data written to storage The following output displays
 all storage and publication locations. The serial number file (.ser) is stored in NVRAM.
```

```
The CRL file will be published to ftp://crl.company.com with a username and password. All
other critical files will be stored to the primary location, ftp://cs-db.company.com.

Device# show running-config

   section crypto pki server
   crypto pki server mycs shutdown database url ftp://cs-db.company.com
   database url crl publish ftp://crl.company.com username myname password 7
12141C0713181F13253920
   database url ser nvram:
Device#
```

Example: Removing Enrollment Requests from the Enrollment Request Database

The following examples show both the enrollment requests that are currently in the enrollment request database and the result after one of the enrollment requests has been removed from the database.

Example: Enrollment Request Currently in the Enrollment Request Database

The following example shows that the **crypto pki server info requests** command has been used to display the enrollment requests that are currently in the Enrollment Request Database:

```
Device# crypto pki server myserver info requests

Enrollment Request Database:
RA certificate requests:
ReqID    State      Fingerprint                                SubjectName
--------------------------------------------------------------------------
Router certificates requests:
ReqID    State      Fingerprint                                SubjectName
--------------------------------------------------------------------------
2        pending    1B07F3021DAAB0F19F35DA25D01D8567      hostname=host1.company.com
1        denied     5322459D2DC70B3F8EF3D03A795CF636      hostname=host2.company.com
```

Example: crypto pki server remove Command Used to Remove One Enrollment Request

The following example shows that the **crypto pki server remove** command has been used to remove Enrollment Request 1:

```
Device# crypto pki server myserver remove 1
```

Example: Enrollment Request Database After the Removal of One Enrollment Request

The following example shows the result of the removal of Enrollment Request 1 from the Enrollment Request Database:

```
Device# crypto pki server mycs info requests

Enrollment Request Database:
RA certificate requests:
ReqID    State     Fingerprint                        SubjectName
--------------------------------------------------------------------
Router certificates requests:
ReqID    State     Fingerprint                        SubjectName
--------------------------------------------------------------------
2        pending   1B07F3021DAAB0F19F35DA25D01D8567   hostname=host1.company.com
```

Example: Autoarchiving the Certificate Server Root Keys

The following output configurations and examples show what you might see if the **database archive** command has not been configured (that is, configured using the default value); if the **database archive** command has been configured to set the CA certificate and CA key archive format as PEM, without configuring a password; and if the **database archive** command has been configured to set the CA certificate and CA key archive format as PKCS12, with a password configured. The last example is sample content of a PEM-formatted archive file. The following example, "ms2" refers to the label of a 2048-bit key pair.

Example: database archive Command Not Configured

Note The default is PKCS12, and the prompt for the password appears after the **no shutdown** command has been issued.

```
Device(config)# crypto pki server ms2
Device(cs-server)# no shutdown

% Ready to generate the CA certificate.
%Some server settings cannot be changed after CA certificate generation.
Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note the next two lines, which are asking for a password.
% Please enter a passphrase to protect the private key.
Password:
% Certificate Server enabled.
Device(cs-server)# end
Device# dir nvram:

Directory of nvram:/
  125  -rw-        1693              <no date>  startup-config
  126  ----           5              <no date>  private-config
    1  -rw-          32              <no date>  myserver.ser
    2  -rw-         214              <no date>  myserver.crl
! Note the next line, which indicates PKCS12 format.
    3  -rw-        1499              <no date>  myserver.p12
```

Example" database archive Command and pem Keyword Configured

Note The prompt for the password appears after the **no shutdown** command has been issued.

```
Device(config)# crypto pki server ms2
Device(cs-server)# database archive pem
Device(cs-server)# no shutdown

% Ready to generate the CA certificate.
%Some server settings cannot be changed after CA certificate generation.
Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
!Note the next two lines, which are asking for a password.
% Please enter a passphrase to protect the private key.
Password:
% Certificate Server enabled.
```

```
Device(cs-server)# end
Device# dir nvram

Directory of nvram:/
  125  -rw-        1693            <no date>  startup-config
  126  ----           5            <no date>  private-config
    1  -rw-          32            <no date>  myserver.ser
    2  -rw-         214            <no date>  myserver.crl
! Note the next line showing that the format is PEM.
    3  -rw-        1705            <no date>  myserver.pem
```

Example: database archive Command and pkcs12 Keyword (and Password) Configured

Note When the password is entered, it is encrypted. However, it is recommended that you remove the password from the configuration after the archive has finished.

```
Device(config)# crypto pki server ms2
Device(cs-server)# database archive pkcs12 password cisco123
Device(cs-server)# no shutdown

% Ready to generate the CA certificate.
% Some server settings cannot be changed after CA certificate generation.
Are you sure you want to do this? [yes/no]: y
% Exporting Certificate Server signing certificate and keys...
! Note that you are not being prompted for a password.
% Certificate Server enabled.
Device(cs-server)# end
Device# dir nvram:

Directory of nvram:/
   125   -rw-         1693             <no date>   startup-config
   126   ----            5             <no date>   private-config
     1   -rw-           32             <no date>   myserver.ser
     2   -rw-          214             <no date>   myserver.crl
! Note that the next line indicates that the format is PKCS12.
     3   -rw-         1499             <no date>   myserver.p12
```

Example: PEM-Formatted Archive

The following sample output shows that autoarchiving has been configured in PEM file format. The archive consists of the CA certificate and the CA private key. To restore the certificate server using the backup, you would have to import the PEM-formatted CA certificate and CA key individually.

Note In addition to the CA certificate and CA key archive files, you should also back up the serial file (.ser) and the CRL file (.crl) regularly. The serial file and the CRL file are both critical for CA operation if you need to restore your certificate server.

```
Device# more nvram:mycs.pem

```

Example: Restoring a Certificate Server from Certificate Server Backup Files

The following example shows that restoration is from a PKCS12 archive and that the database URL is NVRAM (the default).

```
Device# copy tftp://192.0.2.71/backup.ser nvram:mycs.ser

Destination filename [mycs.ser]?
32 bytes copied in 1.320 secs (24 bytes/sec)

Device# copy tftp://192.0.2.71/backup.crl nvram:mycs.crl

Destination filename [mycs.crl]?
214 bytes copied in 1.324 secs (162 bytes/sec)

Device# configure terminal
Device(config)# crypto pki import mycs pkcs12 tftp://192.0.2.71/backup.p12 cisco123

Source filename [backup.p12]?
CRYPTO_PKI: Imported PKCS12 file successfully.

Device(config)# crypto pki server mycs
! fill in any certificate server configuration here

Device(cs-server)# no shutdown
% Certificate Server enabled.

Device(cs-server)# end
Device# show crypto pki server
```

```
Certificate Server mycs:
    Status: enabled
    Server's current state: enabled
    Issuer name: CN=mycs
    CA cert fingerprint: 34885330 B13EAD45 196DA461 B43E813F
    Granting mode is: manual
    Last certificate issued serial number: 0x1
    CA certificate expiration timer: 01:49:13 GMT Aug 28 2007
    CRL NextUpdate timer: 01:49:16 GMT Sep 4 2004
    Current storage dir: nvram:
    Database Level: Minimum - no cert data written to storage
```

The following example shows that restoration is from a PEM archive and that the database URL is flash:

```
Device# copy tftp://192.0.2.71/backup.ser flash:mycs.ser

Destination filename [mycs.ser]?
32 bytes copied in 1.320 secs (24 bytes/sec)
Router# copy tftp://192.0.2.71/backup.crl flash:mycs.crl
Destination filename [mycs.crl]?
214 bytes copied in 1.324 secs (162 bytes/sec)
Device# configure terminal

! Because CA cert has Digital Signature usage, you need to import using the "usage-keys"
keyword

Device(config)# crypto ca import mycs pem usage-keys terminal cisco123
% Enter PEM-formatted CA certificate.
% End with a blank line or "quit" on a line by itself.
! Paste the CA cert from .pem archive.

```

Example: Subordinate Certificate Server

The following configuration and output is typical of what you might see after configuring a subordinate certificate server. Please be aware that “ms2” refers to a 2048-bit RSA key that was generated in an earlier step.

```
Device(config)# crypto pki trustpoint sub
Device(ca-trustpoint)# enrollment url http://192.0.2.6
Device(ca-trustpoint)# rsa keypair ms2 2048
Device(ca-trustpoint)# exit
Device(config)# crypto pki server sub
Device(cs-server)# mode sub-cs
Device(ca-server)# no shutdown

%Some server settings cannot be changed after CA certificate generation.
```

```
% Please enter a passphrase to protect the private key
% or type Return to exit

Example: Root Certificate Server Differentiation

When issuing certificates, the root certificate server (or parent subordinate certificate server) differentiates the certificate request from “Sub CA,” “RA,” and peer requests, as shown in the following sample output:

```
Device# crypto pki server server1 info req

Enrollment Request Database:
RA certificate requests:
ReqID     State        Fingerprint                                SubjectName
--------------------------------------------------------------------------------
Subordinate CS certificate requests:
ReqID     State        Fingerprint                                SubjectName
--------------------------------------------------------------------------------
1     pending        CB9977AD8A73B146D3221749999B0F66 hostname=host-subcs.company.com
RA certificate requests:
```

```
ReqID     State        Fingerprint                                SubjectName
--------------------------------------------------------------------------------
Router certificate requests:
ReqID     State        Fingerprint                                SubjectName
--------------------------------------------------------------------------------
```

Example: Show Output for a Subordinate Certificate Server

The following **show crypto pki server command**output indicates that a subordinate certificate server has been configured:

```
Device# show crypto pki server

Certificate Server sub:
  Status: enabled
  Server's configuration is locked  (enter "shut" to unlock it)
  Issuer name: CN=sub
  CA cert fingerprint: 11B586EE 3B354F33 14A25DDD 7BD39187
  Server configured in subordinate server mode
  Upper CA cert fingerprint: 328ACC02 52B25DB8 22F8F104 B6055B5B
  Granting mode is: manual
  Last certificate issued serial number: 0x1
  CA certificate expiration timer: 22:33:44 GMT Jan 6 2006
  CRL NextUpdate timer: 22:33:29 GMT Jan 13 2005
  Current storage dir: nvram:
  Database Level: Minimum - no cert data written to storage
```

Example: RA Mode Certificate Server

The following output is typical of what you might see after having configured an RA mode certificate server:

```
Device-ra(config)# crypto pki trustpoint myra
Device-ra(ca-trustpoint)# enrollment url http://192.0.2.17
! Include "cn=ioscs RA" or "ou=ioscs RA" in the subject-name.
Device-ra(ca-trustpoint)# subject-name cn=myra, ou=ioscs RA, o=company, c=us
Device-ra(ca-trustpoint)# exit
Device-ra(config)# crypto pki server myra
Device-ra(cs-server)# mode ra
Device-ra(cs-server)# no shutdown

% Generating 1024 bit RSA keys ...[OK]
Certificate has the following attributes:
Fingerprint MD5: 32661452 0DDA3CE5 8723B469 09AB9E85
Fingerprint SHA1: 9785BBCD 6C67D27C C950E8D0 718C7A14 C0FE9C38
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.
% Ready to request the CA certificate.
%Some server settings cannot be changed after the CA certificate has been requested.
Are you sure you want to do this? [yes/no]: yes
%
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this
   password to the CA administrator in order to revoke your certificate.
   For security reasons your password will not be saved in the configuration.
   Please make a note of it.
Password:
Re-enter password:
% The subject name in the certificate will include: cn=myra, ou=ioscs RA, o=company, c=us
% The subject name in the certificate will include: Router-ra.company.com
% Include the router serial number in the subject name? [yes/no]: no
```

```
% Include an IP address in the subject name? [no]: no
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The certificate request fingerprint will be displayed.
% The 'show crypto pki certificate' command will also show the fingerprint.
% Enrollment in progress...
Device-ra (cs-server)#

Sep 15 22:32:40.197: CRYPTO_PKI:  Certificate Request Fingerprint MD5: 82B41A76 AF4EC87D
AAF093CD 07747D3A
Sep 15 22:32:40.201: CRYPTO_PKI:  Certificate Request Fingerprint SHA1: 897CDF40 C6563EAA
0FED05F7 0115FD3A 4FFC5231
Sep 15 22:34:00.366: %PKI-6-CERTRET: Certificate received from Certificate Authority

Device-ra(cs-server)# end
Device-ra# show crypto pki server

Certificate Server myra:
    Status: enabled
    Issuer name: CN=myra
    CA cert fingerprint: 32661452 0DDA3CE5 8723B469 09AB9E85
    ! Note that the certificate server is running in RA mode
    Server configured in RA mode
    RA cert fingerprint: C65F5724 0E63B3CC BE7AE016 BE0D34FE
    Granting mode is: manual
    Current storage dir: nvram:
    Database Level: Minimum - no cert data written to storage
```

The following output shows the enrollment request database of the issuing certificate server after the RA has been enabled:

Note The RA certificate request is recognized by the issuing certificate server because "ou=ioscs RA" is listed in the subject name.

```
Device-ca# crypto pki server mycs info request

Enrollment Request Database:
Subordinate CA certificate requests:
ReqID  State      Fingerprint                      SubjectName
--------------------------------------------------------------
! The request is identified as RA certificate request.
RA certificate requests:
ReqID  State      Fingerprint                      SubjectName
--------------------------------------------------------------
12     pending    88F547A407FA0C90F97CDE8900A30CB0
hostname=Router-ra.company.com,cn=myra,ou=ioscs RA,o=company,c=us
Router certificates requests:
ReqID   State     Fingerprint                      SubjectName
--------------------------------------------------------------
! Issue the RA certificate.
Device-ca# crypto pki server mycs grant 12
```

The following output shows that the issuing certificate server is configured to issue a certificate automatically if the request comes from an RA:

```
Device-ca(config)# crypto pki server mycs
Device-ca(cs-server)# grant ra-auto

% This will cause all certificate requests already authorized by known RAs to be automatically
```

```
 granted.
Are you sure you want to do this? [yes/no]: yes
Router-ca (cs-server)# end
Device-ca# show crypto pki server

Certificate Server mycs:
    Status: enabled
    Server's current state: enabled
    Issuer name: CN=mycs
    CA cert fingerprint: 32661452 0DDA3CE5 8723B469 09AB9E85
    ! Note that the certificate server will issue certificate for requests from the RA.
    Granting mode is: auto for RA-authorized requests, manual otherwise
    Last certificate issued serial number: 0x2
    CA certificate expiration timer: 22:29:37 GMT Sep 15 2007
    CRL NextUpdate timer: 22:29:39 GMT Sep 22 2004
    Current storage dir: nvram:
    Database Level: Minimum - no cert data written to storage
```

The following example shows the configuration of “myra”, an RA server, configured to support automatic rollover from “myca”, the CA. After the RA server is configured, automatic granting of certificate reenrollment requests is enabled:

```
crypto pki trustpoint myra
 enrollment url
http://myca
 subject-name ou=iosca RA
 rsakeypair myra
crypto pki server myra
 mode ra
 auto-rollover
crypto pki server mycs
 grant auto rollover ra-cert
 auto-rollover 25
```

Example: Enabling CA Certificate Rollover to Start Immediately

The following example shows how to enable automated CA certificate rollover on the server mycs with the **crypto pki server**command. The **show crypto pki server** command then shows the current state of the mycs server and that the rollover certificate is currently available for rollover.

```
Device(config)# crypto pki server mycs rollover

Jun 20 23:51:21.211:%PKI-4-NOSHADOWAUTOSAVE:Configuration was
modified.  Issue "write memory" to save new IOS CA certificate
! The config has not been automatically saved because the config has been changed.
Device# show crypto pki server

Certificate Server mycs:
    Status:enabled
    Server's configuration is locked  (enter "shut" to unlock it)
    Issuer name:CN=mycs
    CA cert fingerprint:E7A5FABA 5D7AA26C F2A9F7B3 03CE229A
    Granting mode is:manual
    Last certificate issued serial number:0x2
    CA certificate expiration timer:00:49:26 PDT Jun 20 2008
    CRL NextUpdate timer:00:49:29 PDT Jun 28 2005
    Current storage dir:nvram:
    Database Level:Minimum - no cert data written to storage
    Rollover status:available for rollover
    ! Rollover certificate is available for rollover.
    Rollover CA certificate fingerprint:9BD7A443 00A6DD74 E4D9ED5F B7931BE0
```

```
Rollover CA certificate expiration time:00:49:26 PDT Jun 20 2011
Auto-Rollover configured, overlap period 25 days
```

Where to Go Next

After the certificate server is successfully running, you can either begin enrolling clients through manual mechanisms (as explained in the module "*Configuring Certificate Enrollment for a PKI*") or begin configuring SDP, which is a web-based enrollment interface, (as explained in the module "*Setting Up Secure Device Provisioning (SDP) for Enrollment in a PKI*.")

Feature Information for Configuring and Managing a Certificate Server for PKI Deployment

CHAPTER 115

Storing PKI Credentials

Public key infrastructure (PKI) credentials, such as Rivest, Shamir, and Adelman (RSA) keys and certificates can be stored in a specific location on the router, such as NVRAM and flash memory or on a USB eTtoken 64 KB smart card. USB tokens provide secure configuration distribution, RSA operations such as on-token key generation, signing, and authentication, and the storage of Virtual Private Network (VPN) credentials for deployment.

Prerequisites for Storing PKI Credentials

Prerequisites for Specifying a Local Certificate Storage Location

Before you can specify the local certificate storage location, your system should meet the following requirements:

- A Cisco IOS Release 12.4(2)T PKI-enabled image or a later image
- A platform that supports storing PKI credentials as separate files
- A configuration that contains at least one certificate
- An accessible local file system

Prerequisites for Specifying USB Token Storage for PKI Credentials

Before you can use a USB token, your system should meet the following requirements:

- A Cisco 871 router, Cisco 1800 series, Cisco 2800 series, a Cisco 3800 series router, or a Cisco 7200VXR NPE-G2 platform
- At least a Cisco IOS Release 12.3(14)T image running on any of the supported platforms

- A Cisco supported USB token (Safenet/Aladdin eToken PRO 32 KB or 64 KB)
- A k9 image

Restrictions for Storing PKI Credentials

Restrictions for Specifying a Local Certificate Storage Location

When storing certificates to a local storage location, the following restrictions are applicable:

- Only local file systems may be used. An error message will be displayed if a remote file system is selected, and the command will not take effect.
- A subdirectory may be specified if supported by the local file system. NVRAM does not support subdirectories.

Restrictions for Specifying USB Token Storage

When using a USB token to store PKI data, the following restrictions are applicable:

- USB token support requires a 3DES (k9) Cisco IOS software image, which provides secure file storage.
- You cannot boot an image from a USB token. (However, you can boot a configuration from a USB token.)
- USB hubs are currently not supported. Thus, the number of supported devices is limited to the number of available USB ports.

Information About Storing PKI Credentials

Storing Certificates to a Local Storage Location

Certificates are stored to NVRAM by default; however, some routers do not have the required amount of NVRAM to successfully store certificates.

All Cisco platforms support NVRAM and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, USB flash, or USB token.

During run time, you can specify what active local storage device you would like to use to store certificates.

PKI Credentials and USB Tokens

To use a secure USB token on your router, you should understand the following concepts:

How a USB Token Works

A smart card is a small plastic card, containing a microprocessor and memory that allows you to store and process data. A USB token is a smart card with a USB interface. The token can securely store any type of file within its available storage space (32 KB). Configuration files that are stored on the USB token can be encrypted

and accessed only via a user PIN. The device does not load the configuration file unless the proper PIN has been configured for secure deployment of device configuration files.

After you plug the USB token into the device, you must log into the USB token; thereafter, you can change default settings, such as the user PIN (default: 1234567890) and the allowed number of failed login attempts (default: 15 attempts) before future logins are refused. For more information on accessing and configuring the USB token, see the section “Logging Into and Setting Up the USB Token."

After you have successfully logged into the USB token, you can copy files from the device on to the USB token via the **copy** command. USB token RSA keys and associated IPsec tunnels remain available until the device is reloaded. To specify the length of time before the keys are removed and the IPsec tunnels are torn down, issue the **crypto pki token removal timeout** command. The default timeout is zero, which causes the RSA keys to be removed automatically after the eToken is removed from the device. The default appears in the running configuration as:

```
crypto pki token default removal timeout 0
```

The table below highlights the capabilities of the USB token.

Table 157: Functionality Highlights for USB Tokens

Function	USB Token
Accessibility	Used to securely store and transfer digital certificates, preshared keys, and device configurations from the USB token to the device.
Storage Size	32 KB or 64 KB
File Types	• Typically used to store digital certificates, preshared keys, and device configurations for IPsec VPNs. • USB tokens cannot store Cisco IOS images.
Security	• Files can be encrypted and accessed only with a user PIN. • Files can also be stored in a nonsecure format.
Boot Configurations	• The device can use the configuration stored in the USB token during boot time. • The device can use the secondary configuration stored in the USB token during boot time. (A secondary configuration allows users to load their IPsec configuration.)

Benefits of USB Tokens

USB token support on a Cisco router provides the following application benefits:

Removable Credentials: Provide or Store VPN Credentials on an External Device for Deployment

A USB token can use smart card technology to store a digital certificate and configuration for IPsec VPN deployment. This ability enhances the capability of the router to generate RSA public keys to authenticate at least one IPsec tunnel. (Because a router can initiate multiple IPsec tunnels, the USB token can contain several certificates, as appropriate.)

Storing VPN credentials on an external device reduces the threat of compromising secure data.

PIN Configuration for Secure File Deployment

A USB token can store a configuration file that can be used for enabling encryption on the router via a user-configured PIN. (That is, no digital certificates, preshared keys, or VPNs are used.)

Touchless or Low Touch Configuration

The USB token can provide remote software configuration and provisioning with little or no human interaction. Configuration is set up as an automated process. That is, the USB token can store a bootstrap configuration that the router can use to boot from after the USB token has been inserted into the router. The bootstrap configuration connects the router to a TFTP server, which contains a configuration that completely configures the router.

RSA Operations

A USB token may be used as a cryptographic device in addition to a storage device. Using a USB token as a cryptographic device allows RSA operations such as key generation, signing, and authentication to be performed on the token.

General-purpose, special-usage, encryption, or signature RSA key pairs with a modulus of 2048 bits or less may be generated from credentials located on your token storage device. Private keys are not distributed and remain on the token by default, however you may configure the private key storage location.

Keys that reside on a USB token are saved to persistent token storage when they are generated. Key deletion will remove the keys stored on the token from persistent storage immediately. (Keys that do not reside on a token are saved to or deleted from non-token storage locations when the **write memory** or a similar command is issued.)

Remote Device Configuration and Provisioning in a Secure Device Provisioning (SDP) Environment

SDP may be used to configure a USB token. The configured USB token may be transported to provision a device at a remote location. That is, a USB token may be used to transfer cryptographic information from one network device to another remote network device providing a solution for a staged USB token deployment.

For information about using USB tokens with SDP, see document titles in the “Additional References” section.

How to Configure PKI Storage

Specifying a Local Storage Location for Certificates

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki certificate storage** *location-name*
4. **exit**
5. **copy** *source-url destination-url*
6. **show crypto pki certificates storage**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki certificate storage** *location-name* **Example:** `Device(config)# crypto pki certificate storage flash:/certs`	Specifies the local storage location for certificates.
Step 4	**exit** **Example:** `Device(config)# exit`	Exits global configuration mode.
Step 5	**copy** *source-url destination-url* **Example:** `Device# copy system:running-config nvram:startup-config`	(Optional) Saves the running configuration to the startup configuration. **Note** Settings will only take effect when the running configuration is saved to the startup configuration.
Step 6	**show crypto pki certificates storage** **Example:** `Device# show crypto pki certificates storage`	(Optional) Displays the current setting for the PKI certificate storage location.

Example

The following is sample output from the **show crypto pki certificates storage** command, which shows that the certificates are stored in the certs subdirectory of disk0:

```
Device# show crypto pki certificates storage
Certificates will be stored in disk0:/certs/
```

Setting Up and Using USB Tokens on Cisco Devices

Storing the Configuration on a USB Token

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **boot config** *usbtoken[0-9]:filename*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**boot config** *usbtoken[0-9]:filename* **Example:** `Device(config)# boot config usbtoken0:file`	Specifies that the startup configuration file is stored in a secure USB token.

Logging Into and Setting Up the USB Token

How RSA Keys are Used with a USB Token

- RSA keys are loaded after the USB token is successfully logged into the router.
- By default, newly generated RSA keys are stored on the most recently inserted USB token. Regenerated keys should be stored in the same location where the original RSA key was generated.

Configuring the Device for Manual Login

Unlike automatic login, manual login requires that the user know the actual USB token PIN.

Note Either the manual or automatic login is required.

Manual login can be used when storing a PIN on the device is not desirable. Manual login may also be suitable for some initial deployment or hardware replacement scenarios for which the device is obtained from the local supplier or drop-shipped to the remote site. Manual login can be executed with or without privileges, and it creates files and RSA keys on the USB token available to the Cisco IOS software. If a secondary configuration

file is configured, it is executed only with the privileges of the user who is performing the login. Thus, if you want to use manual login and set up the secondary configuration on the USB token to perform anything useful, you need to enable privileges.

Manual login can also be used in recovery scenarios for which the device configuration has been lost. If the scenario contains a remote site that normally connects to the core network with a VPN, the loss of the configuration and RSA keys requires out-of-band services that the USB token can provide. The USB token can contain a boot configuration, a secondary configuration, or both, and RSA keys to authenticate the connection.

SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* [**admin**] **login** [*pin*]
3. **show usbtoken** *0-9*:*filename*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**crypto pki token** *token-name* [**admin**] **login** [*pin*] **Example:** `Device# crypto pki token usbtoken0 admin login 5678`	Manually logs into the USB token. If the **admin** keyword is not specified initially you can re-enter the **crypto pki token** command again with this keyword option.
Step 3	**show usbtoken** *0-9*:*filename* **Example:** `Device# show usbtoken0:usbfile`	(Optional) Verifies whether the USB token has been logged on to the device.

What to Do Next

After you have logged into the USB token, it is available for use.

- To further configure the USB token, see the “Configuring the USB Token” section.
- To perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the “Setting Administrative Functions on the USB Token” section.

Configuring the USB Token

After you have set up automatic login, you may perform this task to further configure the USB token.

PINs and Passphrases

For additional PIN security with automatic login, you may encrypt your PIN stored in NVRAM and set up a passphrase for your USB token. Establishing a passphrase allows you to keep your PIN secure; another user needs only to know the passphrase, not the PIN.

When the USB token is inserted into the device, the passphrase is needed to decrypt the PIN. Once the PIN is decrypted, the device can then use the PIN to log in to the USB token.

Note The user needs a privilege level of 1 to log in.

Unlocking and Locking the USB Token

The USB token itself can be locked (encrypted) or unlocked (decrypted).

Unlocking the USB token allows it to be used. Once unlocked, Cisco IOS software treats the token as if it were automatically logged in. Any keys on the USB token are loaded, and if a secondary configuration file is on the token, it is executed with full user privileges (privilege level 15) independent of the privilege level of the logged-in user.

Locking the token, unlike logging out of the token, deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if configured.

Secondary Configuration and Unconfiguration Files

Configuration files that exist on a USB token are called secondary configuration files. If you create and configure a secondary configuration file, it is executed after the token is logged in. The existence of a secondary configuration file is determined by the presence of a secondary configuration file option in the Cisco IOS configuration stored in NVRAM. When the token is removed or logged out and the removal timer expires, a separate secondary unconfiguration file is processed to remove all secondary configuration elements from the running configuration. Secondary configuration and secondary unconfiguration files are executed at privilege level 15 and are not dependent on the level of the user logged in.

SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* **unlock** [*pin*]
3. **configure terminal**
4. **crypto pki token** *token-name* **encrypted-user-pin** [**write**]
5. **crypto pki token** *token-name* **secondary unconfig** *file*
6. **exit**
7. **crypto pki token** *token-name* **lock** [*pin*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**crypto pki token** *token-name* **unlock** [*pin*] **Example:** `Device# crypto pki token mytoken unlock mypin`	(Optional) Allows the token to be used if the USB token has been locked. Once unlocked, Cisco IOS software treats the token as if it has been automatically logged in. Any keys on the token are loaded and if a secondary configuration file exists, it is executed.
Step 3	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 4	**crypto pki token** *token-name* **encrypted-user-pin** [**write**] **Example:** `Device(config)# crypto pki token mytoken encrypted-user-pin write`	(Optional) Encrypts the stored PIN in NVRAM.
Step 5	**crypto pki token** *token-name* **secondary unconfig** *file* **Example:** `Device(config)# crypto pki token mytoken secondary unconfig configs/myunconfigfile.cfg`	(Optional) Specifies the secondary configuration file and its location.
Step 6	**exit** **Example:** `Device(config)# exit`	Enters privileged EXEC mode.
Step 7	**crypto pki token** *token-name* **lock** [*pin*] **Example:** `Device# crypto pki token mytoken lock mypin`	(Optional) Deletes any RSA keys loaded from the token and runs the secondary unconfiguration file, if it exists.

Examples

The following example shows both the configuration and encryption of a user PIN and then the device reloading and the user PIN being unlocked:

```
! Configuring the user PIN

Enter configuration commands, one per line. End with CNTL/Z.

Device(config)# crypto pki token usbtoken0: userpin

Enter password: mypassword
```

```
! Encrypt the user PIN

Device(config)# crypto pki token usbtoken0: encrypted-user-pin

Enter passphrase: mypassphrase

Device(config)# exit

Device#

Sep 20 21:51:38.076: %SYS-5-CONFIG_I: Configured from console by console

Device# show running config

crypto pki token usbtoken0 user-pin *encrypted*

! Reloading the router.

Device> enable

Password:

! Decrypting the user pin.

Device# crypto pki token usbtoken0: unlock

Token eToken is usbtoken0

Enter passphrase: mypassphrase

Token login to usbtoken0(eToken) successful

Device#

Sep 20 22:31:13.128: %CRYPTO-6-TOKENLOGIN: Cryptographic Token eToken

Login Successful
```

The following example shows a how a secondary unconfiguration file might be used to remove secondary configuration elements from the running configuration. For example, a secondary configuration file might be used to set up a PKI trustpoint. A corresponding unconfiguration file, named mysecondaryunconfigfile.cfg, might contain this command line:

```
no crypto pki trustpoint token-tp
```

If the token were removed and the following commands executed, the trustpoint and associated certificates would be removed from the device's running configuration:

```
 Device# configure terminal
Device(config)# no crypto pki token mytoken secondary unconfig mysecondaryunconfigfile.cfg
```

What to Do Next

After you have logged into and configured the USB token, it is available for use. If you want to perform USB token administrative tasks, such as changing the user PIN, copying files from the router to the USB token set key storage location, and changing USB tokens, see the "Setting Administrative Functions on the USB Token" section.

Setting Administrative Functions on the USB Token

Perform this task to change default settings, such as the user PIN, the maximum number of failed attempts on the USB token, or the credential storage location.

SUMMARY STEPS

1. **enable**
2. **crypto pki token** *token-name* **admin**] **change-pin** [*pin*]
3. **crypto pki token** *token-name device-name***: label** *token-label*
4. **configure terminal**
5. **crypto key storage** *device-name***:**
6. **crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*] [**storage** *device-name***:**] [**redundancy**] [**on** *device-name*]**:**
7. **crypto key move rsa** *keylabel* [**non-exportable** | [**on** | **storage**]] *location*
8. **crypto pki token** {*token-name* | **default**} **removal timeout** [*seconds*]
9. **crypto pki token** {*token-name* | **default**} **max-retries** [*number*]
10. **exit**
11. **copy usbflash**[*0-9*]**:***filename destination-url*
12. **show usbtoken**[*0-9*]**:***filename*
13. **crypto pki token** *token-name* **logout**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**crypto pki token** *token-name* **admin**] **change-pin** [*pin*] **Example:** `Device# crypto pki token usbtoken0 admin change-pin`	(Optional) Changes the user PIN number on the USB token. • If the PIN is not changed, the default PIN 1234567890 is used. **Note** After the PIN has been changed, you must reset the login failure count to zero (via the **crypto pki token max-retries** command). The maximum number of allowable login failures is set (by default) to 15.
Step 3	**crypto pki token** *token-name device-name***: label** *token-label* **Example:** `Device# crypto pki token mytoken usb0: label newlabel`	(Optional) Sets or changes the name of the USB token. • The value of the *token-label* argument may be up to 31 alphanumeric characters in length including dashes and underscores.

	Command or Action	Purpose
		Tip This command is useful when configuring multiple USB tokens for automatic login, secondary configuration files, or other token specific settings.
Step 4	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 5	**crypto key storage** *device-name***:** **Example:** `Device(config)# crypto key storage usbtoken0:`	(Optional) Sets the default RSA key storage location for newly created keys. **Note** Regardless of configuration settings, existing keys are stored on the device from where they were originally loaded.
Step 6	**crypto key generate rsa** [**general-keys** | **usage-keys** | **signature** | **encryption**] [**label** *key-label*] [**exportable**] [**modulus** *modulus-size*] [**storage** *device-name***:**] [**redundancy**] [**on** *device-name*]**:** **Example:** `Device(config)# crypto key generate rsa label tokenkey1 storage usbtoken0:`	(Optional) Generates the RSA key pair for the certificate server. • The **storage** keyword specifies the key storage location. • When specifying a label name by specifying the *key-label* argument, you must use the same name for the label that you plan to use for the certificate server (through the **crypto pki server** *cs-label* command). If a *key-label* argument is not specified, the default value, which is the fully qualified domain name (FQDN) of the device, is used. If the exportable RSA key pair is manually generated after the CA certificate has been generated, and before issuing the **no shutdown** command, then use the **crypto ca export pkcs12** command to export a PKCS12 file that contains the certificate server certificate and the private key. • By default, the modulus size of a CA key is 1024 bits. The recommended modulus for a CA key is 2048 bits. The range for a modulus size of a CA key is from 350 to 4096 bits. • The **on** keyword specifies that the RSA key pair is created on the specified device, including a Universal Serial Bus (USB) token, local disk, or NVRAM. The name of the device is followed by a colon (:). **Note** Keys created on a USB token must be 2048 bits or less.

	Command or Action	Purpose
Step 7	**crypto key move rsa** *keylabel* [**non-exportable** | [**on** | **storage**]] *location* **Example:** `Device(config)# crypto key move rsa keypairname non-exportable on token`	(Optional) Moves existing Cisco IOS credentials from the current storage location to the specified storage location. By default, the RSA key pair remains stored on the current device. Generating the key on the device and moving it to the token takes less than a minute. Generating a key on the token, using the **on** keyword could take five to ten minutes, and is dependent on hardware key generation routines available on the USB token. When an existing RSA key pair is generated in Cisco IOS, stored on a USB token, and used for an enrollment, it may be necessary to move those existing RSA key pairs to an alternate location for permanent storage. This command is useful when using SDP with USB tokens to deploy credentials.
Step 8	**crypto pki token** {*token-name* | **default**} **removal timeout** [*seconds*] **Example:** `Device(config)# crypto pki token usbtoken0 removal timeout 60`	(Optional) Sets the time interval, in seconds, that the device waits before removing the RSA keys that are stored in the USB token after the USB token has been removed from the device. **Note** If this command is not issued, all RSA keys and IPsec tunnels associated with the USB token are torn down immediately after the USB token is removed from the device.
Step 9	**crypto pki token** {*token-name* | **default**} **max-retries** [*number*] **Example:** `Device(config)# crypto pki token usbtoken0 max-retries 20`	(Optional) Sets the maximum number of consecutive failed login attempts allowed before access to the USB token is denied. • By default, the value is set at 15.
Step 10	**exit** **Example:** `Device(config)# exit`	Exits global configuration mode.
Step 11	**copy usbflash**[*0-9*]**:***filename destination-url* **Example:** `Device# copy usbflash0:file1 nvram:`	Copies files from USB token to the device. • *destination-url*—See the **copy** command page documentation for a list of supported options.
Step 12	**show usbtoken**[*0-9*]**:***filename* **Example:** `Device# show usbtoken:usbfile`	(Optional) Displays information about the USB token. You can use this command to verify whether the USB token has been logged in to the device.

	Command or Action	Purpose
Step 13	**crypto pki token** *token-name* **logout** **Example:** `Device# crypto pki token usbtoken0 logout`	Logs the device out of the USB token. **Note** If you want to save any data to the USB token, you must log back into the token.

Troubleshooting USB Tokens

This section contains descriptions of the following Cisco IOS commands that can be used to help troubleshoot possible problems that may arise while using a USB token:

Troubleshooting the USB Port Connection

Use the **show file systems** command to determine whether the router recognizes that there is a USB module plugged into a USB port. The USB module should appear on the list of file systems. If the module does not appear on the list, it can indicate any of the following problems:

- A connection problem with the USB module.
- The Cisco IOS image running on the router does not support a USB module.
- A hardware problem with the USB module itself.

Sample output from the **show file systems** command showing a USB token appears below. The USB module listing appears in the last line of the examples.

```
Device# show file systems
File Systems:
     Size(b)     Free(b)      Type  Flags  Prefixes
           -           -    opaque     rw   archive:
           -           -    opaque     rw   system:
           -           -    opaque     rw   null:
           -           -   network     rw   tftp:
*  129880064    69414912      disk     rw   flash:#
      491512      486395     nvram     rw   nvram:
           -           -    opaque     wo   syslog:
           -           -    opaque     rw   xmodem:
           -           -    opaque     rw   ymodem:
           -           -   network     rw   rcp:
           -           -   network     rw   pram:
           -           -   network     rw   ftp:
           -           -   network     rw   http:
           -           -   network     rw   scp:
           -           -   network     rw   https:
           -           -    opaque     ro   cns:
    63158272    33037312  usbflash     rw   usbflash0:
       32768         858  usbtoken     rw   usbtoken1:
```

Determining if a USB Token is Supported by Cisco

Use the **show usb device** command to determine if a USB token is supported by Cisco. The following output from this command indicates whether or not the module is supported is bold in the sample output below:

```
Router# show usb device
```

```
Host Controller:1
Address:0x11
Device Configured:YES
Device Supported:YES
Description:eToken Pro 4254
Manufacturer:AKS
Version:1.0
Serial Number:
Device Handle:0x1010000
USB Version Compliance:1.0
Class Code:0xFF
Subclass Code:0x0
Protocol:0x0
Vendor ID:0x529
Product ID:0x514
Max. Packet Size of Endpoint Zero:8
Number of Configurations:1
Speed:Low
Selected Configuration:1
Selected Interface:0
Configuration:
    Number:1
    Number of Interfaces:1
    Description:
    Attributes:None
    Max Power:60 mA
    Interface:
        Number:0
        Description:
        Class Code:255
        Subclass:0
        Protocol:0
        Number of Endpoints:0
```

Determining USB Token Device Problems

Use the **show usb controllers** command to determine if there is a hardware problem with a USB flash module. If the **show usb controllers** command displays an error, the error indicates a hardware problem in the USB module.

You can also use the **show usb controllers** command to verify that copy operations onto a USB flash module are occurring successfully. Issuing the **show usb controllers** command after performing a file copy should display successful data transfers.

The following sample output for the **show usb controllers** command displays a working USB flash module:

```
Router# show usb controllers
Name:1362HCD
Controller ID:1
Controller Specific Information:
    Revision:0x11
    Control:0x80
    Command Status:0x0
    Hardware Interrupt Status:0x24
    Hardware Interrupt Enable:0x80000040
    Hardware Interrupt Disable:0x80000040
    Frame Interval:0x27782EDF
    Frame Remaining:0x13C1
    Frame Number:0xDA4C
    LSThreshold:0x628
    RhDescriptorA:0x19000202
    RhDescriptorB:0x0
```

```
    RhStatus:0x0
    RhPort1Status:0x100103
    RhPort2Status:0x100303
    Hardware Configuration:0x3029
    DMA Configuration:0x0
    Transfer Counter:0x1
    Interrupt:0x9
    Interrupt Enable:0x196
    Chip ID:0x3630
    Buffer Status:0x0
    Direct Address Length:0x80A00
    ATL Buffer Size:0x600
    ATL Buffer Port:0x0
    ATL Block Size:0x100
    ATL PTD Skip Map:0xFFFFFFFF
    ATL PTD Last:0x20
    ATL Current Active PTD:0x0
    ATL Threshold Count:0x1
    ATL Threshold Timeout:0xFF
Int Level:1
Transfer Completion Codes:
         Success              :920            CRC              :0
         Bit Stuff            :0              Stall            :0
         No Response          :0              Overrun          :0
         Underrun             :0              Other            :0

```

Displaying USB Token Infomation

Use the **dir** command with the **filesystem** keyword option **usbtoken***0-9***:** to display all files, directories, and their permission strings on the USB token.

The following sample output displays directory information for the USB token:

```
Device# dir usbtoken1:
Directory of usbtoken1:/
    2  d---          64  Dec 22 2032 05:23:40 +00:00  1000
    5  d---        4096  Dec 22 2032 05:23:40 +00:00  1001
    8  d---           0  Dec 22 2032 05:23:40 +00:00  1002
   10  d---         512  Dec 22 2032 05:23:42 +00:00  1003
   12  d---           0  Dec 22 2032 05:23:42 +00:00  5000
   13  d---           0  Dec 22 2032 05:23:42 +00:00  6000
   14  d---           0  Dec 22 2032 05:23:42 +00:00  7000
   15  ----         940  Jun 27 1992 12:50:42 +00:00  mystartup-config
   16  ----        1423  Jun 27 1992 12:51:14 +00:00  myrunning-config
32768 bytes total (858 bytes free)
```

The following sample output displays directory information for all devices to which the device is aware:

```
Device# dir all-filesystems
Directory of archive:/
No files in directory
No space information available
Directory of system:/
    2  drwx           0                    <no date>  its
  115  dr-x           0                    <no date>  lib
  144  dr-x           0                    <no date>  memory
    1  -rw-        1906                    <no date>  running-config
  114  dr-x           0                    <no date>  vfiles
No space information available
Directory of flash:/
    1  -rw-    30125020  Dec 22 2032 03:06:04 +00:00  c3825-entservicesk9-mz.123-14.T

Feature Information for Storing PKI Credentials

Table 158: Feature Information for Storing PKI Credentials

Feature Name	Releases	Feature Information
Certificate -- Storage Location Specification		This feature allows you to specify the storage location of local certificates for platforms that support storing certificates as separate files. All Cisco platforms support NVRAM, which is the default location, and flash local storage. Depending on your platform, you may have other supported local storage options including bootflash, slot, disk, USB flash, or USB token. The following commands were introduced by this feature: **crypto pki certificate storage**, **show crypto pki certificates storage**.
RSA 4096-bit Key Generation in Software Crypto Engine Support	15.1(1)T	The range value for the **modulus** keyword value for the **crypto key generate rsa** command is extended from 360 to 2048 bits to 360 to 4096 bits.

CHAPTER 116

Source Interface Selection for Outgoing Traffic with Certificate Authority

The Source Interface Selection for Outgoing Traffic with Certificate Authority feature allows you to specify that the address of an interface be used as the source address for all outgoing TCP connections associated with that trustpoint when a designated trustpoint has been configured.

Information About Source Interface Selection for Outgoing Traffic with Certificate Authority

Certificates That Identify an Entity

Certificates can be used to identify an entity. A trusted server, known as the certification authority (CA), issues the certificate to the entity after determining the identity of the entity. A router that is running Cisco IOS XE software obtains its certificate by making a network connection to the CA. Using the Simple Certificate Enrollment Protocol (SCEP), the router transmits its certificate request to the CA and receives the granted certificate. The router obtains the certificate of the CA in the same manner using SCEP. When validating a certificate from a remote device, the router may again contact the CA or a Lightweight Directory Access Protocol (LDAP) or HTTP server to determine whether the certificate of the remote device has been revoked. (This process is known as checking the certificate revocation list [CRL].)

Note Depending on your Cisco IOS release, LDAP is supported.

In some configurations, the router may make the outgoing TCP connection using an interface that does not have a valid or routable IP address. The user must specify that the address of a different interface be used as the source IP address for the outgoing connection. Cable modems are a specific example of this requirement because the outgoing cable interface (the RF interface) usually does not have a routable address. However, the user interface (usually FastEthernet) does have a valid IP address.

Source Interface for Outgoing TCP Connections Associated with a Trustpoint

The **crypto pki trustpoint** command is used to specify a trustpoint. The **source interface**command is used along with the **crypto pki trustpoint**command to specify the address of the interface that is to be used as the source address for all outgoing TCP connections associated with that trustpoint.

Note If the interface address is not specified using the **source interface**command, the address of the outgoing interface is used.

How to Configure Source Interface Selection for Outgoing Traffic with Certificate Authority

Configuring the Interface for All Outgoing TCP Connections Associated with a Trustpoint

Perform this task to configure the interface that you want to use as the source address for all outgoing TCP connections associated with a trustpoint.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment url** *url*
5. **source interface** *interface-address*
6. **interface** *type slot / port*
7. **description** *string*
8. **ip address** *ip-address mask*
9. **interface** *type slot / port*
10. **description** *string*
11. **ip address** *ip-address mask*
12. **crypto map** *map-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Router (config)# crypto pki trustpoint ms-ca`	Declares the Certificate Authority (CA) that your router should use and enters ca-trustpoint configuration mode.
Step 4	**enrollment url** *url* **Example:** `Router (ca-trustpoint)# enrollment url http://yourname:80/certsrv/mscep/mscep.dll`	Specifies the enrollment parameters of your CA.
Step 5	**source interface** *interface-address* **Example:** `Router (ca-trustpoint)# interface fastethernet1/0`	Interface to be used as the source address for all outgoing TCP connections associated with that trustpoint.
Step 6	**interface** *type slot / port* **Example:** `Router (ca-trustpoint)# interface fastethernet1/0`	Configures an interface type and enters interface configuration mode.
Step 7	**description** *string* **Example:** `Router (config-if)# description inside interface`	Adds a description to an interface configuration.
Step 8	**ip address** *ip-address mask* **Example:** `Router (config-if)# ip address 10.1.1.1 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 9	**interface** *type slot / port* **Example:** `Router (config-if)# interface fastethernet1/0`	Configures an interface type.

	Command or Action	Purpose
Step 10	**description** *string* **Example:** `Router (config-if)# description outside interface 10.1.1.205 255.255.255.0`	Adds a description to an interface configuration.
Step 11	**ip address** *ip-address mask* **Example:** `Router (config-if)# ip address 10.2.2.205 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 12	**crypto map** *map-name* **Example:** `Router (config-if)# crypto map mymap`	Applies a previously defined crypto map set to an interface.

Troubleshooting Tips

Ensure that the interface specified in the command has a valid address. Attempt to ping the router using the address of the specified interface from another device (possibly the HTTP or LDAP server that is serving the CRL). You can do the same thing by using a traceroute to the router from the external device.

You can also test connectivity between the router and the CA or LDAP server by using Cisco IOS XE command-line interface (CLI). Enter the **ping ip**command and respond to the prompts. If you answer "yes" to the "Extended commands [n]:" prompt, you will be able to specify the source address or interface.

In addition, you can use Cisco IOS XE CLI to input a traceroute command. If you enter the **traceroute ip** command (in EXEC mode), you will be prompted for the destination and source address. You should specify the CA or LDAP server as the destination and the address of the interface that you specified in the "source interface" as the source address.

Configuration Examples for Source Interface Selection for Outgoing Traffic with Certificate Authority

Source Interface Selection for Outgoing Traffic with Certificate Authority Example

In the following example, the router is located in a branch office. The router uses IP Security (IPSec) to communicate with the main office. FastEthernet 1 is the "outside" interface that connects to the Internet Service Provider (ISP). FastEthernet 0 is the interface connected to the LAN of the branch office. To access the CA server located in the main office, the router must send its IP datagrams out interface FastEthernet 1 (address 10.2.2.205) using the IPSec tunnel. Address 10.2.2.205 is assigned by the ISP. Address 10.2.2.205 is not a part of the branch office or main office.

The CA cannot access any address outside the company because of a firewall. The CA sees a message coming from 10.2.2.205 and cannot respond (that is, the CA does not know that the router is located in a branch office at address 10.1.1.1, which it is able to reach).

Adding the **source interface** command tells the router to use address 10.1.1.1 as the source address of the IP datagram that it sends to the CA. The CA is able to respond to 10.1.1.1.

This scenario is configured using the **source interface** command and the interface addresses as described above.

```
crypto pki trustpoint ms-ca
 enrollment url http://ms-ca:80/certsrv/mscep/mscep.dll
 source interface fastethernet0
!
interface fastethernet 0
 description inside interface
 ip address 10.1.1.1 255.255.255.0
!
interface fastethernet 1
 description outside interface
 ip address 10.2.2.205 255.255.255.0
 crypto map main-office
```

Feature Information for Source Interface Selection for Outgoing Traffic with Certificate Authority

Table 159: Feature Information for Source Interface Selection for Outgoing Traffic with Certificate Authority

Feature Name	Releases	Feature Information
Source Interface Selection for Outgoing Traffic with Certificate Authority.	Cisco IOS XE Release 2.1	This feature allows you to specify that the address of an interface be used as the source address for all outgoing TCP connections associated with that trustpoint when a designated trustpoint has been configured. The following command was introduced: **source interface**.

Glossary

authenticate--Toprove the identity of an entity using the certificate of an identity and a secret that the identity poses (usually the private key corresponding to the public key in the certificate).

CA --Certificate Authority. A CA is an entity that issues digital certificates (especially X.509 certificates) and vouches for the binding between the data items in a certificate.

CA authentication --The user manually approves a certificate from a root CA. Usually a fingerprint of the certificate is presented to the user, and the user is asked to accept the certificate based on the fingerprint. The

certificate of a root CA is signed by itself (self-signed) so that it cannot be automatically authenticated using the normal certificate verification process.

CRL --certificate revocation list. A CRL is a data structure that enumerates digital certificates that have been invalidated by their issuer prior to when they were scheduled to expire.

enrollment --A router receives its certificate via the enrollment process. The router generates a request for a certificate in a specific format (known as PKCS #10). The request is transmitted to a CA, which grants the request and generates a certificate encoded in the same format as the request. The router receives the granted certificate and stores it in an internal database for use during normal operations.

certificate --A data structure defined in International Organization for Standardization (ISO) standard X.509 to associate an entity (machine or human) with the public key of that entity. The certificate contains specific fields, including the name of the entity. The certificate is normally issued by a CA on behalf of the entity. In this case the router will act as its own CA. Common fields within a certificate include the distinguished name (DN) of the entity, the DN of the authority issuing the certificate, and the public key of the entity.

LDAP --Lightweight Directory Access Protocol. A LDAP is a protocol that provides access for management and browser applications that provide read-and-write interactive access to the X.500 directory.

CHAPTER 117

PKI Trustpool Management

The PKI Trustpool Management feature is used to authenticate sessions, such as HTTPS, that occur between devices by using commonly recognized trusted agents called certificate authorities (CAs).

Trustpool certificates are well-known CA certificates with which you can establish trust. IOS PKI has both built-in CAs and also has an option to download trustpool bundle. Built-in CA certificates are used to verify PKCS7 signature of downloaded trustpool bundle. You can download the trustpool bundle if signature verification fails. You can delete Built-in trustpool certificates. Trustpool certificates are used by applications such as SSLVPN, PnP, Smart License, MacSec and so on.

This feature, which is enabled by default, is used to create a scheme to provision, store, and manage a pool of certificates from known CAs in a way similar to the services a browser provides for securing sessions.

Note A new root certificate is included in the built-in certificates for Cisco Plug and Play application.

Note Effective with Cisco IOS XE Denali 16.3, the way PKI Trustpools are managed have changed. If you are planning to upgrade to this release, please review the changes to the feature captured below as part of *PKI Trustpool Enhancements* section.

Prerequisites for PKI Trustpool Management

The use of certificates requires that a crypto subsystem is included in the Cisco IOS software image.

Restrictions for PKI Trustpool Management

Device certificates that use CA certificates cannot be enrolled in a PKI trustpool.

You can download only a Cisco signed PKCS7 certificate through the trustpool URL.

Information About PKI Trustpool Management

CA Certificate Storage in a PKI Trustpool

The router uses a built-in CA certificate bundle that is contained in a special certificate store called a PKI trustpool, which is updated automatically from Cisco. This PKI trustpool is known by Cisco and other vendors. A CA certificate bundle can be in the following formats:

- X.509 certificates in Distinguished Encoding Rules (DER) binary format enveloped within a public-key cryptographic message syntax standard 7 (pkcs7), which is used to sign and encrypt messages under a PKI. An X.509 certificate is a PKI and Privilege Management Infrastructure (PMI) standard that specifies, among other things, standard formats for public key certificates, certificate revocation lists, attribute certificates, and a certification path validation algorithm.
- A file containing concatenated X.509 certificates in Privacy Enhanced Mail (PEM) format with PEM headers.

Note Flash can also be used as the storage location for the bundles instead of NVRAM.

PKI Trustpool Updating

The PKI trustpool is treated as a single entity that needs to be updated when the following conditions occur:

- A certificate in the PKI trustpool is due to expire or has been reissued.
- The published CA certificate bundle contains additional trusted certificates that are needed by a given application.
- The configuration has been corrupted.

Note A built-in certificate in the PKI trustpool cannot be physically replaced. However, a built-in certificate is rendered inactive after an update if its X.509 subject-name attribute matches the certificate in the CA certificate bundle.

The PKI trustpool can be updated automatically or manually. The PKI trustpool may be used by certficate validation depending upon the application using it. See the "Manually Updating Certificates in the PKI Trustpool" and "Configuring Optional PKI Trustpool Policy Parameters" sections for more information.

Note When auto-update is enabled, all the existing downloaded trustpool certificates (excluding inbuilt trustpool certificates) will be deleted regardless of the import method.

The PKI trustpool timer matches the CA certificate with the earliest expiration time. If the timer is running and a bundle location is not configured and not explicitly disabled, syslog warnings are issued to alert the administrator that the PKI trustpool policy option is not set.

Automatic PKI trustpool updates use the configured URL.

When the PKI trustpool expires, the policy is read, the bundle is loaded, and the PKI trustpool is replaced. If the automatic PKI trustpool update encounters problems when initiating, then the following schedule is used to initiate the update until the download is successful: 20 days, 15 days, 10 days, 5 days, 4 days, 3 days, 2 days, 1 day, and then once every hour.

CA Handling in Both PKI Trustpool and Trustpoint

There may be circumstances where a CA resides in both PKI trustpool and trustpoint; for example, a trustpoint uses a CA and a CA bundle is downloaded later with the same CA inside. In this scenario, the CA in the trustpoint and the policy of this trustpoint is considered before the CA in the PKI trustpool or PKI trustpool policy to ensure that any current behavior is not altered when the PKI Trustpool Management feature is implemented on the router.

PKI Trustpool Enhancements

In releases earlier than Cisco IOS XE Denali 16.3, the trustpool consists of built-in certificates deployed with every Cisco box and downloaded CA certificates from published bundles. The downloaded certificates are saved in NVRAM, by default. The certificates from the downloaded trustpool bundle would be extracted and stored in the running configuration which was inefficient and utilized too much space.

From Cisco IOS XE Denali 16.3, the PKI trustpool enhancements stores the bundles in the same downloaded bundle format as one file in the storage location (default is NVRAM) instead of individual certificates like in the previous releases. This helps in saving storage memory as the file is in compressed format. Also, the certificates are not displayed individually in the running configuration. On every reboot the bundles are read from the storage location and individual certificates are installed in the database.

This feature removes the current downloaded certificates from the running configuration. The **crypto pki certificate pool** will not have the DER format certificates because these certificates are incompatible with the old NVRAM file and the new images. During upgrade, the trustpool certificates in DER format are lost and the bundles must be reinstalled again in the storage. This is indicated by a syslog during reboot in case of old NVRAM files. The **show crypto pki trustpool** command indicates that the configuration has been removed. Before you upgrade, use the **show crypto pki trustpool** command to verify that the certificates are available.

The following steps must be followed before upgrading to Cisco IOS XE Denali 16.3 :

- Remove the downloaded trustpool certificates using the **crypto pki trustpool clean** command
- Use the **write memory** command
- Reboot the device
- Download the trustpool bundles using the **crypto pki trustpool import url** command

If you are using trustpool certificates to log into SSH, then you need to follow additional steps to transfer that specific certificate from bundle to a trustpoint. See *Example: Using PKI Trustpool for SSH Connection During Upgrade* for more information.

Note From Cisco IOS XE Gibraltar 16.10 release onwards, when you configure the **match crlsign** command under trustpoint, the crlsign will be crosss checked while validating.

How to Configure PKI Trustpool Management

Manually Updating Certificates in the PKI Trustpool

The PKI Trustpool Management feature is enabled by default and uses the built-in CA certificate bundle in the PKI trustpool, which receives automatic updates from Cisco. Perform this task to manually update certificates in the PKI trustpool if they are not current, are corrupt, or if certain certificates need to be updated.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpool import clean** [**terminal** | **url** *url*]
4. **crypto pki trustpool import** {**terminal**} {**url** *url* | **ca-bundle**} {**vrf** *vrf-name* | **source interface** *interface-name*}
5. **exit**
6. **show crypto pki trustpool**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpool import clean** [**terminal**	**url** *url*] **Example:** `Device(config)# crypto pki trustpool import clean`	(Optional) Manually removes all downloaded PKI CA certificates. • The **clean** keyword specifies the removal of the downloaded PKI trustpool certificates before the new certificates are downloaded.

	Command or Action	Purpose
		• The **terminal** keyword removes the existing CA certificate bundle terminal setting. • The **url** keyword and *url* argument removes the existing URL file system setting.
Step 4	**crypto pki trustpool import** {**terminal**} {**url** *url* | **ca-bundle**} {**vrf** *vrf-name* | **source interface** *interface-name*} **Example:** `Device(config)# crypto pki trustpool import url http://www.cisco.com/security/pki/trs/ios.p7b`	Manually imports (downloads) the CA certificate bundle into the PKI trustpool to update or replace the existing CA certificate bundle. • The **terminal** keyword specifies the importation of a CA certificate bundle through the terminal (cut-and-paste) in PEM format. • The **url** keyword with the *url* argument specifies the importation of a CA certificate bundle through a URL. This URL can be through a variety of URL file systems such as HTTP. See the *PKI Trustpool Updating* section for more information. In CA bundle, you can use the **crypto pki trustpool import** command to pass the traffic through global VRF. Also, the traffic will not divert through a VRF, when you configure the **crypto pki trustpool policy** command specifying the VRF and source interface.
Step 5	**exit** **Example:** `Device(config)# exit`	Exits global configuration mode.
Step 6	**show crypto pki trustpool** **Example:** `Device(config)# show crypto pki trustpool`	Displays the PKI trustpool certificates of the router in a verbose format.

Configuring Optional PKI Trustpool Policy Parameters

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpool policy**
4. **cabundle url** {*url* | **none**}
5. **chain-validation**
6. **crl** {**cache** {**delete-after** {*minutes* | **none**} | **query** *url*}
7. **default** *command-name*

8. **match certificate** *certificate-map-name* [**allow expired-certificate** | **override** {**cdp directory** *ldap-location* | **ocsp** {*number* **url** *url* | **trustpool** *name number* **url** *url*} | **sia** *number url*} | **skip** [**revocation-check** | **authorization-check**]]
9. **ocsp** {**disable-nonce** | **url** *url*}
10. **revocation-check** *method1* [*method2* [*method3*]]
11. **source interface** *name number*
12. **storage** *location*
13. **vrf** *vrf-name*
14. **show**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	**crypto pki trustpool policy**
	Example:
	`Device(config)# crypto pki trustpool policy`
	`Device(ca-trustpool)#`
		Enters ca-trustpool configuration mode where commands can be accessed to configure CA PKI trustpool policy parameters. The trustpool policy only affects the crl retrieval process and has no effect on trustpool import process.

Step 4	**cabundle url** {*url*	**none**} **Example:** `Device(ca-trustpool)# cabundle url http://www.cisco.com/security/pki/crl/crca2048.crl`	Specifies the URL from which the PKI trustpool certificate authority CA certificate bundle is downloaded . • The *url* argument is the URL of the CA certificate bundle. • The **none** keyword specifies that autoupdates of the PKI trustpool CA are not permitted.
Step 5	**chain-validation** **Example:** `Device(ca-trustpool)# chain-validation`	Enables chain validation from the peer's certificate to the root CA certificate in the PKI trustpool. The default has validation stopping at the peer certificate's issuer.
Step 6	**crl** {**cache** {**delete-after** {*minutes*	**none**}	**query** *url*} **Example:** `Device(ca-trustpool)# crl query http://www.cisco.com/security/pki/crl/crca2048.crl`	Specifies the certificate revocation list (CRL) query and CRL cache options for the PKI trustpool. • The **cache** keyword specifies CRL cache options. • The **delete-after** keyword removes the CRL from the cache after a timeout.

	Command or Action	Purpose
		• The *minutes* argument is the number of minutes from 1 to 43,200 to wait before deleting the CRL from the cache. • The **none** keyword specifies that CRLs are not cached. • The **query** keyword with the *url* argument specifies the URL published by the CA server to query the CRL.
Step 7	**default** *command-name* **Example:** `Device(ca-trustpool)# default crl query http://www.cisco.com/security/pki/crl/crca2048.crl`	Resets the value of a ca-trustpool configuration subcommand to its default . • The *command-name* argument is the ca-trustpool configuration mode command with its applicable keywords.
Step 8	**match certificate** *certificate-map-name* [**allow expired-certificate** | **override** {**cdp directory** *ldap-location* | **ocsp** {*number* **url** *url* | **trustpool** *name number* **url** *url*} | **sia** *number url*} | **skip** [**revocation-check** | **authorization-check**]] **Example:** `match certificate mycert override ocsp 1 url http://ocspts.identrust.com`	Enables the use of certificate maps for the PKI trustpool. • The *certifcate-map-name* argument matches the certificate map name. • The optional **allow expired-certificate** keyword ignores expired certificates. **Note** If this keyword is not configured, the router does not ignore expired certificates. • The **override** keyword overrides the online certificate status protocol (OCSP) or SubjectInfoAccess (SIA) attribute fields in a certificate that is in the PKI trustpool. • The **cdp** keyword overrides the certificate distribution point (CDP) in a certificate. • The **directory** keyword and *ldap-location* specifies the CDP in either the http: or ldap: URL, or LDAP directory to override in the certificate. • The **ocsp** keyword and *number* argument and **url** keyword and *url* argument specifies the OCSP sequence number from 0 to 10000 and URL to override in the certificate. • The **trustpool** keyword and *name* and *number* arguments with the **url** keyword and *url* argument override the PKI trustpool for verifying the OCSP certificate by specifying the PKI trustpool name, sequence number, and URL.

	Command or Action	Purpose
		• The **sia** keyword and *number* and *url* arguments override the SIA URL in a certificate by specifying the SIA sequence number and URL. • The optional **skip revocation-check** keyword combination allows the PKI trustpool to enforce certificate revocation lists (CRLs) except for specific certificates. **Note** If this keyword combination is not configured, then the PKI trustpool enforces CRLs for all certificates. • The optional **skip authorization-check** keyword combination skips the authentication, authorization, and accounting (AAA) check of a certificate when public key infrastructure (PKI) integration with an AAA server is configured. **Note** If this keyword combination is not configured, and PKI integration with an AAA server is configured, then the AAA checking of a certificate is done.
Step 9	**ocsp** {**disable-nonce** | **url** *url*} **Example:** `Device(ca-trustpool)# ocsp url http://ocspts.identrust.com`	Specifies OCSP settings for the PKI trustpool. • The **disable-nonce** keyword disables the OCSP Nonce extension. • The **url** keyword and *url* argument specify the OCSP server URL to override (if one exists) in the Authority Info Access (AIA) extension of the certificate. All certificates associated with a configured PKI trustpool are checked by the OCSP server at the specified HTTP URL. The URL can be a hostname, IPv4 address, or an IPv6 address.
Step 10	**revocation-check** *method1* [*method2* [*method3*]] **Example:** `Device(ca-trustpool)# revocation-check ocsp crl none`	Disables revocation checking when the PKI trustpool policy is being used. The *method* argument is used by the router to check the revocation status of the certificate. Available keywords are as follows: • The **crl** keyword performs certificate checking by a certificate revocation list (CRL). This is the default behavior. • The **none** keyword does not require a certificate checking. • The **ocsp** keyword performs certificate checking by an online certificate status protocol (OCSP) server.

	Command or Action	Purpose
		If a second and third method are specified, each method is used only if the previous method returns an error, such as a server being down.
Step 11	**source interface** *name number* **Example:** `Device(ca-trustpool)# source interface tunnel 1`	Specifies the source interface to be used for CRL retrieval, OCSP status, or the downloading of a CA certificate bundle for the PKI trustpool . • The *name* and *number*arguments are for the interface type and number used as the source address for the PKI trustpool.
Step 12	**storage** *location* **Example:** `Device(ca-trustpool)# storage storage disk0:crca2048.crl`	Specifies a file system location where PKI trustpool certificates are stored on the router. • The *location* is the file system location where the PKI trustpool certificates are stored. The types of file system locations are **disk0:**, **disk1:**, **nvram:**, **unix:**, or a named file system.
Step 13	**vrf** *vrf-name* **Example:** `Device(ca-trustpool)# vrf myvrf`	Specifies the VPN routing and forwarding (VRF) instance to be used for enrolment, CRL retrieval, and OCSP status.

Step 14	**show**
	Example:
	`Device(ca-trustpool)# show`
	
	`Chain validation will stop at the first CA certificate in the pool`
	`  Trustpool CA certificates will expire 12:58:31 PST Apr 5 2012`
	`  Trustpool policy revocation order:  crl`
	`  Certficate matching is disabled`
	`  Policy Overrides:`
		Displays the PKI trustpool policy of the router.

Configuration examples for PKI Trustpool Management

Example: Configuring PKI Trustpool Management

The following **show crypto pki trustpool** command output displays the certificates in PKI trustpool:

Note The command output in this example is abridged because it is verbose.

```
Device# show crypto pki trustpool
```

```
CA Certificate
  Status: Available
  Version: 3
  Certificate Serial Number (hex): 00D01E474000000111C38A964400000002
  Certificate Usage: Signature
  Issuer:
    cn=DST Root CA X3
    o=Digital Signature Trust Co.
  Subject:
    cn=Cisco SSCA
    o=Cisco Systems
  CRL Distribution Points:
    http://crl.identrust.com/DSTROOTCAX3.crl
  Validity Date:
    start date: 12:58:31 PST Apr 5 2007
    end   date: 12:58:31 PST Apr 5 2012

CA Certificate
  Status: Available
  Version: 3
  Certificate Serial Number (hex): 6A6967B3000000000003
  Certificate Usage: Signature

CHAPTER 118

PKI Split VRF in Trustpoint

The PKI Split VRF in Trustpoint feature allows you to configure a VPN Routing and Forwarding (VRF) for certificate enrollment and revocation.

Information About PKI Split VRF in Trustpoint

Overview of PKI Split VRF in Trustpoint

The PKI Split VRF in Trustpoint feature allows you to configure VPN Routing and Forwarding (VRF) for certificate enrollment and for certificate revocation list (CRL) checking. The VRF is configured in the enrollment profile using the **enrollment url** command under the **crypto pki profile enrollment** command to attach the enrollment profile to a trustpoint. You can configure the same VRF for enrollment and CRL or configure different VRFs. Based on the configuration (enrollment or revocation), the corresponding VRF is selected and Simple Certificate Enrollment Protocol (SCEP) request is sent via the respective VRF.

To configure enrollment and CRL via different routing paths, you must configure the enrollment url command using the **crypto pki profile enrollment** command. This configured VRF acts as an enrollment VRF and the enrollment request goes via that VRF. However, the CRL uses the global VRF configured in the trustpoint using the

If no VRF is configured in the **enrollment url** command, the enrollment takes global enrollment that is configured in the **crypto pki trustpoint** command.

How to Configure PKI Split VRF in Trustpoint

Configuring the Split VRF

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki profile enrollment** *label*
4. **enrollment url** *url* [**vrf** *vrf-name*]
5. **exit**
6. **show crypto pki profile**
7. **show crypto pki trustpoint**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki profile enrollment** *label* **Example:** `Device(config)# crypto pki profile enrollment pki_profile`	Defines an enrollment profile and enters ca-profile-enroll configuration mode. • *label* —Name for the enrollment profile; the enrollment profile name must match the name specified in the **enrollment profile** command.
Step 4	**enrollment url** *url* [**vrf** *vrf-name*] **Example:** `Device(ca-profile-enroll)# enrollment url http://entrust:81/cda-cgi/clientcgi.exe vrf vrf1`	Specifies the URL and the VPN Routing and Forwarding (VRF) of the CA server to which to send certificate enrollment requests via HTTP or TFTP.
Step 5	**exit** **Example:** `Device(ca-profile-enroll)# exit`	Exits ca-profile-enroll configuration mode. • Enter this command a second time to exit global configuration mode.
Step 6	**show crypto pki profile** **Example:** `Device# show crypto pki profile`	(Optional) Displays information about PKI profile.

	Command or Action	Purpose
Step 7	**show crypto pki trustpoint** **Example:** `Device# show crypto pki trustpoint`	(Optional) Displays information about PKI trustpoints.

Configuration Examples for PKI Split VRF in Trustpoint

Example: Configuring the PKI Split VRF in Trustpoint

Enrollment and Certificate Revocation List Via Same VRF

The following example shows how to configure the enrollment and certificate revocation list (CRL) via the same VRF:

```
crypto pki trustpoint trustpoint1
 enrollment url http://10.10.10.10:80
 vrf vrf1
 revocation-check crl
```

Enrollment and Certificate Revocation List Via Different VRF

The following example shows how to configure the enrollment and certificate revocation list (CRL) via different VRF:

```
crypto pki profile enrollment pki_profile
 enrollment url http://10.10.10.10:80 vrf vrf2

crypto pki trustpoint trustpoint1
 enrollment profile pki_profile
 vrf vrf1
 revocation-check crl
```

Feature Name	Releases	Feature Information
IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.

CHAPTER 119

EST Client Support

The EST Client Support feature allows you to enable EST (Enrolment Over Secure Transport) for all trustpoints while using SSL or TLS to secure transport.

Feature Information for Overview of Cisco TrustSec

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 162: Feature Information for Overview of Cisco TrustSec

Feature Name	Releases	Feature Information
IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.

Information About EST Client Support

Overview of EST Client Support

The EST Client Support feature allows you to use Enrollment over Secure Transport (EST) as a certificate management protocol for provisioning certificates. With the existing SCEP enrollment integrated within the PKI component, the addition of EST will introduce a new component that will use SSL or TLS to secure the transport. PKI will store all certificates.

To enable EST support, the EST client is required to authenticate the server during TLS connection establishment. For this authentication, the TLS server may require the client's credentials.

Prerequisites for EST Client Support

- Enable the **ip http authentication fore-close** command.

Restrictions for EST Client Support

- The EST client supports only TLS 1.2
- The certificate Attribute request is not supported.
- CA-Certificate rollover is not supported.
- Certificate-less TLS authentication is not supported.
- HTTP-based client authentication is not supported.

How to Configure EST Client Support

Configuring a Trustpoint to Use EST

Perform this task to configure a trustpoint to use EST (Enrolment Over Secure Transport) by enabling the user to use the enrollment profile.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki profile enrollment***label*
4. **method-est**
5. **enrollment url***url* [**vrf** *vrf name*]
6. **enrollment credential** *label*
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**crypto pki profile enrollment***label* **Example:** `Device(config)# crypto pki profile enrollment pki_profile`	Defines an enrollment profile and enters ca-profile-enroll configuration mode. • *label*—Name for the enrollment profile; the enrollment profile name must match the name specified in the **enrollment profile** command.
Step 4	**method-est** **Example:** `Device(ca-profile-enroll)# method-est`	Enables enrollment profile to select usage of EST.
Step 5	**enrollment url***url* [**vrf** *vrf name*] **Example:** `Device(ca-profile-enroll)# enrollment url http://entrust:81/cda-cgi/clientcgi.exe vrf vrf1`	Specifies that an enrollment profile is to be used for certificate enrollment. **Note** If the authentication URL is not specified, then the enrollment URL will be considered for authentication.
Step 6	**enrollment credential** *label* **Example:** `Device(ca-profile-enroll)# enrollment credential test_label`	Provides the trustpoint credentials currently available in the profile for TLS client authentication.
Step 7	**exit** **Example:** `Device(ca-profile-enroll)# exit`	Exits ca-profile-enroll configuration mode.

Verifying the EST Client Support Configaration

You can use the following show commands to verify EST Client Support configuration.

- **show crypto pki profile**
- **show crypto pki trustpoints estclient status**

Configuration Examples for EST Client Support

Configuring a Trustpoint to Use EST

The following example shows how to configure a trustpoint to use Enrollment over Secure Transport (EST):

```
crypto pki profile enrollment pki_profile
 method-est
```

```
 enrollment url http://www.example.com/BigCA/est/simpleenroll.dll
 enrollment credential test_label
```

Verifying EST Client Support

The following sample output from the **show crypto pki trustpoints estclient status** command verifies EST Client Support configuration.

```
Router# show crypto pki trustpoints estclient status
Trustpoint estclient:
  Issuing CA certificate configured:
    Subject Name:
     cn=estExampleCA
    Fingerprint MD5: B9D0403C 7D33F1AA F9957796 CA6E86AA
    Fingerprint SHA1: F3698C9C DCB2B5F2 A38EBCB4 1DBA6A90 9F877A5B
  Router Signature certificate configured:
    Subject Name:
     cn=estclientrouter
    Fingerprint MD5: B740849B 37016DB7 A6797CE4 D6140D27
    Fingerprint SHA1: F032B015 50BB5742 2619EFC6 F1F0B8B1 31D9906D
  State:
    Keys generated ..... Yes (Signature, non-exportable)
    Issuing CA authenticated ..... Yes
    Certificate request(s) ..... Yes
```

The following sample output from the **show crypto pki certificate estclient** command shows the status before re-enrollement and after re-enrollment.

```
BEFORE REENROLLMENT

Router# show crypto pki certificate estclient

CHAPTER 120

OCSP Response Stapling

The OCSP Response Stapling feature allows you to check the validity of a peer's user or device credentials contained in a digital certificate using Online Certificate Status Protocol (OCSP).

Information About OCSP Response Stapling

Overview of OCSP Response Stapling

Online Certificate Status Protocol (OCSP) is a method to check certificate revocation when a peer has to retrieve this revocation information and then validate it to check the certificate revocation status. In this method, the certification revocation status is limited by the peer's ability to reach an OCSP responder through the cloud or by the certificate sender's performance in retrieving the certificate revocation-information.

OCSP response stapling supports a new method to fetch the OCSP response for a device’s own certificates. This feature allows the device to obtain its own certificate revocation information by contacting the OCSP server and then sending this result along with its certificates directly to the peer. As a result, the peer does not require to contact the OCSP responder.

How to Configure OCSP Response Stapling

Configuring PKI Client to Request EKU Attribute

Perform this task to configure OCSP (Online Certificate Status Protocol) response stapling.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*

4. **ocsp url** *url*
5. **eku request** *attribute*
6. **match eku** *attribute*
7. **revocation-check** *method1* [*method2* [*method3*]]
8. **exit**
9. **exit**
10. **show cry pki counters**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. **a.** Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Device(config)# crypto pki trustpoint msca`	Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.

Step 4	**ocsp url** *url*
	Example:
	`Device(ca-trustpoint)# ocsp url http://ocsp-server`
	Example:
	`Device(ca-trustpoint)# ocsp url http://10.10.10.1:80`
	Example:
	`Device(ca-trustpoint)# ocsp url http://[2001DB8:1:1::2]:80`
		The *url* argument specifies the URL of an OCSP server so that the trustpoint can check the certificate status. This URL overrides the URL of the OCSP server (if one exists) in the Authority Info Access (AIA) extension of the certificate. All certificates associated with a configured trustpoint are checked by the OCSP server. The URL can be a hostname, IPv4 address, or an IPv6 address.
		Note Make sure that the OCSP request url is configured with the **ocsp url** *url* command and not with an http-proxy server.

Step 5	**eku request** *attribute* **Example:** `Device(ca-trustpoint)# eku request ssh-client`	Requests to include specified eku *attribute* in the certificate. This request, when configured on the PKI client, will be sent to the CA server during enrollment. The *attribute* argument can be one of the following: • client-auth • code-signing • email-protection • ipsec-end-system

	Command or Action	Purpose
		• ipsec-tunnel • ipsec-user • ocsp-signing • server-auth • time-stamping • ssh-server • ssh-client
Step 6	**match eku** *attribute* **Example:** `Device(ca-trustpoint)# match eku client-auth`	Allows PKI to validate a peer certificate only if the specified attribute is present in the certificate else validation fails. The *attribute* argument can be one of the following: • client-auth • code-signing • email-protection • ipsec-end-system • ipsec-tunnel • ipsec-user • ocsp-signing • server-auth • time-stamping • ssh-server • ssh-client
Step 7	**revocation-check** *method1* [*method2* [*method3*]] **Example:** `Device(ca-trustpoint)# revocation-check ocsp none`	(Optional) Checks the revocation status of a certificate. • crl --Certificate checking is performed by a CRL. This is the default option. • none --Certificate checking is ignored. • ocsp --Certificate checking is performed by an OCSP server. If a second and third method are specified, each method will be used only if the previous method returns an error, such as a server being down.

	Command or Action	Purpose
Step 8	**exit** **Example:** `Device(ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode and returns to global configuration mode.
Step 9	**exit** **Example:** `Device(config)# exit`	Returns to privileged EXEC mode.
Step 10	**show cry pki counters** **Example:** `Device# show cry pki counters`	(Optional) Displays the PKI counters of the device.

Configuring PKI Server to Include EKU Attributes

Perform this task to configure OCSP (Online Certificate Status Protocol) response stapling.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **crypto pki server** *cs-label*
5. **eku request** *attribute*
6. **exit**
7. **exit**
8. **show crypto pki counters**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. **a.** Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ip http server** **Example:** `Device(config)# ip http server`	Enables the HTTP server on your system.

	Command or Action	Purpose
Step 4	**crypto pki server** *cs-label* **Example:** `Device(config)# crypto pki server server-pki`	Defines a label for the certificate server and enters certificate server configuration mode. **Note** If you manually generated an RSA key pair, the *cs-label* argument must match the name of the key pair.
Step 5	**eku request** *attribute* **Example:** `Device(cs-server)# eku request ssh-server`	Requests to include specified eku *attribute* in the certificate. The *attribute* argument can be one of the following: • client-auth • code-signing • email-protection • ipsec-end-system • ipsec-tunnel • ipsec-user • ocsp-signing • server-auth • time-stamping • ssh-server • ssh-client
Step 6	**exit** **Example:** `Device(cs-server)# exit`	Exits cs-server configuration mode and returns to global configuration mode.
Step 7	**exit** **Example:** `Device(config)# exit`	Returns to privileged EXEC mode.
Step 8	**show crypto pki counters** **Example:** `Device# show crypto pki counters`	(Optional) Displays the PKI counters of the device.

Example

The following is sample output from the **show crypto pki counters**.

```
Device# show crypto pki counters

PKI Sessions Started: 0
PKI Sessions Ended: 0
PKI Sessions Active: 0

Feature Name	Releases	Feature Information
IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.

CHAPTER 121

Configuring Route Processor Redundancy for PKI

Route Processor Redundancy provides an alternative to the High System Availability feature. HSA enables a system to reset and use a standby Route Switch Processor, if the active RSP fails. Using RPR, you can reduce unplanned downtime because RPR enables a quicker switchover between an active and standby RSP if the active RSP experiences a fatal error.

Route Processor Redundancy feature currently available on Cisco ASR platforms with dual RP support such as ASR 1006, ASR 1009. and ASR 1013.

Note Route Processor Redundancy supports trustpool import.

Prerequisites for Configuring Route Processor Redundancy

- You must use the same memory in both RSPs because the secondary RSP must be able to support the primary RSP during a failover.

Restrictions for Configuring Route Processor Redundancy

- Route Processor Redundancy feature only supports platforms with dual RP support.
- Route Processor Redundancy is supported only on routers that support dual RSPs.
- It is not recomended to configure RA (Registration Authority) as it is not validated.

How To Configure Route Processor Redundancy

Configuring Route Processor Redundancy SSO Mode

```
configure terminal
redundancy
 mode sso
 main-cpu
  standby console enable
exit
```

Verifying Route Processor Redundancy

```
show redundancy states
show crypto pki server
show crypto pki certificates tname
```

Route Processor Redundancy SSO Mode Confuguration Example

Example for server side configuration:

```
asr1k(config)#ip http server

asr1k(config)#crypto pki trustpoint ROOTCA

asr1k(ca-trustpoint)#hash sha512

asr1k(ca-trustpoint)#revocation-check none

asr1k(ca-trustpoint)#rsakeypair  ROOTCA 2048

asr1k(ca-trustpoint)#crypto pki server ROOTCA

asr1k(cs-server)#issuer-name CN=ROOTCA C=pki

asr1k(cs-server)#lifetime certificate 00 00 15

asr1k(cs-server)#lifetime ca-certificate 00 00 25

asr1k(cs-server)#lifetime crl 6

asr1k(cs-server)#serial-number 0x1

asr1k(cs-server)#auto-rollover 00 00 24

% The archive password is not configured. Rollover CA keys and certificates will not be
automatically archived.

asr1k(cs-server)#grant auto

asr1k(cs-server)#database url tftp://<ip>//

% Server database url was changed. You need to move the

% existing database to the new location.
```

```
asr1k(cs-server)#database url p12 tftp://<ip>//
asr1k(cs-server)#database level complete
asr1k(cs-server)#database archive pkcs12 password <pwd>
asr1k(cs-server)#end
```

Example for client side configuration:

```
crypto pki trustpoint client
 enrollment url http://<ip>:80
 usage ike
 subject-name CN=R1 C=pki
 revocation-check crl
 rsakeypair client 2048
 hash sha512
```

Route Processor Redundancy SSO Mode Verification Example

```
show redundancy states
       my state = 13 -ACTIVE
     peer state = 8  -STANDBY HOT
           Mode = Duplex
           Unit = Primary
        Unit ID = 48

Redundancy Mode (Operational) = sso
Redundancy Mode (Configured)  = sso
Redundancy State              = sso
     Maintenance Mode = Disabled
    Manual Swact = enabled
 Communications = Up

   client count = 132
 client_notification_TMR = 30000 milliseconds
          RF debug mask = 0x0
```

```
show crypto pki server
Certificate Server ROOTCA:
    Status: enabled
    State: enabled
    Server's configuration is locked  (enter "shut" to unlock it)

PART XII

Zone-Based Policy Firewalls

CHAPTER 122

Zone-Based Policy Firewalls

This module describes the Cisco unidirectional firewall policy between groups of interfaces known as zones. Prior to the release of the Cisco unidirectional firewall policy, Cisco firewalls were configured only as an inspect rule on interfaces. Traffic entering or leaving the configured interface was inspected based on the direction in which the inspect rule was applied.

Note Cisco IOS XE supports Virtual Fragmentation Reassembly (VFR) on zone-based firewall configuration. When you enable the firewall on an interface by adding the interface to a zone, VFR is configured automatically on the same interface.

Feature Information for Zone-Based Policy Firewalls

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 164: Feature Information for Zone-Based Policy Firewalls

Feature Name	Releases	Feature Information
Zone-Based Firewall Reclassification	Cisco IOS XE Bengaluru 17.6.1	The Zone-Based Firewall reclassification feature is introduced. This feature enforces changes, if any, to a policy configuration on the existing sessions.

Feature Name	Releases	Feature Information
Smart Licensing support for Zone-Based Firewall on ASR1000	Cisco IOS XE Denali 16.3.1	The following command was modified: **show license all**.
Out-of-Order Packet Handling in Zone-Based Policy Firewall	Cisco IOS XE Release 3.5S	The Out-of-Order Packet Handling feature allows OoO packets to pass through the router and reach their destination if a session does not require DPI. All Layer 4 traffic with OoO packets are allowed to pass through to their destination. However, if a session requires Layer 7 inspection, the OoO packets are still dropped.
IOS-XE ZBFW Interop with Crypto VPN	Cisco IOS XE Release 3.17S	The IOS-XE ZBFW Interop with Crypto VPN feature supports the enabling of zone-based firewall under FlexVPN DVTI.
Zone-Based Firewall Support of Multipath TCP	Cisco IOS XE Release 3.13S	Multipoint TCP seamlessly works with zone-based firewall Layer 4 inspection. Multipoint TCP does not work with application layer gateways (ALGs) and application inspection and control (AIC).
Firewall—NetMeeting Directory (LDAP) ALG Support	Cisco IOS XE Release 3.1S	LDAP is an application protocol that is used for querying and updating information stored on directory servers. The Firewall—Netmeeting (LDAP) Directory ALG Support feature enables Cisco firewalls to support Layer 4 LDAP inspection by default. The following command was introduced: **match protocol**.
Debuggability Enhancement in Zone-Based Firewall (Phase-II)	Cisco IOS XE Release 3.10S	The Debuggability Enhancement Zone-Based Firewall feature provides severity levels for debug logs.
Zone-Based Firewall—Default Zone	Cisco IOS Release 2.6	The Zone-Based Firewall— Default Zone feature introduces a default zone that enables a firewall policy to be configured on a zone pair that consist of a zone and a default zone. Any interface without explicit zone membership belongs to the default zone.
Zone-Based Policy Firewalls	Cisco IOS Release 2.1	The Zone-Based Policy Firewall feature provides a Cisco IOS XE software unidirectional firewall policy between groups of interfaces known as zones.

Information About Zone-Based Policy Firewalls

The following sections provide detailed information about zone-based policy firewalls.

Top-Level Class Maps and Policy Maps

Top-level class maps allow you to identify the traffic stream at a high level. This is accomplished by using the **match access-group** and **match protocol** commands. Top-level class maps are also referred to as Layer

3 and Layer 4 class maps. Top-level policy maps allow you to define high-level actions by using the **inspect**,**drop**, and**pass** commands. You can attach policy maps to a target (zone pair).

Note Only inspect type policies can be configured on a zone pair.

Overview of Zones

A zone is a group of interfaces having similar functions or features. They help you specify where a Cisco IOS XE firewall should be applied. For example, on a device, Gigabit Ethernet interface 0/0/0 and Gigabit Ethernet interface 0/0/1 may be connected to the local LAN. These two interfaces are similar because they represent the internal network. So, they can be grouped into a zone for firewall configurations.

By default, the traffic between the interfaces in the same zone is not subject to any policy, and passes freely. Firewall zones are used for security features.

Note Zones may not span interfaces in different VPN routing and forwarding (VRF) instances.

For Dynamic Multipoint VPN (DMVPN) tunnels, zone-based firewall inspects and only evaluates the inner packet. Once the inner packet is encapsulated in Generic Routing Encapsulation (GRE) and Encapsulating Security Payload (ESP) payloads, it is forwarded without further inspection. For incoming packets, ESP and GRE decapsulation takes place before ZBF evaluation. It is not required to configure any explicit rules for ESP and GRE traffic on self to outside or outside to self zone pairs.

Security Zones

A security zone is a group of interfaces to which a policy can be applied.

Grouping interfaces into zones involves two procedures:

- Creating a zone so that interfaces can be attached to it.
- Configuring an interface to be a member of a given zone.

By default, traffic flows between interfaces that are members of the same zone.

When an interface is a member of a security zone, all traffic (except traffic going to the device or initiated by the device) between that interface and an interface in a different zone is dropped by default. To permit traffic to and from a zone-member interface and another interface, you must make that zone part of a zone pair, and apply a policy to that zone pair. If the policy permits traffic through inspect or pass actions, traffic can flow through the interface.

The following are the basic rules to consider when setting up zones:

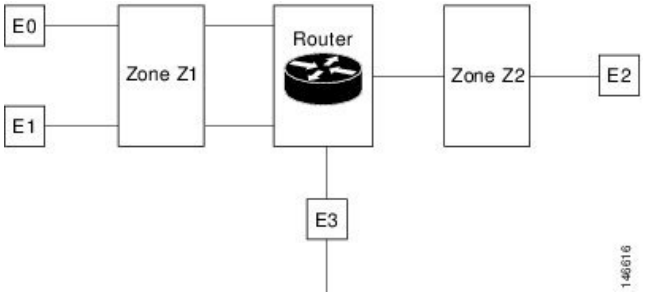
- Traffic from a zone interface to a nonzone interface, or from a nonzone interface to a zone interface is always dropped; unless default zones are enabled (default zone is a nonzone interface).
- Traffic between two zone interfaces is inspected if there is a zone pair relationship for each zone, and if there is a configured policy for that zone pair.
- By default, all traffic between two interfaces in the same zone is always allowed.

- A zone pair can be configured with a zone as both source and destination zones. An inspect policy can be configured on this zone pair to inspect, pass, or drop the traffic between the two zones.
- An interface can be a member of only one security zone.
- When an interface is a member of a security zone, all traffic to and from that interface is blocked unless you configure an explicit interzone policy on a zone pair involving that zone.
- For traffic to flow between all the interfaces in a device, these interfaces must be members of one security zone or another. It is not necessary for all the device interfaces to be members of security zones.
- All the interfaces associated with a zone must be contained in the same virtual routing and forwarding (VRF).

Figure 1 illustrates the following:

- Interfaces E0 and E1 are members of security zone Z1.
- Interface E2 is a member of security zone Z2.
- Interface E3 is not a member of any security zone.

Figure 51: Security Zone Restrictions



- The zone pair and policy are configured in the same zone. Traffic flows freely between interfaces E0 and E1 because they are members of the same security zone (Z1).
- If no policies are configured, traffic will not flow between any other interfaces, for example, E0 and E2, E1 and E2, E3 and E1, and E3 and E2.
- Traffic can flow between E0 or E1 and E2 only when an explicit policy permitting traffic is configured between zone Z1 and zone Z2.
- Traffic can never flow between E3 and E0, E1, or E2 unless default zones are enabled.

Note On the Cisco ASR 1000 Series Aggregation Services Routers, the firewall supports a maximum of 4000 zones.

Security Zone Firewall Policies

A class identifies a set of packets based on its contents. Normally, you define a class so that you can apply an action on the identified traffic that reflects a policy. A class is designated through class maps.

An action is a functionality that is typically associated with a traffic class. Firewall supports the following type of actions:

inspect: Once classified, firewall session is created in the connection table and the packet's content is examined.

pass: The packet is classified and the traffic is allowed to pass through the system without further inspection.

drop: The packet is classified and dropped.

To create security zone firewall policies, you must complete the following tasks:

- Define a match criterion (class map).
- Associate actions to the match criterion (policy map).
- Attach the policy map to a zone pair (service policy).

The **class-map** command creates a class map to be used for matching packets to a specified class. Packets that arrive at targets (such as the input interface, output interface, or zone pair), determined by how the **service-policy** command is configured, are checked against the match criteria configured for a class map to determine if the packet belongs to that class.

The **policy-map** command creates or modifies a policy map that can be attached to one or more targets to specify a service policy. Use the **policy-map** command to specify the name of the policy map to be created, added to, or modified before you can configure policies for classes whose match criteria are defined in a class map.

Virtual Interfaces as Members of Security Zones

A virtual template interface is a logical interface configured with generic configuration information for a specific purpose or for a configuration common to specific users, plus device-dependent information. The template contains Cisco software interface commands that are applied to virtual access interfaces. To configure a virtual template interface, use the **interface virtual-template** command.

Zone member information is acquired from a RADIUS server, and the dynamically created interface is made a member of that zone. The **zone-member security** command adds the dynamic interface to the corresponding zone.

For more information on the Per Subscriber Firewall on LNS feature, see Release Notes for Cisco ASR 1000 Series Aggregation Services Routers for Cisco IOS XE Release 2.

Zone Pairs

A zone pair allows you to specify a unidirectional firewall policy between two security zones.

To define a zone pair, use the **zone-pair security** command. The direction of the traffic is specified by source and destination zones. The source and destination zones of a zone pair must be security zones.

You can select the default or self zone as either the source or the destination zone. The self zone is a system-defined zone that does not have any interfaces as members. A zone pair that includes the self zone, along with the associated policy, applies to traffic directed to the device or traffic generated by the device. It does not apply to traffic that is passing through the device.

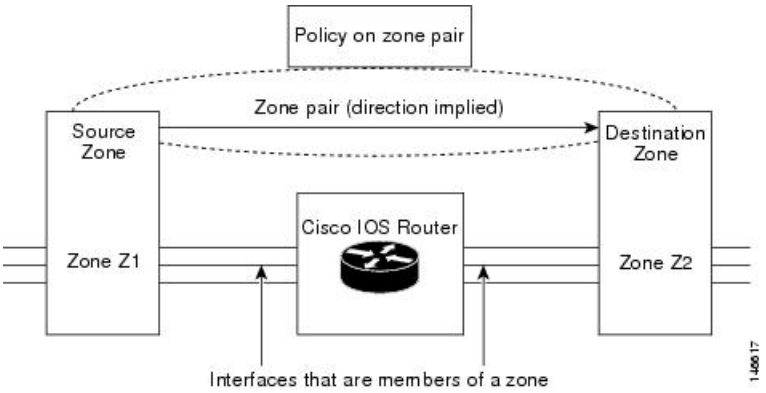
The default zone is applicable to interfaces where no security zone is associated. Default zones are not enabled by default. To enable default zones, use the **zone security default** configuration command.

Because the most common usage of firewall is applying them to traffic through a device, you need at least two zones. For traffic to and from the device, ZBF supports the concept of a self zone.

To permit traffic between zone member interfaces, you must configure a policy permitting (inspecting or passing) traffic between that zone and another zone. To attach a firewall policy map to the target zone pair, use the **service-policy type inspect** command.

The following figure shows the application of a firewall policy to traffic flowing from zone Z1 to zone Z2, which means that the ingress interface for the traffic is a member of zone Z1, and the egress interface is a member of zone Z2.

Figure 52: Zone Pairs



Since there are two zones, this might require policies for traffic going in both directions (from Z1 to Z2 and Z2 to Z1). If traffic is initiated from either direction, you must configure two zone pairs.

If a policy is not configured between zone pairs, traffic is dropped. However, it is not necessary to configure a zone pair and a service policy solely for the return traffic. By default, return traffic is not allowed. If a service policy inspects the traffic in the initiator direction and there is no zone pair and a service policy for the return traffic, the return traffic is inspected.

If a service policy passes the traffic in the forward direction and there is no zone pair and service policy for the return traffic, the return traffic is dropped. In both these cases, you need to configure a zone pair and a service policy to allow the return traffic. In figure 2, it is not mandatory that you configure a zone pair source and destination for allowing return traffic from Z2 to Z1. The service policy on the Z1 to Z2 zone pair takes care of it. For the pass action, a policy must exist for packets in each direction, and for the inspect action, a policy must exist for traffic from the initiator.

A zone-based firewall drops a packet if it is not explicitly allowed by a rule or policy in contrast to a legacy firewall, which permits a packet if it is not explicitly denied by a rule or policy by default.

A zone-based firewall behaves differently when handling intermittent Internet Control Message Protocol (ICMP) responses generated within a zone because of the traffic flowing between in-zones and out-zones.

A policy is not required for Internet Control Message Protocol (ICMP) error packets.

Note A policy is required for ICMP informational messages such as ICMP_ECHO (ping) for packets arriving from an initiator.

In a configuration where an explicit policy is configured for the self zone to go out of its zone and for the traffic moving between the in-zone and out-zone, if any informational ICMP packets, such as ICMP_EHCO_REQUEST are generated, then the zone-based firewall looks for an explicit permit rule for

the ICMP in the self zone to go out of its zone. An explicit inspect rule for the ICMP for the self zone to go out-zone may not help because no session is associated with the intermittent ICMP responses.

Zones and Inspection

Zone-based policy firewalls examine source and destination zones from the ingress and egress interfaces for a firewall policy. It is not necessary that all traffic flowing to or from an interface be inspected; you can designate that individual flows in a zone pair be inspected through your policy map that you apply across the zone pair. The policy map will contain class maps that specify individual flows. Traffic with the inspect action will create a connection in the firewall table and be subject to state checking. Traffic with the pass action will bypass the zone firewall completely, not creating any sessions. After a firewall connection is created, the packets are no longer classified. That is, if the policy map changes, the underlying connections are not noticed. Because a connection is not established, you must create a mirrored policy with a pass action for packets in the reverse direction.

You can also configure inspect parameters such as TCP thresholds and timeouts on a per-flow basis.

Zones and ACLs

Access control lists (ACLs) applied to interfaces that are members of zones are processed before the firewall policy is applied on the zone pair. You must ensure that interface ACLs do not interfere with the policy firewall traffic when there are policies between the source and destination zones. If a class map contains only an access list and does not contain a match protocol, a firewall attempts to match the flow protocol to known application-level gateways (ALGs) and process it as required.

Pinholes or ports opened through a firewall that allows applications-controlled access to a protected network are not punched for return traffic in interface ACLs.

Class Maps and Policy Maps for Zone-Based Policy Firewalls

Quality of service (QoS) class maps have numerous match criteria; firewalls have fewer match criteria. Firewall class maps are of type inspect and this information controls what shows up under firewall class maps.

A policy is an association of traffic classes and actions. It specifies what actions should be performed on defined traffic classes. An action is a specific function, and it is typically associated with a traffic class. For example, inspect, pass, and drop are actions.

Layer 3 and Layer 4 Class Maps and Policy Maps

Layer 3 and Layer 4 class maps identify traffic streams on which different actions should be performed.

A Layer 3 or Layer 4 policy map is sufficient for the basic inspection of traffic.

The following example shows how to configure class map c1 with the match criteria of ACL 101 and HTTP protocol. This command also creates an inspect policy map named p1 which specifies that the packets will be dropped as a part of the traffic at c1:

```
Device(config)# class-map type inspect match-all c1
Device(config-cmap)# match access-group 101
Device(config-cmap)# match protocol http
Device(config-cmap)# exit
Device(config)# policy-map type inspect p1
Device(config-pmap)# class type inspect c1
Device(config-pmap-c)# drop
```

Note On Cisco ASR 1000 Series Aggregation Services Routers, the firewall supports a maximum of 1000 policy maps and 8 classes inside a policy map. You can configure a maximum of 16 match statements in a class map and 1000 globally.

Class-Map Configuration Restriction

If traffic meets multiple match criteria, these match criteria must be applied in the order of specific to less specific. For example, consider the following class map:

```
class-map type inspect match-any my-test-cmap
 match protocol http
 match protocol tcp
```

In this example, the **match protocol http** command is first applied to the HTTP traffic to ensure that the traffic is handled by the service-specific capabilities of HTTP inspection. If the match lines are reversed, and the the **match protocol tcp** command is applied to the traffic before the **match protocol http** command, the traffic is classified as TCP traffic and inspected according to the capabilities of the TCP inspection component of the firewall. If the match protocol TCP is configured first, it creates issues for services such as FTP and TFTP, and for multimedia and voice signaling services such as H.323, Real Time Streaming Protocol (RTSP), Session Initiation Protocol (SIP), and Skinny Client Control Protocol (SCCP). These services require additional inspection capabilities to recognize more complex activities.

Note Configure zone-based firewall on the device such that the TCP traffic flow does not exceed 65k in the window size.

Class-Default Class Map

In addition to user-defined classes, a system-defined class map named class-default represents all the packets that do not match any of the user-defined classes in a policy. The class-default class is always the last class in a policy map.

You can define explicit actions for a group of packets that does not match any of the user-defined classes. If you do not configure any actions for the class-default class in an inspect policy, the default action is drop.

Note For a class-default in an inspect policy, you can configure only drop action or pass action.

The following example shows how to use class-default class in a policy map. In this example, the HTTP traffic is dropped, and the remaining traffic is inspected. Class map c1 is defined for HTTP traffic, and class-default class is used for a policy map p1.

```
Device(config)# class-map type inspect match-all c1
Device(config-cmap)# match protocol http
Device(config-cmap)# exit
Device(config)# policy-map type inspect p1
Device(config-pmap)# class type inspect c1
Device(config-pmap-c)# drop
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
```

```
Device(config-pmap-c)# drop
```

Supported Protocols for Layer 3 and Layer 4

The following protocols are supported:

- FTP
- H.323
- Real Time Streaming Protocol (RTSP)
- Skinny Client Control Protocol (SCCP)
- Session Initiation Protocol (SIP)
- Trivial File Transfer Protocol (TFTP)
- Route Convergence Monitoring and Diagnostics (RCMD)
- Lightweight Directory Access Protocol (LDAP)
- HTTP
- Domain Name System (DNS)
- Simple Mail Transfer Protocol (SMTP/ESMTP)
- Post Office Protocol 3 (POP3)
- Internet Mail Access Protocol (IMAP)
- SUN Remote Procedure Call (SUNRPC)
- GPRS Tunnel Protocol version 0/1 (GTPv1)
- GPRS Tunnel Protocol version 2 (GTPv2)
- Point-to-Point Tunneling Protocol (PPTP)

Access Control Lists and Class Maps

Access lists are packet-classifying mechanisms. Access lists define the actual network traffic that is permitted or denied when an ACL is applied to a specific class map. Thus, the ACL is a sequential collection of permit and deny conditions that apply to a packet. A router tests packets against the conditions set in the ACL one at a time. A deny condition is interpreted as *do not match* Packets that match a deny access control entry (ACE) cause an ACL process to be terminated and the next match statement within the class to be examined.

Note You can configure the range of variables in an ACL as match criteria for a class map. Because the firewall supports only the 5-tuple match criteria, only source address, source port, destination address, destination port and protocol match criteria are supported. Any other match criteria that is configured and accepted by the CLI, is not supported by the firewall

Class maps are used to match a range of variables in an ACL, based on the following criteria:

- If a class map does not match a permit or a deny condition, then the ACL fails.

- The match-all or match-any condition is applied to the match statements contained within the class map. ACLs are processed as normal, and the result is used when comparing against match-all or match-any.
- If a match-all attribute is specified, and any match condition, ACL, or protocol fails to match the packet, further evaluation of the current class is stopped, and the next class in the policy is examined.
- If any match in a match-any attribute succeeds, the class-map criteria are met and the action that is defined in the policy is performed.
- If an ACL matches the match-any attribute, the firewall attempts to ascertain the Layer 7 protocol based on the destination port.

If you specify the match-all attribute in a class map, the Layer 4 match criteria (ICMP, TCP, and UDP) are set, but the Layer 7 match criteria is not set. Hence, the Layer 4 inspection is performed and Layer 7 inspection is omitted.

Access lists come in different forms—standard and extended access lists. Standard access lists are defined to permit or deny an IP address or a range of IP addresses. Extended access lists define both the source and the destination IP address or an IP address range. Extended access lists can also be defined to permit or deny packets based on ICMP, TCP, and UDP protocol types and the destination port number of the packet.

The following example shows how a packet received from the IP address 10.2.3.4 is matched with the class test1. In this example, the access list 102 matches the deny condition and stops processing other entries in the access list. Because the class map is specified with a match-all attribute, the class-map test1 match fails. However, the class map is inspected if it matches one of the protocols listed in the test1 class map.

If the class map test1 had a match-any attribute instead of match-all, the ACL would have matched deny and failed, but the ACL would have matched the HTTP protocol and performed the inspection using pmap1.

```
access-list 102 deny ip 10.2.3.4 0.0.0.0 any
access-list 102 permit any any
class-map type inspect match-all test1
 match access-list 102
 match protocol http
!
class-map type inspect match-any test2
 match protocol sip
 match protocol ftp
 match protocol http
!
parameter-map type inspect pmap1
 tcp idle-time 15
!
parameter-map type inspect pmap2
 udp idle-time 3600
!
policy-map type inspect test
 class type inspect test1
  inspect pmap1
!
 class type inspect test2
  inspect pmap2
!
 class type inspect class-default
  drop log
```

Hierarchical Policy Maps

A policy can be nested within another policy. A policy that contains a nested policy is called a hierarchical policy.

To create an hierarchical policy, attach a policy directly to a class of traffic. An hierarchical policy contains a child policy and a parent policy. The child policy is a previously defined policy that is associated with the new policy using the **service-policy** command. The new policy that uses the pre-existing policy is the parent policy.

Note There can be a maximum of two levels in an hierarchical inspect service policy.

For example, define two access lists—marketing and engineering. Create a class map that does a match against any of the two access groups. Then, create another class map that includes the previous class map with a match-all condition and match the protocol HTTP.

Parameter Maps

A parameter map allows you to specify the parameters that control the behavior of actions and match the criteria specified under a policy map and a class map, respectively.

There are two types of parameter maps:

- Inspect parameter map: An inspect parameter map is optional. If you do not configure a parameter map, the software uses default parameters. Parameters associated with the inspect action apply to all maps. If parameters are specified at both the top and lower levels, parameters at the lower levels override those in the top levels.
- Protocol-specific parameter map: A parameter map that is required for an Instant Messenger (IM) application (Layer 7) policy map.

Firewall and Network Address Translation

Network Address Translation (NAT) enables private IP internetworks that use nonregistered IP addresses to connect to the internet. NAT operates on a device, usually connecting two networks, and translates private (not globally unique) addresses in the internal network into legal addresses before packets are forwarded to another network. NAT can be configured to advertise only one address for the entire network to the outside world. A device configured with NAT has at least one interface that connects to the inside network and one to the outside network.

In a typical environment, NAT is configured at the exit device between a stub domain and the backbone. When a packet leaves the domain, NAT translates the locally significant source address to a global unique address. When a packet enters the domain, NAT translates the globally unique destination address into a local address. If more than one exit point exists, each NAT must have the same translation table. If the software cannot allocate an address because it has run out of addresses, it drops the packet and sends an ICMP host unreachable packet.

With reference to NAT, the term *inside* refers to those networks that are owned by an organization and that must be translated. Inside this domain, hosts will have addresses in one address space. When NAT is configured and when the hosts are outside, hosts will appear to have addresses in another address space. The inside address space is referred to as the local address space and the outside address space is referred to as the global address space.

Consider a scenario where NAT translates both source and destination IP addresses. A packet is sent to a device from inside NAT with the source address 209.168.1.1 and the destination address 10.1.1.1. NAT

translates these addresses and sends the packet to the external network with the source address 209.165.200.225 and the destination address 209.165.200.224.

Similarly, when the response comes back from outside NAT, the source address will be 209.165.200.225 and the destination address will be 209.165.200.224. Therefore, inside NAT, the packets will have a source address of 10.1.1.1 and a destination address of 209.168.1.1.

In this scenario, if you want to create an Application Control Engine (ACE) to be used in a firewall policy, the pre-NAT IP addresses (also known as inside local and outside global addresses) 209.168.1.1 and 209.165.200.224 must be used. In general, we do not recommend mapping outside global addresses.

WAAS Support for the Cisco Firewall

Depending on your release, the Wide Area Application Services (WAAS) firewall software provides an integrated firewall that optimizes security-compliant WANs and application-acceleration solutions with the following benefits:

- Integrates WAAS networks transparently.
- Protects transparent WAN-accelerated traffic.
- Optimizes a WAN through full stateful-inspection capabilities.
- Simplifies Payment Card Industry (PCI) compliance.
- Supports the Network Management Equipment-Wide Area Application Engine (NME-WAE) modules or standalone WAAS device deployment.

WAAS has an automatic discovery mechanism that uses TCP options during the initial three-way handshake to identify WAE devices transparently. After automatic discovery, optimized traffic flows (paths) experience a change in the TCP sequence number to allow endpoints to distinguish between optimized and nonoptimized traffic flows.

Note Paths are synonymous with connections.

WAAS allows the Cisco firewall to automatically discover optimized traffic by enabling the sequence number to change without compromising the stateful Layer 4 inspection of TCP traffic flows that contain internal firewall TCP state variables. These variables are adjusted for the presence of WAE devices.

If the Cisco firewall notices that a traffic flow has successfully completed WAAS automatic discovery, it permits the initial sequence number shift for the traffic flow and maintains the Layer 4 state on the optimized traffic flow.

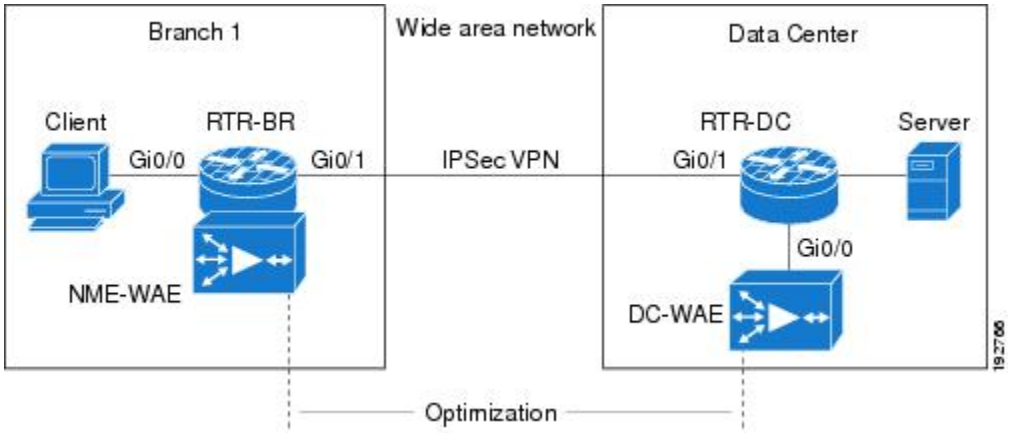
Note Stateful Layer 7 inspection on the client side can also be performed on nonoptimized traffic.

WAAS Traffic Flow Optimization Deployment Scenarios

The following sections describe two different WAAS traffic flow optimization scenarios for branch office deployments. WAAS traffic flow optimization works with the Cisco firewall feature on a Cisco Integrated Services Router (ISR). ZBF inspects the clear text after WAAS has unoptimized the packet.

The following figure shows an example of an end-to-end WAAS traffic flow optimization with the Cisco firewall. In this particular deployment, an NME-WAE is deployed on the same device as the Cisco firewall. Web Cache Communication Protocol (WCCP) is used to redirect traffic for interception.

Figure 53: End-to-End WAAS Optimization Path

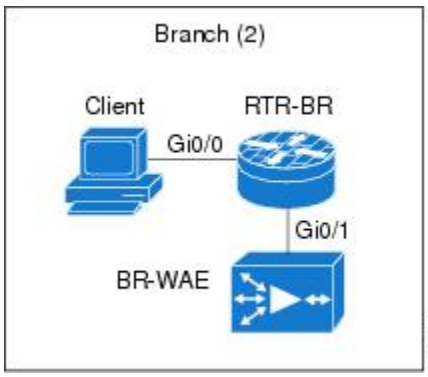


WAAS Branch Deployment with an Off-Path Device

A WAE device can be either a standalone WAE device or an NME-WAE device that is installed on an ISR as an integrated service engine as shown in the figure Wide Area Application Service [WAAS] Branch Deployment in this section.

The following figure shows a WAAS branch deployment that uses WCCP to redirect traffic to an off-path, standalone WAE device for traffic interception. The configuration for this option is the same as the WAAS branch deployment with an NME-WAE.

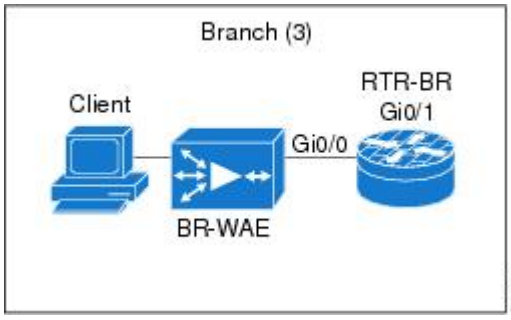
Figure 54: WAAS Off-Path Branch Deployment



WAAS Branch Deployment with an Inline Device

The following figure shows a WAAS branch deployment that has an inline WAE device that is physically in front of the Integrated Services Router (ISR). Because the WAE device is in front of the device, the Cisco firewall receives WAAS-optimized packets, and as a result, Layer 7 inspection on the client side is not supported.

Figure 55: WAAS Inline Path Branch Deployment



An edge WAAS device with the Cisco firewall is applied at branch office sites that must inspect the traffic moving to and from a WAN connection. The Cisco firewall monitors traffic for optimization indicators (TCP options and subsequent TCP sequence number changes) and allows optimized traffic to pass, while still applying Layer 4 stateful inspection and deep packet inspection to all traffic, and maintaining security while accommodating WAAS optimization advantages.

Note If the WAE device is in the inline location, the device enters the bypass mode after the automatic discovery process. Although the device is not directly involved in WAAS optimization, the device must be aware that WAAS optimization is applied to the traffic in order to apply Cisco firewall inspection to network traffic, and make allowances for optimization activity if optimization indicators are present.

Out-of-Order Packet Processing Support in the Zone-Based Firewalls

By default, the Cisco IOS XE firewall drops all out-of-order (OoO) packets when Layer 7 deep packet inspection is enabled or when Layer 4 inspection with Layer 7 protocol match is enabled. Dropping out-of-order packets can cause significant delays in end applications because packets are dropped only after the retransmission timer expires (on behalf of the sender). Layer 7 inspection is a stateful packet inspection and it does not work when TCP packets are out of order.

In Cisco IOS XE Release 3.5S, if a session does not require DPI, OoO packets are allowed to pass through the router and reach their destination. All Layer 4 traffic with OoO packets are allowed to pass through to their destination. However, if a session requires Layer 7 inspection, OoO packets are still dropped. By not dropping OoO packets when DPI is not required, the need to retransmit dropped packets and the bandwidth needed to retransmit on the network is reduced.

Severity Levels of Debug Messages

The severity level of debug messages specifies the types of issues for which a message is logged. While enabling firewall debugging, you can specify the level of messages that should be logged. The following table provides details about severity levels of debug messages.

Table 165: Severity Levels of Firewall Debug Messages

Trace Level	Severity Levels	Description
Critical	1	Applies to issues that make the zone-based policy firewall unusable or where the packets cannot be forwarded. This is the default. Examples of critical events are: • Back pressure triggered by the log mechanism. • Resource limit exceeded. • Memory allocation failure. • High-availability state not allowing new sessions.
Error	2	Applies to all error conditions and packet-drop conditions. Examples of error events are: • Synchronized (SYN) cookie: The number of maximum destination reached. • Not an initiator packet. • Could not send packets. • Application layer gateway (ALG) error condition.
Information	3	Applies to informational messages. Examples of information events are: • Packet drop because of incorrect policy configuration, zone-check failure, malformed packets, or hardcoded limit or threshold. • State machine transition. • Session or imprecise channel database information, search results, and so on. • Packet classification status or result. • Packet pass or drop status. • Session hit or miss. • Packet that is sent is a TCP reset (RST) packet. • SYN cookie event.
Detail	4	All log messages are printed. Examples of detailed events are: • Data structures. • Ternary content addressable memory (TCAM) search keys and result structure. • Firewall event details.

Smart Licensing Support for Zone-Based Policy Firewall

Zone-based policy firewall features for Cisco ASR 1000 Series Aggregation Services Routers are packaged separately from the security package, and hence, zone-based policy firewall requires a separate license to enable and disable features. Smart License support for zone-based firewall on ASR1000 feature implements support for smart licensing at a feature level for Cisco ASR 1000 Series Aggregation Services Routers through the Cisco UniversalK9 IOS software image.

The device need not be reloaded to enable the feature. Smart licensing is not turned on by default. Smart Licensing is toggled on or off globally through the **license smart enable** command or when configuring a zone-based policy firewall through the **zone security** command. The **show license all** command displays the status of smart license when smart licensing is implemented. The following is a sample output from the **show license all** command when smart licensing is enabled globally.

```
Device# show license all

License Store: Primary License Storage
StoreIndex: 0   Feature: internal_service                 Version: 1.0
        License Type: Evaluation
        License State: Active, In Use

```

Zone-Based Firewall Reclassification

From Cisco IOS XE 17.6.1, you can configure ZBFW Session Reclassification. With the ZBFW Reclassification feature, policy configuration changes are applied on the existing firewall sessions. A given flow is reclassified when a packet is received from the session initiator on an established session.

The following are some examples where this can occur:

- Adding, deleting, or editing filters under a class map by:
  - Removing a match protocol.
  - Removing an access group.
  - Editing an Access Control Entry (ACE) under an access-group.
  - Editing an object group.
- Adding, deleting, or editing an Application Visibility and Control (AVC) policy.

Depending on the modifications to a policy, one of the following actions might occur:

- Inspect to drop: The existing session is torn down and the session is removed from the session table.
- Inspect to pass: The existing session is torn down because the zone-based firewall does not inspect the flow. However, in this scenario, the traffic continues to flow.
- Inspect to inspect: The existing session is moved under a new class map.
- Pass to inspect / Drop to inspect: The existing behavior continues, and the flow is blocked because mid-flow reclassification is not supported.

Note When there is a policy change, you cannot establish data during mid-flow.

Prerequisites for Zone-Based Policy Firewalls

Before you create zones, you should group interfaces that are similar when they are viewed from a security perspective.

Restrictions for Zone-Based Policy Firewalls

- In a Cisco Wide Area Application Services (WAAS) and Cisco IOS XE firewall configuration, all the packets processed by a WAE device must go over the Cisco IOS XE firewall in both directions to support the WCCP generic routing encapsulation (GRE) redirect. This situation occurs when a Layer 2 redirect is not available. If a Layer 2 redirect is configured on the WAE, the system defaults to the GRE redirect to continue to function.
- Zone-based firewall cannot interoperate with WAAS and WCCP, when WCCP is configured with Layer 2 redirect method.
- Zone-based firewall configuration cannot be applied on Bridge Domain Interfaces (BDI) that involves a Cisco Unity Express Virtual (vCUE) call flow.
- The self zone is the only exception to the default deny-all policy. All traffic to any router interface is allowed until traffic is explicitly denied.
- In a WAAS and Cisco IOS XE firewall configuration, WCCP does not support traffic redirection using policy-based routing (PBR).
- WCCP traffic redirection does not work when the zone-based policy firewall that is enabled with generic GRE is configured on an ASR is configured with Cisco ISR-WAAS I/O modules. This configuration is a wide-area networking optimization solution. For WCCP traffic redirection to work, remove the zone-based policy firewall configuration from interfaces. If you are using a WAE device, WCCP traffic redirection works correctly.

  In the context of WAAS, generic GRE is an out-of-path deployment mechanism that helps to return packets from the WAAS WAE, through the GRE tunnel to the same device from which they were originally redirected, after completing optimization.
- Stateful inspection support for multicast traffic is not supported between any zones, including the self zone. Use Control Plane Policing for protection of the control plane against multicast traffic.
- When an in-to-out zone-based policy is configured to match the ICMP on a Windows system, the **traceroute** command works. However, the same configuration on an Apple system does not work because it uses a UDP-based traceroute. To overcome this issue, configure an out-to-in zone-based policy using the **icmp time-exceeded** and **icmp host unreachable** commands with the **pass** command (not the **inspect** command). This restriction applies to Cisco IOS XE Release 3.1S and earlier releases.
- ACLs are supported in a class map. However, the ACL-based packet count is disabled by default. Perfilter statistics is available in zone-based firewalls from Cisco IOS XE Release 3.13S and later releases.
- ACL statements using object groups are ignored for packets that are sent to a rendezvous point (RP) for processing.
- Bridge-domain interfaces do not support zone-based firewall inspection, including all Layer 4 and Layer 7 inspection.
- The ZBF cannot inspect traffic when NAT NVI is enabled on the device.
- When traffic enters a zone pair, the firewall examines the entire connection table and matches the traffic with any connection in the table even if the ingress interface does not match the zone pair. In this scenario, asymmetrically routed traffic on the firewall may drop packets, if the inspect action is configured.

In Cisco IOS XE Release 3.15S and later releases, zone-mismatch drop is configured in the class parameter map. If zone-mismatch drop is set, then the zones are checked against the original zones used when the packet is classified. If the zone is not part of the zone pair, the packet is dropped. If zone-mismatch drop is not set, then the zones are not checked.

- When ZBF is configured, all the interfaces that are a part of a zone pair much have RII configured. Interfaces that match the peer device must have the same RII configured. Additionally, flows that are initiated between two interfaces, where even one of the interface does not have an RII assigned, do not sync to the standby
- The zone-based firewall is supported with dynamic interfaces only in the default zone. These interfaces are created or deleted dynamically when traffic is tunneled IPsec or VPN secure tunnels. Virtual templates are used to support certain types of dynamic interfaces. For more information, see Virtual Interfaces as Members of Security Zones, on page 1423.
- To disable the zone-based firewall configurations that have been applied on the interfaces, use the **platform inspect disable-all** command. Similarly, to enable zone-based firewall on the interfaces, use the **no platform inspect disable-all** command.

  To verify if the **platform inspect disable-all** command has been applied, use the following **show running** configuration:

```
show run | sec disable
platform inspect disable-all
```

Note By default, zone-based firewall is always enabled.

- When the **droplog** command is configured under a user-defined class or the default class of a policy, disabling the logging of dropped packets by configuring the **drop** command does not stop the log messages. This is a known issue and the workaround is to configure the **nodroplog** command before configuring the **drop** command to stop the logging of messages. This issue applies to the **pass** command as well. The following example shows the issue:

```
! Logging of dropped packets is enabled by configuring the drop log command.
policy-map type inspect INT-EXT
 class type inspect INT-EXT
  pass
 class class-default
  drop log
!
```

  The following example shows the workaround:

```
! In this example, the no drop log command is configured before the drop command.
policy-map type inspect INT-EXT
 class type inspect INT-EXT
  pass
 class class-default
  drop log
  no drop log
  drop
!
```

- With the ZBFW Session Reclassification feature, mid-flow inspection is not supported for stateful traffic. For example, because of policy configuration changes, the action of an existing flow could change from drop to inspect. In this case, ZBFW does not inspect the existing flow.

- High availability is not supported for zone-based firewall policy reclassification.

How to Configure Zone-Based Policy Firewalls

The following sections provide information about the various tasks that comprise the zone-based policy firewalls configuration.

Configuring Layer 3 and Layer 4 Firewall Policies

Layer 3 and Layer 4 policies are *top-level* policies that are attached to the target (zone pair). Perform the following tasks to configure Layer 3 and Layer 4 firewall policies.

Configuring a Class Map for a Layer 3 and Layer 4 Firewall Policy

Use the following task to configure a class map for classifying network traffic.

Note You must perform at least one match step from step 4, 5, or 6.

When packets are matched to an access group, a protocol, or a class map, a traffic rate is generated for these packets. In a zone-based firewall policy, only the first packet that creates a session matches the policy. Subsequent packets in this flow do not match the filters in the configured policy, but match the session directly. The statistics related to subsequent packets are shown as part of the inspect action.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect** [**match-any** | **match-all**] *class-map-name*
4. **match access-group** {*access-group* | **name** *access-group-name*}
5. **match protocol** *protocol-name* [**signature**]
6. **match class-map** *class-map-name*
7. **end**
8. **show policy-map type inspect zone-pair session**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**class-map type inspect** [**match-any** | **match-all**] *class-map-name* **Example:** `Device(config)# class-map type inspect match-all c1`	Creates a Layer 3 or Layer 4 inspect type class map and enters class-map configuration mode.
Step 4	**match access-group** {*access-group* | **name** *access-group-name*} **Example:** `Device(config-cmap)# match access-group 101`	Configures the match criterion for a class map based on the ACL name or number.
Step 5	**match protocol** *protocol-name* [**signature**] **Example:** `Device(config-cmap)# match protocol http`	Configures the match criterion for a class map on the basis of a specified protocol. • Only Cisco stateful packet inspection-supported protocols can be used as match criteria in inspect type class maps.
Step 6	**match class-map** *class-map-name* **Example:** `Device(config-cmap)# match class-map c1`	Specifies a previously defined class as the match criteria for a class map.
Step 7	**end** **Example:** `Device(config-cmap)# end`	Exits class-map configuration mode and returns to privileged EXEC mode.
Step 8	**show policy-map type inspect zone-pair session** **Example:** `Device(config-cmap)# show policy-map type inspect zone-pair session`	(Optional) Displays Cisco stateful packet inspection sessions created because a policy map is applied on the specified zone pair. **Note** The information displayed under the **Class-map** field is the traffic rate (bits per second) of the traffic that belongs to the connection-initiating traffic only. Unless the connection setup rate is significantly high and is sustained for multiple intervals over which the rate is computed, no significant data is shown for the connection.

Creating a Policy Map for a Layer 3 and Layer 4 Firewall Policy

Use this procedure to create a policy map for a Layer 3 and Layer 4 firewall policy that will be attached to zone pairs.

If you are creating an inspect type policy map, note that only the following actions are allowed: drop, inspect, pass, and service-policy.

Note You must perform at least one step from step 5, 8, 9, or 10.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect** *policy-map-name*
4. **class type inspect** *class-name*
5. **inspect** [*parameter-map-name*]
6. **drop** [**log**]
7. **pass**
8. **service-policy type inspect** *policy-map-name*
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters the global configuration mode.
Step 3	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect p1`	Creates a Layer 3 and Layer 4 inspect type policy map and enters policy-map configuration mode.
Step 4	**class type inspect** *class-name* **Example:** `Device(config-pmap)# class type inspect c1`	Specifies the traffic class on which an action is to be performed and enters the policy-map class configuration mode.
Step 5	**inspect** [*parameter-map-name*] **Example:** `Device(config-pmap-c)# inspect inspect-params`	Enables Cisco stateful packet inspection.
Step 6	**drop** [**log**] **Example:** `Device(config-pmap-c)# drop`	(Optional) Drops packets that are matched with the defined class. **Note** The actions **drop** and **pass** are exclusive, and the actions **inspect** and **drop** are mutually exclusive. That is, you cannot specify both of them at the same time. Only one can be specified.

	Command or Action	Purpose
Step 7	**pass** **Example:** `Device(config-pmap-c)# pass`	(Optional) Allows packets that are matched with the defined class.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-pmap-c)# service-policy type inspect p1`	Attaches a firewall policy map to a zone pair.
Step 9	**end** **Example:** `Device(config-pmap-c)# end`	Exits policy-map class configuration mode and returns to privileged EXEC mode.

Creating an Inspect Parameter Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** {*parameter-map-name* | **global** | **default**}
4. **log** {**dropped-packets** {**disable** | **enable**} | **summary** [**flows** *number*] [**time-interval** *seconds*]}
5. **alert** {**on** | **off**}
6. **audit-trail** {**on** | **off**}
7. **dns-timeout** *seconds*
8. **icmp idle-timeout** *seconds*
9. **max-incomplete** {**low** | **high**} *number-of-connections*
10. **one-minute** {**low** | **high**} *number-of-connections*
11. **sessions maximum** *sessions*
12. **tcp finwait-time** *seconds*
13. **tcp idle-time** *seconds*
14. **tcp max-incomplete host** *threshold* [**block-time** *minutes*]
15. **tcp synwait-time** *seconds*
16. **tcp window-scale-enforcement loose**
17. **udp idle-time** *seconds*
18. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables the privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters the global configuration mode.
Step 3	**parameter-map type inspect** {*parameter-map-name* | **global** | **default**} **Example:** `Device(config)# parameter-map type inspect eng-network-profile`	Configures an inspect parameter map for connecting thresholds, timeouts, and other parameters that pertain to the **inspect** action, and enters parameter map type inspect configuration mode.
Step 4	**log** {**dropped-packets** {**disable** | **enable**} | **summary** [**flows** *number*] [**time-interval** *seconds*]} **Example:** `Device(config-profile)# log summary flows 15 time-interval 30`	(Optional) Configures packet logging during the firewall activity. **Note** This command is visible in parameter map type inspect configuration mode only.
Step 5	**alert** {**on** | **off**} **Example:** `Device(config-profile)# alert on`	(Optional) Enables Cisco stateful packet inspection alert messages that are displayed on the console.
Step 6	**audit-trail** {**on** | **off**} **Example:** `Device(config-profile)# audit-trail on`	(Optional) Enables audit trail messages.
Step 7	**dns-timeout** *seconds* **Example:** `Device(config-profile)# dns-timeout 60`	(Optional) Specifies the domain name system (DNS) idle timeout (the length of time for which a DNS lookup session will be managed when there is no activity).
Step 8	**icmp idle-timeout** *seconds* **Example:** `Device(config-profile)# icmp idle-timeout 90`	(Optional) Configures the timeout for the ICMP sessions.
Step 9	**max-incomplete** {**low** | **high**} *number-of-connections* **Example:** `Device(config-profile)# max-incomplete low 800`	(Optional) Defines the number of existing half-open sessions that will cause the Cisco firewall to start and to stop deleting half-open sessions.
Step 10	**one-minute** {**low** | **high**} *number-of-connections* **Example:** `Device(config-profile)# one-minute low 300`	(Optional) Defines the number of new unestablished sessions that will cause the system to start deleting half-open sessions and stop deleting half-open sessions.
Step 11	**sessions maximum** *sessions* **Example:** `Device(config-profile)# sessions maximum 200`	(Optional) Sets the maximum number of allowed sessions that can exist on a zone pair. Use this command to limit the bandwidth used by the sessions.

	Command or Action	Purpose
Step 12	**tcp finwait-time** *seconds* **Example:** `Device(config-profile)# tcp finwait-time 5`	(Optional) Specifies the length of time a TCP session will be managed for after the Cisco firewall detects a finish-exchange (FIN-exchange).
Step 13	**tcp idle-time** *seconds* **Example:** `Device(config-profile)# tcp idle-time 90`	(Optional) Configures the timeout for TCP sessions.
Step 14	**tcp max-incomplete host** *threshold* [**block-time** *minutes*] **Example:** `Device(config-profile)# tcp max-incomplete host 500 block-time 10`	(Optional) Specifies threshold and blocking time values for TCP host-specific Denial-of-Service (DoS) detection and prevention.
Step 15	**tcp synwait-time** *seconds* **Example:** `Device(config-profile)# tcp synwait-time 3`	(Optional) Specifies how long the software will wait for a TCP session to reach the established state before dropping the session.
Step 16	**tcp window-scale-enforcement loose** **Example:** `Device(config-profile)# tcp window-scale-enforcement loose`	(Optional) Disables the window scale option check in the parameter map for a TCP packet that has an invalid window scale option under the zone-based policy firewall.
Step 17	**udp idle-time** *seconds* **Example:** `Device(config-profile)# udp idle-time 75`	(Optional) Configures an idle timeout threshold of UDP sessions that are going through the firewall.
Step 18	**end** **Example:** `Device(config-profile)# end`	Exits parameter map type inspect configuration mode and returns to privileged EXEC configuration mode.

Creating Security Zones and Zone Pairs and Attaching a Policy Map to a Zone Pair

You need two security zones to create a zone pair. However, you can create only one security zone and use a system-defined security zone called *self*. Note that if you select a *self* zone, you cannot configure inspect policing.

A zone pair can have the same zone for source and destination zone. By default, traffic that stays within a zone is not inspected. In addition, there is the default zone (interfaces with no zone assignment) which can also be specified.

Use this process to complete the following tasks:

- Assign interfaces to security zones.
- Attach a policy map to a zone pair.

- Create at least one security zone.
- Define zone pairs.

Tip Before you create zones, think about what should constitute the zones. The general guideline is that you should group interfaces that are similar when they are viewed from a security perspective.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **description** *line-of-description*
5. **exit**
6. **interface** *type number*
7. **zone-member security** *zone-name*
8. **exit**
9. **zone-pair security** *zone-pair name* [**source** *source-zone-name* | **self** | *default*] **destination** [**self** | *default* | *destination-zone-name*]
10. **description** *line-of-description*
11. **service-policy type inspect** *policy-map-name*
12. **platform inspect match-statistics per-filter**
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables the privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters the global configuration mode.
Step 3	**zone security** *zone-name* **Example:** `Device(config)# zone security z1`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 4	**description** *line-of-description* **Example:** `Device(config-sec-zone)# description Internet Traffic`	(Optional) Describes the zone.

	Command or Action	Purpose
Step 5	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 6	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 7	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security zone1`	Assigns an interface to a specified security zone. **Note** When you make an interface a member of a security zone, all the traffic in and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone a part of a zone pair to which you should apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 8	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 9	**zone-pair security** *zone-pair name* [**source** *source-zone-name* | **self** | *default*] **destination** [**self** | *default* | *destination-zone-name*] **Example:** `Device(config)# zone-pair security zp source z1 destination z2`	Creates a zone pair and enters security zone-pair configuration mode. **Note** To apply a policy, you must configure a zone pair.
Step 10	**description** *line-of-description* **Example:** `Device(config-sec-zone-pair)# description accounting network to internet`	(Optional) Describes the zone pair.
Step 11	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect p2`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, the traffic is dropped by default.
Step 12	**platform inspect match-statistics per-filter** **Example:**	Enables zone-based firewall per-filter statistics.

	Command or Action	Purpose
	`Device(config-sec-zone-pair)# platform inspect match-statistics per-filter`	**Note** To enable per-filter statistics on the device, do the following: • Reload the device. Or, • Remove all the service policies and reapply the changes to the statistics. To activate the **platform inspect match-statistics per-filter** command, reapply all service policies.
Step 13	**end** **Example:** `Device(config-sec-zone-pair)# end`	Exits the security zone-pair configuration mode and returns to the privileged EXEC mode.

Configuring NetFlow Event Logging

Global parameter maps are used for NetFlow event logging. With NetFlow event logging enabled, logs are sent to an off-box, high-speed log collector. By default, this functionality is not enabled. If this functionality is not enabled, the firewall logs are sent to a logger buffer located in the route processor or console.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-global**
4. **log dropped-packets**
5. **log flow-export v9 udp destination** *ipv4-address port*
6. **log flow-export template timeout-rate** *seconds*
7. **end**
8. **show parameter-map type inspect-global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables Privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-global** **Example:**	Configures a global parameter map and enters parameter-map type inspect configuration mode.

	Command or Action	Purpose
	`Device(config)# parameter-map type inspect-global`	
Step 4	**log dropped-packets** **Example:** `Device(config-profile)# log dropped-packets`	Enables logging for all the packets dropped by the firewall.
Step 5	**log flow-export v9 udp destination** *ipv4-address port* **Example:** `Device(config-profile)# log flow-export v9 udp destination 192.0.2.0 5000`	Enables NetFlow event logging and provides the collector's IP address and port.
Step 6	**log flow-export template timeout-rate** *seconds* **Example:** `Device(config-profile)# log flow-export template timeout-rate 5000`	Specifies the template timeout value.
Step 7	**end** **Example:** `Device(config-profile)# end`	Exits global configuration mode and returns to privileged EXEC mode.
Step 8	**show parameter-map type inspect-global** **Example:** `Device# show parameter-map type inspect-global`	Displays the global inspect-type parameter map information.

Configuring the Firewall with WAAS

Perform the following task to configure an end-to-end WAAS traffic flow optimization for the firewall that uses L2 to redirect traffic to a WAE device for traffic interception. When configuring WCCP in a ZBFW enviornment, either L2 or GRE encapsulation is used. However, in this scenario, L2 redirection is important because GRE is required for zone based firewall.

In Cisco IOS XE software, WAAS support is enabled by default and WAAS processing is discovered.

Note Configuring the firewall with WAAS (steps 5 to 13) is not required post Cisco IOS XE Release 3.5S. The commands in steps 5 to 12 have been deprecated after Cisco IOS XE Release 3.5S.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip wccp** *service-id*
4. **ip wccp** *service-id*
5. **log dropped-packets enable**
6. **max-incomplete low**
7. **max-incomplete high**

8. **class-map type inspect** *class-name*
9. **match protocol** *protocol-name* [**signature**]
10. **exit**
11. **policy-map type inspect** *policy-map-name*
12. **class class-default**
13. **class-map type inspect** *class-name*
14. **inspect**
15. **exit**
16. **exit**
17. **zone security** *zone-name*
18. **description** *line-of-description*
19. **exit**
20. **zone-pair security** *zone-pair name* [**source** *source-zone-name* | **self**] **destination** [**self** | *destination-zone-name*]
21. **description** *line-of-description*
22. **exit**
23. **interface** *type number*
24. **description** *line-of-description*
25. **zone-member security** *zone-name*
26. **ip address** *ip-address*
27. **ip wccp** *service-id* {**group-listen** | **redirect** {**in** | **out**}}
28. **exit**
29. **zone-pair security** *zone-pair-name* {**source** *source-zone-name* | **self**} **destination** [**self** | *destination-zone-name*]
30. **service-policy type inspect** *policy-map-name*
31. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables the privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters the global configuration mode.
Step 3	**ip wccp** *service-id* **Example:** `Device(config)# ip wccp 61`	Enters the WCCP dynamically defined service identifier number.
Step 4	**ip wccp** *service-id* **Example:** `Device(config)# ip wccp 62`	Enters the WCCP dynamically defined service identifier number.

	Command or Action	Purpose
Step 5	**log dropped-packets enable** **Example:** `Device(config-profile)# log dropped-packets enable`	
Step 6	**max-incomplete low** **Example:** `Device(config)# max-incomplete low 18000`	
Step 7	**max-incomplete high** **Example:** `Device(config)# max-incomplete high 20000`	
Step 8	**class-map type inspect** *class-name* **Example:** `Device(config)# class-map type inspect most-traffic`	Creates an inspect type class map for the traffic class and enters class-map configuration mode. **Note** The **class-map type inspect most-traffic** command is hidden.
Step 9	**match protocol** *protocol-name* [**signature**] **Example:** `Device(config-cmap)# match protocol http`	Configures the match criteria for a class map on the basis of a specified protocol. Only Cisco stateful packet inspection-supported protocols can be used as match criteria in inspect type class maps.
Step 10	**exit** **Example:** `Device(config-cmap)# exit`	Exits the class-map configuration mode and returns to the global configuration mode.
Step 11	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect p1`	Creates a Layer 3 and Layer 4 inspect type policy map and enters policy-map configuration mode.
Step 12	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Specifies the matching of the system default class. • If the system default class is not specified, unclassified packets are matched.
Step 13	**class-map type inspect** *class-name* **Example:** `Device(config-pmap)# class-map type inspect most-traffic`	Specifies the firewall traffic (class) map on which an action is to be performed and enters policy-map class configuration mode.
Step 14	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables Cisco stateful packet inspection.
Step 15	**exit** **Example:**	Exits policy-map class configuration mode and returns to policy-map configuration mode.

	Command or Action	Purpose
	`Device(config-pmap-c)# exit`	
Step 16	**exit** **Example:** `Device(config-pmap)# exit`	Exits policy-map configuration mode and returns to global configuration mode.
Step 17	**zone security** *zone-name* **Example:** `Device(config)# zone security zone1`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 18	**description** *line-of-description* **Example:** `Device(config-sec-zone)# description Internet Traffic`	(Optional) Describes the zone.
Step 19	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 20	**zone-pair security** *zone-pair name* [**source** *source-zone-name* | **self**] **destination** [**self** | *destination-zone-name*] **Example:** `Device(config)# zone-pair security zp source z1 destination z2`	Creates a zone pair and enters security zone configuration mode. **Note** To apply a policy, you must configure a zone pair.
Step 21	**description** *line-of-description* **Example:** `Device(config-sec-zone)# description accounting network`	(Optional) Describes the zone pair.
Step 22	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 23	**interface** *type number* **Example:** `Device(config)# interface ethernet 0`	Specifies an interface and enters interface configuration mode.
Step 24	**description** *line-of-description* **Example:** `Device(config-if)# description zone interface`	(Optional) Describes an interface.
Step 25	**zone-member security** *zone-name* **Example:**	Assigns an interface to a specified security zone.

	Command or Action	Purpose
	`Device(config-if)# zone-member security zone1`	**Note** When you make an interface a member of a security zone, all traffic in and out of that interface (except the traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone a part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 26	**ip address** *ip-address* **Example:** `Device(config-if)# ip address 10.70.0.1 255.255.255.0`	Assigns an interface IP address for the security zone.
Step 27	**ip wccp** *service-id* {**group-listen** | **redirect** {**in** | **out**}} **Example:** `Device(config-if)# ip wccp 61 redirect in`	Specifies WCCP parameters on the interface.
Step 28	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 29	**zone-pair security** *zone-pair-name* {**source** *source-zone-name* | **self**} **destination** [**self** | *destination-zone-name*] **Example:** `Device(config)# zone-pair security zp source z1 destination z2`	Creates a zone pair and enters security zone-pair configuration mode.
Step 30	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect p2`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 31	**end** **Example:** `Device(config-sec-zone-pair)# end`	Exits security zone-pair configuration mode and returns to privileged EXEC mode.

Configuring Zone-Based Firewall Reclassification

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** {*parameter-map-name* | **global** | session-reclassify-allow}

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables the privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters the global configuration mode.
Step 3	**parameter-map type inspect** {*parameter-map-name* | **global** | session-reclassify-allow}	Enables a session reclassification by configuring the **session-reclassify-allow** attribute under the **parameter-map type inspect-global** mode. To disable this configuration, use the **no** form of the **session-reclassify-allow** command.

Configuration Examples for Zone-Based Policy Firewalls

The following sections provide examples relating to the configuration of zone-based policy firewalls.

Example: Configuring Layer 3 and Layer 4 Firewall Policies

The following example shows a Layer 3 or Layer 4 top-level policy. The traffic is matched to ACL 199 and deep-packet HTTP inspection is configured. Configuring the **match access-group 101** enables Layer 4 inspection. As a result, Layer 7 inspection is omitted unless the class map is of type match-all.

```
class-map type inspect match-all http-traffic
 match protocol http
 match access-group 101
!
policy-map type inspect mypolicy
 class type inspect http-traffic
  inspect
  service-policy http http-policy
```

Example: Creating an Inspect Parameter Map

The following sample configuration shows an inspect paramter map creation.

```
parameter-map type inspect eng-network-profile
 alert on
 audit-trail on
 dns-timeout 60
 icmp idle-timeout 90
 max-incomplete low 800
 one-minute low 300
 sessions maximum 200
 tcp finwait-time 5
```

```
 tcp idle-time 90
 tcp max-incomplete host 500 block-time 10
 tcp synwait-time 3
 udp idle-time 75
```

Example: Creating Security Zones and Zone Pairs and Attaching a Policy Map to a Zone Pair

Example: Creating a Security Zone

The following example shows how to create security zone z1, which is called finance department networks, and security zone z2, which is called engineering services network:

```
zone security z1
 description finance department networks
!
zone security z2
 description engineering services network
```

Example: Creating Zone Pairs

The following example shows how to create zones z1 and z2 and specify that the firewall policy map is applied in zone z2 for traffic flowing between zones:

```
zone-pair security zp source z1 destination z2
service-policy type inspect p1
```

Example: Assigning an Interface to a Security Zone

The following example shows how to attach Ethernet interface 0 to zone z1 and Ethernet interface 1 to zone z2:

```
interface ethernet0
 zone-member security z1
!
interface ethernet1
 zone-member security z2
```

Example: Zone-Based Firewall Per-filter Statistics

The following configuration example shows how to prevent memory shortage when a large number of firewall filters are created. To prevent memory shortage, you can enable the zone-based firewall per-filter statistics with the **platform inspect match-statistics per-filter** command. In the example, for each filter (ACL or UDP), there are statistics available for the number of packets and the number of bytes traversed through zone-based firewall.

```
Device# show policy-map type inspect zone-pair ogacl_zp
 Zone-pair: ogacl_zp
  Service-policy inspect : ogacl_pm
Class-map: ogacl_cm (match-any)
  Match: access-group name ogacl
        xxx packets, xxx bytes
      Match: protocol udp
        xxx packets, xxx bytes
```

Note Per-filter statistics are available only for match-any filters and are not applicable for match-all cases.

Note For Cisco IOS XE 16.3 and Cisco IOS XE 16.4 releases, to enable per-filter statistics, either reload the device or remove the service-policies and then reapply the service policies on the zone pair before the **platform inspect match-statistics per-filter** command is activated.

For Cisco IOS XE 3.17 release, you must save the configuration and reload the system to activate this command.

Note Similarly, to disable per-filter statistics, either reload the device or remove the service-policies and then reapply the service policies on the zone pair.

To check the TCAM memory used in a device, use the **show platform hardware qfp active classification feature-manager shm-stats-counter** command.

```
Device# show platform hardware qfp active classification feature-manager shm-stats-counter
    Shared Memory Information:
    Total shared memory size: 16777216
    Used shared memory size: 14703656
```

Note If traffic drops or per-filter statistics counters are not displayed, then probabilty is the TCAM shared memory used is more than 75% of the total TCAM.

Note If the shared memory used in the device is more than 75% of the capacity, the following warning message is displayed :

```
%CPP_FM-3-CPP_FM_TCAM_WARNING: SIP1: cpp_sp_svr: TCAM limit exceeded: Already used 75 percent
shared memory for per-filter stats.
```

If the shared memory used in the device is 100%, the following warning message is displayed:

```
%CPP_FM-3-CPP_FM_TCAM_WARNING: SIP1: cpp_sp_svr: TCAM limit exceeded: Shared memory for
per-filter stats overflow!
```

Example: Configuring NetFlow Event Logging

The following example specifies how to configure netflow event logging.

```
parameter-map type inspect global
 log dropped-packets
 log flow-export v9 udp destination 192.0.2.0 5000
 log flow-export template timeout rate 5000
```

Example: Configuring the Cisco Firewall with WAAS

The following is an example of an end-to-end WAAS traffic flow optimization configuration for the firewall that uses WCCP to redirect traffic to a WAE device for traffic interception.

The following configuration example shows how to prevent traffic from being dropped between security zone members because the integrated-service-engine interface is configured on a different zone, and each security zone member is assigned an interface.

```
! Zone-based firewall configuration on your router.
ip wccp 61
ip wccp 62
parameter-map type inspect global
 log dropped-packets enable
 max-incomplete low 18000
 max-incomplete high 20000
!
class-map type inspect match-any most-traffic
 match protocol icmp
 match protocol ftp
 match protocol tcp
 match protocol udp
!
policy-map type inspect p1
 class type inspect most-traffic
  inspect
!
 class class-default
  drop
!
zone security in
!
zone security out
!
zone security waas
!
zone-pair security in-out source in destination out
 service-policy type inspect p1
!
zone-pair security out-in source out destination in
 service-policy type inspect p1
!
zone-pair security waas-out source waas destination out
 service-policy type inspect p1
!
zone-pair security in-waas source in destination waas
 service-policy type inspect p1
!
interface GigabitEthernet0/0
 description WAN Connection

The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	http://www.cisco.com/support.

CHAPTER 123

Zone-Based Policy Firewall IPv6 Support

The zone-based policy firewall provides advanced traffic filtering or inspection of IPv4 packets. With IPv6 support, the zone-based policy firewall supports the inspection of IPv6 packets. Prior to IPv6 support, the firewall supported only the inspection of IPv4 packets. Only Layer 4 protocols, Internet Control Messaging Protocol (ICMP), TCP, and UDP packets are subject to IPv6 packet inspection.

This module describes the firewall features that are supported and how to configure a firewall for IPv6 packet inspection.

Restrictions for Zone-Based Policy Firewall IPv6 Support

The following functionalities are not supported:

- Application-level gateways (ALGs)
- Box-to-box high availability (HA)
- Distributed Denial-of-Service attacks
- Firewall resource management
- Layer 7 inspection
- Multicast packets
- Per-subscriber firewall or the broadband-based firewall
- Stateless Network Address Translation 64 (NAT64)
- VRF-Aware Software Infrastructure (VASI)
- Wide Area Application Services (WAAS) and Web Cache Communication Protocol (WCCP)

Information About IPv6 Zone-Based Firewall Support over VASI Interfaces

IPv6 Support for Firewall Features

The firewall features described in the table below are supported by IPv6 packet inspection:

Table 166: Firewall Features Supported on IPv6

Feature	Configuration Information
Class maps	*Zone-Based Policy Firewall* module.
Internet Control Message Protocol Version 6 (ICMPv6), TCP, and UDP protocols	• *Firewall Stateful Inspection of ICMP* module. • *Zone-Based Policy Firewall* module.
IP fragmentation	*Virtual Fragmentation Reassembly* module.
Intrachassis HA	—
Logging of error messages	*Zone-Based Policy Firewall* module.
Nested class maps	*Nested Class Map Support for Zone-Based Policy Firewall* module.
Out-of-order packet handling	The “Out-of-Order Packet Handling” section in the *Zone-Based Policy Firewall* module.
Parameter-maps—For inspect type parameter maps, the number of sessions defined in the parameter map will be cumulative for IPv4 and IPv6 sessions	*Zone-Based Policy Firewall* module.
Policy maps	*Zone-Based Policy Firewall* module.
Port-to-application mapping	—
Stateful Network Address Translation 64 (NAT64)	The *Stateful Network Address Translation 64* module in the *IP Addressing: NAT Configuration Guide*.
TCP SYN Cookie	*Configuring Firewall TCP SYN Cookie* module.
VPN routing and forwarding (VRF)-aware firewall	*VRF-Aware Cisco IOS XE Firewall* module.
Virtual fragmentation reassembly (VFR)	*Virtual Fragmentation Reassembly* module.
Zone, default zone, and zone pair	*Zone-Based Policy Firewall* module.

Dual-Stack Firewalls

A dual-stack firewall is a firewall running IPv4 and IPv6 traffic at the same time. A dual-stack firewall can be configured in the following scenarios:

- One firewall zone running IPv4 traffic and another running IPv6 traffic.
- IPv4 and IPv6 coexist when deployed with stateful Network Address Translation 64 (NAT64). In this scenario, the traffic flows from IPv6 to IPv4 and vice versa.
- The same zone pair allows both IPv4 and IPv6 traffic.

Firewall Actions for IPv6 Header Fields

The firewall actions for IPv6 header fields (in the order they are available in the IPv6 header) are described in the following table:

Table 167: IPv6 Header Fields

IPv6 Header Field	IPv6 Header Field Description	Firewall Action
Version	Similar to the Version field in the IPv4 packet header, except that this field lists number 6 for IPv6, instead of number 4 for IPv4.	Must be IPv6.
Traffic Class	Similar to the Type of Service (ToS) field in the IPv4 packet header. The Traffic Class field tags packets with a traffic class that is used in differentiated services.	Not inspected.
Flow Label	A new field in the IPv6 packet header. The Flow Label field tags packets with a specific flow that differentiates the packets at the network layer.	Not inspected.
Payload Length	Similar to the Total Length field in the IPv4 packet header. The Payload Length field indicates the total length of the data portion of the packet.	The firewall uses this field on a limited basis to calculate the length of some of the Layer 4 protocols, such as ICMP and TCP.
Next Header Length	Similar to the Protocol field in the IPv4 packet header. The value of the Next Header Length field determines the type of information that follows the basic IPv6 header. The type of information following the basic IPv6 header can be a transport-layer packet, for example, a TCP or a UDP packet, or an extension header.	The firewall must recognize this field to create a session.

IPv6 Header Field	IPv6 Header Field Description	Firewall Action
Hop Limit	Similar to the Time-to-Live (TTL) field in the IPv4 packet header. The value of the Hop Limit field specifies the maximum number of devices that an IPv6 packet can pass through before the packet is considered invalid. Each device decrements the Hop Limit value by one. Because the IPv6 header does not have a checksum, the device can decrement the value without recalculating the checksum.	Not inspected.

IPv6 Firewall Sessions

To perform stateful inspection of traffic, the firewall creates internal sessions for each traffic flow. The session information includes IP source and destination addresses, UDP or TCP source and destination ports or ICMP types, the Layer 4 protocol type (ICMP, TCP, or UDP), and VPN routing and forwarding (VRF) IDs. For an IPv6 firewall, the source and the destination addresses contain 128 bits of the IPv6 address.

The firewall creates a TCP session after receiving the first packet when the packet matches the configured policy. The firewall tracks the TCP sequence numbers and drops the TCP packets whose sequence numbers are not within the configured range. Sessions are removed when the TCP idle timer expires or when a Reset (RST) or Finish-Acknowledge (FIN-ACK) packet is received with the appropriate sequence numbers.

The firewall creates UDP sessions when the first UDP packet that matches the configured policy arrives and removes sessions when the UDP idle timer expires. The firewall does not create TCP or UDP sessions for IPv6 packets with multicast IPv6 or unknown IPv6 addresses.

Firewall Inspection of Fragmented Packets

The firewall supports the inspection of fragmented IPv6 packets. IP fragmentation is the process of breaking up a single IP datagram into multiple packets of smaller size. In IPv6, end nodes perform a path maximum transmission unit (MTU) discovery to determine the maximum size of the packet that is to be sent and generate IPv6 packets with the fragment extension header for packets larger than the MTU size.

The firewall inspects fragmented packets by using Virtual Fragmentation Reassembly (VFR). VFR examines the fragment extension header for out-of-sequence fragments and puts them in the correct order for inspection. When you enable the firewall on an interface by adding the interface to a zone, VFR is configured automatically on the same interface. If you explicitly disable VFR, the firewall only inspects the first fragments with Layer 4 headers and passes the rest of the fragments without inspection.

The fragment extension header appears in the following order of headers:

- IPv6 header
- Hop-by-hop options header
- Destination options header
- Routing header
- Fragment extension header

Cisco Express Forwarding checks IPv6 packets with fragment extension headers so that the firewall need not do further checks before processing the packets.

ICMPv6 Messages

IPv6 uses ICMPv6 to perform diagnostic functions, error reporting, and neighbor discovery. ICMPv6 messages are grouped into informational and error messages.

The firewall inspects only the following ICMPv6 messages:

- ECHO REQUEST
- ECHO REPLY
- DESTINATION UNREACHABLE
- PACKET TOO BIG
- PARAMETER PROBLEM
- TIME EXCEEDED

Note Neighbor discovery packets are passed and not inspected by the firewall.

Firewall Support of Stateful NAT64

The zone-based policy firewall supports Stateful NAT64. Stateful NAT64 translates IPv6 packets into IPv4 packets and vice versa. When both the firewall and Stateful NAT64 are configured on a router, the firewall uses IP addresses in an access control list (ACL) to filter packets. However, ACL does not support a mix of IPv4 and IPv6 addresses. Before the firewall and Stateful NAT64 can work together, you must use an IPv6 ACL and the IPv4 address must be embedded in the IPv6 ACL.

Note You cannot use VRF along with a firewall and a Stateful NAT64 configuration because Stateful NAT64 is not VRF-aware.

When a firewall class map uses an ACL, the ACL must use the real IP addresses on the host to configure packet flows. If only a source or a destination address is needed, either the IPv4 address or the IPv6 address is used in the class map ACL. Before the packet flow can be filtered based on both the source and destination addresses, the IPv6 address must be used and the IPv4 address must be embedded in the ACL. The ACL has to use IPv6 addresses to filter Stateful NAT64 packets.

Note Stateless NAT64 with firewall is not supported.

Port-to-Application Mapping

Port-to-application mapping (PAM) allows you to customize TCP or UDP port numbers for network services or applications. The firewall uses PAM to correlate TCP or UDP port numbers to specific network services or applications. By mapping port numbers to network services or applications, an administrator can force firewall inspection on custom configurations that are not defined by using well known ports. Use the **ip port-map** command to configure PAM.

High Availability and ISSU

The IPv6 firewall supports Intrabox HA. Firewall sessions are synchronized to the standby Embedded Services Processors (ESP) for a switchover. In Service Software Upgrade (ISSU) is also supported by the IPv6 firewall.

Pass Action for a Traffic Class

In a firewall, a traffic class identifies a set of packets based on its contents. You can define a class and apply an action to the identified traffic that reflects a policy. An action is a specific functionality that is associated with a traffic class. You can configure inspect, drop, and pass actions for a class.

The pass action passes the traffic from one zone to another. When the pass action is configured, the firewall does not inspect the traffic; it passes the traffic. In the IPv6 firewall, you must explicitly configure the pass action for the return traffic by defining a zone pair and a policy map with pass action.

The following example shows how to configure the pass action for policy maps, outside-to-inside-policy, and inside-to-outside-policy for IPv6 traffic:

```
policy-map type inspect outside-to-inside-policy
 class type inspect ipv6-class
  pass (Defines pass action for the ipv6-class from the outside to the inside)
!
 class class-default
!
policy-map type inspect inside-to-outside-policy
 class type inspect ipv4-class
  inspect (Defines inspect action for ipv4-class)
 class type inspect v6_class
  pass (Defines pass action for ipv6-class from the inside to the outside)
 class class-default
!
!
zone security inside
!
zone security outside
!
zone-pair security in-out source inside destination outside
 service-policy type inspect inside-to-outside-policy
!
zone-pair security out-in source outside destination inside
 service-policy type inspect outside-to-inside-policy
```

How to Configure Zone-Based Policy Firewall IPv6 Support

Configuring an IPv6 Firewall

The steps to configure an IPv4 firewall and an IPv6 firewall are the same. To configure an IPv6 firewall, you must configure the class map in such a way that only an IPv6 address family is matched.

The **match protocol** command applies to both IPv4 and IPv6 traffic and can be included in either an IPv4 policy or an IPv6 policy.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf-definition** *vrf-name*
4. **address-family ipv6**
5. **exit-address-family**
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **sessions maximum** *sessions*
9. **exit**
10. **ipv6 unicast-routing**
11. **ip port-map** *appl-name* **port** *port-num* **list** *list-name*
12. **ipv6 access-list** *access-list-name*
13. **permit ipv6 any any**
14. **exit**
15. **class-map type inspect match-all** *class-map-name*
16. **match access-group name** *access-group-name*
17. **match protocol** *protocol-name*
18. **exit**
19. **policy-map type inspect** *policy-map-name*
20. **class type inspect** *class-map-name*
21. **inspect** [*parameter-map-name*]
22. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:**	Enters global configuration mode.

	Command or Action	Purpose
	`Device# configure terminal`	
Step 3	**vrf-definition** *vrf-name* **Example:** `Device(config)# vrf-definition VRF1`	Configures a virtual routing and forwarding (VRF) routing table instance and enters VRF configuration mode.
Step 4	**address-family ipv6** **Example:** `Device(config-vrf)# address-family ipv6`	Enters VRF address family configuration mode and configures sessions that carry standard IPv6 address prefixes.
Step 5	**exit-address-family** **Example:** `Device(config-vrf-af)# exit-address-family`	Exits VRF address family configuration mode and enters VRF configuration mode.
Step 6	**exit** **Example:** `Device(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect ipv6-param-map`	Enables a global inspect-type parameter map for the firewall to connect thresholds, timeouts, and other parameters that pertain to the inspect action, and enters parameter-map type inspect configuration mode.
Step 8	**sessions maximum** *sessions* **Example:** `Device(config-profile)# sessions maximum 10000`	Sets the maximum number of allowed sessions that can exist on a zone pair.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**ipv6 unicast-routing** **Example:** `Device(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 11	**ip port-map** *appl-name* **port** *port-num* **list** *list-name* **Example:** `Device(config)# ip port-map ftp port 8090 list ipv6-acl`	Establishes a port to application mapping (PAM) by using the IPv6 access control list (ACL).
Step 12	**ipv6 access-list** *access-list-name* **Example:** `Device(config)# ipv6 access-list ipv6-acl`	Defines an IPv6 access list and enters IPv6 access list configuration mode.
Step 13	**permit ipv6 any any** **Example:**	Sets permit conditions for an IPv6 access list.

	Command or Action	Purpose
	`Device(config-ipv6-acl)# permit ipv6 any any`	
Step 14	**exit** **Example:** `Device(config-ipv6-acl)# exit`	Exits IPv6 access list configuration mode and enters global configuration mode.
Step 15	**class-map type inspect match-all** *class-map-name* **Example:** `Device(config)# class-map type inspect match-all ipv6-class`	Creates an application-specific inspect type class map and enters QoS class-map configuration mode.
Step 16	**match access-group name** *access-group-name* **Example:** `Device(config-cmap)# match access-group name ipv6-acl`	Configures the match criteria for a class map on the basis of the specified ACL.
Step 17	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol tcp`	Configures a match criterion for a class map on the basis of the specified protocol.
Step 18	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 19	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ipv6-policy`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 20	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect ipv6-class`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 21	**inspect** [*parameter-map-name*] **Example:** `Device(config-pmap-c)# inspect ipv6-param-map`	Enables stateful packet inspection.
Step 22	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.

Configuring Zones and Applying Zones to Interfaces

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **exit**
5. **zone security** *zone-name*
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** *source-zone* **destination** *destination-zone*]
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **ipv6 address** *ipv6-address/prefix-length*
12. **encapsulation dot1q** *vlan-id*
13. **zone-member security** *zone-name*
14. **end**
15. **show policy-map type inspect zone-pair sessions**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *zone-name* **Example:** `Device(config)# zone security z1`	Creates a security zone and enters security zone configuration mode.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 5	**zone security** *zone-name* **Example:** `Device(config)# zone security z2`	Creates a security zone and enters security zone configuration mode.
Step 6	**exit** **Example:**	Exits security zone configuration mode and enters global configuration mode.

	Command or Action	Purpose
	`Device(config-sec-zone)# exit`	
Step 7	**zone-pair security** *zone-pair-name* [**source** *source-zone* **destination** *destination-zone*] **Example:** `Device(config)# zone-pair security in-2-out source z1 destination z2`	Creates a zone pair and enters security zone-pair configuration mode.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect ipv6-policy`	Attaches a policy map to a top-level policy map.
Step 9	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0.1`	Configures a subinterface and enters subinterface configuration mode.
Step 11	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-subif)# ipv6 address 2001:DB8:2222:7272::72/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface or a subinterface.
Step 12	**encapsulation dot1q** *vlan-id* **Example:** `Device(config-subif)# encapsulation dot1q 2`	Sets the encapsulation method used by the interface.
Step 13	**zone-member security** *zone-name* **Example:** `Device(config-subif)# zone member security z1`	Configures the interface as a zone member. • For the *zone-name* argument, you must configure one of the zones that you had configured by using the **zone security** command. • When an interface is in a security zone, all traffic to and from that interface (except traffic going to the device or initiated by the device) is dropped by default. To permit traffic through an interface that is a zone member, you must make that zone part of the zone pair to which you apply a policy. If the policy permits traffic (via inspect or pass actions), traffic can flow through the interface.
Step 14	**end** **Example:** `Device(config-subif)# end`	Exits subinterface configuration mode and enters privileged EXEC mode.

	Command or Action	Purpose
Step 15	**show policy-map type inspect zone-pair sessions** **Example:** `Device# show policy-map type inspect zone-pair sessions`	Displays the stateful packet inspection sessions created because a policy map is applied on a specified zone pair. • The output of this command displays both IPv4 and IPv6 firewall sessions.

Example

The following sample output from the **show policy-map type inspect zone-pair sessions** command displays the translation of packets from an IPv6 address to an IPv4 address and vice versa:

```
Device# show policy-map type inspect zone-pair sessions

  Zone-pair: in-to-out
  Service-policy inspect : in-to-out

    Class-map: ipv6-class (match-any)
      Match: protocol ftp
      Match: protocol tcp
      Match: protocol udp
      Inspect
        Established Sessions
         Session 110D930C [2001:DB8:1::103]:32847=>(209.165.201.2:21) ftp SIS_OPEN
          Created 00:00:00, Last heard 00:00:00
          Bytes sent (initiator:responder) [37:84]

        Half-open Sessions
         Session 110D930C [2001:DB8:1::104]:32848=>(209.165.201.2:21) ftp SIS_OPENING
          Created 00:00:00, Last heard 00:00:00
          Bytes sent (initiator:responder) [0:0]
```

The following sample output from the **show policy-map type inspect zone-pair sessions** command displays the translation of packets from an IPv6 address to an IPv6 address:

```
Device# show policy-map type inspect zone-pair sessions

  Zone-pair: in-to-out
  Service-policy inspect : in-to-out

    Class-map: ipv6-class (match-any)
      Match: protocol ftp
      Match: protocol tcp
      Match: protocol udp
      Inspect
        Established Sessions
         Session 110D930C [2001:DB8:1::103]:63=>[2001:DB8:2::102]:63 udp SIS_OPEN
          Created 00:00:02, Last heard 00:00:01
          Bytes sent (initiator:responder) [162:0]
```

Configuring an IPv6 Firewall and Stateful NAT64 Port Address Translation

The following task configures an IPv6 firewall with Stateful NAT64 dynamic port address translation (PAT).

A PAT configuration maps multiple IPv6 hosts to a pool of available IPv4 addresses on a first-come first-served basis. The dynamic PAT configuration directly helps conserve the scarce IPv4 address space while providing connectivity to the IPv4 Internet.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 unicast-routing**
4. **interface** *type number*
5. **no ip address**
6. **zone-member security** *zone-name*
7. **negotiation auto**
8. **ipv6 address** *ipv6-address/prefix-length*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ipv6 unicast-routing** **Example:** `Device(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.

	Command or Action	Purpose
Step 4	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 5	**no ip address** **Example:** `Device(config-if)# no ip address`	Removes an IP address or disables IP processing.
Step 6	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone member security z1`	Attaches an interface to a security zone.
Step 7	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.
Step 8	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-if)# ipv6 address 2001:DB8:1::2/96`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 9	**ipv6 enable** **Example:** `Device(config-if)# ipv6 enable`	Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
Step 10	**nat64 enable** **Example:** `Device(config-if)# nat64 enable`	Enables NAT64 on an interface.
Step 11	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 12	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/1`	Configures an interface and enters interface configuration mode.
Step 13	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 209.165.201.25 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 14	**zone member security** *zone-name* **Example:** `Device(config-if)# zone member security z2`	Attaches an interface to a security zone.

	Command or Action	Purpose
Step 15	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.
Step 16	**nat64 enable** **Example:** `Device(config-if)# nat64 enable`	Enables NAT64 on an interface.
Step 17	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 18	**ipv6 access-list** *access-list-name* **Example:** `Device(config)# ipv6 access-list ipv6-ipv4-pair`	Defines an IPv6 access list and enters IPv6 access list configuration mode.
Step 19	**permit ipv6 host** *source-ipv6-address* **host** *destination-ipv6-address* **Example:** `Device(config-ipv6-acl)# permit ipv6 host 2001:DB8:1::2 host 209.165:201.25`	Sets permit conditions for an IPv6 access list, a source IPv6 host address, and a destination IPv6 host address.
Step 20	**exit** **Example:** `Device(config-ipv6-acl)# exit`	Exits IPv6 access list configuration mode and enters global configuration mode.
Step 21	**ipv6 route** *ipv6-prefix/length interface-type interface-number* **Example:** `Device(config)# ipv6 route 2001:DB8:1::2/96 gigabitethernet 0/0/0`	Establishes static IPv6 routes.
Step 22	**ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address* **Example:** `Device(config)# ipv6 neighbor 2001:DB8:1::2/96 gigabitethernet 0/0/0 0000.29f1.4841`	Configures a static entry in the IPv6 neighbor discovery cache.
Step 23	**nat64 v4 pool** *pool-name start-ip-address end-ip-address* **Example:** `Device(config)# nat64 v4 pool pool1 209.165.201.25 209.165.201.125`	Defines a Stateful NAT64 IPv4 address pool.
Step 24	**nat64 v6v4 list** *access-list-name* **pool** *pool-name* **overload** **Example:**	Enables NAT64 PAT or overload address translation.

	Command or Action	Purpose
	`Device(config)# nat64 v6v4 list nat64-ipv6-any pool pool1 overload`	
Step 25	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuration Examples for Zone-Based Policy Firewall IPv6 Support

Example: Configuring an IPv6 Firewall

```
Device# configure terminal
Device(config)# vrf-definition VRF1
Device(config-vrf)# address-family ipv6
Device(config-vrf-af)# exit-address-family
Device(config-vrf)# exit
Device(config)# parameter-map type inspect ipv6-param-map
Device(config-profile)# sessions maximum 10000
Device(config-profile)# exit
Device(config)# ipv6 unicast-routing
Device(config)# ip port-map ftp port 8090 list ipv6-acl
Device(config)# ipv6 access-list ipv6-acl
Device(config-ipv6-acl)# permit ipv6 any any
Device(config-ipv6-acl)# exit
Device(config)# class-map type inspect match-all ipv6-class
Device(config-cmap)# match access-group name ipv6-acl
Device(config-cmap)# match protocol tcp
Device(config-cmap)# exit
Device(config)# policy-map type inspect ipv6-policy
Device(config-pmap)# class type inspect ipv6-class
Device(config-pmap-c)# inspect ipv6-param-map
Device(config-pmap-c)# end
```

Example: Configuring Zones and Applying Zones to Interfaces

```
Device# configure terminal
Device(config)# zone security z1
Device(config-sec-zone)# exit
Device(config)# zone security z2
Device(config-sec-zone)# exit
Device(config)# zone-pair security in-to-out source z1 destination z2
Device(config-sec-zone-pair)# service-policy type inspect ipv6-policy
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/0.1
Device(config-if)# ipv6 address 2001:DB8:2222:7272::72/64
Device(config-if)# encapsulation dot1q 2
```

```
Device(config-if)# zone member security z1
Device(config-if)# end
```

Example: Configuring an IPv6 Firewall and Stateful NAT64 Port Address Translation

```
configure terminal
 ipv6 unicast-routing
 interface gigabitethernet 0/0/0
  no ip address
  zone member security z1
  negotiation auto
  ipv6 address 2001:DB8:1::2/96
  ipv6 enable
  nat64 enable
!
 interface gigabitethernet 0/0/1
  ip address 209.165.201.25 255.255.255.0
  zone member security z2
  negotiation auto
  nat64 enable
!
 ipv6 access-list ipv6-ipv4-pair
  permit ipv6 host 2001:DB8:1::2 host 209.165:201.25
!
 ipv6 route 2001:DB8:1::2/96 gigabitethernet 0/0/0
 ipv6 neighbor 2001:DB8:1::2/96 gigabitethernet 0/0/0 0000.29f1.4841
 nat64 v4 pool pool1 209.165.201.25 209.165.201.125
 nat64 v6v4 list nat64-ipv6-any pool pool1 overload
```

Feature Information for Zone-Based Policy Firewall IPv6 Support

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 168: Feature Information for Zone-Based Policy Firewall IPv6 Support

Feature Name	Releases	Feature Information
Zone-Based Policy Firewall IPv6 Support	Cisco IOS XE Release 3.6S	The Zone-Based Policy firewall supports the inspection of IPv6 packets. The following commands were introduced or modified: **ip port-map** and **show policy-map type inspect zone-pair**.

CHAPTER 124

VRF-Aware Cisco IOS XE Firewall

The VRF-Aware Cisco IOS XE Firewall applies the Cisco IOS XE Firewall functionality to VPN Routing and Forwarding (VRF) interfaces when the firewall is configured on a service provider (SP) or large enterprise edge routers. SPs provide managed services to small and medium business markets.

The VRF-Aware Cisco IOS XE Firewall supports VRF-lite (also known as Multi-VRF CE) and Application Inspection and Control (AIC) for various protocols.

The VRF-aware firewall supports VRF-lite (also known as Multi-VRF CE) and Application Inspection and Control (AIC) for various protocols.

Note Cisco IOS XE Releases do not support Context-Based Access Control (CBAC) firewalls.

Prerequisites for VRF-Aware Cisco IOS XE Firewall

- Understand Cisco IOS XE firewalls.
- Configure VRFs.

Restrictions for VRF-Aware Cisco IOS XE Firewall

- If two VPN networks have overlapping addresses, VRF-aware Network Address Translation (NAT) is required for them to support VRF-aware firewalls. NAT does not support inter-VRF routing. You can use the VRF-aware software infrastructure (VASI) for the inter-VRF routing functionality.

- You cannot apply per-VRF firewall policies if crypto tunnels that belong to multiple VPNs terminate on a single interface.
- Site-Site crypto maps on VASI interfaces are not supported on the following platforms:
  - Cisco 1000 Series Integrated Services Routers
  - Cisco 4000 Series Integrated Services Routers
  - Cisco 1000v Cloud Services Routers
- The same zone cannot be applied to interfaces that are configured on different VRFs.

Information About VRF-Aware Cisco IOS XE Firewall

VRF-Aware Cisco IOS XE Firewall

A VRF-aware firewall inspects IP packets that are sent or received within a VRF. VRF allows multiple instances of routing tables to coexist within a single router. This allows VPN segregation and the ability to have independent overlapping of IP address spaces. VRF allows traffic from the customers of one service provider to be isolated from another. The Cisco IOS XE VRF support splits the router into multiple routing domains, with each routing domain consisting of its own set of interfaces and routing and forwarding tables. Each routing domain is referenced by a unique identifier called the table ID. The global routing domain and the default routing domain (that is not associated with any VRF) is addressed with the table ID, zero. VRF supports overlapping of IP address space, thereby allowing the traffic from nonintersecting VRFs to have the same IP address.

The VRF-Aware Cisco IOS XE Firewall provides the following benefits:

- Scalable deployment—Scales to meet any network's bandwidth and performance requirements.
- VPN support—Provides a complete VPN solution based on Cisco IOS XE IPsec and other software-based technologies, including Layer 2 Tunneling Protocol (L2TP) tunneling, and quality of service (QoS).
- AIC support—Provides policy maps for the Internet Message Access Protocol (IMAP), Post Office Protocol 3 (POP3), Simple Mail Transfer Protocol (SMTP), and Sun Remote Procedure Call (SUN RPC)
- Allows users to configure a per-VRF firewall. The firewall inspects IP packets that are sent and received within a VRF. The firewall also inspects traffic between two different VRFs (intersecting VRFs).
- Allows SPs to deploy the firewall on the provider edge (PE) router.
- Supports overlapping IP address space, thereby allowing traffic from nonintersecting VRFs to have the same IP address.
- Supports VRF (not global) firewall command parameters and Denial-of-Service (DoS) parameters so that the VRF-aware firewall can run as multiple instances (with VRF instances) that are allocated to various VPN customers.
- Generates high-speed logging (HSL) messages that contain the VRF ID; however these messages are collected by a single collector.

The VRF-aware firewall allows you to limit the number of firewall sessions. If the firewall sessions are not limited, it would be difficult for VRFs to share router resources because one VRF may consume a maximum amount of resources, leaving few resources for other VRFs and thereby causing the denial of service to other VRFs.

Note On the Cisco ASR 1000 Series Aggregation Services Routers the firewall supports a maximum of 4000 VRFs.

Address Space Overlap

A VRF splits the device into multiple routing domains. Each of these routing domains contain their own set of interfaces and routing tables. A routing table is referenced by using a per-VRF unique table ID. Zero is the default global routing table ID that is not associated with a VPN routing and forwarding (VRF).

Nonintersecting VRFs are allowed to have overlapping address spaces (that is, the IP address of one VRF may be contained in others).

VRF

VPN routing and forwarding (VRF) allows multiple instances of routing tables to coexit within a single device. A VRF contains a template of a VRF table in a provider edge (PE) device.

The overlapping addresses, usually resulting from the use of private IP addresses in customer networks, are one of the major obstacles to the successful deployment of a peer-to-peer (P2P) VPN implementation. You can use the Multiprotocol Label Switching (MPLS) VPN technology to overcome the overlapping addresses issue.

Each VPN has its own routing and forwarding table in the device so that any customer or site that belongs to a VPN is provided access only to the set of routes contained within that table. Any PE device in the MPLS VPN network therefore contains a number of per-VPN routing tables and a global routing table that is used to reach other devices in the service provider (SP) network. Effectively, a number of virtual devices are created in a single physical device.

VRF-Lite

The VRF-Lite Aware Firewall feature, also called the VRF without MPLS-aware firewall, allows a firewall zone to be applied to non-MPLS-enabled VPN routing and forwarding (VRF) interfaces.

The VRF-Lite Aware Firewall feature enables a service provider (SP) to support two or more VPNs, in which IP addresses can be overlapped among VPNs. VRF-lite uses input interfaces to distinguish routes for different VPNs and forms virtual packet forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be physical, such as Ethernet ports, or logical, such as VLAN switched virtual interfaces (SVIs). However, a Layer 3 interface cannot belong to more than one VRF at a time.

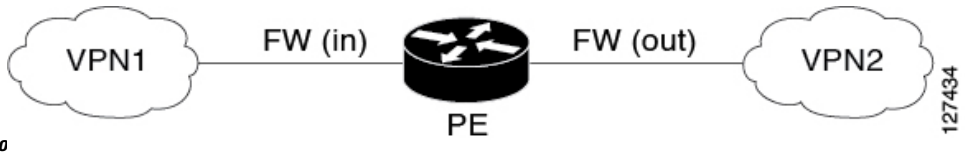
Note All VRF-lite interfaces must be Layer 3 interfaces.

VRF-lite includes the following devices:

- Customer edge (CE) devices provide customers access to the SP network over a data link. The CE device advertises the site's local routes to the provider edge (PE) device and learns about the remote VPN routes from the PE device.
- PE devices exchange routing information with CE devices by using static routing or a routing protocol such as Border Gateway Protocol (BGP), Routing Information Protocol Version 1 (RIPv1), or RIPv2.
- PE devices (or core devices) are any devices in the SP network that are not attached to CE devices.
- A PE device is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE device to maintain all the SP VPN routes. Each PE device maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE device can be associated with a single VRF, if all of these sites are part of the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CE devices, a PE device exchanges VPN routing information with other PE devices by using internal BGP (iBPG).

With VRF-lite, multiple customers can share one CE device, and only one physical link is used between the CE device and the PE device. The shared CE device maintains a separate VRF table for each customer, and switches or routes packets for each customer based on its own routing table. VRF-lite extends the limited PE device functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

Figure 56: Firewall in a VRF-to-VRF



Scenario

MPLS VPN

The Multiprotocol Label Switching (MPLS) VPN Feature allows multiple sites to interconnect transparently through a service provider (SP)network. One SP network can support several IP VPNs. Each VPN appears to its users as a private network, separate from all other networks. Within a VPN, each site can send IP packets to any other site in the same VPN.

Each VPN is associated with one or more VPN routing and forwarding (VRF) instances. A VRF consists of an IP routing table, a derived Cisco Express Forwarding table, and a set of interfaces that use the forwarding table.

The device maintains a separate routing and Cisco Express Forwarding table for each VRF. This prevents information from being sent outside the VPN and allows the same subnet to be used in several VPNs without causing duplicate IP address problems.

The device using Multiprotocol BGP (MP-BGP) distributes the VPN routing information using the MP-BGP extended communities.

VRF-Aware NAT

Network Address Translation (NAT) allows a single device, such as a device, to act as an agent between the Internet (or public network) and a local (or private) network. Although NAT systems can provide broad levels of security advantages, their main objective is to economize on address space.

NAT allows organizations to resolve the problem of IP address depletion when they have existing networks and need to access the Internet. Sites that do not possess Network Information Center (NIC)-registered IP addresses must acquire them. NAT eliminates the concern of NIC-registered IP addresses by dynamically mapping thousands of hidden internal addresses to a range of easy-to-get addresses.

A NAT system makes it difficult for an attacker to determine the following:

- Number of systems running on a network.
- Type of machines and operating systems running on the network.
- Network topology and arrangement.

NAT integration with Multiprotocol Label Switching (MPLS) VPNs allows multiple MPLS VPNs to be configured on a single device to work together. NAT can differentiate the MPLS VPNs from which it receives the IP traffic, even if all MPLS VPNs use the same IP addressing scheme. This enables multiple MPLS VPN customers to share services while ensuring that each MPLS VPN is completely separate from the other.

To provide value-added services, such as, Internet connectivity, domain name servers (DNS), and VoIP service to customers, MPLS service providers must use NAT. NAT helps MPLS VPN customers to use overlapped IP addresses in their network.

NAT can be implemented on a customer edge (CE) device or on a provider edge (PE) device. The NAT integration with MPLS VPNs feature enables the implementation of NAT on a PE device in an MPLS cloud.

VRF-Aware ALG

An application-layer gateway (ALG) is an application that translates the IP address information inside the payload of an application packet. The ALGs identify the address information in the packet payload that needs to be overwritten by NAT and supply the address information to NAT and firewall to create subordinate flows or doors to allow data to flow properly (an example of data flow is FTP data flow. Doors are transient structures that allow incoming traffic that matches a specific criterion. A door is created when there is not enough information to create a complete NAT session entry. A door contains information about the source and destination IP address and the destination port. However, it does not have information about the source port. When media data arrives, the source port information is known and the door is promoted to a real NAT session.

VRF-Aware IPsec

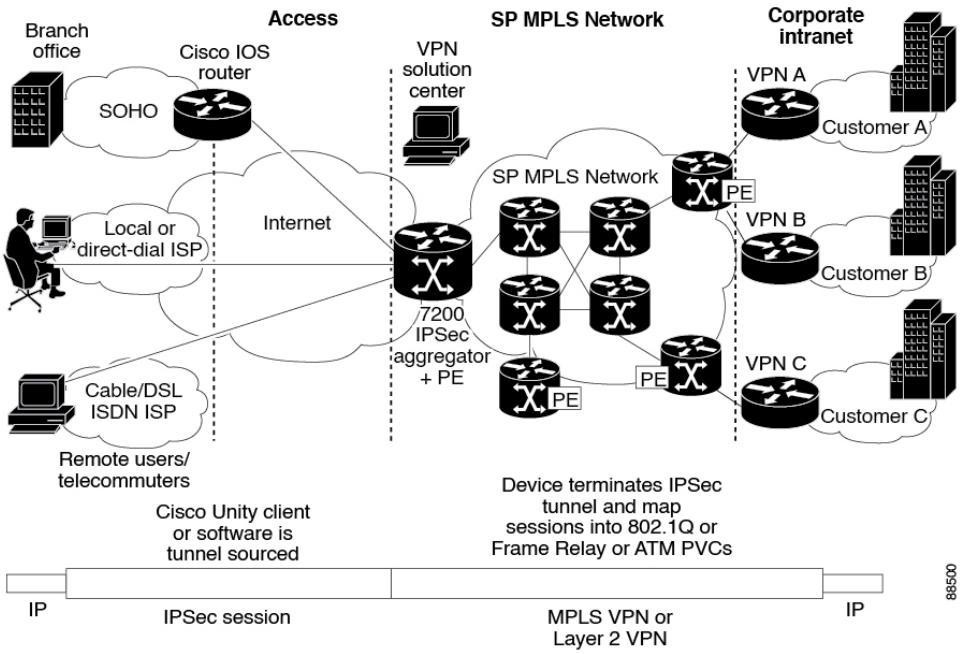
The VRF-Aware IPsec feature maps an IPsec tunnel to a Multiprotocol Label Switching (MPLS) VPN. Using the VRF-Aware IPsec feature, you can map IPsec tunnels to VPN routing and forwarding (VRF) instances using a single public-facing IP address.

Each IPsec tunnel is associated with two VRF domains. The outer encapsulated packet belongs to a VRF domain called the Front Door VRF (FVRF). The inner, protected IP packet belongs to a domain called the Inside VRF (IVRF). In other words, the local endpoint of the IPsec tunnel belongs to the FVRF, whereas source and destination addresses of the inside packet belong to the IVRF.

One or more IPsec tunnels can terminate on a single interface. The FVRF of all these tunnels is the same and is set to the VRF that is configured on that interface. The IVRF of these tunnels can be different and depends on the VRF that is defined in the Internet Security Association and Key Management Protocol (ISAKMP) profile that is attached to a crypto map entry.

The following figure illustrates a scenario showing IPsec to MPLS and Layer 2 VPNs.

Figure 57: IPsec-to-MPLS and Layer 2 VPNs



VRF-Aware Software Infrastructure

The VRF-Aware Software Infrastructure (VASI) allows you to apply services such as access control lists (ACLs), NAT, policing, and zone-based firewalls to traffic that is flowing across two different VRF instances. The VASI interfaces support redundancy of the Route Processor (RP) and Forwarding Processor (FP). This feature supports IPv4 and IPv6 unicast traffic on VASI interfaces.

The primary use of VASI is to allow better isolation of VRFs. The VASI allows for per-VRF-specific features to be applied to the VASI interface without any impact to other VRFs that may share a common interface (for example, all VRFs may share the same interface to the Internet). For the firewall, this feature allows zones to be applied to the VASI.

VASI is implemented by using virtual interface pairs, where each of the interfaces in the pair is associated with a different VRF. The VASI virtual interface is the next hop interface for any packet that needs to be switched between these two VRFs. VASI interfaces provide the framework necessary to support NAT between two VRFs.

Each interface pair is associated with two different VRF instances. The two virtual interfaces, called vasileft and vasiright, in a pair are logically wired back-to-back and are completely symmetrical. Each interface has an index. The association of the pairing is done automatically based on the two interface indexes such that vasileft automatically gets paired to vasiright. You can configure either static routing or dynamic routing with BGP, Enhanced Interior Gateway Routing Protocol (EIGRP), or Open Shortest Path First (OSPF). BGP dynamic routing protocol restrictions and configuration are valid for BGP routing configurations between VASI interfaces. For more information on VASI, see the “ *Configuring the VRF-Aware Software Infrastructure* ” feature.

Security Zones

A security zone is a group of interfaces to which a policy can be applied.

Grouping interfaces into zones involves two procedures:

- Creating a zone so that interfaces can be attached to it.
- Configuring an interface to be a member of a given zone.

By default, traffic flows between interfaces that are members of the same zone.

When an interface is a member of a security zone, all traffic (except traffic going to the device or initiated by the device) between that interface and an interface in a different zone is dropped by default. To permit traffic to and from a zone-member interface and another interface, you must make that zone part of a zone pair, and apply a policy to that zone pair. If the policy permits traffic through inspect or pass actions, traffic can flow through the interface.

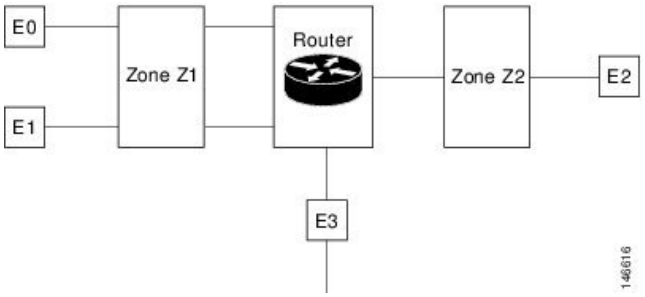
The following are the basic rules to consider when setting up zones:

- Traffic from a zone interface to a nonzone interface, or from a nonzone interface to a zone interface is always dropped; unless default zones are enabled (default zone is a nonzone interface).
- Traffic between two zone interfaces is inspected if there is a zone pair relationship for each zone, and if there is a configured policy for that zone pair.
- By default, all traffic between two interfaces in the same zone is always allowed.
- A zone pair can be configured with a zone as both source and destination zones. An inspect policy can be configured on this zone pair to inspect, pass, or drop the traffic between the two zones.
- An interface can be a member of only one security zone.
- When an interface is a member of a security zone, all traffic to and from that interface is blocked unless you configure an explicit interzone policy on a zone pair involving that zone.
- For traffic to flow between all the interfaces in a device, these interfaces must be members of one security zone or another. It is not necessary for all the device interfaces to be members of security zones.
- All the interfaces associated with a zone must be contained in the same virtual routing and forwarding (VRF).

Figure 1 illustrates the following:

- Interfaces E0 and E1 are members of security zone Z1.
- Interface E2 is a member of security zone Z2.
- Interface E3 is not a member of any security zone.

Figure 58: Security Zone Restrictions



- The zone pair and policy are configured in the same zone. Traffic flows freely between interfaces E0 and E1 because they are members of the same security zone (Z1).
- If no policies are configured, traffic will not flow between any other interfaces, for example, E0 and E2, E1 and E2, E3 and E1, and E3 and E2.
- Traffic can flow between E0 or E1 and E2 only when an explicit policy permitting traffic is configured between zone Z1 and zone Z2.
- Traffic can never flow between E3 and E0, E1, or E2 unless default zones are enabled.

Note On the Cisco ASR 1000 Series Aggregation Services Routers, the firewall supports a maximum of 4000 zones.

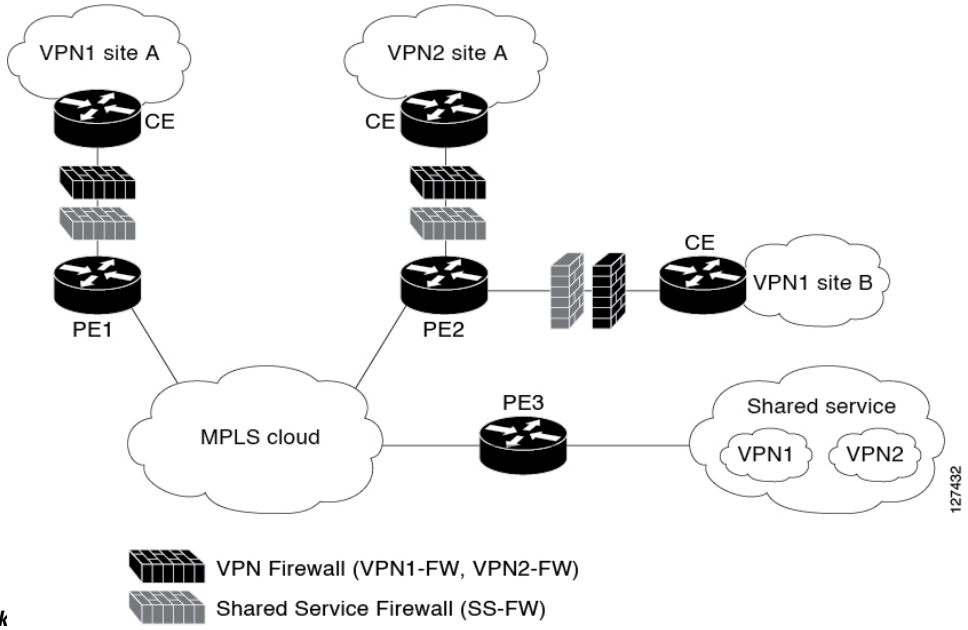
VRF-Aware Cisco Firewall Deployment

A firewall can be deployed at many points within the network to protect VPN sites from shared service (or the Internet) and vice versa. This section describes the following firewall deployment scenarios:

Distributed Network Inclusion of VRF-Aware Cisco Firewall

The following figure illustrates a typical situation in which a service provider (SP) offers firewall services to VPN customers VPN1 and VPN2, thereby protecting VPN sites from an external network (for example, shared services and the Internet) and vice versa.

Figure 59: Distributed



Network

In this example, VPN1 has two sites, Site A and Site B, that span across the Multiprotocol Label Switching (MPLS) core. Site A is connected to PE1, and Site B is connected to PE2. VPN2 has only one site that is connected to PE2. Each VPN has a VLAN segment in the shared service that is connected to the corresponding VLAN subinterface on PE3.

Each of the VPNs (VPN1 and VPN2) has two firewall rules—one to protect the VPN site from the shared service and another to protect the shared service from the VPN site. The firewall that protects the VPN site from the shared service is called the VPN firewall, and the firewall that protects the shared service from the VPN site is called the shared service firewall. Both firewall rules are applied on the VPN routing and forwarding (VRF) interface of each ingress provider edge (PE) device that is connected to the VPN site. The VPN firewall rule is applied in the ingress direction, because the VRF interface is ingress to the VPN site; and the shared service firewall rule is applied in the egress direction, because the VRF interface is egress to the shared service.

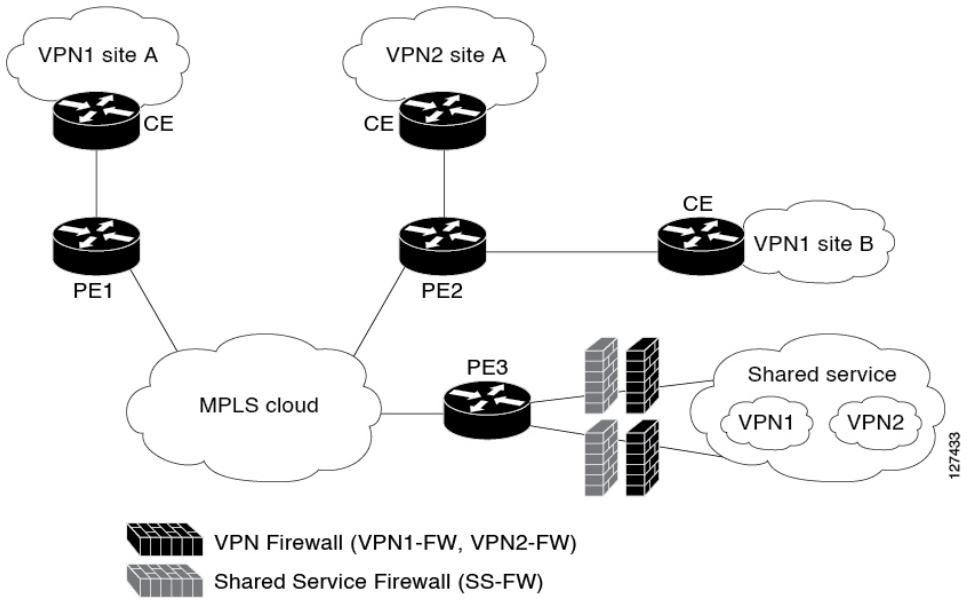
The benefits of using a distributed network are as follows:

- Because the firewall deployment is distributed across a Multiprotocol Label Switching (MPLS) cloud, the firewall processing load is distributed to all ingress PE devices.
- The shared service is protected from VPN sites at the ingress PE device, and hence malicious packets from VPN sites are filtered at the ingress PE device before they enter the MPLS cloud.
- VPN firewall features can be deployed in the ingress direction.

Hub-and-Spoke Network Inclusion of VRF-Aware Cisco Firewall

The following figure illustrates a hub-and-spoke network where firewalls for all VPN sites are applied on the egress PE device, PE3, which is connected to the shared service.

Figure 60: Hub-and-Spoke Network



Typically, each VPN has a VLAN and/or a VPN routing and forwarding (VRF) subinterface that is connected to the shared service. When a packet arrives at a Multiprotocol Label Switching (MPLS) interface, MPLS routes the packet to the corresponding subinterface that is connected to the shared service. Firewall policies on each VPN are applied on the corresponding subinterface (VRF interface) as shown in the above figure. The VPN firewall rule is applied in the egress direction because the subinterface is egress to the VPN site. And the shared service firewall rule is applied in the ingress direction because the subinterface is ingress to the shared service.

The benefits of a hub-and-spoke network are as follows:

- Because the firewall deployment is centralized to the egress provider edge (PE) device (PE3), deploying and managing the firewall is easy.
- The shared service firewall feature can be applied in the ingress direction.
- The VPN site is protected from the shared service at the egress PE device, and hence malicious packets from the shared service are filtered at the PE device before they enter the MPLS cloud.

How to Configure VRF-Aware Cisco IOS XE Firewall

Defining VRFs, Class Maps, and Policy Maps

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*

5. **route-target export** *route-target-ext-community*
6. **route-target import** *route-target-ext-community*
7. **exit**
8. **class-map type inspect match-any** *class-map-name*
9. **match protocol tcp**
10. **match protocol h323**
11. **exit**
12. **policy-map type inspect** *policy-map-name*
13. **class type inspect** *class-map-name*
14. **inspect** [*parameter-map-name*]
15. **exit**
16. **class class-default**
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ip vrf** *vrf-name* **Example:** `Router(config)# ip vrf vrf1`	Defines a VRF instance and to enter VRF configuration mode.
Step 4	**rd** *route-distinguisher* **Example:** `Router(config-vrf)# rd 10:1`	Specifies a route distinguisher (RD) for a VRF instance.
Step 5	**route-target export** *route-target-ext-community* **Example:** `Router(config-vrf)# route-target export 10:1`	Creates a route-target extended community for a VRF instance and exports routing information to the target VPN extended community.
Step 6	**route-target import** *route-target-ext-community* **Example:** `Router(config-vrf)# route-target import 10:1`	Creates a route-target extended community for a VRF instance and imports routing information to the target VPN extended community.
Step 7	**exit** **Example:** `Router(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 8	**class-map type inspect match-any** *class-map-name* **Example:** `Router(config)# class-map type inspect match-any class-map1`	Creates a Layer 3 and Layer 4 (application-specific) inspect type class map and enters class-map configuration mode.
Step 9	**match protocol tcp** **Example:** `Router(config-cmap)# match protocol tcp`	Configures the match criterion for a class map on the basis of the specified protocol.
Step 10	**match protocol h323** **Example:** `Router(config-cmap)# match protocol h323`	Configures the match criterion for a class map on the basis of the specified protocol.
Step 11	**exit** **Example:** `Router(config-cmap)# exit`	Exits class-map configuration mode and enters global configuration mode.
Step 12	**policy-map type inspect** *policy-map-name* **Example:** `Router(config)# policy-map type inspect global-vpn1-pmap`	Creates a Layer 3 and Layer 4 (protocol-specific) inspect type policy map and enters policy-map configuration mode.
Step 13	**class type inspect** *class-map-name* **Example:** `Router(config-pmap)# class type inspect class-map1`	Specifies the traffic (class) on which an action is to be performed and enters policy-map-class configuration mode.
Step 14	**inspect** [*parameter-map-name*] **Example:** `Router(config-pmap-c)# inspect class-map1`	Enables Cisco IOS XE stateful packet inspection.
Step 15	**exit** **Example:** `Router(config-pmap-c)# exit`	Exits policy-map-class configuration mode and enters policy-map configuration mode.
Step 16	**class class-default** **Example:** `Router(config-pmap)# class class-default`	Specifies the default class so that you can configure or modify its policy. • The class-default class is defined by default. Configure the **class class-default** command to change the default drop attribute that is associated with the class-default.
Step 17	**end** **Example:** `Router(config-pmap)# end`	Exits policy-map configuration mode and enters global configuration mode.

Defining Zones and Zone Pairs

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *security-zone-name*
4. **exit**
5. **zone security** *security-zone-name*
6. **exit**
7. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
8. **service-policy type inspect** *policy-map-name*
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *security-zone-name* **Example:** `Router(config)# zone security vpn1-zone`	Creates a security zone and enters security zone configuration mode.
Step 4	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 5	**zone security** *security-zone-name* **Example:** `Router(config)# zone security global-zone`	Creates a security zone and enters security zone configuration mode.
Step 6	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:**	Creates a zone pair and enters security zone-pair configuration mode. • *zone-pair-name*--Name of the zone being attached to an interface.

	Command or Action	Purpose
	`Router(config)# zone-pair security vpn1-global-zone-pair source vpn1-zone destination global-zone`	• **source** *source-zone*--Specifies the name of the router from which traffic is originating. • **destination** *destination-zone*--Specifies the name of the router to which traffic is bound.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Router(config-sec-zone-pair)# service-policy type inspect global-vpn1-pmap`	Attaches a Layer 7 policy map to a top-level policy map.
Step 9	**end** **Example:** `Router(config-sec-zone-pair)# end`	Exits zone-pair configuration mode and enters privileged EXEC mode.

Applying Zones to Interfaces and Defining Routes

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip vrf forwarding** *name*
5. **ip address** *ip-address mask*
6. **zone-member security** *zone-name*
7. **negotiation auto**
8. **exit**
9. **interface** *type number*
10. **ip address** *ip-address mask*
11. **zone-member security** *zone-name*
12. **negotiation auto**
13. **exit**
14. **ip route vrf** *vrf-name destination-ip-address destination-prefix interface-type number* [**global**]
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:**	Enters global configuration mode.

	Command or Action	Purpose
	`Router# configure terminal`	
Step 3	**interface** *type number* **Example:** `Router(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 4	**ip vrf forwarding** *name* **Example:** `Router(config-if)# ip vrf forwarding vrf1`	Associates a VRF with an interface or subinterface.
Step 5	**ip address** *ip-address mask* **Example:** `Router(config-if)# ip address 10.1.1.1 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 6	**zone-member security** *zone-name* **Example:** `Router(config-if)# zone-member security vpn1-zone`	Attaches an interface to a security zone.
Step 7	**negotiation auto** **Example:** `Router(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.
Step 8	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 9	**interface** *type number* **Example:** `Router(config)# interface gigabitethernet 1/1/1`	Configures an interface and enters interface configuration mode.
Step 10	**ip address** *ip-address mask* **Example:** `Router(config-if)# ip address 10.111.111.111 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 11	**zone-member security** *zone-name* **Example:** `Router(config-if)# zone-member security global-zone`	Attaches an interface to a security zone.
Step 12	**negotiation auto** **Example:** `Router(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.

	Command or Action	Purpose
Step 13	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 14	**ip route vrf** *vrf-name destination-ip-address destination-prefix interface-type number* [**global**] **Example:** `Router(config)# ip route vrf vpn1 10.111.111.0 255.255.255.0 gigabitethernet 1/1/1 global`	Establishes static routes for a VRF instance.
Step 15	**end** **Example:** `Router(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuration Examples for VRF-Aware Cisco IOS XE Firewall

Example: Defining VRFs, Class Maps, and Policy Maps

```
Router# configure terminal
Router(config)# ip vrf vrf1
Router(config-vrf)# rd 10:1
Router(config-vrf)# route-target export 10:1
Router(config-vrf)# route-target import 10:1
Router(config-vrf)# exit
Router(config)# class-map type inspect match-any class-map1
Router(config-cmap)# match protocol tcp
Router(config-cmap)# match protocol h323
Router(config-cmap)# exit
Router(config)# policy-map type inspect global-vpn1-pmap
Router(config-pmap)# class type inspect match-acl-111
Router(config-pmap-c)# inspect match-acl-111
Router(config-pmap-c)# exit
Router(config-pmap)# class class-default
Router(config-pmap)# end
```

Example: Defining Policy Maps, Zones, and Zone Pairs

```
Router# configure terminal
Router(config)# zone security vpn1-zone
Router(config-sec-zone)# exit
Router(config)# zone security global-zone
Router(config-sec-zone)# exit
Router(config)# zone-pair security vpn1-global-zone-pair source vpn1-zone destination
global-zone
Router(config-sec-zone-pair)# service-policy type inspect vpn1-global-pmap
Router(config-sec-zone-pair)# end
```

Example: Applying Zones to Interfaces and Defining Routes

```
Router# configure terminal
Router(config)# interface gigabitethernet 0/0/0
Router(config-if)# ip vrf forwarding vrf1
Router(config-if)# ip address 10.1.1.1 255.255.255.0
Router(config-if)# zone-member security vpn1-zone
Router(config-if)# negotiation auto
Router(config-if)# exit
Router(config)# interface gigabitethernet 1/1/1
Router(config-if)# ip address 10.111.111.111 255.255.255.0
Router(config-if)# zone-member security global-zone
Router(config-if)# negotiation auto
Router(config-if)# exit
Router(config)# ip route vrf vpn1 10.111.111.0 255.255.255.0 gigabitethernet 1/1/1 global
Router(config)# end
```

Feature Information for VRF-Aware Cisco IOS XE Firewall

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 169: Feature Information for VRF-Aware Cisco IOS XE Firewall

Feature Name	Releases	Feature Information
VRF-Aware Cisco IOS XE Firewall	Cisco IOS XE Release 2.5	The VRF-Aware Cisco IOS XE Firewall feature applies the Cisco IOS XE Firewall functionality to VRF interfaces when the firewall is configured on an SP or large enterprise edge router.
Firewall--VRF-Aware ALG Support	Cisco IOS XE Release 2.5	The Firewall--VRF-Aware ALG Support feature allows ALG to extract the correct IP address and VRF ID from cached information when creating ALG tokens that require correct IP address VRF ID pairs.

Glossary

C3PL --Cisco Common Classification Policy Language. Structured, feature-specific configuration commands that use policy maps and class maps to create traffic policies based on events, conditions, and actions.

EHLO --Extended HELO substitute command for starting the capability negotiation. This command identifies the sender (client) connecting to the remote SMTP server by using the ESMTP protocol.

ESMTP --Extended Simple Mail Transfer Protocol. Extended version of the Simple Mail Transfer Protocol (SMTP), which includes additional functionality, such as delivery notification and session delivery. ESMTP is described in RFC 1869, SMTP Service Extensions.

HELO --Command that starts the SMTP capability negotiation. This command identifies the sender (client) connecting to the remote SMTP server by its fully qualified DNS hostname.

MAIL FROM --Start of an e-mail message that identifies the sender e-mail address (and name, if used), which appears in the From: field of the message.

MIME --Multipurpose Internet Mail Extension. Standard for transmitting nontext data (or data that cannot be represented in plain ASCII code) in e-mail, such as binary, foreign language text (such as Russian or Chinese), audio, or video data. MIME is defined in RFC 2045.

RCPT TO --Recipient e-mail address (and name, if used) that can be repeated multiple times for a likely message to deliver a single message to multiple recipients.

SMTP --Simple Mail Transfer Protocol. Internet protocol providing e-mail services.

CHAPTER 125

Layer 2 Transparent Firewalls

A Layer 2 transparent firewall operates on bridged packets and is enabled on a pair of locally-switched Ethernet ports. Embedded IP packets forwarded through these ports are inspected similar to normal IP packets in a routing network. The zone-based firewall or Layer 3 firewall configuration can be applied to Layer 2 interfaces for the transparent firewall configuration.

This module provides an overview of the Layer 2 Transparent Firewalls feature.

Restrictions for Layer 2 Transparent Firewalls Support

- Address Resolution Protocol (ARP) inspection is not supported.
- Layer 2 forwarding technologies such as bridge domain, bridge domain interfaces (BDI), Overlay Transport Virtualization (OTV), X-Connect, Virtual Private LAN Services (VPLS), VxLAN, and non-IP flows, are not supported.
- Only normal IP or simple VLAN is supported on Ethernet frames. The transparent firewall generates TCP reset (RST) packets and sends these packets in supported Ethernet frame.
- TCP RST is not supported after intrabox high availability switchover.
- Virtual TCP (vTCP) is not supported.
- Network Address Translation (NAT), Box-to-Box (B2B) high availability, Multiprotocol Label Switching (MPLS), Virtual Routing and Forwarding (VRF) instances, VRF-Aware Software Infrastructure (VASI), Locator-ID Separation Protocol (LISP) are not supported in the Layer 2 switch path.
- Non IP packet flows like Ethernet Operation, Administration, and Maintenance (OAM), Connectivity Fault Management (CFM) is not supported.
- Layer 2-based access control lists (ACLs) are not supported in the transparent firewall class map.

Information About Layer 2 Transparent Firewalls

Layer 2 Transparent Firewall Support

A traditional zone-based firewall acts like a Layer 3 node in a network, and inspects the IP traffic that passes through the node. The traditional firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. However, to place this Layer 3 firewall in an existing network requires the network to be re-subnetted, which is time and resource-intensive. The Layer 2 transparent firewall is transparent to the network and does not require Layer 3 separation between segments. A transparent firewall acts like a "bump in the wire" or a "stealth firewall," and is not seen as a router hop to connected devices. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network; IP readdressing is unnecessary. The transparent firewall operates on bridged packets and the Layer 3 firewall operates on routed packets.

A transparent firewall is enabled on a pair of locally-switched Ethernet ports. Embedded IP packets forwarded through these ports are inspected similar to normal IP packets in a routing network. The transparent firewall only inspects IP packets.

A transparent firewall session is created by using IP Layer 3 and Layer 4 headers that contain 5-tuple information (5-tuple information are source and destination IP addresses, source and destination ports, and the protocol). The transparent firewall supports only Ethernet as a Layer 2 protocol, and supports both IPv4 and IPv6 addresses.

The zone-based firewall or Layer 3 firewall configuration can be applied to Layer 2 interfaces for the transparent firewall configuration. Both Layer 3 firewall and Layer 2 transparent firewall can coexist on a device.

The transparent firewall supports IP (Internet Control Message Protocol [ICMP], TCP, and UDP) inspection with the following topologies:

- Between two GigabitEthernet interfaces.
- Between a GigabitEthernet interface and a GigabitEthernet subinterface.
- Between two GigabitEthernet subinterfaces

The transparent firewall passes the following packets without a policy attached to them:

- Address Resolution Protocol (ARP)
- Multicast packets: Routing Information Protocol (RIP), Open Shortest Path First (OSPF), OSPF Version 3 (OSPFv3), Enhanced Interior Gateway Routing Protocol (EIGRP) IPv4 and IPv6 packets, Intermediate System-to-Intermediate System (ISIS) IPv4 and IPv6 packets
- Protocol-Independent Multicast (PIM) IPv4 and IPv6 packets
- Hot Standby Router Protocol (HSRP), Virtual Router Redundancy Protocol (VRRP), and Gateway Load Balancing Protocol (GLBP)
- Internet Group Management Protocol (IGMP), and Multicast Listener Discovery (MLD)

How to Configure Layer 2 Transparent Firewalls

You can configure a Layer 2 transparent firewall using the same configuration as the zone-based firewalls. For more information, see the "Zone-Based Firewalls" module.

Configuration Examples for Layer 2 Transparent Firewalls

Example: Configuring a Layer 2 Transparent Firewall

The following example shows how to configure a Layer 2 transparent firewall with TCP and UDP inspection:

- Defines class maps.
- Defines policy maps.
- Defines zones and zone pairs.
- Attaches interfaces GigabitEthernet 0/0/0 and GigabitEthernet 0/0/1 to firewall zones.
- Enables local switching by connecting GigabitEthernet 0/0/0 with GigabitEthernet 0/0/1.

```
!Class map configuration
Device# configure terminal
Device(config)# class-map typ inspect match-any lan-wan-inspect-tcp
Device(config-cmap)# match protocol tcp
Device(config-cmap)# match protocol udp
Device(config-cmap)# match protocol icmp
Device(config-cmap)# exit
Device(config-cmap)# exit
Device(config)# class-map type inspect match-any wan-lan-inspect-udp
Device(config-cmap)# match protocol tcp
Device(config-cmap)# match protocol udp
Device(config-cmap)# match protocol icmp
Device(config-cmap)# exit

Device(config-cmap)# exit

!Policy map configuration
Device(config)# policy-map type inspect policy-wan-lan
Device(config-pmap)# class type inspect lan-wan-inspect-tcp
Device(config-pmap-c)# inspect
Device(config-pmap-c)# exit

Table 170: Feature Information for Layer 2 Transparent Firewalls

Feature Name	Releases	Feature Information
Layer 2 Transparent Firewalls	Cisco IOS XE 3.15S	A Layer 2 transparent firewall operates on bridged packets and is enabled on a pair of locally-switched Ethernet ports. Embedded IP packets forwarded through these ports are inspected similar to normal IP packets in a routing network. The zone-based firewall or Layer 3 firewall configuration can be applied to Layer 2 interfaces for the transparent firewall configuration. This feature is supported on Cisco ASR 1000 Series Aggregation Services Routers, and Cisco Cloud Services Router 1000V Series. No commands were introduced or updated for this feature.

CHAPTER 126

Nested Class Map Support for Zone-Based Policy Firewall

The Nested Class Map Support for Zone-Based Policy Firewall feature provides the Cisco IOS XE firewall the functionality to configure multiple traffic classes (which are also called nested class maps or hierarchical class maps) as a single traffic class. When packets meet more than one match criterion, you can configure multiple class maps that can be associated with a single traffic policy. The Cisco IOS XE firewall supports up to three levels of class map hierarchy.

Prerequisites for Nested Class Map Support for Zone-Based Policy Firewall

Before configuring nested class maps, you should be familiar with the modular Quality of Service (QoS) CLI (MQC).

Information About Nested Class Map Support for Zone-Based Policy Firewall

Nested Class Maps

In Cisco IOS XE Release 3.5S and later releases, you can configure multiple traffic classes (which are also called nested class maps or hierarchical class maps) as a single traffic class. When packets meet more than one match criterion, you can configure multiple class maps that can be associated with a single traffic policy. The nesting of class maps can be achieved by configuring the **match class-map** command. The only method

of combining the match-any and match-all characteristics within a single traffic class is by using the **class-map** command.

match-all and match-any Keywords of the class-map Command

To create a traffic class, you must configure the **class-map** command with the **match-all** and **match-any** keywords. You need to specify the **match-all** and **match-any** keywords only if more than one match criterion is configured in the traffic class. The following rules apply to the **match-all** and **match-any** keywords:

- Use the **match-all** keyword when all match criteria in the traffic class must be met to place a packet in the specified traffic class.
- Use the **match-any** keyword when only one of the match criterion in the traffic class must be met to place a packet in the specified traffic class.
- If you do not specify the **match-all** keyword or the **match-any** keyword, the traffic class behaves in a manner that is consistent with the **match-all** keyword.

Your zone-based policy firewall configuration supports nested class maps if the following criteria are met:

- Individual class maps in a hierarchy include multiple **match class-map** command references.
- Individual class maps in a hierarchy include match rules other than the **match class-map** command.

How to Configure Nested Class Map Support for Zone-Based Policy Firewall

Configuring a Two-Layer Nested Class Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **exit**
6. **class-map match-any** *class-map-name*
7. **match protocol** *protocol-name*
8. **exit**
9. **class-map match-any** *class-map-name*
10. **match class-map** *class-map-name*
11. **match class-map** *class-map-name*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**class-map match-any** *class-map-name* **Example:** `Router(config)# class-map match-any child1`	Creates a Layer 3 or Layer 4 class map and enters class map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Router(config-cmap)# match protocol tcp`	Configures the match criteria for a class map on the basis of a specified protocol.
Step 5	**exit** **Example:** `Router(config-cmap)# exit`	Exits class map configuration mode and enters global configuration mode.
Step 6	**class-map match-any** *class-map-name* **Example:** `Router(config)# class-map match-any child2`	Creates a Layer 3 or Layer 4 class map and enters class map configuration mode.
Step 7	**match protocol** *protocol-name* **Example:** `Router(config-cmap)# match protocol udp`	Configures the match criteria for a class map on the basis of a specified protocol.
Step 8	**exit** **Example:** `Router(config-cmap)# exit`	Exits class map configuration mode and enters global configuration mode.
Step 9	**class-map match-any** *class-map-name* **Example:** `Router(config)# class-map match-any parent`	Creates a Layer 3 or Layer 4 class map and enters class map configuration mode.
Step 10	**match class-map** *class-map-name* **Example:** `Router(config-cmap)# match class-map child1`	Configures a traffic class as a classification policy.
Step 11	**match class-map** *class-map-name* **Example:** `Router(config-cmap)# match class-map child2`	Configures a traffic class as a classification policy.

	Command or Action	Purpose
Step 12	**end** **Example:** `Router(config-cmap)# end`	Exits class map configuration mode and enters privileged EXEC mode.

Configuring a Policy Map for a Nested Class Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect** *policy-map-name*
4. **class-type inspect** *class-map-name*
5. **inspect**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**policy-map type inspect** *policy-map-name* **Example:** `Router(config)# policy-map type inspect pmap`	Creates a Layer 3 or Layer 4 inspect type policy map and enters policy map configuration mode.
Step 4	**class-type inspect** *class-map-name* **Example:** `Router(config-pmap)# class-type inspect parent`	Specifies the traffic (class) on which an action is to be performed and enters policy-map class configuration mode.
Step 5	**inspect** **Example:** `Router(config-pmap-c)# inspect`	Enables Cisco IOS XE stateful packet inspection.
Step 6	**end** **Example:** `Router(config-pmap-c)# end`	Exits policy-map class configuration mode and enters privileged EXEC mode.

Attaching a Policy Map to a Zone Pair

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **exit**
5. **zone security** *zone-name*
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** *zone-name* **destination** [*zone-name*]]
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **zone-member security** *zone-name*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *zone-name* **Example:** `Router(config)# zone security source-zone`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 4	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 5	**zone security** *zone-name* **Example:** `Router(config)# zone security destination-zone`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* [**source** *zone-name* **destination** [*zone-name*]]	Creates a zone pair and enters security zone pair configuration mode.

	Command or Action	Purpose
	Example: `Router(config)# zone-pair security secure-zone source source-zone destination destination-zone`	• To apply a policy, you must configure a zone pair.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Router(config-sec-zone-pair)# service-policy type inspect pmap`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 9	**exit** **Example:** `Router(config-sec-zone-pair)# exit`	Exits security zone pair configuration mode and enters global configuration mode.
Step 10	**interface** *type number* **Example:** `Router(config)# interface gigabitethernet 0/0/1`	Configures an interface and enters interface configuration mode.
Step 11	**zone-member security** *zone-name* **Example:** `Router(config-if)# zone-member security source-zone`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the router or initiated by the router) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	**end** **Example:** `Router(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Configuration Examples for Nested Class Map Support for Zone-Based Policy Firewall

Example: Configuring a Two-Layer Nested Class Map

```
Router# configure terminal
Router(config)# class-map match-any child1
Router(config-cmap)# match protocol tcp
Router(config-cmap)# exit
Router(config)# class-map match-any child2
Router(config-cmap)# match protocol udp
Router(config-cmap)# exit
Router(config)# class-map match-any parent
Router(config-cmap)# match class-map child1
```

```
Router(config-cmap)# match class-map child2
Router(config-cmap)# end
```

Example: Configuring a Policy Map for a Nested Class Map

```
Router# configure terminal
Router(config)# policy-map type inspect pmap
Router(config-pmap)# class-type inspect parent
Router(config-pmap-c)# inspect
Router(config-pmap-c)# end
```

Example: Attaching a Policy Map to a Zone Pair

```
Router# configure terminal
Router(config)# zone security source-zone
Router(config-sec-zone)# exit
Router(config)# zone security destination-zone
Router(config-sec-zone)# exit
Router(config)# zone-pair security secure-zone source source-zone destination destination-zone
Router(config-sec-zone-pair)# service-policy type inspect pmap
Router(config-sec-zone-pair)# exit
Router(config)# interface gigabitethernet 0/0/1
Router(config-if)# zone-member security source-zone
Router(config-if)# end
```

Feature Information for Nested Class Map Support for Zone-Based Policy Firewall

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 171: Feature Information for Nested Class Map Support for Zone-Based Policy Firewall

Feature Name	Releases	Feature Information
Nested Class Map Support for Zone-Based Policy Firewall	Cisco IOS XE Release 3.5S	The Nested Class Map Support for Zone-Based Policy Firewall feature provides the Cisco IOS XE firewall the functionality to configure multiple traffic classes (which are also called nested class maps or hierarchical class maps) as a single traffic class. When packets meet more than one match criterion, you can configure multiple class maps that can be associated with a single traffic policy.

CHAPTER 127

Zone Mismatch Handling

The Zone Mismatch Handling feature allows you to validate the zone pair that is associated with an existing session and allows traffic that matches the zone pair into the network. Allowing traffic into the network without validating the zone pair associated with a session can lead to security vulnerabilities.

This module provides an overview of the feature and explains how to configure it.

Restrictions for Zone Mismatch Handling

You cannot configure the **zone-mismatch drop** command under the **parameter-map type inspect-vrf**, **parameter-map type inspect-zone**, and **parameter-map type inspect global** commands.

Information About Zone Mismatch Handling

Zone Mismatch Handling Overview

The zone-based firewall creates sessions for traffic that flows from a source zone to a destination zone, and also matches the traffic when it returns from the destination zone to the source zone. A zone is a group of interfaces that have similar functions or features. A zone pair allows you to specify a unidirectional firewall policy between two security zones that are part of a zone pair.

For the first packet of the traffic, the firewall checks the zone pair that is associated with the ingress and egress interfaces of the packet, and validates the packet before it creates a session for traffic that can be inspected. And when the return traffic comes, the firewall does a session lookup based on the first packet to find an existing session. If the firewall finds a matching session, it allows the traffic to passthrough, and does not check whether the zone associated with the return traffic matches with the zone pair associated with the existing session. Allowing traffic into the network without validating the zone-pair associated with a session can lead to security vulnerabilities.

The Zone Mismatch Handling feature allows you to validate the zone pair that is associated with an existing session and allows traffic that matches the zone pair into the network. When you configure the **zone-mismatch drop** command, the firewall drops all packets (IPv4 and IPv6) that match an existing session but whose zone pair does not match the zone through which these packets arrive or leave. This feature works along with high availability and In-Service Software Upgrade (ISSU).

When you configure the **zone-mismatch drop** command under the **parameter-map type inspect-global** command, the zone mismatch handling configuration applies to the global firewall configuration. Traffic between all zones are inspected for zone-pair mismatch.

You can also configure the **zone-mismatch drop** command under the **parameter-map type inspect** command. This allows you to apply the Zone-Mismatch Handling feature on a per-policy basis.

When you configure the **zone-mismatch drop** command, the configuration is effective only for new sessions. For existing sessions, traffic is not dropped if the sessions do not belong to the same zone-pair.

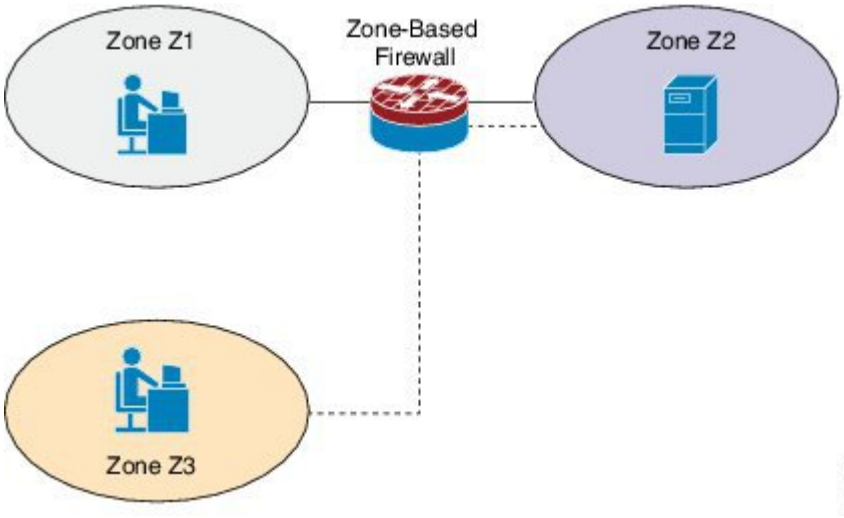
Deployment Scenarios for Zone Mismatch Handling

This section describes some typical scenarios in which the Zone Mismatch Handling feature is deployed:

Traffic Inspection by the Zone-Based Firewall

The following illustration shows traffic inspection by the firewall when the Zone Mismatch Handling feature is enabled.

Figure 61: Traffic Inspection by the Zone-Based Firewall



Zones Z1 and Z2 are part of the same zone pair, which has a parameter map that has the **zone-mismatch drop** command configured on it. Because zone Z3 is not part of the zone pair, the traffic from Z3 is dropped even if the traffic matches the firewall sessions between interface 1 and interface 2.

If you configure the **zone-mismatch drop** command for the parameter-map that is associated with the zone pair to which zone Z3 is attached, that configuration will not be effective for sessions established between Z1 and Z2. However, if you configure the **zone-mismatch drop** command under the **parameter-map type inspect-global** command, the configuration is effective for traffic between all the zones.

Application Layer Gateways Configured with the Zone-Based Firewall

Some application layer gateways (ALGs) also called application-level gateways require multiple control and media channels to operate. The zone-based firewall does not enforce that control and media channels should be in the same zone pair for ALGs. When you configure the **zone-mismatch drop** command for media or data channels, the configuration takes effect after the media or data channels are promoted from imprecise to precise sessions. The zone-based firewall checks these precise sessions like normal sessions. Imprecise sessions are sessions that do not have all 5-tuple information.

How to Configure Zone Mismatch Handling

Configuring Zone Mismatch Handling

You cannot configure the zone-mismatch drop command under the **parameter-map type inspect-vrf**, **parameter-map type inspect-zone**, and **parameter-map type inspect global** commands.

If you configure the **zone-mismatch drop** command under the **parameter-map type inspect-global**command, the zone mismatch handling configuration applies to the global firewall configuration.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Do one of the following:
   - **parameter-map type inspect** *parameter-map-name*
   - **parameter-map type inspect-global**
4. **zone-mismatch drop**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables user EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	Do one of the following: • **parameter-map type inspect** *parameter-map-name* • **parameter-map type inspect-global** **Example:**	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the inspect action and enters parameter-map type inspect configuration mode.

	Command or Action	Purpose

	`Device(config)# parameter-map type inspect pmap1`
	or
	`Device(config)# parameter-map type inspect-global`	

Step 4	**zone-mismatch drop** **Example:** `Device(config-profile)# zone-mismatch drop`	Validates the zone pair that is attached to an existing session and allows traffic that matches the zone pair into the network. If the zone pair of an incoming session does not match the zone through which the session arrives or leaves, the firewall drops these packets.
Step 5	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and returns to privileged EXEC mode.

Configuration Examples for Zone Mismatch Handling

Example: Configuring Zone Mismatch Handling

In the following example, the Zone Mismatch Handling feature is enabled for parameter map pmap-fw.

```
! Configuring zones
Device(config)# zone security private
Device(config-sec-zone)# exit
Device(config)# zone security public
Device(config-sec-zone)# exit
Device(config)# zone security internet
Device(config-sec-zone)# exit

! Attaching zones to interfaces
Device(config)# interface GigabitEthernet 0/1/5
Device(config-if)# ip address 172.16.1.1 255.255.255.0
Device(config-if)# zone-member security private
Device(config-if)# no shutdown
Device(config-if)# exit
Device(config)# interface GigabitEthernet 0/1/6
Device(config-if)# ip address 209.165.200.226 255.255.255.0
Device(config-if)# zone-member security public
Device(config-if)# no shutdown
Device(config-if)# exit
Device(config)# interface GigabitEthernet 0/1/1
Device(config-if)# ip address 198.51.100.1 255.255.255.0
Device(config-if)# zone-member security internet
Device(config-if)# no shutdown
Device(config-if)# exit

!Configuring the Zone Mismatch Handling feature
Device(config)# parameter-map type inspect pmap-fw
Device(config-profile)# zone-mismatch drop
Device(config-profile)# exit

!Configuring class maps
Device(config)# class-map type inspect match-any internet-traffic-class
Device(config-cmap)# match protocol tcp
```

```
Device(config-cmap)# match protocol udp
Device(config-cmap)# match protocol icmp
Device(config-cmap)# exit

! Configuring policy maps and class matching
Device(config)# policy-map type inspect private-internet-policy
Device(config-pmap)# class type inspect internet-traffic-class
Device(config-pmap-c)# inspect pmap-fw
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap-c)# drop
Device(config-pmap-c)# exit
Device(config-pmap)# exit

! Configuring zone pairs
Device(config)# zone-pair security private-internet source private destination internet
Device(config-sec-zone-pair)# service-policy type inspect private-internet-policy
Device(config-sec-zone-pair)# end
```

Table 172: Feature Information for Zone Mismatch Handling

Feature Name	Releases	Feature Information
Zone Mismatch Handling	Cisco IOS XE 3.15S	The Zone Mismatch Handling feature allows you to validate the zone-pair associated with an existing session and allows traffic that matches the zone-pair into the network. This feature is supported on Cisco 4400 Series Integrated Services Routers,Cisco ASR 1000 Series Aggregation Services Routers, and Cisco Cloud Services Router 1000V Series. The following command was introduced: **zone-mismatch handling**.

CHAPTER 128

Configuring Firewall Stateful Interchassis Redundancy

The Firewall Stateful Interchassis Redundancy feature enables you to configure pairs of routers to act as backup for each other. This feature can be configured to determine the active router based on a number of failover conditions. When a failover occurs, the standby router seamlessly takes over and starts performing traffic forwarding services and maintaining a dynamic routing table.

Prerequisites for Firewall Stateful Interchassis Redundancy

- The interfaces attached to the firewall must have the same redundant interface identifier (RII).
- The active device and the standby device must have the same Cisco IOS XE Zone-Based Firewall configuration.
- The active device and the standby device must run on an identical version of the Cisco IOS XE software. The active device and the standby device must be connected through a switch.
- Embedded Service Processor (ESP) must match on both active and standby devices.

Restrictions for Firewall Stateful Interchassis Redundancy

- LAN and MESH scenarios are not supported.
- Cisco ASR 1006 and Cisco ASR 1013 platforms with dual Embedded Services Processors (ESPs) or dual Route Processors (RPs) in the chassis are not supported, because coexistence of interbox high availability (HA) and intrabox HA is not supported.

Cisco ASR 1006 and Cisco ASR 1013 platforms with single ESP and single RP in the chassis supports interchassis redundancy.

- If the dual IOS daemon (IOSd) is configured, the device will not support the firewall Stateful Interchassis Redundancy configuration.

Information About Firewall Stateful Interchassis Redundancy

How Firewall Stateful Inter-Chassis Redundancy Works

You can configure pairs of routers to act as hot standbys for each other. This redundancy is configured on an interface basis. Pairs of redundant interfaces are known as redundancy groups. The figure below depicts the active-standby device scenario. It shows how the redundancy group is configured for a pair of routers that has one outgoing interface. The *Redundancy Group Configuration--Two Outgoing Interfaces* figure depicts the active-active device scenario shows how two redundancy groups are configured for a pair of routers that have two outgoing interfaces.

Note that in both cases, the redundant routers are joined by a configurable control link and a data synchronization link. The control link is used to communicate the status of the routers. The data synchronization link is used to transfer stateful information from Network Address Translation (NAT) and the firewall and to synchronize the stateful database for these applications.

Also, in both cases, the pairs of redundant interfaces are configured with the same unique ID number known as the RII.

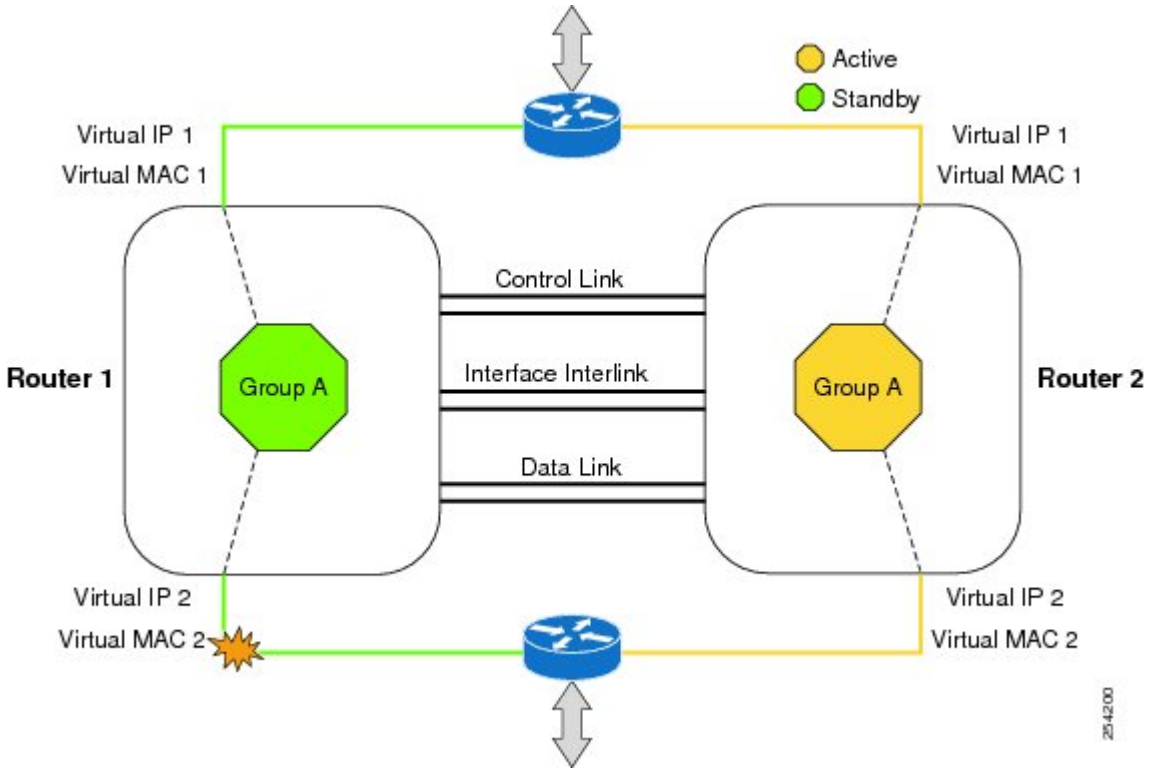

Figure 62: Redundancy Group Configuration--Two Outgoing Interfaces

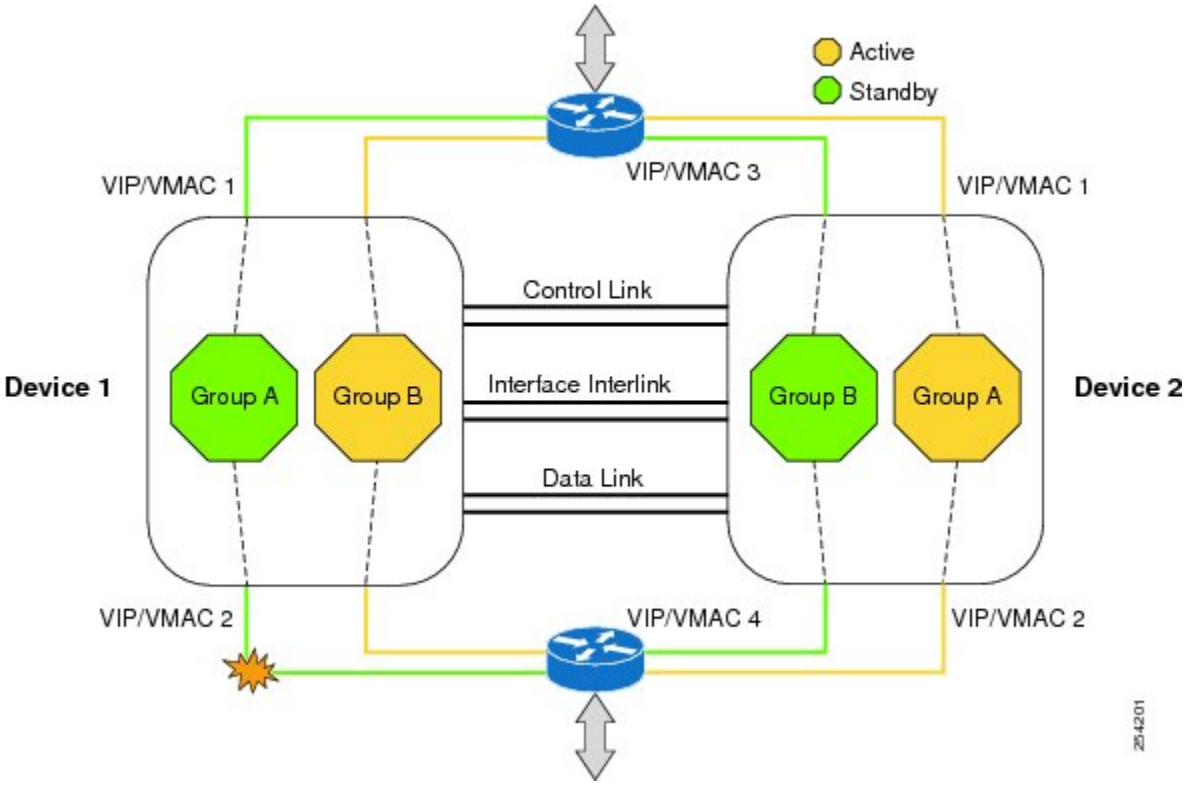


The status of redundancy group members is determined through the use of hello messages sent over the control link. If either of the routers does not respond to a hello message within a configurable amount of time, it is considered that a failure has occurred, and a switchover is initiated. To detect a failure in milliseconds, the control links run the failover protocol integrated with the Bidirectional Forwarding Detection (BFD) protocol. You can configure the following parameters for the hello messages:

- Active timer
- Standby timer
- Hellotime--The interval at which hello messages are sent
- Holdtime--The amount of time before the active or the standby router is declared to be down

The hellotime defaults to 3 seconds to align with Hot Standby Router Protocol (HSRP), and the holdtime defaults to 10 seconds. You can also configure these timers in milliseconds by using the **timers hellotime msec** command.

To determine which pairs of interfaces are affected by the switchover, you must configure a unique ID number for each pair of redundant interfaces. This ID number is known as the RII associated with the interface.

A switchover to the standby router can also occur under other circumstances. Another factor that can cause a switchover is a priority setting that is configurable for each router. The router with the highest priority value will be the active router. If a fault occurs on either the active or the standby router, the priority of the router is decremented by a configurable amount known as the weight. If the priority of the active router falls below the priority of the standby router, a switchover occurs and the standby router becomes the active router. This default behavior can be overridden by disabling the preemption attribute for the redundancy group. You can

also configure each interface to decrease the priority when the L1 state of the interface goes down. This amount overrides the default amount configured for the redundancy group.

Each failure event that causes a modification of a redundancy group's priority generates a syslog entry that contains a time stamp, the redundancy group that was affected, previous priority, new priority, and a description of the failure event cause.

Another situation that will cause a switchover to occur is when the priority of a router or interface falls below a configurable threshold level.

In general, a switchover to the standby router occurs under the following circumstances:

- Power loss or reload occurs on the active router (this includes crashes).
- The run-time priority of the active router goes down below that of the standby router.
- The run-time priority of the active router goes down below the configured threshold value.
- The redundancy group on the active router is reloaded manually using the **redundancy application reload group** *rg-number* command.
- Two consecutive hello messages missed on any monitored interface forces the interface into testing mode. When this occurs, both units first verify the link status on the interface and then execute the following tests:
  - Network activity test
  - ARP test
  - Broadcast ping test

In the Firewall Stateful Inter-Chassis Redundancy feature, the redundancy group traffic is routed through the virtual IP address that is associated with the ingress interface of the redundancy group. The traffic sent to the virtual IP address is received by the router that has the redundancy group in the active state. During a redundancy group failover, the traffic to the virtual IP address is automatically routed to the newly active redundancy group.

The firewall drops the traffic that arrives on the standby redundancy group in case the redundancy group traffic is routed through the physical IP address of a standby router and the traffic reaches the standby redundancy group. However, when the traffic arrives on the active redundancy group, the established TCP or UDP sessions are synchronized to the standby redundancy group.

Exclusive Virtual IP Addresses and Exclusive Virtual MAC Addresses

Virtual IP (VIP) addresses and virtual MAC (VMAC) addresses are used by security applications to control interfaces that receive traffic. An interface is paired with another interface, and these interfaces are associated with the same redundancy group (RG). The interface that is associated with an active RG exclusively owns the VIP and VMAC. The Address Resolution Protocol (ARP) process on the active device sends ARP replies for any ARP request for the VIP, and the Ethernet controller for the interface is programmed to receive packets destined for the VMAC. When an RG failover occurs, the ownership of the VIP and VMAC changes. The interface that is associated with the newly active RG sends a gratuitous ARP and programs the interface's Ethernet controller to accept packets destined for the VMAC.

IPv6 Support

You can assign each redundancy group (RG) on a traffic interface for both IPv4 and IPv6 virtual IP (VIP) addresses under the same redundancy interface identifier (RII). Each RG uses a unique virtual MAC (VMAC) address per RII. For an RG, the IPv6 link-local VIP and global VIP coexist on an interface.

You can configure an IPv4 VIP, a link-local IPv6 VIP, and/or a global IPv6 VIP for each RG on a traffic interface. IPv6 link-local VIP is mainly used when configuring static or default routes, whereas IPv6 global VIP is widely used in both LAN and WAN topologies.

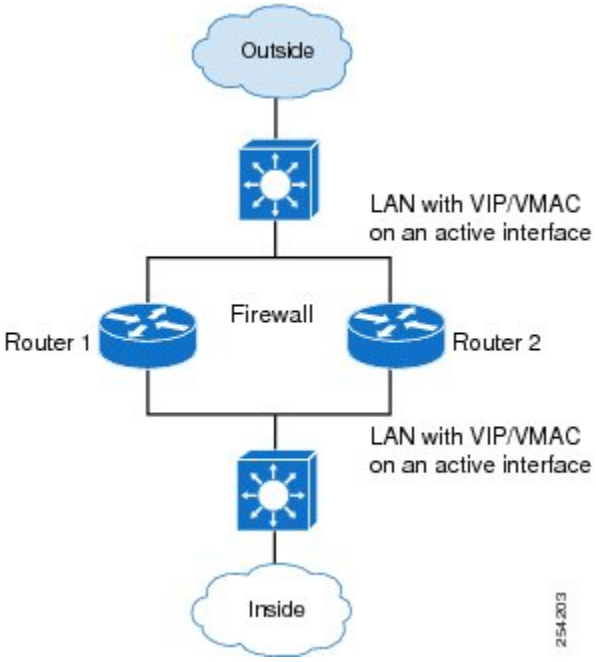
You must configure a physical IP address before configuring an IPv4 VIP.

Supported Topologies

The LAN-LAN topology is supported in the Firewall Stateful Inter-Chassis Redundancy architecture:

LAN-LAN

The figure below shows the LAN-LAN topology. When a dedicated appliance-based firewall solution is used, traffic is often directed to the correct firewall by configuring static routing in the upstream or downstream routers to an appropriate virtual IP address. In addition, the Aggregation Services Routers (ASRs) will participate in dynamic routing with upstream or downstream routers. The dynamic routing configuration supported on LAN facing interfaces must not introduce a dependency on routing protocol convergence; otherwise, fast failover requirements will not be met.



For more information about the LAN-LAN configuration, see the section, Example Configuring LAN-LAN.

VRF-Aware Interchassis Redundancy in Zone-Based Firewalls

In Cisco IOS XE Release 3.14S, zone-based firewalls support VRF-aware interchassis redundancy. The VPN routing and forwarding (VRF) name at the active and standby devices must the same. The same VRF configuration must be available on both active and standby devices.

The VRF-Aware Interchassis Redundancy in Zone-Based Firewalls feature uses a VRF mapping mechanism that sends the VRF hash key along with box-to-box high availability session sync messages across active and standby devices.

How to Configure Firewall Stateful Interchassis Redundancy

Configuring a Redundancy Application Group

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**
4. **application redundancy**
5. **group** *id*
6. **name** *group-name*
7. **shutdown**
8. **priority** *value* [**failover threshold** *value*]
9. **preempt**
10. **track** *object-number* {**decrement** *value* | **shutdown**}
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:**	Enters redundancy application configuration mode.

	Command or Action	Purpose
	`Device(config-red)# application redundancy`	
Step 5	**group** *id* **Example:** `Device(config-red-app)# group 1`	Enters redundancy application group configuration mode.
Step 6	**name** *group-name* **Example:** `Device(config-red-app-grp)# name group1`	(Optional) Specifies an optional alias for the protocol instance.
Step 7	**shutdown** **Example:** `Device(config-red-app-grp)# shutdown`	(Optional) Shuts down a redundancy group manually.
Step 8	**priority** *value* [**failover threshold** *value*] **Example:** `Device(config-red-app-grp)# priority 100 failover threshold 50`	(Optional) Specifies the initial priority and failover threshold for a redundancy group.
Step 9	**preempt** **Example:** `Device(config-red-app-grp)# preempt`	Enables preemption on the group and enables the standby device to preempt the active device regardless of the priority.
Step 10	**track** *object-number* {**decrement** *value* | **shutdown**} **Example:** `Device(config-red-app-grp)# track 200 decrement 200`	Specifies the priority value of a redundancy group that will be decremented if an event occurs.
Step 11	**end** **Example:** `Device(config-red-app-grp)# end`	Exits redundancy application group configuration mode and enters privileged EXEC mode.

Configuring a Redundancy Group Protocol

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**
4. **application redundancy**
5. **protocol** *id*
6. **name** *group-name*
7. **timers hellotime** {*seconds* | **msec** *milliseconds*} **holdtime** {*seconds* | **msec** *milliseconds*}
8. **authentication** {**text** *string* | **md5 key-string** [**0** | **7**] *key-string* **timeout** *seconds* | **key-chain** *key-chain-name*}

9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Enters redundancy application configuration mode.
Step 5	**protocol** *id* **Example:** `Device(config-red-app)# protocol 1`	Specifies the protocol instance that will be attached to a control interface and enters redundancy application protocol configuration mode.
Step 6	**name** *group-name* **Example:** `Device(config-red-app-prtcl)# name prot1`	(Optional) Configures the redundancy group (RG) with a name.
Step 7	**timers hellotime** {*seconds* | **msec** *milliseconds*} **holdtime** {*seconds* | **msec** *milliseconds*} **Example:** `Device(config-red-app-prtcl)# timers hellotime 3 holdtime 9`	Specifies the interval between when hello messages are sent and the time period before which a device is declared to be down.
Step 8	**authentication** {**text** *string* | **md5 key-string** [**0** | **7**] *key-string* **timeout** *seconds* | **key-chain** *key-chain-name*} **Example:** `Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100`	Specifies the authentication information.
Step 9	**end** **Example:** `Device(config-red-app-prtcl)# end`	Exits redundancy application protocol configuration mode and enters privileged EXEC mode.

Configuring a Virtual IP Address and a Redundant Interface Identifier

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **redundancy rii** *id*
5. **redundancy group** *id* **ip** *virtual-ip* **exclusive** [**decrement** *value*]
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 4	**redundancy rii** *id* **Example:** `Device(config-if)# redundancy rii 600`	Configures the redundancy interface identifier (RII) for a redundancy group. • The range is from 1 to 65535.
Step 5	**redundancy group** *id* **ip** *virtual-ip* **exclusive** [**decrement** *value*] **Example:** `Device(config-if)# redundancy group 1 ip 10.10.1.1 exclusive decrement 20`	Associates an interface with a redundancy group and enables a virtual IP address.
Step 6	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring a Control Interface and a Data Interface

SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **redundancy**
4. **application redundancy**
5. **group** *id*
6. **data** *interface-type interface-number*
7. **control** *interface-type interface-number* **protocol** *id*
8. **timers delay** *seconds* [**reload** *seconds*]
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Enters redundancy application configuration mode.
Step 5	**group** *id* **Example:** `Device(config-red-app)# group 1`	Enters redundancy application group configuration mode.
Step 6	**data** *interface-type interface-number* **Example:** `Device(config-red-app-grp)# data GigabitEthernet 0/0/0`	Specifies the data interface that is used by the redundancy group.
Step 7	**control** *interface-type interface-number* **protocol** *id* **Example:** `Device(config-red-app-grp)# control gigabitethernet 0/0/2 protocol 1`	Specifies the control interface that is used by the redundancy group. • This interface is also associated with an instance of the control interface protocol.
Step 8	**timers delay** *seconds* [**reload** *seconds*] **Example:** `Device(config-red-app-grp)# timers delay 100 reload 400`	Specifies the time that a redundancy group will take to delay role negotiations that start after a fault occurs or the system is reloaded.

	Command or Action	Purpose
Step 9	**end** **Example:** `Device(config-red-app-grp)# end`	Exits redundancy application group configuration mode and enters privileged EXEC mode.

Managing and Monitoring Firewall Stateful Inter-Chassis Redundancy

Use the following commands to manage and monitor the Firewall Stateful Inter-Chassis Redundancy feature.

SUMMARY STEPS

1. **enable**
2. **debug redundancy application group config** {**all** | **error** | **event** | **func**}
3. **debug redundancy application group faults** {**all** | **error** | **event** | **fault** | **func**}
4. **debug redundancy application group media** {**all** | **error** | **event** | **nbr** | **packet** {**rx** | **tx**} | **timer**}
5. **debug redundancy application group protocol** {**all** | **detail** | **error** | **event** | **media** | **peer**}
6. **debug redundancy application group rii** {**error** | **event**}
7. **debug redundancy application group transport** {**db** | **error** | **event** | **packet** | **timer** | **trace**}
8. **debug redundancy application group vp** {**error** | **event**}
9. **show redundancy application group** [*group-id* | **all**]
10. **show redundancy application transport** {**client** | **group** [*group-id*]}
11. **show redundancy application control-interface group** [*group-id*]
12. **show redundancy application faults group** [*group-id*]
13. **show redundancy application protocol** {*protocol-id* | **group** [*group-id*]
14. **show redundancy application if-mgr group** [*group-id*]
15. **show redundancy application data-interface group** [*group-id*]
16. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**debug redundancy application group config** {**all**	**error**	**event**	**func**} **Example:** `Device# debug redundancy application group config all`	Displays the redundancy group application configuration.
Step 3	**debug redundancy application group faults** {**all**	**error**	**event**	**fault**	**func**}	Displays the redundancy group application fault.

	Command or Action	Purpose
	Example: `Device# debug redundancy application group faults error`	
Step 4	**debug redundancy application group media** {**all** | **error** | **event** | **nbr** | **packet** {**rx** | **tx**} | **timer**} **Example:** `Device# debug redundancy application group media timer`	Displays the redundancy group application group media information.
Step 5	**debug redundancy application group protocol** {**all** | **detail** | **error** | **event** | **media** | **peer**} **Example:** `Device# debug redundancy application group protocol peer`	Displays the redundancy group application group protocol information.
Step 6	**debug redundancy application group rii** {**error** | **event**} **Example:** `Device# debug redundancy application group rii event`	Displays the redundancy group application group RII information.
Step 7	**debug redundancy application group transport** {**db** | **error** | **event** | **packet** | **timer** | **trace**} **Example:** `Device# debug redundancy application group transport trace`	Displays the redundancy group application group transport information.
Step 8	**debug redundancy application group vp** {**error** | **event**} **Example:** `Device# debug redundancy application group vp event`	Displays the redundancy group application group VP information.
Step 9	**show redundancy application group** [*group-id* | **all**] **Example:** `Device# show redundancy application group all`	Displays the redundancy group information.
Step 10	**show redundancy application transport** {**client** | **group** [*group-id*]} **Example:** `Device# show redundancy application transport group 1`	Displays transport specific information for a redundancy group.

	Command or Action	Purpose
Step 11	**show redundancy application control-interface group** [*group-id*] **Example:** `Device# show redundancy application control-interface group 2`	Displays control interface information for a redundancy group.
Step 12	**show redundancy application faults group** [*group-id*] **Example:** `Device# show redundancy application faults group 2`	Displays fault-specific information for a redundancy group.
Step 13	**show redundancy application protocol** {*protocol-id* | **group** [*group-id*] **Example:** `Device# show redundancy application protocol 3`	Displays protocol specific information for a redundancy group.
Step 14	**show redundancy application if-mgr group** [*group-id*] **Example:** `Device# show redundancy application if-mgr group 2`	Displays interface manager information for a redundancy group.
Step 15	**show redundancy application data-interface group** [*group-id*] **Example:** `Device# show redundancy application data-interface group 1`	Displays data interface specific information.
Step 16	**end** **Example:** `Device# end`	Exits the current configuration mode and returns to privileged EXEC mode.

Configuration Examples for Firewall Stateful Interchassis Redundancy

Example: Configuring a Redundancy Application Group

The following example shows how to configure a redundancy group named group1 with priority and preempt attributes:

```
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# name group1
Device(config-red-app-grp)# priority 100 failover-threshold 50
Device(config-red-app-grp)# preempt
Device(config-red-app-grp)# track 200 decrement 200
Device(config-red-app-grp)# end
```

Example: Configuring a Redundancy Group Protocol

The following example shows how to configure a redundancy group with timers set for hello time and hold time messages:

```
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# protocol 1
Device(config-red-app-prtcl)# timers hellotime 3 holdtime 9
Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100
Device(config-red-app-prtcl)# bfd
Device(config-red-app-prtcl)# end
```

Example: Configuring a Virtual IP Address and a Redundant Interface Identifier

The following example shows how to configure the redundancy group virtual IP address for Gigabit Ethernet interface 0/1/1:

```
Device# configure terminal
Device(config)# interface GigabitEthernet 0/1/1
Device(conf-if)# redundancy rii 600
Device(config-if)# redundancy group 2 ip 10.2.3.4 exclusive decrement 200
Device(config-if)# end
```

Example: Configuring a Control Interface and a Data Interface

```
Device# configure terminal
Device(config-red)# application redundancy
Device(config-red-app-grp)# group 1
Device(config-red-app-grp)# data GigabitEthernet 0/0/0
Device(config-red-app-grp)# control GigabitEthernet 0/0/2 protocol 1
Device(config-red-app-grp)# timers delay 100 reload 400
Device(config-red-app-grp)# end
```

Example: Configuring a LAN-LAN Topology

The following is a sample LAN-LAN configuration that shows how a pair of routers that have two outgoing interfaces are configured for stateful redundancy. In this example, GigabitEthernet 0/1/1 is the ingress interface and GigabitEthernet 0/2/1 is the egress interface. Both interfaces are assigned to zones and a classmap is defined to describe the traffic between zones. Interfaces are also configured for redundancy. The “inspect” action invokes the application-level gateway (ALG) to open a pinhole to allow traffic on other ports. A pinhole is a port that is opened through an ALG to allow a particular application to gain controlled access to a protected network.

The following is the configuration on Device 1, the active device.

```
! Configures redundancy, control and data interfaces

Feature Information for Firewall Stateful Interchassis Redundancy

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 173: Feature Information for Firewall Stateful Interchassis Redundancy

Feature Name	Releases	Feature Information
Firewall Stateful Interchassis Redundancy	Cisco IOS XE Release 3.1(S)	The Firewall Stateful Interchassis Redundancy feature enables you to configure pairs of devices to act a backups for each other. The following commands were introduced or modified: **application redundancy**, **authentication**, **control**, **data**, **debug redundancy application group config**, **debug redundancy application group faults**, **debug redundancy application group media**, **debug redundancy application group protocol**, **debug redundancy application group rii**, **debug redundancy application group transport**, **debug redundancy application group vp**, **group**, **name**, **preempt**, **priority**, **protocol**, **redundancy rii**, **redundancy group**, **track**, **timers delay**, **timers hellotime**, **show redundancy application group**, **show redundancy application transport**, **show redundancy application control-interface**, **show redundancy application faults**, **show redundancy application protocol**, **show redundancy application if-mgr**, **show redundancy application data-interface**.

Feature Name	Releases	Feature Information
VRF-Aware Stateful Interchassis Redundancy in Zone-Based Firewalls	Cisco IOS XE Release 3.14S	In Cisco IOS XE Release 3.14S, zone-based firewalls support VRF-aware interchassis redundancy. The VPN routing and forwarding (VRF) name at the active and standby devices must the same. The same VRF configuration must be available on both active and standby devices.

CHAPTER 129

Firewall Box to Box High Availability Support for Cisco CSR1000v Routers

The Firewall Box to Box High Availability Support on Cisco CSR1000v Routers feature enables you to configure pairs of routers to act as backup for each other. This feature can be configured to determine the active router based on a number of failover conditions. When a failover occurs, the standby router seamlessly takes over and starts performing traffic forwarding services and maintaining a dynamic routing table.

Prerequisites for Firewall Box-to-Box High Availability Support for Cisco CSR1000v Routers

- The interfaces attached to the firewall must have the same redundant interface identifier (RII).
- The active device and the standby device must have the same Cisco IOS XE Zone-Based Firewall configuration.
- The active device and the standby device must run on an identical version of the Cisco IOS XE software. The active device and the standby device must be connected through a switch.

Restrictions for Firewall Box-to-Box High Availability for Cisco CSR1000v Routers

- If the dual IOS daemon (IOSd) is configured, the device will not support the firewall box-to-box high availability configuration.

Information About Firewall Box to Box High Availability Support on Cisco CSR1000v Routers

How Firewall Box to Box High Availability Support on Cisco CSR1000v Works

You can configure pairs of routers to act as hot standbys for each other. This redundancy is configured on an interface basis. Pairs of redundant interfaces are known as redundancy groups. The figure below depicts the active-standby device scenario. It shows how the redundancy group is configured for a pair of routers that has one outgoing interface. The Redundancy Group Configuration—Two Outgoing Interfaces figure depicts the active-active device scenario shows how two redundancy groups are configured for a pair of routers that have two outgoing interfaces.

Note that in both cases, the redundant routers are joined by a configurable control link and a data synchronization link. The control link is used to communicate the status of the routers. The data synchronization link is used to transfer stateful information from Network Address Translation (NAT) and the firewall and to synchronize the stateful database for these applications.

Also, in both cases, the pairs of redundant interfaces are configured with the same unique ID number known as the RII.

Figure 63: Redundancy Group Configuration—Two Outgoing Interfaces

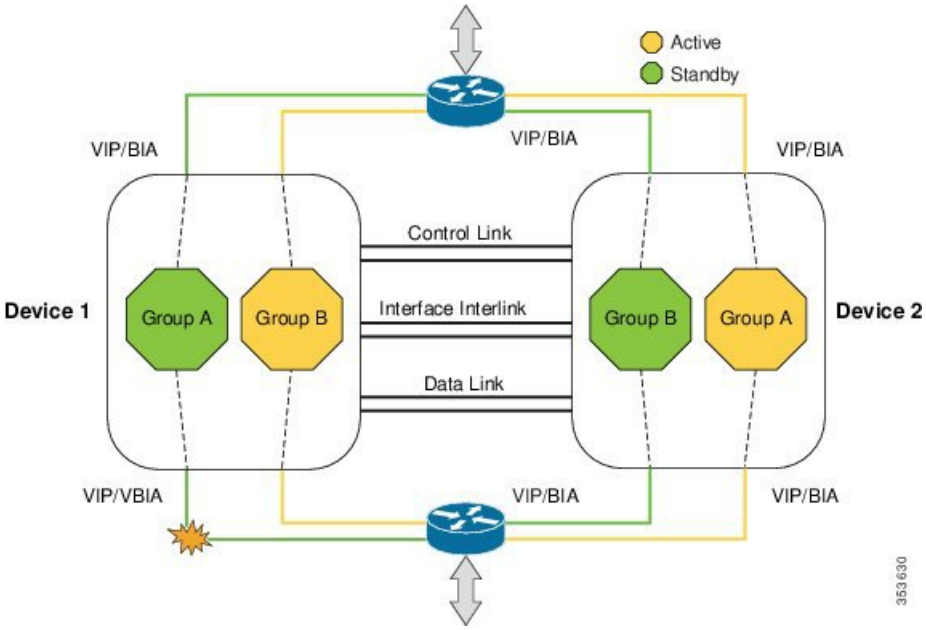

Figure 64: Redundancy Group Configuration

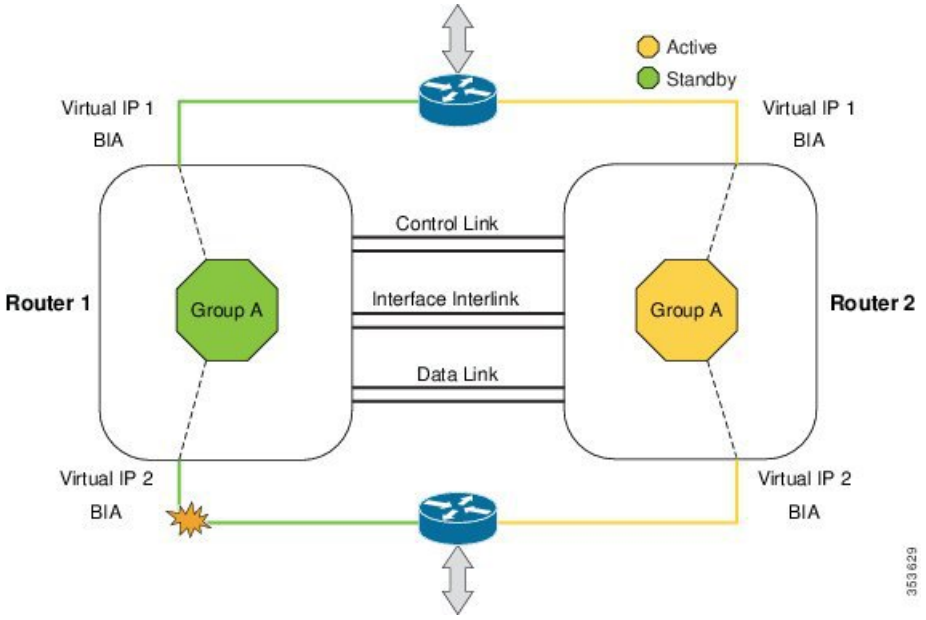
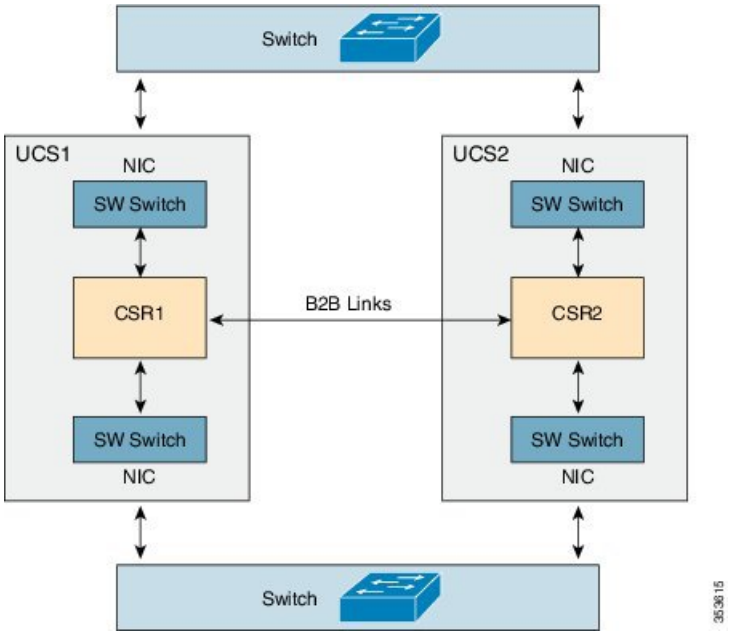


The following scenarios are examples of Box-to-Box High Availability deployment for Cisco CSR1000v routers:

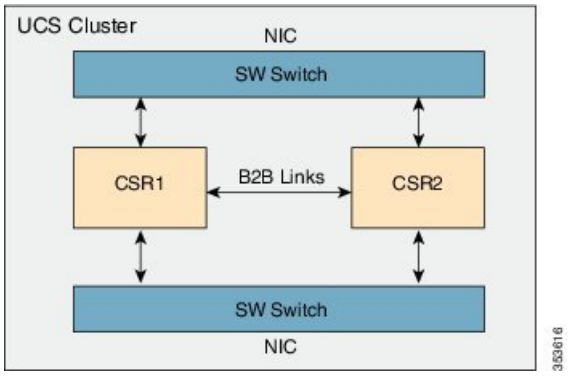
Figure 65: CSR1000v Box-to-Box High Availability on Two Independent Servers



In this deployment, two redundant Cisco CSR 1000v routers are in two independent UCS servers. The two Cisco Unified Computing System (UCS) servers can be in the same data center or two different data centers in different regions. We recommended that you configure two individual physical connections for box-to-box high availability data and control links. However, if the two dedicated physical links are not available, the box-to-box high availability data and control traffic can go through different LAN extension connections. Box-to-Box high availability parameters, such as heart beat period need to be adjusted to take into account the extended delay.

LAN interfaces of each Cisco CSR 1000v router are connected with UCS physical network interface card (NIC) interfaces through switches (for example, ESXi L2 SW). The two physical NICs on each UCS are connected to outside switch to form a box-to-box pair. Gratuitous Address Resolution Protocols (ARP) is sent from CSR LAN interfaces to reach physical switch and its Built-in Address (BIA).

Figure 66: CSR1000v Box-to-Box High Availability on Cluster Server



In the above deployment, NAT and Zone-Based Firewall (ZBFW) box-to-box high availability also works on UCS cluster setup. In this case, box-to-box control and data links go through virtual connections within the cluster. Switches (For example, ESXi L2 SW) are used to connect the 2 redundant Cisco CSR 1000v

routers to form a box-to-box high availability pair; LAN interfaces on two Cisco CSR 1000v routers are connected directly to the SW switches, and two physical NICs of the cluster UCS are connected with the SW switches to communicate outside the network.

Refer to the *Configuring Firewall Stateful Interchassis Redundancy* module for additional information on configurations and examples.

Configuration Example for Firewall Box-to-Box High Availability Support for Cisco CSR 1000v Routers

Example: Configuring Firewall Box-to-Box High Availability for Cisco CSR1000v Routers

The following examples shows how to configure a redundancy application group, a redundancy group protocol, Virtual IP Address and Redundant Interface Identifier, and control and data interfaces:

```
!Configures a redundancy application group
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# name group1
Device(config-red-app-grp)# priority 100 failover-threshold 50
Device(config-red-app-grp)# preempt
Device(config-red-app-grp)# track 200 decrement 200
Device(config-red-app-grp)# exit

!Configures a redundancy group protocol
Device(config-red-app)# protocol 1
Device(config-red-app-prtcl)# timers hellotime 3 holdtime 9
Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100
Device(config-red-app-prtcl)# bfd
Device(config-red-app-prtcl)# end

! Configures a Virtual IP Address and Redundant Interface Identifier
Device# configure terminal
Device(config)# interface GigabitEthernet0/1/1
Device(conf-if)# redundancy rii 600
Device(config-if)# redundancy group 2 ip 10.2.3.4 exclusive decrement 200
Device(config)# redundancy
Device(config-red-app-grp)# data GigabitEthernet0/0/0
Device(config-red-app-grp)# control GigabitEthernet0/0/2 protocol 1
Device(config-red-app-grp)# end

!Configures control and data interfaces
Device# configure terminal
Device(config-red)# application redundancy
Device(config-red-app-grp)# group 1
Device(config-red-app-grp)# data GigabitEthernet 0/0/0
Device(config-red-app-grp)# control GigabitEthernet 0/0/2 protocol 1
Device(config-red-app-grp)# end
```

Firewall Box-to-Box High Availability for Cisco CSR1000v Routers	Cisco IOS XE Release 3.14S	The Firewall Box-to-Box High Availability for Cisco CSR1000v Routers feature enables you to configure pairs of Cisco CSR1000v routers to act a backups for each other.

CHAPTER 130

Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

The Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT feature supports the forwarding of packets from a standby redundancy group to the active redundancy group for packet handling. If this feature is not enabled, the return TCP packets forwarded to the router that did not receive the initial synchronization (SYN) message are dropped because they do not belong to any known existing session.

This module provides an overview of asymmetric routing and describes how to configure asymmetric routing

Restrictions for Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

The following restrictions apply to the Interchassis Asymmetric Routing Support feature:

- LANs that use virtual IP addresses and virtual MAC (VMAC) addresses do not support asymmetric routing.
- In Service Software Upgrade (ISSU) is not supported.

The following features are not supported by the VRF-Aware Asymmetric Routing Support feature:

- Cisco Trustsec
- Edge switching services
- Header compression

- IPsec
- Policy Based Routing (PBR)
- Port bundle
- Lawful intercept
- Layer 2 Tunneling Protocol (L2TP)
- Locator/ID Separation Protocol (LISP) inner packet inspection
- Secure Shell (SSL) VPN
- Session Border Controller (SBC)

Information About Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

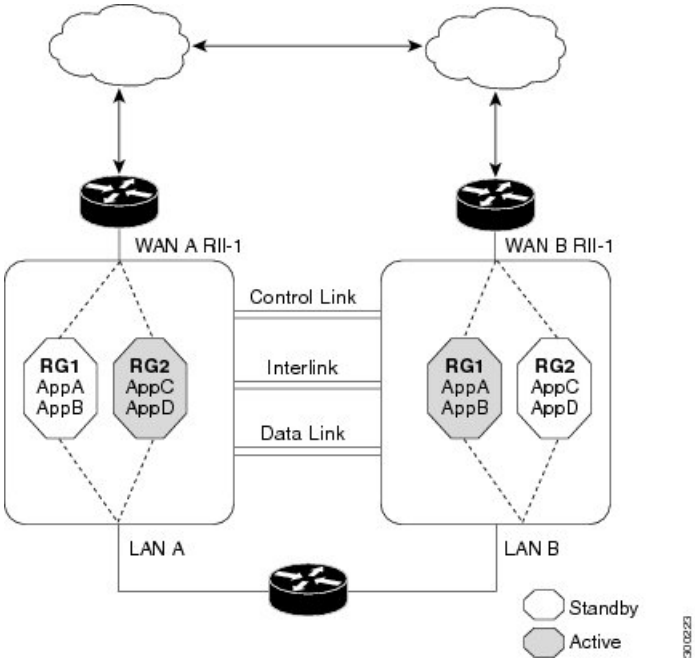
Asymmetric Routing Overview

Asymmetric routing occurs when packets from TCP or UDP connections flow in different directions through different routes. In asymmetric routing, packets that belong to a single TCP or UDP connection are forwarded through one interface in a redundancy group (RG), but returned through another interface in the same RG. In asymmetric routing, the packet flow remains in the same RG. When you configure asymmetric routing, packets received on the standby RG are redirected to the active RG for processing. If asymmetric routing is not configured, the packets received on the standby RG may be dropped.

Asymmetric routing determines the RG for a particular traffic flow. The state of the RG is critical in determining the handling of packets. If an RG is active, normal packet processing is performed. In case the RG is in a standby state and you have configured asymmetric routing and the **asymmetric-routing always-divert enable** command, packets are diverted to the active RG. Use the **asymmetric-routing always-divert enable** command to always divert packets received from the standby RG to the active RG.

The figure below shows an asymmetric routing scenario with a separate asymmetric-routing interlink interface to divert packets to the active RG.

Figure 67: Asymmetric Routing Scenario



The following rules apply to asymmetric routing:

- 1:1 mapping exists between the redundancy interface identifier (RII) and the interface.
- 1:*n* mapping exists between the interface and an RG. (An asymmetric routing interface can receive traffic from and send traffic to multiple RGs. For a non asymmetric-routing interface (normal LAN interface), a 1:1 mapping exists between the interface and the RG.)
- 1:*n* mapping exists between an RG and applications that use it. (Multiple applications can use the same RG).
- 1:1 mapping exists between an RG and the traffic flow. The traffic flow must map only to a single RG. If a traffic flow maps to multiple RGs, an error occurs.
- 1:1 or 1:*n* mapping can exist between an RG and an asymmetric-routing interlink as long as the interlink has sufficient bandwidth to support all the RG interlink traffic.

Asymmetric routing consists of an interlink interface that handles all traffic that is to be diverted. The bandwidth of the asymmetric-routing interlink interface must be large enough to handle all expected traffic that is to be diverted. An IPv4 address must be configured on the asymmetric-routing interlink interface, and the IP address of the asymmetric routing interface must be reachable from this interface.

Note We recommend that the asymmetric-routing interlink interface be used for interlink traffic only and not be shared with high availability control or data interfaces because the amount of traffic on the asymmetric-routing interlink interface could be quite high.

Asymmetric Routing Support in Firewalls

For intrabox asymmetric routing support, the firewall does a stateful Layer 3 and Layer 4 inspection of Internet Control Message Protocol (ICMP), TCP, and UDP packets. The firewall does a stateful inspection of TCP packets by verifying the window size and order of packets. The firewall also requires the state information from both directions of the traffic for stateful inspection. The firewall does a limited inspection of ICMP information flows. It verifies the sequence number associated with the ICMP echo request and response. The firewall does not synchronize any packet flows to the standby redundancy group (RG) until a session is established for that packet. An established session is a three-way handshake for TCP, the second packet for UDP, and informational messages for ICMP. All ICMP flows are sent to the active RG.

The firewall does a stateless verification of policies for packets that do not belong to the ICMP, TCP, and UDP protocols.

The firewall depends on bidirectional traffic to determine when a packet flow should be aged out and diverts all inspected packet flows to the active RG. Packet flows that have a pass policy and that include the same zone with no policy or a drop policy are not diverted.

Note The firewall does not support the **asymmetric-routing always-divert enable** command that diverts packets received on the standby RG to the active RG. By default, the firewall forces all packet flows to be diverted to the active RG.

Asymmetric Routing in NAT

By default, when asymmetric routing is configured, Network Address Translation (NAT) processes non-ALG packets on the standby RG, instead of forwarding them to the active. The NAT-only configuration (that is when the firewall is not configured) can use both the active and standby RGs for processing packets. If you have a NAT-only configuration and you have configured asymmetric routing, the default asymmetric routing rule is that NAT will selectively process packets on the standby RG. You can configure the **asymmetric-routing always-divert enable** command to divert packets received on the standby RG to the active RG. Alternatively, if you have configured the firewall along with NAT, the default asymmetric routing rule is to always divert the packets to the active RG.

When NAT receives a packet on the standby RG and if you have not configured the diverting of packets, NAT does a lookup to see if a session exists for that packet. If a session exists and there is no ALG associated for that session, NAT processes the packet on the standby RG. The processing of packets on the standby RG when a session exists significantly increases the bandwidth of the NAT traffic.

ALGs are used by NAT to identify and translate payload and to create child flows. ALGs require a two-way traffic to function correctly. NAT must divert all traffic to the active RG for any packet flow that is associated with an ALG. This is accomplished by checking if ALG data that is associated with the session is found on the standby RG. If ALG data exits, the packet is diverted for asymmetric routing.

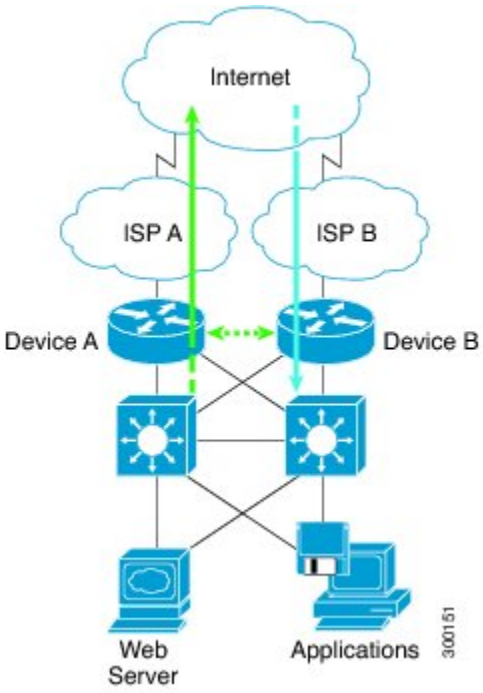
VRF-Aware Software Infrastructure (VASI) support was added in Cisco IOS XE Release 3.16S. Multiprotocol Label Switching (MPLS) asymmetric routing is also supported.

In Cisco IOS XE Release 3.16S, NAT supports asymmetric routing with ALGs, Carrier Grade NAT (CGN), and virtual routing and forwarding (VRF) instances. No configuration changes are required to enable asymmetric routing with ALGs, CGN, or VRF. For more information, see the section, “Example: Configuring Asymmetric Routing with VRF”.

Asymmetric Routing in a WAN-LAN Topology

Asymmetric routing supports only a WAN-LAN topology. In a WAN-LAN topology, devices are connected through LAN interfaces on the inside and WAN interfaces on the outside. There is no control on the routing of return traffic received through WAN links. Asymmetric routing controls the routing of return traffic received through WAN links in a WAN-LAN topology. The figure below shows a WAN-LAN topology.

Figure 68: Asymmetric Routing in a WAN-LAN Topology



VRF-Aware Asymmetric Routing in Zone-Based Firewalls

In Cisco IOS XE Release 3.14S, zone-based firewalls support the VRF-Aware Interchassis Asymmetric Routing feature. The feature supports Multiprotocol Label Switching (MPLS).

During asymmetric routing diversion, the VPN routing and forwarding (VRF) name hash value is sent with diverted packets. The VRF name hash value is converted to the local VRF ID and table ID at the active device after the diversion.

When diverted packets reach the active device on which Network Address Translation (NAT) and the zone-based firewall are configured, the firewall retrieves the VRF ID from NAT or NAT64 and saves the VRF ID in the firewall session key.

The following section describes the asymmetric routing packet flow when only the zone-based firewall is configured on a device:

- When MPLS is configured on a device, the VRF ID handling for diverted packets is the same as the handling of non-asymmetric routing diverted packets. An MPLS packet is diverted to the active device, even though the MPLS label is removed at the standby device. The zone-based firewall inspects the packet at the egress interface, and the egress VRF ID is set to zero, if MPLS is detected at this interface. The firewall sets the ingress VRF ID to zero if MPLS is configured at the ingress interface.

- When a Multiprotocol Label Switching (MPLS) packet is diverted to the active device from the standby device, the MPLS label is removed before the asymmetric routing diversion happens.
- When MPLS is not configured on a device, an IP packet is diverted to the active device and the VRF ID is set. The firewall gets the local VRF ID, when it inspects the packet at the egress interface.

VRF mapping between active and standby devices require no configuration changes.

VRF-Aware Asymmetric Routing in NAT

In Cisco IOS XE Release 3.14S, Network Address Translation supports VRF-aware interchassis asymmetric routing. VRF-aware interchassis asymmetric routing uses message digest (MD) 5 hash of the VPN routing and forwarding (VRF) name to identify the VRF and datapath in the active and standby devices to retrieve the local VRF ID from the VRF name hash and viceversa.

For VRF-aware interchassis asymmetric routing, the VRFs on active and standby devices must have the same VRF name. However, the VRF ID need not be identical on both devices because the VRF ID is mapped based on the VRF name on the standby and active devices during asymmetric routing diversion or box-to-box high availability synchronization.

In case of MD5 hash collision for VRF names, the firewall and NAT sessions that belong to the VRF are not synced to the standby device.

VRF mapping between active and standby devices require no configuration changes.

How to Configure Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

Configuring a Redundancy Application Group and a Redundancy Group Protocol

Redundancy groups consist of the following configuration elements:

- The amount by which the priority will be decremented for each object.
- Faults (objects) that decrement the priority
- Failover priority
- Failover threshold
- Group instance
- Group name
- Initialization delay timer

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**

4. **application redundancy**
5. **group** *id*
6. **name** *group-name*
7. **priority** *value* [**failover threshold** *value*]
8. **preempt**
9. **track** *object-number* **decrement** *number*
10. **exit**
11. **protocol** *id*
12. **timers hellotime** {*seconds* | **msec** *msec*} **holdtime** {*seconds* | **msec** *msec*}
13. **authentication** {**text** *string* | **md5 key-string** [**0** | **7**] *key* [**timeout** *seconds*] | **key-chain** *key-chain-name*}
14. **bfd**
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Configures application redundancy and enters redundancy application configuration mode.
Step 5	**group** *id* **Example:** `Device(config-red-app)# group 1`	Configures a redundancy group and enters redundancy application group configuration mode.
Step 6	**name** *group-name* **Example:** `Device(config-red-app-grp)# name group1`	Specifies an optional alias for the protocol instance.
Step 7	**priority** *value* [**failover threshold** *value*] **Example:** `Device(config-red-app-grp)# priority 100 failover threshold 50`	Specifies the initial priority and failover threshold for a redundancy group.

	Command or Action	Purpose
Step 8	**preempt** **Example:** `Device(config-red-app-grp)# preempt`	Enables preemption on the redundancy group and enables the standby device to preempt the active device. • The standby device preempts only when its priority is higher than that of the active device.
Step 9	**track** *object-number* **decrement** *number* **Example:** `Device(config-red-app-grp)# track 50 decrement 50`	Specifies the priority value of a redundancy group that will be decremented if an event occurs on the tracked object.
Step 10	**exit** **Example:** `Device(config-red-app-grp)# exit`	Exits redundancy application group configuration mode and enters redundancy application configuration mode.
Step 11	**protocol** *id* **Example:** `Device(config-red-app)# protocol 1`	Specifies the protocol instance that will be attached to a control interface and enters redundancy application protocol configuration mode.
Step 12	**timers hellotime** {*seconds* | **msec** *msec*} **holdtime** {*seconds* | **msec** *msec*} **Example:** `Device(config-red-app-prtcl)# timers hellotime 3 holdtime 10`	Specifies the interval between hello messages sent and the time period before which a device is declared to be down. • Holdtime should be at least three times the hellotime.
Step 13	**authentication** {**text** *string* | **md5 key-string** [**0** | **7**] *key* [**timeout** *seconds*] | **key-chain** *key-chain-name*} **Example:** `Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100`	Specifies authentication information.
Step 14	**bfd** **Example:** `Device(config-red-app-prtcl)# bfd`	Enables the integration of the failover protocol running on the control interface with the Bidirectional Forwarding Detection (BFD) protocol to achieve failure detection in milliseconds. • BFD is enabled by default.
Step 15	**end** **Example:** `Device(config-red-app-prtcl)# end`	Exits redundancy application protocol configuration mode and enters privileged EXEC mode.

Configuring Data, Control, and Asymmetric Routing Interfaces

In this task, you configure the following redundancy group (RG) elements:

- The interface that is used as the control interface.

- The interface that is used as the data interface.
- The interface that is used for asymmetric routing. This is an optional task. Perform this task only if you are configuring asymmetric routing for Network Address Translation (NAT).

Note Asymmetric routing, data, and control must be configured on separate interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**
4. **application redundancy**
5. **group** *id*
6. **data** *interface-type interface-number*
7. **control** *interface-type interface-number* **protocol** *id*
8. **timers delay** *seconds* [**reload** *seconds*]
9. **asymmetric-routing interface** *type number*
10. **asymmetric-routing always-divert enable**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Configures application redundancy and enters redundancy application configuration mode.
Step 5	**group** *id* **Example:** `Device(config-red-app)# group 1`	Configures a redundancy group (RG) and enters redundancy application group configuration mode.

	Command or Action	Purpose
Step 6	**data** *interface-type interface-number* **Example:** `Device(config-red-app-grp)# data GigabitEthernet 0/0/1`	Specifies the data interface that is used by the RG.
Step 7	**control** *interface-type interface-number* **protocol** *id* **Example:** `Device(config-red-app-grp)# control GigabitEthernet 1/0/0 protocol 1`	Specifies the control interface that is used by the RG. • The control interface is also associated with an instance of the control interface protocol.
Step 8	**timers delay** *seconds* [**reload** *seconds*] **Example:** `Device(config-red-app-grp)# timers delay 100 reload 400`	Specifies the time required for an RG to delay role negotiations that start after a fault occurs or the system is reloaded.
Step 9	**asymmetric-routing interface** *type number* **Example:** `Device(config-red-app-grp)# asymmetric-routing interface GigabitEthernet 0/1/1`	Specifies the asymmetric routing interface that is used by the RG.
Step 10	**asymmetric-routing always-divert enable** **Example:** `Device(config-red-app-grp)# asymmetric-routing always-divert enable`	Always diverts packets received from the standby RG to the active RG.
Step 11	**end** **Example:** `Device(config-red-app-grp)# end`	Exits redundancy application group configuration mode and enters privileged EXEC mode.

Configuring a Redundant Interface Identifier and Asymmetric Routing on an Interface

Note
- You must not configure a redundant interface identifier (RII) on an interface that is configured either as a data interface or as a control interface.
- You must configure the RII and asymmetric routing on both active and standby devices.
- You cannot enable asymmetric routing on the interface that has a virtual IP address configured.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*

4. **redundancy rii** *id*
5. **redundancy group** *id* [**decrement** *number*]
6. **redundancy asymmetric-routing enable**
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 0/1/3`	Selects an interface to be associated with the redundancy group (RG) and enters interface configuration mode.
Step 4	**redundancy rii** *id* **Example:** `Device(config-if)# redundancy rii 600`	Configures the redundancy interface identifier (RII).
Step 5	**redundancy group** *id* [**decrement** *number*] **Example:** `Device(config-if)# redundancy group 1 decrement 20`	Enables the RG redundancy traffic interface configuration and specifies the amount to be decremented from the priority when the interface goes down. **Note** You need not configure an RG on the traffic interface on which asymmetric routing is enabled.
Step 6	**redundancy asymmetric-routing enable** **Example:** `Device(config-if)# redundancy asymmetric-routing enable`	Establishes an asymmetric flow diversion tunnel for each RG.
Step 7	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Configuring Dynamic Inside Source Translation with Asymmetric Routing

The following configuration is a sample dynamic inside source translation with asymmetric routing. You can configure asymmetric routing with the following types of NAT configurations—dynamic outside source, static inside and outside source, and Port Address Translation (PAT) inside and outside source translations.

For more information on different types of NAT configurations, see the "Configuring NAT for IP Address Conservation" chapter.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip address** *ip-address mask*
5. **ip nat outside**
6. **exit**
7. **redundancy**
8. **application redundancy**
9. **group** *id*
10. **asymmetric-routing always-divert enable**
11. **end**
12. **configure terminal**
13. **ip nat pool** *name start-ip end-ip* {*mask* | **prefix-length** *prefix-length*}
14. **exit**
15. **ip nat inside source list** *acl-number* **pool** *name* **redundancy** *redundancy-id* **mapping-id** *map-id*
16. **access-list** *standard-acl-number* **permit** *source-address wildcard-bits*
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/3`	Configures an interface and enters interface configuration mode.
Step 4	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 10.1.1.1 255.255.255.0`	Sets a primary IP address for an interface.
Step 5	**ip nat outside** **Example:** `Device(config-if)# ip nat outside`	Marks the interface as connected to the outside.

	Command or Action	Purpose
Step 6	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 7	**redundancy** **Example:** `Device(config)# redundancy`	Configures redundancy and enters redundancy configuration mode.
Step 8	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Configures application redundancy and enters redundancy application configuration mode.
Step 9	**group** *id* **Example:** `Device(config-red-app)# group 1`	Configures a redundancy group and enters redundancy application group configuration mode.
Step 10	**asymmetric-routing always-divert enable** **Example:** `Device(config-red-app-grp)# asymmetric-routing always-divert enable`	Diverts the traffic to the active device.
Step 11	**end** **Example:** `Device(config-red-app-grp)# end`	Exits redundancy application group configuration mode and enters privileged EXEC mode.
Step 12	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 13	**ip nat pool** *name start-ip end-ip* {*mask* | **prefix-length** *prefix-length*} **Example:** `Device(config)# ip nat pool pool1 prefix-length 24`	Defines a pool of global addresses. • Enters IP NAT pool configuration mode.
Step 14	**exit** **Example:** `Device(config-ipnat-pool)# exit`	Exits IP NAT pool configuration mode and enters global configuration mode.
Step 15	**ip nat inside source list** *acl-number* **pool** *name* **redundancy** *redundancy-id* **mapping-id** *map-id* **Example:** `Device(config)# ip nat inside source list pool pool1 redundancy 1 mapping-id 100`	Enables NAT of the inside source address and associates NAT with a redundancy group by using the mapping ID.

	Command or Action	Purpose
Step 16	**access-list** *standard-acl-number* **permit** *source-address wildcard-bits* **Example:** `Device(config)# access-list 10 permit 10.1.1.1 255.255.255.0`	Defines a standard access list for the inside addresses that are to be translated.
Step 17	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuration Examples for Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

Example: Configuring a Redundancy Application Group and a Redundancy Group Protocol

```
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# name group1
Device(config-red-app-grp)# priority 100 failover threshold 50
Device(config-red-app-grp)# preempt
Device(config-red-app-grp)# track 50 decrement 50
Device(config-red-app-grp)# exit
Device(config-red-app)# protocol 1
Device(config-red-app-prtcl)# timers hellotime 3 holdtime 10
Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100
Device(config-red-app-prtcl)# bfd
Device(config-red-app-prtcl)# end
```

Example: Configuring Data, Control, and Asymmetric Routing Interfaces

```
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# data GigabitEthernet 0/0/1
Device(config-red-app-grp)# control GigabitEthernet 1/0/0 protocol 1
Device(config-red-app-grp)# timers delay 100 reload 400
Device(config-red-app-grp)# asymmetric-routing interface GigabitEthernet 0/1/1
Device(config-red-app-grp)# asymmetric-routing always-divert enable
Device(config-red-app-grp)# end
```

Example: Configuring a Redundant Interface Identifier and Asymmetric Routing on an Interface

```
Device# configure terminal
Device(config)# interface GigabitEthernet 0/1/3
Device(config-if)# redundancy rii 600
Device(config-if)# redundancy group 1 decrement 20
Device(config-if)# redundancy asymmetric-routing enable
Device(config-if)# end
```

Example: Configuring Dynamic Inside Source Translation with Asymmetric Routing

```
Device(config)# interface gigabitethernet 0/1/3
Device(config-if)# ip address 10.1.1.1 255.255.255.0
Device(config-if)# ip nat outside
Device(config-if)# exit
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# asymmetric-routing always-divert enable
Device(config-red-app-grp)# end
Device# configure terminal
Device(config)# ip nat pool pool1 prefix-length 24
Device(config-ipnat-pool)# exit
Device(config)# ip nat inside source list pool pool1 redundancy 1 mapping-id 100
Device(config)# access-list 10 permit 10.1.1.1 255.255.255.0
```

Example: Configuring VRF-Aware NAT for WAN-WAN Topology with Symmetric Routing Box-to-Box Redundancy

Example: Configuring Asymmetric Routing with VRF

The following example shows how to configure asymmetric routing with virtual routing and forwarding (VRF) instances:

```
Device(config)# redundancy
Device(config-red)# mode sso
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# name RG1
Device(config-red-app-grp)# preempt
Device(config-red-app-grp)# priority 100 failover threshold 40
Device(config-red-app-grp)# control GigabitEthernet 1/0/3 protocol 1
Device(config-red-app-grp)# data GigabitEthernet 1/0/3
Device(config-red-app-grp)# asymmetric-routing interface GigabitEthernet 1/0/4
Device(config-red-app-grp)# asymmetric-routing always-divert enable
Device(config-red-app-grp)# exit
Device(config-red-app)# exit
Device(config-red)# exit
!
Device(config)# interface TenGigabitEthernet 2/0/0
Device(config-if)# ip vrf forwarding vrf001
Device(config-if)# ip address 10.0.0.1 255.255.255.0
Device(config-if)# ip nat inside
Device(config-if)# exit
!
Device(config)# interface TenGigabitEthernet 3/0/0
Device(config-if)# ip vrf forwarding vrf001
Device(config-if)# ip address 192.0.2.1 255.255.255.0
Device(config-if)# ip nat outside
Device(config-if)# exit
!
Device(config-if)# ip nat pool pool-vrf001 209.165.201.1 209.165.201.30 prefix-length 24
Device(config-if)# ip nat inside source list 1 pool pool-vrf001 redundancy 1 mapping-id 1
vrf vrf001 match-in-vrf overload
Device(config-if)# end
```

Feature Information for Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 175: Feature Information for Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT

Feature Name	Releases	Feature Information
Asymmetric Routing Enhancements for NAT44	Cisco IOS XE Release 3.16S	The Asymmetric Routing Enhancements for NAT44 feature supports asymmetric routing with CGN, ALGs, VRF, VASI and MPLS. No commands were introduced or modified.
Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT	Cisco IOS XE Release 3.5S	The Interchassis Asymmetric Routing Support for Zone-Based Firewall and NAT feature supports the forwarding of packets from a standby redundancy group to the active redundancy group for packet handling. The following commands were introduced or modified: **asymmetric-routing**, **redundancy asymmetric-routing enable**.
VRF-Aware Interchassis Asymmetric Routing Support for Zone-Based Firewalls	Cisco IOS XE Release 3.14S	Zone-based firewalls support the VRF-Aware Interchassis Asymmetric Routing feature. This feature supports MPLS. There are no configuration changes for this feature. No commands were introduced or modified.
VRF-Aware Interchassis Asymmetric Routing Support for NAT	Cisco IOS XE Release 3.14S	NAT supports the VRF-Aware Interchassis Asymmetric Routing feature. This feature supports MPLS. There are no configuration changes for this feature. No commands were introduced or modified.

CHAPTER 131

Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

The Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls feature supports high availability (HA) based on redundancy groups (RGs) on IPv6 firewalls. This feature enables you to configure pairs of devices to act as backup for each other. This feature can be configured to determine the active device based on a number of failover conditions. This feature supports the FTP66 application-layer gateway (ALG) for IPv6 packet inspection.

This module provides information about Box-to-Box (B2B) HA support and describes how to configure this feature.

Prerequisites for Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

- Interfaces attached to a firewall must have the same redundant interface identifier (RII).
- Active and standby devices must have the same zone-based policy firewall configuration.
- Active and standby devices must run on identical versions of Cisco software. The active and standby devices must be connected through a switch.
- The box-to-box (B2B) configuration on both active and standby devices should be the same because there is no autosynchronization of the configuration between these devices.

- For asymmetric routing traffic to pass, you must configure the pass action for the class-default class. Class-default class is a system-defined class map that represents all packets that do not match any of the user-defined classes in a policy.
- If you configure a zone pair between two LAN interfaces, ensure that you configure the same redundancy group (RG) on both interfaces. The zone pair configuration is not supported if LAN interfaces belong to different RGs.

Restrictions for Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

- Only IPv4 is supported at box-to-box (B2B) interlink interfaces.
- Multiprotocol Label Switching (MPLS) and virtual routing and forwarding (VRF) are not supported.
- Cisco ASR 1006 and 1013 Aggregation Services Routers with dual Embedded Services Processors (ESPs) or dual Route Processors (RPs) in the chassis are not supported, because coexistence of interbox high availability (HA) and intrabox HA is not supported.

  Cisco ASR 1006 and Cisco ASR 1013 Aggregation Services Routers with single ESP and single RP in the chassis support interchassis redundancy.
- If the dual IOS daemon (IOSd) is configured, the device will not support the firewall stateful interchassis redundancy configuration.
- Stateless Network Address Translation 64 (NAT64) with IPv6 firewalls is not supported.

Information About Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

Zone-Based Policy Firewall High Availability Overview

High availability enables network-wide protection by providing fast recovery from faults that may occur in any part of a network. High availability enables rapid recovery from disruptions to users and network applications.

The zone-based policy firewall supports active/active and active/standby high availability failover and asymmetric routing.

The active/active failover allows both devices involved in the failover to forward traffic simultaneously.

When active/standby high availability failover is configured, only one of the devices involved in the failover handles the traffic at one time, while the other device is in a standby mode, periodically synchronizing session information from the active device.

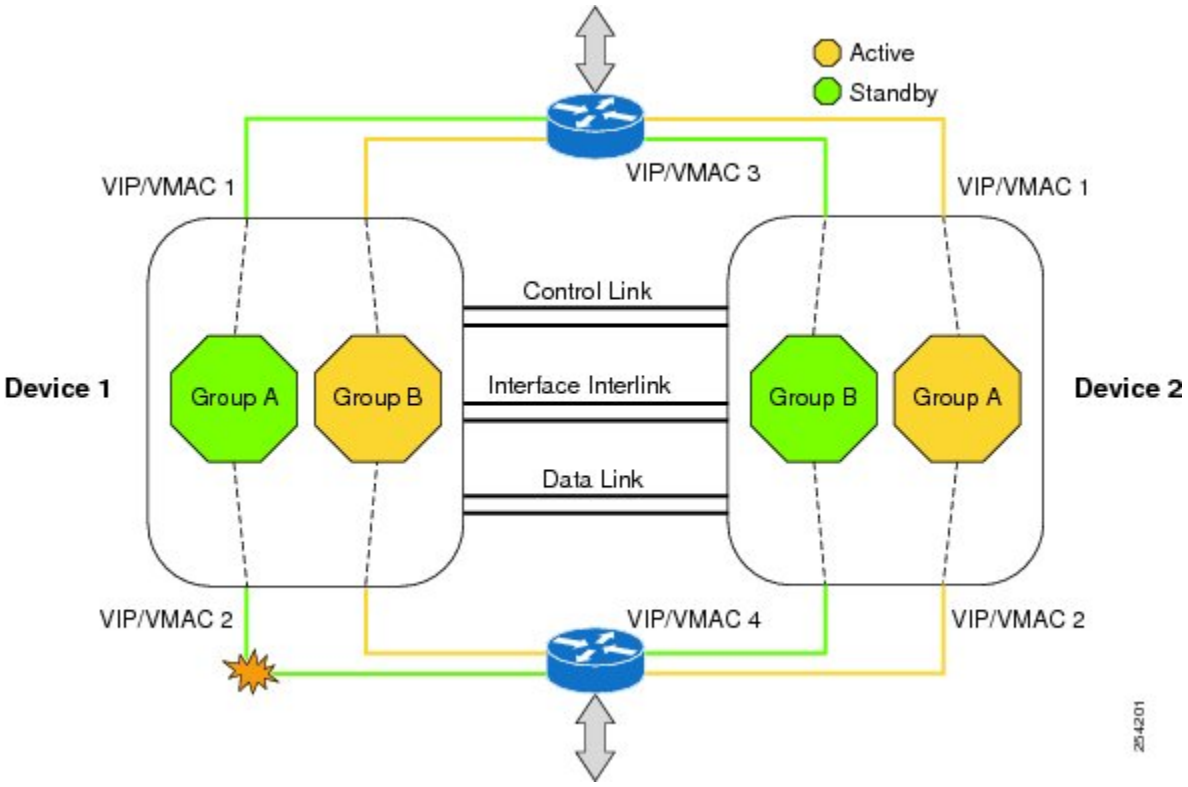
Asymmetric routing supports the forwarding of packets from a standby redundancy group to an active redundancy group for packet handling. If this feature is not enabled, the return TCP packets forwarded to the

device that did not receive the initial synchronization (SYN) message are dropped because they do not belong to any known existing session.

Box-to-Box High Availability Operation

You can configure pairs of devices to act as hot standbys for each other. Redundancy is configured per interface. Pairs of redundant interfaces are known as redundancy groups (RGs). Figure 1 depicts an active/active failover scenario. It shows how two redundancy groups are configured for a pair of devices that have two outgoing interfaces.

Figure 69: Redundancy Group Configuration—Two Outgoing Interfaces



The redundant devices are joined by a configurable control link, a data synchronization link, and an interlink interface. The control link is used to communicate the status of the devices. The data synchronization link is used to transfer stateful information from the firewall and to synchronize the stateful database. The pairs of redundant interfaces are configured with the same unique ID number, known as the redundant interface identifier (RII). The routing table is not synced from active to standby.

Asymmetric routing is supported as part of the firewall HA. In a LAN-WAN scenario, where the return traffic enters standby devices, asymmetric routing is supported. To implement the asymmetric routing functionality, configure both the redundant devices with a dedicated interface (interlink interface) for asymmetric traffic. This dedicated interface will redirect the traffic coming to the standby WAN interface to the active device.

The status of redundancy group members is determined through the use of hello messages sent over the control link. If either of the devices do not respond to a hello message within a configured time period, the software considers that a failure has occurred, and a switchover is initiated. To detect a failure in milliseconds, the control links run the failover protocol. You can configure the following parameters for hello messages:

- Active timer.
- Standby timer.
- Hello time—The interval at which hello messages are sent.
- Hold time—The time period before which the active or standby device is declared to be down.

The hello time defaults to three seconds to align with the Hot Standby Router Protocol (HSRP), and the hold time defaults to 10 seconds. You can also configure these timers in milliseconds by using the **timers hellotime msec** command.

To determine which pairs of interfaces are affected by the switchover, you must configure a unique ID for each pair of redundant interfaces. This ID is the RII that is associated with the interface.

Reasons for Switchover

Another factor that can cause a switchover is the priority setting that can be configured on each device. The device with the highest priority value will be the active device. If a fault occurs on either the active or the standby device, the priority of the device is decremented by a configurable amount, known as the weight. If the priority of the active device falls below the priority of the standby device, a switchover occurs and the standby device becomes the active device. You can override this default behavior by disabling the preemption attribute for the redundancy group. You can also configure each interface to decrease the priority when the Layer 1 state of the interface goes down. The priority that is configured overrides the default priority of the redundancy group.

Each failure event that causes a modification of a redundancy group's priority generates a syslog entry that contains a time stamp, the redundancy group that was affected, the previous priority, the new priority, and a description of the failure event cause.

Another situation that can cause a switchover to occur is when the priority of a device or interface falls below the configurable threshold level.

A switchover to the standby device occurs under the following circumstances:

- Power loss or a reload occurs on the active device (this includes crashes).
- The run-time priority of the active device goes below that of the standby device.
- The run-time priority of the active device goes below the configured threshold level.
- The redundancy group on the active device is reloaded manually by using the **redundancy application reload group** *rg-number* command.
- Two consecutive hello messages missed on any monitored interface forces the interface into testing mode. Both devices will verify the link status on the interface and then execute the following tests:
  - Network activity test
  - Address Resolution Protocol (ARP) test
  - Broadcast ping test

Active/Active Failover

In an active/active failover configuration, both devices can process network traffic. Active/active failover generates virtual MAC (VMAC) addresses for interfaces in each redundancy group (RG).

One device in an active/active failover pair is designated as the primary (active) device, and the other is designated as the secondary (standby) device. Unlike with active/standby failover, this designation does not indicate which device becomes active when both devices start simultaneously. Instead, the primary/secondary designation determines the following:

- The device that provides the running configuration to the failover pair when they start simultaneously.
- The device on which the failover RG appears in the active state when devices start simultaneously. Each failover RG in the configuration is configured with a primary or secondary device preference. You can configure both failover RGs to be in the active state on a single device and the standby failover RGs to be on the other device. You can also configure one failover RG to be in the active state and the other RG to be in the standby state on a single device.

Active/Standby Failover

Active/standby failover enables you to use a standby device to take over the functionality of a failed device. A failed active device changes to the standby state, and the standby device changes to the active state. The device that is now in the active state takes over IP addresses and MAC addresses of the failed device and starts processing traffic. The device that is now in the standby state takes over standby IP addresses and MAC addresses. Because network devices do not see any change in the MAC-to-IP address pairing, Address Resolution Protocol (ARP) entries do not change or time out anywhere on the network.

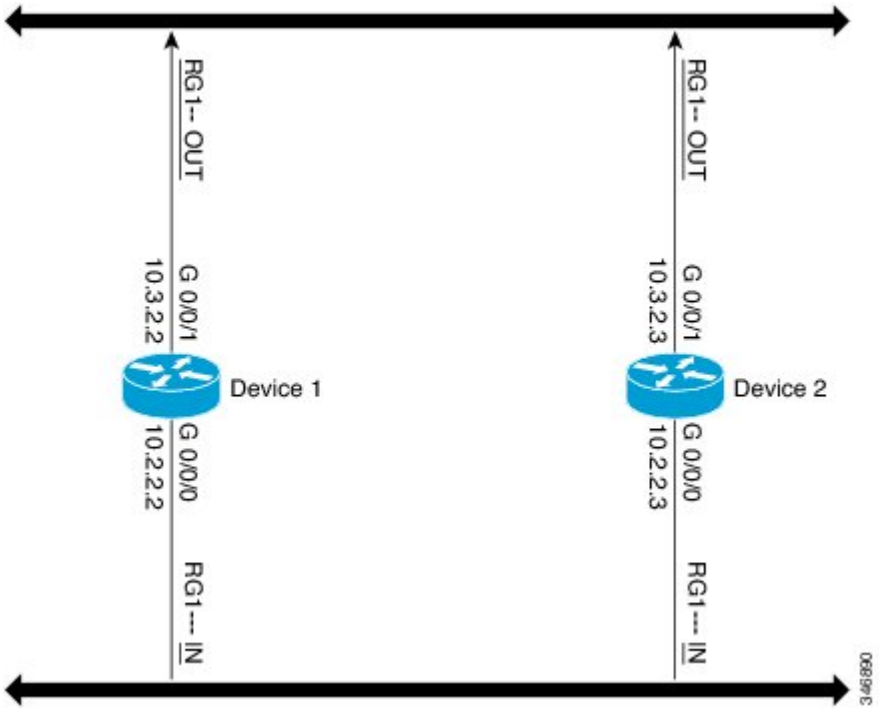
In an active/standby scenario, the main difference between two devices in a failover pair depends on which device is active and which device is a standby, namely which IP addresses to use and which device actively passes the traffic. The active device always becomes the active device if both devices start up at the same time (and are of equal operational health). MAC addresses of the active device are always paired with active IP addresses.

NAT Box-to-Box High-Availability LAN-LAN Topology

In a LAN-LAN topology, all participating devices are connected to each other through LAN interfaces on both the inside and the outside. The figure below shows the NAT box-to-box LAN-LAN topology. Network Address Translation (NAT) is in the active-standby mode and the peers are in one redundancy group (RG). All traffic or a subset of this traffic undergoes NAT translation.

Note Failover is caused by only those failures that the RG infrastructure listens to.

Figure 70: NAT Box-to-Box High-Availability LAN-LAN Topology



WAN-LAN Topology

In a WAN-LAN topology, two devices are connected through LAN interfaces on the inside and WAN interfaces on the outside. There is no control on the routing of return traffic received through WAN links.

WAN links can be provided by the same service provider or different service providers. In most cases, WAN links are provided by different service providers. To utilize WAN links to the maximum, configure an external device to provide a failover.

On LAN-based interfaces, a high availability virtual IP address is required to exchange client information and for faster failover. On WAN-based interfaces, the **redundancy group** *id* **ip** *virtual-ip* **decrement** *value* command is used for failover.

Exclusive Virtual IP Addresses and Exclusive Virtual MAC Addresses

Virtual IP (VIP) addresses and virtual MAC (VMAC) addresses are used by security applications to control interfaces that receive traffic. An interface is paired with another interface, and these interfaces are associated with the same redundancy group (RG). The interface that is associated with an active RG exclusively owns the VIP and VMAC. The Address Resolution Protocol (ARP) process on the active device sends ARP replies for any ARP request for the VIP, and the Ethernet controller for the interface is programmed to receive packets destined for the VMAC. When an RG failover occurs, the ownership of the VIP and VMAC changes. The interface that is associated with the newly active RG sends a gratuitous ARP and programs the interface's Ethernet controller to accept packets destined for the VMAC.

IPv6 Support

You can assign each redundancy group (RG) on a traffic interface for both IPv4 and IPv6 virtual IP (VIP) addresses under the same redundancy interface identifier (RII). Each RG uses a unique virtual MAC (VMAC) address per RII. For an RG, the IPv6 link-local VIP and global VIP coexist on an interface.

You can configure an IPv4 VIP, a link-local IPv6 VIP, and/or a global IPv6 VIP for each RG on a traffic interface. IPv6 link-local VIP is mainly used when configuring static or default routes, whereas IPv6 global VIP is widely used in both LAN and WAN topologies.

You must configure a physical IP address before configuring an IPv4 VIP.

FTP66 ALG Support Overview

Firewalls support the inspection of IPv6 packets and stateful Network Address Translation 64 (NAT64). For FTP to work over IPv6 packet inspection, the application-layer gateway (ALG) (also called the application-level gateway [ALG]), FTP66, is required. The FTP66 ALG is also called all-in-one FTP ALG and one FTP ALG.

The FTP66 ALG supports the following:

- Firewall IPv4 packet inspection
- Firewall IPv6 packet inspection
- NAT configuration
- NAT64 configuration (along with FTP64 support)
- NAT and firewall configuration
- NAT64 and firewall configuration

The FTP66 ALG has the following security vulnerabilities:

- Packet segmentation attack—The FTP ALG state machine can detect segmented packets, and the state machine processing is stopped until a complete packet is received.
- Bounce attack—The FTP ALG does not create doors (for NAT) or pinholes (for firewalls) with a data port number less than 1024. The prevention of a bounce attack is activated only when the firewall is enabled.

How to Configure Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

Configuring a Redundancy Group Protocol

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**

4. **application redundancy**
5. **protocol** *id*
6. **name** *group-name*
7. **timers hellotime** {*seconds* | **msec** *milliseconds*} **holdtime** {*seconds* | **msec** *milliseconds*}
8. **authentication** {**text** *string* | **md5 key-string** [**0** | **7**] *key-string* **timeout** *seconds* | **key-chain** *key-chain-name*}
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Enters redundancy application configuration mode.
Step 5	**protocol** *id* **Example:** `Device(config-red-app)# protocol 1`	Specifies the protocol instance that will be attached to a control interface and enters redundancy application protocol configuration mode.
Step 6	**name** *group-name* **Example:** `Device(config-red-app-prtcl)# name prot1`	(Optional) Configures the redundancy group (RG) with a name.
Step 7	**timers hellotime** {*seconds*	**msec** *milliseconds*} **holdtime** {*seconds*	**msec** *milliseconds*} **Example:** `Device(config-red-app-prtcl)# timers hellotime 3 holdtime 9`	Specifies the interval between when hello messages are sent and the time period before which a device is declared to be down.
Step 8	**authentication** {**text** *string*	**md5 key-string** [**0**	**7**] *key-string* **timeout** *seconds*	**key-chain** *key-chain-name*} **Example:** `Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100`	Specifies the authentication information.

	Command or Action	Purpose
Step 9	**end** **Example:** `Device(config-red-app-prtcl)# end`	Exits redundancy application protocol configuration mode and enters privileged EXEC mode.

Configuring a Redundancy Application Group

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**
4. **application redundancy**
5. **group** *id*
6. **name** *group-name*
7. **shutdown**
8. **priority** *value* [**failover threshold** *value*]
9. **preempt**
10. **track** *object-number* {**decrement** *value* | **shutdown**}
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Enters redundancy application configuration mode.
Step 5	**group** *id* **Example:** `Device(config-red-app)# group 1`	Enters redundancy application group configuration mode.

	Command or Action	Purpose
Step 6	**name** *group-name* **Example:** `Device(config-red-app-grp)# name group1`	(Optional) Specifies an optional alias for the protocol instance.
Step 7	**shutdown** **Example:** `Device(config-red-app-grp)# shutdown`	(Optional) Shuts down a redundancy group manually.
Step 8	**priority** *value* [**failover threshold** *value*] **Example:** `Device(config-red-app-grp)# priority 100 failover threshold 50`	(Optional) Specifies the initial priority and failover threshold for a redundancy group.
Step 9	**preempt** **Example:** `Device(config-red-app-grp)# preempt`	Enables preemption on the group and enables the standby device to preempt the active device regardless of the priority.
Step 10	**track** *object-number* {**decrement** *value* | **shutdown**} **Example:** `Device(config-red-app-grp)# track 200 decrement 200`	Specifies the priority value of a redundancy group that will be decremented if an event occurs.
Step 11	**end** **Example:** `Device(config-red-app-grp)# end`	Exits redundancy application group configuration mode and enters privileged EXEC mode.

Configuring a Control Interface and a Data Interface

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **redundancy**
4. **application redundancy**
5. **group** *id*
6. **data** *interface-type interface-number*
7. **control** *interface-type interface-number* **protocol** *id*
8. **timers delay** *seconds* [**reload** *seconds*]
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable**	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: `Device> enable`	• Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**redundancy** **Example:** `Device(config)# redundancy`	Enters redundancy configuration mode.
Step 4	**application redundancy** **Example:** `Device(config-red)# application redundancy`	Enters redundancy application configuration mode.
Step 5	**group** *id* **Example:** `Device(config-red-app)# group 1`	Enters redundancy application group configuration mode.
Step 6	**data** *interface-type interface-number* **Example:** `Device(config-red-app-grp)# data GigabitEthernet 0/0/0`	Specifies the data interface that is used by the redundancy group.
Step 7	**control** *interface-type interface-number* **protocol** *id* **Example:** `Device(config-red-app-grp)# control gigabitethernet 0/0/2 protocol 1`	Specifies the control interface that is used by the redundancy group. • This interface is also associated with an instance of the control interface protocol.
Step 8	**timers delay** *seconds* [**reload** *seconds*] **Example:** `Device(config-red-app-grp)# timers delay 100 reload 400`	Specifies the time that a redundancy group will take to delay role negotiations that start after a fault occurs or the system is reloaded.
Step 9	**end** **Example:** `Device(config-red-app-grp)# end`	Exits redundancy application group configuration mode and enters privileged EXEC mode.

Configuring a LAN Traffic Interface

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **interface** *type number*
4. **description** *string*
5. **encapsulation dot1q** *vlan-id*
6. **ip vrf forwarding** *name*
7. **ipv6 address** {*ipv6-prefix/prefix-length* | *prefix-name sub-bits/prefix-length*}
8. **zone-member security** *zone-name*
9. **redundancy rii** *RII-identifier*
10. **redundancy group** *id* {**ip** *virtual-ip* | **ipv6** {*link-local-address* | *ipv6-address/prefix-length*} | **autoconfig**} [**exclusive**] [**decrement** *value*]
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 2/0/2`	Configures an interface and enters interface configuration mode.
Step 4	**description** *string* **Example:** `Device(config-if)# description lan interface`	(Optional) Adds a description to an interface configuration.
Step 5	**encapsulation dot1q** *vlan-id* **Example:** `Device(config-if)# encapsulation dot1q 18`	Sets the encapsulation method used by the interface.
Step 6	**ip vrf forwarding** *name* **Example:** `Device(config-if)# ip vrf forwarding trust`	Associates a VPN routing and forwarding (VRF) instance with an interface or subinterface. • The command will not be configured if the specified VRF is not configured.
Step 7	**ipv6 address** {*ipv6-prefix/prefix-length* | *prefix-name sub-bits/prefix-length*} **Example:** `Device(config-if)# ipv6 address 2001:0DB8:1:1:FFFF:FFFF:FFFF:FFFE/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.

	Command or Action	Purpose
Step 8	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone member security z1`	Configures the interface as a zone member. • For the *zone-name* argument, you must configure one of the zones that you had configured by using the **zone security** command while configuring a firewall. • When an interface is in a security zone, all traffic to and from that interface (except traffic going to the router or initiated by the router) is dropped by default. To permit traffic through an interface that is a zone member, you must make that zone part of a zone pair to which you apply a policy. If the policy permits traffic (via inspect or pass actions), traffic can flow through the interface.
Step 9	**redundancy rii** *RII-identifier* **Example:** `Device(config-if)# redundancy rii 100`	Configures an RII for redundancy group-protected traffic interfaces.
Step 10	**redundancy group** *id* {**ip** *virtual-ip* | **ipv6** {*link-local-address* | *ipv6-address/prefix-length*} | **autoconfig**} [**exclusive**] [**decrement** *value*] **Example:** `Device(config-if)# redundancy group 1 ipv6 2001:0DB8:1:1:FFFF:FFFF:FFFF:FFFE/64 exclusive decrement 50`	Enables the redundancy group (RG) traffic interface configuration.
Step 11	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Configuring a WAN Traffic Interface

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **description** *string*
5. **ipv6 address** {*ipv6-prefix/prefix-length* | *prefix-name sub-bits/prefix-length*}
6. **zone-member security** *zone-name*
7. **ip tcp adjust-mss** *max-segment-size*
8. **redundancy rii** *RII-identifier*
9. **redundancy asymmetric-routing enable**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 2/1/0`	Configures an interface and enters interface configuration mode.
Step 4	**description** *string* **Example:** `Device(config-if)# description wan interface`	(Optional) Adds a description to an interface configuration.
Step 5	**ipv6 address** {*ipv6-prefix*/*prefix-length* | *prefix-name sub-bits*/*prefix-length*} **Example:** `Device(config-if)# ipv6 address 2001:DB8:2222::/48`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 6	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security z2`	Configures the interface as a zone member while configuring a firewall. • For the *zone-name* argument, you must configure one of the zones that you had configured by using the **zone security** command. • When an interface is in a security zone, all traffic to and from that interface (except traffic going to the router or initiated by the router) is dropped by default. To permit traffic through an interface that is a zone member, you must make that zone part of a zone pair to which you apply a policy. If the policy permits traffic (via inspect or pass actions), traffic can flow through the interface.
Step 7	**ip tcp adjust-mss** *max-segment-size* **Example:** `Device(config-if)# ip tcp adjust-mss 1360`	Adjusts the maximum segment size (MSS) value of TCP SYN packets going through a router.
Step 8	**redundancy rii** *RII-identifier* **Example:** `Device(config-if)# redundancy rii 360`	Configures an RII for redundancy group-protected traffic interfaces.

	Command or Action	Purpose
Step 9	**redundancy asymmetric-routing enable** **Example:** `Device(config-if)# redundancy asymmetric-routing enable`	Associates a redundancy group with an interface that is used for asymmetric routing.
Step 10	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Configuring an IPv6 Firewall

The steps to configure an IPv4 firewall and an IPv6 firewall are the same. To configure an IPv6 firewall, you must configure the class map in such a way that only an IPv6 address family is matched.

The **match protocol** command applies to both IPv4 and IPv6 traffic and can be included in either an IPv4 policy or an IPv6 policy.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf-definition** *vrf-name*
4. **address-family ipv6**
5. **exit-address-family**
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **sessions maximum** *sessions*
9. **exit**
10. **ipv6 unicast-routing**
11. **ip port-map** *appl-name* **port** *port-num* **list** *list-name*
12. **ipv6 access-list** *access-list-name*
13. **permit ipv6 any any**
14. **exit**
15. **class-map type inspect match-all** *class-map-name*
16. **match access-group name** *access-group-name*
17. **match protocol** *protocol-name*
18. **exit**
19. **policy-map type inspect** *policy-map-name*
20. **class type inspect** *class-map-name*
21. **inspect** [*parameter-map-name*]
22. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**vrf-definition** *vrf-name* **Example:** `Device(config)# vrf-definition VRF1`	Configures a virtual routing and forwarding (VRF) routing table instance and enters VRF configuration mode.
Step 4	**address-family ipv6** **Example:** `Device(config-vrf)# address-family ipv6`	Enters VRF address family configuration mode and configures sessions that carry standard IPv6 address prefixes.
Step 5	**exit-address-family** **Example:** `Device(config-vrf-af)# exit-address-family`	Exits VRF address family configuration mode and enters VRF configuration mode.
Step 6	**exit** **Example:** `Device(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect ipv6-param-map`	Enables a global inspect-type parameter map for the firewall to connect thresholds, timeouts, and other parameters that pertain to the inspect action, and enters parameter-map type inspect configuration mode.
Step 8	**sessions maximum** *sessions* **Example:** `Device(config-profile)# sessions maximum 10000`	Sets the maximum number of allowed sessions that can exist on a zone pair.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**ipv6 unicast-routing** **Example:** `Device(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 11	**ip port-map** *appl-name* **port** *port-num* **list** *list-name* **Example:**	Establishes a port to application mapping (PAM) by using the IPv6 access control list (ACL).

	Command or Action	Purpose
	`Device(config)# ip port-map ftp port 8090 list ipv6-acl`	
Step 12	**ipv6 access-list** *access-list-name* **Example:** `Device(config)# ipv6 access-list ipv6-acl`	Defines an IPv6 access list and enters IPv6 access list configuration mode.
Step 13	**permit ipv6 any any** **Example:** `Device(config-ipv6-acl)# permit ipv6 any any`	Sets permit conditions for an IPv6 access list.
Step 14	**exit** **Example:** `Device(config-ipv6-acl)# exit`	Exits IPv6 access list configuration mode and enters global configuration mode.
Step 15	**class-map type inspect match-all** *class-map-name* **Example:** `Device(config)# class-map type inspect match-all ipv6-class`	Creates an application-specific inspect type class map and enters QoS class-map configuration mode.
Step 16	**match access-group name** *access-group-name* **Example:** `Device(config-cmap)# match access-group name ipv6-acl`	Configures the match criteria for a class map on the basis of the specified ACL.
Step 17	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol tcp`	Configures a match criterion for a class map on the basis of the specified protocol.
Step 18	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 19	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ipv6-policy`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 20	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect ipv6-class`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 21	**inspect** [*parameter-map-name*] **Example:** `Device(config-pmap-c)# inspect ipv6-param-map`	Enables stateful packet inspection.

	Command or Action	Purpose
Step 22	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.

Configuring Zones and Applying Zones to Interfaces

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **exit**
5. **zone security** *zone-name*
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** *source-zone* **destination** *destination-zone*]
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **ipv6 address** *ipv6-address/prefix-length*
12. **encapsulation dot1q** *vlan-id*
13. **zone-member security** *zone-name*
14. **end**
15. **show policy-map type inspect zone-pair sessions**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *zone-name* **Example:** `Device(config)# zone security z1`	Creates a security zone and enters security zone configuration mode.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 5	**zone security** *zone-name* **Example:** `Device(config)# zone security z2`	Creates a security zone and enters security zone configuration mode.
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* [**source** *source-zone* **destination** *destination-zone*] **Example:** `Device(config)# zone-pair security in-2-out source z1 destination z2`	Creates a zone pair and enters security zone-pair configuration mode.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect ipv6-policy`	Attaches a policy map to a top-level policy map.
Step 9	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0.1`	Configures a subinterface and enters subinterface configuration mode.
Step 11	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-subif)# ipv6 address 2001:DB8:2222:7272::72/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface or a subinterface.
Step 12	**encapsulation dot1q** *vlan-id* **Example:** `Device(config-subif)# encapsulation dot1q 2`	Sets the encapsulation method used by the interface.
Step 13	**zone-member security** *zone-name* **Example:** `Device(config-subif)# zone member security z1`	Configures the interface as a zone member. • For the *zone-name* argument, you must configure one of the zones that you had configured by using the **zone security** command. • When an interface is in a security zone, all traffic to and from that interface (except traffic going to the device or initiated by the device) is dropped by default. To permit traffic through an interface that is a zone member, you must make that zone part of the

	Command or Action	Purpose
		zone pair to which you apply a policy. If the policy permits traffic (via inspect or pass actions), traffic can flow through the interface.
Step 14	**end** **Example:** `Device(config-subif)# end`	Exits subinterface configuration mode and enters privileged EXEC mode.
Step 15	**show policy-map type inspect zone-pair sessions** **Example:** `Device# show policy-map type inspect zone-pair sessions`	Displays the stateful packet inspection sessions created because a policy map is applied on a specified zone pair. • The output of this command displays both IPv4 and IPv6 firewall sessions.

Example

The following sample output from the **show policy-map type inspect zone-pair sessions** command displays the translation of packets from an IPv6 address to an IPv4 address and vice versa:

```
Device# show policy-map type inspect zone-pair sessions

  Zone-pair: in-to-out
  Service-policy inspect : in-to-out

    Class-map: ipv6-class (match-any)
      Match: protocol ftp
      Match: protocol tcp
      Match: protocol udp
      Inspect
        Established Sessions
         Session 110D930C [2001:DB8:1::103]:32847=>(209.165.201.2:21) ftp SIS_OPEN
          Created 00:00:00, Last heard 00:00:00
          Bytes sent (initiator:responder) [37:84]

        Half-open Sessions
         Session 110D930C [2001:DB8:1::104]:32848=>(209.165.201.2:21) ftp SIS_OPENING
          Created 00:00:00, Last heard 00:00:00
          Bytes sent (initiator:responder) [0:0]
```

The following sample output from the **show policy-map type inspect zone-pair sessions** command displays the translation of packets from an IPv6 address to an IPv6 address:

```
Device# show policy-map type inspect zone-pair sessions

  Zone-pair: in-to-out
  Service-policy inspect : in-to-out

    Class-map: ipv6-class (match-any)
      Match: protocol ftp
      Match: protocol tcp
      Match: protocol udp
      Inspect
        Established Sessions
         Session 110D930C [2001:DB8:1::103]:63=>[2001:DB8:2::102]:63 udp SIS_OPEN
```

```
Created 00:00:02, Last heard 00:00:01
Bytes sent (initiator:responder) [162:0]
```

Configuration Examples for Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

Example: Configuring a Redundancy Group Protocol

The following example shows how to configure a redundancy group with timers set for hello time and hold time messages:

```
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# protocol 1
Device(config-red-app-prtcl)# timers hellotime 3 holdtime 9
Device(config-red-app-prtcl)# authentication md5 key-string 0 n1 timeout 100
Device(config-red-app-prtcl)# bfd
Device(config-red-app-prtcl)# end
```

Example: Configuring a Redundancy Application Group

The following example shows how to configure a redundancy group named group1 with priority and preempt attributes:

```
Device# configure terminal
Device(config)# redundancy
Device(config-red)# application redundancy
Device(config-red-app)# group 1
Device(config-red-app-grp)# name group1
Device(config-red-app-grp)# priority 100 failover-threshold 50
Device(config-red-app-grp)# preempt
Device(config-red-app-grp)# track 200 decrement 200
Device(config-red-app-grp)# end
```

Example: Configuring a Control Interface and a Data Interface

```
Device# configure terminal
Device(config-red)# application redundancy
Device(config-red-app-grp)# group 1
Device(config-red-app-grp)# data GigabitEthernet 0/0/0
Device(config-red-app-grp)# control GigabitEthernet 0/0/2 protocol 1
Device(config-red-app-grp)# timers delay 100 reload 400
Device(config-red-app-grp)# end
```

Example: Configuring a LAN Traffic Interface

```
Device# configure terminal
Device(config-if)# interface gigabitethernet 2/0/2
Device(config-if)# description lan interface
Device(config-if)# encapsulation dot1q 18
```

```
Device(config-if)# ip vrf forwarding trust
Device(config-if)# ipv6 address 2001:0DB8:1:1:FFFF:FFFF:FFFF:FFFE/64
Device(config-if)# zone member security z1
Device(config-if)# redundancy rii 100
Device(config-if)# redundancy group 1 ipv6 2001:0DB8:1:1:FFFF:FFFF:FFFF:FFFE exclusive
decrement 50
Device(config-if)# end
```

Example: Configuring a WAN Traffic Interface

The following example shows how to configure redundancy groups for a WAN-LAN scenario:

```
Device# configure terminal
Device(config-if)# interface gigabitethernet 2/1/0
Device(config-if)# description wan interface
Device(config-if)# ipv6 address 2001:DB8:2222::/48
Device(config-if)# zone-member security z2
Device(config-if)# ip tcp adjust-mss 1360
Device(config-if)# redundancy rii 360
Device(config-if)# redundancy asymmetric-routing enable
Device(config-if)# end
```

Example: Configuring an IPv6 Firewall

```
Device# configure terminal
Device(config)# vrf-definition VRF1
Device(config-vrf)# address-family ipv6
Device(config-vrf-af)# exit-address-family
Device(config-vrf)# exit
Device(config)# parameter-map type inspect ipv6-param-map
Device(config-profile)# sessions maximum 10000
Device(config-profile)# exit
Device(config)# ipv6 unicast-routing
Device(config)# ip port-map ftp port 8090 list ipv6-acl
Device(config)# ipv6 access-list ipv6-acl
Device(config-ipv6-acl)# permit ipv6 any any
Device(config-ipv6-acl)# exit
Device(config)# class-map type inspect match-all ipv6-class
Device(config-cmap)# match access-group name ipv6-acl
Device(config-cmap)# match protocol tcp
Device(config-cmap)# exit
Device(config)# policy-map type inspect ipv6-policy
Device(config-pmap)# class type inspect ipv6-class
Device(config-pmap-c)# inspect ipv6-param-map
Device(config-pmap-c)# end
```

Example: Configuring Zones and Applying Zones to Interfaces

```
Device# configure terminal
Device(config)# zone security z1
Device(config-sec-zone)# exit
Device(config)# zone security z2
Device(config-sec-zone)# exit
```

```
Device(config)# zone-pair security in-to-out source z1 destination z2
Device(config-sec-zone-pair)# service-policy type inspect ipv6-policy
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/0.1
Device(config-if)# ipv6 address 2001:DB8:2222:7272::72/64
Device(config-if)# encapsulation dot1q 2
Device(config-if)# zone member security z1
Device(config-if)# end
```

Feature Information for Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 176: Feature Information for Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls

Feature Name	Releases	Feature Information
Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls	Cisco IOS XE Release 3.8S	The Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls feature supports high availability (HA) based on redundancy groups (RGs) on IPv6 firewalls. This feature enables you to configure pairs of devices to act as backup for each other. This feature can be configured to determine the active device based on a number of failover conditions. No commands were introduced or modified.
Box-to-Box High Availability Support for IPv6 Zone-Based Firewalls	Cisco IOS XE Release 3.8S	In Cisco IOS XE Release 3.10S, support was added for the Cisco ISR 4400 Series Routers.

CHAPTER 132

Firewall Stateful Inspection of ICMP

The Firewall Stateful Inspection of ICMP feature categorizes Internet Control Management Protocol Version 4 (ICMPv4) messages as either malicious or benign. The firewall uses stateful inspection to *trust* benign ICMPv4 messages that are generated within a private network and permits the entry of associated ICMP replies into the network. The Firewall Stateful Inspection of ICMP feature helps network administrators to debug network issues by using ICMP so that intruders cannot enter the network.

This module provides an overview of the firewall stateful inspection of ICMPv4 messages and describes how to configure the firewall to inspect ICMPv4 messages.

Prerequisites for Firewall Stateful Inspection of ICMP

- You must configure the Cisco firewall before you can configure the Firewall Stateful Inspection of ICMP feature.
- The network must allow all ICMP traffic to pass through security appliance interfaces.
- Access rules must be configured for ICMP traffic that terminates at a security appliance interface.

Restrictions for Firewall Stateful Inspection of ICMP

This feature does not work with the UDP traceroute utility, in which UDP datagrams are sent instead of ICMP packets. UDP traceroute is the default for UNIX systems. For a UNIX host to generate ICMP traceroute packets that are inspected by the firewall, use the "-I" option with the **traceroute** command.

Information About Firewall Stateful Inspection of ICMP

Overview of the Firewall Stateful Inspection of ICMP

Internet Control Management Protocol (ICMP) is a network protocol that provides information about a network and reports errors in the network. Network administrators use ICMP to debug network connectivity issues. To guard against potential intruders using ICMP to discover the topology of a private network, ICMPv4 messages can be blocked from entering a private network; however, network administrators may then be unable to debug the network.

You can configure Cisco routers to use access control lists (ACLs) to either completely allow or deny ICMPv4 messages. When using ACLs for ICMPv4 messages, message *inspection* has precedence over the configured allow or deny actions.

ICMPv4 messages that use the IP protocol can be categorized into the following two types:

- Informational messages that utilize a simple request/reply mechanism.
- Error messages that indicate that some sort of error has occurred while delivering an IP packet.

Note To prevent ICMP attacks from using the Destination Unreachable error message, only one Destination Unreachable message is allowed per session by the firewall.

A host that is processing a UDP session that is traversing the firewall may generate an ICMP error packet with a Destination Unreachable message. In such cases, only one Destination Unreachable message is allowed through the firewall for that session.

The following ICMPv4 packet types are supported:

Table 177: ICMPv4 Packet Types

Packet Type	Name	Description
0	Echo Reply	Reply to an echo request (type 8).
3	Unreachable	Possible reply to any request.
8	Echo Request	Ping or a traceroute request.
11	Time Exceeded	Reply if the time-to-live (TTL) size of a packet is zero.
13	Timestamp Request	Request.
14	Timestamp Reply	Reply to a timestamp request (type 13).

ICMPv4 packet types 0 and 8 are used to ping a destination; the source sends out an Echo Request packet and the destination responds with an Echo Reply packet. Packet types 0, 8, and 11 are used for ICMPv4 traceroute (that is, Echo Request packets that are sent start with a TTL size of 1) and the TTL size is incremented for

each hop. Intermediate hops respond to the Echo Request packet with a Time Exceeded packet and the final destination responds with an Echo Reply packet.

If an ICMPv4 error packet is an embedded packet, the embedded packet is processed according to the protocol and the policy configured for the packet. For example, if the embedded packet is a TCP packet, and a drop action is configured for the packet, the packet is dropped even if ICMPv4 has configured a pass action.

The following scenario describes how ICMPv4 packets pass through the firewall:

1. An ICMPv4 packet arrives at the source interface. The firewall uses the source and destination addresses of the packet without any change for packet inspection. The firewall uses IP addresses (source and destination), the ICMP type, and the protocol for session key creation and lookup.
2. The packet passes the firewall inspection.
3. Return traffic comes from the destination interface and, based on the ICMPv4 message type, the firewall creates the session lookup key.
4. **a.** If the reply message is an informational message, the firewall uses the source and destination addresses from the packet without any change for packet inspection. Here, the destination port is the ICMPv4 message request type.
   b. If the reply message is an ICMPv4 error message, the firewall uses the payload packet present in the ICMP error packet to create the session key for session lookup.
5. If the firewall session lookup is successful, the packet passes the firewall inspection.

ICMP Inspection Checking

ICMP return packets are checked by the inspect code, and not by access control lists (ACLs). The inspect code tracks destination address from each outgoing packet and checks each return packet. For Echo Reply and Timestamp Reply packets, the return address is checked. For Unreachable and Time Exceeded packets, the intended destination address is extracted from the packet data and checked.

How to Configure Firewall Stateful Inspection of ICMP

Configuring Firewall Stateful Inspection of ICMP

Perform this task to configure the firewall stateful inspection of ICMP, which includes the following:

- A class map that matches the ICMP traffic.
- A policy map with the inspect action.
- Security zones and zone pairs (to attach a firewall policy map to the zone pair).

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {**deny** | **permit**} **icmp** *source source-wildcard destination destination-wildcard*

4. **class-map type inspect** *class-map-name*
5. **match protocol** *protocol-name*
6. **exit**
7. **policy-map type inspect** *policy-map-name*
8. **class** *class-map-name*
9. **inspect**
10. **exit**
11. **exit**
12. **zone security** *zone-name*
13. **exit**
14. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
15. **service-policy type inspect** *policy-map-name*
16. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**access-list** *access-list-number* {**deny** | **permit**} **icmp** *source source-wildcard destination destination-wildcard* **Example:** `Device(config)# access-list 102 permit icmp 192.168.0.1 255.255.255.0 192.168.2.22 255.255.255.0`	Defines an extended IP access list.
Step 4	**class-map type inspect** *class-map-name* **Example:** `Device(config)# class-map type inspect c1`	Defines the class on which an action is to be performed and enters QoS class-map configuration mode.
Step 5	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol icmp`	Configures a match criterion for a class map on the basis of the specified protocol.
Step 6	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 7	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect p1`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 8	**class** *class-map-name* **Example:** `Device(config-pmap)# class c1`	Defines the class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 9	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 10	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and enters QoS policy-map configuration mode.
Step 11	**exit** **Example:** `Device(config-pmap)# exit`	Exits QoS policy-map configuration mode and enters global configuration mode.
Step 12	**zone security** *zone-name* **Example:** `Device(config)# zone security z1`	Creates a security zone and enters security zone configuration mode. • Your configuration must have two security zones to create a zone pair: a source zone and a destination zone. • In a zone pair, you can use the default zone as either the source or the destination zone.
Step 13	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 14	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security inout source z1 destination z2`	Creates a zone pair to which interfaces can be assigned and enters security zone-pair configuration mode.
Step 15	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect p1`	Attaches a firewall policy map to a zone pair.

	Command or Action	Purpose
Step 16	**end** **Example:** `Device(config-sec-zone-pair)# end`	Exits security zone-pair configuration mode and enters privileged EXEC mode.

Verifying Firewall Stateful Inspection of ICMP

You can use the following **show** commands in any order.

SUMMARY STEPS

1. **enable**
2. **show ip access-lists**
3. **show policy-map type inspect** *policy-map-name*
4. **show policy-map type inspect zone-pair** *zone-pair-name*
5. **show zone security** *zone-name*
6. **show zone-pair security** [**source** *source-zone* **destination** *destination-zone*]

DETAILED STEPS

Step 1 **enable**

Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

Step 2 **show ip access-lists**

Example:

```
Device# show ip access-lists
```

Displays information about the specified policy map.

Step 3 **show policy-map type inspect** *policy-map-name*

Example:

```
Device# show policy-map type inspect p1
```

Displays information about the specified policy map.

Step 4 **show policy-map type inspect zone-pair** *zone-pair-name*

Example:

```
Device# show policy-map type inspect zone-pair inout
```

Displays the runtime inspect type policy-map statistics for the zone pair.

Step 5 **show zone security** *zone-name*

Example:

```
Device# show zone security z1
```

Displays zone security information.

Step 6 **show zone-pair security** [**source** *source-zone* **destination** *destination-zone*]

Example:

```
Device# show zone-pair security source z1 destination z2
```

Displays source and destination zones and the policy attached to the zone pair.

Example:

The following sample output from the **show ip access-lists** command shows how ACLs are created for an ICMP session for which only ping packets were issued from the host:

```
Device# show ip access-lists

 Extended IP access list 102
     permit icmp any host 192.168.133.3 time-exceeded
     permit icmp any host 192.168.133.3 unreachable
     permit icmp any host 192.168.133.3 timestamp-reply
     permit icmp any host 192.168.133.3 echo-reply (4 matches)
```

The following is sample output from the **show policy-map type inspect p1** command:

```
Device# show policy-map type inspect p1

 Policy Map type inspect p1
  Class c1
   Inspect
```

The following is sample output from the **show policy-map type inspect zone-pair inout** command:

```
Device# show policy-map type inspect zone-pair inout

 Zone-pair: inout
  Service-policy : p1
   Class-map: c1 (match-all)
    Match: protocol icmp
    Inspect
     Session creations since subsystem startup or last reset 0
     Current session counts (estab/half-open/terminating) [0:0:0]
     Maxever session counts (estab/half-open/terminating) [0:0:0]
     Last session created never
     Last statistic reset never
     Last session creation rate 0
     half-open session total 0
   Class-map: class-default (match-any)
    Match: any
    Drop
     0 packets, 0 bytes
```

The following is sample output from the **show zone security** command:

```
Device# show zone security
```

```
zone self
Description: System defined zone
```

The following is sample output from the **show zone-pair security** command:

```
Device# show zone-pair security source z1 destination z2

zone-pair name inout
  Source-Zone z1  Destination-Zone z2
  service-policy p1
```

Configuration Examples for Firewall Stateful Inspection of ICMP

Example: Configuring Firewall Stateful Inspection of ICMP

```
Device# configure terminal
Device(config)# access-list 102 permit icmp 192.168.0.1 255.255.255.0 192.168.2.22
255.255.255.0
Device(config)# class-map type inspect c1
Device(config-cmap)# match protocol icmp
Device(config-cmap)# exit
Device(config)# policy-map type inspect p1
Device(config-pmap)# class c1
Device(config-pmap-c)# inspect
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# zone security z1
Device(config-sec-zone)# exit
Device(config)# zone security z2
Device(config-sec-zone)# exit
Device(config)# zone-pair security inout source z1 destination z2
Device(config-sec-zone-pair)# service-policy type inspect p1
Device(config-sec-zone-pair)# end
```

Feature Information for Firewall Stateful Inspection of ICMP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 178: Feature Information for Firewall Stateful Inspection of ICMP

Feature Name	Releases	Feature Information
Firewall Stateful Inspection of ICMP	Cisco IOS XE Release 2.1 Cisco IOS XE Release 3.2S	The Firewall Stateful Inspection of ICMP feature categorizes ICMPv4 messages as either malicious or benign. The firewall uses stateful inspection to *trust* benign ICMP messages that are generated within a private network and permits the entry of associated ICMP replies.

CHAPTER 133

LISP and Zone-Based Firewalls Integration and Interoperability

The LISP and Zone-Based Firewalls Integration and Interoperability feature enables inner-packet inspection of all Locator ID Separation Protocol (LISP) data packets that pass through a device. To enable LISP inner packet inspection, you have to configure the **lisp inner-packet inspection** command. Without LISP inner packet inspection, endpoint identifier (EID) devices in a LISP network will not have any firewall protection.

This module describes how to configure this feature.

Feature Information for LISP and Zone-Based Firewall Integration and Interoperability

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 179: Feature Information for LISP and Zone-Based Firewall Integration and Interoperability

Feature Name	Releases	Feature Information
LISP and Zone-Based Firewall Integration and Interoperability	Cisco IOS XE Release 3.13S	The LISP and Zone-Based Firewalls Integration and Interoperability feature enables inner-packet inspection of all Locator ID Separation Protocol (LISP) data packets that pass through a device. To enable LISP inner packet inspection, you have to configure the lisp inner-packet inspection command. Without LISP inner inspection, endpoint identifier (EID) devices in a LISP network will not have any firewall protection. The following commands were introduced or modified by this feature: **lisp inner-packet-inspection**, **show parameter-map type inspect-global**, and **show parameter-map type inspect global**.
Intrachassis and Interchassis High Availability for Zone-Based Firewall and LISP Integration	Cisco IOS XE Release 3.14S	In Cisco IOS XE Release 3.14S, the LISP and Zone-Based Firewall Integration and Interoperability feature supports both intrachassis and interchassis high availability. No commands were introduced or modified by this feature.

Prerequisites for LISP and Zone-Based Firewall Integration and Interoperability

- The interchassis high availability configuration on active device and standby devices must be identical.

Restrictions for LISP and Zone-Based Firewall Integration and Interoperability

The following features are not supported:

- Locator ID Separator Protocol (LISP) mobility
- Zone-based firewall, LISP, and Web Cache Control Protocol (WCCP) interoperability
- Zone-based firewall and LISP subinterfaces with VRF interoperability

These features are not supported when LISP inner packet inspection is enabled:

- Asymmetric routing
- LISP control message inspection
- LISP inner packet fragmentation

- Network Address Translation (NAT) and NAT 64
- TCP reset
- Virtual routing and forwarding (VRF)
- Virtual TCP (vTCP)
- VRF-Aware Software Infrastructure (VASI)
- Web Cache Communication Protocol (WCCP)

Information About LISP and Zone-Based Firewalls Integration and Interoperability

LISP Overview

The Locator ID Separation Protocol (LISP) is a network architecture and protocol. LISP replaces a single IP address with two numbering spaces—Routing Locators (RLOCs), which are topologically assigned to network attachment points and used for routing and forwarding of packets through the network; and Endpoint Identifiers (EIDs), which are assigned independently from the network topology and used for numbering devices, and are aggregated along administrative boundaries.

LISP defines functions for mapping between the two numbering spaces and encapsulating traffic originated by devices using non-routable EIDs for transport across a network infrastructure that routes and forwards using RLOCs. LISP provides a set of functions for devices to exchange information that is used to map non-routable EIDs to routable RLOCs.

LISP requires LISP-specific configuration of one or more LISP-related devices, such as the LISP egress tunnel router (ETR), ingress tunnel router (ITR), proxy ETR (PETR), proxy ITR (PITR), map resolver (MR), map server (MS), and LISP alternative logical topology (ALT) device.

Zone-Based Firewall and LISP Interoperability Overview

The zone-based firewall can be deployed either on the southbound or northbound of the Locator ID Separator Protocol (LISP) xTR device, depending on where the edge router (routers such as Cisco ASR 1000 Aggregation Services Routers) is located in the network. The ingress tunnel router (ITR) and egress tunnel router (ETR) together are called the xTR device.

When the zone-based firewall is at the northbound of the xTR device; then the firewall can view LISP encapsulated packets, such as LISP tunneled packets, that pass through the network.

When the zone-based firewall is at the southbound of the xTR device, then the firewall can view the original packet. However; the firewall is not aware of any LISP xTR processing or do not see any LISP header. For egress packets, the xTR device does LISP encapsulation and adds the LISP header on top of the original packet after the firewall inspection. For ingress packets, the xTR device does LISP decapsulation (removal of the LISP header) before the firewall inspection and as a result, the firewall only inspects the original packet; and has no interaction with LISP at all.

This section describes the scenario when the zone-based firewall is deployed at the southbound of the LISP xTR device:

If an edge router is configured as a LISP xTR device to perform LISP encapsulation and decapsulation functions, you can configure the zone-based firewall between the LISP interface and the interfaces that face the LISP local endpoint identifier (EID) devices on the same edge router. LISP header decapsulation is performed before the header enters the zone-based firewall at the LISP interface. LISP header encapsulation is performed after the packet egresses from the firewall at the LISP interface. The firewall inspects only native traffic (what is native traffic here?) in the EID space.

This section describes the scenario when the zone-based firewall is deployed at the northbound of the LISP xTR devicce:

If more than one edge routers are deployed as load-sharing routers at the northbound of the xTR device, the firewall on the edge router is considered northbound of the xTR device. In this case, all packets that pass through the zone-based firewall are LISP encapsulated packets. When a packet arrives, the firewall inspects either the inner header or outer header of the LISP packets. By default, only the outer header is inspected. You can enable inner header inspection by using the **lisp inner-packet-inspection** command.

In Cisco IOS XE Release, if LISP inner packet inspection is enabled, the firewall only inspects the first fragmented inner packet, and all subsequent inner packets pass through the firewall without further inspection. If LISP inner packet inspection is enabled, the LISP instance ID is treated as virtual routing and forwarding (VRF) ID, and LISP packets that belong to different instance IDs are associated with different zone-based firewall sessions.

Feature Interoperability LISP

In Cisco IOS XE Release 3.13S, the LISP and Zone-Based Firewall Integration and Interoperability feature, works with the following features:

- IPv4 inner and outer headers
- IPv6 inner and outer headers
- LISP multitenancy
- Application layer gateways (ALGs)
- Application Inspection and Control (AIC)
- Mulitprotocol Label Switching (MPLS)
- In-Service Software Upgrade (ISSU)
- PxTR Case

Intrachassis and Interchassis High Availability for Zone-Based Firewall and LISP Integration

In Cisco IOS XE Release 3.14S, the LISP and Zone-Based Firewall Integration and Interoperability feature supports both intrachassis and interchassis high availability. When Location ID Separation Protocol (LISP) inner packet inspection is enabled, interchassis and intrachassis redundancy are supported at the xTR northbound device.

For LISP inner packet inspection at the northbound device, LISP instance ID is used as the virtual routing and forwarding (VRF) instance. The VRF configuration at northbound device is ignored if LISP inner packet inspection is enabled.

When two devices are located at the northbound of the xTR device and the xTR device is located inside the cloud, if LISP inner packet inspection is enabled on both devices, zone-based firewall sessions that are created for LISP inner packet flow is synced to the standby device.

A typical interchassis (box-to-box) high availability topology will have two devices in the routing locator (RLOC) space at the northbound of the xTR device. The xTR device sits in the inside network. If LISP inner packet inspection is enabled on both devices, zone-based firewall sessions that are created for LISP inner packets are synced to the standby device.

There are no configuration changes for intrachassis redundancy.

How to Configure LISP and Zone-Based Firewalls Integration and Interoperability

Enabling LISP Inner Packet Inspection

You can configure LISP inner packet inspection after configuring the **parameter-map type inspect global** command or the **parameter-map type inspect-global** command.

Note You cannot configure both these commands simultaneously.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect global**
4. **lisp inner-packet-inspection**
5. **end**
6. **show parameter-map type** {**inspect global** | **inspect-global**}

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect global** **Example:**	Configures a global inspect-type parameter map for connecting thresholds, timeouts, and other parameters

	Command or Action	Purpose
	`Device(config)# parameter-map type inspect global`	pertaining to the inspect action, and enters parameter-map type inspect configuration mode.
Step 4	**lisp inner-packet-inspection** **Example:** `Device(config-profile)# lisp inner-packet-inspection`	Enables LISP inner packet inspection.
Step 5	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and returns to privileged EXEC mode.
Step 6	**show parameter-map type** {**inspect global** | **inspect-global**} **Example:** `Device# show parameter-map type inspect-global`	Displays global inspect-type parameter map information.

Example

The following sample output from the **show parameter-map type inspect-global** command displays that LISP inner-packet inspection is enabled:

```
Device# show parameter-map type inspect-global

parameter-map type inspect-global
  log dropped-packet off
  alert on
  aggressive aging disabled
  syn_flood_limit  unlimited
  tcp window scaling enforcement loose off
  max incomplete unlimited  aggressive aging disabled
  max_incomplete TCP unlimited
  max_incomplete UDP unlimited
  max_incomplete ICMP unlimited
  application-inspect all
  vrf default inspect vrf-default
  vrf vrf2 inspect vrf-default
  vrf vrf3 inspect vrf-default
  lisp inner-packet-inspection
```

Configuring Interchassis High Availability for LISP Inner Packet Inspection

Configuring the xTR Southbound Interface for Interchassis High Availability

Before you begin

Prerequisites

- Zones and zone-pairs must be configured.

- Redundancy and redundancy groups must be configured. See, the "Configuring Firewall Stateful Interchassis Redundancy" module in the *Zone-Based Policy Firewall Configuration Guide* for more information.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **vrf forwarding** *vrf-name*
5. **description** *string*
6. **ip address** *ip-address mask*
7. **exit**
8. **interface** *type number*
9. **description** *string*
10. **zone-member security** *zone-name*
11. **exit**
12. **interface** *type number*
13. **description** *string*
14. **ip address** *ip-address mask*
15. **zone-member security** *zone-name*
16. **cdp enable**
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface TenGigabitEthernet 1/3/0`	Configures an interface and enters interface configuration mode.
Step 4	**vrf forwarding** *vrf-name* **Example:** `Device(config-if)# vrf forwarding lower`	Associates a VRF instance or a virtual network with an interface or subinterface.
Step 5	**description** *string* **Example:**	Adds a description to an interface configuration. • The zone-based firewall cannot be configured at this interface.

	Command or Action	Purpose
	`Device(config-if)# description facing RLOC and the LISP cloud; has a LISP header.`	
Step 6	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 192.0.1.27 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 7	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 8	**interface** *type number* **Example:** `Device(config)# interface LISP 0`	Configures an interface and enters interface configuration mode. • This is the LISP virtual interface.

Step 9	**description** *string*
	Example:
	`Device(config-if)# description LISP virtual interface.`
	`Adds LISP header after firewall inspection or removes LISP header before firewall inspection.`
		Adds a description to an interface configuration.

Step 10	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security ge0-0-3a`	Attaches an interface to a security zone.
Step 11	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 12	**interface** *type number* **Example:** `Device(config)# interface tengigabitethernet 0/3/0`	Configures an interface and enters interface configuration mode.
Step 13	**description** *string* **Example:** `Device(config-if)# description facing internal network, does not have a LISP header.`	Adds a description to an interface configuration.
Step 14	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 192.0.2.5 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 15	**zone-member security** *zone-name* **Example:**	Attaches an interface to a security zone.

	Command or Action	Purpose
	`Device(config-if)# zone-member security ge0-0-0`	
Step 16	**cdp enable** **Example:** `Device(config-if)# cdp enable`	Enable Cisco Discovery Protocol (CDP) on an interface.
Step 17	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring the xTR Northbound Interface for LISP Inner Packet Inspection

In this configuration, a Locator ID Separation Protocol (LISP) virtual interface is not needed because at northbound the LISP header is not inspected. However, you can configure the zone-based firewall to inspect either LISP inner packets or outer packets.

Before you begin

- Zones and zone-pairs must be configured.
- Redundancy and redundancy groups must be configured. See, the "Configuring Firewall Stateful Interchassis Redundancy" module in the *Zone-Based Policy Firewall Configuration Guide* for more information.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **description** *string*
5. **ip address** *ip-address mask*
6. **zone-member security** *zone-name*
7. **negotiation auto**
8. **redundancy rii** *id*
9. **redundancy group** *id* **ip** *virtual-ip* **exclusive decrement** *value*
10. **exit**
11. **interface** *type number*
12. **description** *string*
13. **ip address** *ip-address mask*
14. **zone-member security** *zone-name*
15. **negotiation auto**
16. **redundancy rii** *id*
17. **redundancy group** *id* **ip** *virtual-ip* **exclusive decrement** *value*
18. **ip virtual-reassembly**
19. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 1/2/1`	Configures an interface and enters interface configuration mode. • This interface can see the entire LISP packet.
Step 4	**description** *string* **Example:** `Device(config-if)# description RLOC-space/north LAN`	Adds a description to an interface configuration.
Step 5	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 198.51.100.8 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 6	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security ge0-0-3`	Attaches an interface to a security zone.
Step 7	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables advertisement of speed, duplex mode, and flow control on a Gigabit Ethernet interface.
Step 8	**redundancy rii** *id* **Example:** `Device(config-subif)# redundancy rii 200`	Configures the redundancy interface identifier (RII) for redundancy group protected traffic interfaces
Step 9	**redundancy group** *id* **ip** *virtual-ip* **exclusive decrement** *value* **Example:** `Device(config-if)# redundancy group 1 ip 198.51.100.12 exclusive decrement 50`	Enables the redundancy group (RG) traffic interface configuration.
Step 10	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.

	Command or Action	Purpose
Step 11	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 0/0/3`	Configures an interface and enters interface configuration mode. • This interface can see the entire LISP packet.
Step 12	**description** *string* **Example:** `Device(config-if)# description RLOC-space/south LAN`	Adds a description to an interface configuration.
Step 13	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 198.51.100.27 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 14	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security ge0-0-0`	Attaches an interface to a security zone.
Step 15	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables advertisement of speed, duplex mode, and flow control on a Gigabit Ethernet interface.
Step 16	**redundancy rii** *id* **Example:** `Device(config-subif)# redundancy rii 300`	Configures the redundancy interface identifier (RII) for redundancy group protected traffic interfaces
Step 17	**redundancy group** *id* **ip** *virtual-ip* **exclusive decrement** *value* **Example:** `Device(config-if)# redundancy group 1 ip 194.88.4.1 exclusive decrement 50`	Enables the RG traffic interface configuration.
Step 18	**ip virtual-reassembly** **Example:** `Device(config-if)# ip virtual-reassembly`	Enables virtual fragment reassembly (VFR) on an interface.
Step 19	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for LISP and Zone-Based Firewalls Integration and Interoperability

Example: Enbaling LISP Inner Packet Inspection

```
Device# configure terminal
Device(config)# parameter-map type inspect-global
Device(config-profile)# lisp inner-packet-inspection
Device(config-profile)# end
```

The following example shows a zone-based firewall configuration with LISP inner-packet inspection enabled:

```
 address-family ipv4
 exit-address-family
 !
 address-family ipv6
 exit-address-family

class-map type inspect match-any c-ftp-tcp
 match protocol ftp
 match protocol telnet
 match protocol http
 match protocol tcp
 match protocol udp
!
policy-map type inspect p1
 class type inspect c-ftp-tcp
  inspect
 class class-default
!
zone security ge0-0-0
!
zone security ge0-0-3
!
zone-pair security zp-ge000-ge003 source ge0-0-0 destination ge0-0-3
 service-policy type inspect p1
!
zone-pair security zp-ge003-ge000 source ge0-0-3 destination ge0-0-0
 service-policy type inspect p1
!
interface TenGigabitEthernet 1/3/0
 ip address 192.168.1.1 255.255.255.0
 ipv6 address 2001:DB8:100::2/64
 zone-member security ge0-0-0
!
interface TenGigabitEthernet 0/3/0
 ip address 192.168.2.1 255.255.255.0
 ipv6 address 2001:DB8:200::2/64
 zone-member security ge0-0-3
!
parameter-map type inspect global
 lisp inner-packet-inspection
 log dropped-packet off
  alert on
```

!

CHAPTER 134

Application Aware Firewall

This document describes how Zone Based FireWall policy is defined based on the applications that NBAR can detect and make Zone Based FireWall application aware. The Application FireWall inspects the traffic and blocks traffic based on applications, category, application-family or application-group. This application aware firewall feature provides the following benefits:

- Application visibility and granular control
- Classification of 1400+ layer 7 applications
- Allows or blocks traffic by application, category, application-family or application-group

Feature Information for Application Aware Firewall

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Name	Releases	Feature Information
Application Aware Zone-based FW	Cisco IOS XE Fuji 16.9.1	This document describes how Zone Based FireWall policy is defined based on the applications that NBAR can detect and make Zone Based FireWall application aware. The Application FireWall inspects the traffic and blocks traffic based on applications, category, application-family or application-group. The following commands were introduced or modified: **show class-map***avc-classmap-name* **show policy-map type inspect zone-pair** **show policy-map type inspect zone-pair sessions** **show policy-map type inspect avc** **show platform hardware qfpactive feature firewall drop**

Information About Application Awareness on Zone-Based FW

Prerequisites for Application Aware Firewall

- Ensure that traffic is matched to the Layer3/Layer4 inspect class map. If the traffic does not match the firewall inspection, the AVC policy fails to see the traffic.
- Inspect DNS in the same class-map where the AVC service-policy is applied.

Restrictions on Application Aware Zone-Based FW

- No support for traffic to self-zone.
- The AVC inspect policy should allow all and only deny certain application because many applications are interdependent and therefore allowing one application while denying all others do not work all the time.
- Each application class-map can have upto 16 filters (each match is considered a filter).
- The AVC policy-map can have upto 32 class-maps (including class-default).
- You cannot configure **match protocol attribute application-family** or **match protocol attribute application-group** if you specify the category using the **match protocol attribute category** command.

Before you configure class-map and policy-map, use the **parameter-map type inspect** configure the parameter-map type to log dropped packets:

```
Device (config)# parameter-map type inspect
Device (config-map)# log dropped-packets
```

Policies Based on Network Layers L3/L4

Zone-based Firewall uses policies based on network layers L3/L4, for example, class maps are based on ACL and L4 protocolsTCP/UDP/ICMP or L7 protocolsFTP and SIP. Policies that are defined using the L7 protocol utilize the protocol's destination port to classify the packet. ZBF lacks application visibility, it supports FTP inspection through the FTP ALG, and only identifies the protocols that are based on port 21.

Note If an FTP control flow is opened on some random port, zone-based firewall cannot identify the application.

How to Configure NBAR Based Application Awareness on ZBFW

Configure Layer 4 Zone-Based Firewall

```
Device(config-profile)#class-map type inspect match-any cm1
Device(config-cmap)#match protocol http
Device(config-cmap)#match protocol https
Device(config-cmap)#match protocol dns
Device(config-cmap)#match protocol tcp
Device(config-cmap)#match protocol udp
Device(config-cmap)#match protocol icmp
Device(config-cmap)#exit
Device(config)#class-map match-any nbar-class1
Device(config-cmap)#match protocol yahoo-mail
Device(config-cmap)#match protocol amazon
Device(config-cmap)#match protocol attribute category consumer-internet
Device(config-cmap)#exit
```

L7 Service Policy for Application Aware Firewall

Procedure

	Command or Action	Purpose

Step 1	Configure the class-map for inspection.
	Example:
	`class-map type inspect match-any cm1`
	` match protocol http`
	` match protocol https`
	` match protocol dns`
	` match protocol tcp`
	` match protocol udp`
	` match protocol icmp`
		Defines the protocols and category using the **class-map type inspect** and **match protocol** commands.

Step 2	Define the action, in this case the AVC, using the application firewall policy.
	Example:
	`policy-map type inspect avc nbar-policy1`
	`class nbar-class1`
		Uses the **deny** command to refuse the remote network management protocols listed in the `nbar-class1`class map.

	Command or Action	Purpose
	deny class class-default allow	

Step 3	Log the dropped packets using the application firewall policy.
	Example:
	policy-map type inspect pm1
	class type inspect cm1
	  inspect
	  service-policy avc nbar-policy1
	class class-default
	  drop log
	Traffic from amazon, in nbar-class1, is denied by the policy. For example, a dropped packet is shown in the following drop log message:
	Oct 17 12:44:08.101: %IOSXE-6-PLATFORM: R0/0:
	cpp_cp:
	QFP:0.0 Thread:000 TS:00000002517650404876
	%FW-6-DROP_PKT:
	Dropping dns/amazon pkt from GigabitEthernet3
	171.70.168.183:53 =>
	171.10.1.101:50877(target:class)
	-(in_to_out:cm1) due to AVC Policy drop:classify
	result with ip ident 65434	

What to do next

Add the **ip nbar protocol-discovery ipv4** command on the ingress interface. Then use the **show ip nbar protocol-discovery interface** [**intf-name**] command to see the application classification.

Example: Application Aware Show Commands

In this example, the **show policy-map type inspect zone-pair** command shows the policy map statistics and other information including information about the sessions existing on a specified zone pair. The line following `Class-map: nbar-class1 (match-any)` includes the packet counter value (`7 packets`), which increases whenever traffic matches the nbar-class1 class.

```
Device# show policy-map type inspect zone-pair

Zone-pair: in_to_out
Service-policy inspect : pm1

Class-map: cm1 (match-any)
Match: protocol http
Match: protocol https
Match: protocol dns
Match: protocol tcp
Match: protocol udp
Match: protocol icmp
Inspect
Packet inspection statistics [process switch:fast switch]
tcp packets: [0:485]
dns packets: [0:51]
```

```
Session creations since subsystem startup or last reset 21
Current session counts (estab/half-open/terminating) [13:0:0]
Maxever session counts (estab/half-open/terminating) [13:2:0]
Last session created 00:00:00
Last statistic reset 00:00:19
Last session creation rate 151
Last half-open session total 0

Service-policy inspect avc : nbar-policy1

Class-map: nbar-class1 (match-any)
7 packets, 1449 bytes
30 second offered rate 1000 bps, drop rate 0000 bps
Match: protocol amazon
Match: protocol yahoo-mail
Match: protocol attribute category consumer-internet
Deny

Class-map: class-default (match-any)
211 packets, 94091 bytes
30 second offered rate 27000 bps, drop rate 0000 bps
Match: any
Allow

Class-map: class-default (match-any)
Match: any
Drop
0 packets, 0 bytes
```

```

CHAPTER 135

Firewall Support of Skinny Client Control Protocol

The Firewall Support of Skinny Client Control Protocol feature enables the Cisco IOS XE firewall to support VoIP and the Skinny Client Control Protocol (SCCP). Cisco IP phones use the SCCP to connect with and register to Cisco Unified Communications Manager. To be able to configure Cisco IOS XE firewall between the IP phone and Cisco Unified Communications Manager in a scalable environment, the firewall needs to be able to detect SCCP and understand the information passed within the messages. With the Firewall Support of Skinny Client Control Protocol feature, the firewall inspects Skinny control packets that are exchanged between Skinny clients (such as IP Phones) and the Cisco Unified Communications Manager and configures the router to enable Skinny data channels to traverse through the router. This feature extends the support of SCCP to accommodate video channels.

Prerequisites for Firewall Support of Skinny Client Control Protocol

- Your system must be running Cisco IOS XE Release 2.1 or a later release.
- You must enable the firewall for the SCCP application-level gateway (ALG) to work.
- You must enable the TFTP ALG for SCCP to work because IP phones that use Skinny need the TFTP configuration file from the Cisco Unified Communications Manager.

Restrictions for Firewall Support of Skinny Client Control Protocol

- IPv6 address inspection and translation is not supported.
- TCP segmentation is not supported.

Information About Firewall Support of Skinny Client Control Protocol

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.
- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

SCCP Inspection Overview

SCCP inspection enables voice communication between two SCCP clients by using the Cisco Unified Communications Manager. The Cisco Unified Communications Manager uses the TCP port 2000 (the default SCCP port) to provide services to SCCP clients. Initially, the SCCP client connects to the primary Cisco Unified Communications Manager by establishing a TCP connection and, if available, connects to a secondary Cisco Unified Communications Manager. After the TCP connection is established, the SCCP client registers with the primary Cisco Unified Communications Manager, which is used as the controlling Cisco Unified Communications Manager until it reboots or a keepalive failure occurs. Thus, the TCP connection between the SCCP client and the Cisco Unified Communications Manager exists forever and is used to establish calls coming to or from the client. If a TCP connection fails, the secondary Cisco Unified Communications Manager is used. All data channels established with the initial Cisco Unified Communications Manager remain active and will be closed after the call ends.

The SCCP protocol inspects the locally generated or terminated SCCP control channels and opens or closes pinholes for media channels that originate from or are destined to the firewall. Pinholes are ports that are opened through a firewall to allow an application controlled access to a protected network.

The table below lists the set of messages that are necessary for the data sessions to open and close. SCCP inspection will examine the data sessions that are used for opening and closing the access list pinholes.

Table 180: SCCP Data Session Messages

Skinny Inspection Message	Description
CloseReceiveChannel	Indicates that the call should be aborted. Any intermediate sessions created by the firewall and NAT have to be cleaned up when this message is received.
OpenReceiveChannelACK	Indicates that the phone is acknowledging the OpenReceiveChannel message that it received from the Cisco Unified Communications Manager.
StartMediaTransmission	Contains the Realtime Transport Protocol (RTP) information of the phone that is the source or destination of the call. The message contains the IP address, the RTP port that the other phone is listening on, and the Call ID that uniquely identifies the call.
StopMediaTransmission	Indicates that the call has ended. Sessions can be cleaned up after receiving this message.
StationCloseReceiveChannel	Instructs the Skinny client (on the basis of the information in this message) to close the receiving channel.
StationOpenMultiMediaReceiveChannelAck	Contains the IP address and port information of the Skinny client sending this message. It also contains the status of whether the client is willing to receive video and data channels.
StationOpenReceiveChannelAck	Contains the IP address and port information of the Skinny client sending this message. This message also contains the status of whether or not the client is willing to receive voice traffic.
StationStartMediaTransmission	Contains the IP address and port information of the remote Skinny client.
StationStartMultiMediaTransmit	Indicates that the Cisco Unified Communications Manager received an OpenLogicalChannelAck message for the video or the data channel.
StationStopMediaTransmission	Instructs the Skinny client (on the basis of the information in this message) to stop transmitting voice traffic.
StationStopSessionTransmission	Instructs the Skinny client (on the basis of the information in this message) to end the specified session.

ALG--SCCP Version 17 Support

The ALG—SCCP Version 17 Support feature enables the SCCP ALG to parse SCCP Version 17 packets. Cisco Unified Communications Manager 7.0 and the IP phones that use Cisco Unified Communications

Manager 7.0 support only SCCP Version 17 messages. The format of SCCP changed from Version 17 to support IPv6. The SCCP ALG checks for the SCCP version in the prefix of a message before parsing it according to the version. The SCCP message version is extracted from the message header and if it is greater than Version 17, the message is parsed by using the Version 17 format and the IPv4 address and port information is extracted. The SCCP ALG supports the inspection and translation of IPv4 address information in SCCP messages.

Note IPv6 address inspection and translation are not supported.

The IP address format of the following SCCP ALG-handled messages changed in Version 17:

- StationOpenMultiMediaReceiveChannelAck
- StationOpenReceiveChannelAckMessage
- StationRegisterMessage
- StationStartMediaTransmissionAckMessage
- StationStartMultiMediaTransmissionAckMessage
- StationStartMediaTransmissionMessage
- StationStartMultiMediaTransmissionMessage

How to Configure Firewall Support of Skinny Client Control Protocol

Configuring a Skinny Class Map and Policy Map

When you enable SCCP (through the **match protocol** command) in a firewall configuration, you must enable TFTP (through the **match protocol** command); otherwise, the IP phones that use SCCP cannot communicate with the Cisco Unified Communications Manager. SCCP enables voice communication between two Skinny clients through the use of a Cisco Unified Communications Manager.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **match protocol** *protocol-name*
6. **exit**
7. **policy-map type inspect** *policy-map-name*
8. **class type inspect** *class-map-name*
9. **inspect**
10. **exit**

11. **class class-default**
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Router(config)# class-map type inspect match-any cmap1`	Creates an inspect type class map and enters class map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Router(config-cmap)# match protocol skinny`	Configures the match criterion for a Skinny class map.
Step 5	**match protocol** *protocol-name* **Example:** `Router(config-cmap)# match protocol tftp`	Configures the match criterion for a TFTP class map.
Step 6	**exit** **Example:** `Router(config-cmap)# exit`	Exits class map configuration mode.
Step 7	**policy-map type inspect** *policy-map-name* **Example:** `Router(config)# policy-map type inspect pmap1`	Creates an inspect type policy map and enters policy map configuration mode.
Step 8	**class type inspect** *class-map-name* **Example:** `Router(config-pmap)# class type inspect cmap1`	Specifies the class on which the action is performed and enters policy-map class configuration mode.
Step 9	**inspect** **Example:** `Router(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 10	**exit** **Example:** `Router(config-pmap-c)# exit`	Exits policy-map class configuration mode and enters policy map configuration mode.

	Command or Action	Purpose
Step 11	**class class-default** **Example:** `Router(config-pmap)# class class-default`	Specifies that these policy map settings apply to the predefined default class. • If traffic does not match any of the match criteria in the configured class maps, it is directed to the predefined default class.
Step 12	**end** **Example:** `Router(config-pmap)# end`	Exits policy map configuration mode and enters privileged EXEC mode.

Configuring a Zone Pair and Attaching an SCCP Policy Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** {*zone-name* | **default**}
4. **exit**
5. **zone security** {*zone-name* | **default**}
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** {*source-zone-name* | **self** | **default**} **destination** [*destination-zone-name* | **self** | **default**]]
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **zone-member security** *zone-name*
12. **exit**
13. **interface** *type number*
14. **zone-member security** *zone-name*
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**zone security** {*zone-name* | **default**} **Example:** `Router(config)# zone security zone1`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 4	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 5	**zone security** {*zone-name* | **default**} **Example:** `Router(config)# zone security zone2`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* [**source** {*source-zone-name* | **self** | **default**} **destination** [*destination-zone-name* | **self** | **default**]] **Example:** `Router(config)# zone-pair security in-out source zone1 destination zone2`	Creates a zone pair and enters security zone pair configuration mode. **Note** To apply a policy, you must configure a zone pair.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Router(config-sec-zone-pair)# service-policy type inspect pmap1`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 9	**exit** **Example:** `Router(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 10	**interface** *type number* **Example:** `Router(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 11	**zone-member security** *zone-name* **Example:** `Router(config-if)# zone-member security zone1`	Assigns an interface to a specified security zone. **Note** When you make an interface a member of a security zone, all traffic in and out of that interface (except traffic bound for the router or initiated by the router) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.

	Command or Action	Purpose
Step 12	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 13	**interface** *type number* **Example:** `Router(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 14	**zone-member security** *zone-name* **Example:** `Router(config-if)# zone-member security zone2`	Assigns an interface to a specified security zone.
Step 15	**end** **Example:** `Router(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Configuration Examples for Firewall Support of Skinny Control Protocol

Example: Configuring an SCCP Class Map and a Policy Map

```
Router# configure terminal
Router(config)# class-map type inspect match-any cmap1
Router(config-cmap)# match protocol skinny
Router(config-cmap)# match protocol tftp
Router(config-cmap)# exit
Router(config)# policy-map type inspect pmap1
Router(config-pmap)# class type inspect cmap1
Router(config-pmap-c)# inspect
Router(config-pmap-c)# exit
Router(config-pmap)# class class-default
Router(config-pmap)# end
```

Example: Configuring a Zone Pair and Attaching an SCCP Policy Map

```
Router# configure terminal
Router(config)# zone security zone1
Router(config-sec-zone)# exit
Router(config)# zone security zone2
Router(config-sec-zone)# exit
Router(config)# zone-pair security in-out source zone1 destination zone2
Router(config-sec-zone-pair)# service-policy type inspect pmap1
Router(config-sec-zone-pair)# exit
Router(config)# interface gigabitethernet 0/0/0
```

```
Router(config-if)# zone-member security zone1
Router(config-if)# exit
Router(config)# interface gigabitethernet 0/1/1
Router(config-if)# zone-member security zone2
Router(config-if)# end
```

Feature Information for Firewall Support for Skinny Client Control Protocol

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 181: Feature Information for Firewall Support for Skinny Client Control Protocol

Feature Name	Releases	Feature Information
ALG—SCCP V17 Support	Cisco IOS XE Release 3.5S	The ALG—SCCP Version 17 Support feature enables the SCCP ALG to parse SCCP version 17 packets. The SCCP format has changed from version 17 to support IPv6.
Firewall—SCCP Video ALG Support	Cisco IOS XE Release 2.4	SCCP enables voice communication between two Skinny clients through the use of a Cisco Unified Communications Manager. This feature enables Cisco firewalls to inspect Skinny control packets that are exchanged between a Skinny client and the Cisco Unified Communications Manager. The following command was modified: **match protocol**.

Feature Name	Releases	Feature Information
Firewall Support for Skinny Client Control Protocol	Cisco IOS XE Release 2.1	The Firewall Support of Skinny Client Control Protocol feature enables the Cisco IOS XE firewall to support VoIP and SCCP. Cisco IP phones use the SCCP to connect with and register to Cisco Unified Communications Manager. To be able to configure Cisco IOS XE firewall between the IP phone and Cisco Unified Communications Manager in a scalable environment, the firewall needs to be able to detect SCCP and understand the information passed within the messages. With the Firewall Support of Skinny Client Control Protocol feature, the firewall inspects Skinny control packets that are exchanged between Skinny clients (such as IP Phones) and the Cisco Unified Communications Manager and configures the router to enable Skinny data channels to traverse through the router. This feature extends the support of SCCP to accommodate video channels..

CHAPTER 136

IPv6 Zone-Based Firewall Support over VASI Interfaces

This feature supports VRF-Aware Service Infrastructure (VASI) interfaces over IPv6 firewalls. This feature allows you to apply services such as access control lists (ACLs), Network Address Translation (NAT), policing, and zone-based firewalls to traffic that flows across two different virtual routing and forwarding (VRF) instances. VASI interfaces support the redundancy of Route Processors (RPs) and Forwarding Processors (FPs). VASI interfaces support IPv4 and IPv6 unicast traffic.

This module provides information about VASI interfaces and describes how to configure VASI interfaces.

Restrictions for IPv6 Zone-Based Firewall Support over VASI Interfaces

- Multiprotocol Label Switching (MPLS) traffic over VRF-Aware Software Infrastructure (VASI) interfaces is not supported.
- IPv4 and IPv6 multicast traffic is not supported.
- VASI interfaces do not support the attachment of queue-based features. The following commands are not supported on modular QoS CLI (MQC) policies that are attached to VASI interfaces:
  - **bandwidth (policy-map class)**
  - **fair-queue**
  - **priority**
  - **queue-limit**
  - **random-detect**
  - **shape**

Information About IPv6 Zone-Based Firewall Support over VASI Interfaces

VASI Overview

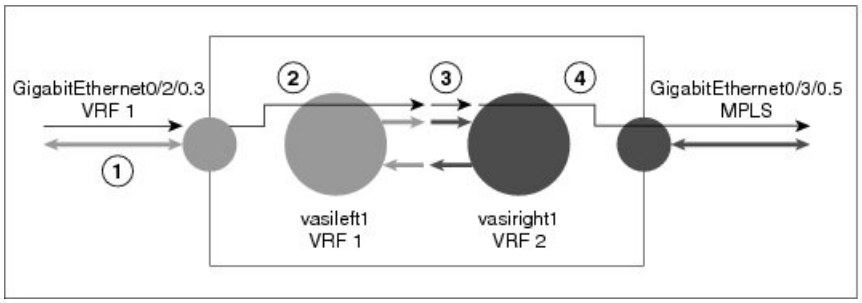
VRF-Aware Software Infrastructure (VASI) provides the ability to apply services such as, a firewall, GETVPN, IPsec, and Network Address Translation (NAT), to traffic that flows across different virtual routing and forwarding (VRF) instances. VASI is implemented by using virtual interface pairs, where each of the interfaces in the pair is associated with a different VRF instance. The VASI virtual interface is the next-hop interface for any packet that needs to be switched between these two VRF instances. VASI interfaces provide the framework to configure a firewall or NAT between VRF instances.

Each interface pair is associated with two different VRF instances. The pairing is done automatically based on the two interface indexes such that the vasileft interface is automatically paired to the vasiright interface. For example, in the figure below, vasileft1 and vasiright1 are automatically paired, and a packet entering vasileft1 is internally handed over to vasiright1.

On VASI interfaces, you can configure either static routing or dynamic routing with Internal Border Gateway Protocol (IBGP), Enhanced Interior Gateway Routing Protocol (EIGRP), or Open Shortest Path First (OSPF).

The following figure shows an inter-VRF VASI configuration on the same device.

Figure 71: Inter-VRF VASI Configuration



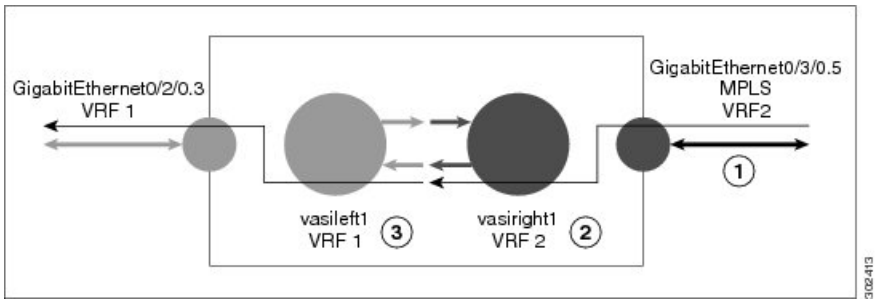
When an inter-VRF VASI is configured on the same device, the packet flow happens in the following order:

1. A packet enters the physical interface that belongs to VRF 1 (Gigabit Ethernet 0/2/0.3).
2. Before forwarding the packet, a forwarding lookup is done in the VRF 1 routing table. Vasileft1 is chosen as the next hop, and the Time to Live (TTL) value is decremented from the packet. Usually, the forwarding address is selected on the basis of the default route in the VRF. However, the forwarding address can also be a static route or a learned route. The packet is sent to the egress path of vasileft1 and then automatically sent to the vasiright1 ingress path.
3. When the packet enters vasiright1, a forwarding lookup is done in the VRF 2 routing table, and the TTL is decremented again (second time for this packet).
4. VRF 2 forwards the packet to the physical interface, Gigabit Ethernet 0/3/0.5.

The following figure shows how VASI works in a Multiprotocol Label Switching (MPLS) VPN configuration.

Note In the following figure, MPLS is enabled on the Gigabit Ethernet interface, but MPLS traffic is not supported across VASI pairs.

Figure 72: VASI with an MPLS VPN Configuration



When VASI is configured with a Multiprotocol Label Switching (MPLS) VPN, the packet flow happens in the following order:

1. A packet arrives on the MPLS interface with a VPN label.
2. The VPN label is stripped from the packet, a forwarding lookup is done within VRF 2, and the packet is forwarded to vasiright1. The TTL value is decremented from the packet.
3. The packet enters vasileft1 on the ingress path, and another forwarding lookup is done in VRF 1. The packet is sent to the egress physical interface in VRF1 (Gigabit Ethernet 0/2/0.3). The TTL is again decremented from the packet.

How to Configure IPv6 Zone-Based Firewall Support over VASI Interfaces

Configuring VRFs and Address Family Sessions

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **address-family ipv6**
5. **exit-address-family**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**vrf definition** *vrf-name* **Example:** `Device(config)# vrf definition VRF1`	Configures a virtual routing and forwarding (VRF) routing table instance and enters VRF configuration mode.
Step 4	**address-family ipv6** **Example:** `Device(config-vrf)# address-family ipv6`	Enters address family configuration mode and configures sessions that carry standard IPv6 address prefixes.
Step 5	**exit-address-family** **Example:** `Device(config-vrf-af)# exit-address-family`	Exits address family configuration mode and enters VRF configuration mode.
Step 6	**end** **Example:** `Device(config-vrf)# end`	Exits VRF configuration mode and enters privileged EXEC mode.

Configuring Class Maps and Policy Maps for VASI Support

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 unicast-routing**
4. **class-map type inspect match-any** *class-map-name*
5. **match protocol** *name*
6. **match protocol** *name*
7. **exit**
8. **policy-map type inspect** *policy-map-name*
9. **class type inspect** *class-map-name*
10. **inspect**
11. **exit**
12. **class class-default**
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ipv6 unicast-routing** **Example:** `Device(config)# ipv6-unicast routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 4	**class-map type inspect match-any** *class-map-name* **Example:** `Device(config)# class-map type inspect match-any c-map`	Creates an inspect type class map and enters QoS class-map configuration mode.
Step 5	**match protocol** *name* **Example:** `Device(config-cmap)# match protocol icmp`	Configures a match criterion for a class map on the basis of a specified protocol.
Step 6	**match protocol** *name* **Example:** `Device(config-cmap)# match protocol tcp`	Configures a match criterion for a class map on the basis of a specified protocol.
Step 7	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 8	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect p-map`	Creates a protocol-specific inspect-type policy map and enters QoS policy-map configuration mode.
Step 9	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect c-map`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 10	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 11	**exit** **Example:**	Exits QoS policy-map class configuration mode and enters QoS policy-map configuration mode.

	Command or Action	Purpose
	`Device(config-pmap-c)# exit`	
Step 12	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Applies the policy map settings to the predefined default class and enters QoS policy-map class configuration mode. • If traffic does not match any of the match criteria in the configured class maps, it is directed to the predefined default class.
Step 13	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.

Configuring Zones and Zone Pairs for VASI Support

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **exit**
5. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
6. **service-policy type inspect** *policy-map-name*
7. **exit**
8. **interface** *type number*
9. **vrf forwarding** *vrf-name*
10. **no ip address**
11. **zone member security** *zone-name*
12. **ipv6 address** *ipv6-address*/*prefix-length*
13. **ipv6 enable**
14. **negotiation auto**
15. **exit**
16. **interface** *type number*
17. **no ip address**
18. **ipv6 address** *ipv6-address*/*prefix-length*
19. **ipv6 enable**
20. **negotiation auto**
21. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:**	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	`Device> enable`	
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *zone-name* **Example:** `Device(config)# zone security in`	Creates a security zone and enters security zone configuration mode. • Your configuration must have two security zones to create a zone pair: a source and a destination zone. • In a zone pair, you can use the default zone as either the source or the destination zone.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 5	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security in-out source in destination out`	Creates a zone pair and enters security zone-pair configuration mode. • To apply a policy, you must configure a zone pair.
Step 6	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect p-map`	Attaches a policy map to a top-level policy map. • If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 7	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 8	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 9	**vrf forwarding** *vrf-name* **Example:** `Device(config-if)# vrf forwarding VRF1`	Associates a virtual routing and forwarding (VRF) instance or a virtual network with an interface or subinterface.
Step 10	**no ip address** **Example:** `Device(config-if)# no ip address`	Removes an IP address or disables IP processing.

	Command or Action	Purpose
Step 11	**zone member security** *zone-name* **Example:** `Device(config-if)# zone member security in`	Attaches an interface to a security zone.
Step 12	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-if)# ipv6 address 2001:DB8:2:1234/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 13	**ipv6 enable** **Example:** `Device(config-if)# ipv6 enable`	Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
Step 14	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables advertisement of speed, duplex mode, and flow control on a Gigabit Ethernet interface.
Step 15	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 16	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/1`	Configures an interface and enters interface configuration mode.
Step 17	**no ip address** **Example:** `Device(config-if)# no ip address`	Removes an IP address or disables IP processing.
Step 18	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-if)# ipv6 address 2001:DB8:3:1234/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 19	**ipv6 enable** **Example:** `Device(config-if)# ipv6 enable`	Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
Step 20	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables advertisement of speed, duplex mode, and flow control on a Gigabit Ethernet interface.
Step 21	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and enters privileged EXEC mode.

Configuring VASI Interfaces

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **vrf forwarding** *vrf-name*
5. **ipv6 address** *ipv6-address/prefix-length* **link-local**
6. **ipv6 address** *ipv6-address/prefix-length*
7. **ipv6 enable**
8. **no keepalive**
9. **zone member security** *zone-name*
10. **exit**
11. **interface** *type number*
12. **ipv6 address** *ipv6-address/prefix-length* **link-local**
13. **ipv6 address** *ipv6-address/prefix-length*
14. **ipv6 enable**
15. **no keepalive**
16. **exit**
17. **ipv6 route** *ipv6-prefix/prefix-length interface-type interface-number ipv6-address*
18. **ipv6 route vrf** *vrf-name ipv6-prefix/prefix-length interface-type interface-number ipv6-address*
19. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface vasileft 1`	Configures a VASI interface and enters interface configuration mode.
Step 4	**vrf forwarding** *vrf-name* **Example:** `Device(config-if)# vrf forwarding VRF1`	Associates a virtual routing and forwarding (VRF) instance or a virtual network with an interface or subinterface.
Step 5	**ipv6 address** *ipv6-address/prefix-length* **link-local** **Example:**	Configures an IPv6 link-local address for an interface and enable IPv6 processing on the interface.

	Command or Action	Purpose
	`Device(config-if)# ipv6 address FE80::8EB6:4FFF:FE6C:E701 link-local`	
Step 6	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-if)# ipv6 address 2001:DB8:4:1234/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 7	**ipv6 enable** **Example:** `Device(config-if)# ipv6 enable`	Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
Step 8	**no keepalive** **Example:** `Device(config-if)# no keepalive`	Disables keepalive packets.
Step 9	**zone member security** *zone-name* **Example:** `Device(config-if)# zone member security out`	Attaches an interface to a security zone.
Step 10	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 11	**interface** *type number* **Example:** `Device(config)# interface vasiright 1`	Configures a VASI interface and enters interface configuration mode.
Step 12	**ipv6 address** *ipv6-address/prefix-length* **link-local** **Example:** `Device(config-if)# ipv6 address FE80::260:3EFF:FE11:6770 link-local`	Configures an IPv6 link-local address for an interface and enable IPv6 processing on the interface.
Step 13	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-if)# ipv6 address 2001:DB8:4:1234/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 14	**ipv6 enable** **Example:** `Device(config-if)# ipv6 enable`	Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
Step 15	**no keepalive** **Example:** `Device(config-if)# no keepalive`	Disables keepalive packets.
Step 16	**exit** **Example:**	Exits interface configuration mode and enters global configuration mode.

	Command or Action	Purpose
	`Device(config-if)# exit`	
Step 17	**ipv6 route** *ipv6-prefix/prefix-length interface-type interface-number ipv6-address* **Example:** `Device(config)# ipv6 route 2001::/64 vasileft 1 2001::/64`	Establishes static IPv6 routes.
Step 18	**ipv6 route vrf** *vrf-name ipv6-prefix/prefix-length interface-type interface-number ipv6-address* **Example:** `Device(config)# ipv6 route vrf vrf1 2001::/64 vasiright 1 2001::/64`	Specifies all VRF tables or a specific VRF table for an IPv6 address.
Step 19	**end** **Example:** `Device(config# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuration Examples for IPv6 Zone-Based Firewall Support over VASI Interfaces

Example: Configuring VRFs and Address Family Sessions

```
Device# configure terminal
Device(config)# vrf definition VRF1
Device(config-vrf)# address-family ipv6
Device(config-vrf-af)# exit-address-family
Device(config-vrf)# end
```

Example: Configuring Class Maps and Policy Maps for VASI Support

```
Device# configure terminal
Device(config)# ipv6-unicast routing
Device(config)# class-map type inspect match-any c-map
Device(config-cmap)# match protocol icmp
Device(config-cmap)# match protocol tcp
Device(config-cmap)# match protocol udp
Device(config-cmap)# exit
Device(config)# policy-map type inspect p-map
Device(config-pmap)# class type inspect c-map
Device(config-pmap-c)# inspect
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap-c)# end
```

Example: Configuring Zones and Zone Pairs for VASI Support

```
Device# configure terminal
Device(config)# zone security in
Device(config)# exit
Device(config)# zone security out
Device(config)# exit
Device(config)# zone-pair security in-out source in destination out
Device(config-sec-zone-pair)# service-policy type inspect p-map
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# vrf forwarding VRF1
Device(config-if)# no ip address
Device(config-if)# zone member security in
Device(config-if)# ipv6 address 2001:DB8:2:1234/64
Device(config-if)# ipv6 enable
Device(config-if)# negotiation auto
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/0/1
Device(config-if)# no ip address
Device(config-if)# ipv6 address 2001:DB8:3:1234/64
Device(config-if)# ipv6 enable
Device(config-if)# negotiation auto
Device(config-if)# end
```

Example: Configuring VASI Interfaces

```
Device# configure terminal
Device(config)# interface vasileft 1
Device(config-if)# vrf forwarding VRF1
Device(config-if)# ipv6 address FE80::8EB6:4FFF:FE6C:E701 link-local
Device(config-if)# ipv6 address 2001:DB8:4:1234/64
Device(config-if)# ipv6 enable
Device(config-if)# no keepalive
Device(config-if)# zone-member security out
Device(config-if)# exit
Device(config)# interface vasiright 1
Device(config-if)# ipv6 address FE80::260:3EFF:FE11:6770 link-local
Device(config-if)# ipv6 address 2001:DB8:4:1234/64
Device(config-if)# ipv6 enable
Device(config-if)# no keepalive
Device(config-if)# exit
Device(config)# ipv6 route 2001::/64 vasileft 1 2001::/64
Device(config)# ipv6 route vrf vrf1 2001::/64 vasiright 1 2001::/64
Device(config)# end
```

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for IPv6 Zone-Based Firewall Support over VASI Interfaces

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 182: Feature Information for IPv6 Zone-Based Firewall Support VASI Interfaces

Feature Name	Releases	Feature Information
IPv6 Zone-Based Firewall Support over VASI Interfaces	Cisco IOS XE Release 3.7S	This feature supports VASI interfaces over IPv6 firewalls. This feature allows you to apply services such as access control lists (ACLs), Network Address Translation (NAT), policing, and zone-based firewalls to traffic that flows across two different virtual routing and forwarding (VRF) instances. VASI interfaces support the redundancy of Route Processors (RPs) and Forwarding Processors (FPs). VASI interfaces support IPv4 and IPv6 unicast traffic. No commands were introduced or modified for this feature.

CHAPTER 137

Configuring the VRF-Aware Software Infrastructure

The VRF-Aware Software Infrastructure feature allows you to apply services such as, access control lists (ACLs), Network Address Translation (NAT), policing, and zone-based firewalls, to traffic that flows across two different virtual routing and forwarding (VRF) instances. VRF-Aware Software Infrastructure (VASI) interfaces support the redundancy of Route Processors (RPs) and Forwarding Processors (FPs), IPsec, and IPv4 and IPv6 unicast and multicast traffic.

This module describes how to configure VASI interfaces.

Restrictions for Configuring the VRF-Aware Software Infrastructure

- Multiprotocol Label Switching (MPLS) traffic over VRF-Aware Software Infrastructure (VASI) interfaces is not supported.
- VASI interfaces do not support the attachment of queue-based features. The following commands are not supported on Modular QoS CLI (MQC) policies that are attached to VASI interfaces:
  - **bandwidth (policy-map class)**
  - **fair-queue**
  - **priority**
  - **queue-limit**
  - **random-detect**
  - **shape**
- VASI 2000 pairs are not supported on Open Shortest Path First (OSPF).

- VASI is not supported because Multicast First Hop and Multicast punt packets on VASI interface are not supported.
- Web Cache Communication Protocol (WCCP) is not supported.

Information About Configuring the VRF-Aware Software Infrastructure

VASI Overview

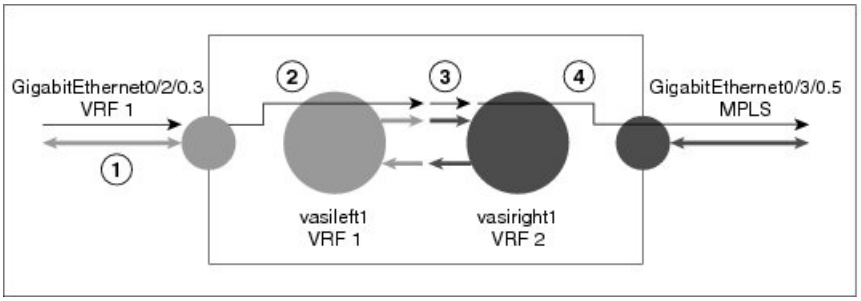
VRF-Aware Software Infrastructure (VASI) provides the ability to apply services such as, a firewall, GETVPN, IPsec, and Network Address Translation (NAT), to traffic that flows across different virtual routing and forwarding (VRF) instances. VASI is implemented by using virtual interface pairs, where each of the interfaces in the pair is associated with a different VRF instance. The VASI virtual interface is the next-hop interface for any packet that needs to be switched between these two VRF instances. VASI interfaces provide the framework to configure a firewall or NAT between VRF instances.

Each interface pair is associated with two different VRF instances. The pairing is done automatically based on the two interface indexes such that the vasileft interface is automatically paired to the vasiright interface. For example, in the figure below, vasileft1 and vasiright1 are automatically paired, and a packet entering vasileft1 is internally handed over to vasiright1.

On VASI interfaces, you can configure either static routing or dynamic routing with Internal Border Gateway Protocol (IBGP), Enhanced Interior Gateway Routing Protocol (EIGRP), or Open Shortest Path First (OSPF).

The following figure shows an inter-VRF VASI configuration on the same device.

Figure 73: Inter-VRF VASI Configuration



When an inter-VRF VASI is configured on the same device, the packet flow happens in the following order:

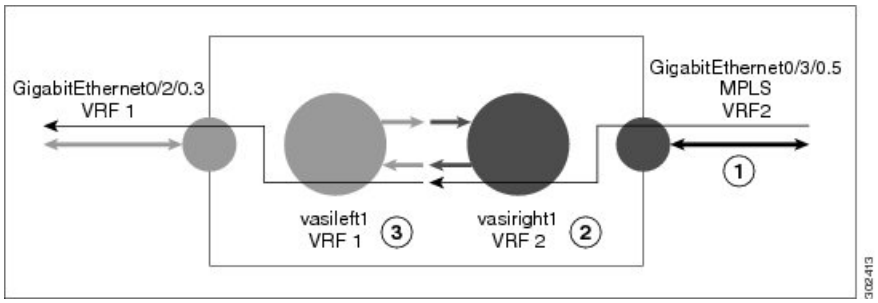
1. A packet enters the physical interface that belongs to VRF 1 (Gigabit Ethernet 0/2/0.3).
2. Before forwarding the packet, a forwarding lookup is done in the VRF 1 routing table. Vasileft1 is chosen as the next hop, and the Time to Live (TTL) value is decremented from the packet. Usually, the forwarding address is selected on the basis of the default route in the VRF. However, the forwarding address can also be a static route or a learned route. The packet is sent to the egress path of vasileft1 and then automatically sent to the vasiright1 ingress path.
3. When the packet enters vasiright1, a forwarding lookup is done in the VRF 2 routing table, and the TTL is decremented again (second time for this packet).

4. VRF 2 forwards the packet to the physical interface, Gigabit Ethernet 0/3/0.5.

The following figure shows how VASI works in a Multiprotocol Label Switching (MPLS) VPN configuration.

Note In the following figure, MPLS is enabled on the Gigabit Ethernet interface, but MPLS traffic is not supported across VASI pairs.

Figure 74: VASI with an MPLS VPN Configuration



When VASI is configured with a Multiprotocol Label Switching (MPLS) VPN, the packet flow happens in the following order:

1. A packet arrives on the MPLS interface with a VPN label.
2. The VPN label is stripped from the packet, a forwarding lookup is done within VRF 2, and the packet is forwarded to vasiright1. The TTL value is decremented from the packet.
3. The packet enters vasileft1 on the ingress path, and another forwarding lookup is done in VRF 1. The packet is sent to the egress physical interface in VRF1 (Gigabit Ethernet 0/2/0.3). The TTL is again decremented from the packet.

Multicast and Multicast VPN on VASI

VRF-Aware Service Infrastructure (VASI) applies services like the zone-based firewall, Network Address Translation (NAT), and IPsec to traffic that travels across different virtual routing and forwarding (VRF) instances. The Multicast and MVPN on VASI feature supports IPv4 and IPv6 multicast and multicast VPN (MVPN) on VASI interfaces. This feature is independent of the multicast modes (sparse, source-specific multicast [SSM] and so on) configured at the customer site and also independent of the MVPN mode—generic routing encapsulation (GRE)-based or Multicast Label Distribution Protocol (MLDP)-based—in the core network.

Multicast reduces traffic in a network by simultaneously delivering a single stream of information to potentially thousands of recipients. Multicast delivers source traffic from an application to multiple receivers without burdening the source or receivers and uses a minimum of network bandwidth. Multicast VPN (MVPN) provides the ability to support multicast over Layer 3 VPNs.

VASI is implemented using virtual interface pairs, where each of the interfaces in the pair is associated with a different VRF. VASI virtual interface is the next hop interface for any packet that needs to be switched between these two VRFs. VASI interfaces are virtual interfaces and you can configure IP address and other services like other logical interfaces. You need to enable multicast on VASI interface pairs for this feature to work.

How to Configure the VRF-Aware Software Infrastructure

Configuring a VASI Interface Pair

To configure a VRF-Aware Software Infrastructure (VASI) interface pair, you must configure the **interface vasileft** command on one interface and the **interface vasiright** command on the second interface. The interface numbers must be identical to pair vasileft with vasiright. You can configure a virtual routing and forwarding (VRF) instance on any VASI interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **vrf forwarding** *table-name*
5. **ip address** {*ip-address mask* [**secondary**] | **pool** *pool-name*}
6. **exit**
7. **ip route** [**vrf** *vrf-name*] *destination-prefix destination-prefix-mask interface-type interface-number*
8. **interface** *type number*
9. **vrf forwarding** *table-name*
10. **ip address** {*ip-address mask* [**secondary**] | **pool** *pool-name*}
11. **exit**
12. **ip route** [**vrf** *vrf-name*] *destination-prefix destination-prefix-mask interface-type interface-number*
13. **end**

DETAILED STEPS

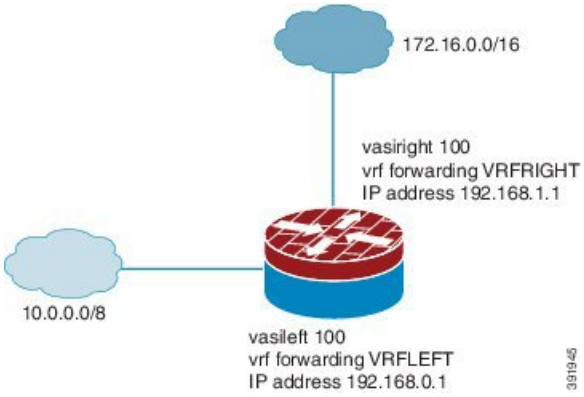
	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface vasileft 100`	Configures a VASI interface and enters interface configuration mode. • In this example, the vasileft interface is configured.
Step 4	**vrf forwarding** *table-name* **Example:** `Device(config-if)# vrf forwarding VRFLEFT`	Configures a VRF table. **Note** You can configure VRF forwarding on any VASI interface. You need not configure VRF instances on both VASI interfaces.

	Command or Action	Purpose
Step 5	**ip address** {*ip-address mask* [**secondary**] | **pool** *pool-name*} **Example:** `Device(config-if)# ip address 192.168.0.1 255.255.255.0`	Configures a primary or secondary IP address for an interface.
Step 6	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 7	**ip route** [**vrf** *vrf-name*] *destination-prefix destination-prefix-mask interface-type interface-number* **Example:** `Device(config)# ip route vrf VRFLEFT 172.16.0.0 255.255.0.0 VASILEFT 100`	Establishes a static route for a VRF instance and a VASI interface. **Note** To add an IP route for a VRF instance, you must specify the **vrf** keyword.
Step 8	**interface** *type number* **Example:** `Device(config)# interface vasiright 100`	Configures a VASI interface and enters interface configuration mode. • In this example, the vasiright interface is configured.
Step 9	**vrf forwarding** *table-name* **Example:** `Device(config-if)# vrf forwarding VRFRIGHT`	Configures the VRF table.
Step 10	**ip address** {*ip-address mask* [**secondary**] | **pool** *pool-name*} **Example:** `Device(config-if)# ip address 192.168.1.1 255.255.255.0`	Configures a primary or secondary IP address for an interface.
Step 11	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 12	**ip route** [**vrf** *vrf-name*] *destination-prefix destination-prefix-mask interface-type interface-number* **Example:** `Device(config)# ip route vrf VRFRIGHT 10.0.0.0 255.0.0.0 VASIRIGHT 100`	Establishes a static route for a VRF instance and a VASI interface. **Note** To add an IP route for a VRF instance, you must specify the **vrf** keyword.
Step 13	**end** **Example:** `Device(config)# end`	Exits global configuration mode and returns to privileged EXEC mode.

Configuration Examples for the VRF-Aware Software Infrastructure

Example: Configuring a VASI Interface Pair

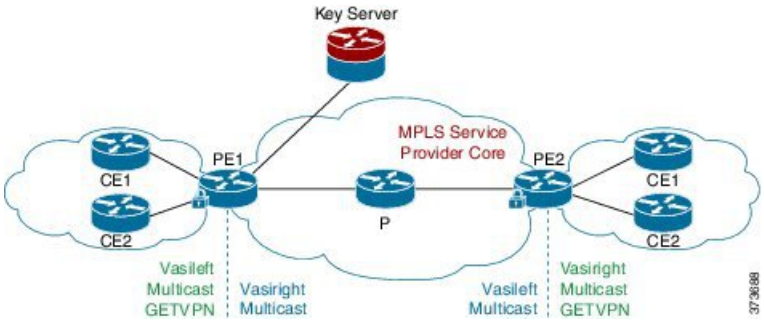
A virtual routing and forwarding (VRF) instance must be enabled for each interface of the VASI pair (VASILEFT and VASIRIGHT). The below example shows how to configure a VASI interface pair.



```
Device(config)# interface vasileft 100
Device(config-if)# vrf forwarding VRFLEFT
Device(config-if)# ip address 192.168.0.1 255.255.255.0
Device(config-if)# exit
Device(config)# ip route vrf VRFLEFT 172.16.0.0 255.255.0.0 vasileft 100
Device(config)# interface vasiright 100
Device(config-if)# vrf forwarding VRFRIGHT
Device(config-if)# ip address 192.168.1.1 255.255.255.0
Device(config-if)# exit
Device(config)# ip route vrf VRFRIGHT 10.0.0.0 255.0.0.0 vasiright 100
Device(config)# end
```

Example: Configuring Multicast and MVPN on VASI

Figure 75: GRE-Based MVPN and GETVPN Configuration



The following example shows how to configure generic routing encapsulation (GRE)-based Multicast VPN (MVPN) and GETVPN on VASI interface pairs. Here, the cryptomap is applied to the vasileft interface. The vasileft interface acts as the customer edge (CE) device and does encryption; the interface is part of the vrf-cust1 virtual routing and forwarding (VRF) instance. The vasiright interface is part of the vrf-core1 VRF instance, to pass traffic across the Multiprotocol Label Switching (MPLS) core and for applied crypto services. The core network supports multicast, and multicast in the VRFs is in stateful switchover (SSO) mode.

Verifying Multicast VASI Configuration

Use the following commands to verify the multicast VRF-Aware Software Infrastructure (VASI) configuration:

SUMMARY STEPS

1. **enable**
2. **show ip mroute**
3. **show ip mroute vrf**

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

- Enter your password if prompted.

Example:

```
Device> enable
```

Step 2 show ip mroute

Displays the contents of the multicast routing (mroute) table.

Example:

```
Device# show ip mroute

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
       X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report,
       Z - Multicast Tunnel, z - MDT-data group sender,
       Y - Joined MDT-data group, y - Sending to MDT-data group,
       G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
       N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
       Q - Received BGP S-A Route, q - Sent BGP S-A Route,
       V - RD & Vector, v - Vector, p - PIM Joins on route,
       x - VxLAN group
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
 Timers: Uptime/Expires
 Interface state: Interface, Next-Hop or VCD, State/Mode
(*, 203.0.113.1), 04:33:39/stopped, RP 0.0.0.0, flags: D
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    GigabitEthernet0/0/2, Forward/Sparse-Dense, 04:33:39/stopped
    GigabitEthernet0/0/0, Forward/Sparse-Dense, 04:33:39/stopped
(10.0.0.3, 203.0.113.1), 04:33:36/00:00:36, flags: T
  Incoming interface: GigabitEthernet0/0/2, RPF nbr 10.1.1.3
  Outgoing interface list:
    GigabitEthernet0/0/0, Forward/Sparse-Dense, 04:33:36/stopped
(10.0.0.1, 203.0.113.1), 04:33:39/00:02:44, flags: T
  Incoming interface: GigabitEthernet0/0/0, RPF nbr 10.1.1.0
  Outgoing interface list:
    GigabitEthernet0/0/2, Forward/Sparse-Dense, 04:33:39/stopped
```

Step 3 **show ip mroute vrf**

Filters the output to display only the contents of the multicast routing table that pertains to the Multicast VPN (MVPN) routing and forwarding (MVRF) instance specified for the *vrf-name* argument.

Example:

```
Device# show ip mroute vrf cust1

(10.2.1.1, 203.1.113.4), 00:40:09/00:02:44, flags: sTI
  Incoming interface: vasileft1, RPF nbr 36.1.1.2
  Outgoing interface list:
    GigabitEthernet0/0/1.1, Forward/Sparse-Dense, 00:40:09/00:02:44
PE1#sh ip mroute vrf cust1-core
(10.2.1.1, 203.1.113.4), 04:22:09/00:02:50, flags: sT
  Incoming interface: Tunnel0, RPF nbr 10.0.0.3
  Outgoing interface list:
    vasiright1, Forward/Sparse-Dense, 04:22:09/00:02:50
PE1#sh ip mroute
(*, 203.1.113.4), 21:08:36/stopped, RP 0.0.0.0, flags: DCZ
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    GigabitEthernet0/0/0, Forward/Sparse-Dense, 04:27:50/stopped
    MVRF cust1-core, Forward/Sparse-Dense, 21:06:53/stopped
(10.0.0.3, 203.1.113.4), 04:26:53/00:01:22, flags: TZ
  Incoming interface: GigabitEthernet0/0/0, RPF nbr 10.1.1.1
  Outgoing interface list:
    MVRF cust1-core, Forward/Sparse-Dense, 04:26:53/stopped
```

Technical Assistance

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Configuring the VRF-Aware Software Infrastructure

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 183: Feature Information for Configuring the VRF-Aware Software Infrastructure

Feature Name	Releases	Feature Information
Multicast and Multicast VPN on VASI	Cisco IOS XE Release 3.14S	The Multicast and MVPN on VASI feature supports IPv4 and IPv6 multicast and multicast VPN (MVPN) on VASI interfaces. This feature is independent of the multicast modes (sparse, source-specific multicast [SSM] and so on) configured at the customer site and also independent of the MVPN mode—generic routing encapsulation (GRE)-based or Multicast Label Distribution Protocol (MLDP)-based—in the core network. No new commands have been introduced or modified for this feature.
VRF-Aware Software Infrastructure	Cisco IOS XE Release 2.6	The VRF-Aware Software Infrastructure feature allows you to apply services such as ACLs, NAT, policing, and zone-based firewalls to traffic that flows across two different VRF instances. The VRF-Aware Software Infrastructure (VASI) interfaces support redundancy of the RP and FP. This feature supports IPv4 and IPv6 unicast and multicast traffic on VASI interfaces.

Feature Name	Releases	Feature Information
VASI (VRF-Aware Software Infrastructure) Enhancements Phase I	Cisco IOS XE Release 3.1S	The VASI Enhancements Phase I feature provides the following enhancements to VASI: • Support for 500 VASI interfaces. • Support for IBGP dynamic routing between VASI interfaces.
VASI (VRF-Aware Software Infrastructure) Enhancements Phase II	Cisco IOS XE Release 3.2S	The VASI Enhancements Phase II feature provides the following enhancements to VASI: • Support for IPv6 unicast traffic over VASI interfaces. • Support for OSPF and EIGRP dynamic routing between VASI interfaces.
VASI (VRF-Aware Software Infrastructure) Scale	Cisco IOS XE Release 3.3S	The VASI Scale feature provides support for 1000 VASI interfaces. The following command was introduced or modified: **interface (VASI)**.
VASI (VRF-Aware Software Infrastructure) Scale	Cisco IOS XE Release 3.7.2S	The VASI Scale feature provides support for eBGP dynamic routing between VASI interfaces.
VASI 2000 Pair Scale	Cisco IOS XE Release 3.10S	The VASI 2000 Pair Scale feature provides support for 2000 VASI interfaces. 2000 VASI interfaces are supported on Border Gateway Protocol (BGP). The following command was introduced or modified: **interface (VASI)**.

CHAPTER 138

FTP66 ALG Support for IPv6 Firewalls

The FTP66 ALG Support for IPv6 Firewalls feature allows FTP to work with IPv6 firewalls. This module describes how to configure a firewall, Network Address Translation (NAT), and Stateful NAT64 to work with the FTP66 application-level gateway (ALG).

Restrictions for FTP66 ALG Support for IPv6 Firewalls

The FTP66 ALG does not support the following:

- Box-to-box high availability.
- Per-subscriber firewalls.
- Stateless Network Address Translation 64 (NAT64).
- Virtual routing and forwarding (VRF) when stateful NAT64 is configured.
- Virtual TCP (vTCP) or the breaking up of packets into smaller packets after translation.

Information About FTP66 ALG Support for IPv6 Firewalls

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.

- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

FTP66 ALG Support Overview

Firewalls support the inspection of IPv6 packets and stateful Network Address Translation 64 (NAT64). For FTP to work over IPv6 packet inspection, the application-layer gateway (ALG) (also called the application-level gateway [ALG]), FTP66, is required. The FTP66 ALG is also called all-in-one FTP ALG and one FTP ALG.

The FTP66 ALG supports the following:

- Firewall IPv4 packet inspection
- Firewall IPv6 packet inspection
- NAT configuration
- NAT64 configuration (along with FTP64 support)
- NAT and firewall configuration
- NAT64 and firewall configuration

The FTP66 ALG has the following security vulnerabilities:

- Packet segmentation attack—The FTP ALG state machine can detect segmented packets, and the state machine processing is stopped until a complete packet is received.
- Bounce attack—The FTP ALG does not create doors (for NAT) or pinholes (for firewalls) with a data port number less than 1024. The prevention of a bounce attack is activated only when the firewall is enabled.

FTP Commands Supported by FTP66 ALG

The FTP66 application-level gateway (ALG) is based on RFC 959. This section describes the main RFC 959 and RFC 2428 FTP commands and responses that the FTP66 ALG processes.

PORT Command

The PORT command is used in active FTP mode. The PORT command specifies the address and the port number to which a server should connect. When you use this command, the argument is a concatenation of a 32-bit Internet host address and a 16-bit TCP port address. The address information is broken into 8-bit fields, and the value of each field is transmitted as a decimal number (in character string representation). The fields are separated by commas.

The following is a sample PORT command, where *h1* is the highest order 8-bit of the Internet host address:

```
PORT h1,h2,h3,h4,p1,p2
```

PASV Command

The PASV command requests a server to listen on a data port that is not the default data port of the server and to wait for a connection, rather than initiate another connection, when a TRANSFER command is received. The response to the PASV command includes the host and port address the server is listening on.

Extended FTP Commands

Extended FTP commands provide a method by which FTP can communicate the data connection endpoint information for network protocols other than IPv4. Extended FTP commands are specified in RFC 2428. In RFC 2428, the extended FTP commands EPRT and EPSV, replace the FTP commands PORT and PASV, respectively.

EPRT Command

The EPRT command allows you to specify an extended address for data connection. The extended address must consist of a network protocol, network address, and transport address. The format of an EPRT command is as follows:

```
EPRT<space><d><net-prt><d><net-addr><d><tcp-port><d>
```

- The <net-prt> argument must be an address family number and must be defined as described in the table below.

Table 184: The <net-prt> Argument Definitions

Address Family Number	Protocol
1	IPv4 (Pos81a)
2	IPv6 (DH96)

- The <net-addr> argument is a protocol-specific string representation of the network address. For the two address family numbers specified in the table above (address family numbers 1 and 2), the addresses must be in the format listed in the table below.

Address Family Number	Address Format	Example
1	Dotted decimal	10.135.1.2
2	IPv6 string representations defined in DH96	2001:DB8:1::1

- The <tcp-port> argument must be a string representation of the number of the TCP port on which the host is listening for data connection.
- The following command shows how to specify the server to use an IPv4 address to open a data connection to host 10.235.1.2 on TCP port 6275:

```
EPRT |1|10.235.1.2|6275|
```

- The following command shows how to specify the server to use an IPv6 network protocol and a network address to open a TCP data connection on port 5282:

```
EPRT |2|2001:DB8:2::2:417A|5282|
```

- The <d> argument is the delimiter character and it must be in ASCII format, in the range from 33 to 126.

EPSV Command

The EPSV command requests that a server listen on a data port and wait for a connection. The response to this command includes only the TCP port number of the listening connection. The response code for entering passive mode by using an extended address must be 229.

The text returned in response to an EPSV command must be in the following format:

```
(<d><d><d><tcp-port><d>)
```

- The portion of the string enclosed in parentheses must be the exact string needed by the EPRT command to open the data connection.

  The first two fields in parentheses must be blank. The third field must be a string representation of the TCP port number on which the server is listening for a data connection. The network protocol used by the data connection is the same network protocol used by the control connection. The network address used to establish the data connection is the same network address used for the control connection.

- The following is a sample response string:

  ```
  Entering Extended Passive Mode (|||6446|)
  ```

The following FTP responses and commands are also processed by the FTP66 ALG. The results of processing these commands are used to drive the transition in the state machine.

- 230 response
- AUTH
- USER
- PASS

How to Configure FTP66 ALG Support for IPv6 Firewalls

Configuring a Firewall for FTP66 ALG Support

You need to explicitly enable the FTP66 ALG by using the **match protocol ftp** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **exit**
6. **policy-map type inspect** *policy-map-name*
7. **class type inspect** *class-map-name*
8. **inspect**
9. **exit**
10. **class class-default**
11. **exit**

12. **exit**
13. **zone security** *zone-name*
14. **exit**
15. **zone-pair security** *zone-pair* **source** *source-zone* **destination** *destination-zone*
16. **service-policy type inspect** *policy-map-name*
17. **exit**
18. **interface** *type number*
19. **no ip address**
20. **ip virtual-reassembly**
21. **zone-member security** *zone-name*
22. **negotiation auto**
23. **ipv6 address** *ipv6-address/prefix-length*
24. **cdp enable**
25. **exit**
26. **ipv6 route** *ipv6-prefix/prefix-length interface-type interface-number*
27. **ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address*
28. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Device(config)# class-map type inspect match-any in2out-class`	Creates an inspect type class map and enters QoS class-map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol ftp`	Configures a match criteria for a class map on the basis of the named protocol.
Step 5	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 6	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect in-to-out`	Creates an inspect type policy map and enters QoS policy-map configuration mode.

	Command or Action	Purpose
Step 7	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect in2out-class`	Specifies the class on which an action is performed and enters QoS policy-map class configuration mode.
Step 8	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 9	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and enters QoS policy-map configuration mode.
Step 10	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Applies the policy map settings to the predefined default class and enters QoS policy-map class configuration mode. • If the traffic does not match any of the match criteria in the configured class maps, it is directed to the predefined default class.
Step 11	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and enters QoS policy-map configuration mode.
Step 12	**exit** **Example:** `Device(config-pmap)# exit`	Exits QoS policy-map configuration mode and enters global configuration mode.
Step 13	**zone security** *zone-name* **Example:** `Device(config)# zone security inside`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode. • Your configuration must have two security zones to create a zone pair: a source and a destination zone. • In a zone pair, you can use the default zone as either the source or the destination zone.
Step 14	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 15	**zone-pair security** *zone-pair* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security in2out source inside destination outside`	Creates a pair of security zones and enters security zone-pair configuration mode. • To apply a policy, you must configure a zone pair.

	Command or Action	Purpose
Step 16	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect in-to-out`	Attaches a firewall policy map to the destination zone pair. • If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 17	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 18	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/1`	Configures an interface and enters interface configuration mode.
Step 19	**no ip address** **Example:** `Device(config-if)# no ip address`	Removes an IP address or disables IP processing.
Step 20	**ip virtual-reassembly** **Example:** `Device(config-if)# ip virtual-reassembly`	Enables virtual fragmentation reassembly (VFR) on an interface.
Step 21	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security inside`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 22	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.
Step 23	**ipv6 address** *ipv6-address/prefix-length* **Example:** `Device(config-if)# ipv6 address 2001:DB8:1::1/96`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 24	**cdp enable** **Example:** `Device(config-if)# cdp enable`	Enables Cisco Discovery Protocol on an interface.
Step 25	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 26	**ipv6 route** *ipv6-prefix/prefix-length interface-type interface-number* **Example:** `Device(config)# ipv6 route 2001::/96 gigabitethernet 0/0/1`	Establishes static IPv6 routes.
Step 27	**ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address* **Example:** `Device(config)# ipv6 neighbor 2001:DB8:1::1 gigabitethernet 0/0/1 0000.29f1.4841`	Configures a static entry in the IPv6 neighbor discovery cache.
Step 28	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuring NAT for FTP66 ALG Support

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip address** *ip-address mask*
5. **ip nat inside**
6. **zone-member security** *zone-name*
7. **exit**
8. **interface** *type number*
9. **ip address** *ip-address mask*
10. **ip nat outside**
11. **zone-member security** *zone-name*
12. **exit**
13. **ip nat inside source static** *local-ip global-ip*
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/2`	Configures an interface and enters interface configuration mode.
Step 4	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 10.1.1.1 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 5	**ip nat inside** **Example:** `Device(config-if)# ip nat inside`	Indicates that an interface is connected to the inside network (the network that is subject to NAT translation).
Step 6	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security inside`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 7	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 8	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 9	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 10.2.1.1 255.255.255.0`	Indicates that an interface is connected to the inside network (the network that is subject to NAT translation).
Step 10	**ip nat outside** **Example:** `Device(config-if)# ip nat outside`	Indicates that the interface is connected to the outside network.

	Command or Action	Purpose
Step 11	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security outside`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 13	**ip nat inside source static** *local-ip global-ip* **Example:** `Device(config)# ip nat inside source static 10.1.1.10 10.1.1.80`	Enables NAT of the inside source address.
Step 14	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuring NAT64 for FTP66 ALG Support

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 unicast-routing**
4. **interface** *type number*
5. **no ip address**
6. **ipv6 virtual-reassembly**
7. **zone-member security** *zone-name*
8. **negotiation auto**
9. **ipv6 address** *ipv6-address*
10. **ipv6 enable**
11. **nat64 enable**
12. **cdp enable**
13. **exit**
14. **interface** *type number*
15. **ip address** *type number*
16. **ip virtual-reassembly**
17. **zone member security** *zone-name*

18. **negotiation auto**
19. **nat64 enable**
20. **exit**
21. **ipv6 route** *ipv6-address interface-type interface-number*
22. **ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address*
23. **nat64 v6v4 static** *ipv6-address ipv4-address*
24. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ipv6 unicast-routing** **Example:** `Device(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 4	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 5	**no ip address** **Example:** `Device(config-if)# no ip address`	Removes an IP address or disables IP processing.
Step 6	**ipv6 virtual-reassembly** **Example:** `Device(config-if)# ipv6 virtual-reassembly`	Enables virtual fragmentation reassembly (VFR) on an interface.
Step 7	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security inside`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.

	Command or Action	Purpose
Step 8	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.
Step 9	**ipv6 address** *ipv6-address* **Example:** `Device(config-if)# ipv6 address 2001:DB8:1::2/96`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 10	**ipv6 enable** **Example:** `Device(config-if)# ipv6 enable`	Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.
Step 11	**nat64 enable** **Example:** `Device(config-if)# nat64 enable`	Enables NAT64 on an interface.
Step 12	**cdp enable** **Example:** `Device(config-if)# cdp enable`	Enables Cisco Discovery Protocol on an interface.
Step 13	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 14	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 15	**ip address** *type number* **Example:** `Device(config-if)# ip address 209.165.201.25 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 16	**ip virtual-reassembly** **Example:** `Device(config-if)# ip virtual-reassembly`	Enables VFR on an interface.
Step 17	**zone member security** *zone-name* **Example:** `Device(config-if)# zone member security outside`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the router or initiated by the router) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair

	Command or Action	Purpose
		to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 18	**negotiation auto** **Example:** `Device(config-if)# negotiation auto`	Enables the autonegotiation protocol to configure the speed, duplex, and automatic flow control of the Gigabit Ethernet interface.
Step 19	**nat64 enable** **Example:** `Device(config-if)# nat64 enable`	Enables NAT64 on an interface.
Step 20	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and enters global configuration mode.
Step 21	**ipv6 route** *ipv6-address interface-type interface-number* **Example:** `Device(config)# ipv6 route 2001:DB8:1::2/96 gigabitethernet 0/0/0`	Establishes static IPv6 routes and specifies the IPv6 address of the next hop that can be used to reach a specified network.
Step 22	**ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address* **Example:** `Device(config)# ipv6 neighbor 2001:DB8:1::103 gigabitethernet 0/0/0 0000.29f1.4841`	Configures a static entry in the IPv6 neighbor discovery cache.
Step 23	**nat64 v6v4 static** *ipv6-address ipv4-address* **Example:** `Device(config)# nat64 v6v4 static 2001:DB8:1::103 209.165.201.32`	Translates an IPv6 source address to an IPv4 source address and an IPv4 destination address to an IPv6 destination address for NAT64.
Step 24	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuration Examples for FTP66 ALG Support for IPv6 Firewalls

Example: Configuring an IPv6 Firewall for FTP66 ALG Support

```
Device# configure terminal
Device(config)# class-map type inspect match-any in2out-class
Device(config-cmap)# match protocol ftp
Device(config-cmap)# exit
Device(config)# policy-map type inspect in-to-out
```

```
Device(config-pmap)# class type inspect in2out-class
Device(config-pmap-c)# inspect
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# zone security inside
Device(config-sec-zone)# exit
Device(config)# zone security outside
Device(config-sec-zone)# exit
Device(config)# zone-pair security in2out source inside destination outside
Device(config-sec-zone-pair)# service-policy type inspect in-to-out
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/1
Device(config-if)# no ip address
Device(config-if)# ip virtual-reassembly
Device(config-if)# zone-member security inside
Device(config-if)# negotiation auto
Device(config-if)# ipv6 address 2001:DB8:1::1/96
Device(config-if)# cdp enable
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/1/1
Device(config-if)# no ip address
Device(config-if)# ip virtual-reassembly
Device(config-if)# zone-member security outside
Device(config-if)# negotiation auto
Device(config-if)# ipv6 address 2001:DB8:2::2/96
Device(config-if)# exit
Device(config)# ipv6 route 2001::/96 gigabitethernet 0/0/1
Device(config)# ipv6 route 2001::/96 gigabitethernet 0/1/1
Device(config)# ipv6 neighbor 2001:DB8:1::1 gigabitethernet 0/0/1 0000.29f1.4841
Device(config)# ipv6 neighbor 2001:DB8:2::2 gigabitethernet 0/1/1 0000.29f1.4842
Device(config)# end
```

Example: Configuring NAT for FTP66 ALG Support

```
Device# configure terminal
Device(config)# interface gigabitethernet 0/1/2
Device(config-if)# ip address 10.1.1.1 255.255.255.0
Device(config-if)# ip nat inside
Device(config-if)# zone-member security inside
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/1/1
Device(config-if)# ip address 10.2.1.1 255.255.255.0
Device(config-if)# ip nat outside
Device(config-if)# zone-member security outside
Device(config-if)# exit
Device(config-if)# ip nat inside source static 10.1.1.10 10.1.1.80
```

Example: Configuring NAT64 for FTP66 ALG Support

```
Device# configure terminal
Device(config)# ipv6 unicast-routing
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# no ip address
Device(config-if)# ipv6 virtual-reassembly
```

```
Device(config-if)# zone-member security inside
Device(config-if)# negotiation auto
Device(config-if)# ipv6 address 2001:DB8:1::2/96
Device(config-if)# ipv6 enable
Device(config-if)# nat64 enable
Device(config-if)# cdp enable
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/1/1
Device(config-if)# ip address 209.165.201.25 255.255.255.0
Device(config-if)# ip virtual-reassembly
Device(config-if)# zone member security outside
Device(config-if)# negotiation auto
Device(config-if)# nat64 enable
Device(config-if)# exit
Device(config)# ipv6 route 2001:DB8:1::2/96 gigabitethernet 0/0/0
Device(config)# 2001:DB8:1::103 gigabitethernet 0/0/0 0000.29f1.4841
Device(config)# nat64 v6v4 static 2001:DB8:1::103 209.165.201.32
```

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for FTP66 ALG Support for IPv6 Firewalls

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 185: Feature Information for FTP66 ALG Support for IPv6 Firewalls

Feature Name	Releases	Feature Information
FTP66 ALG Support for IPv6 Firewalls	Cisco IOS XE Release 3.7S	The FTP66 ALG Support for IPv6 Firewalls feature allows FTP to work with IPv6 firewalls. This module describes how to configure a firewall, Network Address Translation (NAT), and NAT64 to work with the FTP66 application-level gateway (ALG).

CHAPTER 139

Protection Against Distributed Denial of Service Attacks

The Protection Against Distributed Denial of Service Attacks feature provides protection from Denial of Service (DoS) attacks at the global level (for all firewall sessions) and at the VPN routing and forwarding (VRF) level. In Cisco IOS XE Release 3.4S and later releases, you can configure the aggressive aging of firewall sessions, event rate monitoring of firewall sessions, the half-opened connections limit, and global TCP SYN cookie protection to prevent distributed DoS attacks.

Information About Protection Against Distributed Denial of Service Attacks

Aggressive Aging of Firewall Sessions

The Aggressive Aging feature provides the firewall the capability of aggressively aging out sessions to make room for new sessions, thereby protecting the firewall session database from filling. The firewall protects its resources by removing idle sessions. The Aggressive Aging feature allows firewall sessions to exist for a shorter period of time defined by a timer called aging-out time.

The Aggressive Aging feature includes thresholds to define the start and end of the aggressive aging period—high and low watermarks. The aggressive aging period starts when the session table crosses the high watermark and ends when it falls below the low watermark. During the aggressive aging period, sessions will exist for a shorter period of time that you have configured by using the aging-out time. If an attacker initiates sessions at a rate that is faster than the rate at which the firewall terminates sessions, all resources that are allocated for creating sessions are used and all new connections are rejected. To prevent such attacks, you can configure the Aggressive Aging feature to aggressively age out sessions. This feature is disabled by default.

You can configure aggressive aging for half-opened sessions and total sessions at the box level (box refers to the entire firewall session table) and the virtual routing and forwarding (VRF) level. If you have configured

this feature for total sessions, all sessions that consume firewall session resources are taken into account. Total sessions comprise established sessions, half-opened sessions, and sessions in the imprecise session database. (A TCP session that has not yet reached the established state is called a half-opened session.)

A firewall has two session databases: the session database and the imprecise session database. The session database contains sessions with 5-tuple (the source IP address, the destination IP address, the source port, the destination port, and the protocol). A tuple is an ordered list of elements. The imprecise session database contains sessions with fewer than 5-tuple (missing IP addresses, port numbers, and so on). In the case of aggressive aging for half-opened sessions, only half-opened sessions are considered.

You can configure an aggressive aging-out time for Internet Control Message Protocol (ICMP), TCP, and UDP firewall sessions. The aging-out time is set by default to the idle time.

Event Rate Monitoring Feature

The Event Rate Monitoring feature monitors the rate of predefined events in a zone. The Event Rate Monitoring feature includes basic threat detection, which is the ability of a security device to detect possible threats, anomalies, and attacks to resources inside the firewall and to take action against them. You can configure a basic threat detection rate for events. When the incoming rate of a certain type of event exceeds the configured threat detection rate, event rate monitoring considers this event as a threat and takes action to stop the threat. Threat detection inspects events only on the ingress zone (if the Event Rate Monitoring feature is enabled on the ingress zone).

The network administrator is informed about the potential threats via an alert message (syslog or high-speed logger [HSL]) and can take actions such as detecting the attack vector, detecting the zone from which the attack is coming, or configuring devices in the network to block certain behaviors or traffic.

The Event Rate Monitoring feature monitors the following types of events:

- Firewall drops due to basic firewall checks failure—This can include zone or zone-pair check failures, or firewall policies configured with the drop action, and so on.
- Firewall drops due to Layer 4 inspection failure—This can include TCP inspections that have failed because the first TCP packet is not a synchronization (SYN) packet.
- TCP SYN cookie attack—This can include counting the number of SYN packets that are dropped and the number of SYN cookies that are sent as a spoofing attack.

The Event Rate Monitoring feature monitors the average rate and the burst rate of different events. Each event type has a rate object that is controlled by an associated rate that has a configurable parameter set (the average threshold, the burst threshold, and a time period). The time period is divided into time slots; each time slot is 1/30th of the time period.

The average rate is calculated for every event type. Each rate object holds 30 completed sampling values plus one value to hold the current ongoing sampling period. The current sampling value replaces the oldest calculated value and the average is recalculated. The average rate is calculated during every time period. If the average rate exceeds the average threshold, the Event Rate Monitoring feature will consider this as a possible threat, update the statistics, and inform the network administrator.

The burst rate is implemented by using the token bucket algorithm. For each time slot, the token bucket is filled with tokens. For each event that occurs (of a specific event type), a token is removed from the bucket. An empty bucket means that the burst threshold is reached, and the administrator receives an alarm through the syslog or HSL. You can view the threat detection statistics and learn about possible threats to various events in the zone from the output of the **show policy-firewall stats zone** command.

You must first enable basic threat detection by using the **threat-detection basic-threat** command. Once basic threat detection is configured, you can configure the threat detection rate. To configure the threat detection rate, use the **threat-detection rate** command.

The following table describes the basic threat detection default settings that are applicable if the Event Rate Monitoring feature is enabled.

Table 186: Basic Threat Detection Default Settings

Packet Drop Reason	Threat Detection Settings
Basic firewall drops	average-rate 400 packets per second (pps) burst-rate 1600 pps rate-interval 600 seconds
Inspection-based firewall drops	average-rate 400 pps burst-rate 1600 pps rate-interval 600 seconds
SYN attack firewall drops	average-rate 100 pps burst-rate 200 pps rate-interval 600 seconds

Half-Opened Connections Limit

The firewall session table supports the limiting of half-opened firewall connections. Limiting the number of half-opened sessions will defend the firewall against attacks that might fill the firewall session table at the per-box level or at the virtual routing and forwarding (VRF) level with half-opened sessions and prevent sessions from being established. The half-opened connection limit can be configured for Layer 4 protocols, Internet Control Message Protocol (ICMP), TCP, and UDP. The limit set to the number of UDP half-opened sessions will not affect the TCP or ICMP half-opened sessions. When the configured half-opened session limit is exceeded, all new sessions are rejected and a log message is generated, either in syslog or in the high-speed logger (HSL).

The following sessions are considered as half-opened sessions:

- TCP sessions that have not completed the three-way handshake.
- UDP sessions that have only one packet detected in the UDP flow.
- ICMP sessions that do not receive a reply to the ICMP echo request or the ICMP time-stamp request.

TCP SYN-Flood Attacks

You can configure the global TCP SYN-flood limit to limit SYN flood attacks. TCP SYN-flooding attacks are a type of denial of service (DoS) attack. When the configured TCP SYN-flood limit is reached, the firewall verifies the source of sessions before creating more sessions. Usually, TCP SYN packets are sent to a targeted end host or a range of subnet addresses behind the firewall. These TCP SYN packets have spoofed source IP addresses. A spoofing attack is when a person or program tries to use false data to gain access to resources

in a network. TCP SYN flooding can take up all resources on a firewall or an end host, thereby causing denial of service to legitimate traffic. You can configure TCP SYN-flood protection at the VRF level and the zone level.

SYN flood attacks are divided into two types:

- Host flood—SYN flood packets are sent to a single host intending to utilize all resources on that host.
- Firewall session table flood—SYN flood packets are sent to a range of addresses behind the firewall, with the intention of exhausting the session table resources on the firewall, thereby denying resources to the legitimate traffic going through the firewall.

How to Configure Protection Against Distributed Denial of Service Attacks

Configuring a Firewall

In this task, you will do the following:

- Configure a firewall.
- Create a security source zone.
- Create a security destination zone.
- Create a security zone pair by using the configured source and destination zones.
- Configure an interface as a zone member.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** {**icmp** | **tcp** | **udp**}
5. **exit**
6. **parameter-map type inspect global**
7. **redundancy**
8. **exit**
9. **policy-map type inspect** *policy-map-name*
10. **class type inspect** *class-map-name*
11. **inspect**
12. **exit**
13. **class class-default**
14. **drop**
15. **exit**
16. **exit**
17. **zone security** *security-zone-name*

18. **exit**
19. **zone security** *security-zone-name*
20. **exit**
21. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
22. **service-policy type inspect** *policy-map-name*
23. **exit**
24. **interface** *type number*
25. **ip address** *ip-address mask*
26. **encapsulation dot1q** *vlan-id*
27. **zone-member security** *security-zone-name*
28. **end**
29. To attach a zone to another interface, repeat Steps 21 to 25.

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Device(config)# class-map type inspect match-any ddos-class`	Creates an application-specific inspect type class map and enters QoS class-map configuration mode.
Step 4	**match protocol** {**icmp** | **tcp** | **udp**} **Example:** `Device(config-cmap)# match protocol tcp`	Configures the match criterion for a class map based on the specified protocol.
Step 5	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 6	**parameter-map type inspect global** **Example:** `Device(config)# parameter-map type inspect global`	Defines a global inspect parameter map and enters parameter-map type inspect configuration mode.
Step 7	**redundancy** **Example:** `Device(config-profile)# redundancy`	Enables firewall high availability.

	Command or Action	Purpose
Step 8	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 9	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ddos-fw`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 10	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect ddos-class`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 11	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 12	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and enters QoS policy-map configuration mode.
Step 13	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Configures the default class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 14	**drop** **Example:** `Device(config-pmap-c)# drop`	Allows traffic to pass between two interfaces in the same zone.
Step 15	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and enters QoS policy-map configuration mode.
Step 16	**exit** **Example:** `Device(config-pmap)# exit`	Exits QoS policy-map configuration mode and enters global configuration mode.
Step 17	**zone security** *security-zone-name* **Example:** `Device(config)# zone security private`	Creates a security zone and enters security zone configuration mode. • You need two security zones to create a zone pair—a source and a destination zone.
Step 18	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 19	**zone security** *security-zone-name* **Example:** `Device(config)# zone security public`	Creates a security zone and enters security zone configuration mode. • You need two security zones to create a zone pair—a source and a destination zone.
Step 20	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 21	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security private2public source private destination public`	Creates a zone pair and enters security zone-pair configuration mode.
Step 22	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect ddos-fw`	Attaches a policy map to a top-level policy map.
Step 23	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 24	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/0.1`	Configures an interface and enters subinterface configuration mode.
Step 25	**ip address** *ip-address mask* **Example:** `Device(config-subif)# ip address 10.1.1.1 255.255.255.0`	Configures an IP address for the subinterface.
Step 26	**encapsulation dot1q** *vlan-id* **Example:** `Device(config-subif)# encapsulation dot1q 2`	Sets the encapsulation method used by the interface.
Step 27	**zone-member security** *security-zone-name* **Example:** `Device(config-subif)# zone-member security private`	Configures the interface as a zone member. • For the *security-zone-name* argument, you must configure one of the zones that you had configured by using the **zone security** command. • When an interface is in a security zone, all traffic to and from that interface (except traffic going to the device or initiated by the device) is dropped by default. To permit traffic through an interface that is

	Command or Action	Purpose
		a zone member, you must make that zone part of a zone pair to which you apply a policy. If the policy permits traffic (via **inspect** or **pass** actions), traffic can flow through the interface.
Step 28	**end** **Example:** `Device(config-subif)# end`	Exits subinterface configuration mode and enters privileged EXEC mode.
Step 29	To attach a zone to another interface, repeat Steps 21 to 25.	—

Configuring the Aggressive Aging of Firewall Sessions

You can configure the Aggressive Aging feature for per-box (per-box refers to the entire firewall session table), default-VRF, and per-VRF firewall sessions. Before the Aggressive Aging feature can work, you must configure the aggressive aging and the aging-out time of firewall sessions.

Perform the following tasks to configure the aggressive aging of firewall sessions.

Configuring per-Box Aggressive Aging

Per-box refers to the entire firewall session table. Any configuration that follows the **parameter-map type inspect-global** command applies to the box.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **per-box max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
5. **per-box aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
9. **end**
10. **show policy-firewall stats global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable**	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: `Device> enable`	• Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Steps 4 and 5 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**per-box max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# per-box max-incomplete 2000 aggressive-aging high 1500 low 1200`	Configures the maximum limit and the aggressive aging rate for half-opened sessions in the firewall session table.
Step 5	**per-box aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# per-box aggressive-aging high 1700 low 1300`	Configures the aggressive aging limit of total sessions.
Step 6	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 8	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:**	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session.

	Command or Action	Purpose
	`Device(config-profile)# tcp synwait-time 30 ageout-time 10`	• After aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is disabled when the connections drop below the low watermark.
Step 9	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 10	**show policy-firewall stats global** **Example:** `Device# show policy-firewall stats global`	Displays global firewall statistics information.

Configuring Aggressive Aging for a Default VRF

When you configure the **max-incomplete aggressive-aging** `command, it applies to the default VRF.`

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enters one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
5. **session total** *number* [**aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}]
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
9. **end**
10. **show policy-firewall stats vrf global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enters one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Step 5 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# max-incomplete 3455 aggressive-aging high 2345 low 2255`	Configures the maximum limit and the aggressive aging limit of half-opened firewall sessions.
Step 5	**session total** *number* [**aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}] **Example:** `Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60`	Configures the total limit and the aggressive aging limit for total firewall sessions.
Step 6	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 8	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • After aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example,

	Command or Action	Purpose
		instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is disabled when the connections drop below the low watermark.
Step 9	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 10	**show policy-firewall stats vrf global** **Example:** `Device# show policy-firewall stats vrf global`	Displays global VRF firewall policy statistics.

Configuring the Aging Out of Firewall Sessions

You can configure the aging out of ICMP, TCP, or UDP firewall sessions.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **vrf** *vrf-name* **inspect** *vrf-pmap-name*
5. **exit**
6. **parameter-map type inspect** *parameter-map-name*
7. **tcp idle-time** *seconds* [**ageout-time** *seconds*]
8. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
9. **exit**
10. **policy-map type inspect** *policy-map-name*
11. **class type inspect match-any** *class-map-name*
12. **inspect** *parameter-map-name*
13. **end**
14. **show policy-firewall stats vrf** *vrf-pmap-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspectglobal`
		Configures a global parameter map and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Step 4 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**vrf** *vrf-name* **inspect** *vrf-pmap-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds a VRF with a parameter map.
Step 5	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 6	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 7	**tcp idle-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp idle-time 3000 ageout-time 100`	Configures the timeout for idle TCP sessions and the aggressive aging-out time for TCP sessions. • You can also configure the **tcp finwait-time** command to specify how long a TCP session will be managed after the firewall detects a finish (FIN) exchange, or you can configure the **tcp synwait-time** command to specify how long the software will wait for a TCP session to reach the established state before dropping the session.
Step 8	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • When aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the

	Command or Action	Purpose
		default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is enabled when the connections drop below the low watermark.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ddos-fw`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 11	**class type inspect match-any** *class-map-name* **Example:** `Device(config-pmap)# class type inspect match-any ddos-class`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 12	**inspect** *parameter-map-name* **Example:** `Device(config-pmap-c)# inspect pmap1`	Enables stateful packet inspection for the parameter map.
Step 13	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.
Step 14	**show policy-firewall stats vrf** *vrf-pmap-name* **Example:** `Device# show policy-firewall stats vrf vrf1-pmap`	Displays VRF-level policy firewall statistics.

Example

The following is sample output from the **show policy-firewall stats vrf vrf1-pmap** command:

```
Device# show policy-firewall stats vrf vrf1-pmap

 VRF: vrf1, Parameter-Map: vrf1-pmap
  Interface reference count: 2
       Total Session Count(estab + half-open): 270, Exceed: 0
       Total Session Aggressive Aging Period Off, Event Count: 0

                Half Open
       Protocol Session Cnt     Exceed
       -------- -----------     ------
       All      0               0
       UDP      0               0
       ICMP     0               0
       TCP      0               0
```

```
TCP Syn Flood Half Open Count: 0, Exceed: 12
Half Open Aggressive Aging Period Off, Event Count: 0
```

Configuring per-VRF Aggressive Aging

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target export** *route-target-ext-community*
6. **route-target import** *route-target-ext-community*
7. **exit**
8. **parameter-map type inspect-vrf** *vrf-pmap-name*
9. **max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
10. **session total** *number* [**aggressive-aging** {**high** *value* **low** *value* | **percent** *percent* **low percent** *percent*}]
11. **alert on**
12. **exit**
13. Enter one of the following commands:
    - **parameter-map type inspect-global**
    - **parameter-map type inspect global**
14. **vrf** *vrf-name* **inspect** *vrf-pmap-name*
15. **exit**
16. **parameter-map type inspect** *parameter-map-name*
17. **tcp idle-time** *seconds* [**ageout-time** *seconds*]
18. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
19. **exit**
20. **policy-map type inspect** *policy-map-name*
21. **class type inspect match-any** *class-map-name*
22. **inspect** *parameter-map-name*
23. **end**
24. **show policy-firewall stats vrf** *vrf-pmap-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ip vrf** *vrf-name* **Example:** `Device(config)# ip vrf ddos-vrf1`	Defines a VRF instance and enters VRF configuration mode.
Step 4	**rd** *route-distinguisher* **Example:** `Device(config-vrf)# rd 100:2`	Specifies a route distinguisher (RD) for a VRF instance.
Step 5	**route-target export** *route-target-ext-community* **Example:** `Device(config-vrf)# route-target export 100:2`	Creates a route-target extended community and exports the routing information to the target VPN extended community.
Step 6	**route-target import** *route-target-ext-community* **Example:** `Device(config-vrf)# route-target import 100:2`	Creates a route-target extended community and imports routing information from the target VPN extended community.
Step 7	**exit** **Example:** `Device(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.
Step 8	**parameter-map type inspect-vrf** *vrf-pmap-name* **Example:** `Device(config)# parameter-map type inspect-vrf vrf1-pmap`	Configures an inspect VRF-type parameter map and enters parameter-map type inspect configuration mode.
Step 9	**max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# max-incomplete 2000 aggressive-aging high 1500 low 1200`	Configures the maximum limit and the aggressive aging limit for half-opened sessions.
Step 10	**session total** *number* [**aggressive-aging** {**high** *value* **low** *value* | **percent** *percent* **low percent** *percent*}] **Example:** `Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60`	Configures the total session limit and the aggressive aging limit for the total sessions. • You can configure the total session limit as an absolute value or as a percentage.
Step 11	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.

	Command or Action	Purpose
Step 12	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.

Step 13	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Step 14 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 14	**vrf** *vrf-name* **inspect** *vrf-pmap-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds a VRF with a parameter map.
Step 15	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 16	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 17	**tcp idle-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp idle-time 3000 ageout-time 100`	Configures the timeout for idle TCP sessions and the aggressive aging-out time for TCP sessions.
Step 18	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • When aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is disabled when the connections drop below the low watermark.

	Command or Action	Purpose
Step 19	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 20	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ddos-fw`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 21	**class type inspect match-any** *class-map-name* **Example:** `Device(config-pmap)# class type inspect match-any ddos-class`	Specifies the traffic (class) on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 22	**inspect** *parameter-map-name* **Example:** `Device(config-pmap-c)# inspect pmap1`	Enables stateful packet inspection for the parameter map.
Step 23	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.
Step 24	**show policy-firewall stats vrf** *vrf-pmap-name* **Example:** `Device# show policy-firewall stats vrf vrf1-pmap`	Displays VRF-level policy firewall statistics.

Example

The following is sample output from the **show policy-firewall stats vrf vrf1-pmap** command:

```
Device# show policy-firewall stats vrf vrf1-pmap

VRF: vrf1, Parameter-Map: vrf1-pmap
  Interface reference count: 2
       Total Session Count(estab + half-open): 80, Exceed: 0
       Total Session Aggressive Aging Period Off, Event Count: 0

                Half Open
       Protocol Session Cnt     Exceed
       -------- -----------     ------
       All      0               0
       UDP      0               0
       ICMP     0               0
       TCP      0               0

       TCP Syn Flood Half Open Count: 0, Exceed: 116
       Half Open Aggressive Aging Period Off, Event Count: 0
```

Configuring Firewall Event Rate Monitoring

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-zone** *zone-pmap-name*
4. **alert on**
5. **threat-detection basic-threat**
6. **threat-detection rate fw-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second*
7. **threat-detection rate inspect-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second*
8. **threat-detection rate syn-attack average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second*
9. **exit**
10. **zone security** *security-zone-name*
11. **protection** *parameter-map-name*
12. **exit**
13. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
14. **end**
15. **show policy-firewall stats zone**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-zone** *zone-pmap-name* **Example:** `Device(config)# parameter-map type inspect-zone zone-pmap1`	Configures an inspect-zone parameter map and enters parameter-map type inspect configuration mode.
Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages for a zone. • You can use the **log** command to configure the logging of alerts either to the syslog or to the high-speed logger (HSL).

	Command or Action	Purpose
Step 5	**threat-detection basic-threat** **Example:** `Device(config-profile)# threat-detection basic-threat`	Configures basic threat detection for a zone.
Step 6	**threat-detection rate fw-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second* **Example:** `Device(config-profile)# threat-detection rate fw-drop average-time-frame 600 average-threshold 100 burst-threshold 100`	Configures the threat detection rate for firewall drop events. • You must configure the **threat-detection basic-threat** command before you configure the **threat-detection rate** command.
Step 7	**threat-detection rate inspect-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second* **Example:** `Device(config-profile)# threat-detection rate inspect-drop average-time-frame 600 average-threshold 100 burst-threshold 100`	Configures the threat detection rate for firewall inspection-based drop events.
Step 8	**threat-detection rate syn-attack average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second* **Example:** `Device(config-profile)# threat-detection rate syn-attack average-time-frame 600 average-threshold 100 burst-threshold 100`	Configures the threat detection rate for TCP SYN attack events.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**zone security** *security-zone-name* **Example:** `Device(config)# zone security public`	Creates a security zone and enters security zone configuration mode.
Step 11	**protection** *parameter-map-name* **Example:** `Device(config-sec-zone)# protection zone-pmap1`	Attaches the inspect-zone parameter map to the zone and applies the features configured in the inspect-zone parameter map to the zone.
Step 12	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 13	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security private2public source private destination public`	Creates a zone pair and enters security zone-pair configuration mode.
Step 14	**end** **Example:** `Device(config-sec-zone-pair)# end`	Exits security zone-pair configuration mode and enters privileged EXEC mode.
Step 15	**show policy-firewall stats zone** **Example:** `Device# show policy-firewall stats zone`	Displays policy firewall statistics at the zone level.

Configuring the per-Box Half-Opened Session Limit

Per-box refers to the entire firewall session table. Any configuration that follows the **parameter-map type inspect-global** command applies to the box.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **alert on**
5. **per-box max-incomplete** *number*
6. **session total** *number*
7. **end**
8. **show policy-firewall stats global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip to Steps 5 and 6 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 5	**per-box max-incomplete** *number* **Example:** `Device(config-profile)# per-box max-incomplete 12345`	Configures the maximum number of half-opened connections for the firewall session table.
Step 6	**session total** *number* **Example:** `Device(config-profile)# session total 34500`	Configures the total session limit for the firewall session table.
Step 7	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 8	**show policy-firewall stats global** **Example:** `Device# show policy-firewall stats global`	Displays global firewall statistics information.

Configuring the Half-Opened Session Limit for an Inspect-VRF Parameter Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-vrf** *vrf-name*

4. **alert on**
5. **max-incomplete** *number*
6. **session total** *number*
7. **exit**
8. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
9. **alert on**
10. **vrf** *vrf-name* **inspect** *vrf-pmap-name*
11. **end**
12. **show policy-firewall stats vrf** *vrf-pmap-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-vrf** *vrf-name* **Example:** `Device(config)# parameter-map type inspect-vrf vrf1-pmap`	Configures an inspect-VRF parameter map and enters parameter-map type inspect configuration mode.
Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 5	**max-incomplete** *number* **Example:** `Device(config-profile)# max-incomplete 2000`	Configures the maximum number of half-opened connections per VRF.
Step 6	**session total** *number* **Example:** `Device(config-profile)# session total 34500`	Configures the total session limit for a VRF.
Step 7	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.

	Command or Action	Purpose

Step 8	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, you can use either the **parameter-map type inspect-global** command or the **parameter-map type inspect global** command. You cannot configure both these commands together.
		• Skip Step 10 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 9	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 10	**vrf** *vrf-name* **inspect** *vrf-pmap-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds the VRF to the global parameter map.
Step 11	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 12	**show policy-firewall stats vrf** *vrf-pmap-name* **Example:** `Device# show policy-firewall stats vrf vrf1-pmap`	Displays VRF-level policy firewall statistics.

Configuring the Global TCP SYN Flood Limit

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **alert on**
5. **per-box tcp syn-flood limit** *number*

6. **end**
7. **show policy-firewall stats vrf global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map and enters parameter-map type inspect configuration mode.
		• Based on your release, you can configure either the **parameter-map type inspect-global** command or the **parameter-map type inspect global** command. You cannot configure both these commands together.
		• Skip Step 5 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 5	**per-box tcp syn-flood limit** *number* **Example:** `Device(config-profile)# per-box tcp syn-flood limit 500`	Limits the number of TCP half-opened sessions that trigger SYN cookie processing for new SYN packets.
Step 6	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 7	**show policy-firewall stats vrf global** **Example:** `Device# show policy-firewall stats vrf global`	(Optional) Displays the status of the global VRF firewall policy. • The command output also displays how many TCP half-opened sessions are present.

Example

The following is sample output from the **show policy-firewall stats vrf global** command:

```
Device# show policy-firewall stats vrf global

Global table statistics
       total_session_cnt: 0
       exceed_cnt:        0
       tcp_half_open_cnt: 0
       syn_exceed_cnt:    0
```

Configuration Examples for Protection Against Distributed Denial of Service Attacks

Example: Configuring a Firewall

```
Router# configure terminal
Router(config)# class-map type inspect match-any ddos-class
Router(config-cmap)# match protocol tcp
Router(config-cmap-c)# exit
Router(config)# parameter-map type inspect global
Router(config-profile)# redundancy
Router(config-profile)# exit
Router(config)# policy-map type inspect ddos-fw
Router(config-pmap)# class type inspect ddos-class
Router(config-pmap-c)# inspect
Router(config-pmap-c)# exit
Router(config-pmap)# class class-default
Router(config-pmap-c)# drop
Router(config-pmap-c)# exit
Router(config-pmap)# exit
Router(config)# zone security private
Router(config-sec-zone)# exit
Router(config)# zone security public
Router(config-sec-zone)# exit
Router(config)# zone-pair security private2public source private destination public
Router((config-sec-zone-pair)# service-policy type inspect ddos-fw
Router((config-sec-zone-pair)# exit
Router(config)# interface gigabitethernet 0/1/0.1
Router(config-subif)# ip address 10.1.1.1 255.255.255.0
Router(config-subif)# encapsulation dot1q 2
Router(config-subif)# zone-member security private
Router(config-subif)# exit
Router(config)# interface gigabitethernet 1/1/0.1
Router(config-subif)# ip address 10.2.2.2 255.255.255.0
Router(config-subif)# encapsulation dot1q 2
Router(config-subif)# zone-member security public
Router(config-subif)# end
```

Example: Configuring the Aggressive Aging of Firewall Sessions

Example: Configuring per-Box Aggressive Aging

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# per-box max-incomplete 2000 aggressive-aging 1500 low 1200
Device(config-profile)# per-box aggressive-aging high 1700 low 1300
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# end
```

Example: Configuring Aggressive Aging for a Default VRF

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# max-incomplete 2000 aggressive-aging high 1500 low 1200
Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# end
```

Example: Configuring the Aging Out of Firewall Sessions

```
Device# configure terminal
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# vrf vrf1 inspect vrf1-pmap
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp idle-time 3000 ageout-time 100
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# exit
Device(config)# policy-map type inspect ddos-fw
Device(config-profile)# class type inspect match-any ddos-class
Device(config-profile)# inspect pmap1
Device(config-profile)# end
```

Example: Configuring per-VRF Aggressive Aging

```
Device# configure terminal
Device(config)# ip vrf ddos-vrf1
Device(config-vrf)# rd 100:2
Device(config-vrf)# route-target export 100:2
Device(config-vrf)# route-target import 100:2
Device(config-vrf)# exit
Device(config)# parameter-map type inspect-vrf vrf1-pmap
Device(config-profile)# max-incomplete 3455 aggressive-aging high 2345 low 2255
Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60
Device(config-profile)# alert on
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# vrf vrf1 inspect vrf1-pmap
```

```
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp idle-time 3000 ageout-time 100
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# exit
Device(config)# policy-map type inspect ddos-fw
Device(config-pmap)# class type inspect match-any ddos-class
Device(config-pmap-c)# inspect pmap1
Device(config-profile)# end
```

Example: Configuring Firewall Event Rate Monitoring

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type inspect zone zone-pmap1
Device(config-profile)# alert on
Device(config-profile)# threat-detection basic-threat
Device(config-profile)# threat-detection rate fw-drop average-time-frame 600 average-threshold
 100 burst-threshold 100
Device(config-profile)# threat-detection rate inspect-drop average-time-frame 600
average-threshold 100 burst-threshold 100
Device(config-profile)# threat-detection rate syn-attack average-time-frame 600
average-threshold 100 burst-threshold 100
Device(config-profile)# exit
Device(config)# zone security public
Device(config-sec-zone)# protection zone-pmap1
Device(config-sec-zone)# exit
Device(config)# zone-pair security private2public source private destination public
Device(config-sec-zone-pair)# end
```

Example: Configuring the per-Box Half-Opened Session Limit

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# alert on
Device(config-profile)# per-box max-incomplete 12345
Device(config-profile)# session total 34500
Device(config-profile)# end
```

Example: Configuring the Half-Opened Session Limit for an Inspect VRF Parameter Map

```
Device# configure terminal
Device(config)# parameter-map type inspect vrf vrf1-pmap
Device(config-profile)# alert on
Device(config-profile)# max-incomplete 3500
Device(config-profile)# session total 34500
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# alert on
```

```
Device(config-profile)# vrf vrf1 inspect vrf1-pmap
Device(config-profile)# end
```

Example: Configuring the Global TCP SYN Flood Limit

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# alert on
Device(config-profile)# per-box tcp syn-flood limit 500
Device(config-profile)# end
```

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Protection Against Distributed Denial of Service Attacks

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 187: Feature Information for Protection Against Distributed Denial of Service Attacks

Feature Name	Releases	Feature Information
Protection Against Distributed Denial of Service Attacks	Cisco IOS XE Release 3.4S	The Protection Against Distributed Denial of Service Attacks feature provides protection from DoS attacks at the per-box level (for all firewall sessions) and at the VRF level. You can configure the aggressive aging of firewall sessions, event rate monitoring of firewall sessions, the half-opened connections limit, and global TCP SYN cookie protection to prevent DDoS attacks. The following commands were introduced or modified: **clear policy-firewall stats global**, **max-incomplete**, **max-incomplete aggressive-aging**, **per-box aggressive-aging**, **per-box max-incomplete**, **per-box max-incomplete aggressive-aging**, **per-box tcp syn-flood limit**, **session total**, **show policy-firewall stats global**, **show policy-firewall stats zone**, **threat-detection basic-threat**, **threat-detection rate**, and **udp half-open**.

CHAPTER 140

Configuring Firewall Resource Management

The Firewall Resource Management feature limits the number of VPN Routing and Forwarding (VRF) and global firewall sessions that are configured on a router.

Restrictions for Configuring Firewall Resource Management

- After you configure the global-level or VRF-level session limit and reconfigure the session limit, if the global-level or VRF-level session limit is below the initially configured session count, no new session is added; however, no current session is dropped.

Information About Configuring Firewall Resource Management

Firewall Resource Management

Resource Management limits the level of usage of shared resources on a device. Shared resources on a device include:

- Bandwidth
- Connection states
- Memory usage (per table)
- Number of sessions or calls
- Packets per second
- Ternary content addressable memory (TCAM) entries

The Firewall Resource Management feature extends the zone-based firewall resource management from the class level to the VRF level and the global level. Class-level resource management provides resource protection for firewall sessions at a class level. For example, parameters such as the maximum session limit, the session rate limit, and the incomplete session limit protect firewall resources (for example, chunk memory) and keep these resources from being used up by a single class.

When virtual routing and forwarding (VRF) instances share the same policy, a firewall session setup request from one VRF instance can make the total session count reach the maximum limit. When one VRF consumes the maximum amount of resources on a device, it becomes difficult for other VRF instances to share device resources. To limit the number of VRF firewall sessions, you can use the Firewall Resource Management feature.

At the global level, the Firewall Resource Management feature helps limit the usage of resources at the global routing domain by firewall sessions.

VRF-Aware Cisco IOS XE Firewall

The VRF-Aware Cisco IOS XE Firewall applies the Cisco IOS XE Firewall functionality to VPN Routing and Forwarding (VRF) interfaces when the firewall is configured on a service provider (SP) or large enterprise edge routers. SPs provide managed services to small and medium business markets.

The VRF-Aware Cisco IOS XE Firewall supports VRF-lite (also known as Multi-VRF CE) and Application Inspection and Control (AIC) for various protocols.

The VRF-aware firewall supports VRF-lite (also known as Multi-VRF CE) and Application Inspection and Control (AIC) for various protocols.

Note Cisco IOS XE Releases do not support Context-Based Access Control (CBAC) firewalls.

Firewall Sessions

Session Definition

At the virtual routing and forwarding (VRF) level, the Firewall Resource Management feature tracks the firewall session count for each VRF instance. At the global level, the firewall resource management tracks the total firewall session count at the global routing domain and not at the device level. In both the VRF and global levels, session count is the sum of opened sessions, half-opened sessions, and sessions in the imprecise firewall session database. A TCP session that has not yet reached the established state is called a half-opened session.

A firewall has two session databases: the session database and the imprecise session database. The session database contains sessions with 5-tuple (source IP address, destination IP address, source port, destination port, and protocol). A tuple is an ordered list of elements. The imprecise session database contains sessions with fewer than 5-tuple (missing IP addresses, port numbers, and so on).

The following rules apply to the configuration of a session limit:

- The class-level session limit can exceed the global limit.
- The class-level session limit can exceed its associated VRF session maximum.
- The sum of the VRF limit, including the global context, can be greater than the hardcoded session limit.

Session Rate

The session rate is the rate at which sessions are established at any given time interval. You can define maximum and minimum session rate limits. When the session rate exceeds the maximum specified rate, the firewall starts rejecting new session setup requests.

From the resource management perspective, setting the maximum and minimum session rate limit helps protect Cisco Packet Processor from being overwhelmed when numerous firewall session setup requests are received.

Incomplete or Half-Opened Sessions

Incomplete sessions are half-opened sessions. Any resource used by an incomplete session is counted, and any growth in the number of incomplete sessions is limited by setting the maximum session limit.

Firewall Resource Management Sessions

The following rules apply to firewall resource management sessions:

- By default, the session limit for opened and half-opened sessions is unlimited.
- Opened or half-opened sessions are limited by parameters and counted separately.
- Opened or half-opened session count includes Internet Control Message Protocol (ICMP), TCP, or UDP sessions.
- You can limit the number and rate of opened sessions.
- You can only limit the number of half-opened sessions.

How to Configure Firewall Resource Management

Configuring Firewall Resource Management

Note A global parameter map takes effect on the global routing domain and not at the router level.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-vrf** *vrf-pmap-name*
4. **session total** *number*
5. **tcp syn-flood limit** *number*
6. **exit**
7. **parameter-map type inspect-global**
8. **vrf** *vrf-name* **inspect** *parameter-map-name*
9. **exit**
10. **parameter-map type inspect-vrf vrf-default**

11. **session total** *number*
12. **tcp syn-flood limit** *number*
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-vrf** *vrf-pmap-name* **Example:** `Device(config)# parameter-map type inspect-vrf vrf1-pmap`	Configures an inspect VRF-type parameter map and enters parameter-map type inspect configuration mode.
Step 4	**session total** *number* **Example:** `Device(config-profile)# session total 1000`	Configures the total number of sessions.
Step 5	**tcp syn-flood limit** *number* **Example:** `Device(config-profile)# tcp syn-flood limit 2000`	Limits the number of TCP half-opened sessions that trigger synchronization (SYN) cookie processing for new SYN packets.
Step 6	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect-global** **Example:** `Device(config)# parameter-map type inspect-global`	Configures a global parameter map and enters parameter-map type inspect configuration mode.
Step 8	**vrf** *vrf-name* **inspect** *parameter-map-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds a VRF to the parameter map.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**parameter-map type inspect-vrf vrf-default** **Example:**	Configures a default inspect VRF-type parameter map.

	Command or Action	Purpose
	`Device(config)# parameter-map type inspect-vrf vrf-default`	
Step 11	**session total** *number* **Example:** `Device(config-profile)# session total 6000`	Configures the total number of sessions. • You can configure the **session total** command for an inspect VRF-type parameter map and for a global parameter map. When you configure the **session total** command for an inspect VRF-type parameter map, the sessions are associated with an inspect VRF-type parameter map. The **session total** command is applied to the global routing domain when it is configured for a global parameter-map.
Step 12	**tcp syn-flood limit** *number* **Example:** `Device(config-profile)# tcp syn-flood limit 7000`	Limits the number of TCP half-opened sessions that trigger SYN cookie processing for new SYN packets.
Step 13	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.

Configuration Examples for Firewall Resource Management

Example: Configuring Firewall Resource Management

```
Device# configure terminal
Device(config)# parameter-map type inspect-vrf vrf1-pmap
Device(config-profile)# session total 1000
Device(config-profile)# tcp syn-flood limit 2000
Device(config-profile)# exit
Device(config)# parameter-map type inspect-global
Device(config-profile)# vrf vrf1 inspect pmap1
Device(config-profile)# exit
Device(config)# parameter-map type inspect-vrf vrf-default
Device(config-profile)# session total 6000
Device(config-profile)# tcp syn-flood limit 7000
Device(config-profile)# end
```

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Configuring Firewall Resource Management

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 188: Feature Information for Configuring Firewall Resource Management

Feature Name	Releases	Feature Information
Firewall Resource Management	Cisco IOS XE Release 3.3S	The Firewall Resource Management feature limits the number of VPN Routing and Forwarding (VRF) and global firewall sessions that are configured on a router. The following commands were introduced or modified: **parameter-map type inspect-vrf**.

CHAPTER 141

IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management

IPv6 zone-based firewalls support the Protection of Distributed Denial of Service Attacks and the Firewall Resource Management features.

The Protection Against Distributed Denial of Service Attacks feature provides protection from Denial of Service (DoS) attacks at the global level (for all firewall sessions) and at the VPN routing and forwarding (VRF) level. With the Protection Against Distributed Denial of Service Attacks feature, you can configure the aggressive aging of firewall sessions, event rate monitoring of firewall sessions, half-opened connections limit, and global TCP synchronization (SYN) cookie protection to prevent distributed DoS attacks.

The Firewall Resource Management feature limits the number of VPN Routing and Forwarding (VRF) and global firewall sessions that are configured on a device.

This module describes how to configure the Protection of Distributed Denial of Service Attacks and the Firewall Resource Management features.

Restrictions for IPv6 Firewall Support for Protection Against Distributed Denial of Service Attacks and Resource Management

The following restriction applies to the Firewall Resource Management feature:

- After you configure the global-level or the virtual routing and forwarding (VRF)-level session limit and reconfigure the session limit, if the global-level or the VRF-level session limit is below the initially configured session count, no new session is added; however, no current session is dropped.

Information About IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management

Aggressive Aging of Firewall Sessions

The Aggressive Aging feature provides the firewall the capability of aggressively aging out sessions to make room for new sessions, thereby protecting the firewall session database from filling. The firewall protects its resources by removing idle sessions. The Aggressive Aging feature allows firewall sessions to exist for a shorter period of time defined by a timer called aging-out time.

The Aggressive Aging feature includes thresholds to define the start and end of the aggressive aging period—high and low watermarks. The aggressive aging period starts when the session table crosses the high watermark and ends when it falls below the low watermark. During the aggressive aging period, sessions will exist for a shorter period of time that you have configured by using the aging-out time. If an attacker initiates sessions at a rate that is faster than the rate at which the firewall terminates sessions, all resources that are allocated for creating sessions are used and all new connections are rejected. To prevent such attacks, you can configure the Aggressive Aging feature to aggressively age out sessions. This feature is disabled by default.

You can configure aggressive aging for half-opened sessions and total sessions at the box level (box refers to the entire firewall session table) and the virtual routing and forwarding (VRF) level. If you have configured this feature for total sessions, all sessions that consume firewall session resources are taken into account. Total sessions comprise established sessions, half-opened sessions, and sessions in the imprecise session database. (A TCP session that has not yet reached the established state is called a half-opened session.)

A firewall has two session databases: the session database and the imprecise session database. The session database contains sessions with 5-tuple (the source IP address, the destination IP address, the source port, the destination port, and the protocol). A tuple is an ordered list of elements. The imprecise session database contains sessions with fewer than 5-tuple (missing IP addresses, port numbers, and so on). In the case of aggressive aging for half-opened sessions, only half-opened sessions are considered.

You can configure an aggressive aging-out time for Internet Control Message Protocol (ICMP), TCP, and UDP firewall sessions. The aging-out time is set by default to the idle time.

Event Rate Monitoring Feature

The Event Rate Monitoring feature monitors the rate of predefined events in a zone. The Event Rate Monitoring feature includes basic threat detection, which is the ability of a security device to detect possible threats, anomalies, and attacks to resources inside the firewall and to take action against them. You can configure a basic threat detection rate for events. When the incoming rate of a certain type of event exceeds the configured threat detection rate, event rate monitoring considers this event as a threat and takes action to stop the threat. Threat detection inspects events only on the ingress zone (if the Event Rate Monitoring feature is enabled on the ingress zone).

The network administrator is informed about the potential threats via an alert message (syslog or high-speed logger [HSL]) and can take actions such as detecting the attack vector, detecting the zone from which the attack is coming, or configuring devices in the network to block certain behaviors or traffic.

The Event Rate Monitoring feature monitors the following types of events:

- Firewall drops due to basic firewall checks failure—This can include zone or zone-pair check failures, or firewall policies configured with the drop action, and so on.
- Firewall drops due to Layer 4 inspection failure—This can include TCP inspections that have failed because the first TCP packet is not a synchronization (SYN) packet.
- TCP SYN cookie attack—This can include counting the number of SYN packets that are dropped and the number of SYN cookies that are sent as a spoofing attack.

The Event Rate Monitoring feature monitors the average rate and the burst rate of different events. Each event type has a rate object that is controlled by an associated rate that has a configurable parameter set (the average threshold, the burst threshold, and a time period). The time period is divided into time slots; each time slot is 1/30th of the time period.

The average rate is calculated for every event type. Each rate object holds 30 completed sampling values plus one value to hold the current ongoing sampling period. The current sampling value replaces the oldest calculated value and the average is recalculated. The average rate is calculated during every time period. If the average rate exceeds the average threshold, the Event Rate Monitoring feature will consider this as a possible threat, update the statistics, and inform the network administrator.

The burst rate is implemented by using the token bucket algorithm. For each time slot, the token bucket is filled with tokens. For each event that occurs (of a specific event type), a token is removed from the bucket. An empty bucket means that the burst threshold is reached, and the administrator receives an alarm through the syslog or HSL. You can view the threat detection statistics and learn about possible threats to various events in the zone from the output of the **show policy-firewall stats zone** command.

You must first enable basic threat detection by using the **threat-detection basic-threat** command. Once basic threat detection is configured, you can configure the threat detection rate. To configure the threat detection rate, use the **threat-detection rate** command.

The following table describes the basic threat detection default settings that are applicable if the Event Rate Monitoring feature is enabled.

Table 189: Basic Threat Detection Default Settings

Packet Drop Reason	Threat Detection Settings
Basic firewall drops	average-rate 400 packets per second (pps) burst-rate 1600 pps rate-interval 600 seconds
Inspection-based firewall drops	average-rate 400 pps burst-rate 1600 pps rate-interval 600 seconds
SYN attack firewall drops	average-rate 100 pps burst-rate 200 pps rate-interval 600 seconds

Half-Opened Connections Limit

The firewall session table supports the limiting of half-opened firewall connections. Limiting the number of half-opened sessions will defend the firewall against attacks that might fill the firewall session table at the per-box level or at the virtual routing and forwarding (VRF) level with half-opened sessions and prevent sessions from being established. The half-opened connection limit can be configured for Layer 4 protocols, Internet Control Message Protocol (ICMP), TCP, and UDP. The limit set to the number of UDP half-opened sessions will not affect the TCP or ICMP half-opened sessions. When the configured half-opened session limit is exceeded, all new sessions are rejected and a log message is generated, either in syslog or in the high-speed logger (HSL).

The following sessions are considered as half-opened sessions:

- TCP sessions that have not completed the three-way handshake.
- UDP sessions that have only one packet detected in the UDP flow.
- ICMP sessions that do not receive a reply to the ICMP echo request or the ICMP time-stamp request.

TCP SYN-Flood Attacks

You can configure the global TCP SYN-flood limit to limit SYN flood attacks. TCP SYN-flooding attacks are a type of denial of service (DoS) attack. When the configured TCP SYN-flood limit is reached, the firewall verifies the source of sessions before creating more sessions. Usually, TCP SYN packets are sent to a targeted end host or a range of subnet addresses behind the firewall. These TCP SYN packets have spoofed source IP addresses. A spoofing attack is when a person or program tries to use false data to gain access to resources in a network. TCP SYN flooding can take up all resources on a firewall or an end host, thereby causing denial of service to legitimate traffic. You can configure TCP SYN-flood protection at the VRF level and the zone level.

SYN flood attacks are divided into two types:

- Host flood—SYN flood packets are sent to a single host intending to utilize all resources on that host.

- Firewall session table flood—SYN flood packets are sent to a range of addresses behind the firewall, with the intention of exhausting the session table resources on the firewall, thereby denying resources to the legitimate traffic going through the firewall.

Firewall Resource Management

Resource Management limits the level of usage of shared resources on a device. Shared resources on a device include:

- Bandwidth
- Connection states
- Memory usage (per table)
- Number of sessions or calls
- Packets per second
- Ternary content addressable memory (TCAM) entries

The Firewall Resource Management feature extends the zone-based firewall resource management from the class level to the VRF level and the global level. Class-level resource management provides resource protection for firewall sessions at a class level. For example, parameters such as the maximum session limit, the session rate limit, and the incomplete session limit protect firewall resources (for example, chunk memory) and keep these resources from being used up by a single class.

When virtual routing and forwarding (VRF) instances share the same policy, a firewall session setup request from one VRF instance can make the total session count reach the maximum limit. When one VRF consumes the maximum amount of resources on a device, it becomes difficult for other VRF instances to share device resources. To limit the number of VRF firewall sessions, you can use the Firewall Resource Management feature.

At the global level, the Firewall Resource Management feature helps limit the usage of resources at the global routing domain by firewall sessions.

Firewall Sessions

Session Definition

At the virtual routing and forwarding (VRF) level, the Firewall Resource Management feature tracks the firewall session count for each VRF instance. At the global level, the firewall resource management tracks the total firewall session count at the global routing domain and not at the device level. In both the VRF and global levels, session count is the sum of opened sessions, half-opened sessions, and sessions in the imprecise firewall session database. A TCP session that has not yet reached the established state is called a half-opened session.

A firewall has two session databases: the session database and the imprecise session database. The session database contains sessions with 5-tuple (source IP address, destination IP address, source port, destination port, and protocol). A tuple is an ordered list of elements. The imprecise session database contains sessions with fewer than 5-tuple (missing IP addresses, port numbers, and so on).

The following rules apply to the configuration of a session limit:

- The class-level session limit can exceed the global limit.
- The class-level session limit can exceed its associated VRF session maximum.
- The sum of the VRF limit, including the global context, can be greater than the hardcoded session limit.

Session Rate

The session rate is the rate at which sessions are established at any given time interval. You can define maximum and minimum session rate limits. When the session rate exceeds the maximum specified rate, the firewall starts rejecting new session setup requests.

From the resource management perspective, setting the maximum and minimum session rate limit helps protect Cisco Packet Processor from being overwhelmed when numerous firewall session setup requests are received.

Incomplete or Half-Opened Sessions

Incomplete sessions are half-opened sessions. Any resource used by an incomplete session is counted, and any growth in the number of incomplete sessions is limited by setting the maximum session limit.

Firewall Resource Management Sessions

The following rules apply to firewall resource management sessions:

- By default, the session limit for opened and half-opened sessions is unlimited.
- Opened or half-opened sessions are limited by parameters and counted separately.
- Opened or half-opened session count includes Internet Control Message Protocol (ICMP), TCP, or UDP sessions.
- You can limit the number and rate of opened sessions.
- You can only limit the number of half-opened sessions.

How to Configure IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management

Configuring an IPv6 Firewall

The steps to configure an IPv4 firewall and an IPv6 firewall are the same. To configure an IPv6 firewall, you must configure the class map in such a way that only an IPv6 address family is matched.

The **match protocol** command applies to both IPv4 and IPv6 traffic and can be included in either an IPv4 policy or an IPv6 policy.

SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **vrf-definition** *vrf-name*
4. **address-family ipv6**
5. **exit-address-family**
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **sessions maximum** *sessions*
9. **exit**
10. **ipv6 unicast-routing**
11. **ip port-map** *appl-name* **port** *port-num* **list** *list-name*
12. **ipv6 access-list** *access-list-name*
13. **permit ipv6 any any**
14. **exit**
15. **class-map type inspect match-all** *class-map-name*
16. **match access-group name** *access-group-name*
17. **match protocol** *protocol-name*
18. **exit**
19. **policy-map type inspect** *policy-map-name*
20. **class type inspect** *class-map-name*
21. **inspect** [*parameter-map-name*]
22. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**vrf-definition** *vrf-name* **Example:** `Device(config)# vrf-definition VRF1`	Configures a virtual routing and forwarding (VRF) routing table instance and enters VRF configuration mode.
Step 4	**address-family ipv6** **Example:** `Device(config-vrf)# address-family ipv6`	Enters VRF address family configuration mode and configures sessions that carry standard IPv6 address prefixes.
Step 5	**exit-address-family** **Example:** `Device(config-vrf-af)# exit-address-family`	Exits VRF address family configuration mode and enters VRF configuration mode.

	Command or Action	Purpose
Step 6	**exit** **Example:** `Device(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect ipv6-param-map`	Enables a global inspect-type parameter map for the firewall to connect thresholds, timeouts, and other parameters that pertain to the inspect action, and enters parameter-map type inspect configuration mode.
Step 8	**sessions maximum** *sessions* **Example:** `Device(config-profile)# sessions maximum 10000`	Sets the maximum number of allowed sessions that can exist on a zone pair.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**ipv6 unicast-routing** **Example:** `Device(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 11	**ip port-map** *appl-name* **port** *port-num* **list** *list-name* **Example:** `Device(config)# ip port-map ftp port 8090 list ipv6-acl`	Establishes a port to application mapping (PAM) by using the IPv6 access control list (ACL).
Step 12	**ipv6 access-list** *access-list-name* **Example:** `Device(config)# ipv6 access-list ipv6-acl`	Defines an IPv6 access list and enters IPv6 access list configuration mode.
Step 13	**permit ipv6 any any** **Example:** `Device(config-ipv6-acl)# permit ipv6 any any`	Sets permit conditions for an IPv6 access list.
Step 14	**exit** **Example:** `Device(config-ipv6-acl)# exit`	Exits IPv6 access list configuration mode and enters global configuration mode.
Step 15	**class-map type inspect match-all** *class-map-name* **Example:** `Device(config)# class-map type inspect match-all ipv6-class`	Creates an application-specific inspect type class map and enters QoS class-map configuration mode.
Step 16	**match access-group name** *access-group-name* **Example:**	Configures the match criteria for a class map on the basis of the specified ACL.

	Command or Action	Purpose
	`Device(config-cmap)# match access-group name ipv6-acl`	
Step 17	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol tcp`	Configures a match criterion for a class map on the basis of the specified protocol.
Step 18	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 19	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ipv6-policy`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 20	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect ipv6-class`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 21	**inspect** [*parameter-map-name*] **Example:** `Device(config-pmap-c)# inspect ipv6-param-map`	Enables stateful packet inspection.
Step 22	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.

Configuring the Aggressive Aging of Firewall Sessions

You can configure the Aggressive Aging feature for per-box (per-box refers to the entire firewall session table), default-VRF, and per-VRF firewall sessions. Before the Aggressive Aging feature can work, you must configure the aggressive aging and the aging-out time of firewall sessions.

Perform the following tasks to configure the aggressive aging of firewall sessions.

Configuring per-Box Aggressive Aging

Per-box refers to the entire firewall session table. Any configuration that follows the **parameter-map type inspect-global** command applies to the box.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**

- **parameter-map type inspect global**

4. **per-box max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
5. **per-box aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
9. **end**
10. **show policy-firewall stats global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Steps 4 and 5 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**per-box max-incomplete** *number* **aggressive-aging high** {*value* **low** *value*	**percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# per-box max-incomplete 2000 aggressive-aging high 1500 low 1200`	Configures the maximum limit and the aggressive aging rate for half-opened sessions in the firewall session table.
Step 5	**per-box aggressive-aging high** {*value* **low** *value*	**percent** *percent* **low percent** *percent*}	Configures the aggressive aging limit of total sessions.

	Command or Action	Purpose
	Example: `Device(config-profile)# per-box aggressive-aging high 1700 low 1300`	
Step 6	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 8	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • After aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is disabled when the connections drop below the low watermark.
Step 9	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 10	**show policy-firewall stats global** **Example:** `Device# show policy-firewall stats global`	Displays global firewall statistics information.

Configuring Aggressive Aging for a Default VRF

When you configure the **max-incomplete aggressive-aging** `command, it applies to the default VRF.`

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enters one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}

5. **session total** *number* [**aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}]
6. **exit**
7. **parameter-map type inspect** *parameter-map-name*
8. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
9. **end**
10. **show policy-firewall stats vrf global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enters one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Step 5 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# max-incomplete 3455 aggressive-aging high 2345 low 2255`	Configures the maximum limit and the aggressive aging limit of half-opened firewall sessions.
Step 5	**session total** *number* [**aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}] **Example:** `Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60`	Configures the total limit and the aggressive aging limit for total firewall sessions.

	Command or Action	Purpose
Step 6	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 8	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • After aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is disabled when the connections drop below the low watermark.
Step 9	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 10	**show policy-firewall stats vrf global** **Example:** `Device# show policy-firewall stats vrf global`	Displays global VRF firewall policy statistics.

Configuring per-VRF Aggressive Aging

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target export** *route-target-ext-community*
6. **route-target import** *route-target-ext-community*
7. **exit**
8. **parameter-map type inspect-vrf** *vrf-pmap-name*
9. **max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*}
10. **session total** *number* [**aggressive-aging** {**high** *value* **low** *value* | **percent** *percent* **low percent** *percent*}]
11. **alert on**
12. **exit**

13. Enter one of the following commands:
    - **parameter-map type inspect-global**
    - **parameter-map type inspect global**
14. **vrf** *vrf-name* **inspect** *vrf-pmap-name*
15. **exit**
16. **parameter-map type inspect** *parameter-map-name*
17. **tcp idle-time** *seconds* [**ageout-time** *seconds*]
18. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
19. **exit**
20. **policy-map type inspect** *policy-map-name*
21. **class type inspect match-any** *class-map-name*
22. **inspect** *parameter-map-name*
23. **end**
24. **show policy-firewall stats vrf** *vrf-pmap-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ip vrf** *vrf-name* **Example:** `Device(config)# ip vrf ddos-vrf1`	Defines a VRF instance and enters VRF configuration mode.
Step 4	**rd** *route-distinguisher* **Example:** `Device(config-vrf)# rd 100:2`	Specifies a route distinguisher (RD) for a VRF instance.
Step 5	**route-target export** *route-target-ext-community* **Example:** `Device(config-vrf)# route-target export 100:2`	Creates a route-target extended community and exports the routing information to the target VPN extended community.
Step 6	**route-target import** *route-target-ext-community* **Example:** `Device(config-vrf)# route-target import 100:2`	Creates a route-target extended community and imports routing information from the target VPN extended community.
Step 7	**exit** **Example:** `Device(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 8	**parameter-map type inspect-vrf** *vrf-pmap-name* **Example:** `Device(config)# parameter-map type inspect-vrf vrf1-pmap`	Configures an inspect VRF-type parameter map and enters parameter-map type inspect configuration mode.
Step 9	**max-incomplete** *number* **aggressive-aging high** {*value* **low** *value* | **percent** *percent* **low percent** *percent*} **Example:** `Device(config-profile)# max-incomplete 2000 aggressive-aging high 1500 low 1200`	Configures the maximum limit and the aggressive aging limit for half-opened sessions.
Step 10	**session total** *number* [**aggressive-aging** {**high** *value* **low** *value* | **percent** *percent* **low percent** *percent*}] **Example:** `Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60`	Configures the total session limit and the aggressive aging limit for the total sessions. • You can configure the total session limit as an absolute value or as a percentage.
Step 11	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 12	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.

Step 13	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Step 14 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 14	**vrf** *vrf-name* **inspect** *vrf-pmap-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds a VRF with a parameter map.

	Command or Action	Purpose
Step 15	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 16	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 17	**tcp idle-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp idle-time 3000 ageout-time 100`	Configures the timeout for idle TCP sessions and the aggressive aging-out time for TCP sessions.
Step 18	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • When aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is disabled when the connections drop below the low watermark.
Step 19	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 20	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ddos-fw`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 21	**class type inspect match-any** *class-map-name* **Example:** `Device(config-pmap)# class type inspect match-any ddos-class`	Specifies the traffic (class) on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 22	**inspect** *parameter-map-name* **Example:** `Device(config-pmap-c)# inspect pmap1`	Enables stateful packet inspection for the parameter map.
Step 23	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.

	Command or Action	Purpose
Step 24	**show policy-firewall stats vrf** *vrf-pmap-name* **Example:** `Device# show policy-firewall stats vrf vrf1-pmap`	Displays VRF-level policy firewall statistics.

Example

The following is sample output from the **show policy-firewall stats vrf vrf1-pmap** command:

```
Device# show policy-firewall stats vrf vrf1-pmap

VRF: vrf1, Parameter-Map: vrf1-pmap
  Interface reference count: 2
       Total Session Count(estab + half-open): 80, Exceed: 0
       Total Session Aggressive Aging Period Off, Event Count: 0

                Half Open
       Protocol Session Cnt     Exceed
       -------- -----------     ------
       All      0               0
       UDP      0               0
       ICMP     0               0
       TCP      0               0

       TCP Syn Flood Half Open Count: 0, Exceed: 116
       Half Open Aggressive Aging Period Off, Event Count: 0
```

Configuring the Aging Out of Firewall Sessions

You can configure the aging out of ICMP, TCP, or UDP firewall sessions.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **vrf** *vrf-name* **inspect** *vrf-pmap-name*
5. **exit**
6. **parameter-map type inspect** *parameter-map-name*
7. **tcp idle-time** *seconds* [**ageout-time** *seconds*]
8. **tcp synwait-time** *seconds* [**ageout-time** *seconds*]
9. **exit**
10. **policy-map type inspect** *policy-map-name*
11. **class type inspect match-any** *class-map-name*
12. **inspect** *parameter-map-name*
13. **end**
14. **show policy-firewall stats vrf** *vrf-pmap-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspectglobal`
		Configures a global parameter map and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip Step 4 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**vrf** *vrf-name* **inspect** *vrf-pmap-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds a VRF with a parameter map.
Step 5	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 6	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap1`	Configures an inspect-type parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** action and enters parameter-map type inspect configuration mode.
Step 7	**tcp idle-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp idle-time 3000 ageout-time 100`	Configures the timeout for idle TCP sessions and the aggressive aging-out time for TCP sessions. • You can also configure the **tcp finwait-time** command to specify how long a TCP session will be managed after the firewall detects a finish (FIN) exchange, or you can configure the **tcp synwait-time** command to specify how long the software will wait

	Command or Action	Purpose
		for a TCP session to reach the established state before dropping the session.
Step 8	**tcp synwait-time** *seconds* [**ageout-time** *seconds*] **Example:** `Device(config-profile)# tcp synwait-time 30 ageout-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session. • When aggressive aging is enabled, the SYN wait timer of the oldest TCP connections are reset from the default to the configured ageout time. In this example, instead of waiting for 30 seconds for connections to timeout, the timeout of the oldest TCP connections are set to 10 seconds. Aggressive aging is enabled when the connections drop below the low watermark.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ddos-fw`	Creates a protocol-specific inspect type policy map and enters QoS policy-map configuration mode.
Step 11	**class type inspect match-any** *class-map-name* **Example:** `Device(config-pmap)# class type inspect match-any ddos-class`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 12	**inspect** *parameter-map-name* **Example:** `Device(config-pmap-c)# inspect pmap1`	Enables stateful packet inspection for the parameter map.
Step 13	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.
Step 14	**show policy-firewall stats vrf** *vrf-pmap-name* **Example:** `Device# show policy-firewall stats vrf vrf1-pmap`	Displays VRF-level policy firewall statistics.

Example

The following is sample output from the **show policy-firewall stats vrf vrf1-pmap** command:

```
Device# show policy-firewall stats vrf vrf1-pmap

 VRF: vrf1, Parameter-Map: vrf1-pmap
  Interface reference count: 2
```

```
Total Session Count(estab + half-open): 270, Exceed: 0
Total Session Aggressive Aging Period Off, Event Count: 0

         Half Open
Protocol Session Cnt     Exceed
-------- -----------     ------
All      0               0
UDP      0               0
ICMP     0               0
TCP      0               0

TCP Syn Flood Half Open Count: 0, Exceed: 12
Half Open Aggressive Aging Period Off, Event Count: 0
```

Configuring Firewall Event Rate Monitoring

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-zone** *zone-pmap-name*
4. **alert on**
5. **threat-detection basic-threat**
6. **threat-detection rate fw-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second*
7. **threat-detection rate inspect-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second*
8. **threat-detection rate syn-attack average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second*
9. **exit**
10. **zone security** *security-zone-name*
11. **protection** *parameter-map-name*
12. **exit**
13. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
14. **end**
15. **show policy-firewall stats zone**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**parameter-map type inspect-zone** *zone-pmap-name* **Example:** `Device(config)# parameter-map type inspect-zone zone-pmap1`	Configures an inspect-zone parameter map and enters parameter-map type inspect configuration mode.
Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages for a zone. • You can use the **log** command to configure the logging of alerts either to the syslog or to the high-speed logger (HSL).
Step 5	**threat-detection basic-threat** **Example:** `Device(config-profile)# threat-detection basic-threat`	Configures basic threat detection for a zone.
Step 6	**threat-detection rate fw-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second* **Example:** `Device(config-profile)# threat-detection rate fw-drop average-time-frame 600 average-threshold 100 burst-threshold 100`	Configures the threat detection rate for firewall drop events. • You must configure the **threat-detection basic-threat** command before you configure the **threat-detection rate** command.
Step 7	**threat-detection rate inspect-drop average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second* **Example:** `Device(config-profile)# threat-detection rate inspect-drop average-time-frame 600 average-threshold 100 burst-threshold 100`	Configures the threat detection rate for firewall inspection-based drop events.
Step 8	**threat-detection rate syn-attack average-time-frame** *seconds* **average-threshold** *packets-per-second* **burst-threshold** *packets-per-second* **Example:** `Device(config-profile)# threat-detection rate syn-attack average-time-frame 600 average-threshold 100 burst-threshold 100`	Configures the threat detection rate for TCP SYN attack events.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**zone security** *security-zone-name* **Example:** `Device(config)# zone security public`	Creates a security zone and enters security zone configuration mode.

	Command or Action	Purpose
Step 11	**protection** *parameter-map-name* **Example:** `Device(config-sec-zone)# protection zone-pmap1`	Attaches the inspect-zone parameter map to the zone and applies the features configured in the inspect-zone parameter map to the zone.
Step 12	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 13	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security private2public source private destination public`	Creates a zone pair and enters security zone-pair configuration mode.
Step 14	**end** **Example:** `Device(config-sec-zone-pair)# end`	Exits security zone-pair configuration mode and enters privileged EXEC mode.
Step 15	**show policy-firewall stats zone** **Example:** `Device# show policy-firewall stats zone`	Displays policy firewall statistics at the zone level.

Configuring the per-Box Half-Opened Session Limit

Per-box refers to the entire firewall session table. Any configuration that follows the **parameter-map type inspect-global** command applies to the box.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
4. **alert on**
5. **per-box max-incomplete** *number*
6. **session total** *number*
7. **end**
8. **show policy-firewall stats global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable**	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: `Device> enable`	• Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, the **parameter-map type inspect-global** and the **parameter-map type inspect global** commands are supported. You cannot configure both these commands together.
		• Skip to Steps 5 and 6 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 5	**per-box max-incomplete** *number* **Example:** `Device(config-profile)# per-box max-incomplete 12345`	Configures the maximum number of half-opened connections for the firewall session table.
Step 6	**session total** *number* **Example:** `Device(config-profile)# session total 34500`	Configures the total session limit for the firewall session table.
Step 7	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 8	**show policy-firewall stats global** **Example:** `Device# show policy-firewall stats global`	Displays global firewall statistics information.

Configuring the Half-Opened Session Limit for an Inspect-VRF Parameter Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-vrf** *vrf-name*
4. **alert on**
5. **max-incomplete** *number*
6. **session total** *number*
7. **exit**
8. Enter one of the following commands:
   - **parameter-map type inspect-global**
   - **parameter-map type inspect global**
9. **alert on**
10. **vrf** *vrf-name* **inspect** *vrf-pmap-name*
11. **end**
12. **show policy-firewall stats vrf** *vrf-pmap-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-vrf** *vrf-name* **Example:** `Device(config)# parameter-map type inspect-vrf vrf1-pmap`	Configures an inspect-VRF parameter map and enters parameter-map type inspect configuration mode.
Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 5	**max-incomplete** *number* **Example:** `Device(config-profile)# max-incomplete 2000`	Configures the maximum number of half-opened connections per VRF.
Step 6	**session total** *number* **Example:**	Configures the total session limit for a VRF.

	Command or Action	Purpose
	`Device(config-profile)# session total 34500`	
Step 7	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.

Step 8	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map for connecting thresholds and timeouts and enters parameter-map type inspect configuration mode.
		• Based on your release, you can use either the **parameter-map type inspect-global** command or the **parameter-map type inspect global** command. You cannot configure both these commands together.
		• Skip Step 10 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 9	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 10	**vrf** *vrf-name* **inspect** *vrf-pmap-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds the VRF to the global parameter map.
Step 11	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.
Step 12	**show policy-firewall stats vrf** *vrf-pmap-name* **Example:** `Device# show policy-firewall stats vrf vrf1-pmap`	Displays VRF-level policy firewall statistics.

Configuring the Global TCP SYN Flood Limit

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Enter one of the following commands:

- **parameter-map type inspect-global**
- **parameter-map type inspect global**

4. **alert on**
5. **per-box tcp syn-flood limit** *number*
6. **end**
7. **show policy-firewall stats vrf global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Enter one of the following commands:
	• **parameter-map type inspect-global**
	• **parameter-map type inspect global**
	Example:
	`Device(config)# parameter-map type inspect-global`
	`Device(config)# parameter-map type inspect global`
		Configures a global parameter map and enters parameter-map type inspect configuration mode.
		• Based on your release, you can configure either the **parameter-map type inspect-global** command or the **parameter-map type inspect global** command. You cannot configure both these commands together.
		• Skip Step 5 if you configure the **parameter-map type inspect-global** command.
		Note If you configure the **parameter-map type inspect-global** command, **per-box** configurations are not supported because, by default, all **per-box** configurations apply to all firewall sessions.

Step 4	**alert on** **Example:** `Device(config-profile)# alert on`	Enables the console display of stateful packet inspection alert messages.
Step 5	**per-box tcp syn-flood limit** *number* **Example:** `Device(config-profile)# per-box tcp syn-flood limit 500`	Limits the number of TCP half-opened sessions that trigger SYN cookie processing for new SYN packets.
Step 6	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.

	Command or Action	Purpose
Step 7	**show policy-firewall stats vrf global** **Example:** `Device# show policy-firewall stats vrf global`	(Optional) Displays the status of the global VRF firewall policy. • The command output also displays how many TCP half-opened sessions are present.

Example

The following is sample output from the **show policy-firewall stats vrf global** command:

```
Device# show policy-firewall stats vrf global

Global table statistics
       total_session_cnt: 0
       exceed_cnt:        0
       tcp_half_open_cnt: 0
       syn_exceed_cnt:    0
```

Configuring Firewall Resource Management

Note A global parameter map takes effect on the global routing domain and not at the router level.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-vrf** *vrf-pmap-name*
4. **session total** *number*
5. **tcp syn-flood limit** *number*
6. **exit**
7. **parameter-map type inspect-global**
8. **vrf** *vrf-name* **inspect** *parameter-map-name*
9. **exit**
10. **parameter-map type inspect-vrf vrf-default**
11. **session total** *number*
12. **tcp syn-flood limit** *number*
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:**	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
	`Device> enable`	
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-vrf** *vrf-pmap-name* **Example:** `Device(config)# parameter-map type inspect-vrf vrf1-pmap`	Configures an inspect VRF-type parameter map and enters parameter-map type inspect configuration mode.
Step 4	**session total** *number* **Example:** `Device(config-profile)# session total 1000`	Configures the total number of sessions.
Step 5	**tcp syn-flood limit** *number* **Example:** `Device(config-profile)# tcp syn-flood limit 2000`	Limits the number of TCP half-opened sessions that trigger synchronization (SYN) cookie processing for new SYN packets.
Step 6	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 7	**parameter-map type inspect-global** **Example:** `Device(config)# parameter-map type inspect-global`	Configures a global parameter map and enters parameter-map type inspect configuration mode.
Step 8	**vrf** *vrf-name* **inspect** *parameter-map-name* **Example:** `Device(config-profile)# vrf vrf1 inspect vrf1-pmap`	Binds a VRF to the parameter map.
Step 9	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and enters global configuration mode.
Step 10	**parameter-map type inspect-vrf vrf-default** **Example:** `Device(config)# parameter-map type inspect-vrf vrf-default`	Configures a default inspect VRF-type parameter map.
Step 11	**session total** *number* **Example:** `Device(config-profile)# session total 6000`	Configures the total number of sessions. • You can configure the **session total** command for an inspect VRF-type parameter map and for a global parameter map. When you configure the **session total** command for an inspect VRF-type parameter map, the sessions are associated with an inspect VRF-type

	Command or Action	Purpose
		parameter map. The **session total** command is applied to the global routing domain when it is configured for a global parameter-map.
Step 12	**tcp syn-flood limit** *number* **Example:** `Device(config-profile)# tcp syn-flood limit 7000`	Limits the number of TCP half-opened sessions that trigger SYN cookie processing for new SYN packets.
Step 13	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.

Configuration Examples for IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management

Example: Configuring an IPv6 Firewall

```
Device# configure terminal
Device(config)# vrf-definition VRF1
Device(config-vrf)# address-family ipv6
Device(config-vrf-af)# exit-address-family
Device(config-vrf)# exit
Device(config)# parameter-map type inspect ipv6-param-map
Device(config-profile)# sessions maximum 10000
Device(config-profile)# exit
Device(config)# ipv6 unicast-routing
Device(config)# ip port-map ftp port 8090 list ipv6-acl
Device(config)# ipv6 access-list ipv6-acl
Device(config-ipv6-acl)# permit ipv6 any any
Device(config-ipv6-acl)# exit
Device(config)# class-map type inspect match-all ipv6-class
Device(config-cmap)# match access-group name ipv6-acl
Device(config-cmap)# match protocol tcp
Device(config-cmap)# exit
Device(config)# policy-map type inspect ipv6-policy
Device(config-pmap)# class type inspect ipv6-class
Device(config-pmap-c)# inspect ipv6-param-map
Device(config-pmap-c)# end
```

Example: Configuring the Aggressive Aging of Firewall Sessions

Example: Configuring per-Box Aggressive Aging

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# per-box max-incomplete 2000 aggressive-aging 1500 low 1200
Device(config-profile)# per-box aggressive-aging high 1700 low 1300
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# end
```

Example: Configuring Aggressive Aging for a Default VRF

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# max-incomplete 2000 aggressive-aging high 1500 low 1200
Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# end
```

Example: Configuring per-VRF Aggressive Aging

```
Device# configure terminal
Device(config)# ip vrf ddos-vrf1
Device(config-vrf)# rd 100:2
Device(config-vrf)# route-target export 100:2
Device(config-vrf)# route-target import 100:2
Device(config-vrf)# exit
Device(config)# parameter-map type inspect-vrf vrf1-pmap
Device(config-profile)# max-incomplete 3455 aggressive-aging high 2345 low 2255
Device(config-profile)# session total 1000 aggressive-aging high percent 80 low percent 60
Device(config-profile)# alert on
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# vrf vrf1 inspect vrf1-pmap
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp idle-time 3000 ageout-time 100
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# exit
Device(config)# policy-map type inspect ddos-fw
Device(config-pmap)# class type inspect match-any ddos-class
Device(config-pmap-c)# inspect pmap1
Device(config-profile)# end
```

Example: Configuring the Aging Out of Firewall Sessions

```
Device# configure terminal
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# vrf vrf1 inspect vrf1-pmap
```

```
Device(config-profile)# exit
Device(config)# parameter-map type inspect pmap1
Device(config-profile)# tcp idle-time 3000 ageout-time 100
Device(config-profile)# tcp synwait-time 30 ageout-time 10
Device(config-profile)# exit
Device(config)# policy-map type inspect ddos-fw
Device(config-profile)# class type inspect match-any ddos-class
Device(config-profile)# inspect pmap1
Device(config-profile)# end
```

Example: Configuring Firewall Event Rate Monitoring

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type inspect zone zone-pmap1
Device(config-profile)# alert on
Device(config-profile)# threat-detection basic-threat
Device(config-profile)# threat-detection rate fw-drop average-time-frame 600 average-threshold
 100 burst-threshold 100
Device(config-profile)# threat-detection rate inspect-drop average-time-frame 600
average-threshold 100 burst-threshold 100
Device(config-profile)# threat-detection rate syn-attack average-time-frame 600
average-threshold 100 burst-threshold 100
Device(config-profile)# exit
Device(config)# zone security public
Device(config-sec-zone)# protection zone-pmap1
Device(config-sec-zone)# exit
Device(config)# zone-pair security private2public source private destination public
Device(config-sec-zone-pair)# end
```

Example: Configuring the per-Box Half-Opened Session Limit

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# alert on
Device(config-profile)# per-box max-incomplete 12345
Device(config-profile)# session total 34500
Device(config-profile)# end
```

Example: Configuring the Half-Opened Session Limit for an Inspect VRF Parameter Map

```
Device# configure terminal
Device(config)# parameter-map type inspect vrf vrf1-pmap
Device(config-profile)# alert on
Device(config-profile)# max-incomplete 3500
Device(config-profile)# session total 34500
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# alert on
```

```
Device(config-profile)# vrf vrf1 inspect vrf1-pmap
Device(config-profile)# end
```

Example: Configuring the Global TCP SYN Flood Limit

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# alert on
Device(config-profile)# per-box tcp syn-flood limit 500
Device(config-profile)# end
```

Example: Configuring Firewall Resource Management

```
Device# configure terminal
Device(config)# parameter-map type inspect-vrf vrf1-pmap
Device(config-profile)# session total 1000
Device(config-profile)# tcp syn-flood limit 2000
Device(config-profile)# exit
Device(config)# parameter-map type inspect-global
Device(config-profile)# vrf vrf1 inspect pmap1
Device(config-profile)# exit
Device(config)# parameter-map type inspect-vrf vrf-default
Device(config-profile)# session total 6000
Device(config-profile)# tcp syn-flood limit 7000
Device(config-profile)# end
```

Feature Information for IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 190: Feature Information for IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management

Feature Name	Releases	Feature Information
IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management	Cisco IOS XE Release 3.7S	IPv6 zone-based firewalls support the Protection of Distributed Denial of Service Attacks and the Firewall Resource Management features. The Protection Against Distributed Denial of Service Attacks feature provides protection from Denial of Service (DoS) attacks at the global level (for all firewall sessions) and at the VPN routing and forwarding (VRF) level. You can configure the aggressive aging of firewall sessions, event rate monitoring of firewall sessions, half-opened connections limit, and global TCP SYN cookie protection to prevent distributed DoS attacks. The Firewall Resource Management feature limits the number of VPN routing and forwarding (VRF) instances and global firewall sessions that are configured on a device.
IPv6 Firewall Support for Prevention of Distributed Denial of Service Attacks and Resource Management	Cisco IOS XE Release 3.10S	In Cisco IOS XE Release 3.10S, support was added for Cisco CSR 1000V Series Routers.

CHAPTER 142

Configurable Number of Simultaneous Packets per Flow

In zone-based policy firewalls, the number of simultaneous packets per flow is restricted to 25 and packets that exceed the limit are dropped. The dropping of packets when the limit is reached impacts the performance of networks. The Configurable Number of Simultaneous Packets per Flow feature allows you to configure the number of simultaneous packets per flow from 25 to 100.

This modules provides an overview of the feature and explains how to configure it.

Restrictions for Configurable Number of Simultaneous Packets per Flow

- When the TCP window scale option is configured, the firewall cannot simultaneously fit too many TCP packets per flow, and packets that exceed the configured limit are dropped. The maximum window size that can be used, if the TCP window scale option is enabled, is 1 GB.

  The standard TCP window size is between 2 and 65,535 bytes. If the TCP payload size is smaller than 655 bytes, 100 simultaneous packets cannot contain all TCP packets that belong to a single TCP window, and this can result in packet drops. We recommend that you increase the TCP payload size or reduce the TCP window size to avoid packet drops.

- The total available threads in each platform varies according to the enabled license levels. If the configured number of simultaneous packets per flow is bigger than the available hardware thread number, the configuration of simultaneous packets is not effective.

Information About Configurable Number of Simultaneous Packets per Flow

Overview of Configurable Number of Simultaneous Packets per Flow

The Configurable Number of Simultaneous Packets per Flow feature allows you to increase the number of simultaneous packets per flow that can enter a network. You can increase the number of simultaneous packets per flow from 25 to 100. The default is 25 simultaneous packets.

In multithreaded environments, the zone-based policy firewall may simultaneously receive multiple packets for a single traffic flow. During packet processing, the firewall uses two types of locks: flow lock and software lock. The flow lock ensures that packets that belong to the same flow are processed in the correct order. Normal software locks are used when multiple power processing element (PPE) threads try to read or write critical sections or common data structure (for example, memory).

If the number of simultaneous packets per flow is too large, the time taken by a thread to request and acquire a lock may be too long. This latency adversely affects time-critical infrastructure such as resource reuse and heat-beat processing. To control latency, the number of simultaneous packets was restricted to 25, and packets that exceeded 25 were dropped.

However, the dropping of packets drastically impacts system performance of a system. To minimize packet dropping, the Configurable Number of Simultaneous Packets per Flow feature was introduced. You can configure the number of simultaneous packets per flow from 25 to 100.

To change the number of simultaneous packets per flow, you must configure either the **parameter-map type inspect** *parameter-map-name* command or the **parameter-map type inspect global** command, followed by the **session packet** command. The limit configured under the **parameter-map type inspect** *parameter-map-name* command takes precedence over the limit configured under the **parameter-map type inspect global** command.

The firewall considers Session Initiation Protocol (SIP) trunk traffic as a single session. However, the SIP trunk traffic contains a large number of application-layer gateway (ALG) flows of different users. When the throughput of the SIP trunk traffic is high compared to other traffic, the simultaneous packet limit causes packets to drop and users may experience call drops.

How to Configure the Number of Simultaneous Packets per Flow

Configuring Class Maps and Policy Maps for Simultaneous Packets per Flow

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect** {**match-any** | **match-all**} *class-map-name*
4. **match protocol** *protocol-name*

5. **exit**
6. **policy-map type inspect** *policy-map-name*
7. **class type inspect** *class-map-name*
8. **inspect**
9. **exit**
10. **class class-default**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode. • Enter your password if prompted.
Step 3	**class-map type inspect** {**match-any** | **match-all**} *class-map-name* **Example:** `Device(config)# class-map type inspect match-any cmap-protocols`	Creates an inspect-type class map and enters class map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol tcp`	Configures the match criteria for a class map on the basis of a specified protocol.
Step 5	**exit** **Example:** `Device(config-cmap)# exit`	Exits class map configuration mode and returns to global configuration mode.
Step 6	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect policy1`	Creates an inspect-type policy map and enters policy map configuration mode.
Step 7	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect cmap-protocols`	Specifies the traffic class on which an action is to be performed and enters policy-map class configuration mode.
Step 8	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.

	Command or Action	Purpose
Step 9	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits policy-map class configuration mode and returns to policy map configuration mode.
Step 10	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Configures or modifies a policy for the default class.
Step 11	**end** **Example:** `Device(config-pmap)# end`	Exits policy map configuration mode and returns to privileged EXEC mode.

Configuring the Number of Simultaneous Packets per Flow

You can configure the number of simultaneous packets per flow after configuring either the **parameter-map type inspect** command or the **parameter-map type inspect global** command. The number of simultaneous packets per flow configured under the **parameter-map type inspect** command overwrites the number configured under the **parameter-map type inspect global** command.

You must configure the **session packet** command to configure the number of simultaneous packets per flow.

Note You must configure either Steps 3 and 4 or Steps 6 and 7.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** *parameter-map-name*
4. **session packet** *number-of-simultaneous-packets*
5. **exit**
6. **parameter-map type inspect global**
7. **session packet** *number-of-simultaneous-packets*
8. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode.
Step 2	**configure terminal** **Example:**	Enters global configuration mode. • Enter your password if prompted.

	Command or Action	Purpose
	`Device# configure terminal`	
Step 3	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect param1`	(Optional) Defines an inspect type parameter map, which configures connection thresholds, timeouts, and other parameters pertaining to the inspect action; and enters parameter-map type inspect configuration mode.
Step 4	**session packet** *number-of-simultaneous-packets* **Example:** `Device(config-profile)# session packet 55`	(Optional) Configures the number of simultaneous traffic packets that can be configured per session. • Valid values for the *number-of-simultaneous-packets* argument are 25 to 55.
Step 5	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and returns to global configuration mode.
Step 6	**parameter-map type inspect global** **Example:** `Device(config)# parameter-map type inspect global`	(Optional) Defines a global inspect parameter map and enters parameter-map type inspect configuration mode.
Step 7	**session packet** *number-of-simultaneous-packets* **Example:** `Device(config-profile)# session packet 35`	(Optional) Configures the number of simultaneous traffic packets that can be configured per session. • Valid values for the *number-of-simultaneous-packets* argument are 25 to 55.
Step 8	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and returns to privileged EXEC mode.

Configuring Zones for Simultaneous Packets per Flow

This task shows how to configure security zones, a zone pair, and assign interfaces as zone members.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *security-zone*
4. **exit**
5. **zone security** *security-zone*
6. **exit**
7. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **zone-member security** *zone-name*

12. **exit**
13. **interface** *type number*
14. **zone-member security** *zone-name*
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *security-zone* **Example:** `Device(config)# zone security z1`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode. • You need two security zones to create a zone pair: a source zone and a destination zone.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 5	**zone security** *security-zone* **Example:** `Device(config)# zone security z2`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode. • You need two security zones to create a zone pair: a source zone and a destination zone.
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security zp-security source z1 destination z2`	Creates a zone pair and enters security zone pair configuration mode.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect policy1`	Attaches a firewall policy map to the destination zone pair. • If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 9	**exit** **Example:**	Exits security zone pair configuration mode and returns to global configuration mode.

	Command or Action	Purpose
	`Device(config-sec-zone-pair)# exit`	
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 11	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security z1`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone a part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 13	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/3`	Configures an interface and enters interface configuration mode.
Step 14	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security z2`	Assigns an interface to a specified security zone.
Step 15	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for Configurable Number of Simultaneous Packets per Flow

Example: Configuring Class Maps and Policy Maps for Simultaneous Packets per Flow

```
Device# configure terminal
Device(config)# class-map type inspect match-any cmap-protocols
Device(config-cmap)# match protocol tcp
Device(config-cmap)# exit
Device(config)# policy-map type inspect policy1
Device(config-pmap)# class type inspect cmap-protocols
```

```
Device(config-pmap-c)# inspect
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap)# end
```

Example: Configuring the Number of Simultaneous Packets per Flow

You can configure the number of simultaneous packets per flow after configuring either the **parameter-map type inspect** command or the **parameter-map type inspect global** command. The number of simultaneous packets per flow configured under the **parameter-map type inspect** command overwrites the number configured under the **parameter-map type inspect global** command.

```
Device# configure terminal
Device(config)# parameter-map type inspect param1
Device(config-profile)# session packet 55
Device(config-profile)# exit
Device(config)# parameter-map type inspect global
Device(config-profile)# session packet 35
Device(config-profile)# end
```

Example: Configuring Zones for Simultaneous Packets per Flow

```
Device# configure terminal
Device(config)# zone security z1
Device(config-sec-zone)# exit
Device(config)# zone security z2
Device(config-sec-zone)# exit
Device(config)# zone-pair security zp-security source z1 destination z2
Device(config-sec-zone-pair)# service-policy type inspect policy1
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# zone-member security z1
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/0/3
Device(config-if)# zone-member security z2
Device(config-if)# end
```

Feature Information for Configurable Number of Simultaneous Packets per Flow

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 191: Feature Information for Configurable Number of Simultaneous Packets per Flow

Feature Name	Releases	Feature Information
Configurable Number of Simultaneous Packets per Flow	Cisco IOS XE Release 3.11S	In zone-based policy firewalls, the number of simultaneous packets per flow was restricted to 25, and packets that exceeded the limit were dropped. The dropping of packets when the number is reached impacts network performance. The Configurable Number of Simultaneous Packets per Flow feature allows you to configure the number of simultaneous packets per flow from 25 to 100. In Cisco IOS XE Release 3.11S, this feature was introduced on the Cisco ASR 1000 Series Aggregation Services Routers, the Cisco 4400 Series Integrated Services Routers, and the Cisco Cloud Services Routers 1000V Series. The following commands were introduced or modified: **session packet**, **show parameter-map type inspect**, **show platform hardware qfp feature firewall datapath scb**, **show platform hardware qfp feature firewall zone-pair**, and **show platform software firewall parameter-map**.

CHAPTER 143

Firewall High-Speed Logging

The Firewall High-Speed Logging feature supports the high-speed logging (HSL) of firewall messages by using NetFlow Version 9 as the export format.

This module describes how to configure HSL for zone-based policy firewalls.

Feature Information for Firewall High-Speed Logging

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 192: Feature Information for Firewall High-Speed Logging

Feature Name	Releases	Feature Information
Firewall High-Speed Logging	Cisco IOS XE Release 2.1	The Firewall High-Speed Logging Support feature introduces support for the firewall HSL using NetFlow Version 9 as the export format. The following commands were introduced or modified: **log dropped-packet**, **log flow-export v9 udp destination**, **log flow-export template timeout-rate**, **parameter-map type inspect global**.
Configuring Zone-based Firewall using High-Speed Logging	Cisco IOS XE Gibraltar 16.11.1	In this release, support was added for the source interface. The following commands were introduced or modified: **log flow-export v9 udp destination source interface** *interface-name*

Information About Firewall High-Speed Logging

Firewall High-Speed Logging Overview

Zone-based firewalls support high-speed logging (HSL). When HSL is configured, a firewall provides a log of packets that flow through routing devices (similar to the NetFlow Version 9 records) to an external collector. Records are sent when sessions are created and destroyed. Session records contain the full 5-tuple information (the source IP address, destination IP address, source port, destination port, and protocol). A tuple is an ordered list of elements.

HSL allows a firewall to log records with minimum impact to packet processing. The firewall uses buffered mode for HSL. In buffered mode, a firewall logs records directly to the high-speed logger buffer, and exports of packets separately.

Note High-Speed Logging (HSL) cannot be routed over VASI interfaces.

Note You can configure a maximum of 4 HSL destinations in a Zone-based firewall.

A firewall logs the following types of events:

- Audit—Session creation and removal notifications.
- Alert—Half-open and maximum-open TCP session notifications.
- Drop—Packet-drop notifications.
- Pass—Packet-pass (based on the configured rate limit) notifications.
- Summary—Policy-drop and pass-summary notifications.

The NetFlow collector issues the **show platform software interface F0 brief** command to map the FW_SRC_INTF_ID and FW_DST_INTF_ID interface IDs to the interface name.

The following sample output from the **show platform software interface F0 brief** command shows that the ID column maps the interface ID to the interface name (Name column):

```
Device# show platform software interface F0 brief

Name                            ID      QFP ID
GigabitEthernet0/2/0            16         9
GigabitEthernet0/2/1            17        10
GigabitEthernet0/2/2            18        11
GigabitEthernet0/2/3            19        12
```

NetFlow Field ID Descriptions

The following table lists NetFlow field IDs used within the firewall NetFlow templates:

Table 193: NetFlow Field IDs

Field ID	Type	Length	Description
NetFlow ID Fields (Layer 3 IPv4)			
FW_SRC_ADDR_IPV4	8	4	Source IPv4 address
FW_DST_ADDR_IPV4	12	4	Destination IPv4 address
FW_SRC_ADDR_IPV6	27	16	Source IPv6 address
FW_DST_ADDR_IPV6	28	16	Destination IPv6 address
FW_PROTOCOL	4	1	IP protocol value
FW_IPV4_IDENT	54	4	IPv4 identification
FW_IP_PROTOCOL_VERSION	60	1	IP protocol version
Flow ID Fields (Layer 4)			
FW_TCP_FLAGS	6	1	TCP flags
FW_SRC_PORT	7	2	Source port
FW_DST_PORT	11	2	Destination port
FW_ICMP_TYPE	176	1	ICMP [7] type value
FW_ICMP_CODE	177	1	ICMP code value
FW_ICMP_IPV6_TYPE	178	1	ICMP Version 6 (ICMPv6) type value
FW_ICMP_IPV6_CODE	179	1	ICMPv6 code value
FW_TCP_SEQ	184	4	TCP sequence number
FW_TCP_ACK	185	4	TCP acknowledgment number
Flow ID Fields (Layer 7)			
FW_L7_PROTOCOL_ID	95	2	Layer 7 protocol ID. Identifies the Layer 7 application classification used by firewall inspection. Normal records use 2 bytes, but optional records use 4 bytes.
Flow Name Fields (Layer 7)			
FLOW_FIELD_L7_PROTOCOL_NAME	96	32	Layer 7 protocol name. Identifies the Layer 7 protocol name that corresponds to the Layer 7 protocol ID (FW_L7_PROTOCOL_ID).
Flow ID Fields (Interface)			

Field ID	Type	Length	Description
FW_SRC_INTF_ID	10	2	Ingress SNMP [8] ifIndex
FW_DST_INTF_ID	14	2	Egress SNMP ifIndex
FW_SRC_VRF_ID	234	4	Ingress (initiator) VRF [9] ID
FW_DST_VRF_ID	235	4	Egress (responder) VRF ID
FW_VRF_NAME	236	32	VRF name
Mapped Flow ID Fields (Network Address Translation)			
FW_XLATE_SRC_ADDR_IPV4	225	4	Mapped source IPv4 address
FW_XLATE_DST_ADDR_IPV4	226	4	Mapped destination IPv4 address
FW_XLATE_SRC_PORT	227	2	Mapped source port
FW_XLATE_DST_PORT	228	2	Mapped destination port
Status and Event Fields			
FW_EVENT	233	1	High level event codes • 0—Ignore (invalid) • 1—Flow created • 2—Flow deleted • 3—Flow denied • 4—Flow alert
FW_EXT_EVENT	35,001	2	Extended event code. For normal records the length is 2 byte, and 4 byte for optional records.
Timestamp and Statistics Fields			
FW_EVENT_TIME_MSEC	323	8	Time, in milliseconds, (time since 0000 hours UTC [10] January 1, 1970) when the event occurred (if the event is a microevent, use 324 and 325, if it is a nanoevent)
FW_INITIATOR_OCTETS	231	4	Total number of Layer 4 payload bytes in the packet flow that arrives from the initiator
FW_RESPONDER_OCTETS	232	4	Total number of Layer 4 payload bytes in the packet flow that arrives from the responder

Field ID	Type	Length	Description
AAA Fields			
FW_USERNAME	40,000	20 or 64 depending on the template	AAA [11] user name
FW_USERNAME_MAX	40,000	64	AAA user name of the maximum permitted size
Alert Fields			
FW_HALFOPEN_CNT	35,012	4	Half-open session entry count
FW_BLACKOUT_SECS	35,004	4	Time, in seconds, when the destination is blacked out or unavailable
FW_HALFOPEN_HIGH	35,005	4	Configured maximum rate of TCP half-open session entries logged in one minute
FW_HALFOPEN_RATE	35,006	4	Current rate of TCP half-open session entries logged in one minute
FW_MAX_SESSIONS	35,008	4	Maximum number of sessions allowed for this zone pair or class ID
Miscellaneous			
FW_ZONEPAIR_ID	35,007	4	Zone pair ID
FW_CLASS_ID	51	4	Class ID
FW_ZONEPAIR_NAME	35,009	64	Zone pair name
FW_CLASS_NAME	100	64	Class name
FW_EXT_EVENT_DESC	35,010	32	Extended event description
FLOW_FIELD_CTS_SRC_GROUP_TAG	34000	2	Cisco Trustsec source tag
FW_SUMMARY_PKT_CNT	35,011	4	Number of packets represented by the drop/pass summary record
FW_EVENT_LEVEL	33003	4	Defines the level of the logged event • 0x01—Per box • 0x02—VRF • 0x03—Zone • 0x04—Class map • Other values are undefined

Field ID	Type	Length	Description
FW_EVENT_LEVEL_ID	33,004	4	Defines the identifier for the FW_EVENT_LEVEL field • If FW_EVENT_LEVEL is 0x02 (VRF), this field represents VRF_ID. • If FW_EVENT_LEVEL is 0x03 (zone), this field represents ZONE_ID. • If FW_EVENT_LEVEL is 0x04 (class map), this field represents CLASS_ID. • In all other cases the field ID will be 0 (zero). If FW_EVENT_LEVEL is not present, the value of this field must be zero.
FW_CONFIGURED_VALUE	33,005	4	Value that represents the configured half-open, aggressive-aging, and event-rate monitoring limit. The interpretation of this field value depends on the associated FW_EXT_EVENT field.
FW_ERM_EXT_EVENT	33,006	2	Extended event-rate monitoring code
FW_ERM_EXT_EVENT_DESC	33,007	N (string)	Extended event-rate monitoring event description string

HSL Messages

The following are sample syslog messages from an Cisco ASR 1000 Series Aggregation Services Router:

Table 194: Syslog Messages and Their Templates

Message Identifier	Message Description	HSL Template
FW-6-DROP_PKT Type: Info	Dropping %s pkt from %s %CA:%u => %CA:%u (target:class)-(%s:%s) %s %s with ip ident %u %s %s Explanation: Packet dropped by firewall inspection. %s: tcp/udp/icmp/unknown prot/L7 prot %s:interface %CA:%u ip/ip6 addr: port %s:%s: zone pair name/ class name %s "due to" %s: fw_ext_event name %u ip ident %s: if tcp, tcp seq/ack number and tcp flags %s: username	FW_TEMPLATE_DROP_V4 or FW_TEMPLATE_DROP_V6

Message Identifier	Message Description	HSL Template
FW-6-SESS_AUDIT_TRAIL_START Type: Info	(target:class)-(%s:%s):Start %s session: initiator (%CA:%u) -- responder (%CA:%u) from %s %s %s Explanation: Start of an inspection session. This message is issued at the start of each inspection session and it records the source/destination addresses and ports. %s:%s: zonepair name: class name %s: l4/l7 protocolname %CA:%u ip/ip6 addr: port %s : interface %s : username %s : TODO Actual log: *Jan 21 20:13:01.078: %IOSXE-6-PLATFORM: F0: cpp_cp: CPP:00 Thread:125 TS:00000010570290947309 %FW-6-SESS_AUDIT_TRAIL_START: Start tcp session: initiator (10.1.1.1:43365) -- responder (10.3.21.1:23) from FastEthernet0/1/0	FW_TEMPLATE_START_AUDIT_V4 or FW_TEMPLATE_START_AUDIT_V6

Message Identifier	Message Description	HSL Template
FW-6-SESS_AUDIT_TRAIL Type: Info	(target:class)-(%s:%s):Stop %s session: initiator (%CA:%u) sent %u bytes -- responder (%CA:%u) sent %u bytes , from %s %s Explanation: Per-session transaction log of network activities. This message is issued at the end of each inspection session, and it records the source/destination addresses and ports, and the number of bytes transmitted by the client and the server. %s:%s: zonepair name: class name %s: l4/l7 protocolname %CA:%u ip/ip6 addr: port %u bytes counters %s: interface %s : TODO Actual log: *Jan 21 20:13:15.889: %IOSXE-6-PLATFORM: F0: cpp_cp: CPP:00 Thread:036 TS:00000010585102587819 %FW-6-SESS_AUDIT_TRAIL: Stop tcp session: initiator (10.1.1.1:43365) sent 35 bytes -- responder (11.1.1.1:23) sent 95 bytes, from FastEthernet0/1/0	FW_TEMPLATE_STOP_AUDIT_V4 or FW_TEMPLATE_STOP_AUDIT_V6
FW-4-UNBLOCK_HOST Type: Warning	(target:class)-(%s:%s):New TCP connections to host %CA no longer blocked Explanation: New TCP connection attempts to the specified host are no longer blocked. This message indicates that the blocking of new TCP connection attempts to the specified host has been removed. %s:%s: zonepair name: class name %CA: ip/ip6 addr	FW_TEMPLATE_ALERT_TCP_HALF_OPEN_V4 or FW_TEMPLATE_ALERT_TCP_HALF_OPEN_V6 with fw_ext_event id: FW_EXT_ALERT_UNBLOCK_HOST

Message Identifier	Message Description	HSL Template
FW4HOST_TCP_ALERT_ON Type: Warning	"(target:class)-(%s:%s):Max tcp half-open connections (%u) exceeded for host %CA. Explanation: Exceeded the max-incomplete host limit for half-open TCP connections. This message indicates that a high number of half-open connections is coming to a protected server, and this may indicate that a SYN flood attack is in progress. %s:%s: zonepair name: class name %u: half open cnt %CA: ip/ip6 addr	FW_TEMPLATE_ALERT_TCP_HALF_OPEN_V4 or FW_TEMPLATE_ALERT_TCP_HALF_OPEN_V6 with fw_ext_event id: FW_EXT_ALERT_HOST_TCP_ALERT_ON
FW-2-BLOCK_HOST Type: Critical	(target:class)-(%s:%s):Blocking new TCP connections to host %CA for %u minute%s (half-open count %u exceeded). Explanation: Exceeded the max-incomplete host threshold for TCP connections. Any subsequent new TCP connection attempts to the specified host is denied, and the blocking option is configured to block all subsequent new connections. The blocking will be removed when the configured block time expires. %s:%s: zonepair name: class name %CA: ip/ip6 addr %u blackout min %s: s if > 1 min blackout time %u: half open counter	FW_TEMPLATE_ALERT_TCP_HALF_OPEN_V4 or FW_TEMPLATE_ALERT_TCP_HALF_OPEN_V6 with fw_ext_event id: FW_EXT_ALERT_BLOCK_HOST

Message Identifier	Message Description	HSL Template
FW-4-ALERT_ON Type: Warning	(target:class)-(%s:%s):%s, count (%u/%u) current rate: %u Explanation : Either the max-incomplete high threshold of half-open connections or the new connection initiation rate has been exceeded. This error message indicates that an unusually high rate of new connections is coming through the firewall, and a DOS attack may be in progress. This message is issued only when the max-incomplete high threshold is crossed. %s:%s: zonepair name: class name %s: "getting aggressive" %u/%u halfopen cnt/high %u: current rate	FW_TEMPLATE_ALERT_HALFOPEN_V4 or FW_TEMPLATE_ALERT_HALFOPEN_V6: with fw_ext_event id FW_EXT_SESS_RATE_ALERT_ON
FW-4-ALERT_OFF Type: Warning	(target:class)-(%s:%s):%s, count (%u/%u) current rate: %u Explanation: Either the number of half-open connections or the new connection initiation rate has gone below the max-incomplete low threshold. This message indicates that the rate of incoming new connections has slowed down and new connections are issued only when the max-incomplete low threshold is crossed. %s:%s: zonepair name: class name %s: "calming down" %u/%u halfopen cnt/high %u: current rate	FW_TEMPLATE_ALERT_HALFOPEN_V4 or FW_TEMPLATE_ALERT_HALFOPEN_V6: with fw_ext_event id FW_EXT_SESS_RATE_ALERT_OFF

Message Identifier	Message Description	HSL Template
FW-4-SESSIONS_MAXIMUM Type: Warning	Number of sessions for the firewall policy on "(target:class)-(%s:%s) exceeds the configured sessions maximum value %u Explanation: The number of established sessions have crossed the configured sessions maximum limit. %s:%s: zonepair name: class name %u: max session	FW_TEMPLATE_ALERT_MAX_SESSION
FW-6-PASS_PKT Type: Info	Passing %s pkt from %s %CA:%u => %CA:%u (target:class)-(%s:%s) %s %s with ip ident %u Explanation: Packet is passed by firewall inspection. %s: tcp/udp/icmp/unknown prot %s:interface %CA:%u src ip/ip6 addr: port %CA:%u dst ip/ip6 addr: port %s:%s: zonepair name: class name %s %s: "due to", "PASS action found in policy-map" %u: ip ident	FW_TEMPLATE_PASS_V4 or FW_TEMPLATE_PASS_V6
FW-6-LOG_SUMMARY Type: Info	%u packet%s %s from %s %CA:%u => %CA:%u (target:class)-(%s:%s) %s Explanation : Log summary for the number of packets dropped/passed %u %s: pkt_cnt, "s were" or "was" %s: "dropped"/ "passed" %s: interface %CA:%u src ip/ip6 addr: port %CA:%u dst ip/ip6 addr: port %s:%s: zonepair name: class name %s: username	FW_TEMPLATE_SUMMARY_V4 or FW_TEMPLATE_SUMMARY_V6 with FW_EVENT: 3 - drop 4 - pass

Firewall Extended Events

The event name of the firewall extended event maps the firewall extended event value to an event ID. Use the event name option record to obtain the mapping between an event value and an event ID.

Extended events are not part of standard firewall events (inspect, pass, or drop).

The following table describes the firewall extended events applicable prior to Cisco IOS XE Release 3.9S.

Table 195: Firewall Extended Events and Event Descriptions for Releases earlier than Cisco IOS XE Release 3.9S

Value	Event ID	Description
0	FW_EXT_LOG_NONE	No specific extended event.
1	FW_EXT_ALERT_UNBLOCK_HOST	New TCP connection attempts to the specified host are no longer blocked.
2	FW_EXT_ALERT_HOST_TCP_ALERT_ON	Maximum incomplete host limit for half-open TCP connections are exceeded.
3	FW_EXT_ALERT_BLOCK_HOST	All subsequent new TCP connection attempts to the specified host are denied because the maximum incomplete host threshold of half-open TCP connections is exceeded, and the blocking option is configured to block subsequent new connections.
4	FW_EXT_SESS_RATE_ALERT_ON	Maximum incomplete high threshold of half-open connections is exceeded, or the new connection initiation rate is exceeded.
5	FW_EXT_SESS_RATE_ALERT_OFF	Number of half-open TCP connections is below the maximum incomplete low threshold, or the new connection initiation rate has gone below the maximum incomplete low threshold.
6	FW_EXT_RESET	Reset connection.
7	FW_EXT_DROP	Drop connection.
10	FW_EXT_L4_NO_NEW_SESSION	No new session is allowed.
12	FW_EXT_L4_INVALID_SEG	Invalid TCP segment.
13	FW_EXT_L4_INVALID_SEQ	Invalid TCP sequence number.
14	FW_EXT_L4_INVALID_ACK	Invalid TCP acknowledgment (ACK).
15	FW_EXT_L4_INVALID_FLAGS	Invalid TCP flags.
16	FW_EXT_L4_INVALID_CHKSM	Invalid TCP checksum.
18	FW_EXT_L4_INVALID_WINDOW_SCALE	Invalid TCP window scale.

Value	Event ID	Description
19	FW_EXT_L4_INVALID_TCP_OPTIONS	Invalid TCP options.
20	FW_EXT_L4_INVALID_HDR	Invalid Layer 4 header.
21	FW_EXT_L4_OOO_INVALID_SEG	OoO [12] invalid segment.
24	FW_EXT_L4_SYNFLOOD_DROP	Synchronized (SYN) flood packets are dropped.
25	FW_EXT_L4_SCB_CLOSED	Session is closed while receiving packets.
26	FW_EXT_L4_INTERNAL_ERR	Firewall internal error.
27	FW_EXT_L4_OOO_SEG	OoO segment.
28	FW_EXT_L4_RETRANS_INVALID_FLAGS	Invalid retransmitted packet.
29	FW_EXT_L4_SYN_IN_WIN	Invalid SYN flag.
30	FW_EXT_L4_RST_IN_WIN	Invalid reset (RST) flag.
31	FW_EXT_L4_STRAY_SEG	Stray TCP segment.
32	FW_EXT_L4_RST_TO_RESP	Sending reset message to the responder.
33	FW_EXT_L4_CLOSE_SCB	Closing a session.
34	FW_EXT_L4_ICMP_INVAL_RET	Invalid ICMP [13] packet.
37	FW_EXT_L4_MAX_HALFSESSION	Maximum half-open session limit is exceeded.
38	FW_EXT_NO_RESOURCE	Resources (memory) are not available.
40	FW_EXT_INVALID_ZONE	Invalid zone.
41	FW_EXT_NO_ZONE_PAIR	Zone pairs are not available.
42	FW_EXT_NO_TRAFFIC_ALLOWED	Traffic is not allowed.
43	FW_EXT_FRAGMENT	Packet fragments are dropped.
44	FW_EXT_PAM_DROP	PAM [14] action is dropped.
45	FW_EXT_NOT_INITIATOR	Not a session-initiating packet. Occurs due to one of the following reasons: • If the protocol is TCP, the first packet is not a SYN packet. • If the protocol is ICMP, the first packet is not an ECHO or a TIMESTAMP packet.

Value	Event ID	Description
48	FW_EXT_ICMP_ERROR_PKTS_BURST	ICMP error packets came in burst mode. In burst mode, packets are sent repeatedly without waiting for a response from the responder interface.
49	FW_EXT_ICMP_ERROR_MULTIPLE_UNREACH	More than one ICMP error of type "destination unreachable" is received.
50	FW_EXT_ICMP_ERROR_L4_INVALID_SEQ	Embedded packet in the ICMP error message has an invalid sequence number.
51	FW_EXT_ICMP_ERROR_L4_INVALID_ACK	Embedded packet in the ICMP error message has an invalid acknowledge (ACK) number.
52	FW_EXT_MAX	Never used.

[12] Out-of-Order
[13] Internet Control Message Protocol
[14] Port-to-Application Mapping

The following table describes the firewall extended events from that are applicable to Cisco IOS XE Release 3.9S and later releases.

Table 196: Firewall Extended Events and Event Descriptions for Cisco IOS XE Release 3.9S and Later Releases

Value	Event ID	Description
0	FW_EXT_LOG_NONE	No specific extended event.
1	FW_EXT_FW_DROP_L4_TYPE_INVALID_HDR	Small datagram that cannot contain the Layer 4 ICMP, TCP, or UDP headers.
2	FW_EXT_FW_DROP_L4_TYPE_INVALID_ACK_FLAG	Did not contain an ACK flag, or a RST flag was set in the SYN/ACK packet during the TCP three-way handshake and the packet had an invalid sequence number.
3	FW_EXT_FW_DROP_L4_TYPE_INVALID_ACK_NUM	Occurs due to one of the following reasons: • When a packet's ACK value is less than the connection's oldest unacknowledged sequence number. • When a packet's ACK value is greater than the connection's next sequence number. • For SYN/ACK or ACK packets received during the three-way handshake, the sequence number is not equal to the initial sequence number plus 1.

Value	Event ID	Description
4	FW_EXT_FW_DROP_L4_TYPE_INVALID _TCP_INITIATOR	The first packet of a flow was not a SYN packet.
5	FW_EXT_FW_DROP_L4_TYPE_SYN _WITH_DATA	The SYN packet contains the payload and these SYN packet is not supported.
6	FW_EXT_FW_DROP_L4_TYPE_INVALI D_TCP_WIN_SCALE_OPTION	Invalid length for the TCP window-scale option.
7	FW_EXT_FW_DROP_L4_TYPE_INVALID _SEG_SYNSENT_STATE	An invalid TCP segment was received in the SYNSENT state. Occurs due to one of the following reasons: • SYN/ACK has a payload. • SYN/ACK has other flags (push [PSH], urgent [URG], finish [FIN]) set. • Retransmit SYN message with a payload or invalid TCP flags (ACK, PSH, URG, FIN, RST) was received. • A non-SYN packet was received from the initiator.
8	FW_EXT_FW_DROP_L4_TYPE_INVALID _SEG_SYNRCVD_STATE	A retransmitted SYN packet contains a payload or received a packet from the responder.
9	FW_EXT_FW_DROP_L4_TYPE_INVALID _SEG_PKT_TOO_OLD	Packet is older (lesser than) than the receiver's current TCP window.
10	FW_EXT_FW_DROP_L4_TYPE_INVALID _SEG_PKT_WIN_OVERFLOW	The sequence number of the packet is outside (greater than) the receiver's TCP window.
11	FW_EXT_FW_DROP_L4_TYPE_INVALID _SEG_PYLD_AFTER_FIN_SEND	A packet containing a payload was received from the sender after a FIN message was received.
12	FW_EXT_FW_DROP_L4_TYPE_INVALID_FLAGS	TCP flags associated with the packet are not valid. This may occur for the following reasons: • Extra flags along with the SYN flag, are set in the initial packet. Only the SYN flag is allowed in the initial packet. • Expected SYN/ACK did not contain a SYN flag, or the SYN/ACK contained extraneous flags in the second packet of the three-way handshake.

Value	Event ID	Description
13	FW_EXT_FW_DROP_L4_TYPE_INVALID_SEQ	Invalid sequence number. Occurs due to one of the following reasons: • The sequence number is less than the ISN [15]. • The sequence number is equal to the ISN but not equal to a SYN packet. • If the receive window size is zero and the packet contains data, or if the sequence number is greater than the last ACK number. • Sequence number falls beyond the TCP window.
14	FW_EXT_FW_DROP_L4_TYPE_RETRANS _INVALID_FLAGS	A retransmitted packet was already acknowledged by the receiver.
15	FW_EXT_FW_DROP_L4_TYPE_L7_OOO _SEG	The packet contains a TCP segment that arrived prior to the expected next segment.
16	FW_EXT_FW_DROP_L4_TYPE_SYN _FLOOD_DROP	Maximum-incomplete sessions configured for the policy have been exceeded and the host is in block time.
17	FW_EXT_FW_DROP_L4_TYPE_MAX _HALFSESSION	Exceeded the number of allowed half-open sessions.
18	FW_EXT_FW_DROP_L4_TYPE_ TOO_MANY_PKTS	Exceeded the maximum number of simultaneous inspectable packets allowed per flow. The number is currently set to allow 25 simultaneous packets to be inspected. The simultaneous inspection prevents any one flow from monopolizing more than its share of processor resources.
19	FW_EXT_FW_DROP_L4_TYPE_TOO _MANY_ICMP_ERR_PKTS	Exceeded the maximum number of ICMP error packets allowed per flow. This log is triggered by the firewall base inspection.
20	FW_EXT_FW_DROP_L4_TYPE_UNEXPECT _TCP_PYLD	Retransmitted SYN/ACK from the responder included a payload. Payloads are not allowed during a TCP three-way handshake negotiation.
21	FW_EXT_FW_DROP_L4_TYPE_INTERNAL _ERR_UNDEFINED_DIR	Packet direction is undefined.

Value	Event ID	Description
22	FW_EXT_FW_DROP_L4_TYPE_SYN _IN_WIN	A TCP packet of an established session arrived with the SYN flag set. A SYN flag is not allowed after the initial two packets of the three-way handshake.
23	FW_EXT_FW_DROP_L4_TYPE_RST _IN_WIN	A TCP packet with the RST flag set was received with a sequence number that is outside the last received acknowledgment. The packet may be sent out of order.
24	FW_EXT_FW_DROP_L4_TYPE_ STRAY_SEG	An unexpected packet was received after the flow was torn down, or a packet was received from the responder before the initiator sent a valid SYN flag.
25	FW_EXT_FW_DROP_L4_TYPE_ RST_TO_RESP	A SYN/ACK flag was expected from the responder. However, a packet with an invalid sequence number was received. The zone-based firewall sent a RST flag to the responder.
26	FW_EXT_FW_DROP_L4_TYPE _I NTERNAL_ERR_ICMP_NO_NAT	The ICMP packet is NAT [16] translated; but internal NAT information is missing. An internal error.
27	FW_EXT_FW_DROP_L4_TYPE _ INTERNAL_ERR_ICMP_ALLOC_FAIL	Failed to allocate an ICMP error packet during an ICMP inspection.
28	FW_EXT_FW_DROP_L4_TYPE _INTERNAL_ERR_ICMP_GET_STAT_BLK_FAIL	The classification result did not have the required statistics memory. The policy information was not properly downloaded to the data plane.
29	FW_EXT_FW_DROP_L4_TYPE _INTERNAL_ERR_ICMP_DIR_NOT_IDENTIFIED	Packet direction is not defined.
30	FW_EXT_FW_DROP_L4_TYPE_ ICMP_SCB_CLOSE	Received an ICMP packet while the session is being torn down.
31	FW_EXT_FW_DROP_L4_TYPE_ ICMP_PKT_NO_IP_HDR	No IP header in the payload of the ICMP error packet.
32	FW_EXT_FW_DROP_L4_TYPE_ ICMP_ERROR_NO _IP_NO_ICMP	The ICMP error packet has no IP or ICMP, which is probably due to a malformed packet.
33	FW_EXT_FW_DROP_L4_TYPE_ ICMP_ERROR _PKTS_BURST	The ICMP error packet exceeded the burst limit of 10
34	FW_EXT_FW_DROP_L4_TYPE_ ICMP_ERROR _MULTIPLE_UNREACH	The ICMP error packet exceeded the “Unreachable” limit. Only the first unreachable packet is allowed to pass.

Value	Event ID	Description
35	FW_EXT_FW_DROP_L4_TYPE_ ICMP_ERROR _L4_INVALID_SEQ	The sequence number of the embedded packet does not match the sequence number of the TCP packet that triggers the ICMP error packet.
36	FW_EXT_FW_DROP_L4_TYPE_ ICMP_ERROR _L4_INVALID_ACK	The TCP packet contained in an ICMP error packet payload has an ACK flag that was not seen before.
37	FW_EXT_FW_DROP_L4_TYPE_ICMP_PKT_TOO _SHORT	The ICMP error packet length is less than the IP header length plus the ICMP header length.
38	FW_EXT_FW_DROP_L4_TYPE_ SESSION_LIMIT	Resources exceeded the session limit while promoting for an imprecise channel.
39	FW_EXT_FW_DROP_L4_TYPE_ SCB_CLOSE	A TCP packet was received on a closed session.
40	FW_EXT_FW_DROP_INSP_TYPE_ POLICY_NOT_PRESENT	A policy is not present in a zone pair.
41	FW_EXT_FW_DROP_INSP_TYPE_ SESS_MISS_POLICY _NOT_PRESENT	A zone pair is configured in the same zone, but the zone does not have any policies.
44	FW_EXT_FW_DROP_INSP_TYPE_ CLASS_ACTION_DROP	The classification action is to drop the non-ICMP, TCP, and UDP packets.
45	FW_EXT_FW_DROP_INSP_TYPE_ PAM_LOOKUP_FAIL	The classification action is to drop the PAM entry.
48	FW_EXT_FW_DROP_INSP_TYPE_ INTERNAL_ERR_ GET_STAT_BLK_FAIL	Failed to get the statistic block from the classification result bytes.
49	FW_EXT_FW_DROP_SYNCOOKIE_ TYPE_SYNCOOKIE _MAX_DST	The maximum entry limit for SYN flood packets is reached.
50	FW_EXT_FW_DROP_SYNCOOKIE_ TYPE_INTERNAL _ERR_ALLOC_FAIL	Cannot allocate memory for the destination table entry.
51	FW_EXT_FW_DROP_SYNCOOKIE_ TYPE_SYN_COOKIE _TRIGGER	The SYN cookie logic is triggered. Indicates that the SYN/ACK with the SYN cookie was sent and the original SYN packet was dropped.
52	FW_EXT_FW_DROP_POLICY_ TYPE_FRAG_DROP	The first fragment of a VFR [17] packet is dropped and all associated remaining fragments will be dropped.
53	FW_EXT_FW_DROP_POLICY_ TYPE_ACTION_DROP	The classification action is to drop the packet.

Value	Event ID	Description
54	FW_EXT_FW_DROP_POLICY_ TYPE_ICMP_ACTION_DROP	The policy action of the ICMP embedded packet is DROP.
55	FW_EXT_FW_DROP_L7_TYPE_ NO_SEG	Layer 7 ALG [18] does not inspect inspect-segmented packets.
56	FW_EXT_FW_DROP_L7_TYPE_ NO_FRAG	Layer 7 ALG does not inspect fragmented packets.
57	FW_EXT_FW_DROP_L7_TYPE_ UNKNOWN_PROTO	Unknown application protocol type.
58	FW_EXT_FW_DROP_L7_TYPE_ ALG_RET_DROP	Layer 7 ALG inspection resulted in a packet drop.
59	FW_EXT_FW_DROP_NONSESSION _TYPE	Session creation has failed.
60	FW_EXT_FW_DROP_NO_NEW _SESSION_TYPE	During initial HA [19] states, a new session is not allowed.
61	FW_EXT_FW_DROP_NOT_ INITIATOR_TYPE	Not a session initiator packet.
62	FW_EXT_FW_DROP_INVALID _ZONE_TYPE	When default zones are not enabled, traffic is only allowed between interfaces that are associated with security zones.
64	FW_EXT_FW_DROP_NO_ FORWARDING_TYPE	The firewall is not configured.
65	FW_EXT_FW_DROP_ BACKPRESSURE_TYPE	The firewall backpressure can be enabled if HSL [20] is enabled, and the HSL logger was unable to send a log message. Backpressure will remain enabled until HSL is able to send a log.
66	FW_EXT_FW_DROP_L4_TYPE_INTERNAL _ERR _SYNFLOOD_ALLOC_HOSTDB_FAIL	During SYN processing, host rate limits are tracked. The host entry could not be allocated.
67	FW_EXT_FW_DROP_L4_TYPE_ SYNFLOOD_BLACKOUT_DROP	If the configured half-open connection limit is exceeded and blackout time is configured, all new connections to the specified IP address are dropped.
68	FW_EXT_FW_DROP_L7_TYPE_ PROMOTE_FAIL_NO_ZONE_PAIR	A failed policy. When an ALG attempts to promote a session because no zone pairs are configured, the policy fails.
69	FW_EXT_FW_DROP_L7_TYPE_ PROMOTE_FAIL_NO_POLICY	A failed policy. When an ALG attempts to promote a session due to no policy, the policy fails.

Value	Event ID	Description
	FW_EXT_FW_DROP_L4_TYPE_ONEFW _SCB_CLOSE	A packet is received after the Context-Aware firewall (CXSC) requested a teardown.
	FW_EXT_FW_DROP_L4_TYPE_ONEFW _FAIL_CLOSE	CXSC is not running.

How to Configure Firewall High-Speed Logging

Enabling High-Speed Logging for Global Parameter Maps

By default, high-speed logging (HSL) is not enabled and firewall logs are sent to a logger buffer located in the Route Processor (RP) or the console. When HSL is enabled, logs are sent to an off-box, high-speed log collector. Parameter maps provide a means of performing actions on the traffic that reaches a firewall and a global parameter map applies to the entire firewall session table. Perform this task to enable high-speed logging for global parameter maps.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect global**
4. **log dropped-packets**
5. **log flow-export v9 udp destination** *ip-address port-number*
6. **log flow-export template timeout-rate** *seconds*
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**parameter-map type inspect global** **Example:** `Device(config)# parameter-map type inspect global`	Configures a global parameter map and enters parameter-map type inspect configuration mode.
Step 4	**log dropped-packets** **Example:** `Device(config-profile)# log dropped-packets`	Enables dropped-packet logging.
Step 5	**log flow-export v9 udp destination** *ip-address port-number* **Example:** `Device(config-profile)# log flow-export v9 udp destination 10.0.2.0 5000`	Enables NetFlow event logging and provides the IP address and the port number of the log collector.
Step 6	**log flow-export template timeout-rate** *seconds* **Example:** `Device(config-profile) log flow-export template timeout-rate 5000`	Specifies the template timeout value.
Step 7	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and returns to privileged EXEC mode.

Enabling High-Speed Logging for Firewall Actions

Perform this task enable high-speed logging if you have configured inspect-type parameter maps. Parameter maps specify inspection behavior for the firewall and inspection parameter-maps for the firewall are configured as the inspect type.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** *parameter-map-name*
4. **audit-trail on**
5. **alert on**
6. **one-minute** {**low** *number-of-connections* | **high** *number-of-connections*}
7. **tcp max-incomplete host** *threshold*
8. **exit**
9. **policy-map type inspect** *policy-map-name*
10. **class type inspect** *class-map-name*
11. **inspect** *parameter-map-name*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect parameter-map-hsl`	Configures an inspect parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** keyword, and enters parameter-map type inspect configuration mode.
Step 4	**audit-trail on** **Example:** `Device(config-profile)# audit-trail on`	Enables audit trail messages. • You can enable audit-trail to a parameter map to record the start, stop, and duration of a connection or session, and the source and destination IP addresses.
Step 5	**alert on** **Example:** `Device(config-profile)# alert on`	Enables stateful-packet inspection alert messages that are displayed on the console.
Step 6	**one-minute** {**low** *number-of-connections* | **high** *number-of-connections*} **Example:** `Device(config-profile)# one-minute high 10000`	Defines the number of new unestablished sessions that cause the system to start deleting half-open sessions and stop deleting half-open sessions.
Step 7	**tcp max-incomplete host** *threshold* **Example:** `Device(config-profile)# tcp max-incomplete host 100`	Specifies the threshold and blocking time values for TCP host-specific, denial of service (DoS) detection and prevention.
Step 8	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and returns to global configuration mode.
Step 9	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect policy-map-hsl`	Creates an inspect-type policy map and enters policy map configuration mode.
Step 10	**class type inspect** *class-map-name* **Example:**	Specifies the traffic class on which an action is to be performed and enters policy-map class configuration mode.

	Command or Action	Purpose
	`Device(config-pmap)# class type inspect class-map-tcp`	
Step 11	**inspect** *parameter-map-name* **Example:** `Device(config-pmap-c)# inspect parameter-map-hsl`	(Optional) Enables stateful packet inspection.
Step 12	**end** **Example:** `Device(config-pmap-c)# end`	Exits policy-map class configuration mode and returns to privileged EXEC mode.

Configuration Examples for Firewall High-Speed Logging

Example: Enabling High-Speed Logging for Global Parameter Maps

The following example shows how to enable logging of dropped packets, and to log error messages in NetFlow Version 9 format to an external IP address:

```
Device# configure terminal
Device(config)# parameter-map type inspect global
Device(config-profile)# log dropped-packets
Device(config-profile)# log flow-export v9 udp destination 10.0.2.0 5000
Device(config-profile)# log flow-export template timeout-rate 5000
Device(config-profile)# end
```

Example: Enabling High-Speed Logging for Firewall Actions

The following example shows how to configure high-speed logging (HSL) for inspect-type parameter-map parameter-map-hsl.

```
Device# configure terminal
Device(config)# parameter-map type inspect parameter-map-hsl
Device(config-profile)# audit trail on
Device(config-profile)# alert on
Device(config-profile)# one-minute high 10000
Device(config-profile)# tcp max-incomplete host 100
Device(config-profile)# exit
Device(config)# poliy-map type inspect policy-map-hsl
Device(config-pmap)# class type inspect class-map-tcp
Device(config-pmap-c)# inspect parameter-map-hsl
Device(config-pmap-c)# end
```

CHAPTER 144

TCP Reset Segment Control

The TCP Reset Segment Control feature provides a mechanism to configure if a TCP reset (RST) segment should be sent when a session deletion occurs for half-close, half-open, or idle sessions.

Information about TCP Reset Segment Control

TCP Reset Segment Control

The TCP header contains a flag known as the reset (RST) flag. A TCP segment is sent with the RST flag whenever a segment arrives that does not meet the criteria for a referenced connection. For example, a TCP segment is sent with a RST flag when a connection request is received on the destination port, but no process is listening at that port.

This behavior is defined in RFC 793, Transmission Control Protocol, for host-to-host communication and implemented by various vendors. However, for the network devices that reside on the network between hosts, specific rules have not been defined to determine if the device should send the TCP RST segment to the connection initiator, receiver, or both when sessions (half-open, idle, half-close) are cleared. Some devices send the TCP RST segment to both sender and receiver ports when a session is cleared, while some devices silently remove the session in the session table without sending out any TCP RST segments.

The TCP Reset Segment Control feature provides a mechanism to configure if a TCP RST segment should be sent when a session is cleared for half-close, half-open, or idle sessions.

A half-open session is an unestablished session initiated by a TCP synchronization (SYN) segment but is incomplete as only a TCP three-way handshake occurs and a timer is started.

TCP provides the ability for one end of a connection to terminate its output while still receiving data from the other end of the connection. This TCP state is called the half-close state. A session enters the half-close state when it receives the first TCP FIN segment and starts a timer. If another segment is received before the session timeout occurs, then the timer is restarted.

You can set the timeout value for half-open and half-close sessions by using the **tcp synwait-time** and **tcp finwait-time** commands respectively. The default timeout value is 30 seconds.

An idle session is a TCP session that is active between two devices and no data is transmitted by either of the devices for a prolonged period of time. You can set the timeout value for an idle session by using the **tcp idle-time** command. The default timeout value for idle sessions is 3600 seconds.

Once the timeout occurs on the TCP sessions and the session is cleared, the TCP RST segment is sent and the session will be reset only if the TCP reset segment control is configured on the sessions.

How to Configure TCP Reset Segment Control

Configuring TCP Reset for Half-Open Sessions

A half-open session is an unestablished session that is initiated by a TCP synchronization (SYN) segment but has an incomplete three-way handshake. A timer is started as soon as the incomplete three-way handshake occurs. You can set the timer values for a half-open session timeout by using the **tcp synwait-time** command. The default timeout value for these sessions is 30 seconds.

When the timeout occurs and the session is cleared on the half-open TCP session, the TCP reset (RST) segment is sent and the session will be reset only if the TCP reset segment control is configured on the sessions.

If you configure the **tcp half-open reset on** command, the TCP RST segment is sent to both ends of the half-open session when the session is cleared. If you configure the **tcp half-open reset off** command, the TCP RST segment is not transmitted when the session is cleared.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** *parameter-map-name*
4. **tcp synwait-time** *seconds*
5. **tcp half-open reset** {**off** | **on**}
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap-name`	(Optional) Configures an inspect parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** keyword and enters parameter-map type inspect configuration mode.

	Command or Action	Purpose
Step 4	**tcp synwait-time** *seconds* **Example:** `Device(config-profile)# tcp synwait-time 10`	Specifies how long the software will wait for a TCP session to reach the established state before dropping the session.
Step 5	**tcp half-open reset** {**off** | **on**} **Example:** `Device(config-profile)# tcp half-open reset on`	Specifies whether the TCP RST segment should be sent when timeout occurs and the session is cleared for a half-open session.
Step 6	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.

Configuring TCP Reset for Half-Close Sessions

TCP provides the ability for one end of a connection to terminate its output, while still receiving data from the other end of the connection. This TCP state is called the half-close state. A session enters the half-close state when it receives the first TCP finish (FIN) segment and starts a timer. If another segment is received before the session timeout occurs, then the timer is restarted. You can set the timeout value for a half-close session by using the **tcp finwait-time** command. The default timeout value for half-close sessions is 30 seconds.

Once the timeout occurs on the half-close TCP session, the TCP RST segment is sent and the session will be reset only if the TCP reset segment control is configured on the sessions.

If you configure the **tcp half-close reset on** command, the TCP RST segment is sent to both ends of the half-open session when timeout occurs and the session is cleared. If you configure the **tcp half-close reset off** command, the TCP RST segment is not transmitted when the session timeout occurs and the session is cleared.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** *parameter-map-name*
4. **tcp finwait-time** *seconds*
5. **tcp half-close reset** {**off** | **on**}
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap-name`	Configures an inspect parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** keyword and enters parameter-map type inspect configuration mode.
Step 4	**tcp finwait-time** *seconds* **Example:** `Device(config-profile)# tcp finwait-time 10`	(Optional) Specifies how long a TCP session will be managed after the firewall detects a FIN-exchange.
Step 5	**tcp half-close reset** {**off** | **on**} **Example:** `Device(config-profile)# tcp half-close reset on`	Specifies whether the TCP RST segment should be sent when session deletion occurs on a half-open session.
Step 6	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.

Configuring TCP Reset for Idle Sessions

An idle session is a TCP session that is active between two devices and no data is transmitted by either device for a prolonged period of time. You can set the timeout value for an idle session by using the **tcp idle-time** command. The default timeout value for idle sessions is 3600 seconds.

Once the timeout occurs on the idle TCP session, the TCP RST segment is sent and the session will be reset if the TCP reset segment control is configured on the session.

If you configure the **tcp idle reset on** command, the TCP RST segment is sent to both ends of the idle session when timeout occurs and the session is cleared. If you configure the **tcp idle reset off** command, the TCP RST segment is not transmitted when the session timeout occurs and the session is cleared.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** *parameter-map-name*
4. **tcp idle-time** *seconds*
5. **tcp idle reset** {**off** | **on**}
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect** *parameter-map-name* **Example:** `Device(config)# parameter-map type inspect pmap-name`	Configures an inspect parameter map for connecting thresholds, timeouts, and other parameters pertaining to the **inspect** keyword and enters parameter-map type inspect configuration mode.
Step 4	**tcp idle-time** *seconds* **Example:** `Device(config-profile)# tcp idle-time 90`	(Optional) Configures the timeout for TCP sessions.
Step 5	**tcp idle reset** {**off** | **on**} **Example:** `Device(config-profile)# tcp idle reset on`	Specifies whether the TCP RST segment should be sent when session deletion occurs on an idle session.
Step 6	**end** **Example:** `Device(config-profile)# end`	Exits parameter-map type inspect configuration mode and enters privileged EXEC mode.

Configuration Examples for TCP Reset Segment Control

Example: Configuring TCP Reset for Half-Open Sessions

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type inspect pmap-name
Device(config-profile)# tcp synwait-time 10
Device(config-profile)# tcp half-open reset on
Device(config-profile)# end
```

Example: Configuring TCP Reset for Half-Close Sessions

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type inspect pmap-name
```

```
Device(config-profile)# tcp finwait-time 10
Device(config-profile)# tcp half-close reset on
Device(config-profile)# end
```

Example: Configuring TCP Reset for Idle Sessions

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type inspect pmap-name
Device(config-profile)# tcp idle-time 90
Device(config-profile)# tcp idle reset on
Device(config-profile)# end
```

Feature Information for TCP Reset Segment Control

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 197: Feature Information for TCP Reset Segment Control

Feature Name	Releases	Feature Information
TCP Reset Segment Control	Cisco IOS XE Release 3.8S	The TCP Reset Segment Control feature provides a consistent mechanism to configure if the TCP RST bits should be sent out when a session is cleared for half-open, half-close, and idle sessions. The following commands were introduced or modified: **tcp idle reset**, **tcp half-close reset**, and **tcp half-open reset**.

CHAPTER 145

Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall

The Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall feature disables the strict checking of the TCP window-scaling option in a firewall.

Information About Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall

Loose Checking Option for TCP Window Scaling Overview

TCP provides various TCP extensions to improve performance over high-bandwidth and high-speed data paths. One such extension is the TCP window-scaling option. The loose-checking option for TCP window-scaling turns off strict checking of the window-scaling option described in RFC 1323.

A larger window size is recommended to improve TCP performance in network paths with large bandwidth-delay product characteristics that are called Long Fat Networks (LFNs). TCP window scaling expands the definition of the TCP window to 32 bits and then uses a scale factor to carry this 32-bit value in the 16-bit window field of the TCP header. The window size can increase to a scale factor of 14. Typical applications use a scale factor of 3 when deployed in LFNs.

A firewall implementation enforces strict checking of the TCP window-scaling option. A firewall drops SYN/ACK packets that have the TCP window-scaling option if it was not offered in the initial synchronization (SYN) packet for the TCP three-way handshake. The window-scale option is sent only in a SYN segment, which is a segment with the SYN bit on. Therefore, the window scale is fixed in each direction when a connection is opened.

Use the **tcp window-scale-enforcement loose** command to disable the strict checking of the TCP window-scaling option in TCP SYN segments.

How to Configure Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall

Configuring the TCP Window-Scaling Option for a Firewall

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect** {*parameter-map-name* | **global** | **default**}
4. **tcp window-scale-enforcement loose**
5. **exit**
6. **class-map type inspect** {**match-any** | **match-all**} *class-map-name*
7. **match protocol** [*parameter-map*] [**signature**]
8. **exit**
9. **policy-map type inspect** *policy-map-name*
10. **class type inspect** *class-map-name*
11. **inspect** [*parameter-map-name*]
12. **exit**
13. **class** *name*
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect** {*parameter-map-name*	**global**	**default**} **Example:** `Device(config)# parameter-map type inspect pmap-fw`	Configures an inspect parameter map and enters profile configuration mode.
Step 4	**tcp window-scale-enforcement loose** **Example:**	Disables the strict checking of the TCP window-scaling option in a firewall.

	Command or Action	Purpose
	`Device(config-profile)# tcp window-scale-enforcement loose`	
Step 5	**exit** **Example:** `Device(config-profile)# exit`	Exits profile configuration mode and returns to global configuration mode.
Step 6	**class-map type inspect** {**match-any** | **match-all**} *class-map-name* **Example:** `Device(config)# class-map type inspect match-any internet-traffic-class`	Creates an inspect-type class map and enters QoS class-map configuration mode.
Step 7	**match protocol** [*parameter-map*] [**signature**] **Example:** `Device(config-cmap)# match protocol tcp`	Configures a match criteria for a class map on the basis of the specified protocol.
Step 8	**exit** **Example:** `Device(config-cmap)# exit`	Exits the QoS class-map configuration mode and returns to global configuration mode.
Step 9	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect private-internet-policy`	Creates an inspect-type policy map and enters QoS policy-map configuration mode.
Step 10	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect internet-traffic-class`	Specifies the traffic class on which an action is to be performed and enters policy-map class configuration mode.
Step 11	**inspect** [*parameter-map-name*] **Example:** `Device(config-pmap-c)# inspect pmap-fw`	Enables stateful packet inspection.
Step 12	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and returns to QoS policy-map configuration mode.
Step 13	**class** *name* **Example:** `Device(config-pmap)# class class-default`	Associates the map class with a specified data-link connection identifier (DLCI).
Step 14	**end** **Example:** `Device(config-pmap)# end`	Exits QoS policy-map configuration mode and returns to privileged EXEC mode.

Configuring a Zone and Zone Pair for a TCP Window Scaling

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip address** *ip-address*
5. **zone-member security** *security-zone-name*
6. **exit**
7. **interface** *type number*
8. **ip address** *ip-address*
9. **zone-member security** *security-zone-name*
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 0/1/5`	Specifies an interface and enters interface configuration mode.
Step 4	**ip address** *ip-address* **Example:** `Device(config-if)# ip address 10.1.1.1 255.255.255.0`	Assigns an interface IP address.
Step 5	**zone-member security** *security-zone-name* **Example:** `Device(config-if)# zone-member security private`	Configures the interface as a zone member.
Step 6	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 7	**interface** *type number* **Example:** `Device(config)# interface GigabitEthernet 0/1/6`	Specifies an interface and enters interface configuration mode.

	Command or Action	Purpose
Step 8	**ip address** *ip-address* **Example:** `Device(config-if)# ip address 209.165.200.225 255.255.255.0`	Assigns an IP address to an interface.
Step 9	**zone-member security** *security-zone-name* **Example:** `Device(config-if)# zone-member security internet`	Configures an interface as a zone member.
Step 10	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for TCP Window-Scaling

Example: Configuring the TCP Window-Scaling Option for a Firewall

```
Device> enable
Device# configure terminal
Device(config)# parameter-map type inspect pmap-fw
Device(config-profile)# tcp window-scale-enforcement loose
Device(config-profile)# exit
Device(config)# class-map type inspect match-any internet-traffic-class
Device(config-cmap)# match protocol tcp
Device(config-cmap)# exit
Device(config)# policy-map type inspect private-internet-policy
Device(config-pmap)# class type inspect internet-traffic-class
Device(config-pmap-c)# inspect pmap-fw
Device(config-pmap-c)#exit
Device(config-pmap)# class class-default
Device(config-pmap)#end
```

Example: Configuring a Zone and Zone Pair for TCP Window Scaling

```
Device# enable
Device# configure terminal
Device(config)# interface GigabitEthernet 0/1/5
Device(config-if)# ip address 10.1.1.1 255.255.255.0
Device(config-if)# zone-member security private
Device(config-if)# exit
Device(config)# interface GigabitEthernet 0/1/6
Device(config-if)# ip address 209.165.200.225 255.255.255.0
Device(config-if)# zone-member security internet
Device(config-if)# end
```

Feature Information for Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 198: Feature Information for Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall

Feature Name	Releases	Feature Information
Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall	Cisco IOS XE Release 3.10S	Loose Checking Option for TCP Window Scaling in Zone-Based Policy Firewall feature disables the strict checking of the TCP Window Scaling option in an IOS-XE firewall. The following command was introduced or modified: **tcp window-scale-enforcement loose**. In Cisco IOS XE Release 3.10S, support was added for the Cisco CSR 1000V Series Routers.

CHAPTER 146

Enabling ALGs and AICs in Zone-Based Policy Firewalls

Zone-based policy firewalls support Layer 7 application protocol inspection along with application-level gateways (ALGs) and application inspection and control (AIC). Layer 7 application protocol inspection helps to verify the protocol behavior and identify unwanted or malicious traffic that passes through a security module.

Prior to the introduction of Enabling ALGs and AICs in Zone-Based Policy Firewalls feature, the Layer 7 protocol inspection was automatically enabled along with the ALG/AIC configuration. With this feature you can enable or disable Layer 7 inspection by using the **no application-inspect** command.

This module provides an overview of the Enabling ALGs and AICs in Zone-Based Policy Firewalls feature and describes how to configure it.

Information About Enabling ALGs and AICs in Zone-Based Policy Firewalls

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.
- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

Enabling Layer 7 Application Protocol Inspection Overview

Zone-based policy firewalls support Layer 7 protocol inspection along with application-level gateways (ALG) and application inspection and control (AIC). Layer 7 protocol inspection is automatically enabled along with the ALG/AIC configuration.

Layer 7 application protocol inspection is a technique that interprets or understands application-layer protocols and performs appropriate firewall or Network Address Translation (NAT) action. Certain applications require special handling of the data portion of a packet when the packet passes through the security module on a device. Layer 7 application protocol inspection helps to verify the protocol behavior and identify unwanted or malicious traffic that passes through the security module. Based on the configured traffic policy, the security module accepts or rejects packets to ensure the secure use of applications and services.

Sometimes, application inspection implementation issues can cause application packet drop and make networks unstable. Prior to the introduction of the Enabling ALGs and AICs in Zone-Based Policy Firewall feature, to disable application inspection you had to define an access control list (ACL) with the target Layer 7 protocol port define a class map that matches this ACL and matches either the TCP or UDP protocol to bypass the inspection for a specific Layer 7 protocol.

With the introduction of the Enabling ALGs and AICs in Zone-Based Policy Firewall feature, you can enable or disable Layer 7 protocol inspection for a specific protocol or for all supported Layer 7 protocols with the **application-inspect** command. Any configuration changes to a parameter map applies only to new sessions. For example, when you disable FTP Layer 7 inspection, the newly created sessions skip FTP Layer 7 inspection, while existing sessions before the configuration change will perform FTP Layer 7 inspection. For all sessions to perform the configuration change, you must delete all sessions and re-create them.

You can enable Layer 7 application protocol inspection for an individual parameter map or for a global firewall.

How to Enable ALGs and AICs in Zone-Based Policy Firewalls

Enabling Layer 7 Application Protocol Inspection on Firewalls

Application protocol inspection is enabled by default. Use the **no application-inspect** command to disable application protocol inspection.

Use the **application-inspect** command to reconfigure application protocol inspection, if you have disabled it for any reason. Configure either the **parameter-map type inspect** command or the **parameter-map type inspect-global** command before configuring the **application-inspect** command.

You can only configure either the **parameter-map type inspect** command or the **parameter-map type inspect-global** command at any time.

Use the

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. Do one of the following:
   - **parameter-map type inspect** *parameter-map-name*
   - **parameter-map type inspect-global**
4. **application-inspect** {**all** | *protocol-name*}
5. **exit**
6. **class-map type inspect** {**match-all** | **match-any**} *class-map-name*
7. **match protocol** *protocol-name*
8. **exit**
9. **policy-map type inspect** *policy-map-name*
10. **class type inspect** {*class-map-name* | **class-default**}
11. **inspect** *parameter-map-name*
12. **exit**
13. **class** {*class-map-name* | **class-default**}
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Do one of the following:
	• **parameter-map type inspect** *parameter-map-name*
	• **parameter-map type inspect-global**
	Example:
	`Device(config)# parameter-map type inspect pmap-fw`
	or
	`Device(config)# parameter-map type inspect-global`
		• (Optional) Enables an inspect-type parameter map for the firewall to connect thresholds, timeouts, and other parameters that pertain to the inspect action, and enters parameter-map type inspect configuration mode.
		• (Optional) Enables a global parameter map and enters parameter-map type inspect configuration mode.

Step 4	**application-inspect** {**all**	*protocol-name*} **Example:** `Device(config-profile)# application-inspect msrpc`	Enables application inspection for the specified protocols.
Step 5	**exit** **Example:** `Device(config-profile)# exit`	Exits parameter-map type inspect configuration mode and returns to global configuration mode.

	Command or Action	Purpose
Step 6	**class-map type inspect** {**match-all** | **match-any**} *class-map-name* **Example:** `Device(config)# class-map type inspect match-any internet-traffic-class`	Creates an inspect type class map and enters class map configuration mode.
Step 7	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol msrpc`	Configures a match criterion for a class map based on the specified protocol.
Step 8	**exit** **Example:** `Device(config-cmap)# exit`	Exits class map configuration mode and returns to global configuration mode.
Step 9	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect private-internet-policy`	Creates an inspect type policy map and enters policy map configuration mode.
Step 10	**class type inspect** {*class-map-name* | **class-default**} **Example:** `Device(config-pmap)# class type inspect internet-traffic-class`	Specifies the traffic class on which an action is to be performed and enters policy-map class configuration mode.
Step 11	**inspect** *parameter-map-name* **Example:** `Device(config-pmap-c)# inspect pmap-fw`	Enables stateful packet inspection.
Step 12	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits policy-map class configuration mode and returns to policy map configuration mode.
Step 13	**class** {*class-map-name* | **class-default**} **Example:** `Device(config-pmap)# class class-default`	Specifies the default class so that you can configure or modify the policy.
Step 14	**end** **Example:** `Device(config-pmap)# end`	Exits policy map configuration mode and returns to privileged EXEC mode.

Configuring Zones for Enabling Layer 7 Application Protocol Inspection

SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **zone security** {**default** | *security-zone*}
4. **exit**
5. **zone security** {**default** | *security-zone*}
6. **exit**
7. **zone-pair security** *zone-pair* **source** *source-zone* **destination** *destination-zone*
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **zone-member security** *security-zone*
12. **exit**
13. **interface** *type number*
14. **zone-member security** *security-zone*
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** {**default**	*security-zone*} **Example:** `Device(config)# zone security private`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode. • You need two security zones to create a zone pair: a source and a destination zone.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 5	**zone security** {**default**	*security-zone*} **Example:** `Device(config)# zone security internet`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.

	Command or Action	Purpose
Step 7	**zone-pair security** *zone-pair* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security private-internet source private destination internet`	Creates a zone pair and enters security zone pair configuration mode.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect private-internet-policy`	Attaches a firewall policy map to the destination zone pair. • If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 9	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone pair configuration mode and returns to global configuration mode.
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 11	**zone-member security** *security-zone* **Example:** `Device(config-if)# zone-member security private`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 13	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/2/2`	Configures an interface and enters interface configuration mode.
Step 14	**zone-member security** *security-zone* **Example:** `Device(config-if)# zone-member security internet`	Assigns an interface to a specified security zone.
Step 15	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for Enabling ALGs and AICs in Zone-Based Policy Firewalls

Example: Enabling Layer 7 Application Protocol Inspection on Firewalls

The following example shows how to enable Layer 7 application protocol inspection after configuring the **parameter-map type inspect** command. You can enable application inspection after configuring the **parameter-map type inspect-global** command also.

You can only configure either the **parameter-map type inspect** or the **parameter-map type inspect-global** command at any time.

```
Device# configure terminal
Device(config)# parameter-map type inspect pmap-fw
Device(config-profile)# application-inspect msrpc
Device(config-profile)# exit
Device(config)# class-map type inspect match-any internet-traffic-class
Device(config-cmap)# match protocol msrpc
Device(config-cmap)# exit
Device(config)# policy-map type inspect private-internet-policy
Device(config-pmap)# class type inspect internet-traffic-class
Device(config-pmap-c)# inspect pmap-fw
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap)# end
```

Example: Configuring Zones for Enabling Layer 7 Application Protocol Inspection

```
Device# configure terminal
Device(config)# zone security private
Device(config-sec-zone)# exit
Device(config)# zone security internet
Device(config-sec-zone)# exit
Device(config)# zone-pair security private-internet source private destination internet
Device(config-sec-zone-pair)# service-policy type inspect private-internet-policy
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# zone-member security private
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/2/2
Device(config-if)# zone-member security internet
Device(config-if)# end
```

Feature Information for Enabling ALGs and AICs in Zone-Based Policy Firewalls

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 199: Feature Information for Enabling ALGs and AICs in Zone-Based Policy Firewalls

Feature Name	Releases	Feature Information
Enabling ALGs and AICs in Zone-Based Policy Firewalls	Cisco IOS XE Release 3.11S	Zone-based policy firewalls support Layer 7 application protocol inspection along with application-level gateways (ALGs) and application inspection and control (AIC). Layer 7 application protocol inspection helps to verify the protocol behavior and identify unwanted or malicious traffic that passes through security module. Prior to the introduction of Enabling ALGs and AICs in Zone-Based Policy Firewalls feature, the Layer 7protocol inspection was automatically enabled along with the ALG/AIC configuration. With this feature you can enable or disable Layer 7 inspection by using the no application-inspect command. In Cisco IOS XE Release 3.11S, this feature was introduced on Cisco ASR 1000 Series Aggregation Services Routers, Cisco 4400 Series Integrated Services Routers, and Cisco Cloud Services Routers 1000V. The following commands were introduced or modified: **application-inspect**, **show parameter-map type inspect**, and **show platform software firewall**.

CHAPTER 147

Configuring Firewall TCP SYN Cookie

The Firewall TCP SYN Cookie feature protects your firewall from TCP SYN-flooding attacks. TCP SYN-flooding attacks are a type of denial-of-service (DoS) attack. Usually, TCP synchronization (SYN) packets are sent to a targeted end host or a range of subnet addresses behind the firewall. These TCP SYN packets have spoofed source IP addresses. A spoofing attack is when a person or a program pretends to be another by falsifying data and thereby gaining an illegitimate advantage. TCP SYN-flooding can take up all resources on a firewall or an end host, thereby causing DoS to legitimate traffic. To prevent TCP SYN-flooding on a firewall and the end hosts behind the firewall, you must configure the Firewall TCP SYN Cookie feature.

Restrictions for Configuring Firewall TCP SYN Cookie

- Because a default zone does not support zone type parameter map, you cannot configure the Firewall TCP SYN Cookie feature for a default zone.
- The Firewall TCP SYN Cookie feature does not support per-subscriber firewall.

Information About Configuring Firewall TCP SYN Cookie

TCP SYN Flood Attacks

The Firewall TCP SYN Cookie feature implements software to protect the firewall from TCP SYN-flooding attacks, which are a type of DoS attack.

A SYN-flooding attack occurs when a hacker floods a server with a barrage of requests for connection. Because these messages have unreachable return addresses, the connections cannot be established. The resulting volume of unresolved open connections eventually overwhelms the server and can cause it to deny service to valid requests, thereby preventing legitimate users from connecting to a website, accessing e-mail, using FTP service, and so on.

SYN flood attacks are divided into two types:

- Host flood—SYN flood packets are sent to a single host aiming to utilize all resources on that host.
- Firewall session table flood—SYN flood packets are sent to a range of addresses behind the firewall, with the aim of exhausting the session table resources on the firewall and thereby denying resources to the legitimate traffic going through the firewall.

The Firewall TCP SYN Cookie feature helps prevent SYN-flooding attacks by intercepting and validating TCP connection requests. The firewall intercepts TCP SYN packets that are sent from clients to servers. When the TCP SYN cookie is triggered, it acts on all SYN packets that are destined to the configured VPN Routing and Forwarding (VRF) or zone. The TCP SYN cookie establishes a connection with the client on behalf of the destination server and another connection with the server on behalf of the client and knits together the two half-connections transparently. Thus, connection attempts from unreachable hosts will never reach the server. The TCP SYN cookie intercepts and forwards packets throughout the duration of the connection.

The Firewall TCP SYN Cookie feature provides session table SYN flood protection for the global routing domain and for the VRF domain. Because the firewall saves sessions in a global table, you can configure a limit to the number of TCP half-opened sessions. A TCP half-opened session is a session that has not reached the established state. In a VRF-aware firewall, you can configure a limit to the number of TCP half-opened sessions for each VRF. At both the global level and at the VRF level, when the configured limit is reached, the TCP SYN cookie verifies the source of the half-opened sessions before creating more sessions.

How to Configure Firewall TCP SYN Cookie

Configuring Firewall Host Protection

TCP SYN packets are sent to a single host with the aim of taking over all resources on the host. You can configure host protection only for the source zone. Configuring protection on the destination zone will not protect the destination zone from TCP SYN attacks.

Perform this task to configure the firewall host protection.

Note You can specify the **show** commands in any order.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-zone** *zone-pmap-name*
4. **tcp syn-flood rate per-destination** *maximum-rate*
5. **max-destination** *limit*
6. **exit**
7. **zone security** *zone-name*
8. **protection** *parameter-map-name*
9. **exit**
10. **show parameter-map type inspect-zone** *zone-pmap-name*

11. **show zone security**
12. **show policy-firewall stats zone** *zone-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-zone** *zone-pmap-name* **Example:** `Router(config)# parameter-map type inspect-zone zone-pmap`	Configures an inspect zone type parameter map and enters profile configuration mode.
Step 4	**tcp syn-flood rate per-destination** *maximum-rate* **Example:** `Router(config-profile)# tcp syn-flood rate per-destination 400`	Configures the number of SYN flood packets per second for each destination address. • If the rate of SYN packets sent to a particular destination address exceeds the per-destination limit, the firewall starts processing SYN cookies for SYN packets that are routed to the destination address.
Step 5	**max-destination** *limit* **Example:** `Router(config-profile)# max-destination 10000`	Configures the maximum number of destinations that the firewall can track for a zone. • The firewall drops the SYN packets if the maximum destination crosses the limit that is configured by using the *limit* argument.
Step 6	**exit** **Example:** `Router(config-profile)# exit`	Exits profile configuration mode and enters global configuration mode.
Step 7	**zone security** *zone-name* **Example:** `Router(config)# zone security secure-zone`	Configures a security zone and enters security zone configuration mode.
Step 8	**protection** *parameter-map-name* **Example:**	Configures protection for the specified zone using the parameter map.

	Command or Action	Purpose
	`Router(config-sec-zone)# protection zone-pmap`	
Step 9	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration and enters privileged EXEC mode.
Step 10	**show parameter-map type inspect-zone** *zone-pmap-name* **Example:** `Router# show parameter-map type inspect-zone zone-pmap`	(Optional) Displays details about the inspect zone type parameter map.
Step 11	**show zone security** **Example:** `Router# show zone security`	(Optional) Displays zone security information.
Step 12	**show policy-firewall stats zone** *zone-name* **Example:** `Router# show policy-firewall stats zone secure-zone`	(Optional) Displays how many SYN packets exceeded the packet limit and were processed by SYN cookies.

Configuring Firewall Session Table Protection

TCP SYN packets are sent to a range of addresses behind the firewall aiming to exhaust the session table resources on the firewall, thereby denying resources to the legitimate traffic going through the firewall. You can configure firewall session table protection either for the global routing domain or for the VRF domain.

Configuring Firewall Session Table Protection for Global Routing Domain

Perform this task to configure firewall session table protection for global routing domains.

Note A global parameter map takes effect on the global routing domain and not at the router level.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect global**
4. **tcp syn-flood limit** *number*
5. **end**
6. **show policy-firewall stats vrf global**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect global** **Example:** `Router(config)# parameter-map type inspect global`	Configures a global parameter map and enters profile configuration mode.
Step 4	**tcp syn-flood limit** *number* **Example:** `Router(config-profile)# tcp syn-flood limit 500`	Limits the number of TCP half-open sessions that triggers SYN cookie processing for new SYN packets.
Step 5	**end** **Example:** `Router(config-profile)# end`	Exits profile configuration mode and enters privileged EXEC mode.
Step 6	**show policy-firewall stats vrf global** **Example:** `Router# show policy-firewall stats vrf global`	(Optional) Displays the status of the global VRF firewall policy. • The command output also displays how many TCP half-open sessions are present.

Configuring Firewall Session Table Protection for VRF Domain

Perform this task to configure the firewall session table protection for VRF domains.

Note You can specify the **show** commands in any order.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **parameter-map type inspect-vrf** *vrf-pmap-name*
4. **tcp syn-flood limit** *number*
5. **exit**

6. **parameter-map type inspect global**
7. **vrf** *vrf-name* **inspect** *parameter-map-name*
8. **end**
9. **show parameter-map type inspect-vrf**
10. **show policy-firewall stats vrf** *vrf-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**parameter-map type inspect-vrf** *vrf-pmap-name* **Example:** `Router(config)# parameter-map type inspect-vrf vrf-pmap`	Configures an inspect-VRF type parameter map and enters profile configuration mode.
Step 4	**tcp syn-flood limit** *number* **Example:** `Router(config-profile)# tcp syn-flood limit 200`	Limits the number of TCP half-open sessions that triggers SYN cookie processing for new SYN packets.
Step 5	**exit** **Example:** `Router(config-profile)# exit`	Exits profile configuration mode and enters global configuration mode.
Step 6	**parameter-map type inspect global** **Example:** `Router(config)# parameter-map type inspect global`	Binds the inspect-VRF type parameter map to a VRF and enters profile configuration mode.
Step 7	**vrf** *vrf-name* **inspect** *parameter-map-name* **Example:** `Router(config-profile)# vrf vrf1 inspect vrf-pmap`	Binds the parameter map to the VRF.
Step 8	**end** **Example:**	Exits profile configuration mode and enters privileged EXEC mode.

	Command or Action	Purpose
	`Router(config-profile)# end`	
Step 9	**show parameter-map type inspect-vrf** **Example:** `Router# show parameter-map type inspect-vrf`	(Optional) Displays information about inspect VRF type parameter map.
Step 10	**show policy-firewall stats vrf** *vrf-name* **Example:** `Router# show policy-firewall stats vrf vrf-pmap`	(Optional) Displays the status of the VRF firewall policy. • The command output also displays how many TCP half-open sessions are present.

Configuration Examples for Firewall TCP SYN Cookie

Example Configuring Firewall Host Protection

The following example shows how to configure the firewall host protection:

```
Router(config)# parameter-map type inspect-zone zone-pmap
Router(config-profile)# tcp syn-flood rate per-destination 400
Router(config-profile)# max-destination 10000
Router(config-profile)# exit
Router(config)# zone security secure-zone
Router(config-sec-zone)# protection zone-pmap
```

Example Configuring Firewall Session Table Protection

Global Parameter Map

The following example shows how to configure firewall session table protection for global routing domains:

```
Router# configure terminal
Router(config)# parameter-map type inspect global
Router(config-profile)# tcp syn-flood limit 500
```

```
Router(config-profile)# end
```

Inspect-VRF Type Parameter Map

The following example shows how to configure firewall session table protection for VRF domains:

```
Router# configure terminal

Router(config)# parameter-map type inspect-vrf vrf-pmap

Router(config-profile)# tcp syn-flood limit 200

Router(config-profile)# exit

Router(config)# parameter-map type inspect global

Router(config-profile)# vrf vrf1 inspect vrf-pmap

Router(config-profile)# end
```

Feature Information for Configuring Firewall TCP SYN Cookie

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 200: Feature Information for Configuring Firewall TCP SYN Cookie

Feature Name	Releases	Feature Information
Firewall TCP SYN Cookie	Cisco IOS XE Release 3.3S	The Firewall TCP SYN Cookie feature protects your firewall from TCP SYN-flooding attacks. TCP SYN-flooding attacks are a type of DoS attack. Usually, TCP SYN packets are sent to a targeted end host or a range of subnet addresses behind the firewall. These TCP SYN packets have spoofed source IP addresses. A spoofing attack is when a person or a program pretends to be another by falsifying data and thereby gaining an illegitimate advantage. The TCP SYN-flooding can take up all the resource on a firewall or an end host, thereby causing DoS to legitimate traffic. To prevent TCP SYN-flooding on a firewall and the end hosts behind the firewall, you must configure the Firewall TCP SYN Cookie feature. The following commands were introduced or modified: **parameter-map type inspect-vrf**, **parameter-map type inspect-zone**, **parameter-map type inspect global**, **show policy-firewall stats**, **tcp syn-flood rate per-destination**, **tcp syn-flood limit**.

CHAPTER 148

Object Groups for ACLs

The Object Groups for ACLs feature lets you classify users, devices, or protocols into groups and apply these groups to access control lists (ACLs) to create access control policies for these groups. This feature lets you use object groups instead of individual IP addresses, protocols, and ports, which are used in conventional ACLs. This feature allows multiple access control entries (ACEs). You can use each ACE to allow an entire group of users to access a group of servers or services or to deny them access; thereby reducing the size of an ACL and improving manageability.

This module describes object-group ACLs with zone-based policy firewalls and how to configure them for zone-based firewalls.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Object Groups for ACLs

The following restrictions apply to the Object Groups for ACLs feature on zone-based firewalls:

- IPv6 is not supported.
- Dynamic and per-user access control lists (ACLs) are not supported.
- You cannot remove an object group or make an object group empty if it is used in an ACL.

- ACL statements using object groups will be ignored on packets that are sent to RP for processing.
- Object groups are supported only for IP extended ACLs.

Information About Object Groups for ACLs

Overview of Object Groups for ACLs

In large networks, the number of lines in an access control list (ACL) can be large (hundreds of lines) and difficult to configure and manage, especially if the ACLs frequently change. Object group-based ACLs are smaller, more readable, and easier to configure and manage. Object-group-based ACLs simplify static ACL deployments for large user access environments on Cisco IOS routers. The zone-based firewall benefits from object groups, because object groups simplify policy creation (for example, group A has access to group A services).

You can configure conventional access control entries (ACEs) and ACEs that refer to object groups in the same ACL. You can use object-group-based ACLs with quality of service (QoS) match criteria, zone-based policy firewall, Dynamic Host Configuration Protocol (DHCP), and any other features that use extended ACLs.

In addition, you can use object-group-based ACLs with multicast traffic. When there are many inbound and outbound packets, using object group-based ACLs increases performance compared to conventional ACLs. Also, in large configurations, this feature reduces the storage required in NVRAM, because you need not define an individual ACE for every address and protocol pairing.

Integration of Zone-Based Firewalls with Object Groups

Zone-based firewalls use object-group access control lists (ACLs) to apply policies to specific traffic. You define an object-group ACL, associate it with a zone-based firewall policy, and apply the policy to a zone pair to inspect the traffic.

In Cisco IOS XE Release 3.12S, only expanded object-group ACLs are supported with firewalls.

The following features work with object groups that are configured on a firewall:

- Static and dynamic network address translation (NAT)
- Service NAT (NAT that supports non-standard FTP port numbers configured by the **ip nat service** command)
- FTP application layer gateway (ALG)
- Session Initiation Protocol (SIP) ALG

In a class map, you can configure a maximum of 64 matching statements using the **match access-group** command.

Objects Allowed in Network Object Groups

A network object group is a group of any of the following objects:

- IPv6 address
- Host IPv6 addresses

- Other network object groups
- Subnets

Objects Allowed in Service Object Groups

A service object group is a group of any of the following objects:

- Source and destination protocol ports (such as Telnet or Simple Network Management Protocol [SNMP])
- Internet Control Message Protocol (ICMP) types (such as echo, echo-reply, or unreachables)
- Top-level protocols (such as Encapsulating Security Payload [ESP], TCP, or UDP)
- Other service object groups

ACLs Based on Object Groups

All features that use or reference conventional access control lists (ACLs) are compatible with object-group-based ACLs, and the feature interactions for conventional ACLs are the same with object-group-based ACLs. This feature extends the conventional ACLs to support object-group-based ACLs and also adds new keywords and the source and destination addresses and ports.

You can add, delete, or change objects in an object group membership list dynamically (without deleting and redefining the object group). Also, you can add, delete, or change objects in an object group membership list without redefining the ACL access control entry (ACE) that uses the object group. You can add objects to groups, delete them from groups, and then ensure that changes are correctly functioning within the object-group-based ACL without reapplying the ACL to the interface.

You can configure an object-group-based ACL multiple times with a source group only, a destination group only, or both source and destination groups.

You cannot delete an object group that is used within an ACL or a class-based policy language (CPL) policy.

Guidelines for Object Group ACLs

- Object groups must have unique names. For example, to create a network object group named “Engineering” and a service object group named “Engineering,” you must add an identifier (or tag) to at least one object group name to make it unique. For example, you can use the names “Engineering-admins” and “Engineering-hosts” to make the object group names unique and to make it easier for identification.
- Additional objects can be added to an existing object group. After adding an object group, you can add more objects as required for the same group name. You do not need to re-enter existing objects; the previous configuration remains in place until the object group is removed.
- Different objects can be grouped together. For example, objects such as hosts, protocols, or services can be grouped together and configured under the same group name. Network objects can be defined only under a network group, and service objects can be defined only under a service group.
- When you define a group with the **object-group** command and use any security appliance command, the command applies to every item in that group. This feature can significantly reduce your configuration size.

- If an ACL that is associated with a class-map for ZBF inspections includes object-groups, when you add entries to or remove entries from the ACL, the changes take effect only after you exit the access-list configuration prompt.

How to Configure Object Groups for ACLs

To configure object groups for ACLs, you first create one or more object groups. These can be any combination of network object groups (groups that contain objects such as, host addresses and network addresses) or service object groups (which use operators such as **lt**, **eq**, **gt**, **neq**, and **range** with port numbers). Then, you create access control entries (ACEs) that apply a policy (such as **permit** or **deny**) to those object groups.

Creating a Network Object Group

A network object group that contains a single object (such as a single IP address, a hostname, another network object group, or a subnet) or multiple objects with a network object-group-based ACL to create access control policies for the objects.

Perform this task to create a network object group.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **object-group network** *object-group-name*
4. **description** *description-text*
5. **host** {*host-address* | *host-name*}
6. *network-address* {*/nn* | *network-mask*}
7. **group-object** *nested-object-group-name*
8. Repeat the steps until you have specified objects on which you want to base your object group.
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**object-group network** *object-group-name* **Example:**	Defines the object group name and enters network object-group configuration mode.

	Command or Action	Purpose
	`Device(config)# object-group network my-network-object-group`	
Step 4	**description** *description-text* **Example:** `Device(config-network-group)# description test engineers`	(Optional) Specifies a description of the object group. • You can use up to 200 characters.
Step 5	**host** {*host-address* | *host-name*} **Example:** `Device(config-network-group)# host 209.165.200.237`	(Optional) Specifies the IP address or name of a host. • If you specify a host address, you must use an IPv4 address.
Step 6	*network-address* {*/nn* | *network-mask*} **Example:** `Device(config-network-group)# 209.165.200.225 255.255.255.224`	(Optional) Specifies a subnet object. • You must specify an IPv4 address for the network address. The default network mask is 255.255.255.255.
Step 7	**group-object** *nested-object-group-name* **Example:** `Device(config-network-group)# group-object my-nested-object-group`	(Optional) Specifies a nested (child) object group to be included in the current (parent) object group. • The type of child object group must match that of the parent (for example, if you are creating a network object group, you must specify another network object group as the child). • You can use duplicated objects in an object group only via nesting of group objects. For example, if object 1 is in both group A and group B, you can define a group C that includes both A and B. However, you cannot include a group object that causes the group hierarchy to become circular (for example, you cannot include group A in group B and then also include group B in group A). • You can use an unlimited number of levels of nested object groups (however, a maximum of two levels is recommended).
Step 8	Repeat the steps until you have specified objects on which you want to base your object group.	—
Step 9	**end** **Example:** `Device(config-network-group)# end`	Exits network object-group configuration mode and returns to privileged EXEC mode.

Creating a Service Object Group

Use a service object group to specify TCP and/or UDP ports or port ranges. When the service object group is associated with an access control list (ACL), this service object-group-based ACL can control access to ports.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **object-group service** *object-group-name*
4. **description** *description-text*
5. *protocol*
6. {**tcp** | **udp** | **tcp-udp**} [**source** {{[**eq**] | **lt** | **gt**} *port1* | **range** *port1 port2*}] [{[**eq**] | **lt** | **gt**} *port1* | **range** *port1 port2*]
7. **icmp** *icmp-type*
8. **group-object** *nested-object-group-name*
9. Repeat the steps to specify the objects on which you want to base your object group.
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**object-group service** *object-group-name* **Example:** `Device(config)# object-group service my-service-object-group`	Defines an object group name and enters service object-group configuration mode.
Step 4	**description** *description-text* **Example:** `Device(config-service-group)# description test engineers`	(Optional) Specifies a description of the object group. • You can use up to 200 characters.
Step 5	*protocol* **Example:**	(Optional) Specifies an IP protocol number or name.

	Command or Action	Purpose
	`Device(config-service-group)# ahp`	
Step 6	{**tcp** | **udp** | **tcp-udp**} [**source** {{[**eq**] | **lt** | **gt**} *port1* | **range** *port1 port2*}] [{[**eq**] | **lt** | **gt**} *port1* | **range** *port1 port2*] **Example:** `Device(config-service-group)# tcp-udp range 2000 2005`	(Optional) Specifies TCP, UDP, or both.
Step 7	**icmp** *icmp-type* **Example:** `Device(config-service-group)# icmp conversion-error`	(Optional) Specifies the decimal number or name of an Internet Control Message Protocol (ICMP) type.
Step 8	**group-object** *nested-object-group-name* **Example:** `Device(config-service-group)# group-object my-nested-object-group`	(Optional) Specifies a nested (child) object group to be included in the current (parent) object group. • The type of child object group must match that of the parent (for example, if you are creating a network object group, you must specify another network object group as the child). • You can use duplicated objects in an object group only via nesting of group objects. For example, if object 1 is in both group A and group B, you can define a group C that includes both A and B. However, you cannot include a group object that causes the group hierarchy to become circular (for example, you cannot include group A in group B and then also include group B in group A). • You can use an unlimited number of levels of nested object groups (however, a maximum of two levels is recommended).
Step 9	Repeat the steps to specify the objects on which you want to base your object group.	—
Step 10	**end** **Example:** `Device(config-service-group)# end`	Exits service object-group configuration mode and returns to privileged EXEC mode.

Creating an Object-Group-Based ACL

When creating an object-group-based access control list (ACL), configure an ACL that references one or more object groups. As with conventional ACLs, you can associate the same access policy with one or more interfaces.

You can define multiple access control entries (ACEs) that reference object groups within the same object-group-based ACL. You can also reuse a specific object group in multiple ACEs.

Perform this task to create an object-group-based ACL.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended** *access-list-name*
4. **remark** *remark*
5. **deny** *protocol source* [*source-wildcard*] *destination* [*destination-wildcard*] [**option** *option-name*] [**precedence** *precedence*] [**tos** *tos*] [**established**] [**log** | **log-input**] [**time-range** *time-range-name*] [**fragments**]
6. **remark** *remark*
7. **permit** *protocol source* [*source-wildcard*] *destination* [*destination-wildcard*] [**option** *option-name*] [**precedence** *precedence*] [**tos** *tos*] [**established**] [**log** | **log-input**] [**time-range** *time-range-name*] [**fragments**]
8. Repeat the steps to specify the fields and values on which you want to base your access list.
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ip access-list extended** *access-list-name* **Example:** `Device(config)# ip access-list extended nomarketing`	Defines an extended IP access list using a name and enters extended access-list configuration mode.
Step 4	**remark** *remark* **Example:** `Device(config-ext-nacl)# remark protect server by denying access from the Marketing network`	(Optional) Adds a comment about the configured access list entry. • A remark can precede or follow an access list entry. • In this example, the remark reminds the network administrator that the subsequent entry denies the Marketing network access to the interface.
Step 5	**deny** *protocol source* [*source-wildcard*] *destination* [*destination-wildcard*] [**option** *option-name*] [**precedence**	(Optional) Denies any packet that matches all conditions specified in the statement.

	Command or Action	Purpose

	precedence] [**tos** *tos*] [**established**] [**log** | **log-input**] [**time-range** *time-range-name*] [**fragments**]
	Example:
	`Device(config-ext-nacl)# deny ip 209.165.200.244 255.255.255.224 host 209.165.200.245 log`
	`Example based on object-group:`
	`Router(config)#object-group network my_network_object_group`
	`Router(config-network-group)#209.165.200.224 255.255.255.224`
	`Router(config-network-group)#exit`
	`Router(config)#object-group network my_other_network_object_group`
	`Router(config-network-group)#host 209.165.200.245`
	`Router(config-network-group)#exit`
	`Router(config)#ip access-list extended nomarketing`
	`Router(config-ext-nacl)#deny ip object-group my_network_object_group object-group my_other_network_object_group log`
		• Optionally use the **object-group** *service-object-group-name* keyword and argument as a substitute for the *protocol.* argument
		• Optionally use the **object-group** *source-network-object-group-name* keyword and argument as a substitute for the *source source-wildcard.* arguments
		• Optionally use the **object-group** *destination-network-object-group-name* keyword and argument as a substitute for the *destination destination-wildcard.* arguments
		• If the *source-wildcard* or *destination-wildcard*is omitted, a wildcard mask of 0.0.0.0 is assumed, which matches all bits of the source or destination address, respectively.
		• Optionally use the **any** keyword as a substitute for the *source source-wildcard* or *destination destination-wildcard* to specify the address and wildcard of 0.0.0.0 255.255.255.255.
		• Optionally use the **host** *source* keyword and argument to indicate a source and source wildcard of *source* 0.0.0.0 or the **host** *destination* keyword and argument to indicate a destination and destination wildcard of *destination* 0.0.0.0.
		• In this example, packets from all sources are denied access to the destination network 209.165.200.244. Logging messages about packets permitted or denied by the access list are sent to the facility configured by the **logging facility** command (for example, console, terminal, or syslog). That is, any packet that matches the access list will cause an informational logging message about the packet to be sent to the configured facility. The level of messages logged to the console is controlled by the **logging console** command.
		•

Step 6	**remark** *remark* **Example:** `Device(config-ext-nacl)# remark allow TCP from any source to any destination`	(Optional) Adds a comment about the configured access list entry. • A remark can precede or follow an access list entry.
Step 7	**permit** *protocol source* [*source-wildcard*] *destination* [*destination-wildcard*] [**option** *option-name*] [**precedence**	Permits any packet that matches all conditions specified in the statement.

	Command or Action	Purpose
	precedence] [**tos** *tos*] [**established**] [**log** | **log-input**] [**time-range** *time-range-name*] [**fragments**] **Example:** `Device(config-ext-nacl)# permit tcp any any`	• Every access list needs at least one permit statement. • Optionally use the **object-group** *service-object-group-name* keyword and argument as a substitute for the *protocol.* • Optionally use the **object-group** *source-network-object-group-name* keyword and argument as a substitute for the *source source-wildcard.* • Optionally use the **object-group** *destination-network-object-group-name* keyword and argument as a substitute for the *destination destination-wildcard.* • If *source-wildcard* or *destination-wildcard* is omitted, a wildcard mask of 0.0.0.0 is assumed, which matches on all bits of the source or destination address, respectively. • Optionally use the **any**keyword as a substitute for the *source source-wildcard* or *destination destination-wildcard* to specify the address and wildcard of 0.0.0.0 255.255.255.255. • In this example, TCP packets are allowed from any source to any destination. • Use the **log-input** keyword to include input interface, source MAC address, or virtual circuit in the logging output.
Step 8	Repeat the steps to specify the fields and values on which you want to base your access list.	Remember that all sources not specifically permitted are denied by an implicit **deny** statement at the end of the access list.
Step 9	**end** **Example:** `Device(config-ext-nacl)# end`	Exits extended access-list configuration mode and returns to privileged EXEC mode.

Configuring Class Maps and Policy Maps for Object Groups

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-all** *class-map-name*
4. **match access-group name** *access-list-name*

5. **exit**
6. **policy-map type inspect** *policy-map-name*
7. **class type inspect** *class-map-name*
8. **pass**
9. **exit**
10. **class class-default**
11. **drop**
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-all** *class-map-name* **Example:** `Device(config)# class-map type inspect match-all ogacl-cmap`	Creates a Layer 3 and Layer 4 inspect type class map and enters the class-map configuration mode.
Step 4	**match access-group name** *access-list-name* **Example:** `Device(config-cmap)# match access-group name my-ogacl-policy`	Configures a match criterion for a class map on the basis of the specified ACL.
Step 5	**exit** **Example:** `Device(config-cmap)# exit`	Exits class-map configuration mode and returns to global configuration mode.
Step 6	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect ogacl-pmap`	Creates a inspect-type policy map and enters policy-map configuration mode.
Step 7	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect ogacl-cmap`	Specifies the traffic class on which an action is to be performed and enters policy-map class configuration mode.
Step 8	**pass** **Example:** `Device(config-pmap-c)# pass`	Allows packets to be sent to a device without being inspected.

	Command or Action	Purpose
Step 9	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits policy-map class configuration mode and returns to policy-map configuration mode.
Step 10	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Specifies the default class to configure or modify a policy and enters policy-map class configuration mode.
Step 11	**drop** **Example:** `Device(config-pmap-c)# drop`	Drops packets that are sent to a device.
Step 12	**end** **Example:** `Device(config-pmap-c)# end`	Exits policy-map class configuration mode and returns to privileged EXEC mode.

Configuring Zones for Object Groups

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *zone-name*
4. **exit**
5. **zone security** *zone-name*
6. **exit**
7. **interface** *type number*
8. **zone-member security** *zone-name*
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**zone security** *zone-name* **Example:** `Device(config)# zone security outside`	Creates a security zone and enters security zone configuration mode. • You need two security zones to create a zone pair: a source zone and a destination zone
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 5	**zone security** *zone-name* **Example:** `Device(config)# zone security inside`	Creates a security zone and enters security zone configuration mode. • You need two security zones to create a zone pair: a source zone and a destination zone
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 7	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 8	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security inside`	Attaches an interface to a security zone.
Step 9	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to global configuration mode.

Applying Policy Maps to Zone Pairs for Object Groups

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone-pair security** *zone-pair-name* **source** {*zone-name* | **default** | **self**} **destination** {*zone-name* | **default** | **self**}
4. **service-policy type inspect** *policy-map-name*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone-pair security** *zone-pair-name* **source** {*zone-name* | **default** | **self**} **destination** {*zone-name* | **default** | **self**} **Example:** `Device(config)# zone-pair security out-to-in source outside destination inside`	Creates a zone pair and enters security zone-pair configuration mode.
Step 4	**service-policy type inspect** *policy-map-name* **Example:** `Device(conf-sec-zone-pair)# service-policy type inspect ogacl-pmap`	Attaches a firewall policy map to a security zone pair.
Step 5	**end** **Example:** `Device(config-sec-zone-pair)# end`	Exits security zone-pair configuration mode and returns to global configuration mode.

Verifying Object Groups for ACLs

SUMMARY STEPS

1. **enable**
2. **show object-group** [*object-group-name*]
3. **show ip access-list** [*access-list-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**show object-group** [*object-group-name*] **Example:** `Device# show object-group my-object-group`	Displays the configuration in the named or numbered object group (or in all object groups if no name is entered).

	Command or Action	Purpose
Step 3	**show ip access-list** [*access-list-name*] **Example:** `Device# show ip access-list my-ogacl-policy`	Displays the contents of the named or numbered access list or object group-based ACL (or for all access lists and object group-based ACLs if no name is entered).

Configuration Examples for Object Groups for ACLs

Example: Creating an IPv6 Network Object Group

The following example shows how to create an IPv6 network object group named v6-network ognet1:

```
Device> enable
Device# configure terminal
Device(config)# object-group v6-network ognet1
Device(config-v6-network-group)# 1:1:2::0/32
Device(config-v6-network-group)# host AB:233::23D5
Device(config-v6-network-group)# exit
```

The following example shows how to create a network object group named v6-network ognet2, which contains a host, a subnet, and an existing object group (child) as objects:

```
Device> enable
Device# configure terminal
Device(config)# object-group network v6-network ognet2
Device(config-v6network-group)# 1:2:3::4/36
Device(config-v6network-group)# host AABB::CCDD
Device(config-v6network-group)# group-object ognet1
Device(config-v6network-group)# exit
```

Example: Creating a IPv6 Service Object Group

The following example shows how to create a service object group named v6-service ogserv1, which contains several ICMP, TCP, UDP, and TCP-UDP protocols as objects:

```
Device> enable
Device# configure terminal
Device(config)# object-group service v6-service ogserv1
Device(config-v6service-group)# icmp unreachable
Device(config-v6service-group)# tcp smtp
Device(config-v6service-group)# tcp telnet
Device(config-v6service-group)# tcp source range 3000 4000 telnet
Device(config-v6service-group)# pcp
Device(config-v6service-group)# udp domain
Device(config-v6service-group)# hph
Device(config-v6service-group)# exit
```

Example: Creating an IPv6 Object Group-Based ACL

The following example shows how to create an IPv6 object-group-based ACL that permits packets:

```
Device> enable
Device# configure terminal
Device(config)# ipv6 access-list ogacl1
Device(config-ipv6-acl)# permit object-group ogserv1 5:6:7::5/56 object-group ognet1
Device(config-ipv6-acl)# deny ip object-group ognet2 object-group ognet3
Device(config-ipv6-acl)# permit ipv6 any any
Device(config-ipv6-acl)# exit
```

Example: Configuring Class Maps and Policy Maps for Object Groups

```
Device# configure terminal
Device(config)# class-map type inspect match-all ogacl-cmap
Device(config-cmap)# match access-group name my-ogacl-policy
Device(config-cmap)# exit
Device(config)# policy-map type inspect ogacl-pmap
Device(config-pmap)# class type inspect ogacl-cmap
Device(config-pmap-c)# pass
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap-c)# drop
Device(config-pmap-c)# end
```

Example: Configuring Zones for Object Groups

```
Device# configure terminal
Device(config)# zone security outside
Device(config-sec-zone)# exit
Device(config)# zone security inside
Device(config-sec-zone)# exit
Device(config)# zone-pair security out-to-in source outside destination inside
Device(conf-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/1/1
Device(config-if)# zone-member security inside
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/1/0
Device(config-if)# zone-member security outside
Device(config-if)# end
```

Example: Applying Policy Maps to Zone Pairs for Object Groups

```
Device# configure terminal
Device(config)# zone-pair security out-to-in source outside destination inside
Device(config-sec-zone-pair)# service-policy type inspect ogacl-pmap
Device(config-sec-zone-pair)# end
```

Example: Verifying IPv6 Object Groups for ACLs

The following example shows how to display all object groups:

```
Device# show object-group

V6-Network object group ognet1
1:1:2::/32
host AB:233::23D5
V6-Network object group ognet2
1:2:3::4/36
host AABB::CCDD
group-object ognet1
V6-Network object group ognet3
host 1::1
host 1::2
host 1::3
V6-Service object group ogserv1
icmp unreachable
tcp source range 3000 4000 eq telnet
pcp
hbh
```

The following example shows how to display information about IPv6 object-group-based ACL:

```
Device# show ipv6 access-list
IPv6 access list ogacl1
      permit object-group ogserv1 5:6:7::/56 object-group ognet1 sequence 10
      deny ipv6 object-group ognet2 object-group ognet3 sequence 20
      permit ipv6 any any sequence 30
```

Description	Link
The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for IPv6 Object Groups for ACLs

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 201: Feature Information for Object Groups for ACLs

Feature Name	Releases	Feature Information
IPv6 Object Groups for ACLs	Cisco IOS XE Release 16.11.1	The IPv6 Object Groups for ACLs feature lets you classify users, devices, or protocols into groups and apply them to access control lists (ACLs) to create access control policies for those groups. This feature lets you use object groups instead of individual IP addresses, protocols, and ports, which are used in conventional ACLs. This feature allows multiple access control entries (ACEs), but now you can use each ACE to allow an entire group of users to access a group of servers or services or to deny them from doing so.

CHAPTER 149

Cisco Firewall-SIP Enhancements ALG

The enhanced Session Initiation Protocol (SIP) inspection in the Cisco XE firewall provides basic SIP inspect functionality (SIP packet inspection and pinholes opening) as well as protocol conformance and application security. These enhancements give you control on what policies and security checks to apply to SIP traffic and the capability to filter out unwanted messages or users.

The development of additional SIP functionality in Cisco IOS XE software provides increased support for Cisco Call Manager, Cisco Call Manager Express, and Cisco IP-IP Gateway based voice/video systems. The application-layer gateway (ALG) SIP enhancement also supports RFC 3261 and its extensions.

Prerequisites for Cisco Firewall-SIP Enhancements ALG

Your system must be running Cisco IOS XE Release 2.4 or a later release.

Restrictions for Cisco Firewall-SIP Enhancements ALG

DNS Name Resolution

Although SIP methods can have Domain Name System (DNS) names instead of raw IP addresses, this feature currently does not support DNS names.

Cisco ASR 1000 Series Routers

This feature was implemented without support for application inspection and control (AIC) on the Cisco ASR 1000 series routers. The Cisco IOS XE Release 2.4 supports the following commands only: **class-map type inspect**, **class type inspect**, **match protocol**, and **policy-map type inspect**.

Cisco ISR 4000 Series Routers

The Cisco IOS XE Fuji 16.7.1 release does not support Transport Layer Security (TLS) or Secure Real-time Transport Protocol (SRTP).

Information About Cisco Firewall-SIP Enhancements ALG

SIP Overview

Session Initiation Protocol (SIP) is an application-layer control (signaling) protocol for creating, modifying, and terminating sessions with one or more participants. These sessions could include Internet telephone calls, multimedia distribution, and multimedia conferences. SIP is based on an HTTP-like request/response transaction model. Each transaction consists of a request that invokes a particular method or function on the server and at least one response.

SIP invitations that are used to create sessions carry session descriptions that allow participants to agree on a set of compatible media types. SIP makes use of elements called proxy servers to help route requests to users' current locations, authenticate and authorize users for services, implement provider call-routing policies, and provide features to users. SIP also provides a registration function that allows users to upload their current locations for use by proxy servers. SIP runs on top of several different transport protocols.

Firewall for SIP Functionality Description

The firewall for SIP support feature allows SIP signaling requests to traverse directly between gateways or through a series of proxies to the destination gateway or phone. After the initial request, if the Record-Route header field is not used, subsequent requests can traverse directly to the destination gateway address as specified in the Contact header field. Thus, the firewall is aware of all surrounding proxies and gateways and allows the following functionalities:

- SIP signaling responses can travel the same path as SIP signaling requests.
- Subsequent signaling requests can travel directly to the endpoint (destination gateway).
- Media endpoints can exchange data between each other.

SIP UDP and TCP Support

RFC 3261 is the current RFC for SIP, which replaces RFC 2543. This feature supports the SIP UDP and the TCP format for signaling.

SIP Inspection

This section describes the deployment scenarios supported by the Cisco Firewall--SIP ALG Enhancements feature.

Cisco IOS XE Firewall Between SIP Phones and CCM

The Cisco IOS XE firewall is located between Cisco Call Manager or Cisco Call Manager Express and SIP phones. SIP phones are registered to Cisco Call Manager or Cisco Call Manager Express through the firewall, and any SIP calls from or to the SIP phones pass through the firewall.

Cisco IOS XE Firewall Between SIP Gateways

The Cisco IOS XE firewall is located between two SIP gateways, which can be Cisco Call Manager, Cisco Call Manager Express, or a SIP proxy. Phones are registered with SIP gateways directly. The firewall sees the SIP session or traffic only when there is a SIP call between phones registered to different SIP gateways. In some scenarios an IP-IP gateway can also be configured on the same device as the firewall. With this scenario all the calls between the SIP gateways are terminated in the IP-IP gateway.

Cisco IOS XE Firewall with Local Cisco Call Manager Express and Remote Cisco Call Manager Express/Cisco Call Manager

The Cisco IOS XE firewall is located between two SIP gateways, which can be Cisco Call Manager, Cisco Call Manager Express, or a SIP proxy. One of the gateways is configured on the same device as the firewall. All the phones registered to this gateway are locally inspected by the firewall. The firewall also inspects SIP sessions between the two gateways when there is a SIP call between them. With this scenario the firewall locally inspects SIP phones on one side and SIP gateways on the other side.

Cisco IOS XE Firewall with Local Cisco Call Manager Express

The Cisco IOS XE firewall and Cisco Call Manager Express is configured on the same device. All the phones registered to the Cisco Call Manager Express are locally inspected by the firewall. Any SIP call between any of the phones registered will also be inspected by the Cisco IOS XE firewall.

ALG--SIP Over TCP Enhancement

When SIP is transferred over UDP, every SIP message is carried in one single UDP datagram. However, when SIP is transferred over TCP, one TCP segment may contain multiple SIP messages. And it is possible that the last SIP message in one of the TCP segments may be a partial one. Prior to Cisco IOS XE Release 3.5S, when there are multiple SIP messages in one received TCP segment, the SIP ALG parses only the first message. The data that is not parsed is regarded as one incomplete SIP message and returned to vTCP. When the next TCP segment is received, vTCP prefixes the unprocessed data to that segment to pass them to the SIP ALG and causes more and more data have to be buffered in vTCP.

In Cisco IOS XE Release 3.5S, the ALG--SIP over TCP Enhancement feature lets the SIP ALG to handle multiple SIP messages in one TCP segment. When a TCP segment is received, all complete SIP messages inside this segment are parsed one-by-one. If there is an incomplete message in the end, only that portion is returned to vTCP.

How to Configure Cisco Firewall-SIP Enhancements ALG

Enabling SIP Inspection

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **exit**

6. **policy-map type inspect** *policy-map-name*
7. **class type inspect** *class-map-name*
8. **inspect**
9. **exit**
10. **class class-default**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Device(config)# class-map type inspect match-any sip-class1`	Creates an inspect type class map and enters class-map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol sip`	Configures the match criterion for a class map based on the named protocol.
Step 5	**exit** **Example:** `Device(config-cmap)# exit`	Exits class-map configuration mode.
Step 6	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect sip-policy`	Creates an inspect type policy map and enters policy-map configuration mode.
Step 7	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect sip-class1`	Specifies the class on which the action is performed and enters policy-map class configuration mode.
Step 8	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 9	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits policy-map class configuration mode and returns to policy-map configuration mode.

	Command or Action	Purpose
Step 10	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Specifies that these policy map settings apply to the predefined default class. • If traffic does not match any of the match criteria in the configured class maps, it is directed to the predefined default class.
Step 11	**end** **Example:** `Device(config-pmap)# end`	Exits policy-map configuration mode and returns to privileged EXEC mode.

Troubleshooting Tips

The following commands can be used to troubleshoot your SIP-enabled firewall configuration:

- **clear zone-pair**
- **debug cce**
- **debug policy-map type inspect**
- **show policy-map type inspect zone-pair**
- **show zone-pair security**

Configuring a Zone Pair and Attaching a SIP Policy Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** {*zone-name* | **default**}
4. **exit**
5. **zone security** {*zone-name* | **default**}
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** {*source-zone-name* | **self** | **default**} **destination** [*destination-zone-name* | **self** | **default**]]
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **zone-member security** *zone-name*
12. **exit**
13. **interface** *type number*
14. **zone-member security** *zone-name*
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** {*zone-name* | **default**} **Example:** `Device(config)# zone security zone1`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 5	**zone security** {*zone-name* | **default**} **Example:** `Device(config)# zone security zone2`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* [**source** {*source-zone-name* | **self** | **default**} **destination** [*destination-zone-name* | **self** | **default**]] **Example:** `Device(config)# zone-pair security in-out source zone1 destination zone2`	Creates a zone pair and returns to security zone-pair configuration mode. **Note** To apply a policy, you must configure a zone pair.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect sip-policy`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 9	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and returns to global configuration mode.
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.

	Command or Action	Purpose
Step 11	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security zone1`	Assigns an interface to a specified security zone. **Note** When you make an interface a member of a security zone, all traffic in and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 13	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 14	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security zone2`	Assigns an interface to a specified security zone.
Step 15	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for Cisco Firewall-SIP Enhancements ALG

Example: Enabling SIP Inspection

```
class-map type inspect match-any sip-class1
 match protocol sip
!
policy-map type inspect sip-policy
 class type inspect sip-class1
  inspect
!
class class-default
```

Example: Configuring a Zone Pair and Attaching a SIP Policy Map

```
zone security zone1
!
zone security zone2
!
zone-pair security in-out source zone1 destination zone2
 service-policy type inspect sip-policy
!
interface gigabitethernet 0/0/0
 zone security zone1
!
interface gigabitethernet 0/1/1
 zone security zone2
```

Feature Information for Cisco Firewall-SIP Enhancements ALG

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 202: Feature Information for Cisco Firewall-SIP Enhancements: ALG

Feature Name	Releases	Feature Information
AGL--SIP Over TCP Enhancement	Cisco IOS XE Release 3.5S	The ALG--SIP over TCP Enhancement feature lets the SIP ALG to handle multiple SIP messages in one TCP segment. When a TCP segment is received, all complete SIP messages inside this segment are parsed one-by-one. If there is an incomplete message in the end, only that portion is returned to vTCP.
Cisco Firewall--SIP ALG Enhancements	Cisco IOS XE Release 2.4	The Cisco Firewall--SIP ALG Enhancements feature provides voice security enhancements within the firewall feature set in Cisco IOS XE software on the Cisco ASR 1000 series routers. The following commands were implemented without support for Layer 7 (application-specific) syntax, on the Cisco ASR 1000 series routers:**class type inspect, class-map type inspect**, **match protocol**, **policy-map type inspect**.
Firewall--SIP ALG Enhancement for T.38 Fax Relay	Cisco IOS XE Release 2.4.1	The Firewall--SIP ALG Enhancement for T.38 Fax Relay feature provides an enhancement within the Firewall feature set in Cisco IOS XE software on the Cisco ASR 1000 series routers. The feature enables SIP ALG to support T.38 Fax Relay over IP, passing through the firewall on the Cisco ASR 1000 series routers.

CHAPTER 150

MSRPC ALG Support for Firewall and NAT

The MSRPC ALG Support for Firewall and NAT feature provides support for the Microsoft (MS) Remote Procedure Call (RPC) application-level gateway (ALG) on the firewall and Network Address Translation (NAT). The MSRPC ALG provides deep packet inspection (DPI) of the MSRPC protocol. The MSRPC ALG works in conjunction with a provisioning system to allow the network administrator to configure match filters to define match criteria that can be searched in an MSRPC packet.

The MSRPC ALG additionally supports the Virtual Transport Control Protocol (vTCP) functionality which provides a framework for various ALG protocols to appropriately handle the TCP segmentation and parse the segments in the Cisco IOS zone-based firewall, Network Address Translation (NAT) and other applications.

Prerequisites for MSRPC ALG Support for Firewall and NAT

- You must enable the Cisco IOS XE firewall and Network Address Translation (NAT) before applying the Microsoft (MS) Remote Procedure Call (RPC) application-level gateway (ALG) on packets.

Note MSRPC ALG is automatically enabled if traffic is sent to TCP port 135 by either Cisco IOS XE firewall or NAT, or both.

Restrictions for MSRPC ALG Support for Firewall and NAT

- Only TCP-based MSRPC is supported.
- You cannot configure the **allow** and **reset** commands together.
- You must configure the **match protocol msrpc** command for DPI.

- Only traffic that reaches destination port 135 is supported. This setting can be changed by configuration.

Information About MSRPC ALG Support for Firewall and NAT

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.
- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

MSRPC

MSRPC is a framework that developers use to publish a set of applications and services for servers and enterprises. RPC is an interprocess communication technique that allows the client and server software to communicate over the network. MSRPC is an application-layer protocol that is used by a wide array of Microsoft applications. MSRPC supports both connection-oriented (CO) and connectionless (CL) Distributed Computing Environment (DCE) RPC modes over a wide variety of transport protocols. All services of MSRPC establish an initial session that is referred to as the primary connection. A secondary session over a port range between 1024 to 65535 as the destination port is established by some services of MSRPC.

For MSRPC to work when firewall and NAT are enabled, in addition to inspecting MSRPC packets, the ALG is required to handle MSRPC specific issues like establishing dynamic firewall sessions and fixing the packet content after the NAT.

By applying MSRPC protocol inspection, most MSRPC services are supported, eliminating the need for Layer 7 policy filters.

MSRPC ALG on Firewall

After you configure the firewall to inspect the MSRPC protocol, the MSRPC ALG starts parsing MSRPC messages. The following table describes the types of Protocol Data Units (PDU) supported by the MSRPC ALG Support on Firewall and NAT feature:

Table 203: Supported PDU Types

PDU	Number	Type	Description
REQUEST	0	call	Initiates a call request.
RESPONSE	2	call	Responds to a call request.
FAULT	3	call	Indicates an RPC runtime, RPC stub, or RPC-specific exception.
BIND	11	association	Initiates the presentation negotiation for the body data.
BIND_ACK	12	association	Accepts a bind request.
BIND_NAK	13	association	Rejects an association request.
ALTER_CONTEXT	14	association	Requests additional presentation negotiation for another interface and/or version, or to negotiate a new security context, or both.
ALTER_CONTEXT_RESP	15	association	Responds to the ALTER_CONTEXT PDU. Valid values are accept or deny.
SHUTDOWN	17	call	Requests a client to terminate the connection and free the related resources.
CO_CANCEL	18	call	Cancels or orphans a connection. This message is sent when a client encounters a cancel fault.
ORPHANED	19	call	Terminates a request that in progress and that has not been entirely transmitted yet, or aborts a (possibly lengthy) response that is in progress.

MSRPC ALG on NAT

When NAT receives an MSRPC packet, it invokes the MSRPC ALG that parses the packet payload and forms a token to translate any embedded IP addresses. This token is passed to NAT, which translates addresses or ports as per your NAT configuration. The translated addresses are then written back into the packet payload by the MSRPC ALG.

If you have configured both the firewall and NAT, NAT calls the ALG first.

MSRPC Stateful Parser

The MSRPC state machine or the parser is the brain of the MSRPC ALG. The MSRPC stateful parser keeps all stateful information within the firewall or NAT depending on which feature invokes the parser first. The parser provides DPI of MSRPC protocol packets. It checks for protocol conformance and detects

out-of-sequence commands and malformed packets. As the packet is parsed, the state machine records various data and fills in the correct token information for NAT and firewall inspection.

How to Configure MSRPC ALG Support for Firewall and NAT

Note By default, MSRPC ALG is automatically enabled when NAT is enabled. There is no need to explicitly enable MSRPC ALG in the NAT-only configuration. You can use the **no ip nat service msrpc** command to disable MSRPC ALG on NAT.

Configuring a Layer 4 MSRPC Class Map and Policy Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **exit**
6. **policy-map type inspect** *policy-map-name*
7. **class type inspect** *class-map-name*
8. **inspect**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Router(config)# class-map type inspect match-any msrpc-cmap`	Creates an inspect type class map for the traffic class and enters QoS class-map configuration mode.

	Command or Action	Purpose
Step 4	**match protocol** *protocol-name* **Example:** `Router(config-cmap)# match protocol msrpc`	Configures the match criteria for a class map on the basis of a specified protocol. • Only Cisco IOS XE stateful packet inspection-supported protocols can be used as match criteria in inspect type class maps.
Step 5	**exit** **Example:** `Router(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 6	**policy-map type inspect** *policy-map-name* **Example:** `Router(config)# policy-map type inspect msrpc-pmap`	Creates a Layer 3 or Layer 4 inspect type policy map and enters QoS policy-map configuration mode.
Step 7	**class type inspect** *class-map-name* **Example:** `Router(config-pmap)# class type inspect msrpc-class-map`	Specifies the traffic (class) on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 8	**inspect** **Example:** `Router(config-pmap-c)# inspect`	Enables Cisco IOS XE stateful packet inspection.
Step 9	**end** **Example:** `Router(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and enters privileged EXEC mode.

Configuring a Zone Pair and Attaching an MSRPC Policy Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** *security-zone-name*
4. **exit**
5. **zone security** *security-zone-name*
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** *source-zone* **destination** [*destination-zone*]]
8. **service-policy type inspect** *policy-map-name*

9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Rotuer# configure terminal`	Enters global configuration mode.
Step 3	**zone security** *security-zone-name* **Example:** `Router(config)# zone security in-zone`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 4	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 5	**zone security** *security-zone-name* **Example:** `Router(config)# zone security out-zone`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	**exit** **Example:** `Router(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* [**source** *source-zone* **destination** [*destination-zone*]] **Example:** `Router(config)# zone-pair security in-out source in-zone destination out-zone`	Creates a zone pair and enters security zone pair configuration mode. **Note** To apply a policy, you must configure a zone pair.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Router(config-sec-zone-pair)# service-policy type inspect msrpc-pmap`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, traffic is dropped by default.

	Command or Action	Purpose
Step 9	**end** **Example:** `Router(config-sec-zone-pair)# end`	Exits security zone pair configuration mode and enters privileged EXEC mode.

Enabling vTCP Support for MSRPC ALG

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **alg vtcp service msrpc**
4. **exit**
5. **set platform hardware qfp active feature alg msrpc tolerance on**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**alg vtcp service msrpc** **Example:** `Rotuer(config)# alg vtcp service msrpc`	Enables vTCP functionality for MSRPC ALG. **Note** By default, MSRPC ALG supports vTCP.
Step 4	**exit** **Example:** `Rotuer(config)# exit`	Exits global configuration mode and returns to privileged EXEC mode.
Step 5	**set platform hardware qfp active feature alg msrpc tolerance on** **Example:** `Rotuer# set platform hardware qfp active feature alg msrpc tolerance on`	Enables MSRPC unknown message tolerance. **Note** By default, the tolerance is switched off.

Disabling vTCP Support for MSRPC ALG

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no alg vtcp service msrpc**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**no alg vtcp service msrpc** **Example:** `Rotuer(config)# no alg vtcp service msrpc`	Disables vTCP functionality for MSRPC ALG.
Step 4	**end** **Example:** `Rotuer(config)# end`	Exits global configuration mode and returns to privileged EXEC mode.

Configuration Examples for MSRPC ALG Support for Firewall and NAT

Example: Configuring a Layer 4 MSRPC Class Map and Policy Map

```
Router# configure terminal
Router(config)# class-map type inspect match-any msrpc-cmap
Router(config-cmap)# match protocol msrpc
Router(config-cmap)# exit
Router(config)# policy-map type inspect msrpc-pmap
Router(config-pmap)# class type inspect msrpc-cmap
Router(config-pmap-c)# inspect
```

```
Router(config-pmap-c)# end
```

Example: Configuring a Zone Pair and Attaching an MSRPC Policy Map

```
Router# configure terminal
Router(config)# zone security in-zone
Router(config-sec-zone)# exit
Router(config)# zone security out-zone
Router(config-sec-zone)# exit
Router(config)# zone-pair security in-out source in-zone destination out-zone
Router(config-sec-zone-pair)# service-policy type inspect msrpc-pmap
Router(config-sec-zone-pair)# end
```

Example: Enabling vTCP Support for MSRPC ALG

```
Router# configure terminal
Router(config)# alg vtcp service msrpc
Router(config)# end
```

Example: Disabling vTCP Support for MSRPC ALG

```
Router# configure terminal
Router(config)# no alg vtcp service msrpc
Router(config)# end
```

Feature Information for MSRPC ALG Support for Firewall and NAT

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 204: Feature Information for MSRPC ALG Support for Firewall and NAT

Feature Name	Releases	Feature Information
MSRPC ALG Support for Firewall and NAT	Cisco IOS XE Release 3.5S	The MSRPC ALG Support for Firewall and NAT feature provides support for the MSRPC ALG on the firewall and NAT. The MSRPC ALG provides deep packet inspection of the MSRPC protocol. The MSRPC ALG works in conjunction with a provisioning system to allow the network administrator to configure match filters that define match criteria that can be searched in an MSRPC packet. The following commands were introduced or modified: **ip nat service msrpc**, **match protocol msrpc**.
MSRPC ALG Inspection Improvements for Zone-based Firewall and NAT	Cisco IOS XE Release 3.14S	The MSRPC ALG Inspection Improvements for Zone-based Firewall and NAT feature supports Virtual Transport Control Protocol (vTCP) functionality which provides a framework for various ALG protocols to appropriately handle the TCP segmentation and parse the segments in the Cisco firewall, Network Address Translation (NAT) and other applications. The following command was introduced: **alg vtcp service msrpc**.

CHAPTER 151

Sun RPC ALG Support for Firewalls and NAT

The Sun RPC ALG Support for Firewalls and NAT feature adds support for the Sun Microsystems remote-procedure call (RPC) application-level gateway (ALG) on the firewall and Network Address Translation (NAT). Sun RPC is an application layer protocol that enables client programs to call functions in a remote server program. This module describes how to configure the Sun RPC ALG.

Restrictions for Sun RPC ALG Support for Firewalls and NAT

- If you configure the inspect action for Layer 4 or Layer 7 class maps, packets that match the Port Mapper Protocol well-known port (111) pass through the firewall without the Layer 7 inspection. Without the Layer 7 inspection, firewall pinholes are not open for traffic flow, and the Sun remote-procedure call (RPC) is blocked by the firewall. As a workaround, configure the **match program-number** command for Sun RPC program numbers.
- Only Port Mapper Protocol Version 2 is supported; none of the other versions are supported.
- Only RPC Version 2 is supported.

Information About Sun RPC ALG Support for Firewalls and NAT

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.

- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

Sun RPC

The Sun remote-procedure call (RPC) application-level gateway (ALG) performs a deep packet inspection of the Sun RPC protocol. The Sun RPC ALG works with a provisioning system that allows network administrators to configure match filters. Each match filter define a match criterion that is searched in a Sun RPC packet, thereby permitting only packets that match the criterion.

In an RPC, a client program calls procedures in a server program. The RPC library packages the procedure arguments into a network message and sends the message to the server. The server, in turn, uses the RPC library and takes the procedure arguments from the network message and calls the specified server procedure. When the server procedure returns to the RPC, return values are packaged into a network message and sent back to the client.

For a detailed description of the Sun RPC protocol, see RFC 1057, *RPC: Remote Procedure Call Protocol Specification Version 2*.

Sun RPC ALG Support for Firewalls

You can configure the Sun RPC ALG by using the zone-based firewall that is created by using policies and class maps. A Layer 7 class map allows network administrators to configure match filters. The filters specify the program numbers to be searched for in Sun RPC packets. The Sun RPC Layer 7 policy map is configured as a child policy of the Layer 4 policy map with the **service-policy** command.

When you configure a Sun RPC Layer 4 class map without configuring a Layer 7 firewall policy, the traffic returned by the Sun RPC passes through the firewall, but sessions are not inspected at Layer 7. Because sessions are not inspected, the subsequent RPC call is blocked by the firewall. Configuring a Sun RPC Layer 4 class map and a Layer 7 policy allows Layer 7 inspection. You can configure an empty Layer 7 firewall policy, that is, a policy without any match filters.

Sun RPC ALG Support for NAT

By default, the Sun RPC ALG is automatically enabled when Network Address Translation (NAT) is enabled. You can use the **no ip nat service alg** command to disable the Sun RPC ALG on NAT.

How to Configure Sun RPC ALG Support for Firewalls and NAT

For Sun RPC to work when the firewall and NAT are enabled, the ALG must inspect Sun RPC packets. The ALG also handles Sun RPC-specific issues such as establishing dynamic firewall sessions and fixing the packet content after NAT translation.

Configuring the Firewall for the Sun RPC ALG

You must configure a Layer 7 Sun remote-procedure call (RPC) policy map if you have configured the inspect action for the Sun RPC protocol (that is, if you have specified the **match protocol sunrpc** command in a Layer 4 class map).

We recommend that you do not configure both security zones and inspect rules on the same interface because this configuration may not work.

Perform the following tasks to configure a firewall for the Sun RPC ALG:

Configuring a Layer 4 Class Map for a Firewall Policy

Perform this task to configure a Layer 4 class map for classifying network traffic. When you specify the **match-all** keyword with the **class-map type inspect** command, the Sun RPC traffic matches all Sun remote-procedure call (RPC) Layer 7 filters (specified as program numbers) in the class map. When you specify the **match-any** keyword with the **class-map type inspect** , the Sun RPC traffic must match at least one of the Sun RPC Layer 7 filters (specified as program numbers) in the class map.

To configure a Layer 4 class map, use the **class-map type inspect {match-any | match-all}** *classm-map-name* command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect** {**match-any** | **match-all**} *class-map-name*
4. **match protocol** *protocol-name*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect** {**match-any**	**match-all**} *class-map-name* **Example:** `Device(config)# class-map type inspect match-any sunrpc-l4-cmap`	Creates a Layer 4 inspect type class map and enters QoS class-map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol sunrpc`	Configures a match criterion for a class map on the basis of the specified protocol.

	Command or Action	Purpose
Step 5	**end** **Example:** `Device(config-cmap)# end`	Exits QoS class-map configuration mode and enters privileged EXEC mode.

Configuring a Layer 7 Class Map for a Firewall Policy

Perform this task to configure a Layer 7 class map for classifying network traffic. This configuration enables programs such as mount (100005) and Network File System (NFS) (100003) that use Sun RPC. 100005 and 100003 are Sun RPC program numbers. By default, the Sun RPC ALG blocks all programs.

For more information about Sun RPC programs and program numbers, see RFC 1057, *RPC: Remote Procedure Call Protocol Specification Version 2*.

Use the **class-map type inspect** *protocol-name* command to configure a Layer 7 class map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect** *protocol-name* {**match-any** | **match-all**} *class-map-name*
4. **match program-number** *program-number*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect** *protocol-name* {**match-any** | **match-all**} *class-map-name* **Example:** `Device(config)# class-map type inspect sunrpc match-any sunrpc-l7-cmap`	Creates a Layer 7 (application-specific) inspect type class map and enters QoS class-map configuration mode.
Step 4	**match program-number** *program-number* **Example:** `Device(config-cmap)# match program-number 100005`	Specifies the allowed RPC protocol program number as a match criterion.
Step 5	**end** **Example:**	Exits QoS class-map configuration mode and enters privileged EXEC mode.

	Command or Action	Purpose
	`Device(config-cmap)# end`	

Configuring a Sun RPC Firewall Policy Map

Perform this task to configure a Sun remote-procedure call (RPC) firewall policy map. Use a policy map to allow packet transfer for each Sun RPC Layer 7 class that is defined in a class map for a Layer 7 firewall policy.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect** *protocol-name policy-map-name*
4. **class type inspect** *protocol-name class-map-name*
5. **allow**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**policy-map type inspect** *protocol-name policy-map-name* **Example:** `Device(config)# policy-map type inspect sunrpc sunrpc-l7-pmap`	Creates a Layer 7 (protocol-specific) inspect type policy map and enters QoS policy-map configuration mode.
Step 4	**class type inspect** *protocol-name class-map-name* **Example:** `Device(config-pmap)# class type inspect sunrpc sunrpc-l7-cmap`	Specifies the traffic class on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 5	**allow** **Example:** `Device(config-pmap-c)# allow`	Allows packet transfer.
Step 6	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and returns to privileged EXEC mode.

Attaching a Layer 7 Policy Map to a Layer 4 Policy Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map type inspect** *policy-map-name*
4. **class** {*class-map-name* | **class-default**}
5. **inspect** [*parameter-map-name*]
6. **service-policy** *protocol-name policy-map-name*
7. **exit**
8. **class class-default**
9. **drop**
10. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect sunrpc-l4-pmap`	Creates a Layer 4 inspect type policy map and enters QoS policy-map configuration mode.
Step 4	**class** {*class-map-name*	**class-default**} **Example:** `Device(config-pmap)# class sunrpc-l4-cmap`	Associates (class) on which an action is to be performed and enters QoS policy-map class configuration mode.
Step 5	**inspect** [*parameter-map-name*] **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 6	**service-policy** *protocol-name policy-map-name* **Example:** `Device(config-pmap-c)# service-policy sunrpc sunrpc-l7-pmap`	Attaches the Layer 7 policy map to a top-level Layer 4 policy map.
Step 7	**exit** **Example:**	Exits QoS policy-map class configuration mode and returns to QoS policy-map configuration mode.

	Command or Action	Purpose
	`Device(config-pmap-c)# exit`	
Step 8	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Specifies the default class (commonly known as the class-default class) before you configure its policy and enters QoS policy-map class configuration mode.
Step 9	**drop** **Example:** `Device(config-pmap-c)# drop`	Configures a traffic class to discard packets belonging to a specific class.
Step 10	**end** **Example:** `Device(config-pmap-c)# end`	Exits QoS policy-map class configuration mode and returns to privileged EXEC mode.

Creating Security Zones and Zone Pairs and Attaching a Policy Map to a Zone Pair

You need two security zones to create a zone pair. However, you can create only one security zone and the second one can be the system-defined security zone. To create the system-defined security zone or self zone, configure the **zone-pair security** command with the **self** keyword.

Note If you select a self zone, you cannot configure the inspect action.

In this task, you will do the following:

- Create security zones.
- Define zone pairs.
- Assign interfaces to security zones.
- Attach a policy map to a zone pair.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** {*zone-name* | **default**}
4. **exit**
5. **zone security** {*zone-name* | **default**}
6. **exit**
7. **zone-pair security** *zone-pair-name* **source** *source-zone-name* **destination** *destination-zone-name*
8. **service-policy type inspect** *policy-map-name*
9. **exit**
10. **interface** *type number*
11. **ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]]
12. **zone-member security** *zone-name*

13. **exit**
14. **interface** *type number*
15. **ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]]
16. **zone-member security** *zone-name*
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** {*zone-name* | **default**} **Example:** `Device(config)# zone security z-client`	Creates a security zone and enters security zone configuration mode. • Your configuration must have two security zones to create a zone pair: a source zone and a destination zone. • In a zone pair, you can use the default zone or self zone as either the source or destination zone.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 5	**zone security** {*zone-name* | **default**} **Example:** `Device(config)# zone security z-server`	Creates a security zone and enters security zone configuration mode. • Your configuration must have two security zones to create a zone pair: a source zone and a destination zone. • In a zone pair, you can use the default zone as either the source or destination zone.
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* **source** *source-zone-name* **destination** *destination-zone-name* **Example:**	Creates a zone pair and enters security zone-pair configuration mode.

	Command or Action	Purpose
	`Device(config)# zone-pair security clt2srv source z-client destination z-server`	
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect sunrpc-l4-pmap`	Attaches a firewall policy map to a zone pair.
Step 9	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and returns to global configuration mode.
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 2/0/0`	Configures an interface type and enters interface configuration mode.
Step 11	**ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]] **Example:** `Device(config-if)# ip address 192.168.6.5 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 12	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security z-client`	Attaches an interface to a security zone.
Step 13	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 14	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 2/1/1`	Configures an interface type and enters interface configuration mode.
Step 15	**ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]] **Example:** `Device(config-if)# ip address 192.168.6.1 255.255.255.0`	Sets a primary or secondary IP address for an interface.
Step 16	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security z-server`	Attaches an interface to a security zone.
Step 17	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for Sun RPC ALG Support for Firewall and NAT

Example: Configuring a Layer 4 Class Map for a Firewall Policy

```
Device# configure terminal
Device(config)# class-map type inspect match-any sunrpc-l4-cmap
Device(config-cmap)# match protocol sunrpc
Device(config-cmap)# end
```

Example: Configuring a Layer 7 Class Map for a Firewall Policy

```
Device# configure terminal
Device(config)# class-map type inspect sunrpc match-any sunrpc-l7-cmap
Device(config-cmap)# match program-number 100005
Device(config-cmap)# end
```

Example: Configuring a Sun RPC Firewall Policy Map

```
Device# configure terminal
Device(config)# policy-map type inspect sunrpc sunrpc-l7-pmap
Device(config-pmap)# class type inspect sunrpc sunrpc-l7-cmap
Device(config-pmap-c)# allow
Device(config-pmap-c)# end
```

Example: Attaching a Layer 7 Policy Map to a Layer 4 Policy Map

```
Device# configure terminal
Device(config)# policy-map type inspect sunrpcl4-pmap
Device(config-pmap)# class sunrpcl4-cmap
Device(config-pmap-c)# inspect
Device(config-pmap-c)# service-policy sunrpc sunrpc-l7-pmap
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap-c)# drop
Device(config-pmap-c)# end
```

Example: Creating Security Zones and Zone Pairs and Attaching a Policy Map to a Zone Pair

```
Device# configure terminal
Device(config)# zone security z-client
Device(config-sec-zone)# exit
```

```
Device(config)# zone security z-server
Device(config-sec-zone)# exit
Device(config)# zone-pair security clt2srv source z-client destination z-server
Device(config-sec-zone-pair)# service-policy type inspect sunrpc-l4-pmap
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 2/0/0
Device(config-if)# ip address 192.168.6.5 255.255.255.0
Device(config-if)# zone-member security z-client
Device(config-if)# exit
Device(config)# interface gigabitethernet 2/1/1
Device(config-if)# ip address 192.168.6.1 255.255.255.0
Device(config-if)# zone-member security z-server
Device(config-if)# end
```

Example: Configuring the Firewall for the Sun RPC ALG

The following is a sample firewall configuration for the Sun remote-procedure call (RPC) application-level gateway (ALG) support:

```
class-map type inspect sunrpc match-any sunrpc-l7-cmap
 match program-number 100005
!
class-map type inspect match-any sunrpc-l4-cmap
 match protocol sunrpc
!
!
policy-map type inspect sunrpc sunrpc-l7-pmap
 class type inspect sunrpc sunrpc-l7-cmap
  allow
!
!
policy-map type inspect sunrpc-l4-pmap
 class type inspect sunrpc-l4-cmap
  inspect
  service-policy sunrpc sunrpc-l7-pmap
!
 class class-default
  drop
!
!
zone security z-client
!
zone security z-server
!
zone-pair security clt2srv source z-client destination z-server
 service-policy type inspect sunrpc-l4-pmap
!
interface GigabitEthernet 2/0/0
 ip address 192.168.10.1 255.255.255.0
 zone-member security z-client
!
interface GigabitEthernet 2/1/1
 ip address 192.168.23.1 255.255.255.0
 zone-member security z-server
!
```

Table 205: Feature Information for Sun RPC ALG Support for Firewalls and NAT

Feature Name	Releases	Feature Information
Sun RPC ALG Support for Firewalls and NAT	Cisco IOS XE Release 3.2S	The Sun RPC ALG Support for Firewalls and NAT feature adds support for the Sun RPC ALG on the firewall and NAT. The following command was introduced or modified: **match protocol**.

CHAPTER 152

Zone-Based Firewall ALG and AIC Conditional Debugging and Packet Tracing Support

The Zone-Based Firewall ALG and AIC Conditional Debugging and Packet Tracing feature supports the following functionalities for Application Layer Gateway (ALG), and Application Inspection and Control (AIC):

- Packet tracing
- Conditional debugging
- Debug logs

Information About Zone-Based Firewall ALG and AIC Conditional Debugging and Packet Tracing Support

Packet Tracing

Packet tracing provides the ability to generate Control Plane Policing (CPP) statistics for a specified packet flow, with minimal effect on router throughput. It also traces the path of each packet in the flow, which helps in determining the input interface, features used, and the output path.

Application layer gateway (ALG) generates statistics and keeps a log of the path along which the packets travel.

Conditional Debugging

In a typical Application layer gateway (ALG)-enabled scenario where certain connections from the source address or destination address fail, debugging displays a list of messages for all the traffic that passes through

the ALG. Enabling conditional debugging ensures that debug messages related to specified connections are displayed on the console. Prior to the introduction of this feature, debugging used to display many messages for all traffic that passes through the ALG.

Debug Logs

The following severity levels have been added:

1. Error: Error and firewall packet drop conditions.

   Examples:

   - Unable to send a packet
   - ALG error condition

2. Warning: Warning debug messages.
3. Info: Information about an event.

   Examples:

   - Packet drop due to policy configuration, malformed packets, or hardcoded limit and threshold
   - State machine transition
   - ALG check status
   - Packet pass and drop status

4. Verbose: All log messages.

   Examples:

   - Data structures
   - Event details

Note Both the ALG-AIC functional debug flag and the severity level must be set. If only the severity level is set and the ALG-AIC functional debug flag is not set, the debug log will not be enabled. If only the ALG-AIC functional debug flag is set, the Info level, which is the default severity level, is logged.

CHAPTER 153

ALG—H.323 vTCP with High Availability Support for Firewall and NAT

The ALG—H.323 vTCP with High Availability Support for Firewall and NAT feature enhances the H.323 application-level gateway (ALG) to support a TCP segment that is not a single H.323 message. Virtual TCP (vTCP) supports TCP segment reassembly. Prior to this introduction of the feature, the H.323 ALG processed a TCP segment only if it was a complete H.323 message. If the TCP segment was more than one message, the H.323 ALG ignored the TCP segment and the packet was passed without processing.

This module describes how to configure the ALG—H.323 vTCP with high availability (HA) support for firewalls.

Restrictions for ALG—H.323 vTCP with High Availability Support for Firewall and NAT

- When an incoming TCP segment is not a complete H.323 message, the H.323 ALG buffers the TCP segment while waiting for the rest of the message. The buffered data is not synchronized to the standby device for high availability (HA).
- The performance of the H.323 ALG may get impacted when vTCP starts to buffer data.

Information About ALG—H.323 vTCP with High Availability Support for Firewall and NAT

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.
- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

Basic H.323 ALG Support

H.323 is a recommendation published by the ITU-T defining a series of network elements and protocols for multimedia transmission through packet-based networks. H.323 defines a number of network elements used in multimedia transmission.

Although most H.323 implementations today utilize TCP as the transport mechanism for signaling, H.323 Version 2 enables basic UDP transport.

- H.323 Terminal—This element is an endpoint in the network, providing two-way communication with another H.323 terminal or gateway.
- H.323 Gateway—This element provides protocol conversion between H.323 terminals and other terminals that do not support H.323.
- H.323 Gatekeeper—This element provides services like address translation, network access control, and bandwidth management and account for H.323 terminals and gateways.

The following core protocols are described by the H.323 specification:

- H.225—This protocol describes call signaling methods used between any two H.323 entities to establish communication.
- H.225 Registration, Admission, and Status (RAS)—This protocol is used by the H.323 endpoint and gateway for address resolution and admission control services.
- H.245—This protocol is used for exchanging the capabilities of multimedia communication and for the opening and closing of logical channels for audio, video, and data.

In addition to the protocols listed, the H.323 specification describes the use of various IETF protocols like the Real Time Transport (RTP) protocol and audio (G.711, G.729, and so on) and video (H.261, H.263, and H.264) codecs.

NAT requires a variety of ALGs to handle Layer 7 protocol-specific services such as translating embedded IP addresses and port numbers in the packet payload and extracting new connection/session information from control channels. The H.323 ALG performs these specific services for H.323 messages.

Overview of vTCP for ALG Support

When a Layer 7 protocol uses TCP for transportation, the TCP payload can be segmented due to various reasons, such as application design, maximum segment size (MSS), TCP window size, and so on. The application-level gateways (ALGs) that the firewall and NAT support do not have the capability to recognize TCP fragments for packet inspection. vTCP is a general framework that ALGs use to understand TCP segments and to parse the TCP payload.

vTCP helps applications like NAT and Session Initiation Protocol (SIP) that require the entire TCP payload to rewrite the embedded data. The firewall uses vTCP to help ALGs support data splitting between packets.

When you configure firewall or NAT ALGs, the vTCP functionality is activated.

vTCP currently supports Real Time Streaming Protocol (RTSP) and DNS ALGs.

TCP Acknowledgment and Reliable Transmission

Because vTCP resides between two TCP hosts, a buffer space is required to store TCP segments temporarily, before they are sent to other hosts. vTCP ensures that data transmission occurs properly between hosts. vTCP sends a TCP acknowledgment (ACK) to the sending host if vTCP requires more data for data transmission. vTCP also keeps track of the ACKs sent by the receiving host from the beginning of the TCP flow to closely monitor the acknowledged data.

vTCP reassembles TCP segments. The IP header and the TCP header information of the incoming segments are saved in the vTCP buffer for reliable transmission.

vTCP can make minor changes in the length of outgoing segments for NAT-enabled applications. vTCP can either squeeze the additional length of data to the last segment or create a new segment to carry the extra data. The IP header or the TCP header content of the newly created segment is derived from the original incoming segment. The total length of the IP header and the TCP header sequence numbers are adjusted accordingly.

vTCP with NAT and Firewall ALGs

ALG is a subcomponent of NAT and the firewall. Both NAT and the firewall have a framework to dynamically couple their ALGs. When the firewall performs a Layer 7 inspection or NAT performs a Layer 7 fix-up, the parser function registered by the ALGs is called and ALGs take over the packet inspection. vTCP mediates between NAT and the firewall and the ALGs that use these applications. In other words, packets are first processed by vTCP and then passed on to ALGs. vTCP reassembles the TCP segments in both directions within a TCP connection.

Overview of ALG—H.323 vTCP with High Availability Support

The ALG-H.323 vTCP with High Availability Support for Firewall and NAT feature enhances the H.323 application-level gateway (ALG) to support a TCP segment that is not a single H.323 message. After the H.323 ALG is coupled with vTCP, the firewall and NAT interact with the H.323 ALG through vTCP. When

vTCP starts to buffer data, the high availability (HA) function is impacted, because vTCP cannot synchronize the buffered data to a standby device. If the switchover to the standby device happens when vTCP is buffering data, the connection may be reset if the buffered data is not synchronized to the standby device. After the buffered data is acknowledged by vTCP, the data is lost and the connection is reset. The firewall and NAT synchronize the data for HA. vTCP only synchronizes the status of the current connection to the standby device, and in case of errors, the connection is reset.

How to Configure ALG—H.323 vTCP with High Availability Support for Firewall and NAT

Configuring ALG—H.323 vTCP with High Availability Support for Firewalls

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **match protocol** *protocol-name*
6. **exit**
7. **policy-map type inspect** *policy-map-name*
8. **class type inspect** *class-map-name*
9. **inspect**
10. **exit**
11. **class class-default**
12. **exit**
13. **zone security** *zone-name*
14. **exit**
15. **zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone*
16. **service-policy type inspect** *policy-map-name*
17. **exit**
18. **interface** *type number*
19. **zone member security** *zone-name*
20. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Device(config)# class-map type inspect match-any h.323-class`	Creates an inspect type class map and enters QoS class-map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol h323`	Configures the match criteria for a class map on the basis of the named protocol.
Step 5	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol h323ras`	Configures the match criteria for a class map on the basis of the named protocol.
Step 6	**exit** **Example:** `Device(config-cmap)# exit`	Exits QoS class-map configuration mode and enters global configuration mode.
Step 7	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect h.323-policy`	Creates an inspect type policy map and enters QoS policy-map configuration mode.
Step 8	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect h.323-class`	Specifies the class on which the action is performed and enters QoS policy-map class configuration mode.
Step 9	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 10	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits QoS policy-map class configuration mode and enters policy-map configuration mode.
Step 11	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Applies the policy map settings to the predefined default class. • If traffic does not match any of the match criteria in the configured class maps, it is directed to the predefined default class.

	Command or Action	Purpose
Step 12	**exit** **Example:** `Device(config)# exit`	Exits QoS policy-map configuration mode and enters global configuration mode.
Step 13	**zone security** *zone-name* **Example:** `Device(config)# zone security inside`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode. • Your configuration must have two security zones to create a zone pair: a source and a destination zone. • In a zone pair, you can use the default zone as either the source or the destination zone.
Step 14	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and enters global configuration mode.
Step 15	**zone-pair security** *zone-pair-name* **source** *source-zone* **destination** *destination-zone* **Example:** `Device(config)# zone-pair security inside-outside source inside destination outside`	Creates a pair of security zones and enters security-zone-pair configuration mode. • To apply a policy, you must configure a zone pair.
Step 16	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect h.323-policy`	Attaches a firewall policy map to the destination zone pair. • If a policy is not configured between a pair of zones, traffic is dropped by default.
Step 17	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and enters global configuration mode.
Step 18	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/1`	Configures an interface and enters interface configuration mode.
Step 19	**zone member security** *zone-name* **Example:** `Device(config-if)# zone member security inside`	Assigns an interface to a specified security zone. • When you make an interface a member of a security zone, all traffic into and out of that interface (except traffic bound for the router or initiated by the router) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 20	**end** **Example:**	Exits interface configuration mode and enters privileged EXEC mode.

	Command or Action	Purpose
	`Device(config-if)# end`	

Configuration Examples for ALG—H.323 vTCP with High Availability Support for Firewall and NAT

Example: Configuring ALG—H.323 vTCP with High Availability Support for Firewalls

```
Device# configure terminal
Device(config)# class-map type inspect h.323-class
Device(config-cmap)# match protocol h323
Device(config-cmap)# match protocol h323ras
Device(config-cmap)# exit
Device(config)# policy-map type inspect h323-policy
Device(config-pmap)# class type inspect h323
Device(config-pmap-c)# inspect
Device(config-pmap-c)# exit
Device(config-pmap)# class class-default
Device(config-pmap)# exit
Device(config)# zone security inside
Device(config-sec-zone)# exit
Device(config)# zone security outside
Device(config-sec-zone)# exit
Device(config)# zone-pair security inside-outside source inside destination outside
Device(config-sec-zone-pair)# service-policy type inspect h.323-policy
Device(config-sec-zone-pair)# exit
Device(config)# interface gigabitethernet 0/0/1
Device(config-if)# zone-member security inside
Device(config-if)# exit
Device(config)# interface gigabitethernet 0/1/1
Device(config-if)# zone-member security outside
Device(config-if)# end
```

Feature Information for ALG—H.323 vTCP with High Availability Support for Firewall and NAT

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 207: Feature Information for ALG—H.323 vTCP with High Availability Support for Firewall and NAT

Feature Name	Releases	Feature Information
ALG—H.323 vTCP with High Availability Support for Firewall and NAT	Cisco IOS XE Release 3.7S	The ALG—H.323 vTCP with High Availability Support for Firewall and NAT feature enhances the H.323 ALG to support a TCP segment that is not a single H.323 message. vTCP supports segment reassembly. Prior to the introduction of this feature, the H.323 ALG processed a TCP segment only if it was a complete H.323 message. If the TCP segment was more than one message, the H.323 ALG ignored the TCP segment and the packet was passed without processing.

CHAPTER 154

SIP ALG Hardening for NAT and Firewall

The SIP ALG Hardening for NAT and Firewall feature provides better memory management and RFC compliance over the existing Session Initiation Protocol (SIP) application-level gateway (ALG) support for Network Address Translation (NAT) and firewall. This feature provides the following enhancements:

- Management of the local database for all SIP Layer 7 data
- Processing of the Via header
- Support for logging additional SIP methods
- Support for Provisional Response Acknowledgment (PRACK) call flow
- Support for the Record-Route header

The above enhancements are available by default; no additional configuration is required on NAT or firewall.

This module explains the SIP ALG enhancements and describes how to enable NAT and firewall support for SIP.

Restrictions for SIP ALG Hardening for NAT and Firewall

- Session Initiation Protocol (SIP) application-level gateway (ALG) does not provide any security features.
- SIP ALG manages the local database based on call IDs. There might be a corner case involving two calls coming from two different clients with the same call ID, resulting in call ID duplication.

Information About SIP ALG Hardening for NAT and Firewall

SIP Overview

Session Initiation Protocol (SIP) is an application-layer control (signaling) protocol for creating, modifying, and terminating sessions with one or more participants. These sessions could include Internet telephone calls, multimedia distribution, and multimedia conferences. SIP is based on an HTTP-like request/response transaction model. Each transaction consists of a request that invokes a particular method or function on the server and at least one response.

SIP invitations that are used to create sessions carry session descriptions that allow participants to agree on a set of compatible media types. SIP makes use of elements called proxy servers to help route requests to users' current locations, authenticate and authorize users for services, implement provider call-routing policies, and provide features to users. SIP also provides a registration function that allows users to upload their current locations for use by proxy servers. SIP runs on top of several different transport protocols.

Application-Level Gateways

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation (NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT:

- Allow client applications to use dynamic TCP or UDP ports to communicate with the server application.
- Recognize application-specific commands and offer granular security control over them.
- Synchronize multiple streams or sessions of data between two hosts that are exchanging data.
- Translate the network-layer address information that is available in the application payload.

The firewall opens a pinhole, and NAT performs translation service on any TCP or UDP traffic that does not carry the source and destination IP addresses in the application-layer data stream. Specific protocols or applications that embed IP address information require the support of an ALG.

SIP ALG Local Database Management

A Session Initiation Protocol (SIP) trunk is a direct connection of an IP PBX to a service provider over an IP network using SIP. There can be numerous concurrent calls in a SIP trunk. During the call setup process, all calls use the same control channel for call establishment. More than one call uses the same control channel for call setup. When the same control channel is used by more than one call, the stateful information stored in the control-channel sessions becomes unreliable. SIP stateful information consists of media channel information such as the IP address and port number used by client and server endpoints to send media data. The media channel information is used to create a firewall pinhole and a Network Address Translation (NAT) door for the data channel in firewall and NAT, respectively. Because multiple calls use the same control channel for call setup, there will be multiple sets of media data.

In a SIP trunk, more than one call shares the same firewall and NAT session. NAT and firewall identify and manage a SIP session by using the 5 tuple in a SIP packet—source address, destination address, source port,

destination port, and protocol. The conventional method of using the 5 tuple to identify and match calls does not completely support SIP trunking and often leads to Layer 7 data memory leaks and call matching issues.

In contrast to other application-level gateways (ALGs), SIP ALG manages the SIP Layer 7 data by using a local database to store all media-related information contained in normal SIP calls and in SIP calls embedded in a SIP trunk. SIP ALG uses the Call-ID header field contained in a SIP message to search the local database for call matching and to manage and terminate calls. The Call-ID header field is a dialog identifier that identifies messages belonging to the same SIP dialog.

SIP ALG uses the call ID to perform search in the local database and to manage memory resources. In certain scenarios where SIP ALG is unable to free up a Layer 7 data record from the database, a session timer is used to manage and free resources to ensure that there are no stalled call records in the database.

Note Because all Layer 7 data is managed by SIP ALG by using a local database, SIP ALG never replies on firewall and NAT to free SIP Layer 7 data; SIP ALG frees the data by itself. If you use the **clear** command to clear all NAT translations and firewall sessions, the SIP Layer 7 data in the local database is not freed.

SIP ALG Via Header Support

A Session Initiation Protocol (SIP) INVITE request contains a Via header field. The Via header field indicates the transport paths taken by a SIP request. The Via header also contains information about the return path for subsequent SIP responses, which includes the IP address and the port to which the response message is to be sent.

SIP ALG creates a firewall pinhole or a Network Address Translation (NAT) door based on the first value in the Via header field for each SIP request received, except the acknowledge (ACK) message. If the port number information is missing from the first Via header, the port number is assumed to be 5060.

SIP ALG Method Logging Support

The SIP ALG Hardening for NAT and Firewall feature provides support for detailed logging of the following methods in Session Initiation Protocol (SIP) application-level gateway (ALG) statistics:

- PUBLISH
- OPTIONS
- 1XX (excluding 100,180,183)
- 2XX (excluding 200)

The existing SIP methods that are logged in SIP ALG statistics include ACK, BYE, CANCEL, INFO, INVITE, MESSAGE, NOTIFY, REFER, REGISTER, SUBSCRIBE, and 1XX-6XX.

SIP ALG PRACK Call-Flow Support

Session Initiation Protocol (SIP) defines two types of responses: final and provisional. Final responses convey the result of processing a request and are sent reliably. Provisional responses, on the other hand, provide information about the progress of processing a request but are not sent reliably.

Provisional Response Acknowledgement (PRACK) is a SIP method that provides an acknowledgment (ACK) system for provisional responses. PRACK allows reliable exchanges of SIP provisional responses between SIP endpoints. SIP reliable provisional responses ensure that media information is exchanged and resource reservation can occur before connecting the call.

SIP uses the connection, media, and attribute fields of the Session Description Protocol (SDP) during connection negotiation. SIP application-level gateway (ALG) supports SDP information within a PRACK message. If media information exists in a PRACK message, SIP ALG retrieves and processes the media information. SIP ALG also handles the creation of media channels for subsequent media streams. SIP ALG creates a firewall pinhole and a NAT door based on the SDP information in PRACK messages.

SIP ALG Record-Route Header Support

The Record-Route header field is added by a Session Initiation Protocol (SIP) proxy to a SIP request to force future requests in a SIP dialog to be routed through the proxy. Messages sent within a dialog then traverse all SIP proxies, which add a Record-Route header field to the SIP request. The Record-Route header field contains a globally reachable Uniform Resource Identifier (URI) that identifies the proxy.

SIP application-level gateway (ALG) parses the Contact header and uses the IP address and the port value in the Contact header to create a firewall pinhole and a Network Address Translation (NAT) door. In addition, SIP ALG supports the parsing of the Record-Route header to create a firewall pinhole and a NAT door for future messages that are routed through proxies.

How to Configure SIP ALG Hardening for NAT and Firewall

Enabling NAT for SIP Support

NAT support for SIP is enabled by default on port 5060. If this feature has been disabled, perform this task to re-enable NAT support for SIP. To disable the NAT support for SIP, use the **no ip nat service sip** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip nat service sip** {**tcp** | **udp**} **port** *port-number*
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**ip nat service sip** {**tcp** | **udp**} **port** *port-number* **Example:** `Device(config)# ip nat service sip tcp port 5060`	Enables NAT support for SIP.
Step 4	**end** **Example:** `Device(config)# end`	Exist global configuration mode and returns to privileged EXEC mode.

Enabling SIP Inspection

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map type inspect match-any** *class-map-name*
4. **match protocol** *protocol-name*
5. **exit**
6. **policy-map type inspect** *policy-map-name*
7. **class type inspect** *class-map-name*
8. **inspect**
9. **exit**
10. **class class-default**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**class-map type inspect match-any** *class-map-name* **Example:** `Device(config)# class-map type inspect match-any sip-class1`	Creates an inspect type class map and enters class-map configuration mode.
Step 4	**match protocol** *protocol-name* **Example:** `Device(config-cmap)# match protocol sip`	Configures the match criterion for a class map based on the named protocol.

	Command or Action	Purpose
Step 5	**exit** **Example:** `Device(config-cmap)# exit`	Exits class-map configuration mode.
Step 6	**policy-map type inspect** *policy-map-name* **Example:** `Device(config)# policy-map type inspect sip-policy`	Creates an inspect type policy map and enters policy-map configuration mode.
Step 7	**class type inspect** *class-map-name* **Example:** `Device(config-pmap)# class type inspect sip-class1`	Specifies the class on which the action is performed and enters policy-map class configuration mode.
Step 8	**inspect** **Example:** `Device(config-pmap-c)# inspect`	Enables stateful packet inspection.
Step 9	**exit** **Example:** `Device(config-pmap-c)# exit`	Exits policy-map class configuration mode and returns to policy-map configuration mode.
Step 10	**class class-default** **Example:** `Device(config-pmap)# class class-default`	Specifies that these policy map settings apply to the predefined default class. • If traffic does not match any of the match criteria in the configured class maps, it is directed to the predefined default class.
Step 11	**end** **Example:** `Device(config-pmap)# end`	Exits policy-map configuration mode and returns to privileged EXEC mode.

Configuring a Zone Pair and Attaching a SIP Policy Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **zone security** {*zone-name* | **default**}
4. **exit**
5. **zone security** {*zone-name* | **default**}
6. **exit**
7. **zone-pair security** *zone-pair-name* [**source** {*source-zone-name* | **self** | **default**} **destination** [*destination-zone-name* | **self** | **default**]]
8. **service-policy type inspect** *policy-map-name*

9. **exit**
10. **interface** *type number*
11. **zone-member security** *zone-name*
12. **exit**
13. **interface** *type number*
14. **zone-member security** *zone-name*
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**zone security** {*zone-name* | **default**} **Example:** `Device(config)# zone security zone1`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 4	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 5	**zone security** {*zone-name* | **default**} **Example:** `Device(config)# zone security zone2`	Creates a security zone to which interfaces can be assigned and enters security zone configuration mode.
Step 6	**exit** **Example:** `Device(config-sec-zone)# exit`	Exits security zone configuration mode and returns to global configuration mode.
Step 7	**zone-pair security** *zone-pair-name* [**source** {*source-zone-name* | **self** | **default**} **destination** [*destination-zone-name* | **self** | **default**]] **Example:** `Device(config)# zone-pair security in-out source zone1 destination zone2`	Creates a zone pair and returns to security zone-pair configuration mode. **Note** To apply a policy, you must configure a zone pair.
Step 8	**service-policy type inspect** *policy-map-name* **Example:** `Device(config-sec-zone-pair)# service-policy type inspect sip-policy`	Attaches a firewall policy map to the destination zone pair. **Note** If a policy is not configured between a pair of zones, traffic is dropped by default.

	Command or Action	Purpose
Step 9	**exit** **Example:** `Device(config-sec-zone-pair)# exit`	Exits security zone-pair configuration mode and returns to global configuration mode.
Step 10	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 11	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security zone1`	Assigns an interface to a specified security zone. **Note** When you make an interface a member of a security zone, all traffic in and out of that interface (except traffic bound for the device or initiated by the device) is dropped by default. To let traffic through the interface, you must make the zone part of a zone pair to which you apply a policy. If the policy permits traffic, traffic can flow through that interface.
Step 12	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 13	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 14	**zone-member security** *zone-name* **Example:** `Device(config-if)# zone-member security zone2`	Assigns an interface to a specified security zone.
Step 15	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for SIP ALG Hardening for NAT and Firewall

Example: Enabling NAT for SIP Support

```
Device> enable
Device# configure terminal
Device(config)# ip nat service sip tcp port 5060
Device(config)# end
```

Example: Enabling SIP Inspection

```
class-map type inspect match-any sip-class1
 match protocol sip
!
policy-map type inspect sip-policy
 class type inspect sip-class1
  inspect
!
class class-default
```

Example: Configuring a Zone Pair and Attaching a SIP Policy Map

```
zone security zone1
!
zone security zone2
!
zone-pair security in-out source zone1 destination zone2
 service-policy type inspect sip-policy
!
interface gigabitethernet 0/0/0
 zone security zone1
!
interface gigabitethernet 0/1/1
 zone security zone2
```

CHAPTER 155

SIP ALG Resilience to DoS Attacks

The SIP ALG Resilience to DoS Attacks feature provides protection against Session Initiation Protocol (SIP) application layer gateway (ALG) denial of service (DoS) attacks. This feature supports a configurable lock limit, a dynamic blacklist, and configurable timers to prevent DoS attacks.

This module explains the feature and how to configure DoS prevention for the SIP application layer gateway (ALG). Network Address Translation and zone-based policy firewalls support this feature.

Information About SIP ALG Resilience to DoS Attacks

SIP ALG Resilience to DoS Attacks Overview

The SIP ALG Resilience to DoS Attacks feature provides protection against denial of service (DoS) attacks to the Session Initiation Protocol (SIP) application layer gateway (ALG). This feature supports a configurable lock limit, a dynamic blacklist, and configurable timers to prevent DoS attacks. This feature is supported by Network Address Translation (NAT) and zone-based policy firewalls.

SIP is an application-level signaling protocol for setting up, modifying, and terminating real-time sessions between participants over an IP data network. These sessions could include Internet telephone calls, multimedia distribution, and multimedia conferences. SIP DoS attacks are a major threat to networks.

The following are types of SIP DoS attacks:

- SIP register flooding: A registration flood occurs when many VoIP devices try to simultaneously register to a network. If the volume of registration messages exceeds the device capability, some messages are lost. These devices then attempt to register again, adding more congestion. Because of the network congestion, users may be unable to access the network for some time.
- SIP INVITE flooding: An INVITE flood occurs when many INVITE messages are sent to servers that cannot support all these messages. If the attack rate is very high, the memory of the server is exhausted.
- SIP broken authentication and session attack: This attack occurs when an attacker presumes the identity of a valid user, using digest authentication. When the authentication server tries to verify the identity of the attacker, the verification is ignored and the attacker starts a new request with another session identity. These attacks consume the memory of the server.

SIP ALG Dynamic Blacklist

One of the common methods of denial of service (DoS) attacks involves saturating the target network with external communication requests making the network unable to respond to legitimate traffic. To solve this issue, the SIP ALG Resilience to DoS Attacks feature uses configurable blocked lists. A blocked list is a list of entities that are denied a particular privilege, service, or access. Dynamic blacklists are disabled by default. When requests to a destination address exceed a predefined trigger criteria in the configured blocked list, the Session Initiation Protocol (SIP) application layer gateway (ALG) will drop these packets.

The following abnormal SIP session patterns are monitored by dynamic blocked lists:

- In the configured period of time if a source sends multiple requests to a destination and receives non-2xx (as per RFC 3261, any response with a status code between 200 and 299 is a "2xx response") final responses from the destination.
- In the configured period of time if a source sends multiple requests to a destination and does not receive any response from the destination.

SIP ALG Lock Limit

Both Network Address Translation (NAT) and the firewall use the Session Initiation Protocol (SIP) application layer gateway (ALG) to parse SIP messages and create sessions through tokens. To maintain session states, the SIP ALG uses a per call data structure and Layer 7 data to store call-related information that is allocated when a session is initiated and freed when a session is released. If the SIP ALG does not receive a message that indicates that the call has ended, network resources are held for the call.

Because Layer 7 data is shared between threads, a lock is required to access the data. During denial of service (DoS) and distributed DoS attacks, many threads wait to get the same lock, resulting in heavy CPU usage, which makes the system unstable. To prevent the system from becoming unstable, a limit is added to restrict the number of threads that can wait for a lock. SIP sessions are established by request/response mode. When there are too many concurrent SIP messages for one SIP call, packets that exceed the lock limit are dropped.

SIP ALG Timers

To exhaust resources on Session Initiation Protocol (SIP) servers, some denial of service (DoS) attacks do not indicate the end of SIP calls. To prevent these types of DoS attacks, a protection timer is added.

The SIP ALG Resilience to DoS Attacks feature uses the following timers:

- Call-duration timer that controls the maximum length of an answered SIP call.
- Call-proceeding timer that controls the maximum length of an unanswered SIP call.

When the configured maximum time is reached, the SIP application layer gateway (ALG) releases resources for this call, and future messages related to this call may not be properly parsed by the SIP ALG.

How to Configure SIP ALG Resilience to DoS Attacks

Configuring SIP ALG Resilience to DoS Attacks

You can configure the prevention of denial of service (DoS) parameters for the Session Initiation Protocol (SIP) application layer gateway (ALG) that is used by Network Address Translation (NAT) and the zone-based policy firewall.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **alg sip processor session max-backlog** *concurrent-processor-usage*
4. **alg sip processor global max-backlog** *concurrent-processor-usage*
5. **alg sip blacklist trigger-period** *trigger-period* **trigger-size** *minimum-events* **destination** *ip-address*
6. **alg sip blacklist trigger-period** *trigger-period* **trigger-size** *minimum-events* **block-time** *block-time* [**destination** *ip-address*]
7. **alg sip timer call-proceeding-timeout** *time*
8. **alg sip timer max-call-duration** *seconds*
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**alg sip processor session max-backlog** *concurrent-processor-usage* **Example:** `Device(config)# alg sip processor session max-backlog 5`	Sets a per session limit for the number of backlog messages waiting for shared resources.
Step 4	**alg sip processor global max-backlog** *concurrent-processor-usage* **Example:** `Device(config)# alg sip processor global max-backlog 5`	Sets the maximum number of backlog messages waiting for shared resources for all SIP sessions.

	Command or Action	Purpose
Step 5	**alg sip blacklist trigger-period** *trigger-period* **trigger-size** *minimum-events* **destination** *ip-address* **Example:** `Device(config)# alg sip blacklist trigger-period 90 trigger-size 30 destination 10.1.1.1`	Configures dynamic SIP ALG blacklist criteria for the specified destination IP address.
Step 6	**alg sip blacklist trigger-period** *trigger-period* **trigger-size** *minimum-events* **block-time** *block-time* [**destination** *ip-address*] **Example:** `Device(config)# alg sip blacklist trigger-period 90 trigger-size 30 block-time 30`	Configures the time period, in seconds, when packets from a source are blocked if the configured limit is exceeded.
Step 7	**alg sip timer call-proceeding-timeout** *time* **Example:** `Device(config)# alg sip timer call-proceeding-timeout 35`	Sets the maximum time interval, in seconds, to end SIP calls that do not receive a response.
Step 8	**alg sip timer max-call-duration** *seconds* **Example:** `Device(config)# alg sip timer max-call-duration 90`	Sets the maximum call duration, in seconds, for a successful SIP call.
Step 9	**end** **Example:** `Device(config)# end`	Exits global configuration mode and returns to privileged EXEC mode.

Verifying SIP ALG Resilience to DoS Attacks

Use the following commands to troubleshoot the feature.

SUMMARY STEPS

1. **enable**
2. **show alg sip**
3. **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip**
4. **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip dbl**
5. **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip dblcfg**
6. **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip processor**
7. **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip timer**
8. **debug alg** {**all** | **info** | **trace** | **warn**}

DETAILED STEPS

Step 1 **enable**

Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

Step 2 **show alg sip**

Displays all Session Initiation Protocol (SIP) application layer gateway (ALG) information.

Example:

```
Device# show alg sip

sip timer configuration
   Type                     Seconds
   max-call-duration        380
   call-proceeding-timeout  620

sip processor configuration
   Type           Backlog number
   session         14
   global          189

sip blacklist configuration
   dst-addr         trig-period(ms)    trig-size     block-time(sec)
   10.0.0.0             60                 30              2000
   10.1.1.1             20                 30              30
   192.0.2.115          1000               5               30
   198.51.100.34        20                 30              388
```

Step 3 **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip**

Displays SIP ALG-specific statistics information in the Cisco Quantum Flow Processor (QFP).

Example:

```
Device# show platform hardware qfp active feature alg statistics sip

Events
...
Cr dbl entry:                10   Del dbl entry:                10
Cr dbl cfg entry:             8   Del dbl cfg entry:             4
start dbl trig tmr:          10   restart dbl trig tmr:       1014
stop dbl trig tmr:           10   dbl trig timeout:           1014
start dbl blk tmr:            0   restart dbl blk tmr:           0
stop dbl blk tmr:             0   dbl blk tmr timeout:           0
start dbl idle tmr:          10   restart dbl idle tmr:        361
stop dbl idle tmr:            1   dbl idle tmr timeout:          9

DoS Errors
Dbl Retmem Failed:            0    Dbl Malloc Failed:            0
DblCfg Retm Failed:           0    DblCfg Malloc Failed:         0
Session wlock ovflw:          0    Global wlock ovflw:           0
Blacklisted:                561
```

Step 4 **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip dbl**

Displays brief information about all SIP blocked list data.

Example:

```
Device# show platform hardware qfp active feature alg statistics sip dbl
```

```
SIP dbl pool used chunk entries number: 1

 entry_id          src_addr         dst_addr         remaining_time(sec)
 a4a051e0a4a1ebd   10.74.30.189     10.74.5.30               25
```

Step 5 **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip dblcfg**

Displays all SIP blocked list settings.

Example:

```
Device# show platform hardware qfp active feature alg statistics sip dblcfg

SIP dbl cfg pool used chunk entries number: 4
 dst_addr        trig_period(ms)    trig_size    block_time(sec)
 10.1.1.1              20              30             30
 10.74.5.30            1000             5             30
 192.0.2.2             60              30           2000
 198.51.100.115        20              30            388
```

Step 6 **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip processor**

Displays SIP processor settings.

Example:

```
Device# show platform hardware qfp active feature alg statistics sip processor

Session:     14        Global:    189

Current global wlock count:      0
```

Step 7 **show platform hardware qfp** {**active** | **standby**} **feature alg statistics sip timer**

Displays SIP timer settings.

Example:

```
Device# show platform hardware qfp active feature alg statistics sip timer

call-proceeding:    620      call-duration:    380
```

Step 8 **debug alg** {**all** | **info** | **trace** | **warn**}

Example:

```
Device# debug alg warn
```

Enables the logging of ALG warning messages.

Configuration Examples for SIP ALG Resilience to DoS Attacks

Example: Configuring SIP ALG Resilience to DoS Attacks

```
Device# configure terminal
Device(config)# alg sip processor session max-backlog 5
Device(config)# alg sip processor global max-backlog 5
Device(config)# alg sip blacklist trigger-period 90 trigger-size 30 destination 10.1.1.1
Device(config)# alg sip blacklist trigger-period 90 trigger-size 30 block-time 30
Device(config)# alg sip timer call-proceeding-timeout 35
Device(config)# alg sip timer max-call-duration 90
Device(config)# end
```

PART XIII

Security for VPNs with IPsec

CHAPTER 156

Configuring Security for VPNs with IPsec

This module describes how to configure basic IPsec VPNs. IPsec is a framework of open standards developed by the IETF. It provides security for the transmission of sensitive information over unprotected networks such as the Internet. IPsec acts at the network layer, protecting and authenticating IP packets between participating IPsec devices (“peers”), such as Cisco routers.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Prerequisites for Configuring Security for VPNs with IPsec

IKE Configuration

You must configure Internet Key Exchange (IKE) as described in the module *Configuring Internet Key Exchange for IPsec VPNs*.

Note If you decide not to use IKE, you must still disable it as described in the module *Configuring Internet Key Exchange for IPsec VPNs*.

Ensure Access Lists Are Compatible with IPsec

IKE uses UDP port 500. The IPsec encapsulating security payload (ESP) and authentication header (AH) protocols use protocol numbers 50 and 51, respectively. Ensure that your access lists are configured so that traffic from protocol 50, 51, and UDP port 500 are not blocked at interfaces used by IPsec. In some cases, you might need to add a statement to your access lists to explicitly permit this traffic.

Restrictions for Configuring Security for VPNs with IPsec

Cisco IPsec Policy Map MIB

The MIB OID objects are displayed only when an IPsec session is up.

Discontiguous Access Control Lists

Crypto maps using access control lists (ACLs) that have discontiguous masks are not supported.

Physical Interface and Crypto Map

A crypto map on a physical interface is not supported, if the physical interface is the source interface of a tunnel protection interface.

NAT Configuration

If you use Network Address Translation (NAT), you should configure static NAT so that IPsec works properly. In general, NAT should occur before the router performs IPsec encapsulation; in other words, IPsec should work with global addresses.

Unicast IP Datagram Application Only

IPsec can be applied to unicast IP datagrams only. Because the IPsec Working Group has not yet addressed the issue of group key distribution, IPsec does not currently work with multicasts or broadcast IP datagrams.

Unsupported Interface Types

- Crypto VPNs are not supported on the bridge domain interfaces (BDI).
- Crypto maps are not supported on tunnel interface and port-channel interface. As an exception, crypto maps for GDOI are supported on tunnel interfaces.
- Crypto maps are not supported on loopback interfaces.
- If transport profile is enabled on a tunnel, crypto maps are not supported on the tunnel source interfaces.
- Crypto maps are not supported on tunnel interface of MFR.
- Crypto maps are not supported on Vlan interfaces
- GetVPN crypto map is supported on port-channel interfaces.

Information About Configuring Security for VPNs with IPsec

Supported Standards

Cisco implements the following standards with this feature:

- IPsec—IPsec is a framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer; IPsec uses IKE to handle negotiation of protocols and algorithms based on the local policy, and generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

Note The term IPsec is sometimes used to describe the entire protocol of IPsec data services and IKE security protocols, and is also sometimes used to describe only the data services.

- IKE (IKEv1 and IKEv2)—A hybrid protocol that implements Oakley and SKEME key exchanges inside the Internet Security Association and Key Management Protocol (ISAKMP) framework. While IKE is used with other protocols, its initial implementation is with the IPsec protocol. IKE provides authentication of IPsec peers, negotiates IPsec security associations, and establishes IPsec keys.

Note Starting from Cisco IOS XE Bengaluru 17.6.x, configuring a weak crypto algorithm generates a warning, but the warning can be safely ignored and does not impact the working of the algorithms. The following example displays a warning message for a weak crypto algorithm:

```
Device(config-ikev2-proposal)# group 5
%Warning: weaker dh-group is deprecated
```

The following table lists all the weak algorithms.

IKEv1	IKEv2	IPsec
DH_GROUP_768_MODP/Group 1	DH_GROUP_768_MODP/Group 1	ah-md5-hmac
DH_GROUP_1024_MODP/Group 2	DH_GROUP_1024_MODP/Group 2	ah-sha-hmac
DH_GROUP_1536_MODP/Group 5	DH_GROUP_1536_MODP/Group 5	esp-des
DES	DES	esp-3des
3DES	3DES	esp-sha-hmac
MD5	MD5	esp-gmac
DH_GROUP_2048_256_MODP/Group 24	DH_GROUP_2048_256_MODP/Group 24	esp-md5-hmac

IKEv1	IKEv2	IPsec
		esp-null

The component technologies implemented for IPsec include:

Note Starting from Cisco IOS XE 17.11.1a, as part of security hardening and deprecation of weak ciphers, the options to configure DES, 3DES, MD5, and Diffie-Hellman (DH) groups 1, 2, and 5 are deprecated and are no longer supported. Instead, use AES, SHA, and DH Groups 14 or higher. Additionally, the esp-gmac transforms are also deprecated.

If you want to continue using the weak ciphers, disable CSDL compliance on the device using the **crypto engine compliance shield disable** command, and reboot.

- AES—Advanced Encryption Standard. A cryptographic algorithm that protects sensitive, unclassified information. AES is a privacy transform for IPsec and IKE and has been developed to replace DES. AES is designed to be more secure than DES. AES offers a larger key size, while ensuring that the only known approach to decrypt a message is for an intruder to try every possible key. AES has a variable key length—the algorithm can specify a 128-bit key (the default), a 192-bit key, or a 256-bit key.
- DES—Data Encryption Standard. An algorithm that is used to encrypt packet data. Cisco software implements the mandatory 56-bit DES-CBC with Explicit IV. Cipher Block Chaining (CBC) requires an initialization vector (IV) to start encryption. The IV is explicitly given in the IPsec packet. For backwards compatibility, Cisco IOS IPsec also implements the RFC 1829 version of ESP DES-CBC.

Cisco IOS also implements Triple DES (168-bit) encryption, depending on the software versions available for a specific platform. Cisco no longer recommends Triple DES (3DES).

Note Cisco IOS images with strong encryption (including, but not limited to 56-bit data encryption feature sets) are subject to United States government export controls, and have a limited distribution. Images to be installed outside the United States require an export license. Customer orders might be denied or subject to delay due to United States government regulations. Contact your sales representative or distributor for more information, or send an e-mail to export@cisco.com.

- SHA-2 and SHA-1 family (HMAC variant)—Secure Hash Algorithm (SHA) 1 and 2. Both SHA-1 and SHA-2 are hash algorithms used to authenticate packet data and verify the integrity verification mechanisms for the IKE protocol. HMAC is a variant that provides an additional level of hashing. SHA-2 family adds the SHA-256 bit hash algorithm and SHA-384 bit hash algorithm. This functionality is part of the Suite-B requirements that comprises four user interface suites of cryptographic algorithms for use with IKE and IPSec that are described in RFC 4869. Each suite consists of an encryption algorithm, a digital signature algorithm, a key agreement algorithm, and a hash or message digest algorithm. See the Configuring Security for VPNs with IPsec feature module for more detailed information about Cisco IOS Suite-B support.
- Diffie-Hellman—A public-key cryptography protocol that allows two parties to establish a shared secret over an unsecure communications channel. Diffie-Hellman is used within IKE to establish session keys. It supports 768-bit (the default), 1024-bit, 1536-bit, 2048-bit, 3072-bit, and 4096-bit DH groups. It also supports a 2048-bit DH group with a 256-bit subgroup, and 256-bit and 384-bit elliptic curve DH (ECDH). Cisco recommends using 2048-bit or larger DH key exchange, or ECDH key exchange.

- MD5 (Hash-based Message Authentication Code (HMAC) variant)—Message digest algorithm 5 (MD5) is a hash algorithm. HMAC is a keyed hash variant used to authenticate data.

IPsec as implemented in Cisco software supports the following additional standards:

- AH—Authentication Header. A security protocol, which provides data authentication and optional anti-replay services. AH is embedded in the data to be protected (a full IP datagram).
- ESP—Encapsulating Security Payload. A security protocol, which provides data privacy services and optional data authentication, and anti-replay services. ESP encapsulates the data to be protected.

Supported Encapsulation

IPsec works with the following serial encapsulations: Frame Relay, High-Level Data-Links Control (HDLC), and PPP.

IPsec also works with Generic Routing Encapsulation (GRE) and IPinIP Layer 3, Data Link Switching+ (DLSw+), and Source Route Bridging (SRB) tunneling protocols; however, multipoint tunnels are not supported. Other Layer 3 tunneling protocols may not be supported for use with IPsec.

IPsec Functionality Overview

IPsec provides the following network security services. (In general, the local security policy dictates the use of one or more of these services.)

- Data confidentiality—The IPsec sender can encrypt packets before transmitting them across a network.
- Data integrity—The IPsec receiver can authenticate packets sent by the IPsec sender to ensure that the data has not been altered during transmission.
- Data origin authentication—The IPsec receiver can authenticate the source of the sent IPsec packets. This service is dependent upon the data integrity service.
- Anti-replay—The IPsec receiver can detect and reject replayed packets.

IPsec provides secure *tunnels* between two peers, such as two routers. You define which packets are considered sensitive and should be sent through these secure tunnels, and you define the parameters that should be used to protect these sensitive packets by specifying the characteristics of these tunnels. When the IPsec peer recognizes a sensitive packet, the peer sets up the appropriate secure tunnel and sends the packet through the tunnel to the remote peer. (The use of the term *tunnel* in this chapter does not refer to using IPsec in tunnel mode.)

More accurately, these *tunnels* are sets of security associations (SAs) that are established between two IPsec peers. The SAs define the protocols and algorithms to be applied to sensitive packets and specify the keying material to be used by the two peers. SAs are unidirectional and are established per security protocol (AH or ESP).

Multiple IPsec tunnels can exist between two peers to secure different data streams, with each tunnel using a separate set of SAs. For example, some data streams only need to be authenticated, while other data streams must both be encrypted and authenticated.

IKEv1 Transform Sets

An Internet Key Exchange version 1 (IKEv1) transform set represents a certain combination of security protocols and algorithms. During the IPsec SA negotiation, the peers agree to use a particular transform set for protecting a particular data flow.

IKEv2 Transform Sets

An Internet Key Exchange version 2 (IKEv2) proposal is a set of transforms used in the negotiation of IKEv2 SA as part of the IKE_SA_INIT exchange. An IKEv2 proposal is regarded as complete only when it has at least an encryption algorithm, an integrity algorithm, and a Diffie-Hellman (DH) group configured. If no proposal is configured and attached to an IKEv2 policy, then the default proposal is used in the negotiation. The default proposal is a collection of commonly used algorithms which are as follows:

```
encryption aes-cbc-128 3des
integrity sha1 md5
group 5 2
```

Although the **crypto ikev2 proposal** command is similar to the **crypto isakmp policy priority** command, the IKEv2 proposal differs as follows:

- An IKEv2 proposal allows configuration of one or more transforms for each transform type.
- An IKEv2 proposal does not have any associated priority.

Note To use IKEv2 proposals in negotiation, they must be attached to IKEv2 policies. If a proposal is not configured, then the default IKEv2 proposal is used with the default IKEv2 policy.

Transform Sets: A Combination of Security Protocols and Algorithms

About Transform Sets

Note Cisco no longer recommends using ah-md5-hmac, esp-md5-hmac, esp-des or esp-3des. Instead, you should use ah-sha-hmac, esp-sha-hmac or esp-aes. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

A transform set represents a certain combination of security protocols and algorithms. During the IPsec SA negotiation, the peers agree to use a particular transform set for protecting a particular data flow.

During IPsec security association negotiations with IKE, peers search for an identical transform set for both peers. When such a transform set is found, it is selected and applied to the protected traffic as part of both peers' IPsec SAs. (With manually established SAs, there is no negotiation with the peer, so both sides must specify the same transform set.)

The table below shows allowed transform combinations.

Table 209: Allowed Transform Combinations

Transform Type	Transform	Description
AH Transform (*Pick only one.*)	**ah-md5-hmac**	AH with the MD5 (Message Digest 5) (an HMAC variant) authentication algorithm. (No longer recommended).
	ah-sha-hmac	AH with the SHA (Secure Hash Algorithm) (an HMAC variant) authentication algorithm.
ESP Encryption Transform (*Pick only one.*)	**esp-aes**	ESP with the 128-bit Advanced Encryption Standard (AES) encryption algorithm.
	esp-aes 192	ESP with the 192-bit AES encryption algorithm.
	esp-aes 256	ESP with the 256-bit AES encryption algorithm.
	esp-des	ESP with the 56-bit Data Encryption Standard (DES) encryption algorithm. (No longer recommended).
esp-3des		ESP with the 168-bit DES encryption algorithm (3DES or Triple DES). (No longer recommended).
ESP Authentication Transform (*Pick only one.*)	**esp-md5-hmac**	ESP with the MD5 (HMAC variant) authentication algorithm. (No longer recommended).
	esp-sha-hmac	ESP with the SHA (HMAC variant) authentication algorithm.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Cisco IOS Suite-B Support for IKE and IPsec Cryptographic Algorithms

Suite-B has the following cryptographic algorithms:

- Suite-B-GCM-128-Provides ESP integrity protection, confidentiality, and IPsec encryption algorithms that use the 128-bit AES using Galois and Counter Mode (AES-GCM) described in RFC 4106. This suite should be used when ESP integrity protection and encryption are both needed.

- Suite-B-GCM-256-Provides ESP integrity protection and confidentiality using 256-bit AES-GCM described in RFC 4106. This suite should be used when ESP integrity protection and encryption are both needed.
- Suite-B-GMAC-128-Provides ESP integrity protection using 128-bit AES- Galois Message Authentication Code (GMAC) described in RFC 4543, but does not provide confidentiality. This suite should be used only when there is no need for ESP encryption.
- Suite-B-GMAC-256-Provides ESP integrity protection using 256-bit AES-GMAC described in RFC 4543, but does not provide confidentiality. This suite should be used only when there is no need for ESP encryption.

IPSec encryption algorithms use AES-GCM when encryption is required and AES-GMAC for message integrity without encryption.

IKE negotiation uses AES Cipher Block Chaining (CBC) mode to provide encryption and Secure Hash Algorithm (SHA)-2 family containing the SHA-256 and SHA-384 hash algorithms, as defined in RFC 4634, to provide the hash functionality. Diffie-Hellman using Elliptic Curves (ECP), as defined in RFC 4753, is used for key exchange and the Elliptic Curve Digital Signature Algorithm (ECDSA), as defined in RFC 4754, to provide authentication.

Suite-B Requirements

Suite-B imposes the following software crypto engine requirements for IKE and IPsec:

- HMAC-SHA256 and HMAC-SHA384 are used as pseudorandom functions; the integrity check within the IKE protocol is used. Optionally, HMAC-SHA512 can be used.
- Elliptic curve groups 19 (256-bit ECP curve) and 20 (384-bit ECP curve) are used as the Diffie-Hellman group in IKE. Optionally, group 21 (521-bit ECP curve) can be used.
- The Elliptic Curve Digital Signature Algorithm (ECDSA) algorithm (256-bit and 384-bit curves) is used for the signature operation within X.509 certificates.
- GCM (16 byte ICV) and GMAC is used for ESP (128-bit and 256-bit keys). Optionally, 192-bit keys can be used.
- Public Key Infrastructure (PKI) support for validation of X.509 certificates using ECDSA signatures must be used.
- PKI support for generating certificate requests using ECDSA signatures and for importing the issued certificates into IOS must be used.
- IKEV2 support for allowing the ECDSA signature (ECDSA-sig) as authentication method must be used.

Where to Find Suite-B Configuration Information

Suite-B configuration support is described in the following documents:

- For more information on SHA-2 family (HMAC variant) and Elliptic Curve (EC) key pair configuration, see the *Configuring Internet Key Exchange for IPsec VPNs* feature module.
- For more information on configuring a transform for an integrity algorithm type, see the “Configuring the IKEv2 Proposal” section in the *Configuring Internet Key Exchange Version 2 (IKEv2) and FlexVPN Site-to-Site* feature module.

- For more information on configuring the ECDSA-sig to be the authentication method for IKEv2, see the "Configuring IKEv2 Profile (Basic)" section in the *Configuring Internet Key Exchange Version 2 (IKEv2) and FlexVPN Site-to-Site* feature module.
- For more information on configuring elliptic curve Diffie-Hellman (ECDH) support for IPsec SA negotiation, see the *Configuring Internet Key Exchange for IPsec VPNs* and *Configuring Internet Key Exchange Version 2 and FlexVPN* feature modules.

For more information on the Suite-B support for certificate enrollment for a PKI, see the *Configuring Certificate Enrollment for a PKI* feature module.

How to Configure IPsec VPNs

Creating Crypto Access Lists

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Do one of the following:
   - **access-list** *access-list-number* {**deny** | **permit**} *protocol source source-wildcard destination destination-wildcard* [**log**]
   - **ip access-list extended** *name*
4. Repeat Step 3 for each crypto access list you want to create.

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	Do one of the following: • **access-list** *access-list-number* {**deny** | **permit**} *protocol source source-wildcard destination destination-wildcard* [**log**] • **ip access-list extended** *name* **Example:** `Device(config)# access-list 100 permit ip 10.0.68.0 0.0.0.255 10.1.1.0 0.0.0.255`	Specifies conditions to determine which IP packets are protected. • You specify conditions using an IP access list designated by either a number or a name. The **access-list** command designates a numbered extended access list; the **ip access-list extended** command designates a named access list. • Enable or disable crypto for traffic that matches these conditions.

	Command or Action	Purpose
	Example: `Device(config)# ip access-list extended vpn-tunnel`	**Tip** Cisco recommends that you configure "mirror image" crypto access lists for use by IPsec and that you avoid using the **any** keyword.
Step 4	Repeat Step 3 for each crypto access list you want to create.	—

What to Do Next

After at least one crypto access list is created, a transform set needs to be defined as described in the "Configuring Transform Sets for IKEv1 and IKEv2 Proposals, on page 1914" section.

Next the crypto access lists need to be associated to particular interfaces when you configure and apply crypto map sets to the interfaces. (Follow the instructions in the "Creating Crypto Map Sets, on page 1918" and "Applying Crypto Map Sets to Interfaces, on page 1927" sections).

Configuring Transform Sets for IKEv1 and IKEv2 Proposals

Perform this task to define a transform set that is to be used by the IPsec peers during IPsec security association negotiations with IKEv1 and IKEv2 proposals.

Restrictions

If you are specifying SEAL encryption, note the following restrictions:

- Your router and the other peer must not have a hardware IPsec encryption.
- Your router and the other peer must support IPsec.
- Your router and the other peer must support the k9 subsystem.
- SEAL encryption is available only on Cisco equipment. Therefore, interoperability is not possible.
- Unlike IKEv1, the authentication method and SA lifetime are not negotiable in IKEv2, and because of this, these parameters cannot be configured under the IKEv2 proposal.

Configuring Transform Sets for IKEv1

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2* [*transform3*]]
4. **mode** [**tunnel** | **transport**]
5. **end**
6. **clear crypto sa** [**peer** {*ip-address* | *peer-name*} | **sa map** *map-name* | **sa entry** *destination-address protocol spi*]
7. **show crypto ipsec transform-set** [**tag** *transform-set-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto ipsec transform-set** *transform-set-name transform1* [*transform2* [*transform3*]] **Example:** `Device(config)# crypto ipsec transform-set aesset esp-aes 256 esp-sha-hmac`	Defines a transform set and enters crypto transform configuration mode. • There are complex rules defining the entries that you can use for transform arguments. These rules are explained in the command description for the **crypto ipsec transform-set** command, and the table in "About Transform Sets" section provides a list of allowed transform combinations.
Step 4	**mode** [**tunnel** | **transport**] **Example:** `Device(cfg-crypto-tran)# mode transport`	(Optional) Changes the mode associated with the transform set. • The mode setting is applicable only to traffic whose source and destination addresses are the IPsec peer addresses; it is ignored for all other traffic. (All other traffic is in tunnel mode only.)
Step 5	**end** **Example:** `Device(cfg-crypto-tran)# end`	Exits crypto transform configuration mode and enters privileged EXEC mode.
Step 6	**clear crypto sa** [**peer** {*ip-address* | *peer-name*} | **sa map** *map-name* | **sa entry** *destination-address protocol spi*] **Example:** `Device# clear crypto sa`	(Optional) Clears existing IPsec security associations so that any changes to a transform set takes effect on subsequently established security associations. Manually established SAs are reestablished immediately. • Using the **clear crypto sa** command without parameters clears out the full SA database, which clears out active security sessions. • You may also specify the **peer**, **map**, or **entry** keywords to clear out only a subset of the SA database.
Step 7	**show crypto ipsec transform-set** [**tag** *transform-set-name*] **Example:** `Device# show crypto ipsec transform-set`	(Optional) Displays the configured transform sets.

What to Do Next

After you have defined a transform set, you should create a crypto map as specified in the*Creating Crypto Map Sets* section.

Configuring Transform Sets for IKEv2

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ikev2 proposal** *proposal-name*
4. **encryption** *transform1* [*transform2*] ...
5. **integrity** *transform1* [*transform2*] ...
6. **group** *transform1* [*transform2*] ...
7. **end**
8. **show crypto ikev2 proposal**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto ikev2 proposal** *proposal-name* **Example:** `Device(config)# crypto ikev2 proposal proposal-1`	Specifies the name of the proposal and enters crypto IKEv2 proposal configuration mode. • The proposals are referred in IKEv2 policies through the proposal name.
Step 4	**encryption** *transform1* [*transform2*] ... **Example:** `Device(config-ikev2-proposal)# encryption aes-cbc-128`	(Optional) Specifies one or more transforms of the following encryption type: • AES-CBC 128—128-bit AES-CBC • AES-CBC 192—192-bit AES-CBC • AES-CBC 256—256-bit AES-CBC • 3DES—168-bit DES (No longer recommended. AES is the recommended encryption algorithm).
Step 5	**integrity** *transform1* [*transform2*] ... **Example:**	(Optional) Specifies one or more transforms of the following integrity type:

	Command or Action	Purpose
	`Device(config-ikev2-proposal)# integrity sha1`	• The **sha256** keyword specifies SHA-2 family 256-bit (HMAC variant) as the hash algorithm. • The **sha384** keyword specifies SHA-2 family 384-bit (HMAC variant) as the hash algorithm. • The **sha512** keyword specifies SHA-2 family 512-bit (HMAC variant) as the hash algorithm • the **sha1** keyword specifies the SHA-1 (HMAC variant) as the hash algorithm. • The **md5** keyword specifies MD5 (HMAC variant) as the hash algorithm. (No longer recommended. SHA-1 is the recommended replacement.)
Step 6	**group** *transform1* [*transform2*] ... **Example:** `Device(config-ikev2-proposal)# group 14`	(Optional) Specifies one or more transforms of the possible DH group type: • **1**—768-bit DH (No longer recommended.) • **2**—1024-bit DH (No longer recommended) • **5**—1536-bit DH (No longer recommended) • **14**—Specifies the 2048-bit DH group. • **15**—Specifies the 3072-bit DH group. • **16**—Specifies the 4096-bit DH group. • **19**—Specifies the 256-bit elliptic curve DH (ECDH) group. • **20**—Specifies the 384-bit ECDH group. • **24**—Specifies the 2048-bit DH/DSA group.
Step 7	**end** **Example:** `Device(config-ikev2-proposal)# end`	Exits crypto IKEv2 proposal configuration mode and returns to privileged EXEC mode.
Step 8	**show crypto ikev2 proposal** **Example:** `Device# show crypto ikev2 proposal`	(Optional) Displays the parameters for each IKEv2 proposal.

Transform Sets for IKEv2 Examples

The following examples show how to configure a proposal:

IKEv2 Proposal with One Transform for Each Transform Type

```
Device(config)# crypto ikev2 proposal proposal-1
```

```
Device(config-ikev2-proposal)# encryption aes-cbc-128
Device(config-ikev2-proposal)# integrity sha1
Device(config-ikev2-proposal)# group 14
```

IKEv2 Proposal with Multiple Transforms for Each Transform Type

```
crypto ikev2 proposal proposal-2
encryption aes-cbc-128 aes-cbc-192
integrity sha1 sha256
group 14 15
```

For a list of transform combinations, see Configuring Security for VPNs with IPsec.

IKEv2 Proposals on the Initiator and Responder

The proposal of the initiator is as follows:

```
Device(config)# crypto ikev2 proposal proposal-1
Device(config-ikev2-proposal)# encryption aes-cbc-128 aes-cbc-196
Device(config-ikev2-proposal)# integrity sha1 sha256
Device(config-ikev2-proposal)# group 14 16
```

The proposal of the responder is as follows:

```
Device(config)# crypto ikev2 proposal proposal-2
Device(config-ikev2-proposal)# encryption aes-cbc-196 aes-cbc-128
Device(config-ikev2-proposal)# integrity sha256 sha1
Device(config-ikev2-proposal)# group 16 14
```

In the scenario, the initiator's choice of algorithms is preferred and the selected algorithms are as follows:

```
encryption aes-cbc-128
integrity sha1
group 14
```

What to Do Next

After you have defined a transform set, you should create a crypto map as specified in the *Creating Crypto Map Sets* section.

Creating Crypto Map Sets

Creating Static Crypto Maps

When IKE is used to establish SAs, the IPsec peers can negotiate the settings they use for the new security associations. This means that you can specify lists (such as lists of acceptable transforms) within the crypto map entry.

Perform this task to create crypto map entries that use IKE to establish SAs. To create IPv6 crypto map entries, you must use the **ipv6** keyword with the **crypto map** command. For IPv4 crypto maps, use the **crypto map** command without the **ipv6** keyword.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** [**ipv6**] *map-name seq-num* [**ipsec-isakmp**]
4. **match address** *access-list-id*
5. **set peer** {*hostname* | *ip-address*}
6. **crypto ipsec security-association dummy** {**pps** *rate* | **seconds** *seconds*}
7. **set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*]
8. **set security-association lifetime** {**seconds** *seconds* | **kilobytes** *kilobytes* | **kilobytes disable**}
9. **set security-association level per-host**
10. **set pfs** [**group1** | **group14** | **group15** | **group16** | **group19** | **group2** | **group20** | **group24** | **group5**]
11. **end**
12. **show crypto map** [**interface** *interface* | **tag** *map-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto map** [**ipv6**] *map-name seq-num* [**ipsec-isakmp**] **Example:** `Device(config)# crypto map static-map 1 ipsec-isakmp`	Creates or modifies a crypto map entry, and enters crypto map configuration mode. • For IPv4 crypto maps, use the command without the **ipv6** keyword.
Step 4	**match address** *access-list-id* **Example:** `Device(config-crypto-m)# match address vpn-tunnel`	Names an extended access list. • This access list determines the traffic that should be protected by IPsec and the traffic that should not be protected by IPsec security in the context of this crypto map entry.
Step 5	**set peer** {*hostname*	*ip-address*} **Example:**	Specifies a remote IPsec peer—the peer to which IPsec protected traffic can be forwarded.

	Command or Action	Purpose
	`Device(config-crypto-m)# set-peer 192.168.101.1`	• Repeat for multiple remote peers.
Step 6	**crypto ipsec security-association dummy** {**pps** *rate* | **seconds** *seconds*} **Example:** `Device(config-crypto-m)# set security-association dummy seconds 5`	Enables generating dummy packets. These dummy packets are generated for all flows created in the crypto map.
Step 7	**set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*] **Example:** `Device(config-crypto-m)# set transform-set aesset`	Specifies the transform sets that are allowed for this crypto map entry. • List multiple transform sets in the order of priority (highest priority first).
Step 8	**set security-association lifetime** {**seconds** *seconds* | **kilobytes** *kilobytes* | **kilobytes disable**} **Example:** `Device (config-crypto-m)# set security-association lifetime seconds 2700`	(Optional) Specifies a SA lifetime for the crypto map entry. • By default, the SAs of the crypto map are negotiated according to the global lifetimes, which can be disabled.
Step 9	**set security-association level per-host** **Example:** `Device(config-crypto-m)# set security-association level per-host`	(Optional) Specifies that separate SAs should be established for each source and destination host pair. • By default, a single IPsec "tunnel" can carry traffic for multiple source hosts and multiple destination hosts. **Caution** Use this command with care because multiple streams between given subnets can rapidly consume resources.
Step 10	**set pfs** [**group1** | **group14** | **group15** | **group16** | **group19** | **group2** | **group20** | **group24** | **group5**] **Example:** `Device(config-crypto-m)# set pfs group14`	(Optional) Specifies that IPsec either should ask for password forward secrecy (PFS) when requesting new SAs for this crypto map entry or should demand PFS in requests received from the IPsec peer. • Group 1 specifies the 768-bit Diffie-Hellman (DH) identifier (default). (No longer recommended). • Group 2 specifies the 1024-bit DH identifier. (No longer recommended). • Group 5 specifies the 1536-bit DH identifier. (No longer recommended) • Group 14 specifies the 2048-bit DH identifier. • Group 15 specifies the 3072-bit DH identifier. • Group 16 specifies the 4096-bit DH identifier.

	Command or Action	Purpose
		• Group 19 specifies the 256-bit elliptic curve DH (ECDH) identifier. • Group 20 specifies the 384-bit ECDH identifier. • Group 24 specifies the 2048-bit DH/DSA identifier • By default, PFS is not requested. If no group is specified with this command, group 1 is used as the default.
Step 11	**end** **Example:** `Device(config-crypto-m)# end`	Exits crypto map configuration mode and returns to privileged EXEC mode.
Step 12	**show crypto map** [**interface** *interface* | **tag** *map-name*] **Example:** `Device# show crypto map`	Displays your crypto map configuration.

Troubleshooting Tips

Certain configuration changes take effect only when negotiating subsequent SAs. If you want the new settings to take immediate effect, you must clear the existing SAs so that they are reestablished with the changed configuration. If the router is actively processing IPsec traffic, clear only the portion of the SA database that would be affected by the configuration changes (that is, clear only the SAs established by a given crypto map set). Clearing the full SA database should be reserved for large-scale changes, or when the router is processing very little other IPsec traffic.

To clear IPsec SAs, use the **clear crypto sa** command with appropriate parameters. (Omitting all parameters clears out the full SA database, which clears active security sessions.)

What to Do Next

After you have successfully created a static crypto map, you must apply the crypto map set to each interface through which IPsec traffic flows. To complete this task, see the Applying Crypto Map Sets to Interfaces, on page 1927 section.

Creating Dynamic Crypto Maps

Dynamic crypto map entries specify crypto access lists that limit traffic for which IPsec SAs can be established. A dynamic crypto map entry that does not specify an access list is ignored during traffic filtering. A dynamic crypto map entry with an empty access list causes traffic to be dropped. If there is only one dynamic crypto map entry in the crypto map set, it must specify the acceptable transform sets.

Perform this task to create dynamic crypto map entries that use IKE to establish the SAs.

Note IPv6 addresses are not supported on dynamic crypto maps.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto dynamic-map** *dynamic-map-name dynamic-seq-num*
4. **set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*]
5. **match address** *access-list-id*
6. **set peer** {*hostname* | *ip-address*}
7. **set security-association lifetime** {**seconds** *seconds* | **kilobytes** *kilobytes* | **kilobytes disable**}
8. **set pfs** [**group1** | **group14** | **group15** | **group16** | **group19** | **group2** | **group20** | **group24** | **group5**]
9. **exit**
10. **exit**
11. **show crypto dynamic-map** [**tag** *map-name*]
12. **configure terminal**
13. **crypto map** *map-name seq-num* **ipsec-isakmp dynamic** *dynamic-map-name* [**discover**]
14. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto dynamic-map** *dynamic-map-name dynamic-seq-num* **Example:** `Device(config)# crypto dynamic-map test-map 1`	Creates a dynamic crypto map entry and enters crypto map configuration mode.
Step 4	**set transform-set** *transform-set-name1* [*transform-set-name2...transform-set-name6*] **Example:** `Device(config-crypto-m)# set transform-set aesset`	Specifies the transform sets allowed for the crypto map entry. • List multiple transform sets in the order of priority (highest priority first). This is the only configuration statement required in dynamic crypto map entries.

	Command or Action	Purpose
Step 5	**match address** *access-list-id* **Example:** `Device(config-crypto-m)# match address 101`	(Optional) Specifies the list number or name of an extended access list. • This access list determines which traffic should be protected by IPsec and which traffic should not be protected by IPsec security in the context of this crypto map entry. **Note** Although access lists are optional for dynamic crypto maps, they are highly recommended. • If an access list is configured, the data flow identity proposed by the IPsec peer must fall within a **permit** statement for this crypto access list. • If an access list is not configured, the device accepts any data flow identity proposed by the IPsec peer. However, if an access list is configured but the specified access list does not exist or is empty, the device drops all packets. This is similar to static crypto maps, which require access lists to be specified. • Care must be taken if the **any** keyword is used in the access list, because the access list is used for packet filtering as well as for negotiation. • You must configure a match address; otherwise, the behavior is not secure, and you cannot enable TED because packets are sent in the clear (unencrypted.)
Step 6	**set peer** {*hostname* | *ip-address*} **Example:** `Device(config-crypto-m)# set peer 192.168.101.1`	(Optional) Specifies a remote IPsec peer. Repeat this step for multiple remote peers. **Note** This is rarely configured in dynamic crypto map entries. Dynamic crypto map entries are often used for unknown remote peers.
Step 7	**set security-association lifetime** {**seconds** *seconds* | **kilobytes** *kilobytes* | **kilobytes disable**} **Example:** `Device(config-crypto-m)# set security-association lifetime seconds 7200`	(Optional) Overrides (for a particular crypto map entry) the global lifetime value, which is used when negotiating IP Security SAs. **Note** To minimize the possibility of packet loss when rekeying in high bandwidth environments, you can disable the rekey request triggered by a volume lifetime expiry.
Step 8	**set pfs** [**group1** | **group14** | **group15** | **group16** | **group19** | **group2** | **group20** | **group24** | **group5**]	(Optional) Specifies that IPsec should ask for PFS when requesting new security associations for this crypto map

	Command or Action	Purpose
	Example: `Device(config-crypto-m)# set pfs group14`	entry or should demand PFS in requests received from the IPsec peer. • Group 1 specifies the 768-bit Diffie-Hellman (DH) identifier (default). (No longer recommended). • Group 2 specifies the 1024-bit DH identifier. (No longer recommended). • Group 5 specifies the 1536-bit DH identifier. (No longer recommended) • Group 14 specifies the 2048-bit DH identifier. • Group 15 specifies the 3072-bit DH identifier. • Group 16 specifies the 4096-bit DH identifier. • Group 19 specifies the 256-bit elliptic curve DH (ECDH) identifier. • Group 20 specifies the 384-bit ECDH identifier. • Group 24 specifies the 2048-bit DH/DSA identifier • By default, PFS is not requested. If no group is specified with this command, **group1** is used as the default.
Step 9	**exit** **Example:** `Device(config-crypto-m)# exit`	Exits crypto map configuration mode and returns to global configuration mode.
Step 10	**exit** **Example:** `Device(config)# exit`	Exits global configuration mode.
Step 11	**show crypto dynamic-map** [**tag** *map-name*] **Example:** `Device# show crypto dynamic-map`	(Optional) Displays information about dynamic crypto maps.
Step 12	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 13	**crypto map** *map-name seq-num* **ipsec-isakmp dynamic** *dynamic-map-name* [**discover**] **Example:** `Device(config)# crypto map static-map 1 ipsec-isakmp dynamic test-map discover`	(Optional) Adds a dynamic crypto map to a crypto map set. • You should set the crypto map entries referencing dynamic maps to the lowest priority entries in a crypto map set.

	Command or Action	Purpose
		Note You must enter the **discover** keyword to enable TED.
Step 14	**exit** **Example:** `Device(config)# exit`	Exits global configuration mode.

Troubleshooting Tips

Certain configuration changes take effect only when negotiating subsequent SAs. If you want the new settings to take immediate effect, you must clear the existing SAs so that they are reestablished with the changed configuration. If the router is actively processing IPsec traffic, clear only the portion of the SA database that would be affected by the configuration changes (that is, clear only the SAs established by a given crypto map set). Clearing the entire SA database must be reserved for large-scale changes, or when the router is processing minimal IPsec traffic.

To clear IPsec SAs, use the **clear crypto sa** command with appropriate parameters. (Omitting all parameters clears the full SA database, which clears active security sessions.)

What to Do Next

After you have successfully created a crypto map set, you must apply the crypto map set to each interface through which IPsec traffic flows. To complete this task, see the "Applying Crypto Map Sets to Interfaces, on page 1927" section.

Creating Crypto Map Entries to Establish Manual SAs

Perform this task to create crypto map entries to establish manual SAs (that is, when IKE is not used to establish the SAs). To create IPv6 crypto maps entries, you must use the **ipv6** keyword with the **crypto map** command. For IPv4 crypto maps, use the **crypto map** command without the **ipv6** keyword.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** [**ipv6**] *map-name seq-num* [**ipsec-manual**]
4. **match address** *access-list-id*
5. **set peer** {*hostname* | *ip-address*}
6. **set transform-set** *transform-set-name*
7. Do one of the following:
   - **set session-key inbound ah** *spi hex-key-string*
   - **set session-key outbound ah** *spi hex-key-string*
8. Do one of the following:
   - **set session-key inbound esp** *spi* **cipher** *hex-key-string* [**authenticator** *hex-key-string*]
   - **set session-key outbound esp** *spi* **cipher** *hex-key-string* [**authenticator** *hex-key-string*]
9. **exit**
10. **exit**

11. **show crypto map** [**interface** *interface* | **tag** *map-name*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto map** [**ipv6**] *map-name seq-num* [**ipsec-manual**] **Example:** `Device(config)# crypto map mymap 10 ipsec-manual`	Specifies the crypto map entry to be created or modified and enters crypto map configuration mode. • For IPv4 crypto maps, use the **crypto map** command without the **ipv6** keyword.
Step 4	**match address** *access-list-id* **Example:** `Device(config-crypto-m)# match address 102`	Names an IPsec access list that determines which traffic should be protected by IPsec and which traffic should not be protected by IPsec in the context of this crypto map entry. • The access list can specify only one **permit** entry when IKE is not used.
Step 5	**set peer** {*hostname* | *ip-address*} **Example:** `Device(config-crypto-m)# set peer 10.0.0.5`	Specifies the remote IPsec peer. This is the peer to which IPsec protected traffic should be forwarded. • Only one peer can be specified when IKE is not used.
Step 6	**set transform-set** *transform-set-name* **Example:** `Device(config-crypto-m)# set transform-set someset`	Specifies which transform set should be used. • This must be the same transform set that is specified in the remote peer's corresponding crypto map entry. **Note** Only one transform set can be specified when IKE is not used.

Step 7	Do one of the following:
	• **set session-key inbound ah** *spi hex-key-string*
	• **set session-key outbound ah** *spi hex-key-string*
	Example:
	`Device(config-crypto-m)# set session-key inbound ah 256 98765432109876549876543210987654`
	Example:
	`Device(config-crypto-m)# set session-key outbound ah 256 fedcbafedcbafedcfedcbafedcbafedc`
		Sets the AH security parameter indexes (SPIs) and keys to apply to inbound and outbound protected traffic if the specified transform set includes the AH protocol.
		• This manually specifies the AH security association to be used with protected traffic.

	Command or Action	Purpose

Step 8	Do one of the following:
	• **set session-key inbound esp** *spi* **cipher** *hex-key-string* [**authenticator** *hex-key-string*]
	• **set session-key outbound esp** *spi* **cipher** *hex-key-string* [**authenticator** *hex-key-string*]
	Example:
	`Device(config-crypto-m)# set session-key inbound esp 256 cipher 0123456789012345`
	Example:
	`Device(config-crypto-m)# set session-key outbound esp 256 cipher abcdefabcdefabcd`
		Sets the Encapsulating Security Payload (ESP) Security Parameter Indexes (SPI) and keys to apply to inbound and outbound protected traffic if the specified transform set includes the ESP protocol.
		Or
		Specifies the cipher keys if the transform set includes an ESP cipher algorithm. Specifies the authenticator keys if the transform set includes an ESP authenticator algorithm.
		• This manually specifies the ESP security association to be used with protected traffic.

Step 9	**exit** **Example:** `Device(config-crypto-m)# exit`	Exits crypto map configuration mode and returns to global configuration mode.
Step 10	**exit** **Example:** `Device(config)# exit`	Exits global configuration mode.
Step 11	**show crypto map** [**interface** *interface* | **tag** *map-name*] **Example:** `Device# show crypto map`	Displays your crypto map configuration.

Troubleshooting Tips

For manually established SAs, you must clear and reinitialize the SAs for the changes to take effect. To clear IPsec SAs, use the **clear crypto sa** command with appropriate parameters. (Omitting all parameters clears the entire SA database, which clears active security sessions.)

What to Do Next

After you have successfully created a crypto map set, you must apply the crypto map set to each interface through which IPsec traffic flows. To complete this task, see the "Applying Crypto Map Sets to Interfaces, on page 1927" section.

Applying Crypto Map Sets to Interfaces

You must apply a crypto map set to each interface through which IPsec traffic flows. Applying the crypto map set to an interface instructs the device to evaluate the interface's traffic against the crypto map set and to use the specified policy during connection or security association negotiation on behalf of traffic to be protected by the crypto map.

Perform this task to apply a crypto map to an interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type/number*
4. **crypto map** *map-name*
5. **exit**
6. **crypto map** *map-name* **local-address** *interface-id*
7. **exit**
8. **show crypto map** [**interface** *interface*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type/number* **Example:** `Device(config)# interface FastEthernet 0/0`	Configures an interface and enters interface configuration mode.
Step 4	**crypto map** *map-name* **Example:** `Device(config-if)# crypto map mymap`	Applies a crypto map set to an interface.
Step 5	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 6	**crypto map** *map-name* **local-address** *interface-id* **Example:** `Device(config)# crypto map mymap local-address loopback0`	(Optional) Permits redundant interfaces to share the same crypto map using the same local identity.
Step 7	**exit** **Example:** `Device(config)# exit`	(Optional) Exits global configuration mode.
Step 8	**show crypto map** [**interface** *interface*] **Example:** `Device# show crypto map`	(Optional) Displays your crypto map configuration

Configuration Examples for IPsec VPN

Example: Configuring AES-Based Static Crypto Map

This example shows how a static crypto map is configured and how an AES is defined as the encryption method:

```
crypto isakmp policy 10

Feature Information for Configuring Security for VPNs with IPsec

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 210: Feature Information for Configuring Security for IPsec VPNs

Feature Name	Software Releases	Feature Information
Advanced Encryption Standard		This feature adds support for the new encryption standard AES, which is a privacy transform for IPsec and IKE and has been developed to replace DES. The following commands were modified by this feature: **crypto ipsec transform-set**, **encryption (IKE policy)**, **show crypto ipsec transform-set**, **show crypto isakmp policy**.
Suite-B Support in IOS SW Crypto		Suite-B adds support for four user interface suites of cryptographic algorithms for use with IKE and IPSec that are described in RFC 4869. Each suite consists of an encryption algorithm, a digital signature algorithm, a key agreement algorithm, and a hash or message digest algorithm. The following command was modified by this feature: **crypto ipsec transform-set**.

Note GetVPN crypto map is supported on port-channel interfaces from IOS XE 16.9.1 onwards.

Glossary

anti-replay—Security service where the receiver can reject old or duplicate packets to protect itself against replay attacks. IPsec provides this optional service by use of a sequence number combined with the use of data authentication. Cisco IOS XE IPsec provides this service whenever it provides the data authentication service, except for manually established SAs (that is, SAs established by configuration and not by IKE).

data authentication—Verification of the integrity and origin of the data. Data authentication can refer either to integrity alone or to both of these concepts (although data origin authentication is dependent upon data integrity).

data confidentiality—Security service in which the protected data cannot be observed.

data flow—Grouping of traffic, identified by a combination of source address or mask, destination address or mask, IP next protocol field, and source and destination ports, where the protocol and port fields can have the values of **any**. IPsec protection is applied to data flows.

IKE—Internet Key Exchange. IKE establishes a shared security policy and authenticates keys for services (such as IPSec) that require keys. Before any IPSec traffic can be passed, each router/firewall/host must verify the identity of its peer. This can be done by manually entering preshared keys into both hosts or by a CA service.

IPsec—IP Security. A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses IKE to handle the negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

peer—In the context of this module, a "peer" is a router or other device that participates in IPsec.

PFS—perfect forward secrecy. Cryptographic characteristic associated with a derived shared secret value. With PFS, if one key is compromised, previous and subsequent keys are not compromised, because subsequent keys are not derived from previous keys.

SA—security association. Description of how two or more entities use security services in the context of a particular security protocol (AH or ESP) to communicate securely on behalf of a particular data flow. The transform and the shared secret keys are used for protecting the traffic.

SPI—security parameter index. A number which, together with a destination IP address and security protocol, uniquely identifies a particular security association. Without IKE, the SPI is manually specified for each security association.

transform—List of operations performed on a dataflow to provide data authentication, data confidentiality, and data compression. For example, one transform is the ESP protocol with the HMAC-MD5 authentication algorithm; another transform is the AH protocol with the 56-bit DES encryption algorithm and the ESP protocol with the HMAC-SHA authentication algorithm.

tunnel—In the context of this module, "tunnel" is a secure communication path between two peers, such as two routers. It does not refer to using IPsec in tunnel mode.

CHAPTER 157

IPsec Virtual Tunnel Interfaces

IPsec virtual tunnel interfaces (VTIs) provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify the configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

Restrictions for IPsec Virtual Tunnel Interfaces

Fragmentation

Fragmentation is not supported over IPsec tunnel. You can choose to set the lower MTU on hosts to avoid packet fragments or choose to fragment the packets on any device.

IPsec Transform Set

The IPsec transform set must be configured in tunnel mode only.

IKE Security Association

The Internet Key Exchange (IKE) security association (SA) is bound to the VTI.

IPsec SA Traffic Selectors

Static VTIs (SVTIs) support only a single IPsec SA that is attached to the VTI interface. The traffic selector for the IPsec SA is always “IP any any.”

By default, Static VTIs (SVTIs) support only a single IPSec SA that is attached to the virtual tunnel interface. The traffic selector for the IPsec SA is always “IP any any”.

IPv4

This feature supports SVTIs that are configured to encapsulate IPv4 packets .

Tunnel Protection

Do not configure the **shared** keyword when using the **tunnel mode ipsec ipv4** command for IPsec IPv4 mode.

Traceroute

The traceroute function with crypto offload on VTIs is not supported.

VxLAN GPE Tunnel Interface

The VxLAN GPE Tunnel Interface cannot use the same source interface as IPsec VTI.

Information About IPsec Virtual Tunnel Interfaces

The use of IPsec VTIs can simplify the configuration process when you need to provide protection for remote access and it provides an alternative to using generic routing encapsulation (GRE) or Layer 2 Tunneling Protocol (L2TP) tunnels for encapsulation. A benefit of using IPsec VTIs is that the configuration does not require static mapping of IPsec sessions to a physical interface. The IPsec tunnel endpoint is associated with an actual (virtual) interface. Because there is a routable interface at the tunnel endpoint, many common interface capabilities can be applied to the IPsec tunnel.

The IPsec VTI allows for the flexibility of sending and receiving both IP unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Using IP routing to forward the traffic to the tunnel interface simplifies the IPsec VPN configuration . Because DVTIs function like any other real interface you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

The following sections provide details about the IPSec VTI:

Benefits of Using IPsec Virtual Tunnel Interfaces

IPsec VTIs allow you to configure a virtual interface to which you can apply features. Features for clear-text packets are configured on the VTI. Features for encrypted packets are applied on the physical outside interface. When IPsec VTIs are used, you can separate the application of features such as Network Address Translation (NAT), ACLs, and QoS and apply them to clear-text, or encrypted text, or both.

There are two types of VTI interfaces: static VTIs (SVTIs) and dynamic VTIs (DVTIs).

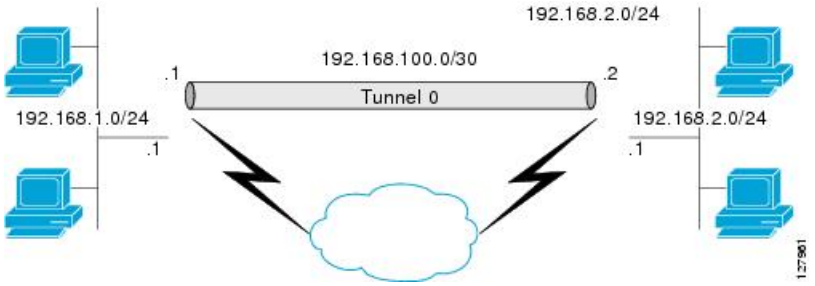
Static Virtual Tunnel Interfaces

SVTI configurations can be used for site-to-site connectivity in which a tunnel provides always-on access between two sites.

Additionally, multiple Cisco IOS software features can be configured directly on the tunnel interface and on the physical egress interface of the tunnel interface. This direct configuration allows users to have solid control on the application of the features in the pre- or post-encryption path.

The figure below illustrates how a SVTI is used.

Figure 76: IPsec SVTI



The IPsec VTI supports native IPsec tunneling and exhibits most of the properties of a physical interface.

Multi-SA Support for SVTI

By default, the traffic selector for an SVTI is set to ‘any any’. As a result, a single IPSec SA is attached for the SVTI corresponding to the ‘any any’ traffic selector.

From Cisco IOS XE Gibraltar 16.12.1, you can define and associate an Access Control List (ACL) with an SVTI to select traffic between specific source and destination proxies instead of the ‘any any’ proxy defined by the default. IPSec SAs are created for each non-any-any traffic selector, and thus, multiple SAs are attached to an SVTI.

This feature is supports IPv4 and IPv6 traffic protection with IPSec encapsulation in tunnel mode. The feature supports both IKEv1 and IKEv2.

Restrictions

- This feature is not supported with tunnel protection shared.
- This feature is not supported with IPSec Mixed Mode.
- Traffic selectors associated with the SVTIs at both the ends of a tunnel must have matching source and destination proxies. Do not narrow down the traffic selector at one of the SVTIs forming a tunnel.

ACL Characteristics and Effects on SVTI IPSec SAs

- An ACL associated with an SVTI must not contain an ‘any any’ proxy. For an ‘any any’ traffic selector, use the default behaviour of the SVTI and do not associate an ACL with the SVTI.
- An ACL associated with an SVTI supports only **permit** statements and must not contain **deny** statements.
- Run-time modification of an ACL associated with an SVTI is not supported. Shut the tunnel down before adding or modifying ACEs in the ACL.
- If you disassociate an ACL from an SVTI, existing IPSec SAs are deleted and a new IPSec SA for default traffic selector of ‘IP any any’ is formed.

- We recommend that you associate a maximum of 100 Access Control Entries (ACEs) with an SVTI. Further, all the ACLs associated with the various tunnel interfaces should together use a maximum of 2000 ACEs.

Reverse Route Injection

For Multi-SA SVTIs, Reverse Route Injection (RRI) can be configured in the IPSec profile.

If you use extended ACL or ACE options, such as protocol, port number, and DHCP, do not use RRI; use other means such as route maps for routing.

Note RRI capability with distance and tag is yet to be supported.

Dual Stack Support for SVTI

SVTI Dual Stack feature provides the capabilities to carry both IPv4 and IPv6 traffic using a single IPsec Security Association (SA) that is tunnelled over IPv4. From IOS XE release 17.9 onwards, Cisco supports specific subnets in ACL when the ingress end of the tunnel interface is configured with a third party IPSec client. Also, based on the third party IPsec client configuration, it responds with a specific traffic selector. In this case, the IPsec supports non-any non-any proxy configuration and allows to carry IPv4 or IPv6 type of traffic in the tunnel interface. This feature is supported only with IKEv2.

Restrictions

- Tunnel-mode configuration is allowed only under the IPsec profiles when you use the tunnel interface in dual-overlay mode.
- In Cisco IOS XE, ACL filtering infrastructure does not work on traffic generated locally on the device.
- You have to use the same set of traffic selectors for rekeying an IPsec SA. You cannot change the traffic selectors during the rekey process but when you change, the rekey request is rejected with the message *TS_UNACCEPTABLE*.
- A maximum of 16 traffic selectors are accepted at the IKEv2 level.
- ACLs on dual-stack tunnel interface are not supported. Any ACL configured on this interface is overwritten by dual-stack ACLs.

Dynamic Virtual Tunnel Interfaces

DVTIs can provide highly secure and scalable connectivity for remote-access VPNs. The DVTI technology replaces dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels.

Note You can configure DVTIs with IKEv1 or IKEv2. The legacy crypto map based configuration supports DVTIs with IKEv1 only. A DVTI configuration with IKEv2 is supported only in FlexVPN.

DVTIs can be used for both the server and the remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is cloned from a virtual template configuration, which includes the IPsec configuration and any Cisco IOS software feature configured on the virtual template interface, such as QoS, NetFlow, or ACLs.

DVTIs function like any other real interface, so you can apply QoS, firewall, or other security services as soon as the tunnel is active. QoS features can be used to improve the performance of various applications across the network. Any combination of QoS features offered in Cisco IOS software can be used to support voice, video, or data applications.

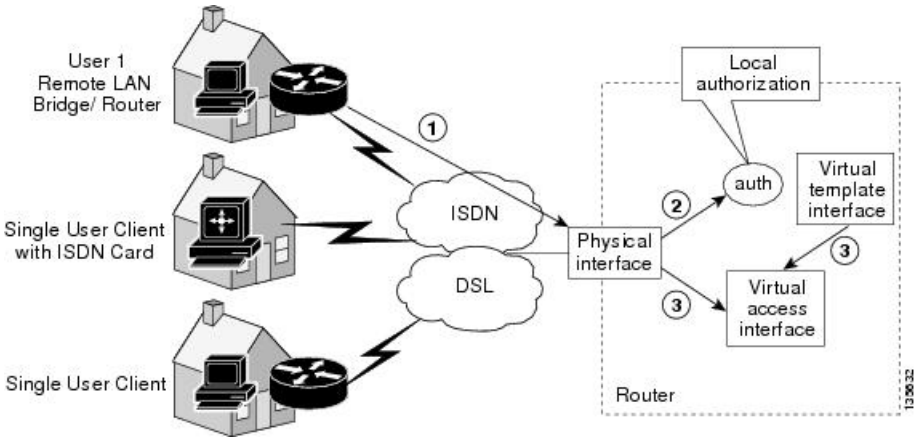
DVTIs provide efficiency in the use of IP addresses and provide secure connectivity. DVTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. The per-group or per-user definition can be created using an extended authentication (Xauth) User or Unity group, or can be derived from a certificate. DVTIs are standards based, so interoperability in a multiple-vendor environment is supported. IPsec DVTIs allow you to create highly secure connectivity for remote access VPNs and can be combined with Cisco Architecture for Voice, Video, and Integrated Data (AVVID) to deliver converged voice, video, and data over IP networks. The DVTI simplifies VPN routing and forwarding- (VRF-) aware IPsec deployment. The VRF is configured on the interface.

A DVTI requires minimal configuration on the router. A single virtual template can be configured and cloned.

The DVTI creates an interface for IPsec sessions and uses the virtual template infrastructure for dynamic instantiation and management of dynamic IPsec VTIs. The virtual template infrastructure is extended to create dynamic virtual-access tunnel interfaces. DVTIs are used in hub-and-spoke configurations. A single DVTI can support several static VTIs.

The figure below illustrates the DVTI authentication path.

Figure 77: Dynamic IPsec VTI



The authentication shown in the figure above follows this path:

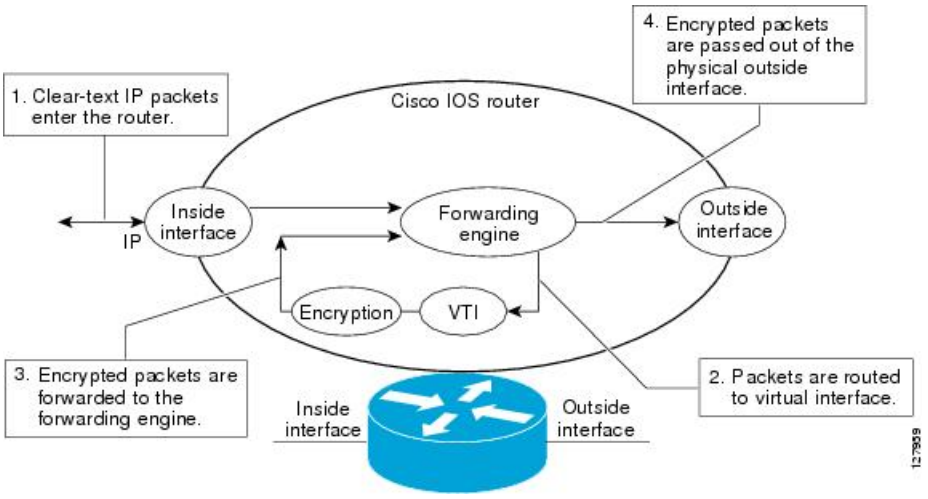
1. User 1 calls the router.
2. Router 1 authenticates User 1.
3. IPsec clones the virtual access interface from the virtual template interface.

Traffic Encryption with the IPsec Virtual Tunnel Interface

When an IPsec VTI is configured, encryption occurs in the tunnel. Traffic is encrypted when it is forwarded to the tunnel interface. Traffic forwarding is handled by the IP routing table, and dynamic or static routing can be used to route traffic to the SVTI. DVTI uses reverse route injection to further simplify the routing configurations. Using IP routing to forward the traffic to encryption simplifies the IPsec VPN configuration . The IPsec virtual tunnel also allows you to encrypt multicast traffic with IPsec.

IPsec packet flow into the IPSec tunnel is illustrated in the figure below.

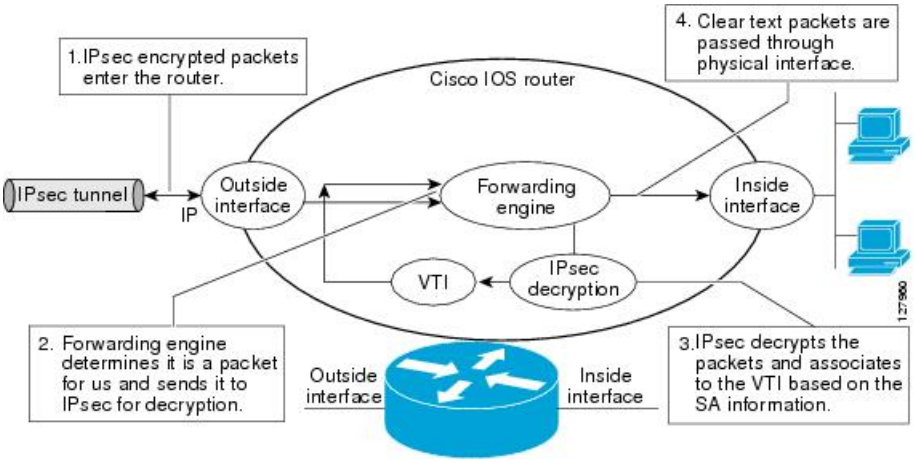
Figure 78: Packet Flow into the IPsec Tunnel



After packets arrive on the inside interface, the forwarding engine switches the packets to the VTI, where they are encrypted. The encrypted packets are handed back to the forwarding engine, where they are switched through the outside interface.

The figure below shows the packet flow out of the IPsec tunnel.

Figure 79: Packet Flow out of the IPsec Tunnel



Dynamic Virtual Tunnel Interface Life Cycle

IPsec profiles define the policy for DVTIs. The dynamic interface is created at the end of IKE Phase 1 and IKE Phase 1.5. The interface is deleted when the IPsec session to the peer is closed. The IPsec session is closed when both IKE and IPsec SAs to the peer are deleted.

Routing with IPsec Virtual Tunnel Interfaces

Because VTIs are routable interfaces, routing plays an important role in the encryption process. Traffic is encrypted only if it is forwarded out of the VTI, and traffic arriving on the VTI is decrypted and routed accordingly. VTIs allow you to establish an encryption tunnel using a real interface as the tunnel endpoint. You can route to the interface or apply services such as QoS, firewalls, network address translation (NAT), and NetFlow statistics as you would to any other interface. You can monitor the interface and route to it, and the interface provides benefits similar to other Cisco IOS interface.

FlexVPN Mixed Mode Support

The FlexVPN Mixed Mode feature provides support for carrying IPv4 traffic over IPsec IPv6 transport. This is the first phase towards providing dual stack support on the IPsec stack. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic.

This feature is only supported for Remote Access VPN with IKEv2 and Dynamic VTI.

The FlexVPN Mixed Mode feature provides support for carrying IPv6 traffic over IPsec IPv4 transport from Cisco IOS XE Everest 16.4.1.

Auto Tunnel Mode Support in IPsec

When configuring a VPN headend in a multiple vendor scenario, you must be aware of the technical details of the peer or responder. For example, some devices may use IPsec tunnels while others may use generic routing encapsulation (GRE) or IPsec tunnel, and sometimes, a tunnel may be IPv4 or IPv6. In the last case, you must configure an Internet Key Exchange (IKE) profile and a virtual template.

The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder's details. This feature automatically applies the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. This feature is useful on dual stack hubs aggregating multivendor remote access, such as Cisco AnyConnect VPN Client, Microsoft Windows7 Client, and so on.

Note The Tunnel Mode Auto Selection feature eases the configuration for a responder only. The tunnel must be statically configured for an initiator.

IPSec Mixed Mode Support for VTI

The IPSec Mixed Mode feature provides support for carrying IPv4 traffic over IPsec IPv6 transport. This is the first phase towards providing dual stack support on the IPsec stack. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic.

This feature is supported for SVTI as well as DVTI and IKEv1 as well as IKEv2.

How to Configure IPsec Virtual Tunnel Interfaces

Configuring Static IPsec Virtual Tunnel Interfaces

Before you begin

Before configuring the tunnel protection for an IPsec profile, it is mandatory to shut down the tunnel interface. After configuration, enable the tunnel interface manually.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto IPsec profile** *profile-name*
4. **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]
5. **exit**
6. **interface** *type number*
7. **ip address** *address mask*
8. **tunnel mode ipsec ipv4**
9. **tunnel source** *interface-type interface-number*
10. **tunnel destination** *ip-address*
11. **tunnel protection IPsec profile** *profile-name*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto IPsec profile** *profile-name* **Example:** `Device(config)# crypto IPsec profile PROF`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices, and enters IPsec profile configuration mode.
Step 4	**set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]	Specifies which transform sets can be used .

	Command or Action	Purpose
	Example: `Device(ipsec-profile)# set transform-set tset`	
Step 5	**exit** **Example:** `Device(ipsec-profile)# exit`	Exits IPsec profile configuration mode, and enters global configuration mode.
Step 6	**interface** *type number* **Example:** `Device(config)# interface tunnel 0`	Specifies the interface on which the tunnel will be configured and enters interface configuration mode.
Step 7	**ip address** *address mask* **Example:** `Device(config-if)# ip address 10.1.1.1 255.255.255.0`	Specifies the IP address and mask.
Step 8	**tunnel mode ipsec ipv4** **Example:** `Device(config-if)# tunnel mode ipsec ipv4`	Defines the mode for the tunnel.
Step 9	**tunnel source** *interface-type interface-number* **Example:** `Device(config-if)# tunnel source loopback 0`	Specifies the tunnel source as a loopback interface.* **Note** *If you are configuring the Tunnel Mode Auto Selection feature using a virtual-template, omit the tunnel source and tunnel mode in interface virtual-template number type tunnel command. If the tunnel source and tunnel mode are specified, clients using IPv6 transport will fail to connect.
Step 10	**tunnel destination** *ip-address* **Example:** `Device(config-if)# tunnel destination 172.16.1.1`	Identifies the IP address of the tunnel destination.
Step 11	**tunnel protection IPsec profile** *profile-name* **Example:** `Device(config-if)# tunnel protection IPsec profile PROF`	Associates a tunnel interface with an IPsec profile.
Step 12	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring BGP over IPsec Virtual Tunnel Interfaces

Perform this task to optionally configure BGP over the virtual tunnel interfaces of two routers.

Before you begin

Perform steps in Configuring Static IPsec Virtual Tunnel Interfaces, on page 1942.

SUMMARY STEPS

1. **router bgp** *autonomous-system-number*
2. **neighbor** *ip-address* **remote-as** *autonomous-system-number*
3. **network** *network-ip-address* **mask** *subnet-mask*
4. **exit**
5. Enter the following commands on the second router.
6. **router bgp** *autonomous-system-number*
7. **neighbor** *ip-address* **remote-as** *autonomous-system-number*
8. **network** *network-ip-address* **mask** *subnet-mask*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**router bgp** *autonomous-system-number* **Example:** `Device(config)# router bgp 65510`	Enters router configuration mode and creates a BGP routing process. *autonomous-system-number* —Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. Number in the range from 1 to 65535. In the example, the first router in this procedure is identified as "65510".
Step 2	**neighbor** *ip-address* **remote-as** *autonomous-system-number* **Example:** `Device(config-router)# neighbor 10.1.1.2 remote-as 65511`	*ip-address* —IP address of the adjacent router's tunnel interface. *autonomous-system-number* —Number of an autonomous system that identifies the router of the second router. Number in the range from 1 to 65535.
Step 3	**network** *network-ip-address* **mask** *subnet-mask* **Example:** `Device(config-router)# network 2.2.2.0 mask 255.255.255.0`	*network-ip-address*—IP address of the network advertised in BGP. For example, the IP address of a loopback interface. *subnet-mask*—subnet mask of the network advertised in BGP.

	Command or Action	Purpose
		Note The BGP network command network and mask *must* exactly match a route that is already in the routing table for it to be brought into BGP and advertised to BGP neighbors. This is different from EIGRP, OSPF where the network statement just has to "cover" an interface network and it will pick up the network with mask from the interface.
Step 4	**exit** **Example:** `Device(config-router)# exit`	Exits router configuration mode.
Step 5	Enter the following commands on the second router.	
Step 6	**router bgp** *autonomous-system-number* **Example:** `Device(config)# router bgp 65511`	Enters router configuration mode and creates a BGP routing process. *autonomous-system-number* —Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. Number in the range from 1 to 65535. In the example, the second router in this procedure is identified as "65511".
Step 7	**neighbor** *ip-address* **remote-as** *autonomous-system-number* **Example:** `Device(config-router)# neighbor 10.1.1.1 remote-as 65510`	*ip-address* —IP address of the adjacent router's tunnel interface.
Step 8	**network** *network-ip-address* **mask** *subnet-mask* **Example:** `Device(config-router)# network 1.1.1.0 mask 255.255.255.0`	*network-ip-address*—IP address of the network advertised in BGP. For example, the IP address of a loopback interface. *subnet-mask*—subnet mask of the network advertised in BGP. **Note** Use the exact network IP address and subnet mask.

Configuring Dynamic IPsec Virtual Tunnel Interfaces

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec profile** *profile-name*
4. **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]
5. **exit**

6. **interface virtual-template** *number* **type tunnel**
7. **tunnel mode ipsec ipv4**
8. **tunnel protection IPsec profile** *profile-name*
9. **exit**
10. **crypto isakamp profile** *profile-name*
11. **match identity address** *ip-address mask*
12. **virtual template** *template-number*
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto ipsec profile** *profile-name* **Example:** `Device(config)# crypto ipsec profile PROF`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices and enters IPsec profile configuration mode.
Step 4	**set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*] **Example:** `Device(ipsec-profile)# set transform-set tset`	Specifies which transform sets can be used with the crypto map entry.
Step 5	**exit** **Example:** `Device(ipsec-profile)# exit`	Exits ipsec profile configuration mode and enters global configuration mode.
Step 6	**interface virtual-template** *number* **type tunnel** **Example:** `Device(config)# interface virtual-template 2 type tunnel`	Defines a virtual-template tunnel interface and enters interface configuration mode.
Step 7	**tunnel mode ipsec ipv4** **Example:** `Device(config-if)# tunnel mode ipsec ipv4`	Defines the mode for the tunnel.
Step 8	**tunnel protection IPsec profile** *profile-name* **Example:** `Device(config-if)# tunnel protection ipsec profile PROF`	Associates a tunnel interface with an IPsec profile.

	Command or Action	Purpose
Step 9	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode.
Step 10	**crypto isakamp profile** *profile-name* **Example:** `Device(config)# crypto isakamp profile profile1`	Defines the ISAKMP profile to be used for the virtual template.
Step 11	**match identity address** *ip-address mask* **Example:** `Device(conf-isa-prof)# match identity address 10.1.1.0 255.255.255.0`	Matches an identity from the ISAKMP profile and enters isakmp-profile configuration mode.
Step 12	**virtual template** *template-number* **Example:** `Device(config)# virtual-template 1`	Specifies the virtual template attached to the ISAKMP profile.
Step 13	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuring Multi-SA Support for Dynamic Virtual Tunnel Interfaces Using IKEv1

Note Security threats, as well as the cryptographic technologies to help protect against them, are constantly changing. For more information about the latest Cisco cryptographic recommendations, see the Next Generation Encryption (NGE) white paper.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **exit**
6. **crypto keyring** *keyring-name*
7. **pre-shared-key** *address* **key** *key*
8. **exit**
9. **crypto isakmp profile** *profile-name*
10. **keyring** *keyring-name*
11. **match identity** *address mask*

12. **virtual-template** *template-number*
13. **exit**
14. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*]
15. **exit**
16. **crypto ipsec profile** *name*
17. **set security-policy limit** *maximum-limit*
18. **set transform-set** *transform-set-name* [*transform-set-name2 .... transform-set-name6*]
19. **exit**
20. **interface virtual-template** *number type tunnel*
21. **ip vrf forwarding** *vrf-name*
22. **ip unnumbered** *type number*
23. **tunnel mode ipsec ipv4**
24. **tunnel protection profile ipsec** *profile-name*
25. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**ip vrf** *vrf-name* **Example:** `Device(config)# ip vrf VRF-100-1`	Defines the VRF instance and enters VRF configuration mode.
Step 4	**rd** *route-distinguisher* **Example:** `Device(config-vrf)# rd 100:21`	Creates routing and forwarding tables for a VRF.
Step 5	**exit** **Example:** `Device(config-vrf)# exit`	Exits VRF configuration mode and enters global configuration mode.
Step 6	**crypto keyring** *keyring-name* **Example:** `Device(config)# crypto keyring cisco-100-1`	Defines a crypto key ring and enters key ring configuration mode.
Step 7	**pre-shared-key** *address* **key** *key* **Example:** `Device(config-keyring)# pre-shared-key address 10.1.1.1 key cisco-100-1`	Defines the preshared key to be used for Internet Key Exchange (IKE) authentication.

	Command or Action	Purpose
Step 8	**exit** **Example:** `Device(config-keyring)# exit`	Exits keyring configuration mode and enters global configuration mode.
Step 9	**crypto isakmp profile** *profile-name* **Example:** `Device(config)# crypto isakmp profile cisco-isakmp-profile-100-1`	Defines an ISAKMP profile and enters ISAKMP configuration mode.
Step 10	**keyring** *keyring-name* **Example:** `Device(conf-isa-prof)# keyring cisco-100-1`	Configures a key ring in ISAKMP mode.
Step 11	**match identity** *address mask* **Example:** `Device(conf-isa-prof)# match identity address 10.1.1.0 255.255.255.0`	Matches an identity from the ISAKMP profile.
Step 12	**virtual-template** *template-number* **Example:** `Device(conf-isa-prof)# virtual-template 101`	Specifies the virtual template that will be used to clone virtual access interfaces.
Step 13	**exit** **Example:** `Device(conf-isa-prof)# exit`	Exits ISAKMP profile configuration mode and enters global configuration mode.
Step 14	**crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] **Example:** `Device(config)# crypto ipsec transform-set cisco esp-aes esp-sha-hmac`	Defines the transform set and enters crypto transform configuration mode.
Step 15	**exit** **Example:** `Device(conf-crypto-trans)# exit`	Exits crypto transform configuration mode and enters global configuration mode.
Step 16	**crypto ipsec profile** *name* **Example:** `Device(config)# crypto ipsec profile cisco-ipsec-profile-101`	Defines the IPsec parameters used for IPsec encryption between two IPsec devices, and enters IPsec profile configuration mode.
Step 17	**set security-policy limit** *maximum-limit* **Example:** `Device(ipsec-profile)# set security-policy limit 3`	Defines an upper limit to the number of flows that can be created for an individual virtual access interface.

	Command or Action	Purpose
Step 18	**set transform-set** *transform-set-name* [*transform-set-name2 .... transform-set-name6*] **Example:** `Device(ipsec-profile)# set transform-set cisco`	Specifies the transform sets to be used with the crypto map entry.
Step 19	**exit** **Example:** `Device(ipsec-profile)# exit`	Exits IPsec profile and enters global configuration mode.
Step 20	**interface virtual-template** *number type tunnel* **Example:** `Device(config)# interface virtual-template 101 type tunnel`	Creates a virtual template interface that can be configured interface and enters interface configuration mode.
Step 21	**ip vrf forwarding** *vrf-name* **Example:** `Device(config-if)# ip vrf forwarding VRF-100-1`	Associates a VRF instance with a virtual-template interface.
Step 22	**ip unnumbered** *type number* **Example:** `Device(config-if)# ip unnumbered GigabitEthernet 0.0`	Enables IP processing on an interface without assigning an explicit IP address to the interface.
Step 23	**tunnel mode ipsec ipv4** **Example:** `Device(config-if)# tunnel mode ipsec ipv4`	Defines the mode for the tunnel.
Step 24	**tunnel protection profile ipsec** *profile-name* **Example:** `Device(config-if)# tunnel protection ipsec profile PROF`	Associates a tunnel interface with an IPsec profile.
Step 25	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode, and returns to privileged EXEC mode.

Configuring IPsec Mixed Mode Support for SVTIs

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto IPsec profile** *profile-name*
4. **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]

5. **exit**
6. **interface** *type number*
7. **ip address** *address mask*
8. Do one of the following:
   - **tunnel mode ipsec ipv4 v6-overlay**
   - **tunnel mode ipsec ipv6 v4-overlay**
9. **tunnel source** *interface-type interface-type*
10. **tunnel destination** *ip-address*
11. **tunnel protection IPsec profile** *profile-name*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto IPsec profile** *profile-name* **Example:** `Device(config)# crypto IPsec profile PROF`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices, and enters IPsec profile configuration mode.
Step 4	**set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*] **Example:** `Device(ipsec-profile)# set transform-set tset`	Specifies which transform sets can be used with the crypto map entry.
Step 5	**exit** **Example:** `Device(ipsec-profile)# exit`	Exits IPsec profile configuration mode, and enters global configuration mode.
Step 6	**interface** *type number* **Example:** `Device(config)# interface tunnel 0`	Specifies the interface on which the tunnel will be configured and enters interface configuration mode.
Step 7	**ip address** *address mask* **Example:**	Specifies the IP address and mask.

	Command or Action	Purpose
	`Device(config-if)# ip address 10.1.1.1 255.255.255.0`	
Step 8	Do one of the following: • **tunnel mode ipsec ipv4 v6-overlay** • **tunnel mode ipsec ipv6 v4-overlay** **Example:** `Device(config-if)# tunnel mode ipsec ipv4 v6-overlay`	Defines the mode for the tunnel.
Step 9	**tunnel source** *interface-type interface-type* **Example:** `Device(config-if)# tunnel source loopback 0`	Specifies the tunnel source as a loopback interface.
Step 10	**tunnel destination** *ip-address* **Example:** `Device(config-if)# tunnel destination 172.16.1.1`	Identifies the IP address of the tunnel destination.
Step 11	**tunnel protection IPsec profile** *profile-name* **Example:** `Device(config-if)# tunnel protection IPsec profile PROF`	Associates a tunnel interface with an IPsec profile.
Step 12	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring IPsec Mixed Mode Support for Dynamic VTIs

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec profile** *profile-name*
4. **set mixed mode**
5. **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]
6. **exit**
7. **interface virtual-template** *number* **type tunnel**
8. **tunnel mode ipsec ipv4**
9. **tunnel protection IPsec profile** *profile-name*
10. **exit**
11. **crypto isakamp profile** *profile-name*

12. **match identity address** *ip-address mask*
13. **virtual template** *template-number*
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto ipsec profile** *profile-name* **Example:** `Device(config)# crypto ipsec profile PROF`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices and enters IPsec profile configuration mode.
Step 4	**set mixed mode** **Example:** `Device(config)# set mixed mode`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices and enters IPsec profile configuration mode.
Step 5	**set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*] **Example:** `Device(ipsec-profile)# set transform-set tset`	Specifies which transform sets can be used with the crypto map entry.
Step 6	**exit** **Example:** `Device(ipsec-profile)# exit`	Exits ipsec profile configuration mode and enters global configuration mode.
Step 7	**interface virtual-template** *number* **type tunnel** **Example:** `Device(config)# interface virtual-template 2 type tunnel`	Defines a virtual-template tunnel interface and enters interface configuration mode.
Step 8	**tunnel mode ipsec ipv4** **Example:** `Device(config-if)# tunnel mode ipsec ipv4`	Defines the mode for the tunnel.
Step 9	**tunnel protection IPsec profile** *profile-name* **Example:** `Device(config-if)# tunnel protection ipsec profile PROF`	Associates a tunnel interface with an IPsec profile.

	Command or Action	Purpose
Step 10	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode.
Step 11	**crypto isakamp profile** *profile-name* **Example:** `Device(config)# crypto isakamp profile profile1`	Defines the ISAKMP profile to be used for the virtual template.
Step 12	**match identity address** *ip-address mask* **Example:** `Device(conf-isa-prof)# match identity address 10.1.1.0 255.255.255.0`	Matches an identity from the ISAKMP profile and enters isakmp-profile configuration mode.
Step 13	**virtual template** *template-number* **Example:** `Device(config)# virtual-template 1`	Specifies the virtual template attached to the ISAKMP profile.
Step 14	**end** **Example:** `Device(config)# end`	Exits global configuration mode and enters privileged EXEC mode.

Configuring Multi-SA Support for Static IPsec Virtual Tunnel Interfaces

Step 1 **enable**

Example:

```
Device> enable
```

Enables privileged EXEC mode. Enter your password if prompted.

Step 2 **configure terminal**

Example:

```
Device# configure terminal
```

Enters global configuration mode.

Step 3 **crypto IPsec profile** *profile-name*

Example:

```
Device(config)# crypto IPsec profile PROF
```

Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec devices, and enters IPsec profile configuration mode.

Step 4 **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]

Example:

```
Device(ipsec-profile)# set transform-set tset
```

Specifies the transform sets that can be used.

Step 5 **exit**

Example:

```
Device(ipsec-profile)# exit
```

Exits IPsec profile configuration mode, and enters global configuration mode.

Step 6 **interface** *type number*

Example:

```
Device(config)# interface tunnel 0
```

Specifies the interface on which the tunnel will be configured and enters interface configuration mode.

Step 7 **ip address** *address mask*

Example:

```
Device(config-if)# ip address 10.1.1.1 255.255.255.0
```

Specifies the IP address and mask.

Step 8 **tunnel mode ipsec** {**ipv4** | **ipv6**}

Example:

```
Device(config-if)# tunnel mode ipsec ipv4
```

Defines the mode for the tunnel.

Step 9 **tunnel source** *interface-type interface-number*

Example:

```
Device(config-if)# tunnel source loopback 0
```

Specifies the tunnel source as a loopback interface.

Step 10 **tunnel destination** *ip-address*

Example:

```
Device(config-if)# tunnel destination 172.16.1.1
```

Identifies the IP address of the tunnel destination.

Step 11 **tunnel protection ipsec policy** {**ipv4** | **ipv6**} *acl*

Example:

```
Device(config-if)# tunnel protection ipsec policy ipv4 ipsec-acl1
```

Associates an ACL with an SVTI to define non-any-any traffic selectors.

Step 12 **tunnel protection ipsec profile** *profile-name*

Example:

```
Device(config-if)# tunnel protection IPsec profile PROF
```

Associates a tunnel interface with an IPsec profile.

Step 13 **exit**

Example:

```
Device(config-if)# exit
```

Exits interface configuration mode and enters global configuration mode.

Step 14 **ip access-list extended** *name* OR **ipv6 access-list** *name*

Example:

IPv4:

```
Device(config)# ip access-list extended ipsec-acl1
```

IPv6:

```
Device(config)# ipv6 access-list ipsec-acl1
```

Defines an extended IP access list using a name and enters extended named access list configuration mode.

Step 15 **permit** *protocol source* [*source-wildcard*] *destination* [*destination-wildcard*] [**option** *option-name*]

Example:

```
Device(config-ext-nacl)# permit ip 30.0.1.0 0.0.0.255 10.0.1.0 0.0.0.255
```

Permits traffic that matches all of the conditions specified in the statement.

Do not use the keyword **any** as the wildcard for both the source and destination proxies. For the 'any any' traffic selector, use the default SVTI without an attached ACL.

Do not use **deny** statements.

Step 16 **end**

Example:

```
Device(config-ext-nacl)# end
```

Exits standard named access list configuration mode and enters privileged EXEC mode.

Configuring Tunnel Mode as Dual-overlay

To configure the tunnel mode as dual-overlay, perform these steps:

Step 1 **enable**

Example:

```
Device> enable
```

Enables privileged EXEC mode. Enter your password if prompted.

Step 2 **configure terminal**

Example:

```
Device# configure terminal
```

Enters global configuration mode.

Step 3 **interface tunnel** *type number*

Example:

```
Device(config)# interface tunnel 1
```

Specifies a tunnel interface and number, and enters interface configuration mode.

Step 4 **ipv6 enable**

Example:

```
Device(config-if)# ipv6 enable
```

Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.

Step 5 **tunnel source** { **ipv4-address | interface-type | interface-number**}

Example:

```
Device(config-if)# tunnel source Gigabitethernet 1
```

Specifies the source IPv6 address or the source interface type and number for the tunnel interface. If an interface type and number are specified, that interface must be configured with an IPv6 address.

Step 6 **tunnel mode ipsec dual-overlay**

Example:

```
Device(config-if)# tunnel mode ipsec dual-overlay
```

Specifies a dual-overlay tunnel. The **tunnel mode ipsec dual-overlay** command specifies the encapsulation protocol for the tunnel.

Step 7 **tunnel destination ip address** *address mask*

Example:

```
Device(config-if)# tunnel destination 89.89.89.1 255.255.255.255.0
```

Specifies the destination IPv6 address for the tunnel interface.

Step 8 **tunnel protection ipsec profile** *ipserc profile-name*

Example:

```
Device(config-if)# tunnel protection IPsec profile ipsecprof
```

Associates a tunnel interface with an IPsec profile. The *name* argument specifies the name of the IPsec profile; this value must match the *name* specified in the **crypto IPsec profile** *name* command

Step 9 **exit**

Example:

```
Device(config-if)# exit
```

Exits interface configuration mode and enters global configuration mode.

Step 10 **end**

Example:

```
Device(config-if)# end
```

Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for IPsec Virtual Tunnel Interfaces

Example: Static Virtual Tunnel Interface with IPsec

The following example configuration uses a preshared key for authentication between peers. VPN traffic is forwarded to the IPsec VTI for encryption and then sent out the physical interface. The tunnel on subnet 10 checks packets for the IPsec policy and passes them to the Crypto Engine (CE) for IPsec encapsulation. The figure below illustrates the IPsec VTI configuration.

Figure 80: VTI with IPsec

Example: Verifying the Results for the IPsec Static Virtual Tunnel Interface

This section provides information that you can use to confirm that your configuration is working properly. In this display, Tunnel 0 is “up,” and the line protocol is “up.” If the line protocol is “down,” the session is not active.

Verifying the IPsec Static Virtual Tunnel Interface

```
Router# show interface tunnel 0

Tunnel0 is up, line protocol is up
Hardware is Tunnel
Internet address is 10.0.51.203/24
MTU 1514 bytes, BW 9 Kbit, DLY 500000 usec,
reliability 255/255, txload 103/255, rxload 110/255
Encapsulation TUNNEL, loopback not set
Keepalive not set
Tunnel source 10.0.149.203, destination 10.0.149.217
Tunnel protocol/transport ipsec/ip, key disabled, sequencing disabled
Tunnel TTL 255
```

```
Checksumming of packets disabled, fast tunneling enabled
Tunnel transmit bandwidth 8000 (kbps)
Tunnel receive bandwidth 8000 (kbps)
Tunnel protection via IPsec (profile "P1")
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 1/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/0 (size/max)
30 second input rate 13000 bits/sec, 34 packets/sec
30 second output rate 36000 bits/sec, 34 packets/sec
191320 packets input, 30129126 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
59968 packets output, 15369696 bytes, 0 underruns
0 output errors, 0 collisions, 0 interface resets
0 output buffer failures, 0 output buffers swapped out

C 10.0.149.0/24 is directly connected, Ethernet3/0
```

Example: VRF-Aware Static Virtual Tunnel Interface

To add the VRF to the static VTI example, include the **ipvrf** and **ip vrf forwarding** commands to the configuration as shown in the following example.

C8000 Router Configuration

```
hostname c8000
.
.
ip vrf sample-vti1
 rd 1:1
 route-target export 1:1
 route-target import 1:1
!
.
.
interface Tunnel0
```

```
 ip vrf forwarding sample-vti1
 ip address 10.0.51.217 255.255.255.0
 tunnel source 10.0.149.217
 tunnel destination 10.0.149.203
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile P1
.
.
!
end
```

Example: Static Virtual Tunnel Interface with QoS

You can apply any QoS policy to the tunnel endpoint by including the **service-policy** statement under the tunnel interface. The following example shows how to police traffic out the tunnel interface.

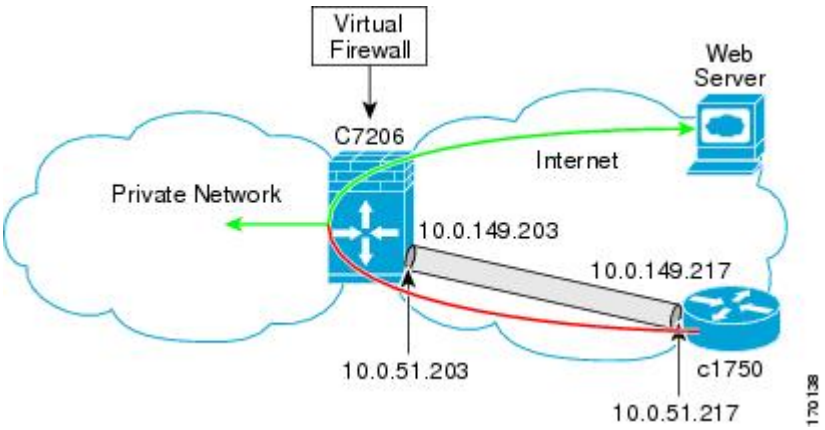
C8000 Router Configuration

```
hostname c8000
.
.
class-map match-all VTI
 match any
!
policy-map VTI
  class VTI
  police cir 2000000
    conform-action transmit
    exceed-action drop
!
.
.
interface Tunnel0
 ip address 10.0.51.217 255.255.255.0
 tunnel source 10.0.149.217
 tunnel destination 10.0.149.203
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile P1
 service-policy output VTI
!
.
.
!
end
```

Example: Static Virtual Tunnel Interface with Virtual Firewall

Applying the virtual firewall to the SVTI tunnel allows traffic from the spoke to pass through the hub to reach the Internet. The figure below illustrates an SVTI with the spoke protected inherently by the corporate firewall.

Figure 81: Static VTI with Virtual Firewall



The basic SVTI configuration has been modified to include the virtual firewall definition:

C8000 Router Configuration

```
hostname c8000
.
.
ip inspect max-incomplete high 1000000
ip inspect max-incomplete low 800000
ip inspect one-minute high 1000000
ip inspect one-minute low 800000
ip inspect tcp synwait-time 60

 set security-policy limit 3
 set transform-set cisco
 set reverse-route gateway 172.16.0.1
!
!
```

```
!
interface Virtual-Template1 type tunnel
 ip unnumbered Ethernet 0/0
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile cisco-ipsec-profile
!
!
```

Example: VRF-Aware IPsec with a Dynamic VTI When a VRF Is Configured Under Both a Virtual Template and an ISAKMP Profile

Note When separate VRFs are configured under an ISAKMP profile and a virtual template, the VRF configured under the virtual template takes precedence. This configuration is not recommended.

The following example shows how to configure VRF-aware IPsec to take advantage of the DVTI when the VRF is configured under both a virtual template and an ISAKMP profile:

```
hostname C8000 server
.
.
.
ip vrf test-vti2
 rd 1:2
 route-target export 1:1
 route-target import 1:1
!
.
.
.
ip vrf test-vti1
 rd 1:1
 route-target export 1:1
 route-target import 1:1
!
.
.
.
crypto isakmp profile cisco-isakmp-profile
 vrf test-vti2
 keyring key
 match identity address 10.1.1.0 255.255.255.0
!
.
.
.
interface Virtual-Template1 type tunnel
 ip vrf forwarding test-vti1
 ip unnumbered Loopback 0
 ip virtual-reassembly
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile test-vti1
!
.
.
```

```
.
end
```

Example: Dynamic Virtual Tunnel Interface with Virtual Firewall

The DVTI Easy VPN server can be configured behind a virtual firewall. Behind-the-firewall configuration allows users to enter the network, while the network firewall is protected from unauthorized access. The virtual firewall uses Context-Based Access Control (CBAC) and NAT applied to the Internet interface as well as to the virtual template.

```
hostname c8000
.
.
ip inspect max-incomplete high 1000000
ip inspect max-incomplete low 800000
ip inspect one-minute high 1000000
ip inspect one-minute low 800000
ip inspect tcp synwait-time 60
ip inspect tcp max-incomplete host 100000 block-time 2
ip inspect name IOSFW1 tcp timeout 300
ip inspect name IOSFW1 udp
!
.
.
interface GigabitEthernet0/1
 description Internet Connection
 ip address 172.18.143.246 255.255.255.0
 ip access-group 100 in
 ip nat outside
!
interface GigabitEthernet0/2
 description Internal Network
 ip address 10.2.1.1 255.255.255.0
!
interface Virtual-Template1 type tunnel
 ip unnumbered Loopback0
 ip nat inside
 ip inspect IOSFW1 in
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile test-vti1
!
ip classless
ip route 0.0.0.0 0.0.0.0 172.18.143.1
!
ip nat translation timeout 120
ip nat translation finrst-timeout 2
ip nat translation max-entries 300000
ip nat pool test1 10.2.100.1 10.2.100.50 netmask 255.255.255.0
ip nat inside source list 110 pool test1 vrf test-vti1 overload
!
access-list 100 permit esp any any
access-list 100 permit udp any eq isakmp any
access-list 100 permit udp any eq non500-isakmp any
access-list 100 permit icmp any any
access-list 110 deny   esp any any
access-list 110 deny   udp any eq isakmp any
access-list 110 permit ip any any
access-list 110 deny   udp any eq non500-isakmp any
!
end
```

Example: Dynamic Virtual Tunnel Interface with QoS

You can add QoS to the DVTI tunnel by applying the service policy to the virtual template. When the template is cloned to make the virtual access interface, the service policy will also be applied to the virtual access interface. The following example shows the basic DVTI configuration with QoS added.

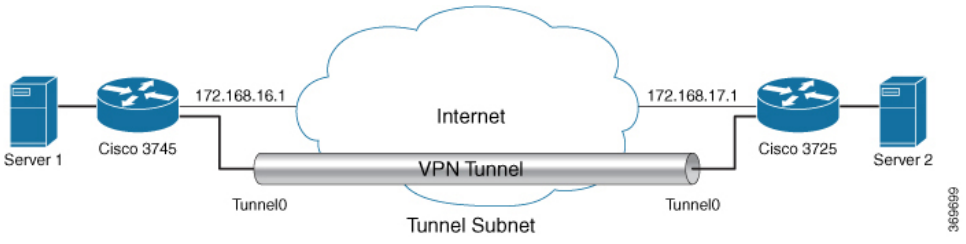
```
hostname c8000
.
.
class-map match-all VTI
 match any
!
policy-map VTI
  class VTI
  police cir 2000000
    conform-action transmit
    exceed-action drop
!
.
.
interface Virtual-Template1 type tunnel
 ip vrf forwarding test-vti1
 ip unnumbered Loopback0
 ip virtual-reassembly
 tunnel mode ipsec ipv4
 tunnel protection ipsec profile test-vti1
 service-policy output VTI
!
.
.
!
end
```

Example: Static Virtual Tunnel Interface with Multiple IPsec SAs

In the following examples an IPSec tunnel is to be established between two routers Cisco 3745 and Cisco 3725 using SVTI. The configuration uses non-any-any traffic selectors and enables the formation of multiple IPSec SAs.

Sample configuration on a Router with the IPv4 Tunnel Mode:

The following figure illustrates the reference topology for the configuration.



Sample configuration for the router Cisco 3745 is as follows:

```
crypto isakmp policy 1
 authentication pre-share
 group 2
!
crypto isakmp policy 5
```

```
 encr 3des
 authentication pre-share
 group 2
crypto isakmp key example address 172.168.17.1
!
!
crypto ipsec transform-set svti1 esp-3des esp-sha-hmac
 mode tunnel
!
!
crypto ipsec profile ipsec_prof
 set transform-set svti1
!
!
!
interface Loopback0
 ip address 30.0.0.1 255.255.255.0
!
interface Loopback1
 ip address 50.0.0.1 255.255.255.0
!
interface Tunnel0
 ip address 11.1.1.2 255.255.255.0
 tunnel source Ethernet0/0

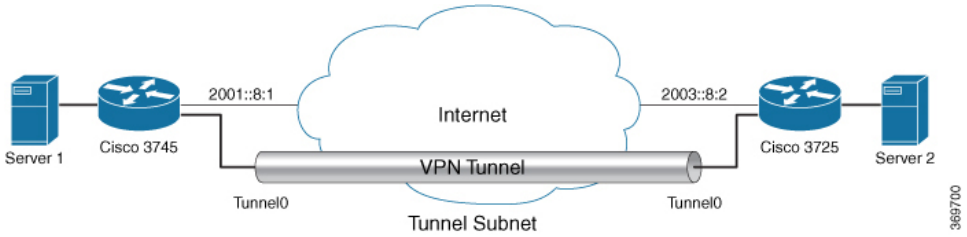
 tunnel destination 172.168.17.1
 tunnel protection ipsec policy ipv4 ipsec_acl1
 tunnel protection ipsec profile ipsec_prof
!
interface Ethernet0/0
 ip address 172.168.16.1 255.255.255.0
!
!
ip access-list extended ipsec_acl1
permit ip 30.0.0.0 0.0.0.255 40.0.0.0 0.0.0.255
permit ip 50.0.0.0 0.0.0.255 60.0.0.0 0.0.0.255
```

Sample configuration on a Router with the IPv6 Tunnel Mode:

The following figure illustrates the reference topology for the configuration.



Sample configuration for the router Cisco 3745 is as follows:

```
crypto isakmp policy 1
 authentication pre-share
 group 2
!
crypto isakmp policy 5
 encr 3des
 authentication pre-share
 group 2
crypto isakmp key example address ipv6 2003::8:2/112
!
!
```

```
crypto ipsec transform-set svti1 esp-3des esp-sha-hmac
 mode tunnel
!
!
crypto ipsec profile ipsec_prof
 set transform-set svti1
!
!
!
interface Loopback0
 ipv6 address 2005::10:1/112
 ipv6 enable
!
interface Loopback1

 tunnel destination 2003::8:2
 tunnel protection ipsec policy ipv6 ipsec_acl2
 tunnel protection ipsec profile ipsec_prof
!
interface Ethernet0/0
 ipv6 address 2001::8:1/112
 ipv6 enable
!
!
ipv6 access-list ipsec_acl2
sequence 10 permit ipv6 host 2005::10:1 host 2005::11:1
sequence 20 permit ipv6 host 2005::15:1 host 2005::16:1
sequence 30 permit ipv6 host 2005::20:1 host 2005::21:1
```

Example: Configuring Tunnel Mode as Dual-overlay

The following example shows how to configure tunnel mode as dual-overlay:

```
Device# configure terminal
Router(config)# interface tunnel 1
Router(config-if)# ipv6 enable
Router(config-if)# tunnel source ethernet 0/0
Router(config-if)# tunnel mode ipsec dual-overlay
Router(config-if)# tunnel destination 89.89.89.1 255.255.255.255.0
Device(config-if)# tunnel protection IPsec profile ipsecprof
```

Verifying the Tunnel Mode as Dual-overlay Configuration

Use the following commands to troubleshoot your configuration:

- **Show crypto session [detail]**
- **Show crypto ipsec sa**
- **Show crypto map**

- **Show crypto socket**
- **Show crypto ikev2 session [detail]**

```
Device# show crypto map

Feature Information for IPsec Virtual Tunnel Interfaces

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 211: Feature Information for IPsec Virtual Tunnel Interfaces

Feature Name	Releases	Feature Configuration Information
Dynamic IPsec VTIs	12.3(7)T 12.3(14)T	Dynamic VTIs enable efficient use of IP addresses and provide secure connectivity. Dynamic VTIs allow dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. IPsec dynamic VTIs allow you to create highly secure connectivity for remote access VPNs. The dynamic VTI simplifies VRF-aware IPsec deployment. The following commands were introduced or modified: **crypto isakmp profile, interface virtual-template, show vtemplate, tunnel mode, virtual-template.**

Feature Name	Releases	Feature Configuration Information
FlexVPN Mixed Mode Support	15.4(2)T Cisco IOS XE Release 3.10S	The FlexVPN Mixed Mode feature provides support for carrying IPv4 traffic over IPsec IPv6 transport. This is the first phase towards providing dual stack support on the IPsec stack. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic. This feature is only supported for Remote Access VPN with IKEv2 and Dynamic VTI.
Multi-SA for Dynamic VTIs	15.2(1)T Cisco IOS XE Release 3.2S	The DVTI can accept multiple IPsec selectors that are proposed by the initiator. The following commands were introduced or modified: **set security-policy limit, set reverse-route.**
Static IPsec VTIs	12.2(33)SRA 12.2(33)SXH 12.3(7)T 12.3(14)T Cisco IOS XE Release 2.1	IPsec VTIs provide a routable interface type for terminating IPsec tunnels and an easy way to define protection between sites to form an overlay network. IPsec VTIs simplify configuration of IPsec for protection of remote links, support multicast, and simplify network management and load balancing.
Tunnel Mode Auto Selection	15.4(2)T Cisco IOS XE Release 3.12S	The Tunnel Mode Auto Selection feature eases the configuration and spares you about knowing the responder's details. This feature automatically applies the tunneling protocol (GRE or IPsec) and transport protocol (IPv4 or IPv6) on the virtual template as soon as the IKE profile creates the virtual access interface. The following command was introduced or modified: **virtual-template**

Feature Name	Releases	Feature Configuration Information
FlexVPN Mixed Mode v6 over v4 Transport	Cisco IOS XE Everest 16.4.1	The FlexVPN Mixed Mode v6 over v4 Transport feature provides support for carrying IPv6 traffic over IPsec IPv4 transport. This implementation does not support using a single IPsec security association (SA) pair for both IPv4 and IPv6 traffic.
IPsec Dual Stack Support on Non Cisco Devices	Cisco IOS XE Cupertino 17.9.x	This feature provides the capabilities to carry both IPv4 and IPv6 traffic using a single IPsec Security Association (SA) that is tunnelled over IPv4. From IOS XE release 17.9.1a onwards, Cisco supports specific subnets in the access control list when the ingress end of the tunnel interface is configured with a third party IPsec client. With the introduction of the SVTI single security association dual stack feature, you can now manage the business-to-business services and other IOT business efficiently.

CHAPTER 158

Session Initiation Protocol Triggered VPN

Session Initiation Protocol Triggered VPN (SIP-Triggered VPN or VPN-SIP) is a service offered by service providers where a VPN is set up using Session Initiation Protocol (SIP) for on-demand media or application sharing between peers. The VPN-SIP feature defines the process in which two SIP user agents resolve each other's IP addresses, exchange the fingerprints of their self-signed certificates, third-party certificates, or pre-shared key securely, and agree to establish an IPsec-based VPN.

Service providers offer the VPN-SIP service to their customers that have SIP-based services such as bank ATMs or branches. This VPN-SIP service replaces an ISDN connection for backup network functionality. If the primary broadband service link goes down, these bank ATMs or branches connect to their central headend or data centres through the VPN-SIP service.

The SIP server of the service provider, which coordinates the VPN-SIP service, is also used for billing of the service based on the time the service is used.

Feature Information for VPN-SIP

Table 212: Feature Information for VPN-SIP

Feature Name	Releases	Feature Information
Session Initiation Protocol Triggered VPN		VPN-SIP is a service offered by service providers where a VPN is setup for on-demand media or application sharing between peers, using Session Initiation Protocol (SIP). The following commands were introduced: **nat force-encap, show vpn-sip session, show vpn-sip sip, show vpn-sip registration-status, vpn-sip local-number, vpn-sip logging, vpn-sip tunnel source**.

Information about VPN-SIP

Components for VPN-SIP Solution

VPN-SIP uses IPSec Static Virtual Tunnel Interface (SVTI). IPSec SVTI stays in active (UP) state even when there is no IPSec security association (SA) established between the tunnel interface and the SVTI peer.

The following are three components for the VPN-SIP Solution:

- SIP
- VPN-SIP
- Crypto (IP Security (IPsec), Internet Key Exchange (IKE), Tunnel Protection (TP), Public Key Infrastructure (PKI) modules within crypto)

Sesssion Initiation Protocol

SIP is used as a name resolution mechanism to initiate an IKE session. VPN-SIP uses SIP service to establish a VPN connection to a home or a small business router that does not have a fixed IP address. This connection is achieved using self-signed certificates or pre-shared keys. SIP negotiates the use of IKE for media sessions in the Session Description Protocol (SDP) offer-and-answer model.

SIP is statically configured. One tunnel interface must be configured for each remote SIP number.

SIP also provides billing capabilities for service providers to charge customers based on the SIP number, for using the VPN-SIP service. Billing based on SIP numbers happens in the service provider network and is independent of the end devices like Cisco VPN-SIP routers.

VPN-SIP Solution

VPN-SIP is the central block that coordinates between SIP and Crypto modules, and provides an abstraction between them.

When traffic destined to a remote network behind a SIP number is routed to the tunnel interface, the IPSec control plane gets a trigger from packet switching path as there is no IPSEC SA configured to that peer. IPsec control plane passes the trigger to VPN-SIP as the tunnel is configured for VPN-SIP.

Note Static routes for remote networks for that SIP number must be configured to point to that tunnel interface.

When the VPN-SIP service is triggered, SIP sets up the call with a SIP phone number pair. SIP also passes incoming call details to the VPN-SIP and negotiates IKE media sessions using local address and fingerprint information of the local self-signed certificate or pre-shared key. SIP also passes remote address and fingerprint information to VPN-SIP.

The VPN-SIP service listens to tunnel status updates and invokes SIP to tear down the SIP session. The VPN-SIP service also provides a means to display current and active sessions.

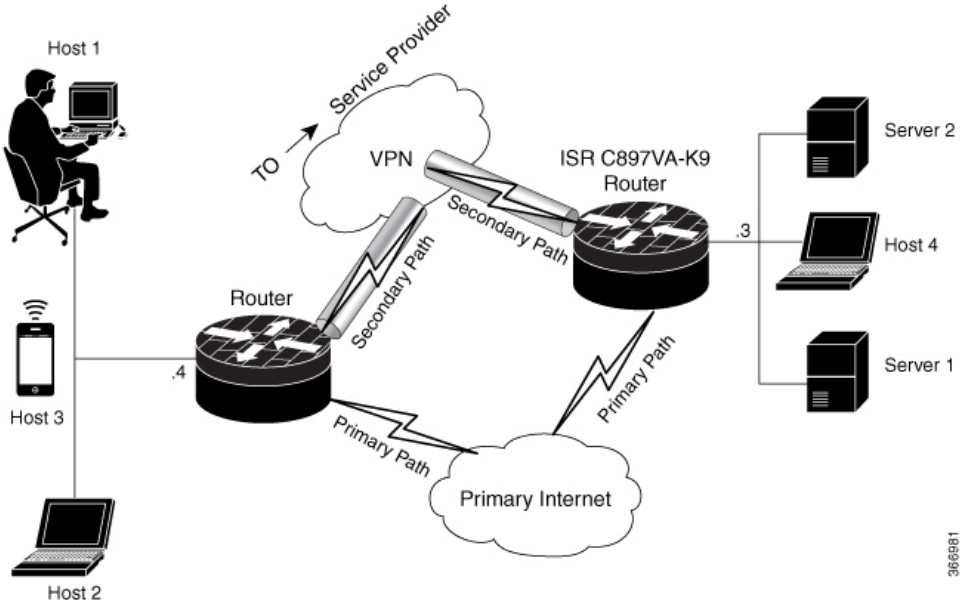
Feature at a glance

The following steps summarize how the VPN-SIP feature works:

- IP SLA monitors the primary link using route tracking. When the primary link fails IP SLA detects this failure.
- Once the primary path fails, IP SLA switches the default route to the higher metric route that is configured on the router.
- When relevant traffic tries to flow using the secondary link, SIP sends an invite message to the SIP server to obtain the VPN peer information.
- The router receives the VPN peer information (IP address, local and remote SIP numbers, IKE port, and finger print) and it establishes VPN-SIP tunnel.
- When the primary path comes back up, IP SLA detects the primary path and the route falls back to the original path. When the idle timer expires, IPSec is torn down and a SIP call is disconnected.

Following is the topology for the VPN-SIP solution:

Figure 82: VPN-SIP Topology



SIP Call Flow

The SIP call flow is divided into initiation at the local peer and call receipt at the remote peer.

At SIP Call Intitiation

When packets are routed to an SVTI interface in data plane, the SIP call must be placed to the peer SIP number to resolve its address, so that VPN tunnel can be brought up.

- When local auth-type is PSK, IKEv2 finds the matching key for a peer SIP number. The IKEv2 keyring must be configured with id_key_id type (string) as SIP number for each SIP peer. IKEv2 computes the fingerprint of the looked-up key and passes it to VPN-SIP.
- When local auth-type is a self-signed certificate or an third-party certificate, IKEv2 computes the fingerprint of the local certificate configured under the IKEv2 profile and passes it to the VPN-SIP

The VPN-SIP module interacts with SIP to setup SIP call to the peer. When the call is successful, VPN-SIP sets the tunnel destination of SVTI to the resolved IP address, requesting SVTI to initiate the VPN tunnel.

Note When a wildcard key is required, use the authentication local pre-share key command and the authentication remote pre-share key command in IKEv2 profile.

When SIP call is received at the remote peer

When a SIP call is received from a peer, following interactions occur between various crypto modules:

- The Tunnel Protection helps VPN-SIP module to set tunnel destination address.

- IKEv2 returns local auth-type (PSK or PKI) and local fingerprint to the VPN-SIP module. When local auth-type is PSK, IKEv2 finds a matching key for a corresponding SIP number.

Note IKEv2 only knows peer by its SIP number.

During the SIP call negotiation between peers, each peer must select a unique local IKEv2 port number to be exchanged over the SDP. To support different port numbers for each session, the VPN-SIP module programmatically configures IP Port Address Translation (PAT) to translate between IKEv2 port (4500) and the port number exchanged over SDP. For the translation to work IP NAT must be configured on secondary link and the loopback interface configured as the VPN-SIP tunnel source. The lifetime of the translation is limited to the lifetime of the VPN-SIP session.

SDP Offer and Answer

Following is the sample for SDP offer and answer that is negotiated in the SIP call as defined in RFC 6193:

```
offer SDP
      ...
      m=application 50001 udp ike-esp-udpencap
      c=IN IP4 10.6.6.49
      a=ike-setup:active
      a=fingerprint:SHA-1 \
      b=AS:512
      4A:AD:B9:B1:3F:82:18:3B:54:02:12:DF:3E:5D:49:6B:19:E5:7C:AB
      ...

   answer SDP
      ...
      m=application 50002 udp ike-esp-udpencap
      c=IN IP4 10.6.6.50
      a=ike-setup:passive
      a=fingerprint:SHA-1 \
      b=AS:512
      D2:9F:6F:1E:CD:D3:09:E8:70:65:1A:51:7C:9D:30:4F:21:E4:4A:8E
```

As part of the SDP negotiation, both peers negotiate the maximum bandwidth rate for the VPN-SIP session using the b=AS :number SDP attribute. if the peers mention different bandwidth numbers in their SDP, both of them should honor the minimum value as the maximum bandwidth. If b=AS :number SDP attribute is missing in the offer or answer, the SIP call is not successfully set up.

The negotiated maximum bandwidth is applied on the SVTI tunnel interface through the programmatically configured QoS policy in the output direction. The programmatically configured QoS policy is not applied and session fails, if there is a pre-existing statically configured policy.

Once SIP call is complete and address of the peer is resolved, VPN-SIP sets tunnel destination of SVTI and sends a request to initiate tunnel.

IKEv2 Negotiation

Following is the process for IKEv2 Security Session (SA) negotiation:

- Before starting the session, IKEv2 checks with VPN-SIP if the session is a VPN-SIP session.
- If it's a VPN-SIP session and local auth-type is PSK, IKEv2 looks up the PSK key pair using SIP number of the peer instead of IP address of the peer.

- For validating self-signed certificate, IKEv2 checks if the certificate is self-signed and validates the certificate.
    - In addition to existing AUTH payload validation as part of IKEv2 protocol, IKEv2 calculates hash of the received certificate or looked-up PSK and compares with the fingerprint from SIP negotiation that IKEv2 queries from VPN-SIP module. Only if the fingerprint matches, IKEv2 considers authentication of peer is valid. If not, IKEv2 declares that peer has failed to authenticate and fails the VPN session.

VPN-SIP solution depends on IPSEC idle timer to detect that traffic is no longer routed over the backup VPN. The idle-time configuration under the IPSec Profile is mandatory for session to be disconnected when there is no traffic. 120 seconds is the recommended time.

VPN-SIP and SIP coordinate to tear down SIP call.

When IPsec idle time expires the VPN-SIP module informs the IKEv2 to bring down the IPsec tunnel. VPN-SIP requests the SIP module to disconnect the SIP call, without waiting for confirmation from the IKEv2.

When SIP call disconnect is received from the peer, VPN-SIP module informs the IKEv2 to bring down the IPsec tunnel, and acknowledges to SIP to tear down the SIP call.

Prerequisites for VPN-SIP

- Security K9 license must be enabled on the router.
- The routers must have a minimum memory of 1 GB.
- For the SIP register request of the SIP User Agent to succeed, the SIP registrar must be available to the VPN-SIP routers.
- The DHCP server must support option 120 and 125 to obtain the SIP server address, which is needed for registration and establishing the SIP session.
- Proper routing configurations must be completed to ensure backup WAN path is used when primary path is down.
- Maximum Transmission Unit (MTU) of the tunnel interface must be less than the MTU of the secondary WAN interface.
- When self-signed or third-party certificates are used for IKEv2 authentication, configure IKEv2 fragmentation on the VPN-SIP router to avoid fragmentation at the IP layer.
- NAT SIP ALG must be disabled.
- Caller ID notification service must be configured in the network.

Restrictions for VPN-SIP

- VPN-SIP and CUBE/SIP gateway cannot be configured on the same device. When CUBE license is active on the device, only CUBE will be functional.
- Only IPv4 is supported for transport and media (IPv4 transport for SIP registration, SIP signaling, and IPv4 packets encrypted over IPv4 transport).

- SIP signalling with peer devices behind NAT is not supported (ICE and STUN are not supported.
- SIP negotiation is supported only in global VRF.
- Remote-access VPN features like private address assignment, configuration mode exchange (CP payloads), routes exchange, are not supported.
- Routing protocols over the VPN-SIP session are not supported.
- Only Rivest-Shamir-Addleman (RSA) server self-signed certificates are supported.
- Pre-shared key lookup functionality using authentication, authorization, and accounting (AAA) is not supported.
- The IPSec idle timer is configured per IPSec profile using the ipsec-profile command. The idle time is the same for all VPN-SIP sessions that use a specific IPSec profile.
- Track objects that are used for IPSLA monitoring, have a maximum limit of 1000 objects in Cisco IOS software. When one track object is used to track one peer router, maximum number of VPN-SIP sessions that one IOS device can have is limited by the maximum number of track objects.
- Only one local SIP number is supported on Cisco IOS software.
- If there is a pre-existing statically configured policy, the programmatically configured QoS policy is not applied and session fails. Remove any statically configured QoS policy on the SVTI interface.
- Cisco does not support the interoperability with VPN-SIP implementation of other vendors.
- For the class policies included in the `policy-map` attached to the VPN-SIP tunnel, only Priority Queueing and Class-Based Weighted Fair Queueing (CBWFQ) are supported.
- For CBWFQ configurations, only the `bandwidth percent` *`percent`* command is supported. The `bandwidth` *`bandwidth`* command is not supported as the bandwidth of the VPN-SIP session varies depending on the negotiation with the peer router.
- VPN-SIP configuration is not supported on IPv6.
- VPN-SIP configuration is supported only in autonomous mode.
- Complex SIP call scenarios such as refer, fork etc. are not supported in VPN-SIP configuration.

How to Configure VPN-SIP

Configuring VPN-SIP

The following steps describe the process of configuring VPN-SIP:

1. Configure the tunnel authentication using third party certificates, self-signed certificates, or pre-shared keys.
   a. Tunnel Authentication using Certificates

      Configure a trustpoint to obtain a certificate from a certification authority (CA) server that is located in the customer's network. This is required for tunnel authentication. Use the following configuration:

```
peer1(config)# crypto pki trustpoint CA
 enrollment url http://10.45.18.132/
 serial-number none
 subject-name CN=peer2
 revocation-check crl
 rsakeypair peer2

peer2(config)# crypto pki authenticate CA
Certificate has the following attributes:
       Fingerprint MD5: F38A9B4C 2D80490C F8E7581B BABE7CBD
      Fingerprint SHA1: 4907CC36 B1957258 5DFE23B2 649E7DDA 99BDB7C3
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.

peer2(config)#crypto pki enroll CA
%
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this
   password to the CA Administrator in order to revoke your certificate.
   For security reasons your password will not be saved in the configuration.
   Please make a note of it.
Password:
Re-enter password:
% The subject name in the certificate will include: CN=peer2
% The subject name in the certificate will include: peer2
% Include an IP address in the subject name? [no]:
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The 'show crypto pki certificate verbose CA' command will show the fingerprint.
Certificate map for Trustpoint
crypto pki certificate map data 1
issuer-name co cn = orange
```

b. Tunnel authentication using self-signed certificate

Configure a PKI trust point to generate a self-signed certificate on the device, when authenticating using a self-signed certificate. Use the following configuration:

```
peer4(config)#crypto pki trustpoint Self
    enrollment selfsigned
    revocation-check none
    rsakeypair myRSA
    exit
crypto pki enroll Self

Do you want to continue generating a new Self Signed Certificate? [yes/no]: yes
% Include the router serial number in the subject name? [yes/no]: yes
% Include an IP address in the subject name? [no]: no
Generate Self Signed Router Certificate? [yes/no]: yes

Router Self Signed Certificate successfully created
```

c. Configure tunnel authentication using a pre-shared key

```
crypto ikev2 keyring keys
peer peer1
identity key-id 1234
pre-shared-key key123
```

2. **a.** Configure IKEv2 Profile for Certificate

```
crypto ikev2 profile IPROF
match certificate data
identity local key-id 5678
authentication remote rsa-sig
```

```
authentication local rsa-sig
keyring local keys
pki trustpoint self
nat force-encap
```

b. Configure an IKEv2 Profile for pre-shared keys

```
crypto ikev2 profile IPROF
match identity remote any
identity local key-id 5678
authentication remote pre-share
authentication local pre-share
keyring local keys
nat force-encap
```

Note To complete the IKEv2 SA configuration, the **nat force-encap** command must be configured on both peers. Since, UDP encapsulation is negotiated in SDP, IKEv2 must start and continue on port 4500.

3. Configure an IPsec profile

```
crypto ipsec profile IPROF
set security-association idle-time 2000
```

4. Configure a LAN side interface

```
interface Vlan101
         ip address 10.3.3.3 255.255.255.0
         no shutdown
!
     interface GigabitEthernet2
         switchport access vlan 101
         no ip address
```

5. Configure a loopback interface

The loopback interface is used as the source interface for the secondary VPN tunnel.

```
interface loopback 1
    ip address 10.11.1.1 255.0.0.0
    ip nat inside
```

6. Configure a secondary interface.

Note Make sure the secondary interface is configured to receive the IP address, SIP server address, and vendor specific information via DHCP.

```
interface GigabitEthernet8
     ip dhcp client request sip-server-address
     ip dhcp client request vendor-identifying-specific
     ip address dhcp
    ip nat outside
```

7. Configure the tunnel interface

```
interface Tunnel1
     ip address 10.3.2.1 255.255.255.255
     load-interval 30
     tunnel source Loopback1
```

```
tunnel mode ipsec ipv4
tunnel destination dynamic
tunnel protection ipsec profile IPROF ikev2-profile IPROF
vpn-sip local-number 5678 remote-number 1234 bandwidth 1000
```

Use the **vpn-sip local-number** *local-number* **remote-number** *remote-number* **bandwidth** *bw-number* command to configure the sVTI interface for VPN-SIP. Bandwidth is the maximum data transmission rate that must be negotiated with this peer and the negotiated value is set on the tunnel interface. Allowed values are 64, 512, and 1000 kbps.

Once an SVTI is configured for VPN-SIP, changes cannot be made to tunnel mode, tunnel destination, tunnel source, and tunnel protection. To change the mode, source, destination, or tunnel protection you must remove the VPN-SIP configuration from the SVTI interface.

8. Add static routes to destination networks

Add a secondary route with a higher metric.

```
ip route 192.168.10.0 255.255.255.0 Tunnel0 track 1
ip route 192.168.10.0 255.255.255.0 Tunnel1 254
```

9. Configure IP SLA

```
ip sla 1
         icmp-echo 10.11.11.1
         threshold 500
         timeout 500
         frequency 2
        ip sla schedule 1 life forever start-time now
```

10. Configure route tracking

```
track 1 ip sla 1 reachability
```

11. Enable VPN-SIP

```
vpn-sip enable
vpn-sip local-number 5678 address ipv4 GigabitEthernet8
vpn-sip tunnel source Loopback1
vpn-sip logging
```

To configure VPN-SIP, you must configure local SIP number and local address. The **vpn-sip local-number** *SIP-number* **address ipv4** *WAN-interface-name* command configures the local SIP number that is used for SIP call and the associated IPv4 address.

Note Only IPv4 addresses can be configured. Crypto module does not support dual stack.

- Backup WAN interface address may change based on DHCP assignment.

When the primary WAN interface is functional, the destination of the VPN-SIP tunnel is set to the backup WAN interface, so that the tunnel interface is active. Destination is set to IP address of the peer that is learnt from SDP of SIP negotiation when traffic is routed to the tunnel interface. When primary WAN interface fails and the back routes are activated, packets are routed to the sVTI through backup.

Note We recommend that you use an unused non-routable address as the address of the loopback interface and do not configure this loopback interface for any other purpose. Once a loopback interface is configured, VPN-SIP listens to any updates to the interface and blocks them. The **vpn-sip logging** command enables the system logging of VPN-SIP module for events, such as session up, down, or failure.

Verifying VPN-SIP on a Local Router

Verifying Registration Status

```
Peer1# show vpn-sip registration-status
 SIP registration of local number 0388881001 : registered 10.6.6.50
```

Verifying SIP Registrar

```
Peer1#show vpn-sip sip registrar

Line          destination      expires(sec)  contact   transport     call-id
=============================================================================================================
0388881001    example.com         2359        10.6.6.50  UDP
3176F988-9EAA11E7-8002AFA0-8EF41435
```

Verifying VPN-SIP Status

```
Peer1#show vpn-sip session detail
VPN-SIP session current status

Interface: Tunnel1
   Session status: SESSION_UP (I)
   Uptime        : 00:00:42
   Remote number : 0388881001 =====> This is the Remote Router's SIP number
   Local number  : 0388882001 =====> Local router's SIP number
   Remote address:port: 10.6.6.49:50002
   Local address:port : 10.6.6.50:50001
   Crypto conn handle: 0x8000017D
   SIP Handle        : 0x800000C7
   SIP callID        : 1554

Verifying DHCP SIP Configuration

```
Peer9#show vpn-sip sip dhcp
SIP DHCP Info

SIP-DHCP interface:  GigabitEthernet8

SIP server address:
Domain name:         dns:example.com
```

Configuration Examples for VPN-SIP

Using self-signed certificates for authentication

The following is sample configuration to configure VPN-SIP using self-signed certificates for authentication. There is no distinction between initiator and responder role in VPN-SIP. The configuration on a peer node will be identical with local SIP numbers changed.

```
// Self-signed certificate
crypto pki trustpoint selfCert
  rsakeypair myRSA
  enrollment selfsigned
  revocation-check none
!
crypto ikev2 profile vpn-sip-profile
 match identity remote any
 authentication local rsa-sig
 authentication remote rsa-sig
 pki trustpoint selfCert // Use same self-signed trustpoint for sign and verify
 nat force-encap
!
crypto ipsec profile vpn-sip-ipsec
 set security-association idle-time 120
!
vpn-sip enable
vpn-sip local-number 0388883001 address ipv4 GigabitEthernet1
vpn-sip tunnel source Loopback11
vpn-sip logging
!
// one tunnel per peer - configuration is for peer with a SIP-number of 0388884001
int tunnel0
 ip unnumbered loopback 0
 tunnel source loopback11
 tunnel mode ipsec ipv4
```

```
 tunnel destination dynamic
 tunnel protection ipsec profile vpn-sip-ipsec ikev2-profile vpn-sip-profile
 vpn-sip local-number 0388883001 remote-number 0388884001 bandwidth 1000
!
// ip unnumbered of tunnel interfaces
int loopback 0
  ip address 10.21.1.1 255.255.255.255
!
int loopback11
ip address 10.9.9.9 255.255.255.255
ip nat inside
!
// one tunnel per peer - this is for peer with SIP-number 0388885001
int tunnel1
 ip unnumbered loopback 0
 tunnel source loopback11
 tunnel mode ipsec ipv4
 tunnel destination dynamic
 tunnel protection ipsec profile vpn-sip-ipsec ikev2-profile iprof
 vpn-sip sip-local 0388883001 sip-remote 0388885001 bandwidth 1000
!
interface GigabitEthernet8
 ip dhcp client request sip-server-address
 ip dhcp client request vendor-identifying-specific
 ip address dhcp
ip nat outside

// backup routes configured with higher AD so that these routes will be activated only when
 primary path goes down. AD need to be chosen to be greater than that of primary route.
ip route 10.0.0.0 255.0.0.0 tunnel 0 250
ip route 10.1.0.0 255.0.0.0 tunnel 0 250
ip route 10.2.0.0 255.0.0.0 tunnel 0 250
ip route 10.3.0.0 255.0.0.0 tunnel 0 250
```

Configuring DHCP in VPN-SIP

Configure DHCP for VPN-SIP

From Cisco IOS XE Release 17.11.1a, you can install a VPN-SIP-enabled router behind a home gateway (HGW). In this installation, the HGW assigns an extension number to the tunnel interface through the Dynamic Host Configuration Protocol (DHCP) instead of a fixed telephone number. This allows you to aggregate data and voice on your network, which can be useful in scenarios where you need to share the same physical subscriber line for both analog and digital data.

In addition, to comply with the HGW network specifications, DHCP for VPN-SIP requires the MAC address of the WAN-side interface to the HGW network through the vendor-class-data DHCP option. With this configuration, the device communicates the MAC address of its own WAN interface to the home gateway network through the vendor-class-data option of the DHCP requests.

Supported PIDs and Firmware

The following table specifies the HGW PIDs and the firmware versions that are tested. Cisco does not provide support for the HGW installed at a customer's location or the operation of an HGW. We recommend that you verify your environment before using this feature.

HGW PID	Firmware Version
RT-400NE	8.06
RT-400MI	09.00.0015
RT-400KI	08.00.0040
RT-500MI	08.00.0004
RT-500KI	08.00.0020
RX-600MI	01.00.0001
RX-600KI	01.00.0001
OG410Xi	2.32
OG410Xa	2.32

Configure DHCP for VPN-SIP

When you configure a DHCP local number, the device defers SIP registration until it receives a DHCP response. The device expects the DHCP server to provide an extension number. This extension number is then used to register with the SIP server. On successful registration, the device initiates a session with the SIP server and receives an extension number, an external number, and other available numbers through a 200 OK response.

Note The external number is the number with which the router is identified globally. This external number is also required to establish a data connection.

With the DHCP enhancement, there are two channels for data connection—SIP signalling channel and IPsec data connection. If the data packets require tunnel protection, a SIP call is initiated.

Perform the following procedures to configure DHCP for VPN-SIP.

Enable the DHCP Client

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ip dhcp client request sip-server-address**
5. **ip dhcp client request vendor-identifying-specific**
6. **ip address dhcp**
7. **ip dhcp client vendor-class mac-address**
8. **ip nat outside**

9. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables the privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**interface type number** **Example:** `Router(config)# interface gigabitethernet 0/0`	Configures an interface type and enters interface configuration mode.
Step 4	**ip dhcp client request sip-server-address** **Example:** `Router(config-if)# ip dhcp client request sip-server-address`	Configures the DHCP client to request a SIP server address from a DHCP server.
Step 5	**ip dhcp client request vendor-identifying-specific** **Example:** `Router(config-if)# ip dhcp client request vendor-identifying-specific`	Configures the DHCP client to request vendor-specific information from a DHCP server.
Step 6	**ip address dhcp** **Example:** `Router(config-if)# ip address dhcp`	Acquires an IP address on the interface from the DHCP.
Step 7	**ip dhcp client vendor-class mac-address** **Example:** `Router(config-if)# ip dhcp client vendor-class mac-address`	Complies with the HGW's DHCP specification.
Step 8	**ip nat outside** **Example:** `Router(config-if)# ip nat outside`	Connects the interface to the outside network.
Step 9	**exit** **Example:** `Router(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Enable DHCP Client Sample Configuration

The following is a sample code for enabling a DHCP client.

```
interface GigabitEthernet 0/0/0
 ip dhcp client request sip-server-address
 ip dhcp client request vendor-identifying-specific
 ip address dhcp
 ip dhcp client vendor-class mac-address
 ip nat outside
```

Configure Tunnel Authentication

You can configure tunnel authentication by using third-party certificates, self-signed certificates, or by using preshared keys (PSKs). To configure tunnel authentication, perform one of the following tasks.

Configure Tunnel Authentication Using Certificates

Configure a trustpoint to obtain a certificate from a certification authority (CA) server that is located in the customer's network. This is required for tunnel authentication.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** name
4. **enrollment url** `url`
5. **serial-number**
6. **subject-name** `[subject-name]`
7. **revocation-check crl**
8. **rsakeypair**
9. **crypto pki authenticate CA**
10. **crypto pki enroll CA** `name`
11. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** name **Example:** `Router(config)# crypto pki trustpoint CA`	Specifies the trustpoint and a given name, and enters the ca-trustpoint configuration mode.

	Command or Action	Purpose
Step 4	**enrollment url `url`** **Example:** `Router(ca-trustpoint)# enrollment url http://10.45.18.132/`	Specifies the URL of the CA to which your router should send certificate requests.
Step 5	**serial-number** **Example:** `Router(ca-trustpoint)# serial-number`	Specifies the serial number of the router in the certificate request, unless you use the **none** keyword. Use the **none** keyword if you don't want to include a serial number in the certificate request.
Step 6	**subject-name `[subject-name]`** **Example:** `Router(ca-trustpoint)# subject-name CN=peer2`	Specifies the requested subject name that is used in the certificate request. If you don’t specify the subject name, the fully qualified domain name (FQDN), which is the default subject name, is used.
Step 7	**revocation-check crl** **Example:** `Router(ca-trustpoint)# revocation-check crl`	Checks the validity of the certificate through the Certificate Revocation Lists (CRL) mechanism.
Step 8	**rsakeypair** **Example:** `Router (ca-trustoint)# rsakeypair peer2`	Provides a key pair for the trustpoint.
Step 9	**crypto pki authenticate CA** **Example:** `Router(config)# crypto pki authenticate CA`	Authenticates the CA to your router by obtaining the self-signed certificate of the CA that contains the public key of the CA.
Step 10	**crypto pki enroll CA `name`** **Example:** `Router(config)# crypto pki enroll CA`	Generates the certificate request and displays the request for copying and pasting into the certificate server. You are prompted for enrollment information such as whether to include the router FQDN and IP address in the certificate request. You are also given a choice about displaying the certificate request on the console terminal.
Step 11	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and returns to privileged EXEC mode.

Example: Configuring Tunnel Authentication Using Certificates

This is the sample code for configuring tunnel authentication using certificates.

```
peer1(config)# crypto pki trustpoint CA
 enrollment url http://10.45.18.132/
 serial-number none
 subject-name CN=peer2
 revocation-check crl
 rsakeypair peer2
```

```
peer2(config)# crypto pki authenticate CA
Certificate has the following attributes:
Fingerprint MD5: F38A9B4C 2D80490C F8E7581B BABE7CBD
Fingerprint SHA1: 4907CC36 B1957258 5DFE23B2 649E7DDA 99BDB7C3
% Do you accept this certificate? [yes/no]: yes
Trustpoint CA certificate accepted.

peer2(config)#crypto pki enroll CA
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this password to the CA
Administrator in order to revoke your certificate.
For security reasons your password will not be saved in the configuration. Please make a
note of it.
Password:
Re-enter password:
% The subject name in the certificate will include: CN=peer2
% The subject name in the certificate will include: peer2
% Include an IP address in the subject name? [no]:
Request certificate from CA? [yes/no]: yes
% Certificate request sent to Certificate Authority
% The 'show crypto pki certificate verbose CA' command will show the fingerprint.
Certificate map for Trustpoint
crypto pki certificate map data 1
issuer-name co cn = orange
```

Configure Tunnel Authentication Using Self-Signed Certificates

To configure tunnel authentication using a self-signed certificate, run the **crypto pki trustpoint self** command. This command enables you to configure a PKI trust point to generate a self-signed certificate on the device.

```
Router(config)# crypto pki trustpoint self
enrollment self signed
revocation-check none
rsakeypair myRSA
exit

crypto pki enroll self
Do you want to continue generating a new Self Signed Certificate? [yes/no]: yes
% Include the router serial number in the subject name? [yes/no]: yes
% Include an IP address in the subject name? [no]: no
Generate Self Signed Router Certificate? [yes/no]: yes
Router Self Signed Certificate successfully created
```

Configure Tunnel Authentication Using PreShared Keys

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ikev2 keyring keyring-name**
4. **peer name**
5. **address {ipv4-address [mask] | ipv6-address prefix}**
6. **identity {address { ipv4-address | ipv6-address} | fqdn name | email email-id | key-id key-id}**
7. **pre-shared-key {local| remote} {0| 6| line}**
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto ikev2 keyring keyring-name** **Example:** `Router(config)# crypto ikev2 keyring kyr1`	Defines an IKEv2 keyring, and enters IKEv2 keyring configuration mode.
Step 4	**peer name** **Example:** `Router(config-ikev2-keyring)# peer peer1`	Defines the peer or peer group, and enters IKEv2 keyring peer configuration mode.
Step 5	**address {ipv4-address [mask] | ipv6-address prefix}** **Example:** `Router(config-ikev2-keyring-peer)# address 10.0.0.1 255.255.255.0`	Specifies an IP address or a range for the peer. This IP address is the IKE endpoint address and is independent of the identity address.
Step 6	**identity {address { ipv4-address | ipv6-address} | fqdn name | email email-id | key-id key-id}** **Example:** `Router(config-ikev2-keyring-peer)# identity key-id 1234`	Identifies the IKEv2 peer through the following identities: • E-mail • FQDN • IPv4 address • Key ID The identity is available for key lookup on the IKEv2 responder only.
Step 7	**pre-shared-key {local| remote} {0| 6| line}** **Example:** `Router(config-ikev2-keyring-peer)# pre-shared-key key123`	Specifies the PSK for the peer. Enter the **local** or the **remote** keyword to specify an asymmetric PSK. By default, the PSK is symmetric.
Step 8	**exit** **Example:** `Router(config-ikev2-keyring-peer)# end`	Exits keyring peer configuration mode mode, and returns to configuration mode.

Example: Configure Tunnel Authentication Using PreShared Keys

This is a sample code for configuring tunnel authentication using preshared keys

```
crypto ikev2 keyring keys
 peer p1
 identity key-id 0388881001
 pre-shared-key cisco
 !
 peer p2
 identity key-id 0388882002
 pre-shared-key cisco
!
crypto ikev2 keyring HUB-KEY
peer SPOKES
address 0.0.0.0 0.0.0.0
pre-shared-key cisco
```

Configure the IKEv2 Profile for a Certificate

To configure the certificate for your IKEv2 profile, run the **crypto ikev2 profile IPROF** command. The following is a sample code for configuring the IKEv2 profile for a certificate.

```
Router(config)# crypto ikev2 profile IPROF-psk
 match identity remote any
 identity local key-id dhcp
 authentication remote pre-share
 authentication local pre-share
 keyring local keys
 nat force-encap
```

Configure an IPSec Profile

To configure an IPSec profile, run the **crypto ipsec profile IPROF** command. The following is a sample code for configuring an IPSec profile.

```
Router(config)# crypto ipsec profile IPROF
 set security-association idle-time 300
```

Enable VPN-SIP

To enable the VPN-SIP feature, run the **vpn-sip enable** command. The following is a sample code to enable VPN-SIP.

```
Router(config)# vpn-sip enable
vpn-sip local-number dhcp address ipv4 GigabitEthernet0/0/0
vpn-sip tunnel source Loopback1
```

Configure a LAN Side Interface

To configure a LAN side interface, run the **interface VLAN <interface>** command. The following is a sample code to configure a LAN side interface.

```
Router(config)# interface GigabitEthernet2
ip address 192.0.2.3 255.255.255.0
no shutdown
```

Configure a Loopback Interface

To configure a loopback interface, run the **interface loopback** <number> command. The following is a code sample to configure a loopback interface.

```
Router(config)# interface Loopback1
 ip address 10.255.255.3 255.255.255.0
 ip nat inside
```

Configure a Tunnel Interface

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **tunnel source** {*ip-address* | *interface-type number*}
5. **tunnel destination**
6. **tunnel protection IPsec profile** *name*
7. **vpn-sip local-number dhcp remote-number bandwidth**
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**interface tunnel** *number* **Example:** `Router(config)# interface tunnel1`	Configures a tunnel interface and enters the interface configuration mode. The *number* argument specifies the number of the tunnel interface that you want to create or configure. There is no limit on the number of tunnel interfaces that you can create.

Step 4	**tunnel source** {*ip-address* | *interface-type number*}
	Example:
	`Router(config-if)# ip address 12.12.12.12 255.255.255.255`
	`tunnel source Loopback1`
		Sets the source IP address or the source interface type number for a tunnel interface. Since the **tunnel protection IPsec profile** command is also used in this procedure, the tunnel source must specify an interface and not an IP address.

Step 5	**tunnel destination** **Example:** `Router(config-if)# tunnel destination destination dynamic`	Specifies the destination of the tunnel.

	Command or Action	Purpose
Step 6	**tunnel protection IPsec profile** *name* **Example:** `Router(config-if)# tunnel protection ipsec profile IPROF ikev2-profile IPROF-psk`	Associates a tunnel interface with an IPsec profile. The *name* argument specifies the name of the IPsec profile. This value must match the name specified in the **crypto IPsec profile** <*name*>command.
Step 7	**vpn-sip local-number dhcp remote-number bandwidth** **Example:** `Router(config-if)# vpn-sip local-number dhcp remote-number 0388881001 bandwidth 1000`	Configures the interface for VPN-SIP. Bandwidth is the maximum data transmission rate that must be negotiated with this peer; the negotiated value is set on the tunnel interface. Choose one of these values—64, 128, 256, 512, or 1000 kbps. **Note** After you configure an interface for VPN-SIP, you cannot make any changes to the tunnel mode, tunnel destination, tunnel source, and tunnel protection. To change the mode, source, destination, or tunnel protection, you must remove the VPN-SIP configuration from the interface.
Step 8	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and returns to privileged EXEC mode.

Example: Configure a Tunnel Interface

This is a sample code to configure a tunnel interface.

```
Router(config)# interface Tunnel1
 ip address 10.12.12.12 255.255.255.255
 tunnel source Loopback1
 tunnel mode ipsec ipv4
 tunnel destination dynamic
 tunnel protection ipsec profile IPROF ikev2-profile IPROF-psk
 vpn-sip local-number dhcp remote-number 0388881001 bandwidth 1000
!
interface Tunnel10
 ip address 10.20.20.21 255.255.255.255
 tunnel source Loopback1
 tunnel mode ipsec ipv4
 tunnel destination dynamic
 tunnel protection ipsec profile IPROF ikev2-profile IPROF-psk
 vpn-sip local-number dhcp remote-number 0388882002 bandwidth 100
```

Verify the DHCP Configuration in VPN-SIP

The following show command outputs indicate how to verify whether the DHCP in VPN-SIP is successfully configured on the Cisco IOS XE router behind the HGW.

```
Router_behind_HGW# show vpn-sip sip dhcp
SIP DHCP Info
SIP-DHCP interface:  GigabitEthernet 0/0/0
```

Troubleshooting for VPN-SIP

Viewing Tunnel Interface in Show Output

Symptom

Show VPN-SIP session doesn't show any information about the tunnel interface. In the following example, information about the tunnel interface, tunnel1 is not shown:

```
Peer5-F#show vpn-sip session
VPN-SIP session current status

Interface: Tunnel2
   Session status: READY_TO_CONNECT
```

```
   Remote number : 0334563333
   Local number  : 0623458888
   Remote address:port: 0.0.0.0:0
   Local address:port : 192.30.18.22:0

Interface: Tunnel3
   Session status: READY_TO_CONNECT
   Remote number : 0323452222
   Local number  : 0623458888
   Remote address:port: 0.0.0.0:0
   Local address:port : 192.30.18.22:0

Interface: Tunnel4
   Session status: READY_TO_CONNECT
   Remote number : 0612349999
   Local number  : 0623458888
   Remote address:port: 0.0.0.0:0
   Local address:port : 192.30.18.22:0

Interface: Tunnel6
   Session status: READY_TO_CONNECT
   Remote number : 0634567777
   Local number  : 0623458888
   Remote address:port: 0.0.0.0:0
   Local address:port : 172.30.18.22:0
```

Possible Cause

VPN-SIP is not configured on the tunnel interface

```
Peer5-F#sh run int tun1
Building configuration...

Current configuration : 201 bytes
!
interface Tunnel1
 ip address 10.5.5.5 255.0.0.0
 tunnel source Loopback11
 tunnel mode ipsec ipv4
 tunnel destination dynamic
 tunnel protection ipsec profile test-prof ikev2-profile test
end
```

Recommended Action

Configure VPN-SIP on the tunnel interface.

```
:

Peer5-F#show running interface tunnel 1
Building configuration...

Current configuration : 278 bytes
!
interface Tunnel1
 ip address 10.5.5.5 255.255.255.255
 tunnel source Loopback11
 tunnel mode ipsec ipv4
 tunnel destination dynamic
 tunnel protection ipsec profile test-prof ikev2-profile test
 vpn-sip local-number 0623458888 remote-number 0312341111 bandwidth 1000
end
```

Following is the running output for the above scenario:

```
Peer5-F#show vpn-sip session detail
VPN-SIP session current status

Interface: Tunnel1
   Session status: READY_TO_CONNECT
   Remote number : 0312341111

============================================================
0623458888    example.com   2863          172.30.18.22
UDP           1E83ECF0-AF0611E7-802B8FCF-594EB9E7@122.50.18.22

Peer5-F#show vpn-sip registration-status

 SIP registration of local number 0623458888 : registered 172.30.18.22
```

Session stuck in Negotiating IKE state

Symptom

VPN-SIP session stuck in Negotiating IKE state.

```
Peer5#show vpn-sip session remote-number 0612349999 detail
VPN-SIP session current status

Interface: Tunnel4
   Session status: NEGOTIATING_IKE (R)
   Uptime        : 00:00:58
   Remote number : 0612349999
   Local number  : 0623458888
   Remote address:port: 172.30.168.3:24825
   Local address:port : 172.30.18.22:50012
   Crypto conn handle: 0x8000002E
   SIP Handle        : 0x8000000C
   SIP callID        : 16
   Configured/Negotiated bandwidth: 1000/1000 kbps
```

Possible Cause

Bad configuration related to IKEv2.

In the following example the Key ID that is configured in the keyring does not match the SIP numberof the remote peer.

```
Peer5-F#show running-config interface tunnel 4
Building configuration...
```

```
Current configuration : 276 bytes
!
interface Tunnel4
 ip address 10.4.4.4 255.0.0.0
 tunnel source Loopback11
 tunnel mode ipsec ipv4

```

Troubleshooting Session Initiation

Symptom

Session does not initiate and gets stuck in Negotiating IKE state

Possible Cause

Fagmentation of IKE packets when a large PKI certificate is included in the IKE authentication message.

Recommended Action

Configure IKEv2 fragmentation on the routers.

Debug Commands

The folllwing debug commands are available to debug VPN-SIP configuration:

Table 213: debug commands

Command Name	Description
debug vpn-sip event	Prints debug messages for SVTI registration with VPN-SIP, SIP registration, call setup, and so on.
debug vpn-sip errors	Prints error messages only when an error occurs during initialization, registration, call setup, and so on.
debug vpn-sip sip all	Enables all SIP debugging traces.
debug vpn-sip sip calls	Enables SIP SPI calls debugging trace.
debug vpn-sip sip dhcp	Enables SIP-DHCP debugging trace
debug vpn-sip sip error	Enables SIP error debugging trace
debug vpn-sip sip events	Enables SIP events debugging trace.
debug vpn-sip sip feature	Enables feature level debugging.
debug vpn-sip sip function	Enables SIP function debugging trace.
debug vpn-sip sip info	Enables SIP information debugging trace.
debug vpn-sip sip level	Enables information level debugging.
debug vpn-sip sip media	Enables SIP media debugging trace.
debug vpn-sip sip messages	Enables SIP SPI messages debugging trace
debug vpn-sip sip non-call	Enables Non-Call-Context trace (OPTIONS, SUBSCRIBE, and so on)
debug vpn-sip sip preauth	Enable SIP preauth debugging trace.
debug vpn-sip sip states	Enable SIP SPI states debugging trace.
debug vpn-sip sip translate	Enables SIP translation debugging trace.
debug vpn-sip sip transport	Enables SIP transport debugging traces.
debug vpn-sip sip verbose	Enables verbose mode.

Standard/RFC	Title
RFC 6193 (with Restrictions)	Media Description for the Internet Key Exchange Protocol (IKE) in the Session Description Protocol (SDP)

CHAPTER 159

Deleting Crypto Sessions of Revoked Peer Certificates

The Delete Crypto Sessions of Revoked Peer Certificates on CRL Download feature deletes an active crypto session with a peer if its certificate is found to be revoked when downloading a new CRL.

Restrictions for Deleting Crypto Sessions of Revoked Peer Certificates

- If revocation check is turned off and this feature is enabled, the IKE database is not populated with the number of sessions. The show outputs do not display information about the deleted sessions.
- Frequent enabling and disabling of this feature (with active sessions on the device) is not recommended.
- Frequent CRL downloads (in a span of 30 minutes) for the same issuername (CA server) is not recommended.
- CRL cache must be enabled. CRL caching cannot be disabled for trustpoint-based prefetch. However, it is possible to disable CRL caching for URL-based prefetch.
- In case of autoenrollment on IKE, the sessions are not deleted until the next IKE rekey, whereas in case of IKEv2, the tunnel must be cleared manually or wait until the certificate expires.
- If IKE has database of “issuer-name” and “SN” populated and receives a notification from PKI about certificate revocation, IKE would act on the PKI notification.

Information About Deleting Crypto Sessions of Revoked Peer Certificates

How a Crypto Session is Deleted

1. When negotiating via certificate authentication, the peer sends the CERT payload to the device, whcih parses each certificate to store information about serial number and the issuer names. This information forms the list of serial numbers issued by the corresponding CA server and is passed to PKI for revocation check.
2. If the revocation-check crl command is configured for a trustpoint, PKI informs IKE about the revocation check thereby disabling IKE from unnecessarily storing unwanted peer certification information.
3. After a successful CRL download, PKI sends IKE a notification, which contains the “issuer-name.” The CRL signature and content is verified. If there is no change in CRL content, PKI does not notify IKE.
4. If PKI notifies IKE containing the issuer name, IKE prepares a list of serial numbers for an issuer name and passes this list to PKI to verify if the serial numbers in the list are revoked.
5. PKI performs revocation check on the serial number list received from the IKE and checks the list against the downloaded CRL. The revoked serial number list is returned to IKE.
6. On a notification from PKI containing the list of revoked serial numbers, IKE identifies and deletes sessions pertaining to those serial numbers those sessions.

How to Enable Deletion of Crypto Sessions for Revoked Peer Certificates

Enabling Deletion of Crypto Sessions

Perform this task to enable the deletion of crypto sessions for revoked certificates.

SUMMARY STEPS

1. **enable**
2. **clear crypto session**
3. **configure terminal**
4. Do one of the following:
   - **crypto isakmp disconnect-revoked-peers**
   - **crypto ikev2 disconnect-revoked-peers**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**clear crypto session** **Example:** `Device# clear crypto session`	(Optional) Deletes IPsec crypto sessions and IKE and security associations. **Note** Use this command to enable the feature for previously established sessions, else the feature is enabled for new sessions only.
Step 3	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 4	Do one of the following:
	• **crypto isakmp disconnect-revoked-peers**
	• **crypto ikev2 disconnect-revoked-peers**
	Example:
	`Device(config)# crypto isakmp disconnect-revoked-peers`
	Example:
	`Device(config)# crypto ikev2 disconnect-revoked-peers`
		Disconnects IKE or IKEv2 crypto sessions with peers having revoked certificates.
		For this command to take effect, reconnected the existing sessions.

Step 5	**end** **Example:** `Device(config)# exit`	Exits global configuration mode and returns to privileged EXEC mode.

Verifying the Delete Crypto Session Capability for a Revoked Peer Certificate

Perform this task to verify if the delete crypto session capability is displayed in the show output.

SUMMARY STEPS

1. **enable**
2. **show crypto isakmp peers**
3. **show crypto ikev2 session detail**

DETAILED STEPS

Step 1 **enable**

Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

Step 2 **show crypto isakmp peers**

Example:

```
Device# show crypto isakmp peers
```

Displays Internet Security Association and Key Management Protocol (ISAKMP) peer descriptions.

Step 3 **show crypto ikev2 session detail**

Example:

```
Device# show crypto ikev2 session detail
```

Displays the status of active Internet Key Exchange Version 2 (IKEv2) sessions.

Configuration Examples for Deleting Crypto Sessions of Revoked Peer Certificates

Example: Enabling Deletion of Crypto Sessions for an IKE Session

```
Device> enable
Device# clear crypto session
Device# configure terminal
Device(config)# crypto isakmp disconnect-revoked-peers
Device# show crypto isakmp peers

Peer: 150.1.1.2 Port: 500 Local: 150.1.1.1
 Phase1 id: 150.1.1.2
 Disconnect Revoked Peer: Enabled
```

Example: Enabling Deletion of Crypto Sessions for an IKEv2 Session

```
Device> enable
Device# clear crypto session
Device# configure terminal
Device(config)# crypto ikev2 disconnect-revoked-peers
Device# show crypto ikev2 session detail

Session-id:1, Status:UP-ACTIVE, IKE count:1, CHILD count:1

Feature Information for Deleting Crypto Sessions of Revoked Peer Certificates

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 214: Feature Information for Deleting Crypto Sessions of Revoked Peer Certificates

Feature Name	Releases	Feature Information
Delete crypto session(s) of revoked peer cert(s) on CRL download		The Delete Crypto Sessions of Revoked Peer Certificates on CRL Download feature deletes an active crypto session with a peer if its certificate is found to be revoked when downloading a new CRL. The following commands were introduced or modified: **crypto ikev2 disconnect-revoked-peers**, **crypto isakmp disconnect-revoked-peers**, **show crypto isakmp peers**, **show crypto ikev2 session detail**.

CHAPTER 160

Crypto Conditional Debug Support

The Crypto Conditional Debug Support feature introduces new debug commands that allow users to debug an IP Security (IPsec) tunnel on the basis of predefined crypto conditions such as the peer IP address, connection-ID of a crypto engine, and security parameter index (SPI). By limiting debug messages to specific IPsec operations and reducing the amount of debug output, users can better troubleshoot a router with a large number of tunnels.

Prerequisites for Crypto Conditional Debug Support

Restrictions for Crypto Conditional Debug Support

-
- Although conditional debugging is useful for troubleshooting peer-specific or functionality related Internet Key Exchange (IKE) and IPSec problems, conditional debugging may not be able to define and check large numbers of debug conditions. Because extra space is needed to store the debug condition values, additional processing overhead is added to the CPU and memory usage is increased. Thus, enabling crypto conditional debugging on a router with heavy traffic should be used with caution.

Information About Crypto Conditional Debug Support

Supported Condition Types

The new crypto conditional debug CLIs--**debug crypto condition**, **debug crypto condition unmatched**, **and show crypto debug-condition**--allow you to specify conditions (filter values) in which to generate and

display debug messages related only to the specified conditions. The table below lists the supported condition types.

Note The **debug crypto condition peer** command with the **ipv4** or **ipv6** keyword can provide the hardware platform specific debugging output. The rest of the condition filters do not provide platform specific debugging output.

Table 215: Supported Condition Types for Crypto Debug CLI

Condition Type (Keyword)	Description
connid [21]	An integer between 1-32766. Relevant debug messages will be shown if the current IPSec operation uses this value as the connection ID to interface with the crypto engine.
FVRF	The name string of a virtual private network (VPN) routing and forwarding (VRF) instance. Relevant debug messages will be shown if the current IPSec operation uses this VRF instance as its front-door VRF (FVRF).
ikev2	The name string for an IKEv2 profile. Relevant debug messages will be shown if the IKEv2 profile name is specified.
isakmp	The name string for an ISAKMP profile. Relevant debug messages will be shown if the ISAKMP profile name is specified.
IVRF	The name string of a VRF instance. Relevant debug messages will be shown if the current IPSec operation uses this VRF instance as its inside VRF (IVRF).
local	The name string of an IPv4 or IPv6 local address.
peer group	A Unity group-name string. Relevant debug messages will be shown if the peer is using this group name as its identity.
peer hostname	A fully qualified domain name (FQDN) string. Relevant debug messages will be shown if the peer is using this string as its identity; for example, if the peer is enabling IKE Xauth with this FQDN string.
peer ipv4 or peer ipv6	A single IP address. Relevant debug messages will be shown if the current IPsec operation is related to the IP address of this peer.
peer subnet	A subnet and a subnet mask that specify a range of peer IP addresses. Relevant debug messages will be shown if the IP address of the current IPsec peer falls into the specified subnet range.
peer username	A username string. Relevant debug messages will be shown if the peer is using this username as its identity; for example, if the peer is enabling IKE Extended Authentication (Xauth) with this username.
session	Provides information about crypto sessions.
SPI	A 32-bit unsigned integer. Relevant debug messages will be shown if the current IPSec operation uses this value as the SPI.

Condition Type (Keyword)	Description
unmatched	Provides debug messages when context information is unavailable.

[21] If an IPSec connid, flowid, or SPI is used as a debug condition, the debug messages for a related IPSec flow are generated. An IPSec flow has two connids, flowids, and SPIs--one inbound and one outbound. Both two connids, flowids, and SPIs can be used as the debug condition that triggers debug messages for the IPSec flow.

How to Enable Crypto Conditional Debug Support

Enabling Crypto Conditional Debug Messages

Performance Considerations

- Before enabling crypto conditional debugging, you must decide what debug condition types (also known as debug filters) and values will be used. The volume of debug messages is dependent on the number of conditions you define.

Note Specifying numerous debug conditions may consume CPU cycles and negatively affect router performance.

- Your router will perform conditional debugging only after at least one of the global crypto debug commands--**debug crypto isakmp**, **debug crypto ipsec**, and **debug crypto engine**--has been enabled. This requirement helps to ensure that the performance of the router will not be impacted when conditional debugging is not being used.

Disable Crypto Debug Conditions

If you choose to disable crypto conditional debugging, you must first disable any crypto global debug CLIs you have issued ; thereafter, you can disable conditional debugging.

Note The **reset** keyword can be used to disable all configured conditions at one time.

SUMMARY STEPS

1. **enable**
2. **debug crypto condition** [**connid** *integer* **engine-id** *integer*] [**flowid** *integer***engine-id** *integer*] [**fvrf** *string*] [**ivrf** *string*] [**peer** [**group** *string*] [**hostname** *string*] [**ipv4** *ipaddress*] [**subnet** *subnet mask*] [**username** *string*]] [**spi** *integer*] [**reset**]
3. **show crypto debug-condition** {[**peer**] [**connid**] [**spi**] [**fvrf**] [**ivrf**] [**unmatched**]}
4. **debug crypto isakmp**
5. **debug crypto ipsec**

6. **debug crypto engine**
7. **debug crypto condition unmatched** [**isakmp** | **ipsec** | **engine**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**debug crypto condition** [**connid** *integer* **engine-id** *integer*] [**flowid** *integer***engine-id** *integer*] [**fvrf** *string*] [**ivrf** *string*] [**peer** [**group** *string*] [**hostname** *string*] [**ipv4** *ipaddress*] [**subnet** *subnet mask*] [**username** *string*]] [**spi** *integer*] [**reset**] **Example:** `Router# debug crypto condition connid 2000 engine-id 1`	Defines conditional debug filters.
Step 3	**show crypto debug-condition** {[**peer**] [**connid**] [**spi**] [**fvrf**] [**ivrf**] [**unmatched**]} **Example:** `Router# show crypto debug-condition spi`	Displays crypto debug conditions that have already been enabled in the router.

Step 4	**debug crypto isakmp**
	Example:
	`Router#`
	`debug crypto isakmp`
		Enables global IKE debugging.

Step 5	**debug crypto ipsec**
	Example:
	`Router#`
	`debug crypto ipsec`
		Enables global IPSec debugging.

Step 6	**debug crypto engine**
	Example:
	`Router#`
	`debug crypto engine`
		Enables global crypto engine debugging.

Step 7	**debug crypto condition unmatched** [**isakmp**	**ipsec**	**engine**] **Example:**	(Optional) Displays debug conditional crypto messages when no context information is available to check against debug conditions.

	Command or Action	Purpose
	`Router# debug crypto condition unmatched ipsec`	If none of the optional keywords are specified, all crypto-related information will be shown.

Enabling Crypto Error Debug Messages

To enable crypto error debug messages, you must perform the following tasks.

debug crypto error CLI

Enabling the **debug crypto error** command displays only error-related debug messages, thereby, allowing you to easily determine why a crypto operation, such as an IKE negotiation, has failed within your system.

Note When enabling this command, ensure that global crypto debug commands are not enabled; otherwise, the global commands will override any possible error-related debug messages.

SUMMARY STEPS

1. **enable**
2. **debug crypto isakmp** | **ipsec** | **engine**} **error**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**debug crypto isakmp** | **ipsec** | **engine**} **error** **Example:** `Router# debug crypto ipsec error`	Enables only error debugging messages for a crypto area.

Configuration Examples for the Crypto Conditional Debug CLIs

Enabling Crypto Conditional Debugging Example

The following example shows how to display debug messages when the peer IP address is 10.1.1.1, 10.1.1.2, or 10.1.1.3, and when the connection-ID 2000 of crypto engine 0 is used. This example also shows how to enable global debug crypto CLIs and enable the **show crypto debug-condition** command to verify conditional settings.

```
Router#
debug crypto condition connid 2000 engine-id 1
Router#
debug crypto condition peer ipv4 10.1.1.1
Router#
debug crypto condition peer ipv4 10.1.1.2
Router#
debug crypto condition peer ipv4 10.1.1.3
Router#
debug crypto condition unmatched
! Verify crypto conditional settings.
Router#
show crypto debug-condition
Crypto conditional debug currently is turned ON
IKE debug context unmatched flag:ON
IPsec debug context unmatched flag:ON
Crypto Engine debug context unmatched flag:ON
IKE peer IP address filters:
10.1.1.1  10.1.1.2   10.1.1.3
Connection-id filters:[connid:engine_id]2000:1,
! Enable global crypto CLIs to start conditional debugging.
Router#
debug crypto isakmp
Router#
debug crypto ipsec
Router#
debug crypto engine
```

Disabling Crypto Conditional Debugging Example

The following example shows how to disable all crypto conditional settings and verify that those settings have been disabled:

```
Router#
debug crypto condition reset
! Verify that all crypto conditional settings have been disabled.
Router#
show crypto debug-condition
Crypto conditional debug currently is turned OFF
IKE debug context unmatched flag:OFF
IPsec debug context unmatched flag:OFF
Crypto Engine debug context unmatched flag:OFF
```

CHAPTER 161

IPv6 over IPv4 GRE Tunnel Protection

The IPv6 over IPv4 GRE Tunnel Protection feature allows both IPv6 unicast and multicast traffic to pass through a protected generic routing encapsulation (GRE) tunnel.

Prerequisites for IPv6 over IPv4 GRE Tunnel Protection

- To enable this feature, you must configure IPsec tunnel protection on an IPv4 GRE tunnel.
- To enable IPv6 multicast, you must configure IPv6 multicast routing.

Restrictions for IPv6 over IPv4 GRE Tunnel Protection

The IPv6 over IPv4 GRE Tunnel Protection feature supports IPv6 over IPv4 point-to-point GRE tunnel protection and not IPv6 over IPv4 mGRE tunnel protection.

Information About IPv6 over IPv4 GRE Tunnel Protection

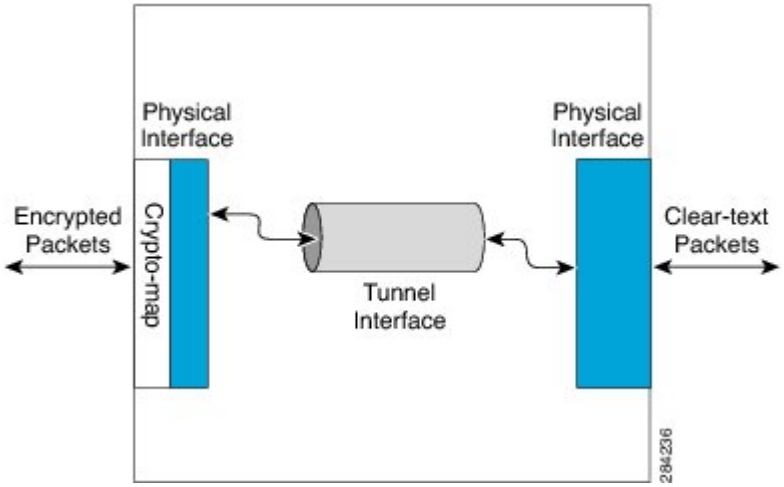
GRE Tunnels with IPsec

Generic routing encapsulation (GRE) tunnels sometimes are combined with IPSec, because IPSec does not support IPv6 multicast packets. This function prevents dynamic routing protocols from running successfully over an IPSec VPN network. Because GRE tunnels do support IPv6 multicast , a dynamic routing protocol can be run over a GRE tunnel. Once a dynamic routing protocol is configured over a GRE tunnel, you can encrypt the GRE IPv6 multicast packets using IPSec.

IPSec can encrypt GRE packets using a crypto map or tunnel protection. Both methods specify that IPSec encryption is performed after GRE encapsulation is configured. When a crypto map is used, encryption is applied to the outbound physical interfaces for the GRE tunnel packets. When tunnel protection is used, encryption is configured on the GRE tunnel interface.

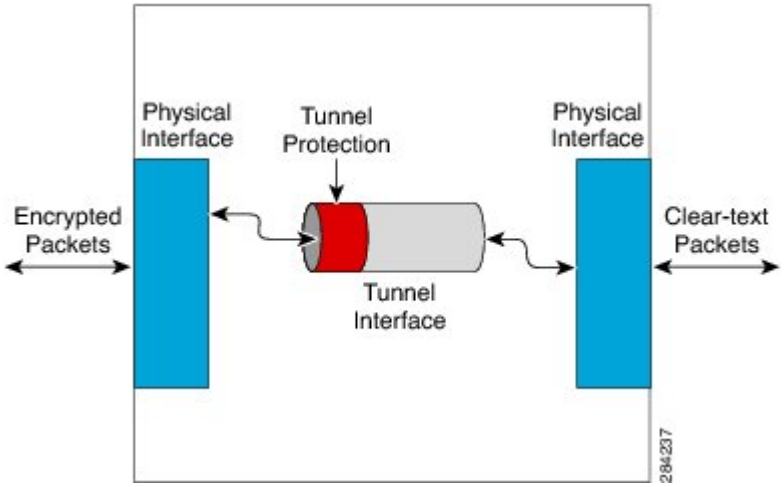
The following figure shows encrypted packets that enter a router through a GRE tunnel interface using a crypto map on the physical interface. Once the packets are decrypted and decapsulated, they continue to their IP destination as clear text.

Figure 83: Using a Crypto Map to Configure IPv6 over IPv4 GRE Tunnel Encryption



The following figure shows encryption using tunnel protection command on the GRE tunnel interface. The encrypted packets enter the router through the tunnel interface and are decrypted and decapsulated before they continue to their destination as clear text.

Figure 84: Using Tunnel Protection to Configure IPv6 over IPv4 GRE Tunnel Encryption



There are two key differences in using the crypto map and tunnel protection methods:

- The IPSec crypto map is tied to the physical interface and is checked as packets are forwarded out through the physical interface. At this point, the GRE tunnel has already encapsulated the packet.

- Tunnel protection ties the encryption functionality to the GRE tunnel and is checked after the packet is GRE encapsulated but before the packet is handed to the physical interface.

How to Configure IPv6 over IPv4 GRE Tunnel Protection

Configuring IPv6 over IPv4 GRE Encryption Using a Crypto Map

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 multicast-routing**
4. **ipv6 unicast-routing**
5. **interface** *type number*
6. **ipv6 address** {**ipv6-address**/*prefix-length* | **prefix-name** *sub-bits*/*prefix-length*}
7. **tunnel mode** {**aurp** | **cayman** | **dvmrp** | **eon** | **gre** | **gre multipoint** | **gre ip** | **gre ipv6** | **ipip** [**decapsulate-any**] | **ipsec ipv4** | **iptalk** | **ipv6** | **ipsec ipv6** | **mpls** | **nos** | **rbscp**}
8. **tunnel source** {**ip-address** | **ipv6-address** | *interface-typeinterface-number*}
9. **tunnel destination** {*hostname* | *ip-address* | *ipv6-address*}
10. **exit**
11. **crypto isakmp policy** *priority*
12. **authentication** {**rsa-sig** | **rsa-encr** | **pre-share**}
13. **hash** {**sha** | **md5**}
14. **group** {**1** | **2** | **5**}
15. **encryption** {**des** | **3des** | **aes 192** | **aes 256**}
16. **exit**
17. **crypto isakmp key** *enc-type-digit keystring* {**address** *peer-address* [*mask*] | **ipv6** {*ipv6-address*/*ipv6-prefix*} | **hostname** *hostname*} [**no-xauth**]
18. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*]
19. **access-list** *access-list-number* [**dynamic** *dynamic-name* [**timeout** *minutes*]] {**deny** | **permit**} *protocol source source-wildcard destination destination-wildcard* [**precedence** *precedence*] [**tos** *tos*] [**time-range** *time-range-name*] [**fragments**] [**log** [*word*] | **log-input** [*word*]]
20. **crypto map** [**ipv6**] *map-name seq-num* [**ipsec-isakmp** [**dynamic** *dynamic-map-name* | **discover** | **profile** *profile-name*]]
21. **set peer** {*hostname* [**dynamic**] [**default**] | *ip-address* [**default**]}
22. **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]
23. **match address** [*access-list-id* | *name*]
24. **exit**
25. **interface** *type number*
26. **crypto map** *map-name* [**redundancy** *standby-group-name* [**stateful**]]
27. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ipv6 multicast-routing** **Example:** `Router(config)# ipv6 multicast-routing`	Enables multicast routing using Protocol Independent Multicast (PIM) and Multicast Listener Discovery (MLD) on all IPv6-enabled interfaces of the router and enables multicast forwarding. • Enable this command only if you are using IPv6 multicast. If you are using IPv6 unicast, you need not enable this command.
Step 4	**ipv6 unicast-routing** **Example:** `Router(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 5	**interface** *type number* **Example:** `Router(config)# interface tunnel 10`	Specifies a tunnel interface and number, and enters interface configuration mode.
Step 6	**ipv6 address** {**ipv6-address**/*prefix-length* | **prefix-name** *sub-bits*/*prefix-length*} **Example:** `Router(config-if)# ipv6 address 0:0:0:7272::72/64`	Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface.
Step 7	**tunnel mode** {**aurp** | **cayman** | **dvmrp** | **eon** | **gre** | **gre multipoint** | **gre ip** | **gre ipv6** | **ipip** [**decapsulate-any**] | **ipsec ipv4** | **iptalk** | **ipv6** | **ipsec ipv6** | **mpls** | **nos** | **rbscp**} **Example:** `Router(config-if)# tunnel mode gre ip`	Sets the encapsulation mode for the tunnel interface.
Step 8	**tunnel source** {**ip-address** | **ipv6-address** | *interface-typeinterface-number*} **Example:** `Router(config-if)# tunnel source ethernet0`	Sets the source address for a tunnel interface.
Step 9	**tunnel destination** {*hostname* | *ip-address* | *ipv6-address*} **Example:** `Router(config-if)# tunnel destination 172.16.0.12`	Specifies the destination for a tunnel interface.

	Command or Action	Purpose
Step 10	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 11	**crypto isakmp policy** *priority* **Example:** `Router(config)# crypto isakmp policy 15`	Defines an Internet Key Exchange (IKE) policy, and enters ISAKMP policy configuration mode. • Policy number 1 indicates the policy with the highest priority. The lower the *priority* argument value, the higher the priority.
Step 12	**authentication** {**rsa-sig** | **rsa-encr** | **pre-share**} **Example:** `Router(config-isakmp-policy)# authentication pre-share`	Specifies the authentication method within an IKE policy. • The **rsa-sig** and **rsa-encr** keywords are not supported in IPv6.
Step 13	**hash** {**sha** | **md5**} **Example:** `Router(config-isakmp-policy)# hash md5`	Specifies the hash algorithm within an IKE policy.
Step 14	**group** {**1** | **2** | **5**} **Example:** `Router(config-isakmp-policy)# group 2`	Specifies the Diffie-Hellman group identifier within an IKE policy.
Step 15	**encryption** {**des** | **3des** | **aes 192** | **aes 256**} **Example:** `Router(config-isakmp-policy)# encryption 3des`	Specifies the encryption algorithm within an IKE policy.
Step 16	**exit** **Example:** `Router(config-isakmp-policy)# exit`	Exits ISAKMP policy configuration mode and enters global configuration mode.
Step 17	**crypto isakmp key** *enc-type-digit keystring* {**address** *peer-address* [*mask*] | **ipv6** {*ipv6-address/ipv6-prefix*} | **hostname** *hostname*} [**no-xauth**] **Example:** `Router(config)# crypto isakmp key cisco-10 address 172.16.0.12 255.240.0.0`	Configures a preshared authentication key.
Step 18	**crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*] **Example:** `Router(config)# crypto ipsec transform-set myset0 ah-sha-hmac esp-3des`	Defines a transform set.
Step 19	**access-list** *access-list-number* [**dynamic** *dynamic-name* [**timeout** *minutes*]] {**deny** | **permit**} *protocol source*	Defines an extended IP access list.

	Command or Action	Purpose
	source-wildcard destination destination-wildcard [**precedence** *precedence*] [**tos** *tos*] [**time-range** *time-range-name*] [**fragments**] [**log** [*word*] | **log-input** [*word*]] **Example:** `Router(config)# access-list 110 permit gre host 192.168.0.16 host 172.16.0.12`	
Step 20	**crypto map** [**ipv6**] *map-name seq-num* [**ipsec-isakmp** [**dynamic** *dynamic-map-name* | **discover** | **profile** *profile-name*]] **Example:** `Router(config)# crypto map mymap 10 ipsec-isakmp`	Creates a new crypto map entry or profile and enters crypto map configuration mode.
Step 21	**set peer** {*hostname* [**dynamic**] [**default**] | *ip-address* [**default**]} **Example:** `Router(config-crypto-map)# set peer 10.0.0.1`	Specifies an IP Security (IPsec) peer in a crypto map entry.
Step 22	**set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*] **Example:** `Router(config-crypto-map)# set transform-set myset0`	Specifies the transform set that can be used with the crypto map entry.
Step 23	**match address** [*access-list-id* | *name*] **Example:** `Router(config-crypto-map)# match address 102`	Specifies an extended access list for a crypto map entry.
Step 24	**exit** **Example:** `Router(config-crypto-map)# exit`	Exits crypto map configuration mode and returns to global configuration mode.
Step 25	**interface** *type number* **Example:** `Router(config)# interface ethernet 1`	Specifies an interface and number and enters interface configuration mode.
Step 26	**crypto map** *map-name* [**redundancy** *standby-group-name* [**stateful**]] **Example:** `Router(config-if)# crypto map mymap`	Applies a previously defined crypto map set to an outbound interface.
Step 27	**end** **Example:** `Router(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring IPv6 over IPv4 GRE Encryption Using Tunnel Protection

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 multicast-routing**
4. **ipv6 unicast-routing**
5. **crypto isakmp policy** *priority*
6. **authentication** {**rsa-sig** | **rsa-encr** | **pre-share**}
7. **hash** {**sha** | **md5**}
8. **group** {**1** | **2** | **5**}
9. **encryption** {**des** | **3des** | **aes** | **aes 192** | **aes 256**}
10. **exit**
11. **crypto isakmp key** *enc-type-digit keystring* {**address** *peer-address* [*mask*] | **ipv6** {*ipv6-address/ipv6-prefix*} | **hostname** *hostname*} [**no-xauth**]
12. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*]
13. **crypto ipsec profile** *profile-name*
14. **set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*]
15. **exit**
16. **interface** *type number*
17. **ipv6 address** {*ipv6-address / prefix-length* | *prefix-name sub-bits/prefix-length*}
18. **tunnel mode** {**aurp** | **cayman** | **dvmrp** | **eon** | **gre** | **gre multipoint** | **gre ip** | **gre ipv6** | **ipip**[**decapsulate-any**] | **ipsec ipv4** | **iptalk** | **ipv6** | **ipsec ipv6** | **mpls** | **nos** | **rbscp**}
19. **tunnel source** {*ip-address* | *ipv6-address* | *interface-type interface-number*}
20. **tunnel destination** {*hostname* | *ip-address* | *ipv6-address*}
21. **tunnel protection ipsec profile** *name* [**shared**]
22. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**ipv6 multicast-routing** **Example:** `Router(config)# ipv6 multicast-routing`	Enables multicast routing using Protocol Independent Multicast (PIM) and Multicast Listener Discovery (MLD) on all IPv6-enabled interfaces of the router and enables multicast forwarding.

	Command or Action	Purpose
		• Enable this command only if you are using IPv6 multicast. If you are using IPv6 unicast, you do not need to enable this command.
Step 4	**ipv6 unicast-routing** **Example:** `Router(config)# ipv6 unicast-routing`	Enables the forwarding of IPv6 unicast datagrams.
Step 5	**crypto isakmp policy** *priority* **Example:** `Router(config)# crypto isakmp policy 15`	Defines an IKE policy, and enters ISAKMP policy configuration mode. Policy number 1 indicates the policy with the highest priority. The lower the *priority* argument value, the higher the priority.
Step 6	**authentication** {**rsa-sig** | **rsa-encr** | **pre-share**} **Example:** `Router(config-isakmp-policy)# authentication pre-share`	Specifies the authentication method within an Internet Key Exchange (IKE) policy. • The **rsa-sig** and **rsa-encr** keywords are not supported in IPv6.
Step 7	**hash** {**sha** | **md5**} **Example:** `Router(config-isakmp-policy)# hash md5`	Specifies the hash algorithm within an IKE policy.
Step 8	**group** {**1** | **2** | **5**} **Example:** `Router(config-isakmp-policy)# group 2`	Specifies the Diffie-Hellman group identifier within an IKE policy.
Step 9	**encryption** {**des** | **3des** | **aes** | **aes 192** | **aes 256**} **Example:** `Router(config-isakmp-policy)# encryption 3des`	Specifies the encryption algorithm within an IKE policy.
Step 10	**exit** **Example:** `Router(config-isakmp-policy)# exit`	Exits ISAKMP policy configuration mode and returns to global configuration mode.
Step 11	**crypto isakmp key** *enc-type-digit keystring* {**address** *peer-address* [*mask*] | **ipv6** {*ipv6-address*/*ipv6-prefix*} | **hostname** *hostname*} [**no-xauth**] **Example:** `Router(config)# crypto isakmp key cisco-10 address 172.16.0.12 255.240.0.0`	Configures a preshared authentication key.
Step 12	**crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*] **Example:**	Defines a transform set, and places the router in crypto transform configuration mode.

	Command or Action	Purpose
	`Router(config)# crypto ipsec transform-set myset0 ah-sha-hmac esp-3des`	
Step 13	**crypto ipsec profile** *profile-name* **Example:** `Router(config)# crypto ipsec profile ipsecprof`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec routers and enters IPsec profile configuration mode.
Step 14	**set transform-set** *transform-set-name* [*transform-set-name2...transform-set-name6*] **Example:** `Router(ipsec-profile)# set transform-set myset0`	Specifies the transform set that can be used with the crypto map entry.
Step 15	**exit** **Example:** `Router(ipsec-profile)# exit`	Exits IPsec profile configuration mode and returns to global configuration mode.
Step 16	**interface** *type number* **Example:** `Router(config)# interface tunnel 1`	Specifies a tunnel interface and number and enters interface configuration mode.
Step 17	**ipv6 address** {*ipv6-address* / *prefix-length* | *prefix-name sub-bits*/*prefix-length*} **Example:** `Router(config-if)# ipv6 address 3ffe:b00:c18:1::3/127`	Specifies the IPv6 network assigned to the interface and enables IPv6 processing on the interface.
Step 18	**tunnel mode** {**aurp** | **cayman** | **dvmrp** | **eon** | **gre** | **gre multipoint** | **gre ip** | **gre ipv6** | **ipip**[**decapsulate-any**] | **ipsec ipv4** | **iptalk** | **ipv6** | **ipsec ipv6** | **mpls** | **nos** | **rbscp**} **Example:** `Router(config-if)# tunnel mode gre ip`	Specifies a GRE IPv6 tunnel.
Step 19	**tunnel source** {*ip-address* | *ipv6-address* | *interface-type interface-number*} **Example:** `Router(config-if)# tunnel source 10.0.0.1`	Specifies the source address or the source interface type and number for the tunnel interface.
Step 20	**tunnel destination** {*hostname* | *ip-address* | *ipv6-address*} **Example:** `Router(config-if)# tunnel destination 172.16.0.12`	Specifies the destination address or hostname for the tunnel interface.
Step 21	**tunnel protection ipsec profile** *name* [**shared**] **Example:** `Router(config-if)# tunnel protection ipsec profile ipsecprof`	Associates a tunnel interface with an IPsec profile. • The *name* argument specifies the name of the IPsec profile; this value must match the *name* specified in the **crypto IPsec profile** *name* command.

	Command or Action	Purpose
		• The **shared** keyword allows IPsec sessions to be shared between multiple tunnel interfaces configured with the same tunnel source IP. **Note** When you modify the tunnel protection for an IPsec profile, you must shut down the tunnel interface first. After the modification is successful, you must manually turn on the tunnel configuration.
Step 22	**end** **Example:** `Router(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for IPv6 over IPv4 GRE Tunnel Protection

Example: Configuring IPv6 over IPv4 GRE Encryption Using a Crypto Map

```
Router> enable
Router# configure terminal
Router(config)# ipv6 multicast-routing
Router(config)# ipv6 unicast-routing
Router(config)# interface tunnel 10
Router(config-if)# ipv6 address my-prefix 0:0:0:7272::72/64
Router(config-if)# tunnel mode gre ip
Router(config-if)# tunnel source ethernet0
Router(config-if)# tunnel destination 172.16.0.12
Router(config-if)# exit
Router(config)# crypto isakmp policy 15
Router(config-isakmp-policy)# authentication pre-share
Router(config-isakmp-policy)# hash md5
Router(config-isakmp-policy)# group 2
Router(config-isakmp-policy)# encryption 3des
Router(config-isakmp-policy)# exit
Router(config)# crypto isakmp key cisco-10 address 172.16.0.12 255.240.0.0
Router(config)# crypto ipsec transform-set myset0 ah-sha-hmac esp-3des
Router(config)# access-list 110 permit gre host 192.168.0.16 host 172.16.0.12
Router(config)# crypto map mymap 10 ipsec-isakmp
Router(config-crypto-map)# set peer 10.0.0.1
Router(config-crypto-map)# set transform-set myset0
Router(config-crypto-map)# match address 102
Router(config-crypto-map)# exit
Router(config)# interface ethernet1
Router(config-if)# crypto map mymap
Router(config-if)# end
```

Example: Configuring IPv6 over IPv4 GRE Encryption Using Tunnel Protection

The following example configures IPsec tunnel protection on an IPv4 GRE tunnel. IPv6 multicast routing is enabled using the **ipv6 multicast-routing** command.

```
Router> enable
Router# configure terminal
Router(config)# ipv6 multicast-routing
Router(config)# ipv6 unicast-routing
Router(config)# crypto isakmp policy 15
Router(config-isakmp-policy)# authentication pre-share
Router(config-isakmp-policy)# hash md5
Router(config-isakmp-policy)# group 2
Router(config-isakmp-policy)# encryption 3des
Router(config-isakmp-policy)# exit
Router(config)# crypto isakmp key cisco-10 address 172.16.0.12 255.240.0.0
Router(config)# crypto ipsec transform-set myset0 ah-sha-hmac esp-3des
Router(config)# crypto ipsec profile ipsecprof
Router(ipsec-profile)# set transform-set myset0
Router(ipsec-profile)# exit
Router(config)# interface tunnel 1
Router(config-if)# ipv6 address 3ffe:b00:c18:1::3/127
Router(config-if)# tunnel mode gre ip
Router(config-if)# tunnel source 10.0.0.1
Router(config-if)# tunnel destination 172.16.0.12
Router(config-if)# tunnel protection ipsec profile ipsecprof
Router(config-if)# end
```

Feature Information for IPv6 over IPv4 GRE Tunnel Protection

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

CHAPTER 162

RFC 430x IPsec Support

The RFC 430x IPsec Support includes features—RFC 430x IPsec Support Phase 1 and RFC430x IPsec Support Phase 2—that implement Internet Key Exchange (IKE) and IPsec behavior as specified in RFC 4301.

Information About RFC 430x IPsec Support

RFC 430x IPsec Support Phase 1

The RFC 430x IPsec Support Phase 1 feature implements Internet Key Exchange (IKE) and IPsec behavior as specified in RFC 4301.

RFC 4301 specifies the base architecture for IPsec-compliant systems. RFC 4301 describes how to provide a set of security services for traffic at the IP layer, in both the IPv4 and IPv6 environments. The RFC 430x IPsec Support Phase 1 feature provides support for the following RFC 4301 implementations on Cisco IOS software.

- **Security association (SA) lifetime**—The lifetime of a security association between IPsec and Internet Key Exchange (IKE) or Internet Key Exchange Version 2 (IKEv2) must not exceed the lifetime of the authentication certificate.
- **OPAQUE selectors**—OPAQUE indicates that the corresponding selector field is not available for verification. When IKEv2 encounters an OPAQUE selector, IKEv2 skips, does not process the OPAQUE selector, and moves to next selector for policy verification.
- **Explicit Congestion Notification (ECN) support**—ECN is propagated when decrypting an IPsec packet thereby ensuring the packet source and destination are aware of congestion that occurs within the network.
- **Fragment processing**—Peers must not send Initial and noninitial fragments in the same tunnel. There must be a separate tunnel mode SA for carrying initial and noninitial fragments and separate tunnel mode SA for noninitial fragments. IPsec peers must support discarding of packets and stateful fragment checking to accommodate bypass traffic.
- **Do not fragment-(DF) bit processing**—DF-bit processing must be set on a per SA basis.

- **Dummy packet generation support**—It should be possible to send dummy packets via IPsec SA to encapsulate the packets when traffic is flowing via IPsec SA tunnel.

RFC 430x IPsec Support Phase 2

The RFC 430x IPsec Support Phase 2 feature provides support for the RFC 4301 implementation of encryption and decryption of Internet Control Message Protocol (ICMP) packets on Cisco IOS software.

ICMP error messages are sent when an ICMP error occurs. For example, when a host is not reachable, the intermediate device sends a message to the originator of the ICMP request that the host is not reachable. When an ICMP error message reaches an IPsec encryption policy, it may not be classified to match an existing SA. So, the packets are classified based on the data inside the ICMP error message. This data contains the source and destination address of the original ICMP message. If an SA is found based on the address in the ICMP error message, the SA is used. If there is no SA, an SA is created if the policy permits. For decryption, the post decrypt check is performed on the data inside the ICMP error message if a valid SA is not found.

The encryption and decryption of ICMP error messages can be verified through the encrypt and decrypt counters displayed in the output of the **show crypto ipsec sa** command.

How to Configure RFC 430x IPsec Support

Configuring RFC 430x IPsec Support Globally

Perform this task to configure the RFC 4301 implementations globally.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto ipsec security-association dummy** {**pps** *rate* | **seconds** *seconds*}
4. **crypto ipsec security-association ecn** {**discard** | **propogate**}
5. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto ipsec security-association dummy** {**pps** *rate* | **seconds** *seconds*} **Example:**	Enables the generation and transmission of dummy packets in an IPsec traffic flow.

	Command or Action	Purpose
	`Device(config)# crypto ipsec security-association dummy seconds 5`	
Step 4	**crypto ipsec security-association ecn** {**discard** | **propogate**} **Example:** `Device(config)# crypto ipsec security-association ecn discard`	Enables the Explicit Congestion Notification (ECN) settings in an IPsec traffic flow.
Step 5	**exit** **Example:** `Device(config-crypto-map)# exit`	Exits global configuration mode and returns to privileged EXEC mode.

Configuring RFC 430x IPsec Support Per Crypto Map

Perform this task to configure the RFC 4301 implementations per crypto map.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *map-name seq-num* **ipsec-isakmp**
4. **set ipsec security-association dfbit** {**clear** | **copy** | **set**}
5. **set ipsec security-association dummy** {**pps** *rate* | **seconds** *seconds*}
6. **set ipsec security-association ecn** {**discard** | **propogate**}
7. **end**
8. **show crypto map ipsec sa**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**crypto map** *map-name seq-num* **ipsec-isakmp** **Example:** `Device(config)# crypto map cmap 1 ipsec-isakmp`	Specifies the crypto map entry to be created or modified and enters crypto map configuration mode.
Step 4	**set ipsec security-association dfbit** {**clear** | **copy** | **set**} **Example:**	Enables do not fragment (DF)-bit processing per security association (SA) for an IPsec traffic flow in a crypto map.

	Command or Action	Purpose
	`Device(config-crypto-map)# set ipsec security-association dfbit set`	
Step 5	**set ipsec security-association dummy** {**pps** *rate* | **seconds** *seconds*} **Example:** `Device(config-crypto-map)# set ipsec security-association dummy seconds 5`	Enables the generation and transmission of dummy packets for an IPsec traffic flow in a crypto map.
Step 6	**set ipsec security-association ecn** {**discard** | **propogate**} **Example:** `Device(config-crypto-map)# set ipsec security-association ecn propogate`	Enables the Explicit Congestion Notification (ECN) settings per SA for an IPsec traffic flow in a crypto map.
Step 7	**end** **Example:** `Device(config-crypto-map)# end`	Exits crypto map configuration mode and returns to privileged EXEC mode.
Step 8	**show crypto map ipsec sa** **Example:** `Device# show crypto map ipsec sa`	Displays the settings used by IPsec SAs.

Example

The following is sample output from the **show crypto map ipsec sa** command:

```
Device# show crypto map ipsec sa

Configuration Examples for RFC 430x IPsec Support

Example: Configuring RFC 430x IPsec Support Globally

The following examples shows how to configure RFC 430x IPsec Support globally:

```
Device> enable
Device# configure terminal
Device(config)# crypto ipsec security-association dummy seconds 15
Device(config)# crypto ipsec security-association ecn propogate
Device(config-crypto-map)# exit
```

Example: Configuring RFC 430x IPsec Support Per Crypto Map

The following examples shows how to configure RFC 430x IPsec Support per crypto map:

```
Device> enable
Device# configure terminal
Device(config)# crypto map cmap 1 ipsec-isakmp
Device(config-crypto-map)# set security-association copy
Device(config-crypto-map)# set security-association dummy seconds 15
Device(config-crypto-map)# set security-association ecn propogate
Device(config-crypto-map)# end
Device# show crypto map ipsec sa

Table 216: Feature Information for RFC430x IPsec Support

Feature Name	Releases	Feature Information
RFC430x IPsec Support Phase 1		The RFC 430x IPsec Support Phase 1 feature implements Internet Key Exchange (IKE) and IPsec behavior as specified in RFC 4301. The following commands were introduced or modified: **crypto ipsec security-association dummy, crypto ipsec security-association ecn, set ipsec security-association dfbit, set ipsec security-association dummy, set ipsec security-association ecn, show crypto map ipsec sa.**
RFC430x IPsec Support Phase 2		The RFC 430x IPsec Support Phase 1 feature implements Internet Key Exchange (IKE) and IPsec behavior as specified in RFC 4301. No commands were modified or updated for this feature.

PART XIV

Unified Threat Defense

CHAPTER 163

Cisco Firepower Threat Defense for ISR

Cisco Firepower Threat Defense is Cisco's premier network security option. It provides a comprehensive suite of security features, such as firewall capabilities, monitoring, alerts, and Intrusion Detection System (IDS)

This module describes how to configure and deploy IDS on Cisco Integrated Services Routers (ISRs).

Restrictions for Cisco Firepower Threat Defense for ISR

- Multicast traffic is not inspected.
- IPv6 traffic cannot be exported.

Information About Cisco Firepower Threat Defense for ISR

Cisco Firepower Threat Defense for ISR Overview

Cisco Firepower Threat Defense is a premier security solution that provides enhanced inspection for packet flows.

The Cisco Firepower Threat Defense solution consists of the following two entities:

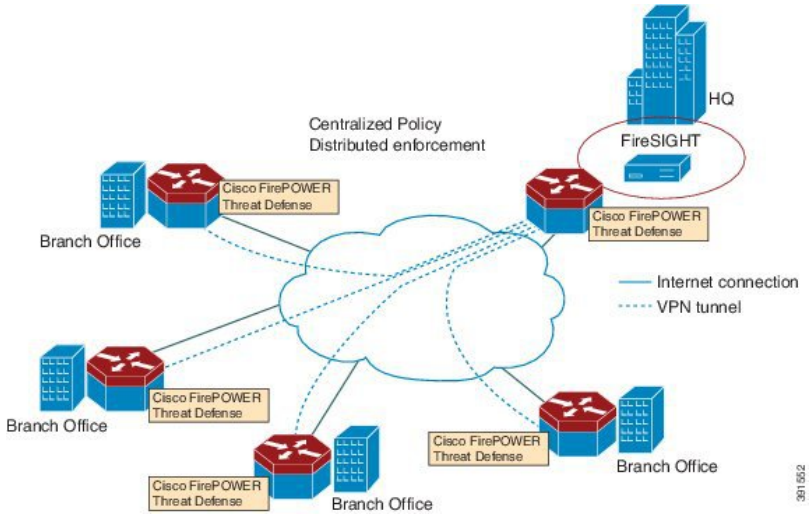
- Cisco FireSIGHT—A centralized policy and reporting entity that can run anywhere in the network. This can be the Cisco FireSIGHT appliance or a virtual installation on a server class machine.
- Virtual Firepower sensor—Security entities that implement policies, and send events and statistics back to the defense center. The Firepower sensor is hosted on Cisco Unified Computing System (UCS) E-Series Blade. Both the FireSIGHT and sensor are distributed as virtual packages.

UCS E-Series Blades are general purpose blade servers that are housed within Cisco Integrated Services Routers (ISR) Generation 2 (G2) and Cisco ISR 4000 Series Integrated Services Routers. These blades can be deployed either as bare-metal on operating systems or as virtual machines on hypervisors. There are two internal interfaces that connect a router to an UCS E-Series Blade. On ISR G2, Slot0 is a Peripheral Component Interconnet Express (PCIe) internal interface, and UCS E-Series Slot1 is a switched interface connected to the backplane Multi Gigabit Fabric (MGF). In Cisco ISR 4000 Series Routers, both internal interfaces are connected to the MGF.

A hypervisor is installed on the UCS E-Series Blade, and Cisco Firepower Threat Defense runs as a virtual machine on it. The Cisco Firepower Threat Defense OVA file is directly installed on the UCS E-Series Blade using the hypervisor operating system. Cisco Firepower Threat Defense runs as an anonymous inline device with no additional communication with the router. Traffic is diverted from the ingress physical interface to the Cisco Firepower Threat Defense that runs on the UCS E-Series Blade.

The following figure shows a Cisco Firepower Threat Defense deployment scenario. In this figure, the traffic lines between sensors and FireSIGHT are control connections. Packets are routed through these connections using router forwarding rules.

Figure 85: Cisco Firepower Threat Defense Deployment Scenario



By default, the virtualized Cisco Firepower sensor comes with three interfaces, one for management, and two others for traffic analysis. These interfaces must be mapped to the UCS E-Series interfaces.

UCS-Based Hosting

The Cisco Unified Computing System (UCS) E-Series Blade provides a generic server blade for hosting applications. This blade typically runs VMware ESXi hypervisor and is managed through vSphere like other VMWare deployments.

If the Firepower sensor is hosted on the Cisco UCS E-Series Blade, you must specify the Cisco IOS interfaces connected to Cisco Firepower Threat Defense. Applications running within the UCS E-Series Blade are only loosely coupled with Cisco IOS, and to determine the interfaces that are attached to appliances a mapping of the interfaces must be done. Interfaces to connect to the Cisco UCS E-Series Blade are Bridge Domain Interfaces (BDI).

The following Cisco UCS E-Series Blades are supported for hosting the Firepower sensor:

- UCS-E 120S
- UCS-E 140D
- UCS-E 140S
- UCS-E 160D
- UCS-E 180D

IDS Packet Flow in Cisco Firepower Threat Defense

Cisco Firepower Threat Defense supports Intrusion Detection System (IDS). In IDS mode, traffic is copied to the sensor and is analyzed for threats. IDS mode cannot enforce policies; it can detect and report violations. In IDS mode, traffic is replicated from interfaces and redirected to Cisco Firepower Threat Defense that runs on the Cisco UCS E-Series blade.

IDS copies the traffic and analyzes them for threats. Enable the **utd** command to replicate packets to the Firepower sensor based on one of the following criteria:

- If global inspection is enabled, all packets that flow through a router are replicated to the sensor.
- If per interface inspection is enabled, packets are replicated only if the input or output interface has enabled the **utd** command for inspection.

To view the interfaces that have enabled packet inspection in IDS mode, use the **show platform software utd interfaces** command. The packet replication occurs as one of the first output features.

For general packet processing, features that are applied to a packet form an ordered sequence that is determined by the configuration of the device. In general, these features are grouped as either input or output features, with the routing function marking the boundary between the two. The IDS packet replication occurs as one of the first output features and so if any input feature drops the packet, it will not be replicated to the IDS engine.

Firepower Sensor Interfaces

The Firepower sensor virtual appliance has three network interfaces—two for analyzing the traffic and one for management connectivity to FireSIGHT. The two traffic-bearing interfaces are represented as two virtual interfaces; Bridge Domain Interfaces (BDIs), in the configuration.

Although two interfaces are available for analyzing the traffic, only one traffic-bearing interface is used for Intrusion Detection System (IDS).

The Firepower sensor is connected to the management network and appears as another host on the LAN segment.

Note To monitor VLAN traffic in your virtual environment, set the VLAN ID of the promiscuous port to 4095.

Cisco Firepower Threat Defense Interoperability

Cisco Firepower Threat Defense supports Intrusion Detection System (IDS). In IDS mode, selected traffic is copied to the Firepower sensor for analysis.

Cisco Firepower Threat Defense interoperates with the following features:

- Zone-based firewall—Application layer gateways (ALGs), application inspection and controls (AICs), and policies configured between zones
- Network Address Translation (NAT)

Note Cisco Firepower Threat Defense does not support outside address translation, because there is no mechanism to inform Firepower Threat Defense about outside global addresses. However; you can still enable address translation on outside interfaces. Intrusion Prevention System (IPS) or IDS is invoked after NAT on the ingress interface, and before NAT on the egress interface, always using inside addresses.

- Crypto
- Intelligent WAN (IWAN)
- Kernel-based Virtual Machine Wide-Area Application Services (kWAAS)

Hardware and Software Requirements for Cisco Firepower Threat Defense

The following hardware is required to run the Cisco Firepower Threat Defense solution:

- Cisco Firepower Sensor version 5.4
- Cisco Integrated Services Routers (ISR) 4000 Series Routers
- Cisco Unified Computing System (UCS) E-Series Blade
- Cisco FireSIGHT

The following software is required to run the Cisco Firepower Threat Defense solution:

- UCS-E hypervisor
- ESXi 5.0.0, 5.1.0, or 5.5.0
- Cisco Firepower Sensor version Cisco IOS XE Release 3.14S and later releases
- Cisco FireSIGHT version 5.2, 5.3 or 5.4. FireSIGHT only supports the current version and is backward compatible with only the previous version. In case, your Cisco Firepower Sensor version is 5.4, then you have to use FireSIGHT version 5.4 or 5.3.

Obtaining Cisco Firepower Threat Defense License

Cisco ISR 4000 Series Integrated Services Routers must have the security K9 license and Application Experience (AppX) license to enable the Cisco Firepower Threat Defense.

```
Technology Package License Information:
------------------------------------------------------------------
Technology    Technology-package           Technology-package
              Current       Type           Next reboot
```

```
-----------------------------------------------------------------
appx              appxk9            EvalRightToUse   appxk9
uc                uck9              EvalRightToUse   uck9
security          securityk9        EvalRightToUse   securityk9
ipbase            ipbasek9          Permanent        ipbasek9
```

How to Deploy Cisco Firepower Threat Defense for ISR

To deploy Cisco Firepower Threat Defense Intrusion Detection System (IDS), perform the following tasks:

1. Obtain the Firepower sensor package.
2. Install the Firepower sensor package through a hypervisor, such as VMWare VSphere.
3. Configure router interfaces for traffic redirection.
   - Bridge-Domain interface (BDI) configuration for Cisco ISR 4000 Series Routers.
   - VLAN configuration for Cisco ISR Generation 2 routers.
4. Bootstrap the Firepower sensor.
5. Configure a policy in Cisco FireSIGHT.
   - The policy is configured through the FireSIGHT GUI.
6. Enable inspection.

Obtaining the Firepower Sensor Package

To deploy the Firepower sensor on an Unified Computing System (UCS) E-Series Blade, download and save the OVA file. OVA is an Open Virtualization Archive that contains a compressed and installable version of a virtual machine. Download the OVA file from https://support.sourcefire.com/sections/1/sub_sections/51#5-2-virtual-appliances.

Installing the Firepower Sensor OVA File

Install the Firepower Sensor OVA on a UCS E-Series Blade, using a hypervisor, such as VMWare VSphere.

Installing Firepower Sensor on a UCS E-Series Blade

This section describes how to install the Firepower Sensor on a Unified Computing System (UCS) E-Series Blade that is installed on Cisco ISR 4000 Series Integrated Services Routers:

1. Install the UCS E-Series card.
2. Verify that the card is running by using the **show platform** command.
3. Configure the Cisco Integrated Management Controller (CIMC) port.

   The CIMC GUI is a web-based management interface for E-Series Servers. You can launch the CIMC GUI to manage the server from any remote host that meets the following minimum requirements:

   - Java 1.6 or later
   - HTTP or HTTPS-enabled
   - Adobe Flash Player 10 or later

   The CIMC runs on the port that is named management. The following example shows how to bootstrap the management port with an IP address:

```
ucse subslot 1/0
  imc access-port dedicated
  imc ip-address 10.66.152.158 255.255.255.0
!
```

Connect to the CIMC through the browser by using the default login and password, which are admin and password, respectively. Based on the configuration example, the browser address is https://10.66.152.158.

4. Install ESXi.

   Download the ESXi image for your Cisco UCS E-Series Blade from https://my.vmware.com/web/vmware/details?downloadGroup=CISCO-ESXI-5.1.0-GA-25SEP2012&productId=284.

5. Install Firepower Sensor by using VMWare VSphere on the Cisco UCS E-Series blade.
6. Configure traffic redirect. For more information, see the section “Configuring Traffic Redirect on Cisco UCS E-Series Blade”.
7. Configure the VMWare vSwitch. The Virtual Machine Network Interface Card (VMNIC) mapping on ISR 4000 Series Routers is as follows:

   - VMNIC0—Mapped to UCS E-Series interface x/0/0 on the router backplane
   - VMNIC1—Mapped to UCS E-Series interface x/0/1 on the router backplane
   - VMNIC2—Mapped to UCS E-Series frontplane GigabitEthernet 2 interface.
   - VMNIC3—Mapped to UCS E-Series frontplane GigabitEthernet 3 interface.

Note VMNIC3 is only available on UCS E-Series 140D, 160Dm and 180D.

UCS E-Series 120S and 140S have 3 network adaptors and one management port. UCS E-Series 140D, 160Dm and 180D have 4 network adaptors.

Configuring Traffic Redirect on Cisco UCS E-Series Blade

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **no ip address**
5. **no negotiation auto**
6. **switchport mode trunk**
7. **no mop enabled**
8. **no mop sysid**
9. **service instance** *service-instance-number ethernet*
10. **encapsulation dot1q** *vlan-id*
11. **rewrite ingress tag pop** {**1** | **2**} **symmetric**
12. **bridge domain** *bridge-ID*
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Router(config)# interface ucse 1/0/0`	Configures an interface and enters interface configuration mode.
Step 4	**no ip address** **Example:** `Router(config-if)# no ip address`	Removes an IP address or disables IP processing on an interface.
Step 5	**no negotiation auto** **Example:** `Router(config-if)# no negotiation auto`	Disables advertisement of speed, duplex mode, and flow control on an interface.
Step 6	**switchport mode trunk** **Example:** `Router(config-if)# switchport mode trunk`	Specifies a trunking VLAN Layer 2 interface.
Step 7	**no mop enabled** **Example:** `Router(config-if)# no mop enabled`	Disables the Maintenance Operation Protocol (MOP) on an interface.
Step 8	**no mop sysid** **Example:** `Router(config-if)# no mop sysid`	Disables the sending of periodic MOP system identification messages from an interface.
Step 9	**service instance** *service-instance-number ethernet* **Example:** `Router(config-if)# service instance 10 ethernet`	Configures an Ethernet service instance on an interface and enters Ethernet service-instance configuration mode.
Step 10	**encapsulation dot1q** *vlan-id* **Example:** `Router(config-if-srv)# encapsulation dot1q 10`	Defines the matching criteria to map 802.1Q frames ingress on an interface to the appropriate service instance.
Step 11	**rewrite ingress tag pop** {**1** | **2**} **symmetric** **Example:**	Specifies the encapsulation adjustment to be performed on a frame ingressing a service instance.

	Command or Action	Purpose
	`Router(config-if-srv)# rewrite ingress tag pop 1 symmetric`	
Step 12	**bridge domain** *bridge-ID* **Example:** `Router(config-if-srv)# bridge domain 10`	Binds a service instance or a MAC tunnel to a bridge domain instance.
Step 13	**end** **Example:** `Router(config-if)# end`	Exits Ethernet service-instance configuration mode and returns to privileged EXEC configuration mode.

Bootstrapping the Firepower Sensor

You must configure the Firepower Sensor manually. Perform this task to configure a Firepower sensor to communicate with FireSIGHT. For more information, see https://support.sourcefire.com/sections/10.

A sensor running on a Cisco Unified Computing System (UCS) E-Series Blade is bootstrapped by logging into the console of the Firepower Sensor virtual machine through VSphere.

Note Firepower Sensor must be installed and deployed before bootstrapping it.

SUMMARY STEPS

1. Provide the default username and password to login.
2. **configure network ipv4 manual** *ip-address network-mask default-gateway*
3. **configure network dns servers** *dns-server*
4. **configure network dns searchdomains** *domain-name*
5. **configure manager add** *dc-hostname registration-key*

DETAILED STEPS

	Command or Action	Purpose
Step 1	Provide the default username and password to login.	To configure the sensor, the default username and password are admin and Sourcefire, respectively. • You must change the admin password after you login to the Firepower Sensor the first time.
Step 2	**configure network ipv4 manual** *ip-address network-mask default-gateway* **Example:** `Device# configure network ipv4 manual 10.66.152.137 255.255.255.0 10.66.152.1`	Configures network connectivity.

	Command or Action	Purpose
Step 3	**configure network dns servers** *dns-server* **Example:** `Device# configure network dns servers 192.10.26.10`	Configures domain name system (DNS) servers.
Step 4	**configure network dns searchdomains** *domain-name* **Example:** `Device# configure network dns searchdomains cisco.com`	Configures DNS search domains.
Step 5	**configure manager add** *dc-hostname registration-key* **Example:** `Device# configure manager sourcefire-dc.cisco.com cisco-sf`	Associates the sensor with the FireSIGHT. • The *registration key* is a string selected by the user that is later used to register the sensor with FireSIGHT.

Example

The following is sample output from the **show network** command that displays the configured network settings of the Firepower Sensor:

```
Device# show network

-------------------------------------------------
IPv4
Configuration             : manual
Address                   : 10.66.152.137
Netmask                   : 255.255.255.0
Gateway                   : 10.66.152.1
MAC Address               : 44:03:A7:43:05:AD
Management port           : 8305
-------------------------------------------------
IPv6
Configuration             : disabled
Management port           : 8305
-------------------------------------------------
```

The following is sample output from the **show dns** command that displays the configured DNS settings:

```
Device# show dns

search cisco.com
nameserver 192.10.26.10
```

The following is sample output from the **show managers** command that displays the configured management settings:

```
Device# show managers

Host                      : sourcefire-dc.cisco.com
Registration Key          : cisco-sf
Registration              : pending
RPC Status                :
```

Enabling IDS Inspection Globally

Based on your requirements, you can configure the Intrusion Detection System (IDS) inspection at a global level or at an interface level.

You cannot enable IDS inspection on dedicated management interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **utd enable**
4. **utd engine advanced**
5. **threat detection**
6. **exit**
7. **utd**
8. **all-interfaces**
9. **engine advanced**
10. **fail close**
11. **rate** *pps-rate*
12. **redirect-interface** *interface interface-number*
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**utd enable** **Example:** `Router(config)# utd enable`	Enters unified threat defense configuration mode.
Step 4	**utd engine advanced** **Example:** `Router(config)# utd engine advanced`	Configures the unified threat defense (UTD) advanced engine and enters UTD advanced engine configuration. mode.
Step 5	**threat detection** **Example:** `Router(config-utd-eng-adv)# threat detection`	Configures threat detection or Intrusion Prevention System (IPS) as the operating mode for the Snort engine.

	Command or Action	Purpose
Step 6	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 7	**utd** **Example:** `Router(config)# utd`	Enters unified threat defense configuration mode.
Step 8	**all-interfaces** **Example:** `Router(config-utd)# all-interfaces`	Configures UTD on all Layer 3 interfaces of the device
Step 9	**engine advanced** **Example:** `outer(config-utd)# engine advanced`	Configures the unified threat defense (UTD) advanced engine and enters UTD advaned engine configuration.
Step 10	**fail close** **Example:** `Device(config-engine-std)# fail close`	(Optional) Defines the action when there is a UTD engine failure. Default option is fail-open. Fail-close option drops all the IPS/IDS traffic when there is an UTD engine failure. Fail-open option allows all the IPS/IDS traffic when there is an UTD engine failure.
Step 11	**rate** *pps-rate* **Example:** `Device(config-engine-std)# rate 2000000`	(Optional) Specify the pps rate to push to the sensor. The range is from 1000 to 4000000.
Step 12	**redirect-interface** *interface interface-number* **Example:** `Router(config-utd)# redirect-interface BDI 10`	Configures IDS traffic redirect on an interface.
Step 13	**end** **Example:** `Router(config-utd)# end`	Exits unified threat defense configuration mode and returns to privileged EXEC mode.

Enabling IDS Inspection per Interface

Based on your requirements, you can configure the Intrusion Detection System (IDS) inspection at a global level or at an interface level.

You cannot enable IDS inspection on dedicated management interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*

4. **utd enable**
5. **exit**
6. Repeat Steps 3 to 5, on all interfaces that require IDS inspection. Do not configure inspection on management interfaces.
7. **utd engine advanced**
8. **threat detection**
9. **utd**
10. **engine advanced**
11. **fail close**
12. **rate** *range*
13. **redirect interface** *type number*
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Router(config)# interface gigabitethernet 0/1/1`	Configures an interface and enters interface configuration mode.
Step 4	**utd enable** **Example:** `Router(config-if)# utd enable`	Enables intrusion detection on an interface.
Step 5	**exit** **Example:** `Router(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 6	Repeat Steps 3 to 5, on all interfaces that require IDS inspection. Do not configure inspection on management interfaces.	-
Step 7	**utd engine advanced** **Example:** `Router(config)# utd engine advanced`	Configures the unified threat defense (UTD) advanced engine and enters UTD advanced engine configuration. mode.
Step 8	**threat detection** **Example:**	Configures threat detection or Intrusion Prevention System (IPS) as the operating mode for the Snort engine.

	Command or Action	Purpose
	`Router(config-utd-eng-adv)# threat detection`	
Step 9	**utd** **Example:** `Router(config)# utd`	Enters unified threat defense configuration mode.
Step 10	**engine advanced** **Example:** `outer(config-utd)# engine advanced`	Configures the unified threat defense (UTD) advanced engine and enters UTD advaned engine configuration.
Step 11	**fail close** **Example:** `Device(config-engine-std)# fail close`	(Optional) Defines the action when there is a UTD engine failure. Default option is fail-open. Fail-close option drops all the IPS/IDS traffic when there is an UTD engine failure. Fail-open option allows all the IPS/IDS traffic when there is an UTD engine failure.
Step 12	**rate** *range* **Example:** `Device(config-engine-std)# rate 1000`	(Optional) Specify the pps rate to push to the sensor. The range is 1000 to 4000000.
Step 13	**redirect interface** *type number* **Example:** `Router(config-utd)# redirect interface BDI 10`	Configures IDS traffic redirect on an interface.
Step 14	**end** **Example:** `Router(config-utd)# end`	Exits unified threat defense configuration mode and returns to privileged EXEC mode.

Configuration Examples for Cisco Firepower Threat Defense on ISR

Example: Configuring Traffic Redirect on Cisco UCS E-Series Blade

This example shows how to configure ingress and egress interfaces for traffic redirect:

```
Router# configure terminal
Router(config)# interface ucse 1/0/0
Router(config-if)# no ip address
Router(config-if)# no negotiation auto
Router(config-if)# switchport mode trunk
Router(config-if)# no mop enabled
Router(config-if)# no mop sysid
Router(config-if)# exit
Router(config)# interface ucse 1/0/1
Router(config-if)# no ip address
Router(config-if)# no negotiation auto
```

```
Router(config-if)# switchport mode trunk
Router(config-if)# no mop enabled
Router(config-if)# no mop sysid
Router(config-if)# service instance 10 ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# rewrite ingress tag pop 1 symmetric
Router(config-if-srv)# bridge domain 10
Router(config-if-srv)# exit
Router(config-if)# exit
Router(config)# interface BDI 10
Router(config-if)# no shutdown
Router(config-if)# ip address 10.1.1.1 255.255.255.0
Router(config-if-srv)# end
```

Example: Bootstrapping the Firepower Sensor

The following example shows how to bootstrap the Firepower Threat Defense sensor:

```
Sourcefire3D login: admin
Password: Sourcefire
Last login: Tue Nov 12 11:15:03 UTC 2013 on tty1

Copyright 2001-2013, Sourcefire, Inc. All rights reserved. Sourcefire is
a registered trademark of Sourcefire, Inc. All other trademarks are
property of their respective owners.

Sourcefire Linux OS v5.2.0 (build 135)
Sourcefire Virtual Device 64bit v5.2.0 (build 838)

> configure password
Enter current password:
Enter new password:
Confirm new password:

> configure network ipv4 manual 10.66.152.137 255.255.255.0 10.66.152.1
Setting IPv4 network configuration.
ADDRCONF(NETDEV_UP): eth0: link is not ready
e1000: eth0: e1000_phy_read_status: Error reading PHY register
e1000: eth0: e1000_watchdog_task: NIC Link is Up
1000 Mbps Full Duplex, Flow Control: None
ADDRCONF(NETDEV_CHANGE): eth0: link becomes ready

Network settings changed.

> configure network dns servers 192.10.26.10

> configure network dns searchdomains cisco.com

configure manager add sourcefire-dc.cisco.com cisco-sf
Manager successfully configured.
```

Example: Enabling IDS Inspection Globally

```
Router# configure terminal
Router(config)# utd enable
```

```
Router(config-utd)# utd engine advanced
Router(config-utd-adv)# threat detection
Router(config-utd-adv)# exit
Router(config)# utd
Router(config-utd)# all-interfaces
Router(config-utd)# engine advanced
Router(config-utd)# fail close
Router(config-utd)# rate 1000
Router(config-utd)# redirect-interface BDI 10
Router(config-utd)# end
```

Example: Enabling IDS Inspection per Interface

```
Device# configure terminal
Device(config)# interface gigabitethernet 0/1/1
Device(config-if)# utd enable
Router(config-utd)# utd engine advanced
Router(config-utd-adv)# threat detection
Router(config-utd-adv)# exit
Router(config)# utd
Router(config-utd)# engine advanced
Router(config-utd)# fail close
Router(config-utd)# rate 1000
Router(config-utd)# redirect-interface BDI 10
Router(config-utd)# end
```

Verifying and Monitoring IDS Inspection

Use the following commands to verify and monitor your Intrusion Detection System (IDS) deployment:

SUMMARY STEPS

1. **enable**
2. **debug platform condition feature utd controlplane**
3. **debug platform condition feature utd dataplane submode**
4. **show platform hardware qfp active utd** {**config** | **status** [**all**] [**clear**] [**drop**] [**general**]}

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode.

- Enter your password if prompted.

Example:

```
Router> enable
```

Step 2 debug platform condition feature utd controlplane

Enables the debugging of the IDS configuration and status information.

Example:

```
Router# debug platform condition feature utd controlplane

network RF:
  network-rf idb-sync-history events debugging is on
IOSXE Conditional Debug Configs:

Conditional Debug Global State: Stop

Feature      Type           Submode       Level
-----------|-------------|------------------------------
UTD           controlplane                info

IOSXE Packet Tracing Configs:

Packet Infra debugs:

Ip Address                                                 Port
-----------------------------------------------------------|----------
```

Step 3 **debug platform condition feature utd dataplane submode**

Enables the debugging of IDS packet flow information.

Example:

```
Router# debug platform  condition feature utd dataplane submode

network RF:
  network-rf idb-sync-history events debugging is on
IOSXE Conditional Debug Configs:

Conditional Debug Global State: Stop

Feature      Type           Submode                    Level
-----------|-------------|---------------------|----------
UTD           controlplane                          info
UTD           dataplane     fia proxy punt          info

IOSXE Packet Tracing Configs:

Packet Infra debugs:

Ip Address                                                 Port
-----------------------------------------------------------|----------
```

Step 4 **show platform hardware qfp active utd** {**config** | **status** [**all**] [**clear**] [**drop**] [**general**]}

Displays information about the IDS inspection in the Cisco Quantum Flow Processor (QFP).

Example:

```
Router# show platform hardware qfp active utd config

Global flags: 0x40004
Num divert interfaces: 1
Divert UIDBs: 65521 0
FIB information
[0][0] 0x309e3c30
[0][1] 0x0
[1][0] 0x309e4040
```

```
[1][1] 0x0
```

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	http://www.cisco.com/support

Feature Information for Cisco Firepower Threat Defense for ISR

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Feature Name	Releases	Feature Information

CHAPTER 164

Snort IPS

The Snort IPS feature enables Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) for branch offices on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series. This feature uses the open source Snort solution to enable IPS and IDS. The Snort IPS feature is available in Cisco IOS XE Release 3.16.1S, 3.17S, and later releases.

Note The Virtual Routing and Forwarding (VRF) feature is supported on Snort IPS configuration from Cisco IOS XE Denali Release 16.3.1 and later releases.

This module explains the feature and how it works.

Restrictions for Snort IPS

The following restrictions apply to the Snort IPS feature:

- When you enable boost license on Cisco 4000 Series ISRs, you cannot configure the virtual-service container for Snort IPS.
- Incompatible with the Zone-Based Firewall SYN-cookie feature.
- Network Address Translation 64 (NAT64) is not supported.
- SnortSnmpPlugin is required for SNMP polling in open source Snort. Snort IPS does not support SNMP polling capabilities or MIBs as the SnortSnmp plugin is not installed on UTD.

- **IOS syslog is rate limited and as a result, all alerts generated by Snort may not be visible via the IOS Syslog. However, you can view all Syslog messages if you export them to an external log server.**

Information About Snort IPS

Snort IPS Overview

The Snort IPS feature enables Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) for branch offices on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series. This feature uses the Snort engine to provide IPS and IDS functionalities.

Snort is an open source network IPS that performs real-time traffic analysis and generates alerts when threats are detected on IP networks. It can also perform protocol analysis, content searching or matching, and detect a variety of attacks and probes, such as buffer overflows, stealth port scans, and so on. The Snort engine runs as a virtual container service on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series.

The Snort IPS feature works in the network intrusion detection and prevention mode that provides IPS or IDS functionalities. In the network intrusion detection and prevention mode, Snort performs the following actions:

- Monitors network traffic and analyzes against a defined rule set.
- Performs attack classification.
- Invokes actions against matched rules.

Based on your requirements, you can enable Snort either in IPS or IDS mode. In IDS mode, Snort inspects the traffic and reports alerts, but does not take any action to prevent attacks. In IPS mode, in addition to intrusion detection, actions are taken to prevent attacks.

The Snort IPS monitors the traffic and reports events to an external log server or the IOS syslog. Enabling logging to the IOS syslog may impact performance due to the potential volume of log messages. External third-party monitoring tools, which supports Snort logs, can be used for log collection and analysis.

Snort IPS Signature Package

The UTD OVA is included in the security license of the router. By default, the router is loaded only with community signature package. There are two types of subscriptions :

- Community Signature Package
- Subscriber-based Signature Package

The community signature package rule set offers limited coverage against threats. The subscriber-based signature package rule set offers the best protection against threats. It includes coverage in advance of exploits, and also provides the fastest access to the updated signatures in response to a security incident or the proactive discovery of a new threat. This subscription is fully supported by Cisco and the package will be updated on Cisco.com. You can download the subscriber-based signature package from the Download Software page.

If the user downloads the signature package manually from the download software page, then the user should ensure that the package has the same version as the Snort engine version. For example, if the Snort engine version is 2982, then the user should download the same version of the signature package. If there is a version mismatch, the signature package update will be rejected and it will fail.

Note When the signature package is updated, the engine will be restarted and the traffic will be interrupted or bypass inspection for a short period depending on their data plane fail-open/fail-close configuration.

Minimum Supported Cisco IOS XE Release and UTD Package Versions for Signature Updates

Table 1 below lists the minimum Cisco IOS XE releases and their respective UTD package versions that support signature package updates post January, 2020. The Cisco IOS XE releases and their respective UTD package versions that are prior to those listed in the table are not supported. The Cisco IOS XE releases and their respective UTD package versions that are more recent than those listed in the table are supported from their first release.

Table 218: UTD Signature Package Update Support Version Matrix

Cisco IOS XE Release	UTD Package Version
16.6.7	1.0.10_SV29111_XE_16_6
16.9.4	1.0.4_SV29111_XE_16_9
16.10.2	1.0.9_SV2.9.11.1_XE16.10

Note When UTD is oversubscribed, the threat defence channel state changes between green and red. The UTD dataplane either drops all further packets if fail-close is configured or forwards the packets un-inspected if fail-close is not configured (default). When the UTD serviceplane recovers from over-subscription, it responds to the UTD dataplane with the green status.

Snort IPS Solution

The Snort IPS solution consists of the following entities:

- Snort sensor—Monitors the traffic to detect anomalies based on the configured security policies (that includes signatures, statistics, protocol analysis, and so on) and sends alert messages to the Alert/Reporting server. The Snort sensor is deployed as a virtual container service on the router.
- Signature store—Hosts the Cisco Signature packages that are updated periodically. These signature packages are downloaded to Snort sensors either periodically or on demand. Validated signature packages are posted to Cisco.com. Based on the configuration, signature packages can be downloaded from Cisco.com or a local server.

The following domains are accessed by the router in the process of downloading the signature package from cisco.com:

- api.cisco.com
- apx.cisco.com
- cloudsso.cisco.com
- cloudsso-test.cisco.com
- cloudsso-test3.cisco.com
- cloudsso-test4.cisco.com
- cloudsso-test5.cisco.com
- cloudsso-test6.cisco.com
- cloudsso.cisco.com
- download-ssc.cisco.com
- dl.cisco.com
- resolver1.opendns.com
- resolver2.opendns.com

Note If you are downloading signature packages from a local server to hold the signature packages, only HTTP is supported.

Signature packages must be manually downloaded from Cisco.com to the local server by using Cisco.com credentials before the Snort sensor can retrieve them.

The Snort container performs a domain-name lookup (on the DNS server(s) configured on the router) to resolve the location for automatic signature updates from Cisco.com or on the local server, if the URL is not specified as the IP address.

- Alert/Reporting server—Receives alert events from the Snort sensor. Alert events generated by the Snort sensor can either be sent to the IOS syslog or an external syslog server or to both IOS syslog and external syslog server. No external log servers are bundled with the Snort IPS solution.
- Management—Manages the Snort IPS solution. Management is configured using the IOS CLI. Snort Sensor cannot be accessed directly, and all configuration can only be done using the IOS CLI.

Overview of Snort Virtual Service Interfaces

The Snort sensor runs as a service on routers. Service containers use virtualization technology to provide a hosting environment on Cisco devices for applications.

You can enable Snort traffic inspection either on a per interface basis or globally on all supported interfaces. The traffic to be inspected is diverted to the Snort sensor and injected back. In Intrusion Detection System (IDS), identified threats are reported as log events and allowed. However, in Intrusion Prevention System (IPS), action is taken to prevent attacks along with log events.

The Snort sensor requires two VirtualPortGroup interfaces. The first VirtualPortGroup interface is used for management traffic and the second for data traffic between the forwarding plane and the Snort virtual container service. Guest IP addresses must be configured for these VirtualPortGroup interfaces. The IP subnet assigned to the management VirtualPortGroup interface should be able to communicate with the Signature server and Alert/Reporting server.

The IP subnet of the second VirtualPortGroup interface must not be routable on the customer network because the traffic on this interface is internal to the router. Exposing the internal subnet to the outside world is a security risk. We recommend the use of 192.0.2.0/30 IP address range for the second VirtualPortGroup subnet. The use of 192.0.2.0/24 subnet is defined in RFC 3330.

You can also use the management interface under the **virtual-service** command for management traffic. If you configure the management interface, you still need two VirtualPortGroup interfaces. However, do not configure the **guest ip address** for the first VirtualPortGroup interface.

You can assign the Snort virtual container service IP address on the same management network as the router on which the virtual service is running. This configuration helps if the syslog or update server is on the management network and is not accessible by any other interfaces.

Virtual Service Resource Profile

The Snort IPS virtual service supports three resource profiles: Low, Medium, and High. These profiles indicate the CPU and memory resources required to run the virtual service. You can configure one of these resource profiles. The resource profile configuration is optional. If you do not configure a profile, the virtual service is activated with its default resource profile. This table provides the resource profiles details for Cisco 4000 Series ISR and Cisco Cloud Services Router 1000v Series.

Platform	Profile	Virtual Service Resource Requirements		Platform Requirements
		System CPU	Memory	
Cisco 4321 ISR	Default	50%	Min: 1GB (RAM) Min: 750MB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
Cisco 4331 ISR	Low (Default)	25%	Min: 1GB (RAM) Min: 750MB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM) Min: 1GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM) Min: 2GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)

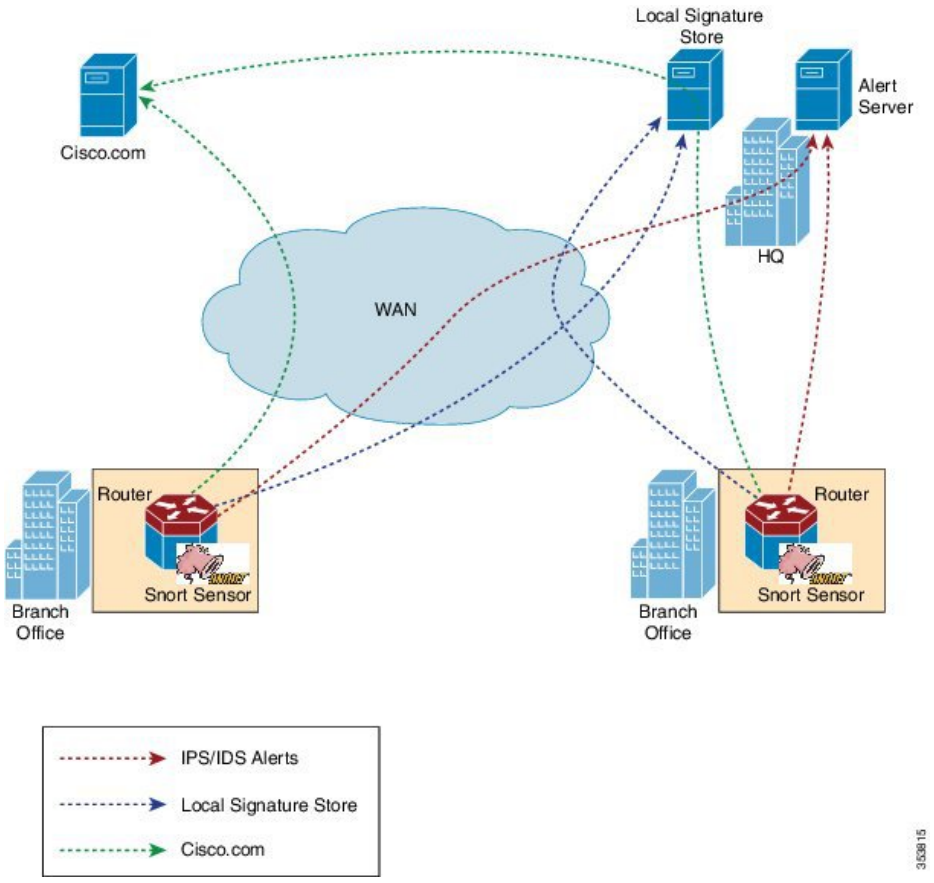
Platform	Profile	Virtual Service Resource Requirements		Platform Requirements
		System CPU	Memory	
Cisco 4351 ISR	Low (Default)	25%	Min: 1GB (RAM) Min: 750MB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM) Min: 1GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM) Min: 2GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
Cisco 4431 ISR	Low (Default)	25%	Min: 1GB (RAM) Min: 750MB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM) Min: 1GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM) Min: 2GB (Disk/Flash)	Min: 12GB (RAM) Min: 12GB(Disk/Flash)
Cisco 4451 ISR	Low (Default)	25%	Min: 1GB (RAM) Min: 750MB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM) Min: 1GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	High	75%	Min: 4GB (RAM) Min: 2GB (Disk/Flash)	Min: 12GB (RAM) Min: 12GB(Disk/Flash)

Platform	Profile	Virtual Service Resource Requirements		Platform Requirements
		System CPU	Memory	
Cisco CSR 1000V	Low (Default)	25%	Min: 1GB (RAM) Min: 750MB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	Medium	50%	Min: 2GB (RAM) Min: 1GB (Disk/Flash)	Min: 8GB (RAM) Min: 8GB(Disk/Flash)
	High	75%	Min: 3GB (RAM) Min: 2GB (Disk/Flash)	Min: 12GB (RAM) Min: 12GB(Disk/Flash)

Deploying Snort IPS

The figure illustrates a Snort IPS deployment scenario:

Figure 86: Snort IPS Deployment Scenario



The following steps describes the deployment of the Snort IPS solution:

- The Snort OVA file is copied to Cisco routers, installed, and then activated.
- Signature packages are downloaded either from Cisco.com or a configured local server to Cisco routers.
- Network intrusion detection or prevention functionality is configured.
- The Alert/Reporting server is configured to receive alerts from the Snort sensor.

How to Deploy Snort IPS

To deploy Snort IPS on supported devices, perform the following tasks:

1. Provision the device.

   Identify the device to install the Snort IPS feature.

2. Obtain the license.

   The Snort IPS functionality is available only in Security Packages which require a security license to enable the service. This feature is available in Cisco IOS XE Release 3.16.1S, 3.17S, and later releases.

Note Contact Cisco Support to obtain the license.

3. Install the Snort OVA file.
4. Configure VirtualPortGroup interfaces and virtual-service.
5. Activate the Snort virtual container service.
6. Configure Snort IPS or IDS mode and policy.
7. Configure the reporting of events to an external alert/log server or IOS syslog or both.
8. Configure the Signature update method.
9. Update the Signatures.
10. Enable IPS globally or on desired interfaces.

Installing the Snort OVA File

An OVA file is an Open Virtualization Archive that contains a compressed, installable version of a virtual machine. The Snort IPS is available as a virtual container service. You must download this OVA file on to the router and use the **virtual-service install** CLI to install the service.

The service OVA file is not bundled with the Cisco IOS XE Release images that are installed on the router. However, the OVA files may be preinstalled in the flash of the router.

You must use a Cisco IOS XE image with security license. During the OVA file installation, the security license is checked and an error is reported if the license is not present.

SUMMARY STEPS

1. **enable**
2. **virtual-service install name** *virtual-service-name* **package** *file-url* **media** *file-system*
3. **show virtual-service list**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**virtual-service install name** *virtual-service-name* **package** *file-url* **media** *file-system* **Example:** `Device# virtual-service install name UTDIPS package harddisk:utd-ips-v102.ova media harddisk:`	Installs an application on the virtual services container of a device. • The length of the name is 20 characters. Hyphen (-) is not a valid character. • You must specify the complete path of the OVA package to be installed. **Note** OVA installation works on both hard disk and bootflash, the preferred filesystem to install the OVA will be hard disk.
Step 3	**show virtual-service list** **Example:** `Device# show virtual-service list`	Displays the status of the installation of all applications installed on the virtual service container.

Configuring VirtualPortGroup Interfaces and Virtual Service

You must configure two VirtualPortGroup interfaces and configure guest IP addresses for both interfaces. However, if you configure a management interface by using the **vnic management GigabitEthernet0** command, then do not configure the guest IP address for the first VirtualPortGroup interface.

Note The VirtualPortGroup interface for data traffic must use a private or nonroutable IP address. We recommend the use of 192.0.2.0/30 IP address range for this interface.

Note Before you change the Cisco IOS software image from any of the XE 3.x versions to XE 16.2.1, or from XE 16.2.1 to any of the XE 3.x versions, uninstall the virtual-service by using the **virtual-service uninstall name [name]** command for each virtual-service on the device. If one of the virtual-services is the ISR-WAAS service, which is installed with the **service waas enable** command, use the **service waas disable** command.

After the device is upgraded with the new version of Cisco IOS software image, re-install the virtual-services. For ISR-WAAS, use the **service wass enable** command, and for other virtual-services, use the **virtual-service install name [name] package [.ova file]** command.

SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **interface** *VirtualPortGroup number*
4. **ip address** *ip-address mask*
5. **exit**
6. **interface** *type number*
7. **ip address** *ip-address mask*
8. **exit**
9. **virtual-service** *name*
10. **profile** *profile-name*
11. **vnic gateway VirtualPortGroup** *interface-number*
12. **guest ip address** *ip-address*
13. **exit**
14. **vnic gateway VirtualPortGroup** *interface-number*
15. **guest ip address** *ip-address*
16. **exit**
17. **vnic management GigabitEthernet0**
18. **guest ip address** *ip-address*
19. **exit**
20. **activate**
21. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *VirtualPortGroup number* **Example:** `Device(config)# interface VirtualPortGroup 0`	Configures an interface and enters interface configuration mode. • Configure a VirtualPortGroup interface. This interface is used for management traffic when the management interface GigabitEthernet0 is not used.
Step 4	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 10.1.1.1 255.255.255.252`	Sets a primary IP address for an interface. This interface needs to be routable to the signature update server and external log server.
Step 5	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.

	Command or Action	Purpose
Step 6	**interface** *type number* **Example:** `Device(config)# interface VirtualPortGroup 1`	Configures an interface and enters interface configuration mode. • Configure a VirtualPortGroup interface. • This interface is used for data traffic.
Step 7	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 192.0.2.1 255.255.255.252`	Sets a primary IP address for an interface. • This IP address should not be routable to the outside network. • The IP address is assigned from the recommended 192.0.2.0/30 subnet.
Step 8	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 9	**virtual-service** *name* **Example:** `Device(config)# virtual-service UTDIPS`	Configures a virtual container service and enters virtual service configuration mode. • The *name* argument is the logical name that is used to identify the virtual container service.

Step 10	**profile** *profile-name*
	Example:
	`Device(config-virt-serv)#profile high`
	Example:
	`Device(config-virt-serv)#profile multi-tenancy`
		(Optional) Configures a resource profile. If you do not configure the resource profile, the virtual service is activated with its default resource profile. The options are: low, medium, high, and multi-tenancy. (For multi-tenancy mode (Cisco CSR 1000v only), a `profile multi-tenancy` command must be configured.)

Step 11	**vnic gateway VirtualPortGroup** *interface-number* **Example:** `Device(config-virt-serv)# vnic gateway VirtualPortGroup 0`	Creates a virtual network interface card (vNIC) gateway interface for the virtual container service, maps the vNIC gateway interface to the virtual port group, and enters the virtual-service vNIC configuration mode. • The interface referenced in this command must be the one configured in Step 3. This command maps the interface that is used for management purposes.
Step 12	**guest ip address** *ip-address* **Example:** `Device(config-virt-serv-vnic)# guest ip address 10.1.1.2`	(Optional) Configures a guest vNIC address for the vNIC gateway interface. • **Note** Configure this command only if the **vnic management gigabitethernet0** command specified in Step 17 is not configured.
Step 13	**exit** **Example:** `Device(config-virt-serv-vnic)# exit`	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.

	Command or Action	Purpose
Step 14	**vnic gateway VirtualPortGroup** *interface-number* **Example:** `Device(config-virt-serv)# vnic gateway VirtualPortGroup 1`	Creates a vNIC gateway interface for the virtual container service, maps the vNIC gateway interface to the virtual port group, and enters the virtual-service vNIC configuration mode. • This interface referenced in this command must be the one configured in Step 6. This command maps the interface in the virtual container service that is used by Snort for monitoring the user traffic.
Step 15	**guest ip address** *ip-address* **Example:** `Device(config-virt-serv-vnic)# guest ip address 192.0.2.2`	Configures a guest vNIC address for the vNIC gateway interface.
Step 16	**exit** **Example:** `Device(config-virt-serv-vnic)# exit`	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.
Step 17	**vnic management GigabitEthernet0** **Example:** `Device(config-virt-serv)# vnic management GigabitEthernet0`	(Optional) Configures the GigabitEthernet interface as the vNIC management interface. • The management interface must either be a VirtualPortGroup interface or GibagitEthernet0 interface. • If you do not configure the **vnic management GigabitEthernet0** command, then you must configure the **guest ip address** command specified in Step 12.
Step 18	**guest ip address** *ip-address* **Example:** `Device(config-virt-serv-vnic)# guest ip address 209.165.201.1`	(Optional) Configures a guest vNIC address for the vNIC management interface and it must be in the same subnet as the management interface and GigabitEthernet0 configuration.
Step 19	**exit** **Example:** `Device(config-virt-serv-vnic)# exit`	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.
Step 20	**activate** **Example:** `Device(config-virt-serv)# activate`	Activates an application installed in a virtual container service.
Step 21	**end** **Example:** `Device(config-virt-serv)# end`	Exits virtual service configuration mode and returns to privileged EXEC mode.

Configuring Snort IPS Globally

Based on your requirements, configure the Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) inspection at a global level or at an interface. Perform this task to configure IPS globally on a device.

Note The term global refers to Snort IPS running on all supported interfaces.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **utd threat-inspection whitelist**
4. **generator id** *generator-id* **signature id** *signature-id* [**comment** *description*]
5. **exit**
6. **utd engine standard**
7. **logging** {**host** *hostname* | **syslog**}
8. **threat-inspection**
9. **threat** {**detection** | **protection** }
10. **policy** {**balanced** | **connectivity** | **security**}
11. **whitelist**
12. **signature update occur-at** {**daily** | **monthly** *day-of-month* | **weekly** *day-of-week*} *hour minute*
13. **signature update server** {**cisco** | **url** *url* } [**username** *username* [**password** *password*]]
14. **logging level** {**alert** | **crit** | **debug** | **emerg** | **err** | **info** | **notice** | **warning**}
15. **exit**
16. **utd**
17. **redirect interface virtualPortGroup** *interface-number*
18. **all-interfaces**
19. **engine standard**
20. **fail close**
21. **exit**
22. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter you password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**utd threat-inspection whitelist** **Example:** `Device(config)# utd threat-inspection whitelist`	(Optional) Enables the UTD allowed list configuration mode.
Step 4	**generator id** *generator-id* **signature id** *signature-id* [**comment** *description*] **Example:** `Device(config-utd-whitelist)# generator id 24 signature id 24245 comment traffic from branchoffice1`	Configures signature IDs to appear in the allowed list. • Signature IDs can be copied from alerts that needs to be suppressed. • You can configure multiple signature IDs. • Repeat this step for each signature ID that needs to be added to the allowed list.
Step 5	**exit** **Example:** `Device(config-utd-whitelist)# exit`	Exits UTD allowed list configuration mode and returns to global configuration mode.
Step 6	**utd engine standard** **Example:** `Device(config)# utd engine standard`	Configures the unified threat defense (UTD) standard engine and enters UTD standard engine configuration mode.
Step 7	**logging** {**host** *hostname* | **syslog**} **Example:** `Device(config-utd-eng-std)# logging host syslog.yourcompany.com`	Enables the logging of emergency messages to a server.
Step 8	**threat-inspection** **Example:** `Device(config-utd-eng-std)# threat-inspection`	Configures threat inspection for the Snort engine.
Step 9	**threat** {**detection** | **protection** } **Example:** `Device(config-utd-eng-std-insp)# threat protection`	Configures threat detection or Intrusion Prevention System (IPS) as the operating mode for the Snort engine. • The default is **detection**. • Configure the **detection** keyword to configure Intrusion Detection System (IDS).
Step 10	**policy** {**balanced** | **connectivity** | **security**} **Example:** `Device(config-utd-eng-std-insp)# policy security`	Configures the security policy for the Snort engine. • The default policy option is **balanced**.
Step 11	**whitelist** **Example:** `Device(config-utd-eng-std-insp)# whitelist`	(Optional) Enables allowed listing under the UTD engine.

	Command or Action	Purpose
Step 12	**signature update occur-at** {**daily** | **monthly** *day-of-month* | **weekly** *day-of-week*} *hour minute* **Example:** `Device(config-utd-eng-std-insp)# signature update occur-at daily 0 0`	Configures the signature update interval parameters. This configuration will trigger the signature update to occur at midnight.
Step 13	**signature update server** {**cisco** | **url** *url* } [**username** *username* [**password** *password*]] **Example:** `Device(config-utd-eng-std-insp)# signature update server cisco username abcd password cisco123`	Configures the signature update server parameters. You must specify the signature update parameters with the server details. If you use Cisco.com for signature updates, you must provide the username and password. If you use local server for signature updates, based on the server settings you can provide the username and password.
Step 14	**logging level** {**alert** | **crit** | **debug** | **emerg** | **err** | **info** | **notice** | **warning**} **Example:** `Device(config-utd-eng-std-insp)# logging level emerg`	Enables the log level.
Step 15	**exit** **Example:** `Device(config-utd-eng-std-insp)# exit`	Exits UTD standard engine configuration mode and returns to global configuration mode.
Step 16	**utd** **Example:** `Device(config)# utd`	Enables unified threat defense (UTD) and enters UTD configuration mode.
Step 17	**redirect interface virtualPortGroup** *interface-number* **Example:** `Device(config-utd)# redirect interface virtualPortGroup 1`	(Optional) Redirects to a VirtualPortGroup interface. This is the data traffic interface. If you do not configure this interface, it is auto-detected.
Step 18	**all-interfaces** **Example:** `Device(config-utd)# all-interfaces`	Configures UTD on all Layer 3 interfaces of the device.
Step 19	**engine standard** **Example:** `Device(config-utd)# engine standard`	Configures the Snort-based unified threat defense (UTD) engine and enters standard engine configuration mode.
Step 20	**fail close** **Example:** `Device(config-engine-std)# fail close`	(Optional) Defines the action when there is a UTD engine failure. Default option is fail-open. Fail-close option drops all the IPS/IDS traffic when there is an UTD engine failure. Fail-open option allows all the IPS/IDS traffic when there is an UTD engine failure.

	Command or Action	Purpose
Step 21	**exit** **Example:** `Device(config-eng-std)# exit`	Exits standard engine configuration mode and returns to global configuration mode.
Step 22	**end** **Example:** `Device(config-utd)# end`	Exits UTD configuration mode and returns to global configuration mode.

Configuring Snort IDS Inspection Globally

Based on your requirements, configure either Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) inspection at a global level or at an interface level. Perform this task to configure IDS on a per-interface basis.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **utd enable**
5. **exit**
6. Repeat Steps 3 to 5, on all interfaces that require inspection.
7. **utd threat-inspection whitelist**
8. **generator id** *generator-id* **signature id** *signature-id* [**comment** *description*]
9. **exit**
10. **utd engine standard**
11. **logging** {**host** *hostname* | **syslog**}
12. **threat-inspection**
13. **threat** {**detection** | **protection** }
14. **policy** {**balanced** | **connectivity** | **security**}
15. **whitelist**
16. **signature update occur-at** {**daily** | **monthly** *day-of-month* | **weekly** *day-of-week*} *hour minute*
17. **signature update server** {**cisco** | **url** *url*} [**username** *username* [**password** *password*]]
18. **logging level** {**alert** | **crit** | **debug** | **emerg** | **err** | **info** | **notice** | **warning**}
19. **exit**
20. **utd**
21. **redirect interface virtualPortGroup** *interface-number*
22. **engine standard**
23. **fail close**
24. **exit**
25. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter you password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface** *type number* **Example:** `Device(config)# interface gigabitethernet 0/0/0`	Configures an interface and enters interface configuration mode.
Step 4	**utd enable** **Example:** `Device(config-if)# utd enable`	Enables unified threat defense (UTD).
Step 5	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 6	Repeat Steps 3 to 5, on all interfaces that require inspection.	–
Step 7	**utd threat-inspection whitelist** **Example:** `Device(config)# utd threat-inspection whitelist`	(Optional) Enables the UTD allowed list configuration mode.
Step 8	**generator id** *generator-id* **signature id** *signature-id* [**comment** *description*] **Example:** `Device(config-utd-whitelist)# generator id 24 signature id 24245 comment traffic from branchoffice1`	Configures signature IDs to appear on the allowed list. • Signature IDs can be copied from alerts that needs to be suppressed. • You can configure multiple signature IDs. • Repeat this step for each signature ID that needs to appear on the allowed list.
Step 9	**exit** **Example:** `Device(config-utd-whitelist)# exit`	Exits UTD allowed list configuration mode and returns to global configuration mode.
Step 10	**utd engine standard** **Example:** `Device(config)# utd engine standard`	Configures the unified threat defense (UTD) standard engine and enters UTD standard engine configuration mode.
Step 11	**logging** {**host** *hostname* | **syslog**} **Example:**	Enables the logging of critical messages to the IOSd syslog.

	Command or Action	Purpose
	`Device(config-utd-eng-std)# logging syslog`	
Step 12	**threat-inspection** **Example:** `Device(config-utd-eng-std)# threat-inspection`	Configures threat inspection for the Snort engine.
Step 13	**threat** {**detection** | **protection** } **Example:** `Device(config-utd-eng-std-insp)# threat detection`	Configures threat protection or Intrusion Detection System (IDS) as the operating mode for the Snort sensor. • Configure the **protection** keyword to configure Intrusion Prevention System (IPS).
Step 14	**policy** {**balanced** | **connectivity** | **security**} **Example:** `Device(config-utd-eng-std-insp)# policy balanced`	Configures the security policy for the Snort sensor.
Step 15	**whitelist** **Example:** `Device(config-utd-eng-std-insp)# whitelist`	(Optional) Enables allowed listing of traffic.
Step 16	**signature update occur-at** {**daily** | **monthly** *day-of-month* | **weekly** *day-of-week*} *hour minute* **Example:** `Device(config-utd-eng-std-insp)# signature update occur-at daily 0 0`	Configures the signature update interval parameters. This configuration will trigger the signature update to occur at midnight.
Step 17	**signature update server** {**cisco** | **url** *url*} [**username** *username* [**password** *password*]] **Example:** `Device(config-utd-eng-std-insp)# signature update server cisco username abcd password cisco123`	Configures the signature update server parameters. You must specify the signature update parameters with the server details. If you use Cisco.com for signature updates, you must provide the username and password. If you use local server for signature updates, based on the server settings you can provide the username and password.
Step 18	**logging level** {**alert** | **crit** | **debug** | **emerg** | **err** | **info** | **notice** | **warning**} **Example:** `Device(config-utd-eng-std-insp)# logging level crit`	Enables the log level.
Step 19	**exit** **Example:** `Device(config-utd-eng-std-insp)# exit`	Exits UTD standard engine configuration mode and returns to global configuration mode.
Step 20	**utd** **Example:** `Device(config)# utd`	Enables unified threat defense (UTD) and enters UTD configuration mode.

	Command or Action	Purpose
Step 21	**redirect interface virtualPortGroup** *interface-number* **Example:** `Device(config-utd)# redirect interface virtualPortGroup 1`	(Optional) Redirects to a VirtualPortGroup interface. This is the data traffic interface. If you do not configure this interface, it is auto-detected.
Step 22	**engine standard** **Example:** `Device(config-utd)# engine standard`	Configures the Snort-based unified threat defense (UTD) engine and enters standard engine configuration mode.
Step 23	**fail close** **Example:** `Device(config-engine-std)# fail close`	(Optional) Defines the action when there is a UTD engine failure. Default option is fail-open. Fail-close option drops all the IPS/IDS traffic when there is an UTD engine failure. Fail-open option allows all the IPS/IDS traffic when there is an UTD engine failure.
Step 24	**exit** **Example:** `Device(config-eng-std)# exit`	Exits standard engine configuration mode and returns to global configuration mode.
Step 25	**end** **Example:** `Device(config-utd)# end`	Exits configuration mode and returns back to exec mode.

Displaying the List of Active Signatures

Active signatures are the ones that prompt Snort IDS/IPS to take action against threats. If the traffic matches with any of the active signatures, Snort container triggers alert in the IDS mode, and drops the traffic in the IPS mode.

The **utd threat-inspection signature active-list write-to bootflash: file name** command provides a list of active signatures and a summary of the total number of active signatures, drop signatures, and alert signatures.

Configuring Quality of Service Policy for Monitoring the Container's Health

It is recommended to configure a Quality of Service (QoS) policy to ensure the health probes that monitor the container's health are not impacted at high traffic rates.

SUMMARY STEPS

1. **ip access-list extended** {acl-name | acl-number}
2. sequence-number permit protocol source *source-wildcard destination destination-wildcard* [precedence] [tos *tos* tos] [log] [time-range*time-range-name*] [fragments]
3. **exit**
4. class-map { [type inspect match-all] | [match-any] } *class-map-name*
5. match access-group { *access-group* | name *access-group-name*}
6. **exit**

7. policy-map *policy-map-name*
8. class {*class-name* | class-default
9. priority level *level*
10. **exit**
11. **interface** *type number*
12. service-policy [history | {output} *policy-map-name* | type control *control-policy-name*]
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**ip access-list extended** {acl-name | acl-number} **Example:** `Device(config)# ip access-list extended health_probes_accesslist`	Enables extended ACL configuration mode. The CLI enters the extended ACL configuration mode in which all subsequent commands apply to the current extended access list.
Step 2	sequence-number permit protocol source *source-wildcard destination destination-wildcard* [precedence] [tos *tos*] [log] [time-range*time-range-name*] [fragments] **Example:** `Device(config-ext-nacl)# 10 permit udp any eq 3367 any eq 3367`	Specifies a permit statement in named IP access list mode. This access list happens to use a **permit**statement first, but a **deny** statement could appear first, depending on the order of statements you need.
Step 3	**exit** **Example:** `Device(config-ext-nacl)# exit`	Exits extended ACL configuration mode and returns to global configuration mode.
Step 4	class-map { [type inspect match-all] | [match-any] } *class-map-name* **Example:** `Device(config)# class-map match-all health_probes_cmap`	Specifies the name of the class map to be created and enters QoS class map configuration mode.
Step 5	match access-group { *access-group* | name *access-group-name*} **Example:** `Device(config-cmap)# match access-group name health_probes_accesslist`	Configure the match criteria for a class map to be successful match criteria for all packets.
Step 6	**exit** **Example:** `Device(config-cmap)# exit`	Exits class-map configuration mode and returns to global configuration mode.
Step 7	policy-map *policy-map-name* **Example:** `Device(config)# policy-map health_probes_pmap`	Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy, and enters QoS policy-map configuration mode.

	Command or Action	Purpose
Step 8	class {*class-name* | class-default **Example:** `Device(config-pmap)# class health_probes_cmap`	Specifies the name of the class whose policy you want to create or change or specifies the default class (commonly known as the class-default class) before you configure its policy, and enters policy-map class configuration mode.
Step 9	priority level *level* **Example:** `Device(config-pmap)# priority level 1`	Assigns priority to a traffic class at the priority level specified. • Enter the level of priority assigned to the priority class. Valid values are 1 (high priority) and 2 (low priority). The default is 1.
Step 10	**exit** **Example:** `Device(config-pmap)# exit`	Exits policy-map configuration mode and returns to global configuration mode.
Step 11	**interface** *type number* **Example:** `Device(config)# interface VirtualPortGroup 1`	Configures an interface and enters interface configuration mode. • Configure a VirtualPortGroup interface. • This interface is used for data traffic.
Step 12	service-policy [history | {output} *policy-map-name* | type control *control-policy-name*] **Example:** `Device(config-if)# service-policy output health_probes_pmap`	Attaches a policy map to a class. The name of a service policy map (created using the **policy-map** command) to be attached. The name can be a maximum of 40 alphanumeric characters.
Step 13	**end** **Example:** `Device(config-if)# end`	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for Snort IPS

Example: Configuring VirtualPortGroup Interfaces and Virtual Service

```
Device# configure terminal
Device(config)# interface VirtualPortGroup 0
Device(config-if)# ip address 10.1.1.1 255.255.255.252
Device(config-if)# exit
Device(config)# interface VirtualPortGroup 1
Device(config-if)# ip address 192.0.2.1 255.255.255.252
Device(config-if)# exit
Device(config)# virtual-service UTDIPS
Device(config-virt-serv)# vnic gateway VirtualPortGroup 0
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# vnic gateway VirtualPortGroup 1
Device(config-virt-serv-vnic)# guest ip address 192.0.2.2
```

```
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# vnic management GigabitEthernet0
Device(config-virt-serv-vnic)# guest ip address 209.165.201.1
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# activate
Device(config-virt-serv-vnic)# end
```

Example: Configuring a Different Resource Profile

```
Device# configure terminal
Device(config)# virtual-service UTDIPS
Device(config-virt-serv)# no activate
Device(config-virt-serv)# end
Device# virtual-service uninstall name UTDIPS
Device# configure terminal
Device(config)# virtual-service UTDIPS
Device(config-virt-serv)# profile medium
Device(config-virt-serv)# end
Device# virtual-service install name UTDIPS package:utd.ova
Device# configure terminal
Device(config)# virtual-service UTDIPS
Device(config-virt-serv)# activate
Device(config-virt-serv)# end
```

Example: Configuring Snort IPS Globally

The following example shows how to configure Intrusion Prevention System (IPS) globally on a device:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# threat protection
Device(config-utd-eng-std-insp)# policy security
Device(config-utd-eng-std)# exit
Device(config)# utd
Device(config-utd)# all-interfaces
Device(config-utd)# engine standard
Device(config-utd-whitelist)# end
Device#
```

Example: Configuring Snort IPS Inspection per Interface

The following example shows how to configure Snort Intrusion Detection System (IDS) on a per-interface basis:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# threat detection
Device(config-utd-eng-std-insp)# policy security
```

```
Device(config-utd-eng-std)# exit
Device(config)# utd
Device(config-utd)# engine standard
Device(config-eng-std)# exit
Device(config)# interface gigabitethernet 0/0/0
Device(config-if)# utd enable
Device(config-if)# exit
```

Example: Configuring UTD with VRF on both Inbound and Outbound Interface

```
Device# configure terminal
Device(config)# vrf definition VRF1
Device(config-vrf)# rd 100:1
Device(config-vrf)# route-target export 100:1
Device(config-vrf)# route-target import 100:1
Device(config-vrf)# route-target import 100:2
!
Device(config-vrf)# address-family ipv4
Device(config-vrf-af)# exit
!
Device(config-vrf)# address-family ipv6
Device(config-vrf-af)# exit
!
Device(config-vrf-af)# vrf definition VRF2
Device(config-vrf)# rd 100:2
Device(config-vrf)# route-target export 100:2
Device(config-vrf)# route-target import 100:2
Device(config-vrf)# route-target import 100:1
!
Device(config-vrf)# address-family ipv4
Device(config-vrf-af)# exit
!
Device(config-vrf)# address-family ipv6
Device(config-vrf-af)# exit
!
Device(config-vrf)# interface VirtualPortGroup0
Device(config-if)# ip address 192.0.2.1 255.255.255.252
Device(config-if)# no mop enabled
Device(config-if)# no mop sysid
!
Device(config-if)# interface VirtualPortGroup1
Device(config-if)# ip address 192.0.2.5 255.255.255.252
Device(config-if)# no mop enabled
Device(config-if)# no mop sysid
!
Device(config-if)# interface GigabitEthernet0/0/2
Device(config-if)# vrf forwarding VRF1
Device(config-if-vrf)# ip address 192.1.1.5 255.255.255.0
Device(config-if-vrf)# ipv6 address A000::1/64
!
Device(config-if)# interface GigabitEthernet0/0/3
Device(config-if)# vrf forwarding VRF2
Device(config-if-vrf)# ip address 192.1.1.5 255.255.255.0
Device(config-if-vrf)# ipv6 address B000::1/64
!
Device(config-if-vrf)# router bgp 100
Device(config-if-vrf)# bgp log-neighbor-changes
!
Device(config-vrf)# address-family ipv4 vrf VRF1
Device(config-vrf-af)# redistribute connected
Device(config-vrf-af)# redistribute static
Device(config-vrf-af)# exit
```

```
!
Device(config-vrf)# address-family ipv6 vrf VRF1
Device(config-vrf-af)# redistribute connected
Device(config-vrf-af)# redistribute static
Device(config-vrf-af)# exit
!
Device(config-vrf)# address-family ipv4 vrf VRF2
Device(config-vrf-af)# redistribute connected
Device(config-vrf-af)# redistribute static
Device(config-vrf-af)# exit
!
Device(config-vrf)# address-family ipv6 vrf VRF2
Device(config-vrf-af)# redistribute connected
Device(config-vrf-af)# redistribute static
Device(config-vrf-af)# exit
!
Device(config)# utd
Device(config-utd)# all-interfaces
Device(config-utd)# engine standard
Device(config-utd)# exit

Device(config)# utd engine standard
Device(config-utd-eng-std)# logging syslog
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-engstd-insp)# threat protection
Device(config-utd-engstd-insp)# policy security
Device(config-utd-engstd-insp)# exist
Device(config-utd-eng-std)# exit
!
Device(config)# virtual-service utd
Device(config-virt-serv)# profile low
Device(config-virt-serv)# vnic gateway VirtualPortGroup0
Device(config-virt-serv-vnic)# guest ip address 192.0.2.2
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# vnic gateway VirtualPortGroup1
Device(config-virt-serv-vnic)# guest ip address 192.0.2.6
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# activate

UTD Snort IPS Drop Log
============================
2016/06/13-14:32:09.524475 IST [**] [Instance_ID: 1] [**] Drop [**]
[1:30561:1] BLACKLIST DNS request for known malware
domain domai.ddns2.biz - Win.Trojan.Beebone [**]
[Classification: A Network Trojan was Detected]
[Priority: 1] [VRF_ID: 2] {UDP} 11.1.1.10:58016 -> 21.1.1.10:53
```

Example: Configuring Logging IOS Syslog

The following example shows how to configure logging IOS syslog with the log levels on a device:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# logging syslog
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-engstd-insp)# logging level debug
Device(config-utd-eng-std-insp)# end
Device#
```

Example: Configuring Logging to Centralized Log Server

The following example shows how to configure logging to a centralized log server:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std-insp)# logging host syslog.yourcompany.com
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# logging level info
Device(config-utd-eng-std-insp)# end
Device#
```

Example: Configuring Signature Update from a Cisco Server

The following example shows how to configure the signature update from a Cisco server :

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# signature update server cisco username CCOuser password
passwd123
Device(config-utd-eng-std-insp)# end
Device#
```

Note Ensure that the DNS is configured to download signatures from the Cisco server.

Example: Configuring Signature Update from a Local Server

The following example shows how to configure the signature update from a local server:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# signature update server url http://192.168.1.2/sig-1.pkg
Device(config-utd-eng-std-insp)# end
Device#
```

Example: Configuring Automatic Signature Update

The following example shows how to configure the automatic signature update on a server:

```
Device# configure terminal
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# signature update occur-at daily 0 0
Device(config-utd-eng-std-insp)# signature update server cisco username abcd password
cisco123
Device(config-utd-eng-std-insp)# end
Device#
```

Example: Performing Manual Signature Update

The following examples show how to perform a manual signature update in different ways:

```
Device# utd threat-inspection signature update
```

It takes the existing server configuration to download from or the explicit server information configured with it. These commands perform a manual signature update with the below settings:

```
Device# show utd engine standard threat-inspection signature update status

Current signature package version: 2983.4.s
Current signature package name: UTD-STD-SIGNATURE-2983-4-S.pkg
Previous signature package version: 29.0.c
----------------------------------------
Last update status: Successful
----------------------------------------
Last successful update time: Mon Aug  7 02:02:32 2017 UTC
Last successful update method: Manual
Last successful update server: cisco
Last successful update speed: 3022328 bytes in 25 secs
----------------------------------------
Last failed update time: Mon Aug  7 01:53:21 2017 UTC
Last failed update method: Manual
Last failed update server: cisco
Last failed update reason: ('Connection aborted.', gaierror(-2, 'Name or service hnot
known'))
----------------------------------------
Last attempted update time: Mon Aug  7 02:02:32 2017 UTC
Last attempted update method: Manual
Last attempted update server: cisco
----------------------------------------
Total num of updates successful: 1
Num of attempts successful: 1
Num of attempts failed: 3
Total num of attempts: 4
----------------------------------------
Next update scheduled at: None
----------------------------------------
Current status: Idle

Device# utd threat-inspection signature update server cisco username ccouser password
passwd123

Device# utd threat-inspection signature update server url http://192.168.1.2/sig-1.pkg
```

Example: Configuring Signature Allowed Lists

The following example shows how to configure signature allowed list:

```
Device# configure terminal
Device(config)# utd threat-inspection whitelist
Device(config-utd-whitelist)# utd-whitelist)# generator id 1 signature id 23456 comment
"traffic from client x"
Device(config-utd-whitelist)# exit
Device(config)# utd engine standard
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-eng-std-insp)# whitelist
Device(config-utd-eng-std-insp)# end
Device#
```

Note After the allowed list signature ID is configured, Snort will allow the flow to pass through the device without any alerts and drops.

Examples for Displaying Active Signatures

Example: Displaying Active Signatures List With Connectivity Policy

```
Device# utd threat-inspection signature active-list write-to bootflash:siglist_connectivity
Device# more bootflash:siglist_connectivity
================================================================================
Signature Package Version: 2982.1.s
Signature Ruleset: Connectivity
Total no. of active signatures: 581
Total no. of drop signatures: 452
Total no. of alert signatures: 129

For more details of each signature please go to www.snort.org/rule_docs to lookup
================================================================================
List of Active Signatures:
--------------------------
<snipped>
```

Example: Displaying Active Signatures List With Balanced Policy

```
Device# utd threat-inspection signature active-list write-to bootflash:siglist_balanced
Device# more bootflash:siglist_balanced
================================================================================
Signature Package Version: 2982.1.s
Signature Ruleset: Balanced
Total no. of active signatures: 7884
Total no. of drop signatures: 7389
Total no. of alert signatures: 495

For more details of each signature please go to www.snort.org/rule_docs to lookup
================================================================================

List of Active Signatures:
--------------------------
<snipped>
```

Example: Displaying Active Signatures List With Security Policy

```
Device# utd threat-inspection signature active-list write-to bootflash:siglist_security
Device# more bootflash:siglist_security
================================================================================
Signature Package Version: 2982.1.s
Signature Ruleset: Security
Total no. of active signatures: 11224
Total no. of drop signatures: 10220
Total no. of alert signatures: 1004

For more details of each signature please go to www.snort.org/rule_docs to lookup
```

```
================================================================================

List of Active Signatures:
--------------------------
<snipped>
```

Verifying the Integrated Snort IPS Configuration

Use the following commands to troubleshoot your configuration.

SUMMARY STEPS

1. **enable**
2. **show virtual-service list**
3. **show virtual-service detail**
4. **show service-insertion type utd service-node-group**
5. **show service-insertion type utd service-context**
6. **show utd engine standard config**
7. **show utd engine standard status**
8. **show utd engine standard threat-inspection signature update status**
9. **show utd engine standard logging events**
10. **clear utd engine standard logging events**
11. **show platform hardware qfp active feature utd config**
12. **show platform software utd global**
13. **show platform software utd interfaces**
14. **show platform hardware qfp active feature utd stats**
15. **show utd engine standard statistics daq all**

DETAILED STEPS

Step 1 enable

Example:

```
Device> enable
```

Enables privileged EXEC mode.

- Enter your password if prompted.

Step 2 show virtual-service list

Displays the status of the installation of all applications on the virtual service container.

Example:

```
Device# show virtual-service list

Virtual Service List:

Name                    Status             Package Name
--------------------------------------------------------------------------------
```

```
UTDIPS                    Activated          utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
```

Step 3 **show virtual-service detail**

Displays the resources used by applications installed in the virtual services container of a device.

Example:

```
Device# show virtual-service detail

Device#show virtual-service detail
Virtual service UTDIPS detail
  State                  : Activated
  Owner                  : IOSd
  Package information
    Name                 : utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
    Path                 : bootflash:/utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
    Application
      Name               : UTD-Snort-Feature
      Installed version  : 1.0.1_SV2982_XE_16_3
      Description        : Unified Threat Defense
    Signing
      Key type           : Cisco development key
      Method             : SHA-1
    Licensing
      Name               : Not Available
      Version            : Not Available

  Detailed guest status

------------------------------------------------------------------------
Process               Status            Uptime           # of restarts

  Resource admission (without profile) : passed
    Disk space    : 710MB
    Memory        : 1024MB
    CPU           : 25% system CPU
    VCPUs         : Not specified
```

Step 4 **show service-insertion type utd service-node-group**

Displays the status of service node groups.

Example:

```
Device# show service-insertion type utd service-node-group

Service Node Group name : utd_sng_1
Service Context : utd/1
Member Service Node count : 1

Service Node (SN) : 30.30.30.2
Auto discovered : No
SN belongs to SNG : utd_sng_1
Current status of SN : Alive
Time current status was reached : Tue Jul 26 11:57:48 2016

Cluster protocol VPATH version : 1
Cluster protocol incarnation number : 1
Cluster protocol last sent sequence number : 1469514497
Cluster protocol last received sequence number: 1464
Cluster protocol last received ack number : 1469514496
```

Step 5 **show service-insertion type utd service-context**

Displays the AppNav and service node views.

Example:

```
Device# show service-insertion type utd service-context

Service Context : utd/1
Cluster protocol VPATH version : 1
Time service context was enabled : Tue Jul 26 11:57:47 2016
Current FSM state : Operational
Time FSM entered current state : Tue Jul 26 11:57:58 2016
Last FSM state : Converging
Time FSM entered last state : Tue Jul 26 11:57:47 2016
Cluster operational state : Operational

Stable AppNav controller View:
30.30.30.1

Stable SN View:
30.30.30.2

Current AppNav Controller View:
30.30.30.1

Current SN View:
30.30.30.2
```

Step 6 **show utd engine standard config**

Displays the unified threat defense (UTD) configuration.

Example:

```
Device# show utd engine standard config

UTD Engine Standard Configuration:
  Operation Mode : Intrusion Prevention
  Policy         : Security

Signature Update:
  Server    : cisco
  User Name : ccouser
  Password  : YEX^SH\fhdOeEGaOBIQAIcOVLgaVGf
  Occurs-at : weekly ;  Days:0 ; Hour: 23; Minute: 50

Logging:
  Server    :   IOS Syslog; 10.104.49.223
  Level     : debug

Whitelist Signature IDs:
  28878
```

Step 7 **show utd engine standard status**

Displays the status of the utd engine.

Example:

```
Device# show utd engine standard status

Profile : High
System memory :
Usage : 8.00 %
Status : Green
Number of engines : 4
```

```
Engine Running CFT flows Health Reason
======================================================
Engine(#1): Yes 0 Green None
Engine(#2): Yes 0 Green None
Engine(#3): Yes 0 Green None
Engine(#4): Yes 0 Green None
======================================================

Overall system status: Green

Signature update status:
========================
Current signature package version: 2983.4.s
Last update status: Successful
Last successful update time: Mon Aug  7 02:02:32 2017 UTC
Last failed update time: Mon Aug  7 01:53:21 2017 UTC
Last failed update reason: ('Connection aborted.', gaierror(-2, 'Name or service not known'))
Next update scheduled at: None
Current status: Idle
```

Step 8 **show utd engine standard threat-inspection signature update status**

Displays the status of the signature update process.

Example:

```
Device# show utd engine standard threat-inspection signature update status

Current signature package version: 2983.4.s
Current signature package name: UTD-STD-SIGNATURE-2983-4-S.pkg
Previous signature package version: 29.0.c
----------------------------------------

Num of attempts successful: 1
Num of attempts failed: 3
Total num of attempts: 4
----------------------------------------
Next update scheduled at: None
----------------------------------------
Current status: Idle
```

Step 9 **show utd engine standard logging events**

Displays log events from the Snort sensor.

Example:

```
Device# show utd engine standard logging events

2016/06/13-14:32:09.524475 IST [**] [Instance_ID: 1] [**] Drop [**] [1:30561:1]
BLACKLIST DNS request for known malware domain domai.ddns2.biz -
Win.Trojan.Beebone [**] [Classification: A Network Trojan was Detected] [Priority: 1]
[VRF_ID: 2] {UDP} 11.1.1.10:58016 -> 21.1.1.10:53
2016/06/13-14:32:21.524988 IST [**] [Instance_ID: 1] [**] Drop [**] [1:30561:1]
BLACKLIST DNS request for known malware domain domai.ddns2.biz -
Win.Trojan.Beebone [**] [Classification: A Network Trojan was Detected] [Priority: 1]
[VRF_ID: 2] {UDP} a000:0:0:0:0:0:0:10:59964 -> b000:0:0:0:0:0:0:10:53
```

Step 10 **clear utd engine standard logging events**

Example:

```
Device# clear utd engine standard logging events
```

Clears logged events from the Snort sensor.

Step 11 **show platform hardware qfp active feature utd config**

Displays information about the health of the service node.

Example:

```
Device# show platform hardware qfp active feature utd config

Global configuration
NAT64: disabled
SN threads: 12
CFT inst_id 0 feat id 1 fo id 1 chunk id 8
Context Id: 0, Name: Base Security Ctx
Ctx Flags: (0x60000)
Engine: Standard
SN Redirect Mode : Fail-open, Divert
Threat-inspection: Enabled, Mode: IDS
Domain Filtering : Not Enabled
URL Filtering : Not Enabled
SN Health: Green
```

Step 12 **show platform software utd global**

Displays the interfaces on which UTD is enabled.

Example:

```
Device# show platform software utd global

UTD Global state
Engine               : Standard
Global Inspection    : Enabled
Operational Mode     : Intrusion Prevention
Fail Policy          : Fail-open
Container techonlogy : LXC
Redirect interface   : VirtualPortGroup1
UTD interfaces
All dataplane interfaces
```

Step 13 **show platform software utd interfaces**

Displays the information about all interfaces.

Example:

```
Device# show platform software utd interfaces

UTD interfaces
All dataplane interfaces
```

Step 14 **show platform hardware qfp active feature utd stats**

Displays dataplane UTD statistics.

Example:

```
Device# show platform hardware qfp active feature utd stats

Security Context:    Id:0    Name: Base Security Ctx

Summary Statistics:
Pkts entered policy feature                        pkt                 228
                                                   byt               31083

Drop Statistics:

Service Node flagged flow for dropping                                  48
Service Node not healthy                                                62

General Statistics:

Deploying Snort IPS Using Cisco Prime CLI Templates

You can use the Cisco Prime CLI templates to provision the Snort IPS deployment. The Cisco Prime CLI templates make provisioning Snort IPS deployment simple. To use the Cisco Prime CLI templates to provision the Snort IPS deployment, perform these steps:

Step 1 Download the Prime templates from the Software Download page, corresponding to the IOS XE version running on your system.

Step 2 Unzip the file, if it is a zipped version.

Step 3 From Prime, choose **Configuration** > **Templates** > **Features and Technologies**, select **CLI Templates**.

Step 4 Click **Import**.

Step 5 Select the folder where you want to import the templates to and click **Select Templates** and choose the templates that you just downloaded to import.

The following Snort IPS CLI templates are available:

- Copy OVA to Device—Use this template to copy the Snort IPS OVA file to the router file system.
- Delete OVA—Use this template to delete the copied Snort IPS OVA file from the router file system.
- Dynamic NAT—Use this template if Dynamic NAT (Network Address Translation) is configured in your environment and an Access List is used to select the NAT translation that needs to be modified for Snort IPS Management Interface IP.
- Dynamic NAT Cleanup—Use this template to delete the NAT configuration for Snort IPS.
- Dynamic PAT—Use this template if Dynamic PAT (Port Address Translation) is configured in your environment and an Access List is used to select the PAT translation that needs to be modified for Snort IPS Management Interface IP.
- Dynamic PAT Cleanup—Use this template to delete the PAT configuration for Snort IPS.
- IP Unnumbered—Use this template to configure Snort IPS and required Virtual-Service for IP Unnumbered deployment.
- IP Unnumbered Cleanup—Use this template to delete the configured Snort IPS Management interface with IP Unnumbered.
- Management Interface—Use this template if you would like to use System Management interface (e.g. GigabitEthernet0) to route Snort IPS Management traffic.
- Management Interface Cleanup—Use this template to delete the configured System Management interface (e.g. GigabitEthernet0) to route the Snort IPS Management traffic.
- Static NAT—Use this template to configure Snort IPS and required Virtual-Service for existing Static NAT deployment.
- Static NAT Cleanup—Use this template to delete the configured Snort IPS in a Static NAT deployment.
- Upgrade OVA—Use this template to upgrade Snort IPS OVA file.

Migrating to IOx Container

This section provides information about Cisco IOx and UTD migration to IOx for extending UTD support on Cisco 1000 Series Integrated Service Routers (ISRs). Cisco IOx combines Cisco IOS and the Linux OS for highly secure networking.

About Cisco IOx

Cisco IOx is an application platform that provides uniform and consistent hosting capabilities for various types of applications across various Cisco platforms. This platform brings together the networking operating

system-Cisco IOS, and the open source platform-Linux to bring together custom applications and interfaces on the network.

A virtual services container is a virtualized environment on a device. It is also referred to as a virtual machine (VM), virtual service, or container. You can install an application within a virtual services container. The application runs in the virtual services container of the operating system of a device. The application is delivered as an open virtual application (OVA), which is a tar file with a .ova extension. The OVA package is installed and enabled on a device through a command-line interface. Cisco Plug-in for OpenFlow is an example of an application that can be deployed within a virtual services container.

Virtual services container infrastructure that is used to host UTD OVA is not supported on Cisco 1100 Series ISRs. Currently, UTD supports both the containers. However, the OVA container feature support is continued on Cisco IOS XE Gibralter 16.10 release and is not supported for later releases.

Upgrading from Virtual Service Container to IOx

An OVA file is an Open Virtualization Archive that contains a compressed, installable version of a virtual machine. The Snort IPS is available as a virtual container service. You must download this OVA file on to the device and use the **virtual-service install** CLI to install the service.

For the UTD IOx infrastructure, the IOx based OVA is installed using IOx CLI commands. Before installing, start the IOx environment in global configuration mode.

The IOx based OVA is called a TAR file. You must use a Cisco IOS XE image with security license. During the OVA file installation, the security license is checked and an error is reported if the license is not present.

Perform the following steps to upgrade from virtual service to IOx container:

Step 1 **no activate**

Example:

```
Device# configure terminal
Device (config)# virtual-service utd
Device (config-virt-serv)# no activate
Device (config-virt-serv)# exit
Device (config)# no virtual-service utd
```

Deactivates virtual manager based virtual-service instance.

Step 2 **show virtual-service list**

Example:

```
Device# show virtual-service list
```

Displays the status of all applications installed on the virtual service container. Ensure that virtual service instance is deactivated.

Step 3 **virtual-service uninstall name** *virtual-service instance*

Example:

```
Device# virtual-service uninstall name utd
```

Uninstall virtual manager based virtual-service instance. Ensure that virtual service instance does not show up when you run **show virtual-service list** command.

Step 4 **iox**

Example:

```
Device# configure terminal
Device (config)# iox
Device (config)# end
```

Starts the IOx environment in Global Configuration mode.

Step 5 **app-hosting install appid** *name* **package** *bootflash:<tarfile>*

Example:

```
Device# app-hosting install appid UTD package bootflash:utd.tar
Device#
```

Copies and installs Iox based OVA tar file on to the device.

Step 6 **show app-hosting list**

Example:

```
Device# show app-hosting list
App id                                   State
---------------------------------------------------------
UTD                                      DEPLOYED
Device#
```

Displays the status of the installation. Ensure that the application is deployed.

Step 7 **app-hosting activate appid** *name*

Example:

```
Device# app-hosting activate appid UTD
```

Activates the IOx based TAR file on the device.

Step 8 **show app-hosting list**

Example:

```
Device# show app-hosting list
App id                                   State
---------------------------------------------------------
UTD                                      ACTIVATED

Device#
```

Displays the status of the activation. Ensure that the application is activated.

Step 9 **app-hosting start appid** *name*

Example:

```
Device# app-hosting start appid UTD
Device# show app-hosting list | in UTD
```

Starts the IOx based OVA.

Step 10 **show app-hosting list**

Example:

```
Example:
Device# show app-hosting list
App id                                   State
---------------------------------------------------------
UTD                                      RUNNING
```

```
Device#
```

Displays the status of the start. Ensure that the application is running.

Example of IOx Configuration

Following is the example configuration of IOx:

```
Device# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Device(config)# iox
Device(config)# interface VirtualPortGroup0
Device(config-if)# no shutdown
Device(config-if)# ip address 192.0.2.1 255.255.255.252
Device(config-if)# exit
Device(config)# interface VirtualPortGroup1
Device(config-if)# no shutdown
Device(config-if)# ip address 192.0.2.5 255.255.255.252
Device(config-if)# exit
Device(config)# app-hosting appid utd
Device(config-app-hosting)# app-vnic gateway0 virtualportgroup 0 guest-interface 0
Device(config-app-hosting-gateway0)# guest-ipaddress 192.0.2.2 netmask 255.255.255.252
Device(config-app-hosting-gateway0)# exit
Device(config-app-hosting)# app-vnic gateway1 virtualportgroup 1 guest-interface 1
Device(config-app-hosting-gateway1)# guest-ipaddress 192.0.2.6 netmask 255.255.255.252
Device(config-app-hosting-gateway1)# exit
Device(config-app-hosting)# app-resource package-profile custom
Device(config-app-hosting)# start
Device(config-app-hosting)# exit
Device(config)# exit
Device#
```

Troubleshooting Snort IPS

Traffic is not Diverted

Problem Traffic is not diverted.

Possible Cause Vitual-service may not be activated.

Solution Check whether the virtual-service is activated by using the **show virtual-service list** command. The following is sample output from the command:

```
Device# show virtual-service list

Virtual Service List:

Name Status Package Name
------------------------------------------------------------------------------
snort Activated utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
```

Possible Cause Unified threat defense (UTD) may not be enabled for specified interface or interfaces.

Solution Use the **show platform software utd global** command to verify if UTD is enabled for the interface:

```
Device# show platform software utd global

UTD Global state
Engine               : Standard
Global Inspection    : Disabled
Operational Mode     : Intrusion Prevention
Fail Policy          : Fail-open
Container techonlogy : LXC
Redirect interface   : VirtualPortGroup1
UTD interfaces
GigabitEthernet0/0/0
```

Possible Cause The service node may not be working properly.

Solution Use the **show platform hardware qfp active feature utd config** command to verify if the health of the service node is green:

```
Device# show platform hardware qfp active feature utd config

Global configuration
NAT64: disabled
SN threads: 12
CFT inst_id 0 feat id 0 fo id 0 chunk id 4
Context Id: 0, Name: Base Security Ctx
Ctx Flags: (0x60000)
Engine: Standard
SN Redirect Mode : Fail-open, Divert
Threat-inspection: Enabled, Mode: IDS
Domain Filtering : Not Enabled
URL Filtering : Not Enabled
SN Health: Green
```

Possible Cause The Snort process may not be activated.

Solution Use the **show virtual-service detail** command to verify if the Snort process is up and running:

```
Device# show virtual-service detail

Virtual service UTDIPS detail
  State                  : Activated
  Owner                  : IOSd
  Package information
    Name                 : utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
    Path                 : bootflash:/utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova

Possible Cause The AppNav tunnel may not be activated.

Solution Use the **show service-insertion type utd service-node-group** and **show service-insertion type utd service-context** commands to verify if the AppNav tunnel is activated.

Solution The following is sample output from the **show service-insertion type utd service-node-group** command:

```
Device# show service-insertion type utd service-node-group

Service Node Group name : utd_sng_1
Service Context : utd/1
Member Service Node count : 1

Service Node (SN) : 30.30.30.2
Auto discovered : No
SN belongs to SNG : utd_sng_1
Current status of SN : Alive
Time current status was reached : Tue Jul 26 11:57:48 2016

Cluster protocol VPATH version : 1
Cluster protocol incarnation number : 1
Cluster protocol last sent sequence number : 1469514497
Cluster protocol last received sequence number: 1464
Cluster protocol last received ack number : 1469514496
```

Solution The following is sample output from the **show service-insertion type utd service-context** command:

```
Device# show service-insertion type utd service-context

Service Context : utd/1
Cluster protocol VPATH version : 1
Time service context was enabled : Tue Jul 26 11:57:47 2016
Current FSM state : Operational
Time FSM entered current state : Tue Jul 26 11:57:58 2016
Last FSM state : Converging
Time FSM entered last state : Tue Jul 26 11:57:47 2016
Cluster operational state : Operational

Stable AppNav controller View:

```

Possible Cause Check data plane UTD statistics for the status of the traffic. If the traffic is not diverted, the number of packets diverted and rejected will be zero. If the numbers are nonzero, then traffic diversion is happening, and the Snort sensor is resending packets back to the dataplane.

Solution Use the **show platform hardware qfp active feature utd stats** commands to verify the status of the traffic.

```
Device# show platform hardware qfp active feature utd stats

Security Context:    Id:0    Name: Base Security Ctx

Summary Statistics:

```

Signature Update is not Working

Problem Signature update from Cisco Borderless Software Distribution (BSD) server is not working.

Possible Cause Signature update may have failed due to various reasons. Check for the reason for the last failure to update the signatures.

Solution Use the **show utd engine standard threat-inspection signature update status** command to display the reason for the last failure to update the signatures:

```
Device# show utd eng standard threat-inspection signature update status
Current signature package version: 29.0.c
Current signature package name: default
Previous signature package version: None
----------------------------------------
Last update status: Failed
----------------------------------------
Last successful update time: None
Last successful update method: None
Last successful update server: None
Last successful update speed: None
----------------------------------------
Last failed update time: Thu Jan 11 13:34:36 2018 PST
Last failed update method: Manual
Last failed update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
Last failed update reason: [Errno 113] No route to host
----------------------------------------
Last attempted update time: Thu Jan 11 13:34:36 2018 PST
Last attempted update method: Manual
Last attempted update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
----------------------------------------
Total num of updates successful: 0
Num of attempts successful: 0
Num of attempts failed: 1
Total num of attempts: 1
----------------------------------------
Next update scheduled at: None
----------------------------------------
Current status: Idle
```

Possible Cause Domain Name System (DNS) is not configured correctly.

Solution Use the **show running-config | i name-server** command to display the name server details:

```
Device#  show run | i name-server

ip name-server 10.104.49.223
```

Possible Cause System error—Failed to process the username and password combination.

Solution Ensure that you have provided the correct credentials for signature package download.

Signature Update from the Local Server is not Working

Problem Signature update from the local server not working.

Possible Cause Last failure Reason: Invalid scheme—only HTTP/HTTPS supported.

Solution Ensure that you have provided the HTTP or secure HTTP (HTTPS) as the local download method.

Possible Cause Last failure Reason: Name or service not known.

Solution Ensure that the hostname or IP address provided for the local server is correct.

Possible Cause Last failure Reason: Credentials not supplied.

Solution Ensure that you have provided the credentials for local HTTP/HTTPS server.

Possible Cause Last failure Reason: File not found.

Solution Ensure that the signature file name or URL that you have provided is correct.

Possible Cause Last failure Reason: Download corrupted.

Solution

- Verify whether the retry signature update is corrupted as the previous signature download.
- Ensure that the correct signature package is available.

Logging to IOSd Syslog is not Working

Problem Logging to IOSd syslog is not working.

Possible Cause Logging to syslog may not be configured in the unified threat defense (UTD) configuration.

Solution Use the **show utd engine standard config** command to display the UTD configuration and to ensure that logging to syslog is configured.

```
Device# show utd engine standard config

UTD Engine Standard Configutation:
  Operation Mode : Intrusion Prevention
  Policy         : Security

Signature Update:
  Server    : cisco
  User Name : ccouser
  Password  : YEX^SH\fhdOeEGaOBIQAIcOVLgaVGf
  Occurs-at : weekly ;  Days:0 ; Hour: 23; Minute: 50

Logging:
  Server    :   IOS Syslog; 10.104.49.223
```

```
  Level     : debug

Whitelist Signature IDs:
  28878
```

Solution Use the following **show utd engine standard logging events** command to display the event logs for the UTD engine.

```
Device# show utd engine standard logging events

2016/06/13-14:32:09.524475 IST [**] [Instance_ID: 1] [**] Drop [**] [1:30561:1]
BLACKLIST DNS request for known malware domain domai.ddns2.biz -
Win.Trojan.Beebone [**] [Classification: A Network Trojan was Detected]
[Priority: 1] [VRF_ID: 2] {UDP} 11.1.1.10:58016 -> 21.1.1.10:53
2016/06/13-14:32:21.524988 IST [**] [Instance_ID: 1] [**] Drop [**] [1:30561:1]
BLACKLIST DNS request for known malware domain domai.ddns2.biz -
Win.Trojan.Beebone [**] [Classification: A Network Trojan was Detected] [Priority: 1]
[VRF_ID: 2] {UDP} a000:0:0:0:0:0:0:10:59964 -> b000:0:0:0:0:0:0:10:53
```

Logging to an External Server is not Working

Problem Logging to an external server is not working.

Possible Cause Syslog may not be running on the external server.

Solution Verify whether syslog server is running on the external server. Configure the following command on the external server to view its status:

```
ps -eaf | grep syslog

 root 2073 1 0 Apr12 ? 00:00:02 syslogd -r -m
```

Possible Cause Connectivity between unified threat defense (UTD) Linux Container (LXC) and external server may be lost.

Solution Verify the connectivity from the management interface to the external syslog server.

UTD Conditional Debugging

Conditional debugging is supported by multi-tenancy for Unified Threat Defense. For further details about how to configure conditional debugging, see:

http://www.cisco.com/c/en/us/td/docs/routers/asr1000/troubleshooting/guide/Tblshooting-xe-3s-asr-1000-book.html#task_AC969BB06B414DCBBDEF7ADD29EF8131

Technical Assistance

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	http://www.cisco.com/support

Feature Information for Snort IPS

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 219: Feature Information for Snort IPS

Feature Name	Releases	Feature Information
Snort IPS	Cisco IOS XE 3.16.1S, 3.17S and later releases	The Snort IPS feature, enables Intrusion Prevention System (IPS) and Intrusion Detection System (IDS) for branch offices on Cisco IOS XE-based platforms. This feature uses the open source Snort solution to enable IPS and IDS.
VRF support on Snort IPS	Cisco IOS XE Denali 16.3.1	Supports Virtual Fragmentation Reassembly (VFR) on Snort IPS configuration.
Snort IPS support on Cisco Cloud Services Router 1000v Series	Cisco IOS XE Denali 16.3.1	Cisco Cloud Services Router 1000v Series supports Snot IPS.
UTD Snort IPS Enhancements for 16.4 Release	Cisco IOS XE Everest 16.4.1	The UTD Snort IPS enhancements for 16.4 release adds a feature for displaying the list of active signatures.
Threat Inspection Alerts Visibility UTD Serviceability enhancements	Cisco IOS XE Fuji 16.8.1	This feature provides summary of threat inspection alerts. The following commands are introduced: • **show utd engine standard logging statistics threat-inspection** • **show utd engine standard logging statistics threat-inspection** *detail* Following commands are modified as part of UTD Serviceability Enahancement: • **show utd engine standard status** • **show utd engine standard threat-inspection signature update status**
UTD (IPS and URL filtering) migration to IOX Containers	Cisco IOS XE Gibraltar 16.10.1	UTD is supported on Cisco 1100 Series ISRs by migrating virtual service container to IOx from OVA.

CHAPTER 165

Web Filtering

The Web Filtering feature enables the user to provide controlled access to Internet websites or Interanet sites by configuring the domain-based or URL-based policies and filters on the device. The user can configure the web filtering profiles to manage the web access. The Web Filtering feature is implemented using the container service and it is similar to the Snort IPS solution.

Web Filtering can either allow or deny access to a specific domain or URL based on:

- Allowed list and Blocked list—These are static rules, which helps the user to either allow or deny domains or URLs. If the same pattern is configured under both the allowed list and blocked list, the traffic will be allowed.
- Category—URLs can be classified into multiple categories such as News, Social Media, Education, Adult and so on. Based on the requirements, user has the option to block or allow one or more categories.
- Reputation—Each URL has a reputation score associated with it. The reputation score range is from 0-100, and it is categorized as: high-risk (reputation score (0-20), suspicious (0-40), moderate-risk (0-60), low-risk (0-80), and trustworthy (0-100). Based on the reputation score of a URL and the configuration, a URL is either blocked or allowed. If the user defines a reputation threshold through the CLI, all the URLs, with a reputation score lower than the user-defined threshold will be blocked.

Web Filtering

The Web Filtering feature enables the user to provide controlled access to Internet websites by configuring the domain-based or URL-based policies and filters on the device. Domain-based Filtering enables the user to control access to websites/servers at domain level, and URL-based Filtering enables the user to control access to websites at URL level. This section includes the following topics:

Domain-based Filtering

Domain-based filtering allows the user to control access to a domain by permitting or denying access based on the domain-based policies and filters configured on the device. When the client sends a DNS request through the Cisco Cloud Services Router 1000V Series, the DNS traffic is inspected based on the domain-based policies (allowed list/blocked list). Domains that are on the allowed list or blocked list will not be subjected to URL-based filtering even if they are configured. Graylist traffic does not match both allowed list and blocked list, and it is subjected to URL-based filtering if it is configured.

Domain-based Filtering Using Allowed List Filter

To allow the complete domain (cisco.com) without subjecting to any filtering, use the allowed list option . When a user makes a request to access a website using a browser, the browser makes a DNS request to get the IP address of the website. Domain filtering applies the filter on the DNS traffic. If the website's domain name matches to one of the allowed list patterns, domain filtering adds the website's address to the allowed list. The browser receives the IP address for the website and sends the HTTP(s) request to the IP address of the website. Domain filtering treats this traffic as allowed traffic. This allowed traffic is not further subjected to URL-based filtering even if it is configured. If the Snort IPS is configured, the traffic will be subjected to Snort IPS .

Domain-based Filtering Using Blocked List Filter

When a user want to block a complete domain (badsite.com), use the blocked list option. Domain filtering applies the filter on the DNS traffic. If the website's domain name matches to one of the patterns on the blocked list, domain filtering will send the configured blocked server's IP address in the DNS response to the end user instead of the actual resolved IP address of the website. The browser receives the blocked server's IP address as the IP address for the website and sends the HTTP(s) request to this IP address. This traffic is not further subjected to URL filtering or Snort IPS even if they are configured.The block server receives the HTTP(s) request and serves a block page to the end user. Also, when the DNS request matches a blocked list, all application traffic to that domain will be blocked.

Domain filtering is applied to all the DNS traffic even if the DNS requests are made in the context of non-HTTP(S) requests such as FTP, telnet, and so on. The blocked listed non-HTTP(S) traffic (FTP, telnet, and so on.) will also be forwarded to the block server. It is block server's responsibility to serve a block page or deny the request. You can configure an internal or external block server. For configuration steps, see Configure Domain-based Web Filtering with an External Block Server, on page 2120 and Configure Domain-based Web Filtering with a Local Block Server , on page 2121.

If the traffic is not part of the allowed list or on the blocked list during domain filtering, it will be subjected to URL filtering and Snort IPS if they are configured.

A user may consider using a combination of domain filtering allowed and blocked pattern lists to design the filters. For example, if a user wants to create an allowed list *www\.foo\.com*but also wants other domains on a blocked list, such as *www\.foo\.abc* and *www\.foo\.xyz*, configure the *www\.foo\.com* in the allowed list pattern and *www\.foo\.* in the blocked list pattern.

Note If you are using the *www* prefix in the allowed or blocked regex pattern, it can create a problem if the Server Name Indicator (SNI) returned in the client message doesn't match. For example, if you want to allow *www./foo./com* and SNI returns as *foo.com* only. We recommend not to include the *www* in the regex match.

URL-based Filtering

URL-based filtering allows a user to control access to Internet websites by permitting or denying access to specific websites based on the allowed list/blocked list, category, or reputation configuration. For example, when a client sends a HTTP/HTTP(s) request through the Cisco CSR 1000V Cloud Services Router, the HTTP/HTTP(s) traffic is inspected based on the URL filtering policies (Allowed list, Blocked list, Category, and Reputation). If the HTTP/HTTP(s) request matches the blocked list, the HTTP(s) request is blocked either by inline block page response or redirects the URL to a block server. If the HTTP/HTTP(s) request matches the allowed list, the traffic is allowed without further URL filtering inspection.

For HTTPS traffic, the inline block page will not be displayed. URL-based filtering will not decode any encoded URL before performing a lookup.

When there is no allowed list/blocked list configuration on the device, based on the category and reputation of the URL, traffic is allowed or blocked either using a block page or redirect URL for HTTP. For HTTP(s), there is no block page or redirect URL, the flow will be dropped.

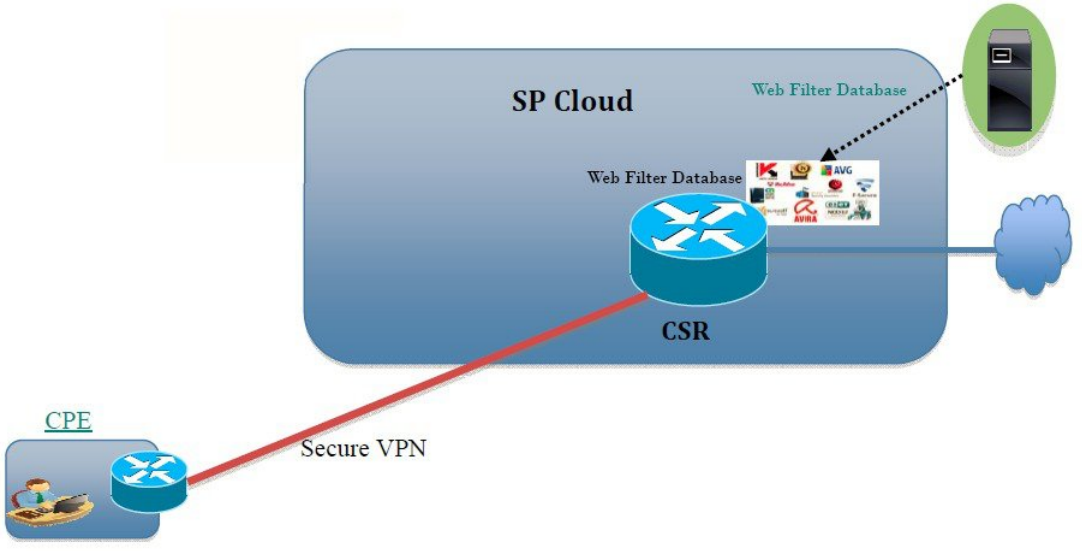
The URL database is downloaded from the cloud when the user configures the category/reputation-based URL filtering. The URL category/reputation database has only a few IP address based records and the category/reputation look up occurs only when the host portion of the URL has the domain name. After the full database is downloaded from the cloud, if there are any updates to the existing database, the incremental updates will be automatically downloaded in every 15 minutes. The complete database size is approximately 440 MB and the downloaded database should always synchronize with the cloud. The database will be invalid if the connection to the cloud is lost for more than 24 hours.

If the device does not get the database updates from the cloud, the fail-open option ensures that the traffic designated for URL filtering is not dropped. When you configure the fail-close option, all the traffic destined for URL filtering will be dropped when the cloud connectivity is lost.

Note The web filtering database is periodically updated from the cloud in every 15 minutes.

The figure illustrates the Web Filtering topology.

Figure 87: Web Filtering Network Topology



Virtual Service Resource Profiles for URL Filtering

The Cisco ISR 4000 Series Integrated Services Routers support *urlf-medium* and *urlf-high* resource profiles along with *urlf-low* profile. These profiles indicate the CPU and memory resources required to run the virtual service.

Platform	Profile	Virtual Service Resource Requirements		Platform Requirements
		System CPU	SP Memory	
CSR1000v, ISRv	*urlf-low*	25%	3 GB	8 GB (RAM)
	urlf-medium	50%	4 GB	8 GB (RAM)
	urlf-high	75%	6 GB	12 GB (RAM)

Cloud-Lookup

The Cloud-Lookup feature operates in single-tenancy mode to retrieve the category and reputation score of URLs that are not available in the local database. The Cloud-Lookup feature is enabled by default.

The Cloud-Lookup feature is an enhancement over the on-box database lookup feature. Earlier, the on-box database lookup feature allowed URLs that are not present in the on-box database and have a reputation score of 0. When Cloud-Lookup is enabled, the URLs that were allowed earlier may be dropped based on the reputation score and the configured block-threshold. In order to allow such URLs, one must add them to an allowed list. Category and reputation scores for different URLs from Cloud-Lookup are explained below.

There are two kinds of URLs:

- Name based URLs
- IP based URLs

When the Cloud-Lookup feature is enabled, the category and reputation score of unknown URLs are returned as follows:

Name based URLs

- Valid URL — corresponding category and reputation score is received.
- Unknown URL (new URL or unknown to the cloud) — category is 'uncategorized' and reputation score is 40
- Internal URLs with proper domain name (for example, internal.abc.com) — category and reputation score is based on the base domain name (abc.com from the example above).
- Completely internal URLs (for example, abc.xyz) — category is 'uncategorized' and reputation score is 40

IP based URLs

- Public hosted IP — corresponding category and reputation score is received.
- Private IP like 10.<>, 192.168.<> — category is 'uncategorized' and reputation score is 100
- Non-hosted/Non-routable IP — category is 'uncategorized' and reputation score is 40

The Cloud-Lookup score is different from the on-box database for these URLs (Unknown/Non-hosted/Non-routable/Internal URLs).

Note The Cloud-Lookup feature is not available in multi-tenancy mode.

Benefits of Web Filtering

The Web Filtering feature allows a user to provide controlled access to the internet by configuring domain and URL based policies and filters. It helps to secure the network by blocking malicious or unwanted websites.Web Filtering comprises of URL-based filtering and the Domain-based filtering. Domain-based filtering helps control access to websites/servers at domain level and the URL-based filtering helps control access to websites at URLs level. A user can use web filtering to add an individual URL to a blocked list or domain names and configure allowed listing policies for the same. A user can also provision to allow or block a URL based on reputation or category.

Prerequisites for Web Filtering

Before you configure the web filtering feature on the Cisco CSR 1000V Cloud Services Router, ensure that you have the following:

- The Cisco CSR 1000V Cloud Services Router runs the Cisco IOS XE Denali 16.3 software image or later.
- The Cisco CSR 1000V Cloud Services Router requires 2 vCPU, 8GB memory, and 2GB extra disk space for deploying the container service.

- The Cisco CSR 1000V Cloud Service Router must have a security K9 license to enable the web filtering feature.

Restrictions for Web Filtering

The following restrictions apply to the web filtering feature:

- This feature is only supported on Cisco CSR 1000V Cloud Services Router and it is not supported on Cisco 4000 Series Integrated Services Routers.
- The allowed list/blocked list pattern supports only regex pattern, and currently 64 patterns are supported for allowed list/blocked list. For more information on regex pattern, see the Regular Expressions chapter.
- Domain filtering supports only the IPv4 domains resolved through DNS protocol using IPv4 UDP transport. Domain filtering alerts are sent only to IOS syslog.
- Domain filtering with OpenDNS is not supported.
- URL filtering with Virtual Routing and Forwarding (VRF) is not supported.
- Domain filtering with CWS is not supported.
- Domain filtering does not support category and reputation.
- Local block server does not support serving HTTPS block page.When the URL filter tries to inject block page or redirect message, it does not support HTTPS traffic.
- When there is a username and password in the URL, URL filter does not remove them from the URL before matching the allowed list/blocked list pattern. However, the category/reputation lookup does not have this limitation and removes the username and password from the URL before lookup.
- HTTPS inspection is limited. Web filtering uses server certificate to obtain the URL/domain information. It is not possible to inspect the full URL path.
- UTD does not inter-operate with WCCP, and NBAR under inter-VRF scenario.
- Web filter profile names for URL, domain, block and sourcedb can have only alpha-numeric characters, dashes and underscores.
- If a virtual-service profile is modified, the virtual-service must be re-installed for the profile change to take effect.

How to Deploy Web Filtering

To deploy web filtering on supported devices, perform the following tasks:

Before you begin

- **Provision the device:** Identify the device to install the Web Filtering feature. This feature is supported on Cisco CSR 1000V Cloud Services Router.
- **Obtain the license:** The web filtering functionality is available only in security packages which require a security license to enable the service. Contact Cisco Support to obtain the license.

Step 1 Install and activate the virtual container service—How to Install and Activate the Virtual Container Service , on page 2119

Step 2 Configure the domain-based web filtering with an external block server—Configure Domain-based Web Filtering with an External Block Server, on page 2120

Step 3 Configure the domain-based web filtering with local block server—Configure Domain-based Web Filtering with a Local Block Server , on page 2121

Step 4 Configure the URL-based web filtering with a local block server—Configure URL-based Web Filtering with a Local Block Server, on page 2123

Step 5 Configure the URL-based web filtering with an Inline block server—Configure URL-based Web Filtering with an Inline Block Page, on page 2125

Step 6 Configure the Snort IPS/IDS—Configuring Domain/URL based Web Filtering and Snort IPS, on page 2126

How to Install and Activate the Virtual Container Service

To install and activate the virtual container service, perform the following task:

Step 1 Install the UTD OVA file—Installing the UTD OVA File, on page 2119.

Step 2 Configure the VirtualPortGroup interfaces and virtual-service—Configuring VirtualPortGroup Interfaces and Virtual Service, on page 2119.

Step 3 Activate the Snort virtual container service.

Installing the UTD OVA File

An OVA file is an Open Virtualization Archive that contains a compressed, installable version of a virtual machine. You must download this OVA file on to the router and use the virtual-service install CLI to install the service. The service OVA file is not bundled with the Cisco IOS XE Release images that are installed on the router. However, the OVA files may be preinstalled in the flash of the router.

You must use a Cisco IOS XE image with security license. During the OVA file installation, the security license is checked and an error is reported if the license is not present.

This is the sample configuration:

```
Device> enable
Device# virtual-service install name UTDIPS package harddisk:utd-ips-v102.ova media harddisk:

Device# show virtual-service list
Virtual Service List:
Name Status Package Name
------------------------------------------------------------------------------
snort Installed utdsnort.1_2_2_SV2982_XE_main.20160
```

Configuring VirtualPortGroup Interfaces and Virtual Service

You must configure two VirtualPortGroup interfaces and configure guest IP addresses for both interfaces.

Note The VirtualPortGroup interface for data traffic must use a private or nonroutable IP address. We recommend the use of 192.0.2.0/30 IP address range for this interface.

This is the sample configuration:

```
Device# configure terminal
evice(config)# interface VirtualPortGroup0
Device(config-if)# ip address 192.0.2.1 255.255.255.252
Device(config-if)# exit
Device(config)# interface VirtualPortGroup 1
Device(config-if)# ip address 192.0.2.5 255.255.255.252
Device(config-if)# exit
Device(config)# virtual-service UTDIPS

Device(config-virt-serv)# profile urlf-low (This is minimum requirement for web filtering
to work.)

Device(config-virt-serv)# vnic gateway VirtualPortGroup 0 (The IP-address configured in
VPG0 interface should have access to Internet over http(s).If the VPG0 interface does not
have access to Internet, the web filter database will not be updated.)
Device(config-virt-serv-vnic)# guest ip address 192.0.2.2
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# vnic gateway VirtualPortGroup 1
Device(config-virt-serv-vnic)# guest ip address 192.0.2.6
Device(config-virt-serv-vnic)# exit
Device(config-virt-serv)# activate
Device(config-virt-serv)# end

Device# show virtual-service list
Virtual Service List:

Name                     Status              Package Name
------------------------------------------------------------------------------
snort                    Activated           utdsnort.1_2_2_SV2982_XE_main.20160
```

Configure Domain-based Web Filtering with an External Block Server

To configure domain-based web filtering with an external block server, perform these steps:

Step 1 Install and activate the virtual service. For more information, see Configuring VirtualPortGroup Interfaces and Virtual Service, on page 2119.

Step 2 Configure the blocked list parameter-map:

```
parameter-map type regex domainfilter_blacklist_pmap1
  pattern examplebook\.com
  pattern bitter\.com
```

Step 3 Configure the allowed list parameter-map:

```
parameter-map type regex domainfilter_whitelist_pmap1
  pattern example\.com
  pattern exmaplegogle\.com
```

Step 4 Configure the domain profile and associate the blocked list and allowed list parameter-maps:

```
utd web-filter domain profile 1
 blacklist
  parameter-map regex domainfilter_blacklist_pmap1
 whitelist
  parameter-map regex domainfilter_whitelist_pmap1
```

Step 5 (Optional) By default the domain filtering alerts are not enabled. Configure the alerts for the blocked list or allowed list, or both under the domain profile:

```
alert {all | blacklist | whitelist}
```

Step 6 Configure the external redirect-server under the domain profile:

```
redirect-server external x.x.x.x (This is the IP address that is used for serving block page when a
 page is on the blocked list)
```

Step 7 Configure the UTD engine standard with domain profile:

```
utd engine standard
 web-filter
  domain-profile 1
```

Step 8 Configure the UTD with engine standard and enable it globally or on a specific interface:

```
utd
  all-interfaces
  engine standard
```

This example shows how to configure domain-based web filtering with an external block server:

```
parameter-map type regex domainfilter_blacklist_pmap1
  pattern examplebook\.com
  pattern bitter\.com
parameter-map type regex domainfilter_whitelist_pmap1
  pattern exmaplegogle\.com
  pattern exmaplegogle\.com
utd engine standard
  web-filter
    domain-profile 1
!
utd web-filter domain profile 1
  alert all
  blacklist
    parameter-map regex domainfilter_blacklist_pmap1
  whitelist
    parameter-map regex domainfilter_whitelist_pmap1
  redirect-server external 192.168.1.1
!
utd
  all-interfaces
  engine standard
```

Configure Domain-based Web Filtering with a Local Block Server

To configure domain-based web filtering with a local block server, perform these steps:

Step 1 Install and activate the virtual service. For more information, see Configuring VirtualPortGroup Interfaces and Virtual Service, on page 2119.

Step 2 Configure a loopback interface or use any existing interface that the client can access:

```
interface loopback 110
 ip address 10.1.1.1 255.255.255.255
exit
```

Step 3 Configure the UTD web filter with the local block server profile:

```
utd web-filter block local-server profile 1
 block-page-interface loopback 110
 http-ports 80
 content text "Blocked by Web-Filter"
```

Step 4 Configure the blocked list parameter-map:

```
parameter-map type regex domainfilter_blacklist_pmap1
  pattern bitter\.com
```

Step 5 Configure the allowed list parameter-map:

```
parameter-map type regex domainfilter_whitelist_pmap1
  pattern sweet\.com
```

Step 6 Configure the domain profile and associate the blocked list and allowed list parameter-maps:

```
utd web-filter domain profile1
 blacklist
  parameter-map regex domainfilter_blacklist_pmap1
 whitelist
  parameter-map regex domainfilter_whitelist_pmap1
```

Step 7 (Optional) By default the domain filtering alerts are not enabled. Configure the alerts for blocked list or allowed list, or both under the domain profile:

```
alert {all |blacklist | whitelist}
```

Step 8 Configure the redirect-server as local block server under the domain profile:

```
redirect-server local-block-server 1
```

Step 9 Configure the UTD engine standard with domain profile:

```
utd engine standard
 web-filter
  domain-profile 1
```

Step 10 Configure the UTD with engine standard and enable it globally or on a specific interface:

```
utd
  all-interfaces
  engine standard
```

This example shows how to configure a domain-based web filtering with a local block server:

```
interface loopback 110
  ip address 10.1.1.1 255.255.255.255
exit
parameter-map type regex domainfilter_blacklist_pmap1
  pattern bitter\.com
parameter-map type regex domainfilter_whitelist_pmap1
  pattern sweet\.com
utd engine standard
  web-filter
    domain-profile 1
!
```

```
utd web-filter block local-server profile 1
  block-page-interface Loopback110
  content text "Blocked by Web-Filter"
  http-ports 80
!
utd web-filter domain profile 1
  alert all
  blacklist
    parameter-map regex domainfilter_blacklist_pmap1
  whitelist
    parameter-map regex df_whitelist_pmap1
  redirect-server local-block-server 1
!
utd
  all-interfaces
  engine standard
```

Configure URL-based Web Filtering with a Local Block Server

To configure URL-based web filtering with a local block server, perform these steps:

Step 1 Install and activate the virtual service. For more information, see Configuring VirtualPortGroup Interfaces and Virtual Service, on page 2119.

Step 2 Configure a loopback interface or use any existing interface that the client can access:

```
interface loopback 110
 ip address 10.1.1.1 255.255.255.255
exit
```

Step 3 Configure the UTD web filter with the local block server profile:

```
utd web-filter block local-server profile 1
 block-page-interface loopback 110
 http-ports 80
 content text "Blocked by Web-Filter"
```

Step 4 Configure the blocked list parameter-map:

```
parameter-map type regex urlf_blacklist_pmap1
 pattern exmplee.com/sports
```

Step 5 Configure the allowed list parameter-map:

```
parameter-map type regex urlf_whitelist_pmap1
 pattern examplehoo.com/finance
```

Step 6 Configure the URL profile and do the following:

```
utd web-filter url profile 1
```

a) Associate the blocked list and allowed list parameter-maps:

```
  blacklist
    parameter-map regex urlf_blacklist_pmap1
  whitelist
    parameter-map regex urlf_whitelist_pmap1
```

b) Configure the alerts for blocked list, allowed list or both under the local block-server profile:

```
alert {all | blacklist | whitelist}
```

c) Configure the categories to be allowed or blocked:

```
categories allow
  sports
```

d) Configure the reputation block threshold:

```
reputation
  block-threshold high-risk
```

e) Configure the URL source database with the fail option:

```
sourcedb fail close
```

f) Configure the log level. The default option is error. When you set the option to **info** or **detail**, the performance may impact:

```
log level error
```

g) Configure local block server:block

```
block local-server 1
```

Step 7 Configure the UTD engine standard with URL profile:

```
utd engine standard
 web-filter
   url-profile 1
```

Step 8 Configure the UTD engine standard and enable the UTD on a global or specific interface:

```
utd
  all-interfaces
  engine standard
```

This example shows how to configuration a URL-based web filtering with a local block server:

```
parameter-map type regex urlf_blacklist_pmap1
 pattern examplee.com/sports
parameter-map type regex urlf_whitelist_pmap1
 pattern exmaplehoo.com/finance
!
interface loopback 110
 ip address 10.1.1.1 255.255.255.255
 exit
utd web-filter block local-server profile 1
 block-page-interface loopback 110
 http-ports 80
 content text "Blocked by Web-Filter"
utd web-filter url profile 1
 blacklist
  parameter-map regex urlf_blacklist_pmap1
 whitelist
  parameter-map regex urlf_whitelist_pmap1
 alert all
 categories allow
  sports
 reputation
  block-threshold high-risk
```

```
 sourcedb fail close
 log level error
 block local-server 1
!
utd engine standard
 web-filter
  url-profile 1
!
utd
 all-interfaces
 engine standard
```

Configure URL-based Web Filtering with an Inline Block Page

To configure URL-based web filtering with an in-line block page, perform these steps:

Step 1 Install and activate the virtual service. For more information, see Configuring VirtualPortGroup Interfaces and Virtual Service, on page 2119.

Step 2 Configure the blocked list parameter-map:

```
parameter-map type regex urlf_blacklist_pmap1
 pattern exmaplegogle.com/sports
```

Step 3 Configure the allowed list parameter-map:

```
parameter-map type regex urlf_whitelist_pmap1
 pattern exmaplehoo.com/finance
```

Step 4 Configure the UTD block page profile:

```
utd web-filter block page profile 1
 text "Blocked by Web-Filter URLF" (The other options are file and redirect-url)
```

Step 5 Configure the URL profile and do the following:

```
utd web-filter url profile 1
```

a) Associate the blocked list and allowed list parameter-maps:

```
blacklist
  parameter-map regex urlf_blacklist_pmap1
whitelist
  parameter-map regex urlf_whitelist_pmap1
```

b) Configure the alerts for blocked list, allowed list or both under the local block-server profile:

```
alert {all | blacklist | whitelist | categories-reputation}
```

c) Configure the categories to be allowed or blocked:

```
categories allow
  sports
```

d) Configure the reputation block threshold:

```
reputation
  block-threshold high-risk
```

e) Configure the URL source database with the fail option:

```
sourcedb fail close
```

f) Configure the log level. The default option is error. When you set the option to **info** or **detail**, the performance may impact:

```
log level error
```

g) Configure local block server:block

```
block local-server 1
```

Step 6 Configure the UTD engine standard with URL profile:

```
utd engine standard
 web-filter
   url-profile 1
```

Step 7 Configure the UTD engine standard and enable the UTD on a global or specific interface:

```
utd
  all-interfaces
  engine standard
```

This example shows how to configuration an URL-based web filtering with an inline block server:

```
parameter-map type regex urlf_blacklist_pmap1
  pattern exmaplegogle.com/sports
parameter-map type regex urlf_whitelist_pmap1
 pattern exmaplehoo.com/finance
!
utd web-filter block page profile 1
 text "Blocked by Web-Filter URLF"
!
utd web-filter url profile 1
 blacklist
  parameter-map regex urlf_blacklist_pmap1
 whitelist
  parameter-map regex urlf_whitelist_pmap1
 alert all
 categories allow
  sports
 reputation
  block-threshold high-risk
 sourcedb fail close
 log level error
!
utd engine standard
 web-filter
  url-profile 1
!
utd
 all-interfaces
 engine standard
```

Configuring Domain/URL based Web Filtering and Snort IPS

To configure Domain/URL based web filtering and Snort IPS, perform these steps:

Step 1 Configure the domain profile:

```
utd web-filter domain profile 1
```

Step 2 Configure the URL profile:

```
utd web-filter url profile 1
```

Step 3 Configure the threat-inspection under UTD engine standard:

```
utd engine standard
 threat-inspection
```

Step 4 Configure the web-filter under UTD engine standard with the domain and URL profiles:

```
utd engine standard
 logging syslog
 threat-inspection
  threat protection
  policy security
 signature update server cisco username xxx password QhLb]Z[ifMbFgLYgR]^KLDUZ
  signature update occur-at daily 0 0
  logging level error
 web-filter
  domain-profile 1
  url-profile 1
```

Step 5 Configure the UTD engine standard and enable it globally or on a specific interface:

```
utd
  all-interfaces
  engine standard
```

Verifying the Web Filter Configuration

You can verify the Web Filtering configuration using the following commands:

```
Device# show utd engine standard config

UTD Engine Standard Configuration:
  Operation Mode : Intrusion Detection
  Policy         : Balanced

  Signature Update: Not Configured

  Logging:
    Server    :  IOS Syslog
    Level     : err (Default)
    Statistics    : Disabled

  Whitelist : Disabled
  Whitelist Signature IDs:

Web-Filter      : Enabled

  Whitelist :
    www.cisco.com
```

```
  Blacklist :
    www.hotstar.com

  Categories Action : Block
  Categories :
    Fashion and Beauty

  Block Profile:
   No config present

  Reputation Block Threshold : Moderate risk
  Alerts Enabled : Blacklist
  Cloud Lookup : Enabled
  Debug level : Error
Conditional debug level : Error
```

Troubleshooting Web Filtering

To collect the logs, use the **virtual-service move name "CONTAINER_NAME" log to bootflash:** command. You can troubleshoot issues that are related to enabling Web Filtering feature using the following commands on the device:

- **debug utd engine standard all**
- **debug utd engine standard climgr**
- **debug utd engine standard daq**
- **debug utd engine standard internal**
- **debug utd engine standard onep**
- **show utd engine standard logging events**

Note This tool will only show output for the configured URL filtering alerts/events. Users can configure the type of events and alerts they want to see in this output by following the steps in the section "Configuration Examples". For example, If you have configured "alert all", you will see "whitelist", "blacklist" and category & reputation events. If you configure only "alert whitelist", you will only see "whitelist" events."

For release 16.8.1, configuration error recovery on container is enhanced in order to apply configuration and signature updates to the container. With the improved error recovery, you can have:

- Greater robustness during configuration download to detect and act upon errors.
- Efficient way of handling signature and configuration updates occuring together.
- Early detect and recover from the loss of the oneP connection between IOSd and CLIMGR. For example, when CLIMGR crashes.
- Improved visibility to the detailed results of the (current or recent) configuration download, without requiring you to enable debugs.

The following site https://www.brightcloud.com/tools/url-ip-lookup.php can be used to validate how a website will be classified by our URL-Filtering feature.

Configuration Examples

The following example shows how to enable domain filtering on CSR 1000V Cloud Services Router:

```
Device# configure terminal
Device(config)# parameter-map type regex wlist1
Device(config-profile)# pattern google.com
Device(config-profile)# pattern cisco.com
Device(config-profile)# exit
Device(config)# parameter-map type regex blist1
Device(config-profile)# pattern exmaplehoo.com
Device(config-profile)# pattern bing.com
Device(config-profile)# exit
Device(config)# utd web-filter block local-server profile 1
Device(config--utd-webf-blk-srvr)# content file bootflash:test.utd.file
Device(config--utd-webf-blk-srvr)# end
```

For the local block server to work, HTTP server should be running. Use the ip http server command to configure the block server. The show ip http server status command displays the server status as enabled.

```
Device# show ip http server status
HTTP server status: Enabled
HTTP server port: 80
```

Example: Configuring Web Filter Domain Profile

The following example shows how to configure web filter domain profile:

```
Device(config)# utd web-filter domain profile 1
Device(config-utd-webfltr-domain)# blacklist
Device(config-utd-webf-dmn-bl)# parameter-map regex blist1
Device(config-utd-webf-dmn-bl)# whitelist
Device(config-utd-webf-dmn-wl)# parameter-map regex wlist1
Device(config-utd-webf-dmn-wl)# exit
Device(config-utd-webfltr-domain)# alert all
Device(config-utd-webfltr-domain)# redirect-server external 1.2.3.4
Device(config-utd-webfltr-domain)# exit
```

Configuring Web Filter URL Profile

The following example shows how to configure web filter URL profile:

```
Device(config)# utd web-filter url profile 1
Device(config-utd-webfltr-url)# blacklist
Device(config-utd-webf-url-bl)# parameter-map regex blist1
Device(config-utd-webf-url-bl)# whitelist
Device(config-utd-webf-url-wl)# parameter-map regex wlist1
Device(config-utd-webf-url-wl)# exit
Device(config-utd-webfltr-url)# categories allow
Device(config-utd-webf-url-cat)# news-and-media
Device(config-utd-webf-url-cat)# search-engines
Device(config-utd-webf-url-cat)# computer-and-internet-info
Device(config-utd-webf-url-cat)# computer-and-internet-security
Device(config-utd-webf-url-cat)# financial-services
Device(config-utd-webf-url-cat)# image-and-video-search
Device(config-utd-webf-url-cat)# job-search
Device(config-utd-webf-url-cat)#exit
Device(config-utd-webfltr-url)# alert all
```

```
Device(config-utd-webfltr-url)# reputation
Device(config-utd-webf-url-rep)# block-threshold suspicious
Device(config-utd-webf-url-rep)# exit
Device(config-utd-webfltr-url)# block local-server 1
Device(config-utd-webfltr-url)# exit
```

Configuring UTD Snort IPS/IDS Allowed List Signatures

The following example shows how to configure signature allowed lists:

```
Device(config)# utd threat-inspection whitelist
Device(config-utd-whitelist)# generator id 1 signature id 1
Device(config-utd-whitelist)# generator id 1 signature id 2
Device(config-utd-whitelist)# exit
```

Example: Configuring Web Filter Profile

The following example shows how to configure web filter profile:

```
Device(config)# utd engine standard
Device(config-utd-eng-std)# logging server 1.2.3.4
Device(config-utd-eng-std)# threat-inspection
Device(config-utd-engstd-insp)#threat protection
Device(config-utd-engstd-insp)# policy security
Device(config-utd-engstd-insp)# logging level emerg
Device(config-utd-engstd-insp)# whitelist
Device(config-utd-engstd-insp)# web-filter
Device(config-utd-engstd-webf)# domain-profile 1
Device(config-utd-engstd-webf)# url-profile 1
Device(config-utd-engstd-webf)# exit
```

Example: Alert Messages for Web Filtering Events

The following example shows alert messages for web filtering events:

```
016/06/02-14:44:41.061501 IST [**] [Instance_ID: 1] [**] Drop [**] UTD WebFilter Blacklist
 [**] [URL: www.edition.cnn.com/2016/03/31/asia/kolkata-bridge-collapse/index.html]
[Initiator_VRF: 0] {TCP} 1.0.0.9:56608 -> 2.0.0.29:80

2016/06/02-14:48:06.636270 IST [**] [Instance_ID: 1] [**] Pass [**] UTD WebFilter Whitelist
 [**] [URL: www.ndtv.com/index.html] [Initiator_VRF: 0] {TCP} 1.0.0.9:56611 -> 2.0.0.23:80

Jun 2 14:37:57.856 IST: %IOSXE-6-PLATFORM: F0: cpp_cp: QFP:0.0 Thread:000
TS:00000618422205723793 %UTD-6-UTD_DF_BLACKLIST_MATCH: UTD WebFilter Domain Blacklist [**]
 [Domain: www.cricinfo.com] [Matched Pattern: www.cricinfo.com] {UDP} 2.0.0.10:53 ->
1.0.0.9:55184

Jun 2 14:39:22.653 IST: %IOSXE-6-PLATFORM: F0: cpp_cp: QFP:0.0 Thread:000
TS:00000618507002407540 %UTD-6-UTD_DF_WHITELIST_MATCH: UTD WebFilter Domain Whitelist [**]
 [Domain: www.cricinfo.com] [Matched Pattern: www.cricinfo.com] {UDP} 2.0.0.10:53 ->
1.0.0.9:55286
```

Example: Unconfigure Cloud-Lookup

The following example shows how to unconfigure Cloud-Lookup feature in Web Filtering:

```
Device(config)# utd engine standard
Device(config-utd-eng-std)# web-filter
% Please ensure urlf-<low/medium/high> virtual-service profile is configured to use the
web-filter feature

Device(config-utd-engstd-webf)# no cloud-lookup
Device(config-utd-engstd-webf)# end
Device # exit
```

Technical Assistance

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	http://www.cisco.com/support

Feature Information for Cisco Web Filtering

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 220: Feature Information for Cisco Web Filtering

Feature Name	Releases	Feature Information
Cisco Web Filtering	Cisco IOS XE Denali Release 16.3.1	The Web Filtering feature enables the user to provide controlled access to Internet websites by configuring the domain-based or URL-based policies and filters on the device. The user can configure the web filtering profiles to manage the web access.Web Filtering feature is implemented using the container service and it is similar to the Snort IPS solution.
UTD feature parity on ISRv UTD Serviceability Enhancements	Cisco IOS XE Fuji Release 16.8.1	Domain and URL filtering in both single-tenant and multi-tenant mode are supported for CSR. For ISRv, only single-tenant is supported. This feature is available on all models of the ENCS platforms. Error recovery feature in UTD is enhanced to allow the container to recover from internal error by initiating a bulk configuration download from IOS. The command **utd web-filter** *profile name* is modifed.
Web Root URL Filtering Enhancements	Cisco IOS XE Fuji Release 16.9.1	The URLF Virtual Resource Profiles in Web Filtering are supported only on platforms CSR1000v and ISRv. The URL Filtering supports cloud-lookup feature to search for the URLs in cloud that are not present in the database.

CHAPTER 166

Configuring Multi-Tenancy for Unified Threat Defense

Multi-tenancy for Unified Threat Defense provides Snort IPS and Web Filtering for multiple users. You can define policies for one or more tenants in a single Cisco CSR 1000v instance. Each policy can have a threat inspection profile and a web filtering profile. The following sections describe how to configure multi-tenancy for Unified Threat Defense. Many of the commands used in these configuration steps are similar to those used in configuring single-tenancy—see: Snort IPS, on page 2065 andWeb Filtering , on page 2113 .

Information About Multi-Tenancy for Unified Threat Defense

Multi-tenancy for Snort IPS and Web Filtering allows you to define policies for one or more tenants, in one Cisco CSR 1000v instance. This feature was introduced in Cisco IOS XE Everest 16.6.1.

Each tenant is a VPN routing and forwarding instance with one or more VPN routing and forwarding tables (VRFs). A Unified Threat Defense (UTD) policy is associated with a threat inspection profile and web filtering profile. Multiple tenants can share a UTD policy.

The system logs include the name of the VRF which allows you to produce statistics per-tenant.

The CLI commands used in multi-tenancy mode are similar to those used in single-tenancy mode (see Snort IPS, on page 2065 and Web Filtering , on page 2113). In multi-tenancy, you enter a sub-mode `utd engine standard multi-tenancy` and configure UTD policies, web filtering and threat-inspection profiles. After exiting the `utd engine standard multi-tenancy` sub-mode, the UTD policies are applied.

The benefits of web filtering and threat inspection (Snort IPS/IDS) are explained in the following sections:

- Benefits of Web Filtering , on page 2117
- Overview of Snort Virtual Service Interfaces, on page 2135

Web Filtering Overview

Web Filtering allows you to provide controlled access to the internet by configuring URL-based policies and filters. Web Filtering helps to control access to websites by blocking malicious or unwanted websites and therefore making the network more secure. You can blocked list individual URLs or domain names and configure allowed list policies for the same. You can also make provision to allow or block a URL based on reputation or category.

Snort IPS Overview

The Snort IPS feature enables Intrusion Prevention System (IPS) or Intrusion Detection System (IDS) for branch offices on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series. This feature uses the Snort engine to provide IPS and IDS functionalities.

Snort is an open source network IPS that performs real-time traffic analysis and generates alerts when threats are detected on IP networks. It can also perform protocol analysis, content searching or matching, and detect a variety of attacks and probes, such as buffer overflows, stealth port scans, and so on. The Snort engine runs as a virtual container service on Cisco 4000 Series Integrated Services Routers and Cisco Cloud Services Router 1000v Series.

The Snort IPS feature works in the network intrusion detection and prevention mode that provides IPS or IDS functionalities. In the network intrusion detection and prevention mode, Snort performs the following actions:

- Monitors network traffic and analyzes against a defined rule set.
- Performs attack classification.
- Invokes actions against matched rules.

Based on your requirements, you can enable Snort either in IPS or IDS mode. In IDS mode, Snort inspects the traffic and reports alerts, but does not take any action to prevent attacks. In IPS mode, in addition to intrusion detection, actions are taken to prevent attacks.

The Snort IPS monitors the traffic and reports events to an external log server or the IOS syslog. Enabling logging to the IOS syslog may impact performance due to the potential volume of log messages. External third-party monitoring tools, which supports Snort logs, can be used for log collection and analysis.

Snort IPS Solution

The Snort IPS solution consists of the following entities:

- Snort sensor—Monitors the traffic to detect anomalies based on the configured security policies (that includes signatures, statistics, protocol analysis, and so on) and sends alert messages to the Alert/Reporting server. The Snort sensor is deployed as a virtual container service on the router.
- Signature store—Hosts the Cisco Signature packages that are updated periodically. These signature packages are downloaded to Snort sensors either periodically or on demand. Validated signature packages are posted to Cisco.com. Based on the configuration, signature packages can be downloaded from Cisco.com or a local server.

  The following domains are accessed by the router in the process of downloading the signature package from cisco.com:

  - api.cisco.com

- apx.cisco.com
- cloudsso.cisco.com
- cloudsso-test.cisco.com
- cloudsso-test3.cisco.com
- cloudsso-test4.cisco.com
- cloudsso-test5.cisco.com
- cloudsso-test6.cisco.com
- cloudsso.cisco.com
- download-ssc.cisco.com
- dl.cisco.com
- resolver1.opendns.com
- resolver2.opendns.com

Note If you are downloading signature packages from a local server to hold the signature packages, only HTTP is supported.

Signature packages must be manually downloaded from Cisco.com to the local server by using Cisco.com credentials before the Snort sensor can retrieve them.

The Snort container performs a domain-name lookup (on the DNS server(s) configured on the router) to resolve the location for automatic signature updates from Cisco.com or on the local server, if the URL is not specified as the IP address.

- Alert/Reporting server—Receives alert events from the Snort sensor. Alert events generated by the Snort sensor can either be sent to the IOS syslog or an external syslog server or to both IOS syslog and external syslog server. No external log servers are bundled with the Snort IPS solution.
- Management—Manages the Snort IPS solution. Management is configured using the IOS CLI. Snort Sensor cannot be accessed directly, and all configuration can only be done using the IOS CLI.

Overview of Snort Virtual Service Interfaces

The Snort sensor runs as a service on routers. Service containers use virtualization technology to provide a hosting environment on Cisco devices for applications.

You can enable Snort traffic inspection either on a per interface basis or globally on all supported interfaces. The traffic to be inspected is diverted to the Snort sensor and injected back. In Intrusion Detection System (IDS), identified threats are reported as log events and allowed. However, in Intrusion Prevention System (IPS), action is taken to prevent attacks along with log events.

The Snort sensor requires two VirtualPortGroup interfaces. The first VirtualPortGroup interface is used for management traffic and the second for data traffic between the forwarding plane and the Snort virtual container

service. Guest IP addresses must be configured for these VirtualPortGroup interfaces. The IP subnet assigned to the management VirtualPortGroup interface should be able to communicate with the Signature server and Alert/Reporting server.

The IP subnet of the second VirtualPortGroup interface must not be routable on the customer network because the traffic on this interface is internal to the router. Exposing the internal subnet to the outside world is a security risk. We recommend the use of 192.0.2.0/30 IP address range for the second VirtualPortGroup subnet. The use of 192.0.2.0/24 subnet is defined in RFC 3330.

You can assign the Snort virtual container service IP address on the same management network as the router on which the virtual service is running. This configuration helps if the syslog or update server is on the management network and is not accessible by any other interfaces

Restrictions for Configuring Multi-Tenancy for Unified Threat Defense

-
- Domain-based filtering is not supported.
- Up to 25 tenants are supported on each Cisco CSR 1000v instance.
- A maximum of 25 policies are supported.
- A maximum of 50,000 concurrent sessions are supported on a Cisco CSR 1000v.
-
- The blocked list/allowed list rules support only a regular expression (regex) pattern. Currently, 64 patterns are supported for each blocked list/allowed list rule. However, each tenant can have multiple rules.
- Local block server does not support serving HTTPS block page.When the URL filter tries to inject block page or redirect message, it does not support HTTPS traffic.
- When there is a username and password in the URL, URL filter does not remove them from the URL before matching the blocked list/allowed list pattern. However, the category/reputation lookup does not have this limitation and removes the username and password from the URL before lookup.
- HTTPS inspection is limited. Web filtering uses server certificate to obtain the URL/domain information. It is not possible to inspect the full URL path.
- UTD does not inter-operate with WCCP, and NBAR under inter-VRF scenario.
- The Snort IPS command `threat inspection profile` *`profile-name`* uses an alphanumeric profile-name, not an ID (number).

How to Configure Multi-Tenancy for Unified Threat Defense

To deploy multi-tenancy for Unified Threat Defense on supported devices, perform the following tasks:

Before you begin

Provision the device upon which you wish to install web filtering and threat inspection for multi-tenancy. This feature is currently only supported on the Cisco CSR 1000v.

Obtain the license. UTD is available only for routers running security packages and you will require a security license to enable the service. Contact Cisco Support to obtain a security license.

SUMMARY STEPS

1. Install and activate the virtual-service: Installing the UTD OVA File for Multi-Tenancy, on page 2137.
2. Configure the VirtualPortGroup interfaces and the virtual-service: How to Configure VirtualPortGroup Interfaces and Virtual Service for Multi-Tenancy, on page 2138.
3. Configure the VRFs: How to Configure VRFs for Multi-Tenancy, on page 2141.
4. Configure threat inspection and web filtering for multi-tenancy: How to Configure Multi-Tenancy Web Filtering and Threat Inspection, on page 2142

DETAILED STEPS

Step 1 Install and activate the virtual-service: Installing the UTD OVA File for Multi-Tenancy, on page 2137.

Step 2 Configure the VirtualPortGroup interfaces and the virtual-service: How to Configure VirtualPortGroup Interfaces and Virtual Service for Multi-Tenancy, on page 2138.

Step 3 Configure the VRFs: How to Configure VRFs for Multi-Tenancy, on page 2141.

Step 4 Configure threat inspection and web filtering for multi-tenancy: How to Configure Multi-Tenancy Web Filtering and Threat Inspection, on page 2142

Installing the UTD OVA File for Multi-Tenancy

The virtual-service OVA file is an Open Virtualization Archive file that contains a compressed, installable version of a virtual machine. You must download this OVA file to the router and then install the virtual-service. The virtual-service OVA file is not bundled with Cisco IOS XE release images that are installed on the router. OVA files may be available pre-installed in the router's flash memory.

For installing the OVA file, you must use a Cisco IOS XE image with a security license. During installation, the security license is checked.

Example of installing the virtual service:

```
Device> enable
Device# virtual-service install name utd package
bootflash:utdsnort.1.0.4_SV2983_XE_16_6.20170623_174453_RELEASE.ova
Device# show virtual-service list

Name Status   Package Name
------------------------------------------------------------------------------
utd Activated utdsnort.1.0.4_SV2983_XE_16_6.20170
```

Example of upgrading the virtual service:

```
Device> enable
Device# virtual-service upgrade name utd package
bootflash:utdsnort.1.0.4_SV2983_XE_16_6.20170623_174453_RELEASE.ova
Device# show virtual-service list
```

```
Name Status   Package Name
------------------------------------------------------------------------------
utd Activated utdsnort.1.0.4_SV2983_XE_16_6.20170
```

Example of uninstalling the virtual service:

```
Device> enable
Device# virtual-service uninstall name utd
Device# show virtual-service list

Virtual Service List:
```

How to Configure VirtualPortGroup Interfaces and Virtual Service for Multi-Tenancy

As shown in this procedure, for multi-tenancy you must configure two VirtualPortGroup interfaces and guest IP addresses for both interfaces.

Note The VirtualPortGroup interface for data traffic must use a private or nonroutable IP address. We recommend the use of 192.0.2.0/30 IP address range for this interface.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface VirtualPortGroup** *interface-number*
4. **ip address** *ip-address mask*
5. **exit**
6. **interface VirtualPortGroup** *interface-number*
7. **ip address** *ip-address mask*
8. **exit**
9. **virtual-service** *name*
10. **profile multi-tenancy**
11. **vnic gateway VirtualPortGroup** *interface-number*
12. **guest ip address** *ip-address*
13. **exit**
14. **vnic gateway VirtualPortGroup** *interface-number*
15. **guest ip address** *ip-address*
16. **exit**
17. **activate**
18. **end**
19. **show virtual-service list**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**interface VirtualPortGroup** *interface-number* **Example:** `Device(config)# interface VirtualPortGroup 0`	Enters interface configuration mode and configures a VirtualPortGroup interface. This interface is used for management traffic when the management interface GigabitEthernet0 is not used.
Step 4	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 10.1.1.1 255.255.255.252`	Sets a primary IP address for an interface. This interface needs to be routable to the signature update server and external log server.
Step 5	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 6	**interface VirtualPortGroup** *interface-number* **Example:** `Device(config)# interface VirtualPortGroup 1`	Configures an interface and enters interface configuration mode. Configure a VirtualPortGroup interface. This interface is used for data traffic.
Step 7	**ip address** *ip-address mask* **Example:** `Device(config-if)# ip address 192.0.2.1 255.255.255.252`	Sets a primary IP address for an interface. This IP address should not be routable to the outside network. The IP address is assigned from the recommended 192.0.2.0/30 subnet.
Step 8	**exit** **Example:** `Device(config-if)# exit`	Exits interface configuration mode and returns to global configuration mode.
Step 9	**virtual-service** *name* **Example:** `Device(config)# virtual-service utd`	Configures a virtual container service and enters virtual service configuration mode. The *name* argument is the logical name that is used to identify the virtual container service.
Step 10	**profile multi-tenancy** **Example:** `Device(config-virt-serv)#profile multi-tenancy`	Configures a resource profile. For multi-tenancy mode (Cisco CSR 1000v only), this `profile multi-tenancy` command must be configured.

	Command or Action	Purpose
Step 11	**vnic gateway VirtualPortGroup** *interface-number* **Example:** `Device(config-virt-serv)# vnic gateway VirtualPortGroup 0`	Enters the virtual-service virtual network interface card (vNIC) configuration mode. Creates a vNIC gateway interface for the virtual container service and maps the vNIC gateway interface to the virtual port group interface. This is the interface that was configured in Step 3.
Step 12	**guest ip address** *ip-address* **Example:** `Device(config-virt-serv-vnic)# guest ip address 10.1.1.2`	Configures a guest vNIC address for the vNIC gateway interface.
Step 13	**exit** **Example:** `Device(config-virt-serv-vnic)# exit`	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.
Step 14	**vnic gateway VirtualPortGroup** *interface-number* **Example:** `Device(config-virt-serv)# vnic gateway VirtualPortGroup 1`	Enters virtual-service vNIC configuration mode. Configures a vNIC gateway interface for the virtual container service and maps the interface to the virtual port group. The interface (*interface-number*) configured in Step 6) is used by the Snort engine for monitoring user traffic.
Step 15	**guest ip address** *ip-address* **Example:** `Device(config-virt-serv-vnic)# guest ip address 192.0.2.2`	Configures a guest vNIC address for the vNIC gateway interface.
Step 16	**exit** **Example:** `Device(config-virt-serv-vnic)# exit`	Exits virtual-service vNIC configuration mode and returns to virtual service configuration mode.
Step 17	**activate** **Example:** `Device(config-virt-serv)# activate`	Activates an application installed in a virtual container service.
Step 18	**end** **Example:** `Device(config-virt-serv)# end`	Exits virtual service configuration mode and returns to privileged EXEC mode.

Step 19	**show virtual-service list**
	Example:
	`Device# show virtual-service list`
	
	`Virtual Service List:`
	
	`Name  Status  Package Name`
	`----------`
	`utd  Activated  utdsnort.1.0.4_SV2983_XE_16_6.20170`	

How to Configure VRFs for Multi-Tenancy

This procedure describes the typical steps required for configuring VRFs for the tenants, which are later used in: How to Configure Multi-Tenancy Web Filtering and Threat Inspection, on page 2142.

Note For inter-VRF traffic, if the traffic flowing between two VRFs has ingress and egress interfaces configured for UTD, rules are applied to decide which VRF represents the session. The UTD policy for the selected VRF then applies to all packets in the inter-VRF traffic.

SUMMARY STEPS

1. **vrf definition** *vrf-name*
2. **rd** *route-distinguisher*
3. **address-family ipv4**
4. **exit address-family**
5. Repeat steps 1 to 4 for each VRF.

DETAILED STEPS

	Command or Action	Purpose
Step 1	**vrf definition** *vrf-name* **Example:** `Device(config)# vrf definition 100`	Defines the name of the VRF and enters VRF configuration mode.
Step 2	**rd** *route-distinguisher* **Example:** `Device(config-vrf)# rd 100:1`	Creates the routing and forwarding tables and associates the *route-distinguisher* with the VRF instance named *vrf-name*. The router uses the route-distinguisher to identify the VRF to which a packet belongs. The route-distinguisher is of one of the following two types: • Autonomous System-related. An AS number xxx and an arbitrary number y—xxx:y • IP address-related. An IP address A.B.C.D and an arbitrary number y—A.B.C.D:y
Step 3	**address-family ipv4** **Example:** `Device(config-vrf)# address-family ipv4`	Enters address family configuration mode for configuring routing sessions using the IP Version 4 address.
Step 4	**exit address-family** **Example:** `Device(config-vrf-af)# exit`	Exits address family configuration mode.
Step 5	Repeat steps 1 to 4 for each VRF.	

How to Configure Multi-Tenancy Web Filtering and Threat Inspection

To configure threat inspection (IPS/IDS) and web filtering for multi-tenancy (multiple tenants/VRFs), perform the following steps.

In this procedure, the definition of blocked list and allowed lists are shown in the initial steps 1 to 5. The main configuration steps (in UTD standard engine configuration mode for multi-tenancy) are shown in step 6 onwards.

Note For details about threat inspection and web filtering for single-tenancy, see Snort IPS, on page 2065 and Web Filtering , on page 2113.

Before you begin

Remove any existing single-tenancy UTD configuration, using the `no utd engine standard` command.

You must have previously configured a VRF for each tenant—see How to Configure VRFs for Multi-Tenancy, on page 2141.

Procedure

	Command or Action	Purpose
Step 1	**parameter-map type regex** *blacklist-name* **Example:** `Device(config)# parameter-map type regex urlf-blacklist1`	Defines a blocked list parameter map, which is used later in step 17.

Step 2	**pattern** *URL-name*
	Example:
	`Device(config-profile)# pattern www\.cnn\.com`
	`Device(config-profile)# pattern www\.msnbc\.com`
		Defines the URL to be on the blocked list. Note that the periods within *URL-name* must be preceded by an escape "\" character. Repeat this step to configure multiple URLs to be on the blocked list.

Step 3	**parameter-map type regex** *whitelist-name* **Example:** `Device(config-profile)# parameter-map type regex urlf-whitelist1`	Defines an allowed list parameter map, which is used later in step 20.
Step 4	**pattern** *URL-name* **Example:** `Device(config-profile)# pattern www\.nfl\.com`	Defines the URL(s) to be on the allowed list. Note that, for URLs on the blocked list, periods within *URL-name* must be preceded by an escape "\" character. Repeat this step to configure multiple URLs to be on the allowed list.
Step 5	**exit** **Example:** `Device(config-profile)# exit`	

	Command or Action	Purpose
Step 6	**utd multi-tenancy** **Example:** `Device(config)# utd multi-tenancy`	This command acts a switch, in preparation for the following `utd engine standard multi-tenancy` command.
Step 7	**utd engine standard multi-tenancy** **Example:** `Device(config)# utd engine standard multi-tenancy`	Enters UTD standard engine configuration mode for multi-tenancy. **Note** Later. after you exit the UTD standard engine configuration mode in step 50, the policy configurations are applied.
Step 8	**web-filter sourcedb** *sourcedb-number* **Example:** `Device(config)# web-filter sourcedb 1`	Configures a web filtering sourcedb profile—*sourcedb-number*, which is numeric. This is used later in step 29.
Step 9	**logging level** {**alerts** | **critical** | **debugging** | **emergencies** | **errors** | **informational** | **notifications** | **warnings**} **Example:** `Device(config)# logging level errors`	Sets the level of system messages that are reported upon for web filtering events. Messages of the specified level and lower are reported. (Each level has a numeric value as shown in the table below.) ***Table 221: System Message Severity Levels*** **Level** / **Description** 0 – emergencies / System unusable 1 – alerts / Immediate action needed 2 – critical / Critical condition 3 – errors / Error condition 4 – warnings / Warning condition 5 – notifications / Normal but significant condition 6 – informational / Informational messages only 7 – debugging / Appears during debugging only
Step 10	**web-filter block local-server profile** *profile-id* **Example:** `Device(config-utd-multi-tenancy)# web-filter block local-server profile 1` The content text is displayed by the local server.	Configures the a local block server profile for web filtering. The range of values for *profile-id* is 1–255. See Configure URL-based Web Filtering with a Local Block Server. **Note** When configuring commands for multi-tenancy, compared to single-tenancy, you do not use the initial `utd` keyword.

	Command or Action	Purpose
Step 11	**block-page-interface loopback** *id* **Example:** `Device(config-utd-mt-webf-blk-srvr)# block-page-interface loopback 110`	Associates a loopback interface with this profile. The IP address of this loopback interface is then used as the IP address of the block local-server.
Step 12	**content text** *display-text* **Example:** `Device(config-utd-mt-webf-blk-srvr)# content text "Blocked by Web-Filter"`	Specifies the warning text that appears after a blocked page is accessed.
Step 13	**http-ports** *port-number* **Example:** `Device(config-utd-mt-webf-blk-srvr)# http-ports 80`	The http-ports value is a string of ports separated by commas. The nginx HTTP server listens to these ports.

Step 14	**web-filter block page profile** *profile-name*
	Example:
	`Device(config-utd-multi-tenancy)# web-filter block page profile 1`
	`Device(config-utd-mt-webf-block-urc)# text "this page is blocked"`
		See Configure URL-based Web Filtering with an Inline Block Page, on page 2125, except that the command used here for multi-tenancy does not use the `utd` keyword which is used for single-tenancy.).

Step 15	**web-filter url profile** *web-filter-profile-id*
	Example:
	`Device(config-utd-multi-tenancy)# web-filter url profile 1`
	`Device(config-utd-mt-webfltr-url)#`
		Specifies a URL profile for web filtering—*web-filter-profile-id*. Values: 1–255. After this command, you can configure alerts for blocked lists, allowed lists, and categories. For further information, see: Configure URL-based Web Filtering with an Inline Block Page.
		Note When configuring commands for multi-tenancy, compared to single-tenancy, you do not use an initial `utd` keyword.

Step 16	**blacklist** **Example:** `Device(config-utd-mt-webfltr-url)# blacklist`	Enters web filtering blocked list configuration mode.
Step 17	**parameter-map regex** *blacklist-name* **Example:** `Device(config-utd-mt-webf-url-bl)# parameter-map regex urlf-blacklist1`	Specifies a parameter-map regular expression using the blocked list that was defined earlier in step 1.

Step 18	**exit**
	Example:
	`Device(config-utd-mt-webf-url-bl)# exit`
	`Device(config-utd-mt-webfltr-url)#`
		Exits web filtering blocked list configuration mode.

	Command or Action	Purpose

Step 19	**whitelist**
	Example:
	`Device(config-utd-mt-webfltr-url)# whitelist`
	`Device(config-utd-mt-webf-url-wl)#`
		Enters web filtering allowed list configuration mode.

Step 20	**parameter-map regex** *whitelist-name* **Example:** `Device(config-utd-mt-webf-url-wl)# parameter-map regex urlf-list1`	Specifies a parameter-map regular expression using the allowed list that was defined earlier in step 3.

Step 21	**exit**
	Example:
	`Device(config-utd-mt-webf-url-wl)# exit`
	`Device(config-utd-mt-webfltr-url)#`
		Exits web filtering allowed list configuration mode.

Step 22	**exit**
	Example:
	`Device(config-utd-mt-webfltr-url)# exit`
	`Device(config-utd-multi-tenancy)#`
		Exits web filtering URL profile mode.

Step 23	**utd global** **Example:** `Device(config-utd-multi-tenancy)# utd global`	The commands entered for `utd global` apply to all tenants or policies e.g the commands shown below: `logging host syslog` and `threat inspection` for this Cisco CSR 1000v instance.

Step 24	**logging** {**host** *hostname* | **syslog**}
	Example:
	In this example, alerts are logged to a designated host log file.
	`Device(config-utd-mt-utd-global)# logging host systemlog1`
	Example:
	In this example, alerts are logged to IOS syslogs.
	`Device(config-utd-mt-utd-global)# logging syslog`
		The `logging` command specifies either a host name or IOS syslog, to which syslog messages are sent.

Step 25	**threat inspection** **Example:** `Device(config-utd-mt-utd-global)# threat inspection`	Enters global threat inspection mode.
Step 26	**signature update server** {**cisco** | **url** *url* } [**username** *username* [**password** *password*]] **Example:** `Device(config-utd-mt-utd-global-threat)# signature update server cisco username abcd password cisco123`	Configures the signature update server parameters. You must specify the signature update parameters with the server details. If you use www.cisco.com for signature updates, you must provide the username and password. If you use a local server for signature updates, based on the server settings you can provide the username and password.

	Command or Action	Purpose
		The router must be able to resolve the domain name by being connected to the internet.
Step 27	**signature update occur-at** {**daily** | **monthly** *day-of-month* | **weekly** *day-of-week*} *hour minute* **Example:** `Device(config-utd-mt-utd-global-threat)# signature update occur-at daily 0 0`	Configures the signature update interval parameters. This configuration will trigger the signature update to occur at midnight.
Step 28	**web-filter** **Example:** `Device(config-utd-mt-utd-global-threat)# web-filter`	This command, used in combination with the following `sourcedb` command, specifies the URL source database for web filtering.
Step 29	**sourcedb** *sourcedb-number* **Example:** `Device(config-utd-mt-utd-global-threat)# sourcedb 1`	Assigns a web filtering source database. Only one source database can be active.
Step 30	**exit** **Example:** `Device(config-utd-mt-utd-global-threat)# exit`	Exits threat inspection configuration mode.
Step 31	**exit** **Example:** `Device(config-utd-mt-global)# exit`	Exits global update configuration mode.
Step 32	**threat-inspection whitelist profile** *policy-name* **Example:** `Device(config-utd-multi-tenancy)# threat-inspection whitelist profile wh101`	Associates an allowed list profile with the policy currently being configured. A similar command is used in single-tenancy, but with a `utd` keyword.
Step 33	**signature id** *id* **Example:** `Device(config-utd-mt-list)# signature id 101`	Specify the ID *id* that you have previously identified as a threat; for example, after observing the ID in an alert log file. Repeat this command for multiple signature IDs.
Step 34	**exit** **Example:** `Device(config-utd-mt-whitelist)# exit`	Exits an allowed list configuration mode.
Step 35	**threat-inspection profile** *profile-name* **Example:** `Device(config-utd-multi-tenancy)# threat-inspection profile 101`	Configures a threat inspection profile, which can be reused by multiple tenants. You can configure multiple threat-inspection profiles. Within a profile you can configure multiple allowed lists. `profile-name` is alphanumeric.

	Command or Action	Purpose
Step 36	**threat** {**detection** | **protection** } **Example:** `Device(config-utd-mt-threat)# threat protection`	Specifies Intrusion Detection System (IDS) or Intrusion Prevention System (IPS) as the operating mode for the Snort engine. The default is **threat detection**
Step 37	**policy** {**balanced** | **connectivity** | **security**} **Example:** `Device(config-utd-mt-threat)# policy security`	Configures the security policy for the Snort engine. • The default security policy type is **balanced**.
Step 38	**logging level**{**alert** | **crit** | **debug** | **emerg** | **err** | **info** | **notice** | **warning**}	Provides logs in one of these categories: • alert—provides alert level logs (severity=2) • crit—critical level logs (severity=3) • debug—all logs (severity=8) • emerg—emergency level logs (severity=1) • err—error level logs (severity=4) Default. • info—info level logs (severity=7) • notice—notice level logs (severity=6) • warning—warning level logs (severity=5)
Step 39	**whitelist profile** *profile-name* **Example:** `Device(config-utd-mt-threat)# whitelist profile wh101`	You can also specify allowed list profiles in a profile only for allowed lists in another place—the `threat-inspection whitelist profile` command above. (Optional) Enables allowed lists under the UTD engine.
Step 40	**exit** **Example:** `Device(config-utd-mt-threat)# exit`	Exits threat inspection mode.
Step 41	Repeat steps 35 to 40 to add additional threat-inspection profiles.	
Step 42	**policy** *policy-name* **Example:** `Device(config-utd-multi-tenancy)# policy pol101`	Defines the policy that will be associated with multiple tenants. A threat detection (IPS) and web filtering profile are added to the policy.
Step 43	**vrf** [*vrf-name* | global] **Example:** This example shows the configuration of two tenants (VRFs) and two policies. `Device(config-utd-mt-policy)# vrf vrf101`	Repeat the `vrf vrf-name` command for each of the VRFs (tenants) that will use the UTD policy. These VRFs previously defined, see: How to Configure VRFs for Multi-Tenancy, on page 2141. Alternatively use `vrf global` to associate with the global (default) VRF and enables VRF under the interface.

	Command or Action	Purpose
Step 44	**all-interfaces** **Example:** `Device(config-utd-mt-policy)# all-interfaces`	(Optional) Associates all interfaces under the VRF with the policy.
Step 45	**threat-inspection profile** *profile-name* **Example:** `Device(config-utd-mt-policy)# threat-inspection profile 101`	(Optional) Associates the policy with a previously defined threat inspection profile, see Step 35.
Step 46	**web-filter url profile** *web-filter-profile-id* **Example:** `Device(config-utd-mt-policy)# web-filter url profile 1`	(Optional) Associates the policy with a previously defined web filtering profile, see step 15.
Step 47	**fail close** **Example:** `Device(config-utd-mt-policy)# fail close`	(Optional) Drops IPS/IDS packets on engine failure. Default is `fail open`.
Step 48	**exit**	Exits from policy configuration mode.
Step 49	Repeat steps 42 to 48 for each policy	
Step 50	**exit** **Example:** `Device(config-utd-multi-tenancy)# exit`	Exits the `utd engine standard multi-tenancy` mode. The policy configurations are applied, which may take a few minutes. During this time, further `utd engine standard multi-tenancy` configuration mode commands cannot be entered.

Step 51	**exit**
	Example:
	`Device(config)# exit`
	`Device#`	

Step 52	**show logging**
	Example:
	`Device(config)# show logging`
	`..UTD MT configuration download has started`
	`..UTD MT configuration download has completed`	

Step 53	**interface** *sub-interface* **Example:** `Device(config)# interface GigabitEthernet4.101`	Specify a sub-interface to be used for the tenant (VRF).
Step 54	**encapsulation dot1Q** *vlan-id* **Example:** `Device(config-if)# encapsulation dot1Q 101`	Applies a VLAN ID to the sub-interface.

	Command or Action	Purpose
Step 55	**ip vrf forwarding** *vrf-name* **Example:** `Device(config-if)# ip vrf forwarding vrf101`	Associates a VRF instance with the sub-interface.
Step 56	**ip address** *ip-address subnet-mask* **Example:** `Device(config-if)# ip address 111.0.0.1 255.255.255.0`	Specifies the sub-interface IP address of the VRF.
Step 57	**ip route** *ip-address subnet-mask sub-interface* **Example:** In this example, the VRF's subnet GigabitEthernet4.101 is linked to the global routing table using the static IP address 111.0.0.0 255.255.255.0. `Device(config-if)# ip route 111.0.0.0 255.255.255.0 GigabitEthernet4.101`	(Optional) This `ip route` command and the `ip route vrf` command in the following step are optional—you can use these steps if you want to configure route leaking using a static route between the VRF and the global routing table. This configures a static route to the VRF subnet from the VRF interface, so that the VRF subnet is accessible from the global routing table. For further information on configuring route leaking, see Route Leaking in MPLS/VPN Networks.
Step 58	**ip route vrf** *vrf-name ip-address subnet-mask* **global** **Example:** `Device(config-if)# ip route vrf vrf101 0.0.0.0 0.0.0.0 5.2.1.1 global`	(Optional) This step and the previous step are optional——you can use these steps if you want to configure route leaking using a static route between the VRF and the global routing table. For further information on configuring route leaking, see Route Leaking in MPLS/VPN Networks. Specifies the static VRF default route to the global routing table.
Step 59	**utd enable**	(Optional) Enables UTD on an interface. You can use this command if the `all-interfaces` command was not configured (in step 44).
Step 60	To configure a sub-interface for each tenant (VRF), repeat steps 53 to 59.	
Step 61	**exit**	Exits interface configuration mode.

The profiles for web filtering and threat inspection (IPS) have now been applied.

Example Configuration—Multi-Tenancy for Unified Threat Defense

This example shows a typical running configuration after configuring Multi-Tenancy for UTD for two tenants.

Note The following example mentions parameter maps `urlf-blacklist1` and `urlf-whitelist1`. The configuration of these parameter maps is not shown in the example. For further information on blocked list and approved list parameter-maps, see Configure URL-based Web Filtering with an Inline Block Page.

```
utd multi-tenancy
utd engine standard multi-tenancy
 web-filter block page profile 1
  text "This page is blocked"
 web-filter block page profile 2
  text "This page is blocked"
 web-filter url profile 1
  alert all

```

Verifying Unified Threat Defense Engine Standard Configuration

Use the following commands to verify your configuration.

SUMMARY STEPS

1. **enable**
2. **show utd multi-tenancy**
3. **show utd engine standard global**
4. **show utd engine standard status**
5. **show utd engine standard statistics**
6. **show utd engine standard statistics daq** [**dp** | **cp**]
7. **show utd engine standard statistics url-filtering** [**engine** | *no*]
8. **show utd engine standard statistics url-filtering vrf name** *vrf-name*
9. **show utd engine standard statistics internal**
10. **show utd engine standard logging event**
11. **show logging** | **include** CONFIG_DOWNLOAD
12. **show utd threat-inspection whitelist** [**profile** *profile-name*]
13. **show utd threat-inspection profile** *profile-name*
14. **show utd** [**policy** *profile-name*]
15. **show utd web-filter url** [**profile** *profile-name*]
16. **show utd web-filter block local-server** [**profile** *profile-name*]
17. **show utd web-filter sourcedb** [**profile** *profile-name*]
18. **show utd engine standard statistics daq dp** [**engine** *engine-num*] [**vrf** [**name** *vrf-name* | **global**]]
19. **show utd engine standard config threat-inspection whitelist** [**profile** *profile-name*]
20. **show utd engine standard config web-filter url profile** *profile-name*
21. **show utd engine standard config** [**vrf name** *vrf-name*]
22. **show utd engine standard config threat-inspection profile** *profile-name*
23. **show utd engine standard threat-inspection signature update status**
24. **show platform software qfp active feature utd config** [**vrf**[{**id** *vrf-id* | **name** *vrf-name* | **global** }]
25. **show platform software utd interfaces**
26. **show platform hardware qfp active feature utd config** [**vrf** {**id** *vrf-id* | **name** *vrf-name* | **global** }]
27. **show platform hardware qfp active feature utd stats** [**clear** | **divert** | **drop** | **general** | **summary**] [**vrf** {**id** *vrf-id* | **name** *vrf-name* | **global** }] [all] [**verbose**]
28. **show platform hardware qfp active feature utd stats summary** [**vrf name** *vrf-name* | **all**]
29. **show platform hardware qfp active feature utd stats drop all**

DETAILED STEPS

Step 1 **enable**

Example:

```
Device# enable
```

Enables privileged EXEC mode. Enter your password if prompted.

Step 2 **show utd multi-tenancy**

Displays the current status of multi-tenancy.

Example:

```
Device# show utd multi-tenancy
Multitenancy is enabled
```

Step 3 **show utd engine standard global**

Displays the global settings for utd engine standard.

Example:

```
Device# show utd engine standard global
UTD Engine Standard Global: enabled
Threat-inspection: enabled
Web-filter: enabled
Logging:
```

Step 4 **show utd engine standard status**

Verify that the status of the UTD engine is Green.

Example:

```
Device# show utd eng standard status
Engine version       : 1.0.2_SV2983_XE_16_8

Profile              : Multi-tenancy
System memory        :
              Usage  : 3.50 %
              Status : Green
Number of engines    : 1

Engine        Running    CFT flows  Health     Reason
=========================================================
Engine(#1):   Yes        0          Green      None
=========================================================

Overall system status: Green

Signature update status:
========================
Current signature package version: 29.0.c
Last update status: Failed
Last successful update time: None
Last failed update time: Thu Jan 11 13:34:36 2018 PST
Last failed update reason: [Errno 113] No route to host
Next update scheduled at: None
Current status: Idle
```

Step 5 **show utd engine standard statistics**

Example:

```
Device# show utd engine standard statistics
*************Engine #1*************
===============================================================================
Memory usage summary:
```

```
Total non-mmapped bytes (arena): 80125952
Bytes in mapped regions (hblkhd): 359546880
Total allocated space (uordblks): 68314032
Total free space (fordblks): 11811920
Topmost releasable block (keepcost): 112
================================================================================
Packet I/O Totals:
Received: 49088
Analyzed: 49088 (100.000%)
Dropped: 0 ( 0.000%)
Filtered: 0 ( 0.000%)
Outstanding: 0 ( 0.000%)
Injected: 640
================================================================================
Breakdown by protocol (includes rebuilt packets):
Eth: 49394 (100.000%)

<output removed for brevity>

Total: 49394
================================================================================
Action Stats:
Alerts: 65 ( 0.132%)
Logged: 65 ( 0.132%)
Passed: 0 ( 0.000%)
```

Step 6 **show utd engine standard statistics daq [dp | cp]**

Show Snort DAQ statistics.

Example:

```
Device# show utd engine standard statistics daq dp
IOS-XE DAQ Counters(Engine #1):
--------------------------------
Frames received 654101
Bytes received 549106120
RX frames released 654101
Packets after vPath decap 654101
Bytes after vPath decap 516510928
Packets before vPath encap 651686
Bytes before vPath encap 514800669
Frames transmitted 651686
Bytes transmitted 544447557

<output removed for brevity>
```

Example:

```
Device# show utd engine standard statistics daq cp
IOS-XE DAQ CP Counters(Engine #1):
-----------------------------------
Packets received :16353210
Bytes received :1112018252
Packets transmitted :16353210
Bytes transmitted :1700733776
Memory allocation :16353212
Memory free :16353210
CFT API error :0
VPL API error :0
Internal error :0
External error :0
Memory error :0
Timer error :0
```

```
RX ring full 0
CFT full 0
sPath lib flow handle exhausted 0
Memory status changed to yellow :1
Memory status changed to red :0
Process restart notifications :0
```

Step 7 **show utd engine standard statistics url-filtering** [**engine** | *no*]

Gives the URL statistics for all the tenants combined: the number of hits for sites on the blocked list, number of hits for sites on the allowed list, and the number of sites that are blocked by category block and reputation block.

Example:

```
Device# show utd engine standard statistics url-filtering
UTM Preprocessor Statistics
---------------------------
URL Filter Requests Sent:               377226166       379846771       381117940
URL Filter Response Received:           377009606       379622845       380892658
Blacklist Hit Count:                    0               0               0
Whitelist Hit Count:                    0               0               0

Reputation Lookup Count:                376859139       379458008       380706804
Reputation Action Block:                0               0               0
Reputation Action Pass:                 307             280             102
Reputation Action Default Pass:         376858832       379457728       380706702
Reputation Score None:                  376858832       379457728       380706702
Reputation Score Out of Range:          0               0               0

Category Lookup Count:                  376859139       379458008       380706804
Category Action Block:                  0               0               0
Category Action Pass:                   307             280             102
Category Action Default Pass:           376858832       379457728       380706702
Category None:                          376858832       379457728       380706702

Device# show utd engine standard statistics url-filtering engine1
UTM Preprocessor Statistics
-----------------------------------------------------
URL Filter Requests Sent:               377226166
URL Filter Response Received:           377009606
Blacklist Hit Count:                    0
Whitelist Hit Count:                    0

Reputation Lookup Count:                376859139
Reputation Action Block:                0
Reputation Action Pass:                 307
Reputation Action Default Pass:         376858832
Reputation Score None:                  376858832
Reputation Score Out of Range:          0

Category Lookup Count:                  376859139
Category Action Block:                  0
Category Action Pass:                   307
Category Action Default Pass:           376858832
Category None:                          376858832
```

Step 8 **show utd engine standard statistics url-filtering vrf name** *vrf-name*

Gives per-tenant URL statistics by using the additional parameters—**vrf name** *vrf-name* .

Example:

```
Device# show utd engine standard statistics url-filtering vrf name vrf101
UTM Preprocessor Statistics
---------------------------
URL Filter Requests Sent: 764
URL Filter Response Received: 764
Blacklist Hit Count: 3
Whitelist Hit Count: 44

Reputation Lookup Count: 764
Reputation Action Block: 0
Reputation Action Pass: 58
Reputation Action Default Pass: 706
Reputation Score None: 706
Reputation Score Out of Range: 0

Category Lookup Count: 764
Category Action Block: 5
Category Action Pass: 53
Category Action Default Pass: 706
Category None: 706
```

Step 9 **show utd engine standard statistics internal**

Example:

```
Device# show utd engine standard statistics internal
*************Engine #1*************
===============================================================================
Memory usage summary:
Total non-mmapped bytes (arena): 80125952
Bytes in mapped regions (hblkhd): 359546880
Total allocated space (uordblks): 68314032
Total free space (fordblks): 11811920
Topmost releasable block (keepcost): 112
===============================================================================
Packet I/O Totals:
Received: 49088
Analyzed: 49088 (100.000%)
Dropped: 0 ( 0.000%)
Filtered: 0 ( 0.000%)
Outstanding: 0 ( 0.000%)
Injected: 640
===============================================================================
Breakdown by protocol (includes rebuilt packets):
Eth: 49394 (100.000%)
VLAN: 49394 (100.000%)
IP4: 49394 (100.000%)
Frag: 0 ( 0.000%)
ICMP: 5 ( 0.010%)
UDP: 2195 ( 4.444%)
TCP: 47194 ( 95.546%)

<output removed for brevity>
```

Step 10 **show utd engine standard logging event**

Displays the logs which contains alerts and URLs that are either on the blocked or allowed list per VRF.

Example:

```
Device# show utd engine standard logging event

2017/08/04-16:01:49.205959 UTC [**] [Instance_ID: 1] [**] Drop [**]
```

```
UTD WebFilter Category/Reputation [**] [URL: www.cricinfo.com] ** [Category: Sports]
** [Reputation: 96] [VRF: vrf101] {TCP} 23.72.180.26:80 -> 111.0.0.254:53509
2017/08/04-16:02:12.253330 UTC [**] [Instance_ID: 1] [**] Pass [**]
 UTD WebFilter Whitelist [**] [URL: www.espn.go.com/m]
[VRF: vrf101] {TCP} 111.0.0.254:53511 -> 199.181.133.61:80
```

Step 11 **show logging** | **include** CONFIG_DOWNLOAD

Example:

```
show# logging | include CONFIG_DOWNLOAD
Aug 23 11:34:21.250 PDT: %IOSXE_UTD-4-MT_CONFIG_DOWNLOAD: UTD MT configuration download has started
Aug 23 11:54:18.496 PDT: %IOSXE_UTD-4-MT_CONFIG_DOWNLOAD: UTD MT configuration download has completed
```

Step 12 **show utd threat-inspection whitelist** [**profile** *profile-name*]

Displays all allowed list profiles or a specific allowed list profile.

Example:

```
Device# show utd threat-inspection whitelist
Whitelist Profile: wh101
Signature ID: 101
```

Example:

```
Device# show utd threat-inspection whitelist profile wh101
Whitelist Profile: wh101
Signature ID: 101
```

Step 13 **show utd threat-inspection profile** *profile-name*

Displays the details of a threat-inspection profile specified by the *profile-name*.

Example:

```
Device# show utd threat-inspection profile 101
Threat-inspection Profile: 101
Operational Mode: Intrusion Protection
Operational Policy: Security
Logging Level: debug
Whitelist Profile: wh101
```

Step 14 **show utd** [**policy** *profile-name*]

Displays all UTD policies or a specific UTD policy.

Example:

```
Device# show utd policy pol101
Policy name: pol101
VRF name: vrf101, VRF ID: 1
Global Inspection (across above VRFs): Enabled
Threat-inspection profile: 101
Web-filter URL profile: 1
Fail Policy: Fail-open
```

Step 15 **show utd web-filter url** [**profile** *profile-name*]

Displays all URL profiles or a specific profile.

Example:

```
Device# show utd web-filter url profile 1
URL Profile: 1
Alert: all
Blacklist Parameter Map Regex: urlf-blacklist1
Whitelist Parameter Map Regex: urlf-whitelist1
Block Categories:
dating
sports
Block Page Profile 1
Log level error
reputation block-threshold high-risk
```

Step 16 **show utd web-filter block local-server** [**profile** *profile-name*]

Displays all block page profiles or a specific block page profile.

Example:

```
Device# show utd web-filter block local-server profile 2
Block Local Server Profile: 2
Content text: "Blocked by Web-Filter"
HTTP ports: 80
```

Step 17 **show utd web-filter sourcedb** [**profile** *profile-name*]

Displays all sourcedb profiles or a specific sourcedb profile.

Example:

```
Device# show utd web-filter sourcedb
SourceDB Profile: 1
database update server interval hour 0 minute 0
Fail open
Log level: error
Proxy host port 0

SourceDB Profile: 2
database update server interval hour 0 minute 0
Fail open
Log level: error
Proxy host port 0
```

Example:

```
Device# show utd web-filter sourcedb profile 1
SourceDB Profile: 1
database update server interval hour 0 minute 0
Fail open
Log level: error
Proxy host port 0
```

Step 18 **show utd engine standard statistics daq dp** [**engine** *engine-num*] [**vrf** [**name** *vrf-name* | **global**]]

Displays serviceplane data acquistion (DAQ) statistics for all VRFs or a specific VRF.

Example:

The following example shows the serviceplane data acquisition statistics for VRF vrf101.

```
Device# show utd engine standard statistics daq dp vrf name vrf101
IOS-XE DAQ Counters(Engine #1):
--------------------------------
Frames received 374509
Bytes received 303136342
RX frames released 374509
Packets after vPath decap 374509
Bytes after vPath decap 284405526
Packets before vPath encap 372883
Bytes before vPath encap 283234522
Frames transmitted 372883
Bytes transmitted 300202270

Memory allocation 781856
Memory free 749636
Memory free via timer 29420
Merged packet buffer allocation 0
Merged packet buffer free 0

VPL buffer allocation 0
VPL buffer free 0
VPL buffer expand 0
VPL buffer merge 0
VPL buffer split 0
VPL packet incomplete 0

VPL API error 0
CFT API error 0
Internal error 52
External error 0
Memory error 0
Timer error 0

Kernel frames received 373590
Kernel frames dropped 0

FO cached via timer 0
Cached fo used 0
Cached fo freed 0
FO not found 0
CFT full packets 0
```

Step 19 **show utd engine standard config threat-inspection whitelist** [**profile** *profile-name*]

Displays the details of a threat-inspection allowed list profile stored in a container.

Example:

```
Device# show utd engine standard config threat-inspection whitelist
UTD Engine Standard Configuration:

UTD threat-inspection whitelist profile table entries:
Whitelist profile: wh101
Entries: 1
```

Step 20 **show utd engine standard config web-filter url profile** *profile-name*

Displays the details of the web-filter profile stored in the container.

Example:

```
Device# show utd engine standard config web-filter url profile 1
UTD Engine Standard Configuration:
```

```
UTD web-filter profile table entries
Web-filter URL profile: 1
Whitelist:
www.espn.com
www.nbcsports.com
www.nfl.com
Blacklist:
www.cnn.com
Categories Action: Block
Categories:
Social Network
Sports
Block Profile: 1
Redirect URL: http://172.27.56.97/vrf101.html
Reputation Block Threshold: High risk
Alerts Enabled: Whitelist, Blacklist, Categories, Reputation
Debug level: Error
Conditional debug level: Error
```

Step 21 **show utd engine standard config** [**vrf name** *vrf-name*]

Displays the details of the UTD policy, threat-inspection profile and web-filter profile associated with a particular VRF.

Example:

```
Device# show utd engine standard config vrf name vrf101
UTD Engine Standard Configuration:

UTD VRF table entries:
VRF: vrf101 (1)
Policy: pol101
Threat Profile: 101
Webfilter Profile: 1
```

Step 22 **show utd engine standard config threat-inspection profile** *profile-name*

Displays the details of a specific threat-inspection profile.

Example:

```
Device# show utd engine standard config threat-inspection profile 101
UTD Engine Standard Configuration:

UTD threat-inspection profile table entries:
Threat profile: 101
Mode: Intrusion Prevention
Policy: Security
Logging level: Debug
Whitelist profile: wh101

Description:
Displays the details of a threat-inspection profile stored in the container.
```

Step 23 **show utd engine standard threat-inspection signature update status**

Shows the output of the current signature package version, previous signature package version, and last status update.

Example:

```
Device# show utd engine standard threat-inspection signature update status
Current signature package version: 29.0.c
Current signature package name: default
Previous signature package version: None
```

```
---------------------------------------
Last update status: Failed
---------------------------------------
Last successful update time: None
Last successful update method: None
Last successful update server: None
Last successful update speed: None
---------------------------------------
Last failed update time: Thu Jan 11 13:34:36 2018 PST
Last failed update method: Manual
Last failed update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
Last failed update reason: [Errno 113] No route to host
---------------------------------------
Last attempted update time: Thu Jan 11 13:34:36 2018 PST
Last attempted update method: Manual
Last attempted update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
---------------------------------------
Total num of updates successful: 0
Num of attempts successful: 0
Num of attempts failed: 1
Total num of attempts: 1
---------------------------------------
Next update scheduled at: None
---------------------------------------
Current status: Idle
```

Step 24 **show platform software qfp active feature utd config** [**vrf**[{**id** *vrf-id* | **name** *vrf-name* | **global** }]

Shows the service node statistics. The VRF information can only be shown in the case of multi-tenancy. Displays the data plane UTD configuration. In the following example the security context information is highlighted.

Example:

```
Device# Global configuration
  NAT64: disabled
  SN threads: 12
  CFT inst_id 0 feat id 0 fo id 0 chunk id 4
  Context Id: 0, Name: Base Security Ctx
   Ctx Flags: (0xf0000)
        Engine: Standard
        SN Redirect Mode : Fail-close, Divert
        Threat-inspection: Enabled, Mode: IPS
        Domain Filtering : Not Enabled
        URL Filtering    : Not Enabled
   SN Health: Green
```

Step 25 **show platform software utd interfaces**

Example:

```
Device# show platform software utd interfaces

UTD interfaces
All dataplane interfaces
```

Step 26 **show platform hardware qfp active feature utd config** [**vrf** {**id** *vrf-id* | **name** *vrf-name* | **global** }]

Show UTD datapath configuration and status.

Example:

```
Device# show platform hardware qfp active feature utd config vrf name vrf101
Global configuration
  NAT64: disabled
  Drop pkts: disabled
  Multi-tenancy: enabled
  Data plane initialized: yes
  SN threads: 12
  CFT inst_id 0 feat id 1 fo id 1 chunk id 8
  SN Health: Green
```

Step 27 **show platform hardware qfp active feature utd stats** [**clear** | **divert** | **drop** | **general** | **summary**] [**vrf** {**id** *vrf-id* | **name** *vrf-name* | **global** }] [all] [**verbose**]

Displays dataplane UTD statistics, including counts of zeros

clear—Clear Statistics

divert—Display AppNav Redirect Statistics

drop—Display Drop Statistics

general—Display General Statistics

summary—Display Summary Statistics

verbose—Display Verbose Statistics

vrf Display per VRF stats—The VRF information can only be entered if multi-tenancy is enabled.

id—display stats associated with the VRF id

name—display stats associated with the VRF with the provided name

global—display the stats associated with the global VRF (i.e vrf-id 0)

Example:

```
Device# show platform hardware qfp active feature utd stats

Summary Statistics:
TCP Connections Created 29893
UDP Connections Created 24402
ICMP Connections Created 796
Pkts dropped pkt 258
byt 66365
Pkts entered policy feature pkt 715602
byt 562095214
Pkts entered divert feature pkt 662014
byt 516226302
Pkts slow path pkt 55091
byt 4347864
Pkts Diverted pkt 662014
byt 516226302
Pkts Re-injected pkt 659094
byt 514305557

Would-Drop Statistics:

Service Node flagged flow for dropping 258

General Statistics:
Non Diverted Pkts to/from divert interface 1022186
Inspection skipped - UTD policy not applicable 1081563
```

```
<output removed for brevity>
```

Example:

Step 28 **show platform hardware qfp active feature utd stats summary** [**vrf name** *vrf-name* | **all**]

Displays information about all VRFs or a specific VRF, taken from the summary option of the **show platform hardware qfp active feature utd stats** command.

Example:

```
Device# show platform hardware qfp active feature utd stats vrf name vrf101
Security Context: Id:1 Name: 1 : vrf101

Summary Statistics:
TCP Connections Created 18428
UDP Connections Created 13737
ICMP Connections Created 503
Pkts dropped pkt 258
byt 66365
Pkts entered policy feature pkt 407148
byt 296496913
Pkts entered divert feature pkt 383176
byt 283158966
Pkts slow path pkt 32668
byt 2571632
Pkts Diverted pkt 383176
byt 283158966
Pkts Re-injected pkt 381016
byt 281761395

<output removed for brevity>
```

Step 29 **show platform hardware qfp active feature utd stats drop all**

Displays information from all the VRFs taken from the drop option of the **show platform** command.

Example:

```
Device# show platform hardware qfp active feature utd stats drop all

Would-Drop Statistics:

No diversion interface                                          0
No egress interface                                             0
Inspection service down                                         0
Could not find divert interface                                 0
Could not find divert fib                                       0
UTD FIB did not contain oce_chain                               0
Invalid IP version                                              0
IPS not supported                                               0
Re-inject Error                                                 0
Service Node flagged flow for dropping                       1225
Could not attach feature object                                 0
Could not allocate feature object                               0
Error getting feature object                                    0
Policy: could not create connection                             0
NAT64 Interface Look up Failed                                  0
Decaps: VPATH connection establishment error                    0
Decaps: VPATH could not find flow, no tuple                     0
Decaps: VPATH notification event error                          0
Decaps: Could not delete flow                                   0
Decaps: VPATH connection classification error                   0
```

```
Encaps: Error retrieving feature object                                  0
Encaps: Flow not classified                                              0
Encaps: VPATH connection specification error                             0
Encaps: VPATH First packet meta-data failed                              0
Encaps: VPATH No memory for meta-data                                    0
Encaps: VPATH Could not add TLV                                          0
Encaps: VPATH Could not fit TLV into memory                              0
Service Node Divert Failed                                               0
No feature object                                                        0
Service Node not healthy                                               123
Could not allocate VRF meta-data                                         0
Could not allocate debug meta-data                                       0
Packet was virtually fragmented (VFR)                                    0
IPv6 Fragment                                                            0
IPv4 Fragment                                                            0
```

Troubleshooting Multi-Tenancy for Unified Threat Defense

Traffic is not Diverted

Problem Traffic is not diverted.

Possible Cause Vitual-service may not be activated.

Solution Check whether the virtual-service is activated by using the **show virtual-service list** command. The following is sample output from the command:

```
Device# show virtual-service list

Virtual Service List:

Name Status Package Name
--------------------------------------------------------------------------------
snort Activated utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
```

Possible Cause Unified threat defense (UTD) may not be enabled for specified interface or interfaces.

Solution Use the **show platform software utd global** command to verify if UTD is enabled for the interface:

```
Device# show platform software utd global

UTD Global state
Engine               : Standard
Global Inspection    : Disabled
Operational Mode     : Intrusion Prevention
Fail Policy          : Fail-open
Container techonlogy : LXC
Redirect interface   : VirtualPortGroup1
UTD interfaces
GigabitEthernet0/0/0
```

Possible Cause The service node may not be working properly.

Solution Use the **show platform hardware qfp active feature utd config** command to verify if the health of the service node is green:

```
Device# show platform hardware qfp active feature utd config

Global configuration
NAT64: disabled
SN threads: 12
CFT inst_id 0 feat id 0 fo id 0 chunk id 4
Context Id: 0, Name: Base Security Ctx
Ctx Flags: (0x60000)
Engine: Standard
SN Redirect Mode : Fail-open, Divert
Threat-inspection: Enabled, Mode: IDS
Domain Filtering : Not Enabled
URL Filtering : Not Enabled
SN Health: Green
```

Solution Alternatively, in the case of multi-tenancy, you can use the **show platform hardware qfp active feature utd config vrf name** *vrf-name* command to verify if the health of the service node, for a specific VRF, is green:

```
Device# show platform hardware qfp active feature utd config vrf name vrf102
Global configuration
  NAT64: disabled
  Drop pkts: disabled
  Multi-tenancy: enabled
  Data plane initialized: yes
  SN threads: 12
  CFT inst_id 0 feat id 0 fo id 0 chunk id 4
  SN Health: Green
```

Possible Cause The Snort process may not be activated.

Solution Use the **show virtual-service detail** command to verify if the Snort process is up and running:

```
Device# show virtual-service detail

Virtual service UTDIPS detail
  State                : Activated
  Owner                : IOSd
  Package information
    Name               : utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
    Path               : bootflash:/utdsnort.1_0_1_SV2982_XE_16_3.20160701_131509.ova
    Application
      Name             : UTD-Snort-Feature
      Installed version : 1.0.1_SV2982_XE_16_3
      Description      : Unified Threat Defense
    Signing
      Key type         : Cisco development key
      Method           : SHA-1

```

Possible Cause The AppNav tunnel may not be activated.

Solution Use the **show service-insertion type utd service-node-group** and **show service-insertion type utd service-context** commands to verify if the AppNav tunnel is activated.

Solution The following is sample output from the **show service-insertion type utd service-node-group** command:

```
Device# show service-insertion type utd service-node-group

Service Node Group name : utd_sng_1
Service Context : utd/1
Member Service Node count : 1

Service Node (SN) : 30.30.30.2
Auto discovered : No
SN belongs to SNG : utd_sng_1
Current status of SN : Alive
Time current status was reached : Tue Jul 26 11:57:48 2016

Cluster protocol VPATH version : 1
Cluster protocol incarnation number : 1
Cluster protocol last sent sequence number : 1469514497
Cluster protocol last received sequence number: 1464
Cluster protocol last received ack number : 1469514496
```

Solution The following is sample output from the **show service-insertion type utd service-context** command:

```
Device# show service-insertion type utd service-context

Service Context : utd/1
Cluster protocol VPATH version : 1
Time service context was enabled : Tue Jul 26 11:57:47 2016
Current FSM state : Operational
Time FSM entered current state : Tue Jul 26 11:57:58 2016
Last FSM state : Converging
Time FSM entered last state : Tue Jul 26 11:57:47 2016
Cluster operational state : Operational

Stable AppNav controller View:
30.30.30.1

Stable SN View:
30.30.30.2

Current AppNav Controller View:
30.30.30.1

Current SN View:
30.30.30.2
```

Possible Cause Check data plane UTD statistics for the status of the traffic. If the traffic is not diverted, the number of packets diverted and rejected will be zero. If the numbers are nonzero, then traffic diversion is happening, and the Snort sensor is resending packets back to the dataplane.

Solution Use the **show platform hardware qfp active feature utd stats** command to verify the status of the traffic.

```
Device# show platform hardware qfp active feature utd stats

Security Context:    Id:0    Name: Base Security Ctx

Summary Statistics:
Active Connections                                              29

                                                     byt             45391747
Pkts Diverted                                        pkt              3224752
                                                     byt            249103697
Pkts Re-injected                                     pkt              3224746
                                                     byt            249103373
….
```

Solution Alternatively, in the case of multi-tenancy, you can use the **show platform hardware qfp active feature utd stats vrf name** *vrf-name* command to verify the status of the traffic, for a specific VRF.

```
Device# show platform hardware qfp active feature utd stats vrf name vrf 101

Security Context:    Id:1    Name: 1 : vrf101

Summary Statistics:
Active Connections                                                      2

….
```

Signature Update is not Working

Problem Signature update from Cisco Borderless Software Distribution (BSD) server is not working.

Possible Cause Signature update may have failed due to various reasons. Check for the reason for the last failure to update the signatures.

Solution Use the **show utd engine standard threat-inspection signature update status** command to display the reason for the last failure to update the signatures:

```
Device# show utd eng standard threat-inspection signature update status
Current signature package version: 29.0.c
Current signature package name: default
Previous signature package version: None
----------------------------------------
Last update status: Failed
----------------------------------------
Last successful update time: None
Last successful update method: None
Last successful update server: None
Last successful update speed: None
```

```
---------------------------------------
Last failed update time: Thu Jan 11 13:34:36 2018 PST
Last failed update method: Manual
Last failed update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
Last failed update reason: [Errno 113] No route to host
---------------------------------------
Last attempted update time: Thu Jan 11 13:34:36 2018 PST
Last attempted update method: Manual
Last attempted update server: http://172.27.57.252/UTD-STD-SIGNATURE-2983-1-S.pkg
---------------------------------------
Total num of updates successful: 0
Num of attempts successful: 0
Num of attempts failed: 1
Total num of attempts: 1
---------------------------------------
Next update scheduled at: None
---------------------------------------
Current status: Idle
```

Possible Cause Domain Name System (DNS) is not configured correctly.

Solution Use the **show running-config | i name-server** command to display the name server details:

```
Device#  show run | i name-server

ip name-server 10.104.49.223
```

Possible Cause System error—Failed to process the username and password combination.

Solution Ensure that you have provided the correct credentials for signature package download.

Signature Update from the Local Server is not Working

Problem Signature update from the local server not working.

Possible Cause Last failure Reason: Invalid scheme—only HTTP/HTTPS supported.

Solution Ensure that you have provided the HTTP or secure HTTP (HTTPS) as the local download method.

Possible Cause Last failure Reason: Name or service not known.

Solution Ensure that the hostname or IP address provided for the local server is correct.

Possible Cause Last failure Reason: Credentials not supplied.

Solution Ensure that you have provided the credentials for local HTTP/HTTPS server.

Possible Cause Last failure Reason: File not found.

Solution Ensure that the signature file name or URL that you have provided is correct.

Possible Cause Last failure Reason: Download corrupted.

Solution

- Verify whether the retry signature update is corrupted as the previous signature download.
- Ensure that the correct signature package is available.

Logging to IOSd Syslog is not Working

Problem Logging to IOSd syslog is not working.

Possible Cause Logging to syslog may not be configured in the unified threat defense (UTD) configuration.

Solution Use the **show utd engine standard config** command to display the UTD configuration and to ensure that logging to syslog is configured.

```
Device# show utd engine standard config

UTD Engine Standard Configutation:
  Operation Mode : Intrusion Prevention
  Policy         : Security

Signature Update:
  Server    : cisco
  User Name : ccouser
  Password  : YEX^SH\fhdOeEGaOBIQAIcOVLgaVGf
  Occurs-at : weekly ;  Days:0 ; Hour: 23; Minute: 50

Logging:
  Server    :   IOS Syslog; 10.104.49.223
  Level     : debug

Whitelist Signature IDs:
  28878
```

Solution Use the following **show utd engine standard logging events** command to display the event logs for the UTD engine.

```
Device# show utd engine standard logging events

2016/06/13-14:32:09.524475 IST [**] [Instance_ID: 1] [**] Drop [**] [1:30561:1]
BLACKLIST DNS request for known malware domain domai.ddns2.biz -
Win.Trojan.Beebone [**] [Classification: A Network Trojan was Detected]
[Priority: 1] [VRF_ID: 2] {UDP} 11.1.1.10:58016 -> 21.1.1.10:53
2016/06/13-14:32:21.524988 IST [**] [Instance_ID: 1] [**] Drop [**] [1:30561:1]
BLACKLIST DNS request for known malware domain domai.ddns2.biz -
Win.Trojan.Beebone [**] [Classification: A Network Trojan was Detected] [Priority: 1]
[VRF_ID: 2] {UDP} a000:0:0:0:0:0:0:10:59964 -> b000:0:0:0:0:0:0:10:53
```

Logging to an External Server is not Working

Problem Logging to an external server is not working.

Possible Cause Syslog may not be running on the external server.

Solution Verify whether syslog server is running on the external server. Configure the following command on the external server to view its status:

```
ps -eaf | grep syslog

 root 2073 1 0 Apr12 ? 00:00:02 syslogd -r -m
```

Possible Cause Connectivity between unified threat defense (UTD) Linux Container (LXC) and external server may be lost.

Solution Verify the connectivity from the management interface to the external syslog server.

UTD Conditional Debugging

Conditional debugging is supported by multi-tenancy for Unified Threat Defense. For further details about how to configure conditional debugging, see:

http://www.cisco.com/c/en/us/td/docs/routers/asr1000/troubleshooting/guide/Tbls hooting-xe-3s-asr-1000-book.html#task_AC969BB06B414DCBBDEF7ADD29EF8131

PART XV

Umbrella

CHAPTER 167

Cisco Umbrella Integration

The Cisco Umbrella Integration feature enables cloud-based security service by inspecting the Domain Name System (DNS) query that is sent to the DNS server through the device. The security administrator configures policies on the Cisco Umbrella portal to either allow or deny traffic towards the fully qualified domain name (FQDN). Cisco device acts as a DNS forwarder on the network edge, transparently intercepts DNS traffic, and forwards the DNS queries to the Cisco Umbrella portal. This feature is available on Cisco IOS XE Denali 16.3 and later releases.

Restrictions for Cisco Umbrella Integration

- If an application or host uses IP address directly instead of DNS to query domain names, policy enforcement is not applied.
- When the client is connected to a web proxy, the DNS query does not pass through the Cisco device. In this case, the connector does not detect any DNS request and the connection to the web server bypasses any policy from the Cisco Umbrella portal.
- When the Cisco Umbrella Integration policy blocks a DNS query, the client is redirected to a Cisco Umbrella block page. HTTPS servers provide these block pages and the IP address range of these block pages is defined by the Cisco Umbrella portal.

- User authentication and identity is not supported in this release.
- The type A, AAAA, and TXT queries are the only records that are redirected. Other types of query bypasses the connector. Cisco Umbrella Connector maintains a list of IP address that is known for malicious traffic. When the Cisco Umbrella roaming client detects the destination of packets to those addresses, it forwards those addresses to Cisco Umbrella cloud for further inspection.
- Only the IPv4 address of the host is conveyed in the EDNS option.
- A maximum of 64 local domains can be configured, and the allowed domain name length is 100 characters.

Prerequisites for Cisco Umbrella Integration

Before you configure the Cisco Umbrella Integration feature, ensure that the following are met:

- The device has a security K9 license to enable Cisco Umbrella Integration.
- The device runs the Cisco IOS XE Denali 16.3 software image or later.
- Cisco Umbrella subscription license is available.
- The device is set as the default DNS server gateway and needs to ensure that the DNS traffic goes through the Cisco device.
- Communication for device registration to the Cisco Umbrella server is via HTTPS. This requires a root certificate to be installed on the router. To download this certificate directly from a link instead of pasting it in, you can find the certificate here: https://cacerts.digicert.com/DigiCertGlobalRootCA.crt.pem

Cloud-based Security Service Using Cisco Umbrella Integration

The Cisco Umbrella Integration feature provides cloud-based security service by inspecting the DNS query that is sent to the DNS server through the device. When a host initiates the traffic and sends a DNS query, the Cisco Umbrella Connector in the device intercepts and inspects the DNS query. If the DNS query is for a local domain, it forwards the query without changing the DNS packet to the DNS server in the enterprise network. If it is for an external domain, it adds an Extended DNS (EDNS) record to the query and sends it to Cisco Umbrella Resolver. An EDNS record includes the device identifier information, organization ID and client IP. Based on this information, Cisco Umbrella Cloud applies different policies to the DNS query.

Encrypting the DNS Packet

The DNS packet sent from the Cisco device to Cisco Umbrella Integration server must be encrypted if the EDNS information in the packet contains information such as user IDs, internal network IP addresses, and so on. When the DNS response is sent back from the DNS server, device decrypts the packet and forwards it to the host.

You can encrypt DNS packets only when the DNScrypt feature is enabled on the Cisco device.

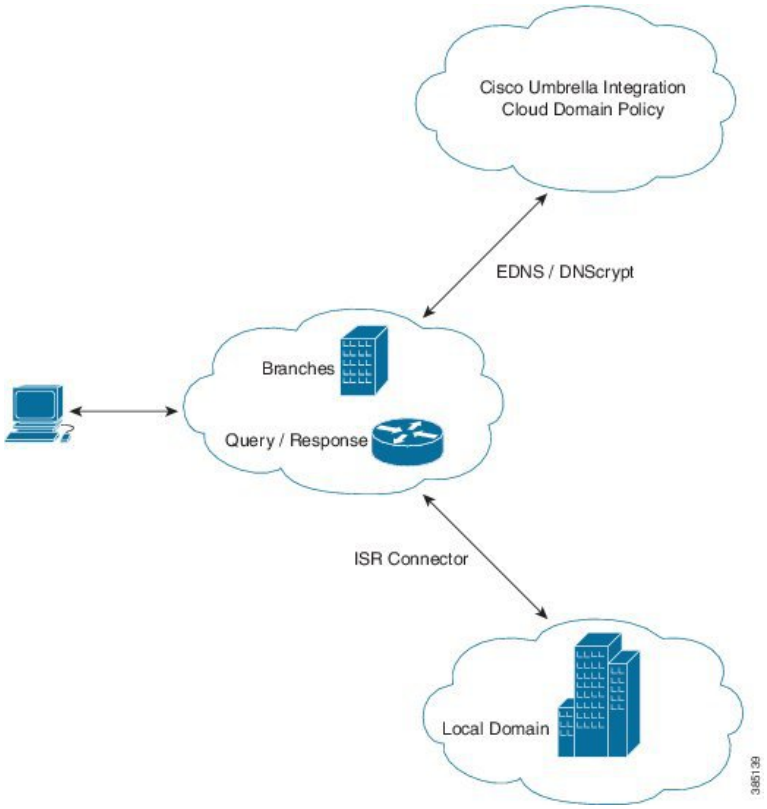
The Cisco device uses the following Anycast recursive Cisco Umbrella Integration servers:

- 208.67.222.222

- 208.67.220.220
- 2620:119:53::53
- 2620:119:35::35

The Figure 1 describes the Cisco Umbrella Integration topology.

Figure 88: Cisco Umbrella Integration Topology



Benefits of Cisco Umbrella Integration

Cisco Umbrella Integration provides security and policy enforcement at DNS level. It enables the administrator to split the DNS traffic and directly send some of the desired DNS traffic to a specific DNS server (DNS server located within the enterprise network). This helps the administrator to bypass the Cisco Umbrella Integration.

Configure the Cisco Umbrella Connector

To configure Cisco Umbrella Connector:

- Get the API token from the Cisco Umbrella registration server.

- Have the root certificate establish the HTTPS connection with the Cisco Umbrella registration server. Import the root certificate of DigiCert given below into the device using the **crypto pki trustpool import terminal** command.

```

-----END CERTIFICATE-----
```

- Verify that the PEM import is successful. A message is displayed after importing the certificate.

This is the sample configuration:

```
enable
configure terminal
parameter-map type umbrella global
 token AABBA59A0BDE1485C912AFE472952641001EEECC

exit
```

Registering the Cisco Umbrella Tag

To register the Cisco Umbrella tag, perform these steps:

1. Configure the umbrella parameter map as shown in the previous section.
2. Configure **umbrella out** on the WAN interface:

```
interface gigabitEthernet 0/0/1
 umbrella out
```

3. Configure **umbrella in** on the LAN interface:

```
interface gigabitEthernet 0/0/0.4
 umbrella in mydevice_tag
```

Note For the Cisco devices, the length of the hostname and umbrella tag should not exceed 49 characters.

4. After you configure **umbrella in** with a tag using the **umbrella in mydevice_tag** command, the device registers the tag to the Cisco Umbrella Integration portal.
5. The device initiates the registration process by resolving *api.opendns.com*. You need to have a name server (*ip name-server x.x.x.x*) and domain lookup (*ip domain-lookup*) configured on the device to successfully resolve the FQDN.

Note You should configure the **umbrella out** command before you configure **umbrella in** command. Registration is successful only when the port 443 is in *open* state and allows the traffic to pass through the existing firewall.

Configuring Cisco Device as a Pass-through Server

You can identify the traffic to be bypassed using domain names. In the Cisco device, you can define these domains in the form of regular expressions. If the DNS query that is intercepted by the device matches one of the configured regular expressions, then the query is bypassed to the specified DNS server without redirecting to the Cisco Umbrella cloud. This sample configuration shows how to define a regex parameter-map with a desired domain name and regular expressions:

```
Device# configure terminal
Device(config)# parameter-map type regex dns_bypass
Device(config)# pattern www.fisco.com
Device(config)# pattern .*engineering.fisco.*

Attach the regex param-map with the openDNS global configuration as shown below:

Device(config)# parameter-map type umbrella global
Device(config-profile)# token AADDD5FF6E510B28921A20C9B98EEEFF
Device(config-profile)# local-domain dns_bypass
```

DNSCrypt, Resolver, and Public-key

- DNSCrypt
- Resover IP
- Public-Key

We recommend that you change the above parameters only when you perform certain tests in the lab. These parameters are reserved for future use. If you modify these parameters, it can affect the normal functioning of the device.

Resolver

The following commands change the redirection of DNS packets from the Cisco device to Cisco Umbrella cloud:

- **resolver ipv4** *1.1.1.1*
- **resolver ipv4** *1.1.1.2*

- **resolver ipv6** *1234::1*
- **resolver ipv6** *2345::1*

In this example, all the IPv4 DNS packets are redirected to 1.1.1.1 or 1.1.1.2 and IPv6 DNS packets are redirected to 1234::1 or 2345::1. You should remove the IP address to restore to the default values of the resolver. When you modify a resolver IP address, the following message is displayed:

```
User configured would overwrite defaults
Defaults are restored when no more user configured are present
```

With the default values of **208.67.222.222** and **208.67.220.220**, all DNS packets are redirected to Cisco Umbrella Anycast resolvers. The device uses the first default resolver IP address for all its redirection. When the Cisco device does not receive a response for three consecutive DNS queries, the device automatically switches to a different resolver IP address. This behavior remains the same for IPv6 resolver addresses.

Note IPv6 redirection is deferred and all IPV6 DNS packets are not redirected to Cisco Umbrella Anycast servers.

Public-key

Public-key is used to download the DNSCrypt certificate from Cisco Umbrella Integration cloud. This value is preconfigured to **B735:1140:206F:225D:3E2B:D822:D7FD:691E:A1C3:3CC8:D666:8D0C:BE04:BFAB:CA43:FB79** which is the public-key of Cisco Umbrella Integration Anycast servers. If there is a change in the public-key and if you modify this command, then you have to remove the modified command to restore the default value. If you modify the value, the DNSCrypt certificate download may fail.

DNSCrypt

To disable DNSCrypt, use the **no dnscrypt** command and to re-enable DNSCrypt, use the **dnscrypt** command.

When the DNSCrypt is used, the DNS request packets size is more than 512 bytes. Ensure that these packets are allowed through the intermediary devices; otherwise, the response may not reach the intended recipients.

Verifying the Cisco Umbrella Connector Configuration

Verify the Cisco Umbrella Connector configuration using the following commands:

```
Router# show umbrella config
Umbrella Configuration
==================
   Token:  AAC1A2555C11B2B798FFF3AF27C2FB8F001CB7B2
   OrganizationID: 1882034
   Local Domain Regex parameter-map name: NONE
   DNSCrypt: Enabled
  Public-key: B735:1140:206F:225D:3E2B:D822:D7FD:691E:A1C3:3CC8:D666:8D0C:BE04:BFAB:CA43:FB79

   UDP Timeout: 5 seconds
   Resolver address:
       1. 208.67.220.220
       2. 208.67.222.222
       3. 2620:119:53::53
       4. 2620:119:35::35
```

```
   Umbrella Interface Config:

```

Troubleshooting Cisco Umbrella Integration

Troubleshoot issues that are related to enabling Cisco Umbrella Integration feature using these commands:

- **debug umbrella device-registration**
- **debug umbrella config**
- **debug umbrella dnscrypt**

Depending on the OS, run either of these two commands from the client device:

- The **nslookup -type=txt debug.umbrella.com** command from the command prompt of the Windows machine
- The **nslookup -type=txt debug.umbrella.com** command from the terminal window or shell of the Linux machine

```
nslookup -type=txt debug.opendns.com 8.8.8.8
Server: 8.8.8.8
Address: 8.8.8.8#53
Non-authoritative answer:
debug.opendns.com text = "server r6.mum1"
debug.opendns.com text = "device 010A826AAABB6C3D"
debug.opendns.com text = "organization id 1892929"
debug.opendns.com text = "remoteip 171.168.1.7"
debug.opendns.com text = "flags 436 0 6040 39FF000000000000000"
debug.opendns.com text = "originid 119211936"
debug.opendns.com text = "orgid 1892929"
debug.opendns.com text = "orgflags 3"
debug.opendns.com text = "actype 0"
debug.opendns.com text = "bundle 365396"
debug.opendns.com text = "source 72.163.220.18:36914"
debug.opendns.com text = "dnscrypt enabled (713156774457306E)"
```

Configuration Examples

This example shows how to enable Cisco Umbrella Integration:

Deploying Cisco Umbrella Integration Using Cisco Prime CLI Templates

You can use the Cisco Prime CLI templates to provision the Cisco Umbrella Integration deployment. The Cisco Prime CLI templates make provisioning Cisco Umbrella Integration deployment simple.

Note The Cisco Prime CLI templates is supported only on Cisco Prime version 3.1 or later.

To use the Cisco Prime CLI templates to provision the Cisco Umbrella Integration deployment, perform these steps:

Step 1 Download the Cisco Prime templates corresponding to the Cisco IOS XE version running on your system.

Step 2 Unzip the file, if it is a zipped version.

Step 3 From Cisco Prime Web UI, choose **Configuration** > **Templates** > **Features and Technologies**, and then select **CLI Templates** (User Defined).

Step 4 Click **Import**.

Step 5 Select the folder where you want to import the templates and click Select Templates and choose the templates that you just downloaded.

Step 6 The following Cisco Umbrella Integration templates are available:

- Umbrella—Use this template to provision Umbrella Connector on the device.
- Umbrella Cleanup—Use this template to remove previously configured Umbrella Connector.

Feature Information for Cisco Umbrella Integration

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 222: Feature Information for Cisco Umbrella Integration

Feature Name	Releases	Feature Information
Cisco Umbrella Integration	Cisco IOS XE Everest Release 16.6.1	The Cisco Umbrella Integration feature enables cloud-based security service by inspecting the DNS query that is sent to any DNS server through Cisco devices. The security administrator configures policies on the Umbrella cloud to either allow or deny traffic towards the fully qualified domain name (FQDN). This feature is supported only on Cisco ISRs.

PART XVI

User Security

CHAPTER 168

Cisco IOS Login Enhancements-Login Block

The Cisco IOS Login Enhancements (Login Block) feature allows users to enhance the security of a router by configuring options to automatically block further login attempts when a possible denial-of-service (DoS) attack is detected.

The login block and login delay options introduced by this feature can be configured for Telnet or SSH virtual connections. By enabling this feature, you can slow down “dictionary attacks” by enforcing a “quiet period” if multiple failed connection attempts are detected, thereby protecting the routing device from a type of denial-of-service attack.

Note Whenever you want to use the AAA "quiet-mode" feature, you have to configure the aaa new-model using the **aaa new-model** command.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Cisco IOS Login Enhancements

Protecting Against Denial of Service and Dictionary Login Attacks

Connecting to a routing device for the purposes of administering (managing) the device, at either the User or Executive level, is most frequently performed using Telnet or SSH (secure shell) from a remote console (such as a PC). SSH provides a more secure connection option because communication traffic between the user's device and the managed device are encrypted. The Login Block capability, when enabled, applies to both Telnet connections and SSH connections.

The automated activation and logging of the Login Block and Quiet Period capabilities introduced by this feature are designed to further enhance the security of your devices by specifically addressing two well known methods that individuals use to attempt to disrupt or compromise networked devices.

If the connection address of a device is discovered and is reachable, a malicious user may attempt to interfere with the normal operations of the device by flooding it with connection requests. This type of attack is referred to as an attempted Denial-of-Service, because it is possible that the device may become too busy trying to process the repeated login connection attempts to properly handle normal routing services or will not be able to provide the normal login service to legitimate system administrators.

The primary intention of a dictionary attack, unlike a typical DoS attack, is to actually gain administrative access to the device. A dictionary attack is an automated process to attempt to login by attempting thousands, or even millions, of username/password combinations. (This type of attack is called a "dictionary attack" because it typically uses, as a start, every word found in a typical dictionary as a possible password.) As scripts or programs are used to attempt this access, the profile for such attempts is typically the same as for DoS attempts; multiple login attempts in a short period of time.

By enabling a detection profile, the routing device can be configured to react to repeated failed login attempts by refusing further connection request (login blocking). This block can be configured for a period of time, called a "quiet period". Legitimate connection attempts can still be permitted during a quiet period by configuring an access-list (ACL) with the addresses that you know to be associated with system administrators.

Login Enhancements Functionality Overview

Delays Between Successive Login Attempts

A Cisco device can accept virtual connections as fast as they can be processed. Introducing a delay between login attempts helps to protect the Cisco device against malicious login connections such as dictionary attacks and DoS attacks. Delays can be enabled in one of the following ways:

- Via the **auto secure** command. If you enable the AutoSecure feature, the default login delay time of one second is automatically enforced.
- Via the **login block-for** command. You must enter this command before issuing the **login delay** command. If you enter only the **login block-for** command, the default login delay time of one second is automatically enforced.
- Via the new global configuration mode command, **login delay**, which allows you to specify a the login delay time to be enforced, in seconds.

Login Shutdown If DoS Attacks Are Suspected

If the configured number of connection attempts fail within a specified time period, the Cisco device will not accept any additional connections for a "quiet period." (Hosts that are permitted by a predefined access-control list [ACL] are excluded from the quiet period.)

The number of failed connection attempts that trigger the quiet period can be specified via the new global configuration mode command **login block-for**. The predefined ACL that is excluded from the quiet period can be specified via the new global configuration mode command **login quiet-mode access-class**.

This functionality is disabled by default, and it is not enabled if autosecure if enabled.

How to Configure Cisco IOS Login Enhancements

Configuring Login Parameters

Use this task to configure your Cisco device for login parameters that help detect suspected DoS attacks and slow down dictionary attacks.

All login parameters are disabled by default. You must issue the **login block-for** command, which enables default login functionality, before using any other login commands. After the **login block-for** command is enabled, the following defaults are enforced:

- A default login delay of one second
- All login attempts made via Telnet or SSH are denied during the quiet period; that is, no ACLs are exempt from the login period until the **login quiet-mode access-class** command is issued.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **login block-for** *seconds* **attempts** *tries* **within** *seconds*
5. **login quiet-mode access-class** {*acl-name* | *acl-number*}
6. **login delay** *seconds*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**aaa new-model** **Example:** `Router(config)# aaa new-model`	Enables the authentication, authorization, and accounting (AAA) access control model.
Step 4	**login block-for** *seconds* **attempts** *tries* **within** *seconds* **Example:** `Router(config)# login block-for 100 attempts 2 within 100`	Configures your Cisco IOS XE device for login parameters that help provide DoS detection. **Note** This command must be issued before any other login command can be used.

Step 5	**login quiet-mode access-class** {*acl-name* | *acl-number*}
	Example:
	`Router(config)# login quiet-mode access-class myacl`
		(Optional) Although this command is optional, it is recommended that it be configured to specify an ACL that is to be applied to the router when the router switches to quiet mode. When the router is in quiet mode, all login requests are deniedand the only available connection is through the console.
		If this command is not configured, then the default ACL **sl_def_acl** is created on the router. This ACL is hidden in the running configuration. Use the **show access-list sl_def_acl** to view the parameters for the default ACL.
		For example:
		`Router#show access-lists sl_def_acl`
		`Extended IP access list sl_def_acl`
		`10 deny tcp any any eq telnet`
		`20 deny tcp any any eq www`
		`30 deny tcp any any eq 22`
		`40 permit ip any any`

Step 6	**login delay** *seconds* **Example:** `Router(config)# login delay 10`	(Optional) Configures a delay between successive login attempts.

What to Do Next

After you have configured login parameters on your router, you may wish to verify the settings. To complete this task, see the following section "Verifying Login Parameters, on page 2189."

Verifying Login Parameters

Use this task to verify the applied login configuration and present login status on your router.

SUMMARY STEPS

1. **enable**
2. **show login failures**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**show login failures** **Example:** `Router# show login`	Displays login parameters. • **failures** --Displays information related only to failed login attempts.

Examples

The following sample output from the **show login** command verifies that no login parameters have been specified:

```
Router# show login
No login delay has been applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps
Router NOT enabled to watch for login Attacks
```

The following sample output from the **show login** command verifies that the **login block-for**command is issued. In this example, the command is configured to block login hosts for 100 seconds if 16 or more login requests fail within 100 seconds; five login requests have already failed.

```
Router# show login
A default login delay of 1 seconds is applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps.
Router enabled to watch for login Attacks.
If more than 15 login failures occur in 100 seconds or less, logins will be disabled for
100 seconds.
Router presently in Watch-Mode, will remain in Watch-Mode for 95 seconds.
Present login failure count 5.
```

The following sample output from the **show login** command verifies that the router is in quiet mode. In this example, the **login block-for** command was configured to block login hosts for 100 seconds if 3 or more login requests fail within 100 seconds.

```
Router# show login
A default login delay of 1 seconds is applied.
No Quiet-Mode access list has been configured.
All successful login is logged and generate SNMP traps.
All failed login is logged and generate SNMP traps.
Router enabled to watch for login Attacks.
If more than 2 login failures occur in 100 seconds or less, logins will be disabled for 100
 seconds.
Router presently in Quiet-Mode, will remain in Quiet-Mode for 93 seconds.
Denying logins from all sources.
```

The following sample output from **show login failures** command shows all failed login attempts on the router:

```
Router# show login failures
Information about login failure's with the device
Username      Source IPAddr  lPort Count  TimeStamp
try1          10.1.1.1        23    1     21:52:49 UTC Sun Mar 9 2003
try2          10.1.1.2        23    1     21:52:52 UTC Sun Mar 9 2003
```

The following sample output from **show login failures** command verifies that no information is presently logged:

```
Router# show login failures
*** No logged failed login attempts with the device.***
```

Configuration Examples for Login Parameters

Setting Login Parameters Example

The following example shows how to configure your router to enter a 100 second quiet period if 15 failed login attempts is exceeded within 100 seconds; all login requests will be denied during the quiet period except hosts from the ACL “myacl.”

```
Router(config)# aaa new-model
Router(config)# login block-for 100 attempts 15 within 100
Router(config)# login quiet-mode access-class myacl
```

Feature Information for Cisco IOS Login Enhancements-Login Block

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 223: Feature Information for Cisco IOS Login Enhancements (Login Block)

Feature Name	Releases	Feature Configuration Information
Cisco IOS Login Enhancements	Cisco IOS XE Release 2.1	The Cisco IOS Login Enhancements (Login Block) feature allows users to enhance the security of a router by configuring options to automatically block further login attempts when a possible denial-of-service (DoS) attack is detected. In Cisco IOS XE Release 2.1, this feature was introduced on Cisco ASR 1000 Series Service Aggregation Routers. The following commands were modified by this feature: **login block-for**, **login delay**, **login quiet-mode access-class**, **show login**.

CHAPTER 169

Configuring Security with Passwords, Privileges, and Logins

Cisco IOS based networking devices provide several features that can be used to implement basic security for CLI sessions using only the operating system running on the device. These features include the following:

- Different levels of authorization for CLI sessions to control access to commands that can modify the status of the networking device versus commands that are used to monitor the device
- Assigning passwords to CLI sessions
- Requiring users log in to a networking device with a username
- Changing the privilege levels of commands to create new authorization levels for CLI sessions

This module is a guide to implementing a baseline level of security for your networking devices. It focuses on the least complex options available for implementing a baseline level of security. If you have networking devices installed in your network with no security options configured, or you are about to install a networking device and you need help understanding the how to implement a baseline of security, this document will help you.

Restrictions for Configuring Security with Passwords, Privileges, and Logins

Your networking device must not be configured to use any local or remote authentication, authorization, and accounting (AAA) security features. This document describes only the non-AAA security features that can be configured locally on the networking device.

For information how to configure AAA security features that can be run locally on a networking device, or for information on how to configure remote AAA security using TACACS+ or RADIUS servers, see the *Securing User Services Configuration Guide Library*.

Restrictions and Guidelines for Reversible Password Types

- Password type 0 and type 7 are deprecated. So password type 0 and type 7, used for administrator login to Console, Telnet, SSH, webUI, and NETCONF, must be migrated to password type 8 or type 9.
- No action is required if username and password are type 0 and type 7 for local authentication such as CHAP, EAP and so on for ISG and Dot1x.
- Enable password type 0 and type 7 must be migrated to password type 8 or type 9.

Restrictions and Guidelines for Irreversible Password Types

- Password type 5 is deprecated. Password type 5 must be migrated to stronger password type 8 or type 9.
- For username secret password type 5 and for enable secret password type 5, migrate to type 8 or type 9.
- Secret password type 4 is not supported.

Information About Configuring Security with Passwords, Privileges, and Logins

Benefits of Creating a Security Scheme

The foundation of a good security scheme in the network is the protection of the user interfaces of the networking devices from unauthorized access. Protecting access to the user interfaces on your networking devices prevents unauthorized users from making configuration changes that can disrupt the stability of your network or compromise your network security.

The Cisco IOS XE features described in this document can be combined in many different ways to create a unique security scheme for each of your networking devices. Here are some possible examples that you can configure:

- You can enable non administrative users to run a subset of the administrative commands available on the networking device by lowering the entitlement level for the commands to the non administrative privilege level. This can be useful for the following scenarios:
  - ISPs that want their first-line technical support staff to perform tasks such as enabling new interfaces for new customers or resetting the connection for a customer whose connection has stopped passing traffic. See the Example: Configuring a Device to Allow Users to Shutdown and Enable Interfaces, on page 2229 section for an example of how to do this.
  - When you want your first-line technical support staff to have the ability to clear console port sessions that were disconnected improperly from a terminal server. See the Example: Configuring a Device to Allow Users to Clear Remote Sessions, on page 2226 section for an example of how to do this.

- When you want your first-line technical support staff to have the ability to view, but not change, the configuration of a networking device to facilitate troubleshooting a networking problem. See the Example: Configuring a Device to Allow Users to View the Running Configuration, on page 2227 section for an example of how to do this.

Cisco IOS XE CLI Modes

To aid in the configuration of Cisco devices, the Cisco IOS XE command-line interface is divided into different command modes. Each command mode has its own set of commands available for the configuration, maintenance, and monitoring of router and network operations. The commands available to you at any given time depend on the mode you are in. Entering a question mark(**?**) at the system prompt (device prompt) allows you to obtain a list of commands available for each command mode.

The use of specific commands allows you to navigate from one command mode to another. The standard order in which a user would access the modes is as follows: user EXEC mode; privileged EXEC mode; global configuration mode; specific configuration modes; configuration submodes; and configuration subsubmodes.

Note The default configuration of a Cisco IOS XE software based networking device only allows you to configure passwords to protect access to user EXEC mode (for local, and remote CLI sessions) and privileged EXEC mode. This document describes how you can provide additional levels of security by protecting access to other modes, and commands, using a combination of usernames, passwords and the **privilege** command.

Most EXEC mode commands are one-time commands, such as **show** or **more** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. EXEC mode commands are not saved across reboots of the router.

From privileged EXEC mode, you can enter *global configuration mode* . In this mode, you can enter commands that configure general system characteristics. You also can use global configuration mode to enter specific configuration modes. Configuration modes, including global configuration mode, allow you to make changes to the running configuration. If you later save the configuration, these commands are stored across router reboots.

From global configuration mode you can enter a variety of protocol-specific or feature-specific configuration modes. The CLI hierarchy requires that you enter these specific configuration modes only through global configuration mode. For example, *interface configuration mode* , is a commonly used configuration mode.

From configuration modes, you can enter configuration submodes. Configuration submodes are used for the configuration of specific features within the scope of a given configuration mode. As an example, this chapter describes the *subinterface configuration mode* , a submode of the interface configuration mode.

ROM monitor mode is a separate mode used when the router cannot boot properly. If your system (router, switch, or access server) does not find a valid system image to load when it is booting, the system will enter ROM monitor mode. ROM monitor (ROMMON) mode can also be accessed by interrupting the boot sequence during startup. ROMMON is not covered in this document because it does not have any security features available in it.

User EXEC Mode

When you start a session on a router, you generally begin in *user EXEC mode* , which is one of two access levels of the EXEC mode. For security purposes, only a limited subset of EXEC commands are available in

user EXEC mode. This level of access is reserved for tasks that do not change the configuration of the router, such as determining the router status.

If your device is configured to require users to log-in the log-in process will require a username and a password. You may try three times to enter a password before the connection attempt is refused.

User EXEC mode is set by default to privilege level 1. Privileged EXEC mode is set by default to privilege level 15. When you are logged into a networking device in user EXEC mode your session is running at privilege level 1. By default the EXEC commands at privilege level 1 are a subset of those available at privilege level 15. When you are logged into a networking device in privileged EXEC mode your session is running at privilege level 15. You can move commands to any privilege level between 1 and 15 using the **privilege** command.

In general, the user EXEC commands allow you to connect to remote devices, change terminal line settings on a temporary basis, perform basic tests, and list system information.

To list the available user EXEC commands, use the following command:

Command	Purpose
`Device(config)#` **?**	Lists the user EXEC mode commands

The user EXEC mode prompt consists of the host name of the device followed by an angle bracket (>), as shown in the following example:

```
Device>
```

The default host name is generally Router, unless it has been changed during initial configuration using the **setup** EXEC command. You also change the host name using the **hostname** global configurationcommand.

Note Examples in Cisco IOS XE documentation assume the use of the default name of "Device." Different devices (for example, access servers) may use a different default name. If the device (router, access server, or switch) has been named with the **hostname** command, that name will appear as the prompt instead of the default name.

To list the commands available in user EXEC mode, enter a question mark (**?**) as shown in the following example:

```
Device> ?

Exec commands:
 <1-99>           Session number to resume
 connect          Open a terminal connection
 disconnect       Disconnect an existing telnet session
 enable           Turn on privileged commands
 exit             Exit from Exec mode
 help             Description of the interactive help system
 lat              Open a lat connection
 lock             Lock the terminal
 login            Log in as a particular user
 logout           Exit from Exec mode and log out
 menu             Start a menu-based user interface
 mbranch          Trace multicast route for branch of tree
 mrbranch         Trace reverse multicast route to branch of tree
```

```
mtrace           Trace multicast route to group
name-connection  Name an existing telnet connection
pad              Open a X.29 PAD connection
ping             Send echo messages
resume           Resume an active telnet connection
show             Show running system information
systat           Display information about terminal lines
telnet           Open a telnet connection
terminal         Set terminal line parameters
tn3270           Open a tn3270 connection
trace            Trace route to destination
where            List active telnet connections
x3               Set X.3 parameters on PAD
```

The list of commands will vary depending on the software feature set and platform you are using.

Note You can enter commands in uppercase, lowercase, or mixed case. Only passwords are case sensitive. However, Cisco IOS XE documentation convention is to always present commands in lowercase.

Privileged EXEC Mode

In order to have access to all commands, you must enter *privileged EXEC mode* , which is the second level of access for the EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. In privileged EXEC mode, you can enter any EXEC command, because privileged EXEC mode is a superset of the user EXEC mode commands.

Because many privileged EXEC mode commands set operating parameters, privileged EXEC level access should be password protected to prevent unauthorized use. The privileged EXEC command set includes those commands contained in user EXEC mode. Privileged EXEC mode also provides access to configuration modes through the **configure**command, and includes advanced testing commands, such as **debug**.

Privileged EXEC mode is set by default to privilege level 15. User EXEC mode is set by default to privilege level 1. For more information see the User EXEC Mode, on page 2195. When you are logged into a networking device in privileged EXEC mode your session is running at privilege level 15. When you are logged into a networking device in user EXEC mode your session is running at privilege level 1. By default the EXEC commands at privilege level 15 are a superset of those available at privilege level 1. You can move commands to any privilege level between 1 and 15 using the **privilege** command. See the Cisco IOS XE Privilege Levels, on page 2204 for more information on privilege levels and the **privilege** command.

The privileged EXEC mode prompt consists of the host name of the device followed by a pound sign(#), as shown in the following example:

```
Device#
```

To access privileged EXEC mode, use the following command:

Command	Purpose

`Device> enable`
 	
`Password`
 	
`Device# exit`
 	
`Device>`
	Enables privileged EXEC mode.
	• If a privileged EXEC mode password has been configured the system will prompt you for a password after you issue the enable command.
	• Use the exit command to leave privileged EXEC mode.

Note Privileged EXEC mode is sometimes referred to as "enable mode," because the **enable** command is used to enter the mode.

If a password has been configured on the system, you will be prompted to enter it before being allowed access to privileged EXEC mode. The password is not displayed on the screen and is case sensitive. If an enable password has not been set, privileged EXEC mode can be accessed only by a local CLI session (terminal connected to the console port).

If you attempt to access privileged EXEC mode on a router over a remote connection, such as a telnet connection, and you have not configured a password for privileged EXEC mode you will see the **% No password set** error message. For more information on remote connections see the Remote CLI Sessions, on page 2201. The system administrator uses the **enable secret** or **enable password**global configuration commands to set the password that restricts access to privileged EXEC mode. For information on configuring a password for privileged EXEC mode, see the Protecting Access to Privileged EXEC Mode, on page 2210.

To return to user EXEC mode, use the following command:

Command	Purpose
`Device# disable`	Exits from privileged EXEC mode to user EXEC mode.

The following example shows the process of accessing privileged EXEC mode:

```
Device> enable
Password:<letmein>
Device#
```

Note that the password will not be displayed as you type, but is shown here for illustrational purposes. To list the commands available in privileged EXEC mode, issue the **?** command at the prompt. From privileged EXEC mode you can access global configuration mode, which is described in the following section.

Note Because the privileged EXEC command set contains all of the commands available in user EXEC mode, some commands can be entered in either mode. In Cisco IOS XE documentation, commands that can be entered in either user EXEC mode or privileged EXEC mode are referred to as EXEC mode commands. If user or privileged is not specified in the documentation, assume that you can enter the referenced commands in either mode.

Global Configuration Mode

The term “global” is used to indicate characteristics or features that affect the system as a whole. Global configuration mode is used to configure your system globally, or to enter specific configuration modes to configure specific elements such as interfaces or protocols. Use the **configure terminal**privileged EXEC command to enter global configuration mode.

To access global configuration mode, use the following command in privileged EXEC mode:

Command	Purpose
`Device# configure terminal`	From privileged EXEC mode, enters global configuration mode.

The following example shows the process of entering global configuration mode from privileged EXEC mode:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)#
```

Note that the system prompt changes to indicate that you are now in global configuration mode. The prompt for global configuration mode consists of the host-name of the device followed by (config) and the pound sign (#). To list the commands available in privileged EXEC mode, issue the **?** command at the prompt.

Commands entered in global configuration mode update the running configuration file as soon as they are entered. In other words, changes to the configuration take effect each time you press the Enter or Return key at the end of a valid command. However, these changes are not saved into the startup configuration file until you issue the **copy running-config startup-config** EXEC mode command. This behavior is explained in more detail later in this document.

As shown in the example above, the system dialogue prompts you to end your configuration session (exit configuration mode) by pressing the Control (Ctrl) and “z” keys simultaneously; when you press these keys, **^Z** is printed to the screen. You can actually end your configuration session by entering the Ctrl-Z key combination, using the **end** command, using the Ctrl-C key combination. The **end** command is the recommended way to indicate to the system that you are done with the current configuration session.

Caution If you use Ctrl-Z at the end of a command line in which a valid command has been typed, that command will be added to the running configuration file. In other words, using Ctrl-Z is equivalent to hitting the Enter (Carriage Return) key before exiting. For this reason, it is safer to end your configuration session using the **end** command. Alternatively, you can use the Ctrl-C key combination to end your configuration session without sending a Carriage Return signal.

You can also use the **exit** command to return from global configuration mode to EXEC mode, but this only works in global configuration mode. Pressing Ctrl-Z or entering the **end** command will always take you back to EXEC mode regardless of which configuration mode or configuration submode you are in.

To exit global configuration command mode and return to privileged EXEC mode, use one of the following commands:

Command	Purpose

`Device(config)# end`
or
`Device(config)# ^Z`
	Ends the current configuration session and returns to privileged EXEC mode.

`Device(config)# exit`	Exits the current command mode and returns to the preceding mode. For example, exits from global configuration mode to privileged EXEC mode.

From global configuration mode, you can enter a number of protocol-specific, platform-specific, and feature-specific configuration modes.

Interface configuration mode, described in the following section, is an example of a configuration mode you can enter from global configuration mode.

Interface Configuration Mode

One example of a specific configuration mode you enter from global configuration mode is interface configuration mode.

Many features are enabled on a per-interface basis. Interface configuration commands modify the operation of an interface such as an Ethernet, FDDI, or serial port. Interface configuration commands always follow an **interface** global configuration command, which defines the interface type.

For details on interface configuration commands that affect general interface parameters, such as bandwidth or clock rate, refer to the Release 12.2 *Cisco IOS Interface Configuration Guide* . For protocol-specific commands, refer to the appropriate Cisco IOS XE software command reference.

To access and list the interface configuration commands, use the following command:

Command	Purpose
`Device(config)# interface type number`	Specifies the interface to be configured, and enters interface configuration mode.

In the following example, the user enters interface configuration mode for serial interface 0. The new prompt, *hostname* (config-if)#, indicates interface configuration mode.

```
Device(config)# interface serial 0
Device(config-if)#
```

To exit interface configuration mode and return to global configuration mode, enter the **exit** command.

Configuration submodes are configuration modes entered from other configuration modes (besides global configuration mode). Configuration submodes are for the configuration of specific elements within the configuration mode. One example of a configuration submode is subinterface configuration mode, described in the following section.

Subinterface Configuration Mode

From interface configuration mode, you can enter subinterface configuration mode. Subinterface configuration mode is a submode of interface configuration mode. In subinterface configuration mode you can configure

multiple virtual interfaces (called subinterfaces) on a single physical interface. Subinterfaces appear to be distinct physical interfaces to the various protocols.

For detailed information on how to configure subinterfaces, refer to the appropriate documentation module for a specific protocol in the Cisco IOS XE software documentation set.

To access subinterface configuration mode, use the following command in interface configuration mode:

Command	Purpose
`Device(config-if)# interface type number`	Specifies the virtual interface to be configured and enters subinterface configuration mode.

In the following example, a subinterface is configured for serial line 2, which is configured for Frame Relay encapsulation. The subinterface is identified as "2.1" to indicate that it is subinterface 1 of serial interface 2. The new prompt *hostname* (config-subif)# indicates subinterface configuration mode. The subinterface can be configured to support one or more Frame Relay PVCs.

```
Device(config)# interface serial 2
Device(config-if)# encapsulation frame-relay
Device(config-if)# interface serial 2.1
Device(config-subif)#
```

To exit subinterface configuration mode and return to interface configuration mode, use the **exit** command. To end your configuration session and return to privileged EXEC mode, press Ctrl-Z or enter the **end** command.

Cisco IOS XE CLI Sessions

Local CLI Sessions

Local CLI sessions require direct access to the the console port of the networking device. Local CLI sessions start in user EXEC mode. All of the tasks required to configure and manage a networking device can be done using a local CLI session. The most common method for establishing a local CLI session is to connect the serial port on a PC to the console port of the networking device and then to launch a terminal emulation application on the PC. The type of cable and connectors required and the settings for the terminal emulation application on the PC are dependant on the type of networking device that you are configuring. See to the documentation for your networking device for more information on setting it up for a local CLI session.

Remote CLI Sessions

Remote CLI sessions are created between a host such as a PC and a networking device such as a router over a network using a remote terminal access application such as Telnet and Secure Shell (SSH). Local CLI sessions start in user EXEC mode. Most of the tasks required to configure and manage a networking device can be done using a remote CLI session. The exceptions are tasks that interact directly with the console port (such as recovering from a corrupted operating system (OS) by uploading a new OS image over the console port) and interacting with the networking device when it is in ROM Monitor Mode.

This document explains how to configure security for remote Telnet sessions. Telnet is the most common method for accessing a remote CLI session on a networking device.

Note SSH is a more secure alternative to Telnet. SSH provides encryption for the session traffic between your local management device such as a PC and the networking device that you are managing. Encrypting the session traffic with SSH prevents hackers that might intercept the traffic from being able to decode it. See Secure Shell Version 2 Support feature module for more information on using SSH.

Terminal Lines are Used for Local and Remote CLI Sessions

Cisco networking devices use the word lines to refer to the software components that manage local and remote CLI sessions. You use the **line console 0** global configuration command to enter line configuration mode to configure options, such as a password, for the console port.

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# password password-string
```

Remote CLI sessions use lines that are referred to virtual teletypewriter (VTY) lines. You use the **line vty** *line-number* [*ending-line-number*] global configuration command to enter line configuration mode to configure options, such as a password, for remote CLI sessions.

```
Device# configure terminal
Device(config)# line vty 0 4
Device(config-line)# password password-string
```

Protect Access to Cisco IOS XE EXEC Modes

Cisco IOS XE provides the ability to configure passwords that protect access to the following:

Protecting Access to User EXEC Mode

The first step in creating a secure environment for your networking device is protecting access to user EXEC mode by configuring passwords for local and remote CLI sessions.

You protect access to user EXEC mode for local CLI sessions by configuring a password on the console port. See the Configuring and Verifying a Password for Local CLI Sessions, on page 2208.

You protect access to user EXEC mode for remote CLI sessions by configuring a password on the virtual terminal lines (VTYs). See the Configuring and Verifying a Password for Remote CLI Sessions, on page 2206 for instructions on how to configure passwords for remote CLI sessions.

Protecting Access to Privileged EXEC mode

The second step in creating a secure environment for your networking device is protecting access to privileged EXEC mode with a password. The method for protecting access to privileged EXEC mode is the same for local and remote CLI sessions.

You protect access to privileged EXEC mode by configuring a password for it. This is sometimes referred to as the enable password because the command to enter privileged EXEC mode is **enable**.

Command	Purpose

enable
 	
`Device> enable`
 	
`Password`
 	
`Device#`
	Enables privileged EXEC mode.
	• Enter your password if prompted. The password will not be shown in the terminal window.
	• The ">" at the end of the prompt string is changed to a "#" to indicate that you are in privileged EXEC mode.

Cisco IOS XE Password Encryption Levels

Some of the passwords that you configure on your networking device are saved in the configuration in plain text. This means that if you store a copy of the configuration file on a disk, anybody with access to the disk can discover the passwords by reading the configuration file. The following password types are stored as plain text in the configuration by default:

- Console passwords for local CLI sessions
- Virtual terminal line passwords for remote CLI sessions
- Username passwords using the default method for configuring the password
- Privileged EXEC mode password when it is configured with the **enable password** *password* command
- Authentication key chain passwords used by RIPv2 and EIGRP
- BGP passwords for authenticating BGP neighbors
- OSPF authentication keys for authenticating OSPF neighbors
- ISIS passwords for authenticating ISIS neighbors

This excerpt from a router configuration file shows examples of passwords and authentication keys that are stored as clear text.

```
!
enable password O9Jb6D
!
username username1 password 0 kV9sIj3
!
key chain trees
 key 1
  key-string willow
!
interface Ethernet1/0.1
 ip address 172.16.6.1 255.255.255.0
 ip router isis
 ip rip authentication key-chain trees
 ip authentication key-chain eigrp 1 trees
 ip ospf authentication-key j7876
 no snmp trap link-status
 isis password u7865k
!
line vty 0 4
 password V9jA5M
!
```

You can encrypt these clear text passwords in the configuration file by using the **service password-encryption** command. This should be considered only a minimal level of security because the encryption algorithm used by the **service password-encryption** command to encrypt passwords creates text strings that be decrypted using tools that are publicly available. You should still protect access to any electronic or paper copies of your configuration files after you use the **service password-encryption** command.

The **service password-encryption** command does not encrypt the passwords when they are sent to the remote device. Anybody with a network traffic analyzer who has access to you network can capture these passwords from the packets as they are transmitted between the devices. See the Configuring Password Encryption for Clear Text Passwords, on page 2212for more information on encrypting clear text passwords in configuration files.

Many of the Cisco IOS XE features that use clear text passwords can also be configured to use the more secure MD5 algorithm. The MD5 algorithm creates a text string in the configuration file that is much more difficult to decrypt. The MD5 algorithm does not send the password to the remote device. This prevents people using a traffic analyzer to capture traffic on your network from being able to discover your passwords.

You can determine the type of password encryption that has been used by the number that is stored with the password string in the configuration file of the networking device. The number 5 in the configuration excerpt below indicates that the enable secret password has been encrypted using the MD5 algorithm.

enable secret 5 1fGCS$rkYbR6.Z8xo4qCl3vghWQ0

The number 7 in the excerpt below indicates that the enable password has been encrypted using the less secure algorithm used by the **service password-encryption** command.

!

enable password 7 00081204

Cisco IOS XE CLI Session Usernames

After you have protected access to user EXEC mode and privileged EXEC mode by configuring passwords for them you can further increase the level of security on your networking device by configuring usernames to limit access to CLI sessions to your networking device to specific users.

Usernames that are intended to be used for managing a networking device can be modified with additional options such as:

See the *Cisco IOS Security Command Reference* . (http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html) for more information on how to configure the **username** command.

Cisco IOS XE Privilege Levels

The default configuration for Cisco IOS XE based networking devices uses privilege level 1 for user EXEC mode and privilege level 15 for privileged EXEC. The commands that can be run in user EXEC mode at privilege level 1 are a subset of the commands that can be run in privileged EXEC mode at privilege 15.

The **privilege** command is used to move commands from one privilege level to another. For example, some ISPs allow their first level technical support staff to enable and disable interfaces to activate new customer connections or to restart a connection that has stopped transmitting traffic. See the Example: Configuring a Device to Allow Users to Shutdown and Enable Interfaces, on page 2229 for an example of how to configure this option.

The **privilege** command can also be used to assign a privilege level to a username so that when a user logs in with the username, the session will run at the privilege level specified by the **privilege** command. For example if you want your technical support staff to view the configuration on a networking device to help them troubleshoot network problems without being able to modify the configuration, you can create a username, configure it with privilege level 15, and configure it to run the **show running-config** command automatically. When a user logs in with the username the running configuration will be displayed automatically. The user's session will be logged out automatically after the user has viewed the last line of the configuration. See the Example: Configuring a Device to Allow Users to View the Running Configuration, on page 2227 for an example of how to configure this option.

These command privileges can also be implemented when using AAA with TACACS+ and RADIUS. For example, TACACS+ provides two ways to control the authorization of router commands on a per-user or per-group basis. The first way is to assign privilege levels to commands and have the router verify with the TACACS+ server whether or not the user is authorized at the specified privilege level. The second way is to explicitly specify in the TACACS+ server, on a per-user or per-group basis, the commands that are allowed. For more information about implementing AAA with TACACS+ and RADIUS, see the technical note How to Assign Privilege Levels with TACACS+ and RADIUS .

Cisco IOS XE Password Configuration

Cisco IOS XE software does not prompt you to repeat any passwords that you configure to verify that you have entered the passwords exactly as you intended. New passwords, and changes to existing passwords, go into effect immediately after you press the Enter key at the end of a password configuration command string. If you make a mistake when you enter a new password and have saved the configuration on the networking device to its startup configuration file and exited privileged EXEC mode before you realize that you made a mistake, you may find that you are no longer able to manage the device.

The following are common situations that can happen:

- You make a mistake configuring a password for local CLI sessions on the console port.
  - If you have properly configured access to your networking device for remote CLI sessions, you can Telnet to it and reconfigure the password on the console port.
- You make a mistake configuring a password for remote Telnet or SSH sessions.
  - If you have properly configured access to your networking device for local CLI sessions, you can connect a terminal to it and reconfigure the password for the remote CLI sessions.
- You make a mistake configuring a password for privileged EXEC mode (enable password or enable secret password).
  - You will have to perform a lost password recovery procedure.
- You make a mistake configuring your username password, and the networking device requires that you log into it with your username.
  - If you do not have access to another account name, you will have to perform a lost password recovery procedure.

To protect yourself from having to perform a lost password recovery procedure open two CLI sessions to the networking device and keep one of them in privilege EXEC mode while you reset the passwords using the other session. You can use the same device (PC or terminal) to run the two CLI sessions or two different devices. You can use a local CLI session and a remote CLI session or two remote CLI sessions for this procedure. The CLI session that you use to configure the password can also be used to verify that the password

was changed properly. The other CLI session that you keep in privileged EXEC mode can be used to change the password again if you made a mistake the first time you configured it.

You should not save password changes that you have made in the running configuration to the startup configuration until you have verified that your password was changed successfully. If you discover that you made a mistake configuring a password, and you were not able to correct the problem using the second CLI session technique described above, you can power cycle the networking device so that it returns to the previous passwords that are stored in the startup configuration.

AES Password Encryption and Master Encryption Keys

You can enable strong, reversible 128-bit Advanced Encryption Standard (AES) password encryption, also known as type-6 encryption. To start using type-6 encryption, you must enable the AES password encryption feature and configure a master encryption key, which is used to encrypt and decrypt passwords. After you enable AES password encryption and configure a master key, all existing and newly created clear-text passwords for supported applications are stored in type-6 encrypted format, unless you disable type-6 password encryption. You can also configure the device to convert all existing weakly encrypted passwords to type-6 encrypted passwords.

Type 0 and type 7 passwords can be autoconverted to type 6 if the AES password encryption feature and master encryption key are configured.

Note Type 6 username and password are backward compatible to the Cisco IOS release 16.10.1 only. If you downgrade to any release version lower than Cisco IOS release 16.10.1, type 6 username and password will be rejected. After autoconversion, to avoid an administrator password getting rejected during a downgrade, migrate the passwords.

How To Configure Security with Passwords Privileges and Logins

Protecting Access to User Exec Mode

Configuring and Verifying a Password for Remote CLI Sessions

This task will assign a password for remote CLI sessions. After you have completed this task the networking device will prompt you for a password the next time that you start a remote CLI session with it.

Cisco IOS XE based networking devices require that you have a password configured for remote CLI sessions. If you attempt to start a remote CLI session with a device that doesn’t have a password configured for remote CLI sessions you will see a message that a password is required and has not been set. The remote CLI session will be terminated by the remote host.

Before you begin

If you have not previously configured a password for remote CLI sessions, you must perform this task over a local CLI session using a terminal or a PC running a terminal emulation application, attached to the console port.

Your terminal, or terminal emulation application, must be configured with the settings that are used by the console port on the networking device. The console ports on most Cisco networking devices require the following settings: 9600 baud, 8 data bits, 1 stop bit, no parity, and flow control is set to "none." See the documentation for your networking device if these settings do not work for your terminal.

To perform the verification step (Step 6) for this task, your networking device must have an interface that is in an operational state. The interface must have a valid IP address.

Note If you have not previously configured a password for remote CLI sessions, you must perform this task over a local CLI session using a terminal attached to the console port.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line vty** *line-number* [*ending-line-number*]
4. **password** *password*
5. **end**
6. **telnet** *ip-address*
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**line vty** *line-number* [*ending-line-number*] **Example:** `Device(config)# line vty 0 4`	Enters line configuration mode.

	Command or Action	Purpose
Step 4	**password** *password* **Example:** `Device(config-line)# password H7x3U8`	The argument *password* is a character string that specifies the line password. The following rules apply to the *password* argument: • The first character cannot be a number. • The string can contain any alphanumeric characters, including spaces, up to 80 characters. You cannot specify the password in the format number-space-anything. • Passwords are case sensitive.
Step 5	**end** **Example:** `Device(config-line)# end`	Exits the current configuration mode and returns to privileged EXEC mode.
Step 6	**telnet** *ip-address* **Example:** `Device# telnet 172.16.1.1`	Start a remote CLI session with the networking device from your current CLI session using the IP address of an interface in the networking device that is in an operational state (interface up, line protocol up). • Enter the password that you configured is step 4 when prompted. **Note** This procedure is often referred to as a starting a recursive Telnet session because you are initiating a remote Telnet session with the networking device from the networking device itself.
Step 7	**exit** **Example:** `Device# exit`	Terminates the remote CLI session (recursive Telnet session) with the networking device.

Troubleshooting Tips

To display information for all users who have access to a lawful intercept view, issue the **show users lawful-intercept** command. (This command is available only to authorized lawful intercept view users.)

What to Do Next

Proceed to the Configuring and Verifying a Password for Local CLI Sessions, on page 2208.

Configuring and Verifying a Password for Local CLI Sessions

This task will assign a password for local CLI sessions over the console port. After you have completed this task, the networking device will prompt you for a password the next time that you start a local CLI session on the console port.

This task can be performed over a local CLI session using the console port or a remote CLI session. If you want to perform the optional step of verifying that you configured the password correctly you should perform this task using a local CLI session using the console port.

Before you begin

If you want to perform the optional step of verifying the local CLI session password, you must perform this task using a local CLI session. You must have a terminal or a PC running a terminal emulation program, connected to the console port of the networking device. Your terminal must be configured with the settings that are used by the console port on the networking device. The console ports on most Cisco networking devices require the following settings: 9600 baud, 8 data bits, 1 stop bit, no parity, and flow control is set to "none." See the documentation for your networking device if these settings do not work for your terminal.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **line console 0**
4. **password** *password*
5. **end**
6. **exit**
7. Press the Enter key.

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**line console 0** **Example:** `Device(config)# line console 0`	Enters line configuration mode and selects the console port as the line that you are configuring.
Step 4	**password** *password* **Example:** `Device(config-line)# password Ji8F5Z`	The argument *password* is a character string that specifies the line password. The following rules apply to the *password* argument: • The first character cannot be a number. • The string can contain any alphanumeric characters, including spaces, up to 80 characters. You cannot

	Command or Action	Purpose
		specify the password in the format number-space-anything. • Passwords are case sensitive.
Step 5	**end** **Example:** `Device(config-line)# end`	Exits the current configuration mode and returns to privileged EXEC mode.
Step 6	**exit** **Example:** `Device# exit`	Exits privileged EXEC mode.
Step 7	Press the Enter key.	(Optional) Initiates the local CLI session on the console port. • Enter the password that you configured is step 4 when prompted to verify that it was configured correctly. **Note** This step can be performed only if you are using a local CLI session to perform this task.

Troubleshooting Tips

If your new password is not accepted proceed to the Configuration Examples for Configuring Security with Passwords Privileges and Logins for instructions on what to do next.

What to Do Next

Proceed to the Protecting Access to Privileged EXEC Mode, on page 2210.

Protecting Access to Privileged EXEC Mode

Configuring and Verifying the Enable Password

Cisco no longer recommends that you use the **enable password** command to configure a password for privileged EXEC mode. The password that you enter with the **enable password** command is stored as plain text in the configuration file of the networking device. You can encrypt the password for the **enable password** command in the configuration file of the networking device using the **service password-encryption** command. However the encryption level used by the **service password-encryption** command can be decrypted using tools available on the Internet.

Instead of using the **enable password**command, Cisco recommends using the **enable secret** commandbecause it encrypts the password that you configure with it with strong encryption . For more information on password encryption issues see the Cisco IOS XE Password Encryption Levels, on page 2203. For information on configuring the **enable secret**command see the Configuring and Verifying the Enable Secret Password, on page 2213.

Note The networking device must not have a password configured by the **enable secret** command in order to perform this task successfully. If you have already configured a password for privileged EXEC mode using the **enable secret** command, the password configured takes precedences over the password that you configure in this task using the **enable password** command.

You cannot use the same password for the **enable secret** command and the **enable** *password* command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable password** *password*
4. **end**
5. **exit**
6. **enable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	**enable password** *password*
	Example:
	`Device(config)# enable password t6D77CdKq`
		The argument *password* is a character string that specifies the enable password. The following rules apply to the *password* argument:
		• Must contain from 1 to 25 uppercase and lowercase alphanumeric characters.
		• Must not have a number as the first character.
		• Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized.
		• Can contain the question mark (?) character if you precede the question mark with the key combination Crtl-v when you create the password; for example, to create the password abc?123, do the following:
		  • Enter abc
		  • Type Crtl-v

	Command or Action	Purpose
		• Enter ?123
Step 4	**end** **Example:** `Device(config)# end`	Exits the current configuration mode and returns to privileged EXEC mode.
Step 5	**exit** **Example:** `Device# exit`	Exits privileged EXEC mode.
Step 6	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter the password you configured in step 3.

Troubleshooting Tips

If your new password is not accepted, proceed to the Recovering from Lost or Misconfigured Passwords for Privileged EXEC Mode section for instructions on what to do next.

What to Do Next

Encrypt the clear text enable password in the configuration file of the networking device using the procedure described in Configuring Password Encryption for Clear Text Passwords, on page 2212.

Configuring Password Encryption for Clear Text Passwords

Cisco IOS XE stores passwords in clear text in network device configuration files for several features such as passwords for local and remote CLI sessions, and passwords for neighbor authentication for routing protocols. Clear text passwords are a security risk because anybody with access to archived copies of the configuration files can discover the passwords that are stored as clear text. The **service password-encryption** command can be used to encrypt clear text commands in the configuration files of networking devices. See the Cisco IOS XE Password Encryption Levels, on page 2203 for more information.

Perform the following steps to configure password encryption for passwords that are stored as clear text in the configuration files of your networking device.

Before you begin

You must have at least one feature that uses clear text passwords configured on your networking device for this command to have any immediate effect.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service password-encryption**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**service password-encryption** **Example:** `Device(config)# service password-encryption`	Enables Password encryption for all passwords clear text passwords, including username passwords, authentication key passwords, the privileged command password, console and virtual terminal line access passwords, and Border Gateway Protocol neighbor passwords.
Step 4	**end** **Example:** `Device(config)# end`	Exits the current configuration mode and returns to privileged EXEC mode.

Configuring and Verifying the Enable Secret Password

Cisco recommends that you use the **enable secret** command, instead of the **enable** *password* command to configure a password for privileged EXEC mode. The password created by the **enable secret** command is encrypted with the more secure MD5 algorithm.

Note You cannot use the same password for the **enable secret** command and the **enable** *password* command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Perform one of the following steps:
   - **enable secret** *password*
   - **enable secret 5** *previously-encrypted-password*
4. **end**
5. **exit**
6. **enable**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	Perform one of the following steps:
	• **enable secret** *password*
	• **enable secret 5** *previously-encrypted-password*
	Example:
	`Device(config)# enable secret t6D77CdKq`
	Example:
	`Device(config)# enable secret 5 $1$/x6H$RhnDI3yLC4GA01aJnHLQ4/`
		The argument *password* is a character string that specifies the **enable secret** password. The following rules apply to the *password* argument:
		• Must contain from 1 to 25 uppercase and lowercase alphanumeric characters.
		• Must not have a number as the first character.
		• Can have leading spaces, but they are ignored. However, intermediate and trailing spaces are recognized.
		• Can contain the question mark (?) character if you precede the question mark with the key combination Crtl-v when you create the password; for example, to create the password abc?123, do the following:
		• Enter abc
		• Type Crtl-v
		• Enter ?123
		or
		Sets a previously encrypted password for privileged EXEC mode by entering the number 5 before the previously encrypted string. You must enter an exact copy of a password from a configuration file that was previously encrypted by the **enable secret** command to use this method.

Step 4	**end** **Example:** `Device(config)# end`	Exits the current configuration mode and returns to privileged EXEC mode.
Step 5	**exit** **Example:**	Exits privileged EXEC mode.

	Command or Action	Purpose
	`Device# exit`	
Step 6	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter the password that you configured in Step 3.

Troubleshooting Tips

If your new password is not accepted proceed to the Configuration Examples for Configuring Security with Passwords Privileges and Logins for instructions on what to do next.

What to Do Next

If you have finished configuring passwords for local and remote CLI sessions and you want to configure additional security features, such as usernames, and privilege levels proceed to the Configuring Security Options to Manage Access to CLI Sessions and Commands, on page 2217.

Configuring a Device to Allow Users to View the Running Configuration

To access the running configuration of a device using the **show running-config** command at a privilege level lower than level 15, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **privilege exec all level** *level command-string*
4. **file privilege** *level*
5. **privilege configure all level** *level command-string*
6. **end**
7. **show privilege**
8. **show running-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**privilege exec all level** *level command-string* **Example:** `Device(config)# privilege exec all level 5 show running-config`	Changes the privilege level of the specified command from one privilege level to another.
Step 4	**file privilege** *level* **Example:** `Device(config)# file privilege 5`	Allows a user of the privilege level to execute commands that involve the file system on a device.
Step 5	**privilege configure all level** *level command-string* **Example:** `Device(config)# privilege configure all level 5 logging`	Allows a user of a privilege level to see specific configuration commands. For example, allows the user of privilege level 5 to see the logging configuration commands in the running configuration.
Step 6	**end** **Example:** `Device(config)# end`	Exits global configuration mode and returns to privileged EXEC mode.
Step 7	**show privilege** **Example:** `Device# show privilege`	Displays the current privilege level.
Step 8	**show running-config** **Example:** `Device# show running-config`	Displays the current running configuration for the specified privilege level.

Example

The following output for the **show running-config** command displays the logging configuration commands in the running configuration. Users with a privilege level below 15 can view the running configuration after configuring the **privilege configure all level** *level command-string* command.

```
Device# show running-config

Building configuration...

Current configuration : 128 bytes
!
boot-start-marker
boot-end-marker
!
no logging queue-limit
logging buffered 10000000
```

```
no logging rate-limit
!
!
!
end
```

Configuring Security Options to Manage Access to CLI Sessions and Commands

The tasks in this section describe how to configure your networking device to permit the use of a subset of privileged EXEC mode commands by users who should not have access to all of of the commands available in privileged EXEC mode.

These tasks are beneficial for companies that have multiple levels of network support staff and the company wants the staff at each level to have access to a different subset of the privileged EXEC mode commands.

In this task the users who should not have access to all of of the commands available in privileged EXEC mode are referred to as the first-line technical support staff.

This section contains the following procedures:

Configuring the Networking Device for the First-Line Technical Support Staff

This task describes how to configure the networking device for first-line technical support users. First-line technical support staff are usually not allowed to run all of the commands available in privileged EXEC mode (privilege level 15) on a networking device. They are prevented from running commands that they are not authorized for by not being granted access to the password assigned to privileged EXEC mode or to other roles that have been configured on the networking device.

The **privilege** command is used to move commands from one privilege level to another in order to create the additional levels of administration of a networking device that is required by companies that have different levels of network support staff with different skill levels.

The default configuration of a Cisco IOS XE device permits two types of users to access the CLI. The first type of user is a person who is only allowed to access user EXEC mode. The second type of user is a person who is allowed access to privileged EXEC mode. A user who is only allowed to access user EXEC mode is not allowed to view or change the configuration of the networking device, or to make any changes to the operational status of the networking device. On the other hand, a user who is allowed access to privileged EXEC mode can make any change to a networking device that is allowed by the CLI.

In this task the two commands that normally run at privilege level 15 are reset to privilege level 7 using the privilege command in order that first-line technical support users will be allowed to run the two commands. The two commands for which the privilege levels will be reset are the **clear counters** command and **reload** command.

- The **clear counters** command is used to reset the counter fields on interfaces for statistics such as packets received, packets transmitted, and errors. When a first-line technical support user is troubleshooting an interface related connectivity issue between networking devices, or with remote users connecting to the network, it is useful to reset the interface statistics to zero and them monitor the interfaces for a period of time to see if the values in the interface statistics counters change.
- The **reload** command is used initiate a reboot sequence for the networking device. One common use of the reload command by first-line technical support staff is to cause the networking device to reboot during a maintenance window so that it loads a new operating system that was previously copied onto the networking device's file system by a user with a higher level of authority.

Any user that is permitted to know the **enable secret** password that is assigned to the first-line technical support user role privilege level can access the networking device as a first-line technical support user. You can add an additional level of security by configuring a username on the networking device and requiring that the users know the username and the password. Configuring a username as an additional level of security is described in the . Configuring a Device to Require a Username for the First-Line Technical Support Staff, on page 2221

Note You must not have the **aaa new-model** command enabled on the networking device. You must not have the **login local** command configured for the local CLI sessions over the console port or the remote CLI sessions.

Note For clarity, only the arguments and keywords that are relevant for each step are shown i steps in this task. See the Cisco IOS command reference book for your Cisco IOS release fo on the additional arguments and keywords that can be used with these commands.

Caution Do not use the no form of the **privilege** command to reset the privilege level of a comm because it might not return the configuration to the correct default state. Use the **reset** keyw command instead to return a command to its default privilege level. For example, to rem **exec level** *reload* command from the configuration and return the **reload** command to it 15, use the **privilege exec reset** *reload* command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable secret level** *level password*
4. **privilege exec level** *level command-string*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Device> enable`	Enters privileged EXEC mode. Enter the password when prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**enable secret level** *level password* **Example:**	Configures a new enable secret password for privilege level 7.

	Command or Action	Purpose
	`Device(config)# enable secret level 7 Zy72sKj`	
Step 4	**privilege exec level** *level command-string* **Example:** `Device(config)# privilege exec level 7 clear counters`	Changes the privilege level of the **clear counters** command from privilege level 15 to privilege level 7.
Step 5	**end** **Example:** `Device(config)# end`	Exits global configuration mode.

Verifying the Configuration for the First-Line Technical Support Staff

This task describes how to verify that the network device is configured correctly for the first-line technical support staff.

Before you begin

The following commands must have been modified to run at privilege level 7 for this task:

- **clear counters**
- **reload**

SUMMARY STEPS

1. **enable** *level password*
2. **show privilege**
3. **clear counters**
4. **clear ip route** *
5. **reload in time**
6. **reload cancel**
7. **disable**
8. **show privilege**

DETAILED STEPS

Step 1 **enable** *level password*

Logs the user into the networking device at the privilege level specified for the level argument.

Example:

```
Device> enable 7 Zy72sKj
```

Step 2 **show privilege**

Displays the privilege level of the current CLI session

Example:

```
Device# show privilege

Current privilege level is 7
```

Step 3 **clear counters**

The clear counters command clears the interface counters. This command has been changed from privilege level 15 to privilege level 7.

Example:

```
Device# clear counters

Clear "show interface" counters on all interfaces [confirm]
Device#
02:41:37: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console
```

Step 4 **clear ip route ***

The *ip route* argument string for the **clear** command should not be allowed because it was not changed from privilege level 15 to privilege level 7.

Example:

```
Device# clear ip route *
                                                                        ^
% Invalid input detected at '^' marker.
```

Step 5 **reload in time**

The reload command causes the networking device to reboot.

Example:

```
Device# reload in

10
Reload scheduled in 10 minutes by console
Proceed with reload? [confirm]

Device#

***
*** --- SHUTDOWN in 0:10:00 ---
***
02:59:50: %SYS-5-SCHEDULED_RELOAD: Reload requested for 23:08:30 PST Sun Mar 20
```

Step 6 **reload cancel**

The **reload cancel** terminates a reload that was previously setup with the the **reload in** *time* command.

Example:

```
Device# reload cancel

***
*** --- SHUTDOWN ABORTED ---
***
04:34:08: %SYS-5-SCHEDULED_RELOAD_CANCELLED:  Scheduled reload cancelled at 15:38:46 PST Sun Mar 27
 2005
```

Step 7 **disable**

Exits the current privilege level and returns to privilege level 1.

Example:

```
Device# disable
```

Step 8 **show privilege**

Displays the privilege level of the current CLI session

Example:

```
Device> show privilege

Current privilege level is 1
```

Troubleshooting Tips

If your configuration does not work the way that you want it to and you want to remove the privilege commands from the configuration, use the **reset** keyword for the **privilege** command to return the commands to their default privilege level. For example, to remove the command **privilege exec level** *reload* command from the configuration and return the **reload** command to its default privilege of 15 use the **privilege exec reset** *reload*command.

What to Do Next

If you want to add an additional level of security by requiring that the first level technical staff use a login name, proceed to the Configuring a Device to Require a Username for the First-Line Technical Support Staff, on page 2221.

Configuring a Device to Require a Username for the First-Line Technical Support Staff

This task configures the networking device to require that the first-line technical support staff login to the networking device with a login name of admin. The admin username configured in this task is assigned the privilege level of 7 which will allow users who log in with this name to run the commands that were reassigned to privilege level 7 in the previous task. When a user successfully logs in with the admin username, the CLI session will automatically enter privilege level 7.

Before Cisco IOS XE Release 2.3, two types of passwords were associated with usernames: Type 0, which is a clear text password visible to any user who has access to privileged mode on the router, and type 7, which has a password encrypted by the **service password encryption** command.

In Cisco IOS XE Release 2.3 and later releases, the new **secret** keyword for the **username** command allows you to configure Message Digest 5 (MD5) encryption for username passwords.

Before you begin

The following commands must have been modified to run at privilege level 7 for this task:

- **clear counters**
- **reload**

See the Configuring the Networking Device for the First-Line Technical Support Staff, on page 2217 for instructions on how to change the privilege level for a command.

Note MD5 encryption for the **username** command is not supported in versions of Cisco IOS software prior to Cisco IOS XE Release 2.3.

You must not have the aaa-new model command enabled on the networking device. You must not have the **login local** command configured for the local CLI sessions over the console port or the remote CLI sessions.

Note For clarity, only the arguments and keywords that are relevant for each step are shown i steps in this task. Refer to the Cisco IOS command reference book for your Cisco IOS X information on the additional arguments and keywords that can be used with these com

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **username** *username* **privilege** *level* **secret** *password*
4. **end**
5. **disable**
6. **login** *username*
7. **show privilege**
8. **clear counters**
9. **clear** *ip route* *
10. **reload in** *time*
11. **reload cancel**
12. **disable**
13. **show privilege**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:**	Enters privileged EXEC mode. Enter the password when prompted.

	Command or Action	Purpose
	`Device> enable`	
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**username** *username* **privilege** *level* **secret** *password* **Example:** `Device(config)# username admin privilege 7 secret Kd65xZa`	Creates a username and applies MD5 encryption to the *password* text string.
Step 4	**end** **Example:** `Device(config)# end`	Exits global configuration mode.
Step 5	**disable** **Example:** `Device# disable`	Exits the current privilege level and returns to user EXEC mode.
Step 6	**login** *username* **Example:** `Device> login admin`	Logs in the user. Enter the username and password you configured in step 3 when prompted.

Step 7	**show privilege**
	Example:
	`Device# show privilege`
	`Current privilege level is 7`
		The **show privilege** command displays the privilege level of the CLI session.

Step 8	**clear counters**
	Example:
	`Device# clear counters`
	`Clear "show interface" counters on all interfaces [confirm]`
	`Device#`
	`02:41:37: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console`
		The **clear counters** command clears the interface counters. This command has been changed from privilege level 15 to privilege level 7.

	Command or Action	Purpose

Step 9	**clear** *ip route* *
	 Example:
	 `Device# clear ip route *`
	 `                     ^`
	 `% Invalid input detected at '^' marker.`
		The *ip route* argument string for the **clear** command is not allowed because it was not changed from privilege level 15 to privilege level 7.

Step 10	**reload in** *time*
	 Example:
	 `Device# reload in`
	 `10`
	 `Reload scheduled in 10 minutes by console`
	 `Proceed with reload? [confirm]`
	 `Device#`
	 `***`
	 `*** --- SHUTDOWN in 0:10:00 ---`
	 `***`
	 `02:59:50: %SYS-5-SCHEDULED_RELOAD: Reload requested for 23:08:30 PST Sun Mar 20`
		The reload command causes the networking device to reboot.

Step 11	**reload cancel**
	 Example:
	 `Device# reload cancel`
	 `***`
	 `*** --- SHUTDOWN ABORTED ---`
	 `***`
	 `04:34:08: %SYS-5-SCHEDULED_RELOAD_CANCELLED: Scheduled reload cancelled at 15:38:46 PST Sun Mar 27 2005`
		The **reload cancel** command terminates a reload that was previously setup with the the **reload in** *time* command.

Step 12	**disable** **Example:** `Device# disable`	Exits the current privilege level and returns to user EXEC mode.

Step 13	**show privilege**
	 Example:
	 `Device> show privilege`
	 `Current privilege level is 1`
		Displays the privilege level of the current CLI session

Recovering from a Lost or Misconfigured Password for Local Sessions

There are three methods that can be used to recover from a lost or misconfigured password for local CLI sessions over console port. The method that you will use depends on the current configuration of your networking device.

Networking Device Is Configured to Allow Remote CLI Sessions

The fastest method to recover from a lost, or misconfigured password for local CLI sessions is to establish a remote CLI session with the networking device and repeat the Configuring and Verifying a Password for Local CLI Sessions, on page 2208. Your networking device must be configured to allow remote CLI sessions and you must know the remote CLI session password to perform this procedure.

Networking Device Is Not Configured to Allow Remote CLI Sessions

- If you cannot establish a remote session to your networking device, and you have not saved the misconfigured local CLI session password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous local CLI session password is restored.

Caution Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

Recovering from a Lost or Misconfigured Password for Remote Sessions

There are three methods that can be used to recover from a lost, or misconfigured remote CLI session password. The method that you will use depends on the current configuration of your networking device.

Networking Device Is Configured to Allow Local CLI Sessions

The fastest method to recover from a lost, or misconfigured password for remote CLI sessions is to establish a local CLI session with the networking device and repeat the Configuring and Verifying a Password for Remote CLI Sessions, on page 2206. Your networking device must be configured to allow local CLI sessions and you must know the local CLI session password to perform this procedure.

Networking Device Is Not Configured to Allow Local CLI Sessions

- If you cannot establish a local CLI session to your networking device, and you have not saved the misconfigured remote CLI session password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous remote CLI session password is restored.

Caution Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

Recovering from Lost or Misconfigured Passwords for Privileged EXEC Mode

There are two methods that can be used to recover from a lost, or misconfigured Privileged EXEC Mode password. The method that you will use depends on the current configuration of your networking device.

A Misconfigured Privileged EXEC Mode Password Has Not Been Saved

- If you have not saved the misconfigured privileged EXEC mode password to the startup configuration, you can restart the networking device. When the networking device starts up again it will read the startup configuration file. The previous privileged EXEC mode password is restored.

Caution Restarting a networking device will cause it to stop forwarding traffic. This will also cause an interruption in any services that are running on the networking device, such as a DHCP server service, to stop. You should only restart a networking device during a period of time that has been allocated for network maintenance.

Configuration Examples for Configuring Security with Passwords Privileges and Logins

Example: Configuring an Encrypted Preshared Key

The following is an example of a configuration for which a type 6 preshared key has been encrypted. It includes the prompts and messages that a user might see.

```
Device(config)# password encryption aes
New key:
Confirm key:
Device (config)#

01:46:40: TYPE6_PASS: New Master key configured, encrypting the keys with
the new master key
Device (config)# exit
```

Example: Configuring a Device to Allow Users to Clear Remote Sessions

The following example shows how to configure a networking device to allow a non administrative user to clear remote CLI session virtual terminal (VTY) lines.

The first section is an excerpt of the running configuration for this example. The following sections show you how this example is used.

The following section is an excerpt of the running-configuration:

```
!
privilege exec level 7 clear line
!
no aaa new-model
!
!
username admin privilege 7 secret 5 $1$tmIw$1aM7sadKhWMpkVTzxNw1J.
```

```
!
privilege exec level 7 clear line
!
! the privilege exec level 7 clear command below is entered automatically
! when you enter the privilege exec level 7 clear line command above, do
! not enter it again
!
privilege exec level 7 clear
!
```

The following section using the **login** command shows the user logging in to the networking device with the username of admin:

```
R1> login
Username: admin
Password:
```

The following section using the **show privilege** command shows that the current privilege level is 7:

```
R1# show privilege

Current privilege level is 7
R1#
```

The following section using the **show user** command shows that two users (admin and root) are currently logged in to the networking device:

```
R1# show user

    Line       User       Host(s)              Idle       Location
*  0 con 0     admin      idle                 00:00:00
   2 vty 0     root       idle                 00:00:17 172.16.6.2
  Interface    User               Mode         Idle     Peer Address
```

The following section using the **clear line** *2* command terminates the remote CLI session in use by the username root:

```
R1# clear line  2

[confirm]
 [OK]
```

The following section using the **show user** command shows that admin is the only user currently logged in to the networking device:

```
R1# show user
    Line       User       Host(s)              Idle       Location
*  0 con 0     admin      idle                 00:00:00
  Interface    User               Mode         Idle     Peer Address
```

Example: Configuring a Device to Allow Users to View the Running Configuration

For Users With Privilege Level 15

The following example shows how to configure the networking device to allow a non administrative users (no access to privileged EXEC mode) to view the running configuration automatically. This example requires

that the username is configured for privilege level 15 because many of the commands in the configuration file can be viewed only by users who have access to privilege level 15.

The solution is to temporarily allow the user access to privilege level 15 while running the **show running-config** command and then terminating the CLI session when the end of the configuration file has been viewed. In this example the networking device will automatically terminate the CLI session when the end of the configuration file has been viewed. No further configuration steps are required.

Caution You must include the **noescape** keyword for the **username** command to prevent the user from entering an escape character that will terminate viewing the configuration file and leave the session running at privilege level 15.

```
!
!
username viewconf privilege 15 noescape secret 5 $1$zA9C$TDWD/Q0zwp/5xRwRqdgc/.
username viewconf autocommand show running-config
!
```

For Users With Privilege Level Lower Than Level 15

The following example shows how to configure a networking device to allow a user with privilege level lower than level 15 to view the running configuration.

```
Device> enable
Device# configure terminal
Device(config)# privilege exec all level 5 show running-config
Device(config)# file privilege 5
Device(config)# privilege configure all level 5 logging
Device(config)# end
Device# show privilege

Current privilege level is 5

Device# show running-config

Building configuration...

Current configuration : 128 bytes
!
boot-start-marker
boot-end-marker
!
no logging queue-limit
logging buffered 10000000
no logging rate-limit
!
!
!
end
```

Example: Configuring a Device to Allow Users to Shutdown and Enable Interfaces

The following example shows how to configure a networking device to allow non administrative users to shutdown and enable interfaces.

The first section is an an excerpt of the running configuration for this example. The following sections show you how this example is used.

The following section is an excerpt of the running-configuration:

```
!
no aaa new-model
!
username admin privilege 7 secret 5 $1$tmIw$1aM7sadKhWMpkVTzxNw1J.
!
privilege interface all level 7 shutdown
privilege interface all level 7 no shutdown
privilege configure level 7 interface
privilege exec level 7 configure terminal
!
! the privilege exec level 7 configure command below is entered automatically
! when you enter the privilege exec level 7 configure terminal command above, do
! not enter it again
!
privilege exec level 7 configure
!
```

The following section using the **login** command shows the user logging in to the networking device with the username of admin:

```
R1> login
Username: admin
Password:
```

The following section using the **show privilege** command shows that the current privilege level is 7:

```
R1# show privilege
Current privilege level is 7
```

The following section using the **show user** command shows that admin is the only user currently logged in to the networking device:

```
R1# show user
    Line       User       Host(s)              Idle       Location
*  0 con 0     admin      idle                 00:00:00
  Interface    User               Mode         Idle     Peer Address
```

The following section shows that the admin user is permitted to shutdown and enable an interface:

```
R1# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
R1(config)# interface ethernet 1/0
R1(config-if)# shutdown
R1(config-if)# no shutdown
R1(config-if)# exit
R1#
```

Where to Go Next

Once you have established a baseline of security for your networking devices you can consider more advanced options such as:

- Role-Based CLI Access--The role-based CLI access feature offers a more comprehensive set of options than the **privilege** command (described in this document) for network managers who want to allow different levels of technical support staff to have different levels of access to CLI commands.
- AAA Security--Many Cisco networking devices offer an advanced level of security using authentication, authorization and accounting (AAA) features. All of the tasks described in this document, and other - more advanced security features - can be implemented using AAA on the networking device in conjunction with a remote TACACS+ or RADIUS server. For information how to configure AAA security features that can be run locally on a networking device, or for information on how to configure remote AAA security using TACACS+ or RADIUS servers, see the *Cisco IOS XE Security Configuration Guide:Securing User Services* , Release 2.

Description	Link
The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies. To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds. Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.	http://www.cisco.com/techsupport

Feature Information for Configuring Security with Passwords Privileges and Logins

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 224: Feature Information for Configuring Security with Passwords, Privilege Levels, and Login Usernames for CLI Sessions on Networking Devices

Feature Name	Releases	Feature Configuration Information
Enhanced Password Security		Using the Enhanced Password Security feature, you can configure MD5 encryption for username passwords. MD5 encryption is a one-way hash function that makes reversal of an encrypted password impossible, providing strong encryption protection. Using MD5 encryption, you cannot retrieve clear text passwords. MD5 encrypted passwords cannot be used with protocols that require that the clear text password be retrievable, such as Challenge Handshake Authentication Protocol (CHAP).

CHAPTER 170

Role-Based CLI Access

The Role-Based CLI Access feature allows the network administrator to define views, which are a set of operational commands and configuration capabilities that provide selective or partial access to Cisco IOS EXEC and configuration (config) mode commands. Views restrict user access to Cisco IOS command-line interface (CLI) and configuration information; that is, a view can define what commands are accepted and what configuration information is visible. Thus, network administrators can exercise better control over access to Cisco networking devices.

Prerequisites for Role-Based CLI Access

Your image must support CLI views.

Restrictions for Role-Based CLI Access

Lawful Intercept Images Limitation

CLI views are a part of all platforms and Cisco IOS images because they are a part of the Cisco IOS parser. However, the lawful intercept view is available only in images that contain the lawful intercept subsystem.

Maximum Number of Allowed Views

The maximum number of CLI views and superviews, including one lawful intercept view, that can be configured is 15. (This does not include the root view.)

Parse View Profiles

When you configure Parse View profiles, the 'no' or 'default' commands in combination with any configuration commands are not saved to the startup-configuration file. The configuration is accepted and is persistent until the device is reloaded. Examples of commands which are not saved to the startup-configuration:

- **command configure include all no**
- **command interface include all no**
- **command configure include all default**

Information About Role-Based CLI Access

Benefits of Using CLI Views

Although users can control CLI access via both privilege levels and enable mode passwords, these functions do not provide network administrators with the necessary level of detail needed when working with Cisco IOS devices. CLI views provide a more detailed access control capability for network administrators, thereby, improving the overall security and accountability of Cisco IOS software.

As of Cisco IOS Release 12.3(11)T, network administrators can also specify an interface or a group of interfaces to a view; thereby, allowing access on the basis of specified interfaces.

Root View

When a system is in root view, it has all of the access privileges as a user who has level 15 privileges. If the administrator wishes to configure any view to the system (such as a CLI view, a superview, or a lawful intercept view), the system must be in root view.

The difference between a user who has level 15 privileges and a root view user is that a root view user can configure a new view and add or remove commands from the view. Also, when you are in a CLI view, you have access only to the commands that have been added to that view by the root view user.

Lawful Intercept View

Like a CLI view, a lawful intercept view restricts access to specified commands and configuration information. Specifically, a lawful intercept view allows a user to secure access to lawful intercept commands that are held within the TAP-MIB, which is a special set of simple network management protocol (SNMP) commands that store information about calls and users.

Commands available in lawful intercept view belong to one of the these categories:

- Lawful intercept commands that should not be made available to any other view or privilege level
- CLI views that are useful for lawful intercept users but do not have to be excluded from other views or privilege levels

Superview

A superview consists of one or more CLI views, which allow users to define what commands are accepted and what configuration information is visible. Superviews allow a network administrator to easily assign all users within configured CLI views to a superview instead of having to assign multiple CLI views to a group of users.

Superviews contain these characteristics:

- A CLI view can be shared among multiple superviews.
- Commands cannot be configured for a superview; that is, you must add commands to the CLI view and add that CLI view to the superview.
- Users who are logged into a superview can access all of the commands that are configured for any of the CLI views that are part of the superview.
- Each superview has a password that is used to switch between superviews or from a CLI view to a superview.
- If a superview is deleted, its associated CLI views are not deleted.

View Authentication via a New AAA Attribute

View authentication is performed by an external authentication, authorization, and accounting (AAA) server via the new attribute **cli-view-name**.

AAA authentication associates only one view name to a particular user; that is, only one view name can be configured for a user in an authentication server.

How to Use Role-Based CLI Access

Configuring a CLI View

Perform this task to create a CLI view and add commands or interfaces to the view, as appropriate.

Before you begin

Before you create a view, you must perform the following tasks:

- Enable AAA using the **aaa new-model** command.
- Ensure that your system is in root view-not privilege level 15.

SUMMARY STEPS

1. **enable view**
2. **configure terminal**
3. **parser view** *view-name* [**inclusive**]
4. **secret** [**0** | **5**] *encrypted-password*

5. **commands** *parser-mode* {**exclude** | **include-exclusive** | **include**} [**all**] [**interface** *interface-name* | *command*]
6. **end**
7. **enable** [*privilege-level* | **view** *view-name*]
8. **show parser view all**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable view** **Example:** `Device> enable view`	Enables root view. • Enter your privilege level 15 password (for example, root password) if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.

Step 3	**parser view** *view-name* [**inclusive**]
	Example:
	`Device(config)# parser view first inclusive`
	`Device(config-view)#`
		Creates a view including all commands by default. If the **inclusive** keyword option is not selected, it creates a view excluding all commands by default. You are in the view configuration mode.

Step 4	**secret** [**0** | **5**] *encrypted-password* **Example:** `Device(config-view)# secret 5 secret`	Associates a CLI view or superview with a password. **Note** You must issue this command before you can configure additional attributes for the view. **Note** With CSCts50236, the password can be removed or overwritten. Use the **no secret** command to remove the configured password.
Step 5	**commands** *parser-mode* {**exclude** | **include-exclusive** | **include**} [**all**] [**interface** *interface-name* | *command*] **Example:** `Device(config-view)# commands exec include show version`	Adds commands or interfaces to a view and specifies the mode in which the specified command exists. **Note** While configuring parser view profiles, the following **no** or **default** commands are not saved to the startup configuration. These commands are in use until the device is reloaded. Once the device is reloaded, reapply these commands to get the required results. • **commands configure include all no** • **commands interface include all no** • **commands configure include all default**

	Command or Action	Purpose
Step 6	**end** **Example:** `Device(config-view)# end`	Exits view configuration mode and returns to privileged EXEC mode.
Step 7	**enable** [*privilege-level* | **view** *view-name*] **Example:** `Device# enable view first`	Prompts you for a password to access a configured CLI view, and you can switch from one view to another view. Enter the password to access the CLI view.
Step 8	**show parser view all** **Example:** `Device# show parser view all`	(Optional) Displays information for all views that are configured on the device. **Note** Although this command is available for both root and lawful intercept users, the **all** keyword is available only to root users. However, the **all** keyword can be configured by a user in root view to be available for users in lawful intercept view and CLI view.

Troubleshooting Tips

You must associate a password with a view. If you do not associate a password, and you attempt to add commands to the view using the **commands** command, a system message such as the following is displayed:

```
%Password not set for view <viewname>.
```

Configuring a Lawful Intercept View

Perform this task to initialize and configure a view for lawful-intercept-specific commands and configuration information.

Before you begin

Before you initialize a lawful intercept view, ensure that the privilege level is set to 15 using the **privilege** command.

Note Only an administrator or a user who has level 15 privileges can initialize a lawful intercept view.

SUMMARY STEPS

1. **enable view**
2. **configure terminal**
3. **li-view** *li-password* **user** *username* **password** *password*
4. **username lawful-intercept** [*name*] [**privilege** *privilege-level* | **view** *view-name*] **password** *password*

5. **parser view** *view-name*
6. **secret 5** *encrypted-password*
7. **name** *new-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable view** **Example:** `Device> enable view`	Enables root view. • Enter your privilege level 15 password (for example, root password) if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**li-view** *li-password* **user** *username* **password** *password* **Example:** `Device(config)# li-view lipass user li_admin password li_adminpass`	Initializes a lawful intercept view. After the li-view is initialized, you must specify at least one user via **user** *username* **password** *password* options.
Step 4	**username lawful-intercept** [*name*] [**privilege** *privilege-level* | **view** *view-name*] **password** *password* **Example:** `Device(config)# username lawful-intercept li-user1 password li-user1pass`	Configures lawful intercept users on a Cisco device.
Step 5	**parser view** *view-name* **Example:** `Device(config)# parser view li view name`	(Optional) Enters view configuration mode, which allows you to change the lawful intercept view password or the lawful intercept view name.
Step 6	**secret 5** *encrypted-password* **Example:** `Device(config-view)# secret 5 secret`	(Optional) Changes an existing password for a lawful intercept view.
Step 7	**name** *new-name* **Example:** `Device(config-view)# name second`	(Optional) Changes the name of a lawful intercept view. If this command is not issued, the default name of the lawful intercept view is “li-view.”

Troubleshooting Tips

To display information for all users who have access to a lawful intercept view, issue the **show users lawful-intercept** command. (This command is available only to authorized lawful intercept view users.)

Configuring a Superview

Perform this task to create a superview and add at least one CLI view to the superview.

Before you begin

Before adding a CLI view to a superview, ensure that the CLI views that are added to the superview are valid views in the system; that is, the views have been successfully created using the **parser view** command.

Note You can add a view to a superview only after you configure a password for the superview (using the **secret 5** command). Thereafter, issue the **view** command in view configuration mode to add at least one CLI view to the superview.

SUMMARY STEPS

1. **enable view**
2. **configure terminal**
3. **parser view** *superview-name* **superview**
4. **secret 5** *encrypted-password*
5. **view** *view-name*
6. **end**
7. **show parser view all**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable view** **Example:** `Device> enable view`	Enables root view. • Enter your privilege level 15 password (for example, root password) if prompted.
Step 2	**configure terminal** **Example:** `Device# configure terminal`	Enters global configuration mode.
Step 3	**parser view** *superview-name* **superview** **Example:** `Device(config)# parser view su_view1 superview`	Creates a superview and enters view configuration mode.
Step 4	**secret 5** *encrypted-password* **Example:** `Device(config-view)# secret 5 secret`	Associates a CLI view or superview with a password. **Note** You must issue this command before you can configure additional attributes for the view.
Step 5	**view** *view-name*	Adds a normal CLI view to a superview.

	Command or Action	Purpose
	Example: `Device(config-view)# view view_three`	Issue this command for each CLI view that is to be added to a given superview.

Step 6	**end**
	Example:
	
	`Device(config-view)# end`
	`Device#`
		Exits view configuration mode and returns to privileged EXEC mode.

Step 7	**show parser view all** **Example:** `Device# show parser view`	(Optional) Displays information for all views that are configured on the device. **Note** Although this command is available for both root and lawful intercept users, the **all** keyword is available only to root users. However, the **all** keyword can be configured by a user in root view to be available for users in lawful intercept view and CLI view.

Monitoring Views and View Users

To display debug messages for all views-root, CLI, lawful intercept, and superview-use the **debug parser view** command in privileged EXEC mode.

Configuration Examples for Role-Based CLI Access

Example: Configuring a CLI View

The following example shows how to configure two CLI views, “first” and “second". Thereafter, you can verify the CLI view in the running configuration.

```
Device(config)# parser view first inclusive
Device(config-view)# secret 5 firstpass
Device(config-view)# command exec exclude show version
Device(config-view)# command exec exclude configure terminal
Device(config-view)# command exec exclude all show ip
Device(config-view)# exit
Device(config)# parser view second
Device(config-view)# secret 5 secondpass
Device(config-view)# command exec include-exclusive show ip interface
Device(config-view)# command exec include logout
Device(config-view)# exit
!
!
Device(config-view)# do show running-config | beg view

parser view first inclusive
 secret 5 $1$MCmh$QuZaU8PIMPlff9sFCZvgW/
```

```
 commands exec exclude configure terminal
 commands exec exclude configure
 commands exec exclude all show ip
 commands exec exclude show version
 commands exec exclude show
!
parser view second
 secret 5 $1$iP2M$R16BXKecMEiQesxLyqygW.
 commands exec include-exclusive show ip interface
 commands exec include show ip
 commands exec include show
 commands exec include logout
!
```

Example: Verifying a CLI View

After you have configured the CLI views “first” and “second", you can issue the **enable view**command to verify which commands are available in each view. The following example shows which commands are available inside the CLI view “first” after the user has logged into this view. (Because the **show ip** command is configured with the all option, a complete set of suboptions is shown, except the **show ip interface** command, which is using the **include-exclusive** keyword in the second view.)

```
Device# enable view first
Password:
Device# ?
Exec commands:
  configure  Enter configuration mode
  enable     Turn on privileged commands
  exit       Exit from the EXEC
  show       Show running system information
Device# show ?
  ip       IP information
  parser   Display parser information
  version  System hardware and software status
Device# show ip ?

  access-lists            List IP access lists
  accounting              The active IP accounting database
  aliases                 IP alias table
  arp                     IP ARP table
  as-path-access-list     List AS path access lists
  bgp                     BGP information
  cache                   IP fast-switching route cache
  casa                    display casa information
  cef                     Cisco Express Forwarding
  community-list          List community-list
  dfp                     DFP information
  dhcp                    Show items in the DHCP database
  drp                     Director response protocol
  dvmrp                   DVMRP information
  eigrp                   IP-EIGRP show commands
  extcommunity-list       List extended-community list
  flow                    NetFlow switching
  helper-address          helper-address table
  http                    HTTP information
  igmp                    IGMP information
  irdp                    ICMP Device Discovery Protocol
.
.
.
```

Example: Configuring a Lawful Intercept View

The following example shows how to configure a lawful intercept view, add users to the view, and verify the users that were added:

```
!Initialize the LI-View.
Device(config)# li-view lipass user li_admin password li_adminpass
Device(config)# end
! Enter the LI-View; that is, check to see what commands are available within the view.
Device# enable view li-view
Password:
Device# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Device(config)# parser view li-view

Device(config-view)# ?
View commands:
  commands  Configure commands for a view
  default   Set a command to its defaults
  exit      Exit from view configuration mode
  name      New LI-View name
  no        Negate a command or set its defaults
  password  Set a password associated with CLI views
Device(config-view)#
! NOTE:LI View configurations are never shown as part of 'running-configuration'.
! Configure LI Users.
Device(config)# username lawful-intercept li-user1 password li-user1pass

Device(config)# username lawful-intercept li-user2 password li-user2pass
! Displaying LI User information.
Device# show users lawful-intercept
li_admin
li-user1
li-user2
Device#
```

Note The lawful intercept view is available only on specific images and the view name option is available only in the LI view.

Example: Configuring a Superview

The following sample output from the **show running-config** command shows that "view_one" and "view_two" have been added to superview "su_view1", "view_three", and "view_four" have been added to superview "su_view2":

```
Device# show running-config
!
parser view su_view1 superview
 secret 5 <encoded password>
 view view_one
 view view_two
!
parser view su_view2 superview
 secret 5 <encoded password>
 view view_three
```

```
 view view_four
!
```

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Role-Based CLI Access

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 225: Feature Information for Role-Based CLI Access

Feature Name	Releases	Feature Information
Role-Based CLI Access		The Role-Based CLI Access feature enables network administrators to restrict user access to CLI and configuration information. The CLI view capability was extended to restrict user access on a per-interface level, and additional CLI views were introduced to support the extended view capability. Also, support to group configured CLI views into a superview was introduced. The following commands were introduced or modified: **commands (view)**, **enable**, **li-view**, **name (view)**, **parser view , parser view superview**, **secret**, **show parser view**, **show users**, **username**, and **view**.
Role-Based CLI Inclusive Views		The Role-Based CLI Inclusive Views feature enables a standard CLI view including all commands by default. The following command was modified: **parser view inclusive**.

CHAPTER 171

Information About Secure Storage

Secure Storage feature allows you to secure critical configuration information by encrypting it. It encrypts VPN, IPSec, and other asymmetric key-pairs, pre-shared secrets, the type 6 password encryption key and certain credentials. An instance-unique encryption key is stored in the hardware trust anchor to prevent it from being compromised.

By default, this feature is enabled on platforms that come with a hardware trust anchor. This feature is not supported on platforms that do not have hardware trust anchor.

Supported Platforms

Starting from Cisco IOS Release 15.6(3) M1, the following Cisco 880 Series platforms support Secure Storage:

Enabling Secure Storage

Before you begin

By default, this feature is enabled on a platform. Use this procedure on a platform where it is disabled.

SUMMARY STEPS

1. Config terminal
2. service private-config-encryption
3. do write memory

DETAILED STEPS

	Command or Action	Purpose
Step 1	Config terminal **Example:** `router#config terminal`	Enters the configuration mode.

	Command or Action	Purpose
Step 2	service private-config-encryption **Example:** `router(config)# service private-config-encryption`	Enables the Secure Storage feature on your platform.
Step 3	do write memory **Example:** `router(config)# do write memory`	Encrypts the private-config file and saves the file in an encrypted format.

Example

The following example shows how to enable Secure Storage:

```
router#config terminal
router(config)# service private-config-encryption
router(config)# do write memory
```

Disabling Secure Storage

Before you begin

To disable Secure Storage feature on a platform, perform this task:

SUMMARY STEPS

1. Config terminal
2. no service private-config-encryption
3. do write memory

DETAILED STEPS

	Command or Action	Purpose
Step 1	Config terminal **Example:** `router#config terminal`	Enters the configuration mode.
Step 2	no service private-config-encryption **Example:** `router(config)# no service private-config-encryption`	Disables the Secure Storage feature on your platform.
Step 3	do write memory **Example:** `router(config)# do write memory`	Decrypts the private-config file and saves the file in plane format.

Example

The following example shows how to disable Secure Storage:

```
router#config terminal
router(config)# no service private-config-encryption
router(config)# do write memory
```

Verifying the Status of Encryption

Use the **show parser encrypt file status** command to verify the status of encryption. The following command output indicates that the feature is available but the file is not encrypted. The file is in 'plain text' format.

```
router#show parser encrypt file status
Feature: Enabled
File Format: Plain Text
Encryption Version: Ver1
```

The following command output indicates that the feature is enabled and the file is encrypted. The file is in 'cipher text' format.

```
router#show parser encrypt file status
Feature: Enabled
File Format: Cipher Text
Encryption Version: Ver1
```

Downgrading the Platform Image to an Older Version

Before you downgrade the platform image to an older version where the Secure Storage is not supported, you have to disable the feature in the version where it is supported.

If you do not disable this feature before downgrading to an older image, the private-config file will be in encrypted format. The following Syslog message will be generated to indicate that the file is in encrypted format:

```
%PARSER-4-BADCFG: Unexpected end of configuration file.
```

If the file is in 'plain text', no Syslog message will be generated.

Feature Information for Overview of Secure Storage

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 232: Feature Information for Overview of Cisco TrustSec

Feature Name	Releases	Feature Information
Secure Storage	Cisco IOS XE Fuji 16.9.1	The support for Secure Storage is introduced for ASR and ISR platforms.

CHAPTER 172

AutoSecure

The AutoSecure feature secures a router by using a single CLI command to disable common IP services that can be exploited for network attacks, enable IP services and features that can aid in the defense of a network when under attack, and simplify and harden the security configuration of the router.

AutoSecure enhances secure access to the router by configuring a required minimum password length to eliminate common passwords that can be common on many networks, such as “lab” and “company name.” Syslog messages are generated after the number of unsuccessful attempts exceeds the configured threshold.

AutoSecure also allows a router to revert (roll) back to its pre-AutoSecure configuration state if the AutoSecure configuration fails.

When AutoSecure is enabled, a detailed audit trail of system logging messages capture any changes or tampering of the AutoSecure configuration that may have been applied to the running configuration.

Restrictions for AutoSecure

The AutoSecure configuration can be configured at run time or setup time. If any related configuration is modified after AutoSecure has been enabled, the AutoSecure configuration may not be fully effective.

Information About AutoSecure

Securing the Management Plane

The management plane is secured by turning off certain global and interface services that can be potentially exploited for security attacks and turning on global services that help mitigate the threat of attacks. Secure access and secure logging are also configured for the router.

Caution If your device is managed by a network management (NM) application, securing the management plane could turn off some services like the HTTP server and disrupt the NM application support.

The following subsections define how AutoSecure helps to secure the management plane:

Disabling Global Services

After enabling this feature (through the **auto secure** command), the following global services are disabled on the router without prompting the user:

- Finger--Collects information about the system (reconnaissance) before an attack. If enabled, the information can leave your device vulnerable to attacks.
- PAD--Enables all packet assembler and disassembler (PAD) commands and connections between PAD devices and access servers. If enabled, it can leave your device vulnerable to attacks.
- Small Servers--Causes TCP and User Datagram Protocol (UDP) diagnostic port attacks: a sender transmits a volume of fake requests for UDP diagnostic services on the router, consuming all CPU resources.
- Bootp Server--Bootp is an insecure protocol that can be exploited for an attack.
- HTTP Server--Without secure-http or authentication embedded in the HTTP server with an associated ACL, the HTTP server is insecure and can be exploited for an attack. (If you must enable the HTTP server, you are prompted for the proper authentication or access list.)

Note If you are using Cisco Configuration Professional (CCP), you must manually enable the HTTP server through the **ip http server** command.

- Identification Service--An insecure protocol, defined in RFC 1413, that allows one to query a TCP port for identification. An attacker can access private information about the user from the ID server.
- CDP--If a large number of Cisco Discovery Protocol (CDP) packets are sent to the router, the available memory of the router can be consumed, causing the router to crash.

Caution NM applications that use CDP to discover network topology are not able to perform discovery.

- NTP--Without authentication or access-control, Network Time Protocol (NTP) is insecure and can be used by an attacker to send NTP packets to crash or overload the router. (If you want to turn on NTP, you must configure NTP authentication using Message Digest 5 (MD5) and the **ntp access-group** command. If NTP is enabled globally, disable it on all interfaces on which it is not needed.)
- Source Routing--Provided only for debugging purposes, so source routing should be disabled in all other cases. Otherwise, packets may slip away from some of the access control mechanisms that they should have gone through.

Disabling Per Interface Services

After enabling this feature, the following per interface services are disabled on the router without prompting the user:

- ICMP redirects--Disabled on all interfaces. Does not add a useful functionality to a correctly configured to network, but it could be used by attackers to exploit security holes.
- ICMP unreachables--Disabled on all interfaces. Internet Control Management Protocol (ICMP) unreachables are a known cause for some ICMP-based denial of service (DoS) attacks.
- ICMP mask reply messages--Disabled on all interfaces. ICMP mask reply messages can give an attacker the subnet mask for a particular subnetwork in the internetwork.
- Proxy-Arp--Disabled on all interfaces. Proxy-Arp requests are a known cause for DoS attacks because the available bandwidth and resources of the router can be consumed in an attempt to respond to the repeated requests that are sent by an attacker.
- Directed Broadcast--Disabled on all interfaces. Potential cause of SMURF attacks for DoS.
- Maintenance Operations Protocol (MOP) service--Disabled on all interfaces.

Enabling Global Services

After AutoSecure is enabled, the following global services are enabled on the router without prompting the user:

- The **service password-encryption** command--Prevents passwords from being visible in the configuration.
- The **service tcp-keepalives-in** and **service tcp-keepalives-out** commands--Ensures that abnormally terminated TCP sessions are removed.

Securing Access to the Router

Caution If your device is managed by an NM application, securing access to the router could turn off vital services and may disrupt the NM application support.

After enabling this feature, the following options in which to secure access to the router are available to the user:

- If a text banner does not exist, users are prompted to add a banner. This feature provides the following sample banner:

```
Authorized access only
This system is the property of ABC Enterprise
Disconnect IMMEDIATELY if you are not an authorized user!
Contact abc@xyz.com +99 876 543210 for help.
```

- The login and password (preferably a secret password, if supported) are configured on the console, AUX, vty, and tty lines. The **transport input** and **transport output**commandsare also configured on all of these lines. (Telnet and secure shell (SSH) are the only valid transport methods.) The **exec-timeout** command is configured on the console and AUX as 10.

- When the image on the device is a crypto image, AutoSecure enables SSH and secure copy (SCP) for access and file transfer to and from the router. The **timeout** *seconds* and **authentication-retries** *integer* options for the **ip ssh** command are configured to a minimum number. (Telnet and FTP are not affected by this operation and remain operational.)
- If the AutoSecure user specifies that their device does not use Simple Network Management Protocol (SNMP), one of the following functions occur:
  - In interactive mode, the user is asked whether to disable SNMP regardless of the values of the community strings, which act like passwords to regulate access to the agent on the router.
  - In non-interact mode, SNMP is disabled if the community string is “public” or “private.”

Note After AutoSecure has been enabled, tools that use SNMP to monitor or configure a device is unable to communicate with the device through SNMP.

- If authentication, authorization, and accounting (AAA) is not configured, configure local AAA. AutoSecure prompts users to configure a local username and password on the router.

Security Logging

The following logging options are available after AutoSecure is enabled. These options identify security incidents and provide ways to respond to them.

- Sequence numbers and time stamps for all debug and log messages. This option is useful when auditing logging messages.
- Logging messages can be generated for login-related events; for example, the message “Blocking Period when Login Attack Detected” is displayed when a login attack is detected and the router enters “quiet mode.” (Quiet mode means that the router does not allow any login attempts through Telnet, HTTP, or SSH.)

For more information on login system messages, see the Cisco IOS Release 12.3(4)T feature module Cisco IOS Login Enhancements .

- The **logging console critical**command, which sends system logging (syslog) messages to all available TTY lines and limits messages based on severity.
- The **logging buffered** command, which copies logging messages to an internal buffer and limits messages logged to the buffer based on severity.
- The **logging trap debugging** command, which allows all commands with a severity higher than debugging to be sent to the logging server.

Securing the Forwarding Plane

To minimize the risk of attacks on the router forward plane, AutoSecure provides the following functions:

- Cisco Express Forwarding (CEF)--AutoSecure enables CEF or distributed CEF (dCEF) on the router whenever possible. Because there is no need to build cache entries when traffic starts arriving for new destinations, CEF behaves more predictably than other modes when presented with large volumes of

traffic addressed to many destinations. Thus, routers configured for CEF perform better under SYN attacks than routers using the traditional cache.

Note CEF consumes more memory than a traditional cache.

- If the TCP intercept feature is available, it can be configured on the router for connection timeout.
- If strict Unicast Reverse Path Forwarding (uRPF) is available, it can be configured on the router to help mitigate problems that are caused by the introduction of forged (spoofed) IP source addresses. uRPF discards IP packets that lack a verifiable IP source address.
- If the router is being used as a firewall, it can be configured for context-based access control (CBAC) on public interfaces that are facing the Internet.

Note At the beginning of the AutoSecure dialogue, you are prompted for a list of public interfaces.

How to Configure AutoSecure

Configuring AutoSecure

Caution Although the **auto secure**command helps to secure a router, it does not guarantee the complete security of the router.

SUMMARY STEPS

1. **enable**
2. auto secure [management | forwarding] [no-interact | full] [ntp | login | ssh | firewall | tcp-intercept]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	auto secure [management | forwarding] [no-interact | full] [ntp | login | ssh | firewall | tcp-intercept] **Example:**	A semi-interactive dialogue session begins to secure either the management or forwarding planes on the router when the **management** or **forwarding** keyword is selected. If neither option is selected, then the dialogue asks for both

	Command or Action	Purpose
	`Router# auto secure`	planes to be configured. If the **management** keyword is selected, then the management plane is secured only. If the **forwarding keyword is selected, then**the forwarding plane is secured only. If the **no-interact** keyword is selected, then the user is not prompted for any interactive configurations. If the **full** keyword is selected, then user is prompted for all interactive questions, which is the default.

Configuring Enhanced Security Access to the Router

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable password** {*password* | [*encryption-type*] *encrypted-password* }
4. **security authentication failure rate** *threshold-rate* **log**
5. **exit** *threshold-rate* **log**
6. **show auto secure config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables higher privilege levels, such as privileged EXEC mode. Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**enable password** {*password* | [*encryption-type*] *encrypted-password* } **Example:** `Router(config)# enable password elephant`	Sets a local password to control access to various privilege levels.
Step 4	**security authentication failure rate** *threshold-rate* **log** **Example:** `Router(config)# security authentication failure rate 10 log`	Configures the number of allowable unsuccessful login attempts. • *threshold-rate* --Number of allowable unsuccessful login attempts.

	Command or Action	Purpose
		• **log** --Syslog authentication failures if the rate exceeds the threshold.
Step 5	**exit** *threshold-rate* **log** **Example:** `Router(config)# exit`	Exits configuration mode and enters privileged EXEC mode.
